The group gears up for attaining various goals it is pursuing. The worker and the members plan and make preparation for the group meetings. The worker has to spend considerable amount of time in developing the activities and procedures for the conduct of the group meetings. A number of decisions have to be taken with regard to the selection of an activity or task, sequencing of the tasks and activities, assigning responsibilities etc. Materials and equipment to conduct the group activities have to be procured. Resource agencies and persons have to be contacted. For example, a pre-retirement counselling group may plan for exercises that would give them an idea about the possible changes that take place in their social status and roles and how best to cope up with the new situation. The possible exercises could be role-plays, screening of a video followed with a discussion, an orientation lecture session by an expert counsellor in the field etc. Structuring Time: The worker continues this task of setting the time limits for group sessions and individual tasks which has already been initiated in the previous phase as the life of the group is for specified period. The members and the worker have to be quite conscious of using time to get maximum benefit out of the group meetings. It is often NSOU ? PGSW-III 91 the tendency to delay the start the meetings for the sake of latecomers. Delaying the starting time may encourage late coming and cause inconvenience to others who report in time. It also happens that the meetings are either closed early or late. This is also not healthy as it causes inconvenience to members who have other works to attend and discourage them to attending or they may not pay proper attention to the group activity. Further, it is quite possible to get totally engrossed in a particular group task and lose track of the time. This may spill over into the other activity and giving it insufficient time. Consequently the benefits from the other activity are badly affected. So it is important that members must carefully structure their time and follow it. Facilitating the Group Sessions: It is not sufficient just to plan and prepare for the group sessions. The very reason for forming the group is to enable the members to come on to one platform to work towards solving their problems, which they could not solve individually. This suggests that the group needs guidance and support to carry out the tasks it has set forth. The worker has to take a lead in this and facilitate the group to perform its tasks successfully. At this stage of group's life, the members seriously pursue the goals of both individual and group. Worker encourages members to actively involved in the group activities, may they be sharing, discussing, and performing a task. The worker develops some insight into their strengths and weaknesses. It may be noticed that some members are performing well and while others do not show progress. Because of this the group's progress is affected. The worker has to facilitate the non- performing members to perform. Equipped with the sound knowledge base in human behaviour he/she assists each and every member to be aware of their cognitive processes intrapersonal processes that are blocking their progress, and enables them to organise their social transactions interpersonal interactions in the group to establish purposeful relationship. Intrapersonal limitations revolve around feelings, thoughts, beliefs and behaviour patterns of the member. For example when a member is asked to give his feeling about the just concluded group session, if he/she expresses that so and so member is rude in interacting, then the member is giving his thought but not the feeling which may unhappiness or happiness with the session. Sometimes the member does not understand the association between these cognitive processes. In the above example the link between the thoughts and feelings are not established if NSOU ? PGSW-III 92 the member could link the association between the thoughts of being dealt rudely by others during the course of the session and his/her being unhappy. In another case a member may entertain irrational thoughts and beliefs. In the above example if a member says that he/she feels the behaviour of a particular member is rude towards him/ her because the member resembles somebody in his/ her past with which he/ she had bad relationships. The worker facilitates the member to perform in desired direction by making them to understand these mental states. The worker then make suggestions for reframing and restructuring of the thoughts and expressions, as well as for stopping of the recurrence of unhealthy thoughts to enable the member to deal with these cognitive processes. The worker facilitates interpersonal interactions whenever he/she finds them deteriorating. Deteriorating interpersonal relations are discerned when members fail to communicate with each other, participate in the group activities, avoids some members, differ and pick up quarrels with each other, and form subgroups and work against each other. The worker helps to improve the interpersonal interactions by introducing a number of ice breaking, role-playing, modelling, and simulation exercises. At the environmental level worker connects the members with resources, creates congenial physical and social environment. Examining Group's Performance: The group processes are examined with a view to ensure that group attains its goals. It provides proper direction and guidance to the group. It includes the assessment of the levels of participation and involvement of group members in the group activities, the changes that are taking place in the members' perceptions, attitudes and behaviours, acquisition of new skills and strengthening of existing skills that would help members to deal with their problem areas and grow. It points out the areas for and type of interventions that have to be planned and implemented by the worker at individual level as well as at the group level. The assessment is being done by the worker, members themselves and others who are associated with the group. The tools that help generally helps in the assessment are observations

and recording. The structure observation here refers to the observations of

worker and other members and self-observations of members themselves. For example, it is decided to assess the communication patterns among the members. The worker and members are informed in advance or later, that is during or after a specific task has NSOU ? PGSW-III 93 been performed, to note their observations on various aspects of communication such as the language, the gestures, modes of communication verbal or non-verbal the member/s resorts to. While, recording of the group are written reports, audiotapes and videotapes, measurement scales of behaviour,

Evaluation (on going) is an integral component of social group work. The term evaluates simply means to examine the value of. According to Trecker (1955), it attempts to measure the quality of group's experience in relation to the objectives and functions of the agency. Evaluation provides the necessary feedback on the performance of the group. It is carried out after the end of group work activity. It focuses on the worker's performance, agency support, the group process and growth of the members. The evaluation may be entrusted to the worker or to someone in the agency or to an outside expert(

work groups are different from other groups as they come into existence for a specific purpose of enabling people in need to resolve their needs through group experience which under constant guidance from a professional trained social worker. We also have information about the types of social work groups that can be thought of by the worker keeping in mind the needs/problem situation of the members, the interests of the agency, and the availability of resources. We have learnt that the social work group formation has a numbers of phases and each phase has a number of steps, which the worker and members have to carefully involve. We have also examined the role of social group worker in group formation. We have discussed the generic roles group work in different stages. The group worker is the key player in the formation of the group. The worker plays a number of roles. He/ she plays the most widely shared roles of social worker in general viz., enabler, mediator, advocate, educator, and facilitator. The roles specific to social work group are that of a leader and decision maker(

Social Work Group Formation, n.d. -a). As enabler the worker furnishes the necessary information to members so that member's doubts are clarified and their participation levels improve. He/she encourages the member/s who takes initiatives in performing the group tasks. As mediator, the worker resolves the conflicts in the group by liaison. Brings conflicting members onto discussion forum and interprets each member's points of view so that the misunderstandings that caused the conflict are put to an end. The worker also mediates the negotiations between the group and the other staff of the agency and other resource agencies(

As advocate the worker presents the case of the members to the agency authorities to secure certain additional facilities and concessions. She/he pleads on behalf of the member with family and/or with the community to cooperate with the member by way of accommodating the member's needs. He/she presents the case of the member/ s to the referral services(

As educator the worker clarifies the misnomers the member/s have about various aspects such as the problem/need, irrational beliefs, unfounded fears etc. He passes on information to the members about the developments taking place in the areas concerning their social situations. NSOU ? PGSW-III 95 As facilitator the worker creates congenial environment for the group to go ahead with its activities and tasks. He/she procures the required material for the smooth conduct of the group sessions/tasks. The worker helps members who are shy and withdrawn type to participate by helping them to identify their intrapersonal and interpersonal shortcomings and assists them in overcoming these. As a Leader the group worker also plays the role of a leader in the group. As a professional with sound knowledge base in human behaviour and social interactions and interpersonal relations, the group worker is automatically assumes leadership role. Till the time the group has its leader from among the members the worker discharges the functions of a leader. Douglas discussed four leadership acts the worker performs viz., preparation, intervention (working), intervention (control) and evaluation. The worker provides directions to group members in planning the group activities, making preparations for carrying out the planned activities and finally in carrying out activities. He exercises controls over those members who are either not cooperative or involving in actions that are detrimental to the group's norms and purposes. As decision maker he performs the role as decision maker. Decision making is to choose among the alternatives available. A number of decisions have to be taken in planning and organising group and its activities. The decision-making process starts from the conception of the group to that of termination of the group. At every stage decisions have to be made. For example, a decision has to be taken to decide the size and composition of the group in the formation stage. They have to be made independently by the worker or made in active consultation with and involvement of members, agency administrators and other staff and at times even with resource and referral agencies. Even though the worker has conviction in the democratic process, still the worker is compelled to take decision as the group is in a fix or dilemma to take decisions. Finally, the worker as a leader develops and promotes Co-leadership in the group. The worker identifies the potential leaders from among the members and creates opportunities for them to take up leadership responsibilities. NSOU ? PGSW-III 96 6.5 Exercise 1. NSOU ? PGSW-III 98

Unit 7 ? Group Development Structure 7.0 Objectives 7.1 Introduction 7.2 Group Development 7.3 Group Process 7.4 Group Dynamics 7.5 Conclusion 7.6 Exercise 7.7 Reference 7.0 Objectives The basic objective of this part is to develop clear concepts on group development, group process and group dynamics. This concept is very much essential in order to help in understanding growth of the group, which generally is the system to prepare the members to face various challenges, to tackle problems, to find solutions, to plan work, and to deliver results. 7.1 Introduction Groups, like individuals, are each unique with their own experiences and expectations. Many commentators studying group development and dynamics have recognized that group development, as a generalization, is more predictable than individual behavior. Many theories of stages of group development have been cultivated, and it must be stressed that no single definitive model of stages of group development exists. Two of the most useful theories of stages of group development are those discussed by Tuckman (1965) and Rogers (1967). These models, like others (for example Heap, 1977), propose as groups develop and change they pass through stages which may be conceptualized. Tuckman's model has been used extensively NSOU ? PGSW-III 99 within youth work theory and practice and is an excellent model for attempting to analyze individual and group behavior (Groups at Work-Social Psychology Assignment, n.d.). Before going into those models, let us try to understand the basic concept of group development. 7.2 Group Development Group development in social group work refers to the process of progress of group's achievement over a period of time. The term generally used to indicate the pattern in a way the groups of people change over time and make decisions. Two specific indicators of group development are: (a) the members feeling settled and happy in the group; and (b) progress the group is making in achieving its objectives. Regular meetings of the group, a wider interaction among members, a free flowing conversation, and language, general spirit of cooperation and accommodation of members are some signs of positive environment in a group, reflecting a clear sign of group development (Siddiqui, 2008). The indicators of group development are : attendance, punctuality, definite meeting time and attendance, development of a formal organization, willingness on the part of the members to undertake initiative and responsibility, Increased innovation and motivation, controlled behavior of the members, high level of participation, emergence of leader, and shift from 'I' and 'Me' to 'We' and 'Us'. The process was first described by Tuckman, an educational psychologist who came up with the process in the 1960s. Since then group development is known as team building and team development and have become a generally accepted pattern of group behavior. In group development, group is formed; members get to know each other, even if there are pre-existing relationships, and also closely interact with each other. Understanding the stages of group development helps in developing proper intervention in the group process to bring about group's growth and achieving group goals. Some theorists have claimed that groups develop through more or less predefined stages (eg. Kurt Lewin's unfreezing-change-freezing, Tuckman's Team Development Stages, etc.). Others have said that group development is cyclic. Yet some have argued that group development happens while groups may or may not go through NSOU ? PGSW-III 100 certain phases at some moment in time. To get an acceptable definition of this phrase is difficult because it has been defined in many ways with varying degrees of depth and complexity. • Berkowitz (1974) has stated that group development refers to the fact that group process undergoes modification which enables the group to have more alternative ways to solve problems (as cited in Smith, 2001). • Ridgeway's (1983) definition of group development focuses on the groups need for improved communication patterns (as cited in Smith, 2001). • Sarri & Galinsky (1974) have defined group development as changes through time in the internal structure, processes and culture of group (as cited in Bission, 1988). As an outline in this definition (Sarri&Galinsky as cited in Ito et.al., 2008) of group development entails changes within three different dimensions. The first dimension, the social dimension, is concerned with the organization of groups' structure and the pattern of the participants' roles and structures. The second dimension focuses on the group's activities, task and the operative process of the group and is labelled the activity dimension. The other dimension, group culture, includes properties such as group norms, values and a shared group purposes. 7.2.1 Stages of Group Development: An Overview Tuckman's model (1965) has been used extensively used theory and practice and is an excellent model for attempting to analyse individual and group behaviour. His model is elaborated below Stage 1: Forming In the Forming stage, group members rely on safe, patterned behaviour and look to the group leader for guidance and direction. Group members have a desire for acceptance by the group and a need to know that the group is safe. They set about gathering impressions and data about the similarities and differences among them and forming preferences for future sub grouping. Rules of behaviour seem to be to keep things simple and to avoid controversy. Serious topics and feelings are avoided. The major task functions also concern orientation. Members attempt to become NSOU ? PGSW-III 101 oriented to the tasks as well as to one another. Discussion centres on defining the scope of the task, how to approach it, and similar concerns. To grow from this stage to the next, each member must relinquish the comfort of non-threatening topics and risk the possibility of conflict (Stages of Team Development, n.d.). Oppressive behaviour is least likely within the formation stage of a group as individuals generally look to create a comfort zone and do not wish to rock the boat. Often frustrations will be built upon between individuals who disagree strongly, but this will generally not surface until storming begins. A knowledge and understanding of the feelings and emotions felt by group members in this stage is helpful, if not essential, to the effective structuring of a programme to work towards the desired outcome for the group. The worker should be patients and undertake activities/decisions to show results in the first sessions of group formation and to arouse the interest of members. The members can be briefed about duration of the group, its size, nature, meeting place, etc. Thus, the planning for forming the group in particular should focus on the following details. Composition of group: The nature of membership depends on purpose of the group and its goals. The worker must collect details about members on the following points: the socio- economic background of members, geographical location, client group, earlier experience of group participation, reasons for joining the group, and individual needs and interests. Collecting information about these issues will help the worker in carrying out the work. Size of group: A decision about the size of the group should be made keeping the purpose of the group and the needs of members in mind. The decision about the size depends on several factors including the experience of worker and the age group of the clients/members. Frequency of the meeting: Frequency of group

meeting is to be fixed depending upon the purpose or convenience of members, the workers own work load, etc. As such, there is no fixed

NSOU ? PGSW-III 102

99%

MATCHING BLOCK 236/546

SA

Unit 7 Group development and group dynamics[13 ...
(D122077760)

formula to decide the frequency. For example, recreational group of children meet more frequently, support group may be once in a week or once in 15 days and self help group or saving groups weekly or once in a month and so on. Frequency of meeting of treatment group is decided more in accordance with the needs of the members. Place of meetings: A place of group meeting has also to be decided in accordance with the convenience of the members and in convenience of space and other resources needful for group activities. Frequent change of venue of meeting is known to cause difficulties and should be avoided. Members consent about the place of meeting could severely affect the participation. Duration of the group: The decision about the duration is taken considering the experience, capacity of the members to achieve the goal in a given time frame. The duration of the group can be changed depending upon the progress made by the group, such as a certain level of cohesion and the decision of the members to continue in their own. Establish group culture, mutual aid system and social responsibility is also important for a worker in the planning and forming stage. Stage 2: Storming The next stage, which Tuckman refers as storming stage. As the group members attempt to organize for the task, conflict inevitably results in their personal relations. Individuals have to bend and mould their feelings, ideas, attitudes, and beliefs to suit the group organization. Because of "fear of exposure" or "fear of failure," there will be an increased desire for structural clarification and commitment. Although conflicts may or may not surface as group issues, they do exist. Questions will arise about who is going to be responsible for what, what the rules are, what the reward system is, and what criteria for evaluation are. These reflect conflicts over leadership, structure, power, and authority ("Team to Achieve Millennium - PHDessay.Com," 2017). There may be wide swings in members' behavior based on emerging issues of competition NSOU ? PGSW-III 103 and hostilities. Because of the discomfort generated during this stage, some members may remain completely silent while others attempt to dominate. In order to progress to the next stage, group members must move from a "testing and proving" mentality to a problem-solving mentality. The most important trait in helping groups to move on to the next stage seems to be the ability to listen("Team to Achieve Millennium - PHDessay.Com," 2017). The potential for oppressive behaviour is strong within the storming phase as group members preferred roles and release frustrations built within the forming period. This personal oppression should be discouraged whilst it is understood that a degree of conflict is necessary if the group is to further develop(Groups at Work- Social Psychology Assignment, n.d.). It is important to be aware that conflict will take place within all groups, and if handled well this conflict can produce benefits for the group in terms of development, objective and task setting, and ultimate outcome. Thus conflict is not inherently something to be feared or avoided(Groups at Work-Social Psychology Assignment, n.d.). In the exploration stage, the worker must focus on preparation of profile and setting objectives. Hence, the worker must take details of members including their name, age and educational status; general awareness level of group goals; the self confidence level; communication skills; and leadership potential. This profile can serve as the benchmark to see what changes can occur in individuals as a result of their participation in group activities. The success of the group depends to a great extent on the clarity on setting objectives. The group objectives should be broad enough to cover these individual differences of needs. The objectives of group will however depend on the kind of member the worker is working with. The purpose of the group is also influenced by the sponsoring organization. A number of other objectives can also be identified to work with the groups. Some of the objectives of group work are: to provide recreational services on activities, to provide creative activities among group members, to prepare members for social responsibility, to develop life skills, and to provide helps in dealing with problems of social functioning.

NSOU ? PGSW-III 104

100%**MATCHING BLOCK 237/546****SA**Unit 7 Group development and group dynamics[13 ...
(D122077760)

Stage 3: Norming In Tuckman's Norming stage, interpersonal relations are characterized by cohesion. Group members are engaged in active acknowledgment of all members' contributions, community building and maintenance, and solving of group issues. Members are willing to change their preconceived ideas or opinions on the basis of facts presented by other members, and they actively ask questions of one another. Leadership is shared, and cliques dissolve. When members begin to know-and identify with-one another, the level of trust in their personal relations contributes to the development of group cohesion(Stages of Team Development, n.d.). It is during this stage of development (assuming the group gets this far) that people begin to experience a sense of group belonging and a feeling of relief as a result of resolving interpersonal conflicts. The major task function of stage three is the data flow between group members: They share feelings and ideas, solicit and give feedback to one another, and explore actions related to the task (Stages of Team Development, n.d.). Creativity is high. If this stage of data flow and cohesion is attained by the group members, their interactions are characterized by openness and sharing of information on both a personal and task level. They feel good about being part of an effective group. The major drawback of the norming stage is that members may begin to fear the inevitable future breakup of the group; they may resist change of any sort(Stages of Team Development, n.d.). The storming and norming phases of group development are inextricably linked, as it is often through the storming and challenging that acceptable group norms become set. It is important that a youth worker works hard during this stage to ensure oppression against individuals within the group do not become the acceptable norm, as then all group members will oppress these individuals. Thus, individual oppressions must be challenged and emphasis placed on challenging attitudes and opinions but not group members(Groups at Work-Social Psychology Assignment, n.d.). Stage 4: Performing The Performing stage is not reached by all groups. If group members are able to evolve to stage four, their capacity, range, and depth of personal relations expand to true interdependence. In this stage, people can work independently, in subgroups, or

NSOU ? PGSW-III 105

100%**MATCHING BLOCK 238/546****SA**Unit 7 Group development and group dynamics[13 ...
(D122077760)

as a total unit with equal facility. Their roles and authorities dynamically adjust to the changing needs of the group and individuals. Stage four is marked by interdependence in personal relations and problem solving in the realm of task functions (FacultyDevelopment_GroupDevelopment.Pdf, n.d.). By now, the group should be most productive. Individual members have become self-assuring, and the need for group approval is past. Members are both highly task oriented and highly people oriented. There is unity: group identity is complete, group morale is high, and group loyalty is intense. The task function becomes genuine problem solving, leading toward optimal solutions and optimum group development. There is support for experimentation in solving problems and an emphasis on achievement. The overall goal is productivity through problem solving and work(FacultyDevelopment_

Group Development.

100%**MATCHING BLOCK 239/546****SA**Unit 7 Group development and group dynamics[13 ...
(D122077760)

Pdf, n.d.). Stage 5: Adjourning Tuckman's final stage, adjourning, involves the termination of task behaviours and disengagement from relationships. A planned conclusion usually includes recognition for participation and achievement and an opportunity for members to say personal goodbyes. Concluding a group can create some apprehension – in effect, a minor crisis. The termination of the group is a regressive movement from giving up control to giving up inclusion in the group. The most effective interventions in this stage are those that facilitate task termination and the disengagement process(FacultyDevelopment_GroupDevelopment.Pdf, n.d.). The ending of a group can be a very unhappy and distressing time for some members, as they may feel some extent of dependency on the group. Garland et al. describe some of the typical responses to the ending phase as(Groups at Work-Social Psychology Assignment, n.d.): • Denial – 'forgetting' the time of the groups termination. • Regression – reverting to a less independent state of functioning. • Need expression – in the hope the group will continue. • Recapitulation – detailed recall of past experiences within the group. • Evaluation – detailed discussion on the value of the group experience.

NSOU ? PGSW-III 106 •

Flight – destructive denial of any positive benefit of the group, or a positive disengagement towards other interests. Potential exists within this stage for members to be oppressed as scapegoats, that is blamed or at fault for the ending of the group. This can be minimised by constant focusing and refocusing on group end points and staged celebrations of group achievements. As we have seen the value of a theoretical understanding of conceptualising this group stage theory in youth work and other helping professions, lies in enabling group workers to 'tune into the group's processes and respond appropriately' (Preston-Shoot, 1987).

7.2.2 Role of Social Worker in different stages of group development There are different roles of social worker according to different stages of development. For our easy understanding we can elaborate this concept as below by keeping reclassified stages of group development vis-a-vis role of a social worker. The social worker practicing this method in the Indian setting following the western theoretical framework may find it an uphill task. Let us try to understand to bifurcate various stages of development in view of the above to outline the role of social worker.

Stage I: Planning and Formation of Group: Under this, the worker has to work hard to form a group. Planning stage refers to contacting the potential members individually or in small groups to share with them the idea of forming a group. The formation stage thus will require careful planning. The worker should contact the members individually and in groups to discuss the idea and purpose of group formation. The members can be briefed about duration of the group, its size, nature, meeting place, etc. Thus, the planning for forming the group in particular should focus on the following details. (i) Composition of group: The nature of membership depends on purpose of the group and its goals. The worker must collect details about members on the following points: the socio-economic background of members, geographical location, client group, earlier experience of group participation, reasons for joining the group, and individual needs and interests. Collecting information about these issues will help the worker in carrying out the work. NSOU ? PGSW-III 107 (ii) Size of group: A decision about the size of the group should be made keeping the purpose of the group and the needs of members in mind. The decision about the size depends on several factors including the experience of worker and the age group of the clients/members. (iii) Frequency of the meeting: Frequency of group meeting is to be fixed depending upon the purpose or convenience of members, the workers own work load, etc. As such, there is no fixed formula to decide the frequency. For example, recreational group of children meet more frequently, support group may be once in a week or once in 15 days and self help group or saving groups weekly or once in a month and so on. Frequency of meeting of treatment group is decided more in accordance with the needs of the members. (iv) Place of meetings: A place of group meeting has also to be decided in accordance with the convenience of the members and in convenience of space and other resources needful for group activities. Frequent change of venue of meeting is known to cause difficulties and should be avoided. Members consent about the place of meeting could severely affect the participation. (v) Duration of the group: The decision about the duration is taken considering the experience, capacity of the members to achieve the goal in a given time frame. The duration of the group can be changed depending upon the progress made by the group, such as a certain level of cohesion and the decision of the members to continue in their own. (vi) Establish group culture, mutual aid system and social responsibility is also important for a worker in the planning and forming stage.

Stage II: Exploration Stage: It is critical stage in the group process and group development and it can be a point of making a group or break a group. It is time at which members are searching s individual role and function or one's status in the group. Issues of control and power are prominent and tested in leader-member as well as member-member interaction. The worker at this stage has to offer magical solution to problems. Each group member's needs are to be met and expressed. At the task level there may be

NSOU ? PGSW-III 108

97%

MATCHING BLOCK 241/546

SA

Unit 7 Group development and group dynamics.docx
(D121776257)

anxiety and uncertainty. So, it is important that all members are involved in the group activity. Thus, in the exploration stage, the worker must focus on preparation of profile and setting objectives. The following details could be mentioned as responsibility of worker in this stage. (i) Preparation of profile: The worker must prepare a profile of members including their name, age and educational status; general awareness level of group goals; the self confidence level; communication skills; and leadership potential. This profile can serve as the benchmark to see what changes can occur in individuals as a result of their participation in group activities. (ii) Setting objectives: The success of the group depends to a great extent on the clarity on setting objectives. The group objectives should be broad enough to cover these individual differences of needs. The objectives of group will however depend on the kind of member the worker is working with. Stage III: Performing Stage: In this stage, the role of the worker is that he or she must have the capacity to develop cohesion, monitoring and a change to be avoided in allocating task, which put too much pressure on individuals as well as to the groups. The feeling of cohesiveness in the group is what members enjoy most i.e. when they feel they belong to the group. Stage IV: Evaluation Stage: In the evaluation stage, the role of worker is to perform the following: (a) record keeping, (b) help members to evaluate what they have achieved and also have failed to achieve, and (c) find out what is the development of individual and group. Evaluation is an essential part of all processes as it helps the worker and member both to assess the outcome of their efforts. The evaluation can be carried out informally or in a formal manner. Stage V: Termination Stage: At the termination of a group in particular, an assessment of the individual's dependence on the group should be carefully done. The worker can help the group NSOU ? PGSW-III 109 to feel good about the success achieved. However, the worker must guard against any emotional over dependence on the part of the member on group as it can undermine the individual's self reliance and coping capacities. In conclusion, it can be said that the worker has an important role to play in group development and its stages. The worker therefore should have a clear concept and thinking as well as decision towards different stages so as to bring a success of group goal.

7.2.3 Conclusion Generally, the well known models of group development have identified a linear arrangement of development stages, where one stage is completed to precede or follow the other stage, such as forming, storming, norming, performing and adjourning, provided by Tuckman (1965). As Konopka (1963) noted, the relationships of the members to each other are taken complex and full meaning and possibilities. They are never static. They change in time and in relation to specific situations and events in the life span of a group. They propose that as groups develop and change they pass through stages which may be conceptualised. This section dealt clearly on Tuckman's stage of development and it very well highlighted the role of social workers in different stages of group development.

7.2.4 Check Your Progress 1. Explain in short what is group development? 2. Write different stages of group development and its characteristics. 3. What role can a social worker play in different stages of group development?

Group Process Objectives The basic purpose of this sub section is to provide basic knowledge on the concept of group process for developing professional competence of handling social groups. This understanding will help a worker to know what to expect in different process of group and how to deal with the situations. The phrase "Group Process" refers to the understanding of the behaviour of people in groups, such as task groups, and the processes used to solve problems or make decisions. A group here is defined as "a collection of individuals that have shared common interests or experiences." A group develops relationships and generates an energy, or identity, that is different together than when individuals are by themselves or with others. When a group comes together they are primarily concerned with the contribution of content to achieve the purpose for which they were formed. Content is defined as the "substantive or meaningful part of something". Group process as the means by which group members interact, make decisions, handle problems, and develop their roles. As the definition implies there are several elements to a group process. Elements, which typically influence group proceedings, include process design, communication, participation, decision making and role fulfilment. As the facilitator your advantage point provides a great opportunity to regularly observe how things are going. Depending on the frequency of meetings and an understanding of what to look for, you can be instrumental in ensuring group and individual success. For the purpose of this paper I am concerned with the "process that the facilitator designs" to help the group accomplish its purpose.

7.3.1 Understanding on group process Ridgeway (1983) about the dynamics of groups listed the following group processes in small group. She identified basic fundamental processes in small group, which are identified as communication, cohesiveness, group development, conformity, deviance, social control, status differentiation, leadership, group culture. The key elements likely to happen in variety of ways and group process could be understood on the following ways:

NSOU ? PGSW-III 111

Interaction; Communication; Cohesion; Conflict; Structuring; Leadership; Decision making; Norming and group culture; Social control; Group development Let us try to understand each of those areas of importance in the group process. Interaction People join groups for a various purposes. The interaction started rolling as people come face to face in a situation. The interaction process is very fluid and undergoes frequent changes that may lead to either conflict or cohesion of a group. While communication, both verbal and non-verbal, facilitates interaction. Interaction can be person or issue focussed. One person dominated interaction will result in concentration of power in the group. Such a person will determine its purpose and will influence the participation of other members. S/he may impose restriction on interaction of other members among themselves. In such a context the interaction will be focussed but it could be termed as autocratic. This domination can be questioned by other members. The general sociological understanding is that the larger the size of the group, lesser is the interaction among its members. The relationship among members is emotional bond (Toseland and Rivas 2001). Leadership is the key variable in understanding interaction. The low participation among members is indicative of an interaction where some members are keeping a low profile, remaining at eh periphery of the affairs of the group. The subgroup is another interaction pattern inevitable in some groups. The pattern of interaction can be isolated or formation of sub-groups or all round interaction. Some of the possible ways of improving interaction in group can be controlling the size, or reducing distance, developing effective leadership, clarify group goals, explain the nature of interaction pattern, dealing with fairness and resistance, etc. Communication Communication is another important aspects of group interaction. The nature of communication itself makes difference on group interaction and its various processes. The negative communication may dissatisfied members in fulfilling their desired goal, while positive communication among members makes them happy and interact more freely among them. The communication process needs close monitoring and skilful communicator always is a great asset of the group. Good communication makes a healthy environment in the group. On the other hand communication gap NSOU ? PGSW-III 112 may create misunderstanding among the members. So, the worker should remember that the nature of communication can help in giving a structured form in the group for assigning role and responsibility among group members. Cohesiveness Group cohesiveness in social group work refers to the willingness of all members to stay together in the group. Secondary groups, like women's groups, SHGs, children's group, neighbours are spontaneous and natural. The members join them in their own. The nature of group formed by social worker is little different from these groups. The cohesiveness of a formed group is more fluid and the situation changes with different events and activities. They external and internal environment of these groups are dynamic in nature. Therefore, cohesiveness is not the simple factors of members liking or disliking or interpersonal interaction. People want to stay in a group because of variety of reasons, group potential for meeting the needs. People stay in the group despite of competing with each other. But the factors that generally helps in the group cohesive are group norms and group culture; group goal; a caring leader; non threatening group environment; a greater degree of homogeneity among group members. Group Conflict It is natural phenomenon that the members join together in secondary group, other than primary group voluntarily and stay and work together, play or carry out their activities; therefore, it is impossible to move forward without having any conflict among them. Heated exchange of ideas, silence, negative feedback, personal remarks directed against individuals, attacking integrity of individuals, are all symptoms indicative in a group. Some factors that can cause group conflict are like miscommunication, ideological differences, rigidity of group members, cultural differences, leadership styles, group goals not being able to address individual needs, outside environment, lack of resources, and heterogeneity among members. There are various ways in which group worker, group leader or facilitator can be taken care such group conflict for smooth function of the group based on democratic norms. Structuring Group structuring begins with group functioning. Tuckman (1963) refers that storming is one important stage, which is useful to understand the respective positions

NSOU ? PGSW-III 113

100%

MATCHING BLOCK 244/546

SA

Unit 7 Group development and group dynamics.docx
(D121776257)

of members in a specific group. The structuring is based on ongoing assessment of member's ability and roles which helps in reducing conflict. It emerged as they became aware of the goals and conflict of sharing of sharing rewards. Group Decision Making Group decision is a process of arriving at a decision where more than two individuals are involved. It is therefore, necessary for to understand the process of decision making. It is a pattern, follow some broad models of decision making, such as the Rational Model, the Political Model, and the Process Model. The rational model is based upon grounded goal, objectives, alternatives etc. It takes all available information and the decision makers are capable in assessing the advantages and disadvantages of any alternative goals or consequences of selecting or not selecting any each alternative. But rational model does possess a silent disadvantage. The model assumes that there are no intrinsic biases to the decision making process (Lyles and Thomas, 1988). Therefore, the worker must be conscious on such facts while helping members to arrive at a certain decision. While political model, one should be careful as it tells us to the fact that the decision makers has some interest and are motivated by and act on their own needs and perceptions. It does not believe in making full information available or focussing the optimal viewpoints. Personal interest and biases are common among members and it influences their behaviour. This model cannot be the best for social group work practice. The process model of decision making is more structured. In this model, decisions are made based upon standard operating procedures or pre-establishing guidelines within the group. Leadership in Groups Leadership facilitate in group functioning. A leaderless group face problems in maintaining order and focus in group functioning. Social scientist doesn't however believe that leaders are born. It can emerge from the group. As Lewin suggested leadership is a function of interaction in a group. Some theories identifies as the central factors in leadership and then go on identify power as the central factor of leadership and then gone into identifying different kinds of power. All people who are able to help group or members in a society in getting the things done as seen as people having power. They are respected or fear by others and many of them have emerges as different status than other members in the group, who normally refers as leaders. French and Raven (1968) has identified a few types of power of members

NSOU ? PGSW-III 114

which help in enhancing individual status and leadership in a group, such as connective power (expertise in any area that can facilitate the group's tasks), information power (information that are required to facilitate group's progress of activities and decisions), expert power (expertise that helps setting and implementing tasks), legitimate power (a position of authority), reference power (liking and admiring members by many), reward power —ability to punish etc..)

Leadership Styles and Bases of Power - Strategy, Organization, System, Manager, Definition, Model, Type, Hierarchy, Business, n.d.) Norming and Group Culture Norms serve as guideline for acceptable behaviour. Violation of norms invokes social sanctions. All groups establish norms and belief systems. But norming becomes a problem when there is a wide range of belief and commitment to various values. Norms define the group culture. It is difficult to evolve norms of role allocation acceptable to all. But adopting some procedure and system can regulate members and group functioning. In providing freedom to members and helping them in respecting each other can further helps the group growth (Leadership Styles and Bases of Power - Strategy, Organization, System, Manager, Definition, Model, Type, Hierarchy, Business, n.d.). Social Control A system of control is inevitable to enforce compliance. There are formal rules of conduct and violation of rules can evoke penalty. The other kind of rules is not coded but is known to members through process of socialization. It of course is an essential part to work with a group. Group Development The stages of group development help the worker to monitor what is happening in a group. Bale (1950) was perhaps the first person to study the groups. He noted that the first thing that the people in a group do is to familiarize themselves with other members in the group and explore possibilities that the group has to offer them. He called it as orientation stage. The members may review their relationship with others in general and assessment based on experience. He termed this stage as evaluation stage. NSOU ? PGSW-III 115 Besides, by generalizing the elements of the processes one can identify seven common steps of Group Process(Facilitation Center, n.d.). The close observation of these steps can help the facilitator to work more effectively. These steps are (Vick, Wayne. J. 2013): Reference: (Facilitation Center, n.d.) Step 1: Focusing Purpose of group- Focussing purpose of the group forms the foundation of the work of a group and consequently the group worker work as a facilitator. He/she seeks to help a group achieve its purpose or reason for being. So the purpose must be clearly identified. That is often difficult to do particularly in problem solving when participants come to a group event seeing a problem from a completely different perspective. Yet the facilitator must clarify the purpose long before participants step foot into the room. Getting clear on the purpose is absolutely critical to achieving success for the group. Step 2: Planning for Group and its Process The worker helps the group by planning a process that will achieve the purpose of the group. It is during this step that other models, concepts and frameworks are

NSOU ? PGSW-III 116

100%

MATCHING BLOCK 246/546

SA

Unit 7 Group development and group dynamics.docx
(D121776257)

brought to bear on the kind of work that is being done. If we are doing problem solving we must look at the kind of problem the group is facing and to select and use a problem solving model as our guide to planning the event. There are many different types of problem solving models. If we are not doing problem solving and just want to explore, learn more, or understand someone's plan, it works equally well, although there may be group process steps that we spend little to no time on. If we are developing a plan, like a strategic plan, it works equally well. Step 3: Gathering Data for Group Programme- Information or data is just like a pile of sand one use to make a sand castle. One should understand that the sand will become a beautiful sand sculpture when it is understood and properly formed. But before we work it, it is just a pile of sand. So, data is just information if it is not reviewed or understood or assessed within the proper context. Step 4: Process Data and information for group decision Data is meaningless until it has been processed or activities are given proper shape. This is where we process the data, through various tools and techniques to squeeze out its meaning and learn what it has to tell us. It is possible, and often likely, that we may decide to collect more data to confirm or complete our understanding of the situation. Steps 3 and 4 are somewhat meaning that a group's activities rarely flow from one step to another in a simple, four step, and clean process. We may need to gather data and process the information two or three times before we have enough information and understanding to look at options and make a decision. Step 5: Examine Options In this step of the group process one should ask what group could do about this? Examining options not only assumes the development of the options but could also include the development of criteria used for assessing the value of those options to solving the issues or achieving our goals, and the actual assessment as well. Step 6: Make Decisions Finally, after obtaining information and its proper understanding the group members need to make a decision. Decision making is the act of choosing a course of action, determining what to do. In addition this step one can also include the

NSOU ? PGSW-III 117

99%

MATCHING BLOCK 247/546

SA

Unit 7 Group development and group dynamics.docx
(D121776257)

setting of priorities and action planning with success metrics and follow-up requirements. Step 7: Document Results This is often a forgotten step yet it is extremely important for three reasons, one standardization of documenting that changes the group; historical note for future and recognition and celebration: following implementation and verification of the successful project taking time to recognize the accomplishment provides a reward of sorts to the team. Allow them to celebrate for the success they created. Documenting all the results is critical but it is necessary for group process purpose. 7.3.2 Conclusion The understanding of group processes is very meaningful to develop a small group. The process can be identified by highlighting some important areas like interaction, communication, cohesiveness, group development, conformity, deviance, social control, status differentiation, leadership, group culture as part of the group process. While other can also identify the elements of group processes by analyzing seven common steps, which are like focus on the purpose; planning process; gather relevant data of group and activities process information relating to progress: examining options of groups: decision making process; document results. The worker can play an effective in understanding such concept and helping group members scientifically. 3.2.5 Check your Progress (Use the space proved for your answers) 1. What is group process? Discuss the concept briefly by mentioning different points 2. Write roles of social worker in group processes.

Unit 7 Group development and group dynamics.docx
(D121776257)

Group Dynamics 7.4.1 Objectives The basic objectives of this sub-section is to give a clear understanding on the concept of group dynamics, which is a system of behaviours and psychological processes occurring within a social group (intra group dynamics), or between social groups (intergroup dynamics). As the study of group dynamics can be useful in understanding decision-making behaviour, tracking the spread of problems in groups, creating effective therapy techniques, etc, it is necessary for worker to understand this concept. Group dynamics are at the core of understanding in psychology, sociology, anthropology, political science, epidemiology, education, social work, business, and communication studies. The group dynamics (or group processes) has a consistent, underlying premise: 'the whole is greater than the sum of its parts.' A social group is an entity, which has qualities that cannot be understood just by studying the individuals that make up the group. 7.4.2 History of Group Dynamics In 1924, Gestalt psychologist, Max Wertheimer identified this fact, stating 'There are entities where the behaviour of the whole cannot be derived from its individual elements nor from the way these elements fit together; rather the opposite is true: the properties of any of the parts are determined by the intrinsic structural laws of the whole' (Wertheimer 1924, p. 7). As a field of study, group dynamics has roots in both psychology and sociology. Wilhelm Wundt (1832–1920), credited as the founder of experimental psychology, had a particular interest in the psychology of communities, which he believed possessed phenomena (human language, customs, and religion) that could not be described through a study of the individual. Ultimately, it was social psychologist Kurt Lewin (1890–1947) who coined the term group dynamics to describe the positive and negative forces within groups of people (as cited in Kariel, 1956). In 1945, he established The Group Dynamics Research Center at the Massachusetts Institute of Technology, the first institute devoted explicitly to the study of group dynamics. Throughout his career, Lewin was focused on how the study of group dynamics could be applied to real-world, social issues.

100%

MATCHING BLOCK 249/546

SA

Unit 7 Group development and group dynamics[13 ...
(D122077760)

An increasing amount of research has applied evolutionary psychology principles to group dynamics. Humans are argued to have evolved in an increasingly complicated social environment and to have many adaptations concerned with group dynamics. Examples include mechanisms for dealing with status, reciprocity, identifying cheaters, ostracism, altruism, group decision, leadership, and intergroup relations. 7.4.3 Some Eminent theorists Gustave Le Bon: Gustave Le Bon was a French social psychologist whose seminal study, *The Crowd: A Study of the Popular Mind* (1896) led to the development of group psychology. Sigmund Freud: In *Group Psychology and the Analysis of the Ego*, (1922), Sigmund Freud based his preliminary description of group psychology on Le Bon's work, but went on to develop his own, original theory, related to what he had begun to elaborate in *Totem and Taboo*. Theodor Adorno reprised Freud's essay in 1951 with his *Freudian Theory and the Pattern of Fascist Propaganda*, and said that "It is not an overstatement if we say that Freud, though he was hardly interested in the political phase of the problem, clearly foresaw the rise and nature of fascist mass movements in purely psychological categories." Jacob L. Moreno: Jacob L. Moreno was a psychiatrist, dramatist, philosopher and theoretician who coined the term "group psychotherapy" in the early 1930s and was highly influential at the time ("Group Dynamics," 2021). Kurt Lewin: Kurt Lewin (1943, 1948, 1951) is commonly identified as the founder of the movement to study groups scientifically. He coined the term group dynamics to describe the way groups and individuals act and react to changing circumstances over a period of times (Human Communication Processes Session 4.Pdf, n.d.). William Schutz: William Schutz (1958, 1966) looked at interpersonal relations from the perspective of three dimensions: inclusion, control and affection. This became the basis for a theory of group behaviour that sees groups as resolving issues in each of these stages in order to be able to develop to the next stage ("What Is Group Dynamics Example - Law Essays," 2020). Conversely, a group may also devolve to an earlier stage if

99%

MATCHING BLOCK 250/546

SA

Unit 7 Group development and group dynamics[13 ...
(D122077760)

unable to resolve outstanding issues in a particular stage. He referred to these group dynamics as "the interpersonal underworld" because they dealt with group processes that were largely unseen, as opposed to "content" issues, which were nominally the agenda of group meetings. Wilfred Bion: Wilfred Bion (1961) studied group dynamics from a psychoanalytic perspective, and stated that he was much influenced by Wilfred Trotter for whom he worked at University College Hospital London, as did another key figure in the Psychoanalytic movement, Ernest Jones. He discovered several group processes which involved the group as a whole adopting an orientation which, in his opinion, interfered with the ability of a group to accomplish its work (Human Communication Processes Session 4.Pdf, n.d.). His experiences are reported in his published books, especially *Experiences in Groups*. The Tavistock Institute has further developed and applied the theory and practices developed by Bion. Bruce Tuckman: Bruce Tuckman (1965) proposed the four-stage model called Tuckman's Stages for a group. Tuckman's model states that the ideal group decision-making process should occur in four stages (Bruce Tuckman's Stages for a Group, n.d.).

- Forming (pretending to get on or get along with others)
- Storming (letting down the politeness barrier and trying to get down to the issues even if tempers flare up)
- Norming (getting used to each other and developing trust and productivity)
- Performing (working in a group to a common goal on a highly efficient and cooperative basis)

Tuckman later added a fifth stage for the dissolution of a group called adjourning. (Adjourning may also be referred to as mourning, i.e. mourning the adjournment of the group). This model refers to the overall pattern of the group, but of course individuals within a group work in different ways. If distrust persists, a group may never even get to the norming stage. Richard Hackman: Richard Hackman developed a synthetic, research-based model for designing and managing work groups. Hackman suggested that groups are successful when they NSOU ? PGSW-III 121 satisfy internal and external clients develop capabilities to perform in the future, and when members find meaning and satisfaction in the group. Hackman proposed five conditions that increase the chance and following to such conditions the groups will be successful (Human Communication Processes Session 4.Pdf, n.d.) These include:

- Being a real team: which results from having a shared task, clear boundaries which clarify who is inside or outside of the group, and stability in group membership.
- Compelling direction: This results from a clear, challenging, and consequential goal.
- Enabling structure: which results from having tasks which have variety, a group size that is not too large, talented group members who have least moderate social skill, and strong norms that specify appropriate behavior?
- Supportive context: that occurs in groups nested in larger groups (e.g. companies). In companies, supportive contexts involves a) reward systems that reward performance and cooperation (e.g. group based rewards linked to group performance), b) an educational system that develops member skills, c) an information and materials system that provides the needed information and raw materials (e.g. computers).
- Expert coaching: which occurs on the rare occasions when group members feels they need help with task or interpersonal issues. Hackman emphasizes that many team leaders are overbearing and undermine group effectiveness.

Scott Peck: M. Scott Peck developed stages for larger-scale groups (i.e., communities) which are similar to Tuckman's stages of group development. Peck describes the stages of a community as:

- Pseudo-community
- Chaos
- Emptiness
- True Community

Communities may be distinguished from other types of groups, in Peck's view, by the need for members to eliminate barriers to communication in order to be able

100%

MATCHING BLOCK 253/546

SA

Unit 7 Group development and group dynamics.docx
(D121776257)

to form true community. Examples of common barriers are: expectations and preconceptions; prejudices; ideology, counterproductive norms, theology and solutions; the need to heal, convert, fix or solve and the need to control. A community is born when its members reach a stage of "emptiness" or peace. Intra-group dynamics: Intra group dynamics (also referred to as in group-, within-group, or commonly just 'group dynamics') are the underlying processes that give rise to a set of norms, roles, relations, and common goals that characterize a particular social group. Examples of groups include religious, political, military, and environmental groups, sports teams, work groups, and therapy groups. Amongst the members of a group, there is a state of interdependence, through which the behaviours, attitudes, opinions, and experiences of each member are collectively influenced by the other group members. In many fields of research, there is an interest in understanding how group dynamics influence individual behaviour, attitudes, and opinions. The dynamics of a particular group depend on how one defines the boundaries of the group. Often, there are distinct subgroups within a more broadly defined group. For example, one could define U.S. residents ('Americans') as a group, but could also define a more specific set of U.S. residents (for example, 'Americans in the South'). For each of these groups, there are distinct dynamics that can be discussed. Notably, on this very broad level, the study of group dynamics is similar to the study of culture. For example, there are group dynamics in the U.S. South that sustain a culture of honour, which is associated with norms of toughness, honour- related violence, and self-defence. Group formation: Group formation starts with a psychological bond between individuals. The social cohesion approach suggests that group formation comes out of bonds of interpersonal attraction. In contrast, the social identity approach suggests that a group starts when a collection of individuals perceive that they share some social category ('smokers', 'nurses,' 'students,' 'hockey players'), and that interpersonal attraction only secondarily enhances the connection between individuals. Additionally, from the social identity approach, group formation involves both identifying with some individuals and explicitly not identifying with others. So to say, a level of psychological

NSOU ? PGSW-III 123

98%

MATCHING BLOCK 251/546

W

distinctiveness is necessary for group formation. Through interaction, individuals begin to develop group norms, roles, and attitudes which define the group, and are internalized to influence behaviour. Emergent groups arise from a relatively spontaneous process of group formation. For example, in response to a natural disaster, an emergent response group may form. These groups are characterized as having no pre-existing structure (e.g. group membership, allocated roles) or prior experience working together. Yet, these groups still express high levels of interdependence and coordinate knowledge, resources, and tasks. Group membership and social identity: The social group is a critical source of information about individual identity. An individual's identity (or self-concept) has two components: personal identity and social identity (or collective self). One's personal identity is defined by more idiosyncratic, individual qualities and attributes. In contrast, one's social identity is defined by his or her group membership, and the general characteristics (or prototypes) that define the group and differentiate it from others. We naturally make comparisons between our own group and other groups, but we do not necessarily make objective comparisons. Instead, we make evaluations that are self-enhancing, emphasizing the positive qualities of our own group (see ingroup bias). In this way, these comparisons give us a distinct and valued social identity that benefits our self-esteem. Our social identity and group membership also satisfies a need to belong. Of course, individuals belong to multiple groups. Therefore, one's social identity can have several, qualitatively distinct parts (for example, one's ethnic identity, religious identity, and political identity). Optimal distinctiveness theory suggests that individuals have a desire to be similar to others, but also a desire to differentiate themselves, ultimately seeking some balance of these two desires (to obtain optimal distinctiveness). For example, one might imagine a young teenager in the United States who tries to balance these desires, not wanting to be 'just like everyone else,' but also wanting to 'fit in' and be similar to others. One's collective self may offer a balance between these two desires. That is, to be similar to others (those who you share group membership with), but also to be different from others (those who are outside of your group). NSOU ? PGSW-III 124 Group cohesion: In the social sciences, group cohesion refers to the processes that keep members of a social group connected. Terms such as attraction, solidarity, and morale are often used to describe group cohesion. It is thought to be one of the most important characteristics of a group, and has been linked to group performance, intergroup conflict and therapeutic change. Group cohesion, as a scientifically studied property of groups, is commonly associated with Kurt Lewin and his student, Leon Festinger. Lewin defined group cohesion as the willingness of individuals to stick together, and believed that without cohesiveness a group could not exist. As an extension of Lewin's work, Festinger (along with Stanley Schachter and Kurt Back) described cohesion as, "the total field of forces which act on members to remain in the group" (Festinger, Schachter, & Back, 1950, p. 37). Later, this definition was modified to describe the forces acting on individual members to remain in the group, termed attraction to the group. Since then, several models for understanding the concept of group cohesion have been developed, including Albert Carron's hierarchical model and several bi-dimensional models (vertical v. horizontal cohesion, task v. social cohesion, belongingness and morale, and personal v. social attraction). Before Lewin and Festinger, there were, of course, descriptions of a very similar group property. For example, Emile Durkheim described two forms of solidarity (mechanical and organic), which created a sense of collective conscious and an emotion-based sense of community. Black sheep effect: Beliefs within the

SL 2.2 Content--- Group Dynamics.docx (D21201358)

Individuals tend to upgrade likeable in-group members and deviate from unlikeable group members, making them a separate outgroup. This is called the black sheep effect. A person's beliefs about the group may be changed depending upon whether they are part of the in group or out group. New members of a group must prove themselves to the full members, or "old-timers", to become accepted. Full members have undergone socialization and are already accepted within the group. They have more privilege than newcomers but more responsibility to help the group achieve its goals. Marginal members were once full members but lost membership because they failed NSOU ? PGSW-III 125 to live up to the group's expectations. They can re-join the group if they go through re-socialization. In a Bogart and Ryan study, the development of new members' stereotypes about in-groups and out-groups during socialization was surveyed. Results showed that the new members judged themselves as consistent with the stereotypes of their in-groups, even when they had recently committed to join those groups or existed as marginal members. They also tended to judge the group as a whole in an increasingly less positive manner after they became full members. Depending on the self-esteem of individual members of the in-group may experience different private beliefs about the group's activities but will publicly express the opposite—that they actually share these beliefs. One member may not personally agree with something the group does, but to avoid the black sheep effect, they will publicly agree with the group and keep the private beliefs to themselves. If the person is privately self-aware, he or she is more likely to comply with the group even if they possibly have their own beliefs about the situation.

Group influence on individual behaviour: Individual behaviour is influenced by the presence of others. For example, studies have found that individuals work harder and faster when others are present see social and that an individual's performance is reduced when others in the situation create distraction or conflict. Groups also influence individual's decision- making processes. These include decisions related to in-group bias, persuasion (see Asch conformity experiments), obedience (see Milgram Experiment), and group think. There are both positive and negative implications of group influence on individual behaviour. This type of influence is often useful in the context of work settings, team sports, and political activism.

Group structure: A group's structure is the internal framework that defines members' relations to one another over time. Frequently studied elements of group structure include roles, norms, values, communication patterns, and status differentials. Group structure has also been defined as the underlying pattern of roles, norms, and networks of relations among members that define and organize the group. Roles can be defined as a tendency to behave, contribute and interrelate with others in a particular way. Roles may be assigned formally, but more often are

NSOU ? PGSW-III 126

defined through the process of role differentiation. Role differentiation is the degree to which different group members have specialized functions. A group with a high level of role differentiation would be categorized as having many different roles that are specialized and narrowly defined. A key role in a group is the leader, but there are other important roles as well, including task roles, relationship roles, and individual roles. Functional (task) roles are generally defined in relation to the tasks the team is expected to perform. Individuals engaged in task roles focus on the goals of the group and on enabling the work that members do; examples of task roles include coordinator, recorder, critic, or technician. A group member engaged in a relationship role (or socio-emotional role) is focused on maintaining the interpersonal and emotional needs of the groups' members; examples of relationship role include encourager, harmonizer, or compromiser. Norms are the informal rules that groups adopt to regulate members' behaviour. Norms refer to what should be done and represent value judgments about appropriate behaviour in social situations. Although they are infrequently written down or even discussed, norms have powerful influence on group behaviour. They are a fundamental aspect of group structure as they provide direction and motivation, and organize the social interactions of members. Norms are said to be emergent, as they develop gradually throughout interactions between group members. While many norms are widespread throughout society, groups may develop their own norms that members must learn when they join the group. There are various types of norms, including: prescriptive, proscriptive, descriptive, and injunctive. Prescriptive Norms: The socially appropriate way to respond in a social situation, or what group members are supposed to do (e.g. saying thank you after someone does a favour for you). Proscriptive Norms: Actions that group members should not do; prohibitive (e.g. not belching in public). Descriptive Norms: Describe what people usually do (e.g. clapping after a speech) Injunctive Norms: Describe behaviours that people ought to do; more evaluative in nature than a descriptive norm. Inter member relations are the connections among the members of a group, or the social network within a group. Group members are linked to one another at varying NSOU ? PGSW-III 127 levels. Examining the inter member relations of a group can highlight a group's density (how many members are linked to one another), or the degree centrality of members (number of ties between members). Analyzing the inter member relations aspect of a group can highlight the degree centrality of each member in the group, which can lead to a better understanding of the roles of certain group (e.g. an individual who is a 'go-between' in a group will have closer ties to numerous group members which can aid in communication, etc.). Values are goals or ideas that serve as guiding principles for the group. Like norms, values may be communicated either explicitly or on an ad hoc basis. Values can serve as a rallying point for the team. However, some values (such as conformity) can also be dysfunction and lead to poor decisions by the team. Communication Communication patterns describe the flow of information within the group and they are typically described as either centralized or decentralized. With a centralized pattern, communications tend to flow from one source to all group members. Centralized communications allow consistent, standardization information but they may restrict the free flow of information. Decentralized communications make it easy to share information directly between group members. When decentralized, communications tend to flow more freely, but the delivery of information may not be as fast or accurate as with centralized communications. Another potential downside of decentralized communications is the sheer volume of information that can be generated, particularly with electronic media. Status differentials are the relative differences in status among group members. When a group is first formed the members may all be on an equal level, but over time certain members may acquire status and authority within the group; this can create what is known as a pecking order within a group. Status can be determined by a variety of factors and characteristics, including specific status characteristics (e.g. task-specific behavioural and personal characteristics, such as experience) or diffuse status characteristics (e.g. age, race, ethnicity). It is important that other group members perceive an individual's status to be warranted and deserved, as otherwise they may not have authority within the group. Status differentials may affect the relative amount of pay among group members and they may also affect the group's

tolerance to violation of group norms (e.g. people with higher status may be given more freedom to violate group norms). Group Performance: While many daily tasks undertaken by individuals could be performed in isolation, the preference is to perform with other people. Social Facilitation and Performance Gains: In a study of dynamo genic stimulation for the purpose of explaining pace making and competition in 1898, Norman Triplett theorized that "the bodily presence of another rider is a stimulus to the racer in arousing the competitive instinct...". This dynamo genic factor is believed to have laid the groundwork for what is now known as social facilitation—an "improvement in task performance that occurs when people work in the presence of other people". Further to Triplett's observation, in 1920, Floyd Allport found that although people in groups were more productive than individuals, the quality of their product/ effort was inferior. In 1965, Robert Zajonc expanded the study of arousal response (originated by Triplett) with further research in the area of social facilitation. In his study, Zajonc considered two experimental paradigms. In the first—audience effects—Zajonc observed behaviour in the presence of passive spectators, and the second—co-action effects—he examined behaviour in the presence of another individual engaged in the same activity. Zajonc observed two categories of behaviours—dominant responses to tasks that are easier to learn and which dominate other potential responses and non-dominant responses to tasks that are less likely to be performed. In his Theory of Social Facilitation, Zajonc concluded that in the presence of others, when action is required, depending on the task requirement, either social facilitation or social interference will impact the outcome of the task. If social facilitation occurs, the task will have required a dominant response from the individual resulting in better performance in the presence of others, whereas if social interference occurs the task will have elicited a non-dominant response from the individual resulting good performance of the task and it is a positive impact of group activities. Several theories analyzing performance gains in groups via drive, motivational, cognitive and personality processes, explain why social facilitation occurs.

Unit 7 Group development and group dynamics[13 ... (D122077760)

Nickolas Cottrell, 1972, proposed the evaluation apprehension model whereby he suggested people associate social situations with an evaluative process. Cottrell argued this situation is met with apprehension and it is this motivational response, not arousal/elevated drive, that is responsible for increased productivity on simple tasks and decreased productivity on complex tasks in the presence of others. In *The Presentation of Self in Everyday Life* (1959), Erving Goffman assumes that individuals can control how they are perceived by others. He suggests that people fear being perceived as having negative, undesirable qualities and characteristics by other people, and that it is this fear that compels individuals to portray a positive self-presentation/social image of themselves. In relation to performance gains, Goffman's "self-presentation theory" predicts, in situations where they may be evaluated, individuals will consequently increase for positive image.

Social orientation theory considers the way a person approaches social situations. It predicts that self-confident individuals with a positive outlook will show performance gains through social facilitation, whereas a self-conscious individual approaching social situations with apprehension is less likely to perform well due to social interference effects. Intergroup dynamics: Intergroup dynamics refers to the behavioural and psychological relationship between two or more groups. This includes perceptions, attitudes, opinions, and behaviours towards one's own group, as well as those towards another group. In some cases, intergroup dynamics is pro-social, positive, and beneficial.

100%

MATCHING BLOCK 261/546

SA

(SP NSOU 12-7-2016) final Content Write up_ fo ... (D21119376)

In other cases, intergroup dynamics can create conflict. For example, Fischer & Ferlie found initially positive dynamics between a clinical institution and its external authorities dramatically changed to a 'hot' and intractable conflict when authorities interfered.

Intergroup

conflict According to social identity theory, intergroup conflict starts with a process of comparison between individuals in one group (the in group) to those of another group (the out group). This comparison process is not unbiased and objective. Instead, it is a mechanism for enhancing one's self-esteem. In the process of such comparisons, an individual tends to favor the in-group over the out-group, exaggerate and over generalize the differences between the in group and the out group (to enhance group NSOU ? PGSW-III 130 distinctiveness), minimize the perception of differences between in-group members, remember more detailed and positive information about the in-group, and more negative information about the out-group, etc. Even without any intergroup interaction (as in the minimal group paradigm), individuals begin to show favouritism towards their own group, and negative reactions towards the out group. This conflict can result in prejudice, stereotypes, and discrimination. Intergroup conflict can be highly competitive, especially for social groups with a long history of conflict (for example, the 1994 Rwandan Genocide, rooted in group conflict between the ethnic Hutu and Tutsi). In contrast, intergroup competition can sometimes be relatively harmless, particularly in situations where there is little history of conflict (for example, between students of different universities) leading to relatively harmless generalizations and mild competitive behaviours. Intergroup conflict is commonly recognized amidst racial, ethnic, religious, and political groups.

MATCHING BLOCK 263/546

SA SL 2.2 Content--- Group Dynamics.docx (D21201358)

Intergroup conflict reduction: There have been several strategies developed for reducing the tension, bias, prejudice, and conflict between social groups. These include the contact hypothesis, the jigsaw classroom, and several categorization-based strategies. Contact hypothesis (intergroup contact theory): Gordon Allport (1954) suggested that by promoting contact between groups, prejudice can be reduced. Further, he suggested four optimal conditions for contact: equal status between the groups in the situation; common goals; intergroup cooperation; and the support of authorities, law, or customs. Since then, over 500 studies have been done on prejudice reduction under variations of the contact hypothesis, and a meta-analytic review suggests overall support for its efficacy. In some cases, even without the four optimal conditions outlined by Allport, prejudice between groups can be reduced. Super ordinate identities: Under the contact hypothesis, several models have been developed. A number of these models utilize a super ordinate identity to reduce prejudice. That is, a more broadly defined, 'umbrella' group/identity that includes the groups that are in conflict. By emphasizing this super ordinate identity, individuals in both subgroups can share NSOU ? PGSW-III 131 a common social identity. For example, if there is conflict between White, Black, and Latino students in a high school, one might try to emphasize the 'high school' group/ identity that students share to reduce conflict between the groups. Models utilizing super ordinate identities include the common in-group identity model, the in-group projection model, the mutual intergroup differentiation model, and the in-group identity model. Interdependence: There are also techniques for reducing prejudice that utilize interdependence between two or more groups. That is, members across groups have to rely on one another to accomplish some goal or task. In the Robbers Cave Experiment, Sheriff used this strategy to reduce conflict between groups. Elliot Aronson's Jigsaw Classroom also uses this strategy of interdependence. In 1971, thick racial tensions were abounding in Austin, Texas. Aronson was brought in to examine the nature of this tension within schools, and to devise a strategy for reducing it (so to improve the process of school integration, mandated under Brown v. Board of Education in 1954). Despite strong evidence for the effectiveness of the jigsaw classroom, the strategy was not widely used (arguably because of strong attitudes existing outside of the schools, which still resisted the notion that racial and ethnic minority groups are equal to Whites and, similarly, should be integrated into schools). 7.4.3 Conclusion Group dynamics are the processes that occur between group members. These dynamics are affected by each member's internal thoughts and feelings, their expressed thoughts and feelings, their nonverbal communication, and the relationship between group members. Group dynamics helps you understand how each person's actions make sense in the context of the group. On the other hand it also refers to a system of behaviours and psychological processes which are occurring within a social group (intergroup dynamics), or between social groups (intergroup dynamics). The study of group dynamics is very useful in understanding decision-making behaviour, tracking the spread of problems in groups, creating effective therapy techniques, and following the emergence and popularity of new ideas and technologies. However, one can understand this concept by analyzing Systems theory describes how individuals behave within a system. As groups are considered systems, systems theory helps us begin to

understand group dynamics. Systems theory involves understanding that group dynamics is a more complex process than just summing up the individual characteristics of each group member. Instead, group dynamics is best understood by combining the characteristics of each group member, how each group member's actions affect the group, and how these group interactions affect each group member. This creates a cyclical and reciprocal feedback loop which simultaneously impacts all group members and all group members' relationships. 7.4.4 Answers to check your progress 1. Skills and Techniques in Social Groupwork Practice Structure 8.1 Objectives 8.2 Introduction 8.3 Topic Name: Skills and Techniques 8.3.1 Skills in Group Work 8.3.2 Techniques in Group Work 8.4 Conclusion 8.5 Exercise 8.6 Reference 8.1 Objectives The basic objective of this section is to develop knowledge among social work professionals on various skills and techniques that are essential in the process of group work practice. Understanding of such skills and techniques is very much required before undertaking group work practice in any set up, whether community or agency set up. 8.2 Introduction In a general sense skill means the capacity to perform activities. Virginia Robinson refers skills as "the capacity to set in motion and control a process of change in specific material in such a way that the change that takes place in the material is affected with the greatest degree of consideration for and utilization of the quality and capacity of the material"(Gaurav, 2013). Trecker defines methods and skill as "Methods means the purposeful use of insights and understanding based upon a body of knowledge and principles", and " Skill is the capacity to apply knowledge and understanding to a given situation"(Dhawa: 2014). NSOU ? PGSW-III 138 8.3.1 Skills in Social group work It is needless to say that skills are essential for a social group worker to become more productive in-group situation. The skills are necessary to mainly exchange ideas among the members freely and clearly, using language understood by everyone and with no fears of starting arguments or hurting feelings, examining objectively how well the group and its members are working, sharing the leadership jobs among the group members and show sensitivity to the feelings of all, accepting new ideas and new members into the group without irreparable conflict, and to disciplining the group to work toward long range objectives and profit from failures, thinking clearly about group problems, findings, causes and working for solutions, adjusting group procedures and plans to meet the feelings and the desires of the members, creating new jobs or committees as needed and to terminate them or the group itself, when the needs are fulfilled. Phillips has enumerated the following skills for social group workers and its practice settings (Pathare, n.d.). Skill in Using Agency Functions: The group worker must be skilful enough to carry the functions of agency. He should always try to propagate what the agency in the community wants to do. He does the following activities for this. The Intake Process: The worker who meets the applicants while carrying out the agency's procedures for intake, will discuss with him as to what exactly the member wants from the agency and what is available in the agency for him/her (Gaurav, 2013). Connecting the Group with the Agency: The worker relates the group more firmly to the agency by helping it to understand what the agency stands for and what kind of responsible behaviour is expected of them as well as of other groups (Gaurav, 2013). Serving the Individual through the Group work Process: Since the function of the agency includes helping group units to develop in socially useful ways, as well as helping individuals the social worker's attention must be on the development of the group as a whole and on each individual's use of the group (Gaurav, 2013).

NSOU ? PGSW-III 139

Working with the Individual outside the Group of Meetings: Although the worker offers his services within the group process he also provides help to the individual if need be for the better use of group experience on the part of member. The Referral Process: An important part of the group work agency's service is to work with members and their parents in a process of considering the use of other community services for help with problems that cannot be dealt within the group work agency. Skill in Communication of Feelings: The social group worker should have the following skills. • The Worker's Feelings: High among the qualities essential to a social worker's skill is the capacity to feel with others(Skills and Techniques of Group Work – Article1000.Com, n.d.). • The Group Member's Feelings: The worker must be skilful in helping the group members to know, accept, express and be responsible for their feelings(Skills and Techniques of Group Work – Article1000.Com, n.d.). • Group Feelings: The interaction of each member with the others and the worker produces group feelings. The worker helps the group in understanding their feelings and its meanings. Skill in Stimulating and Using Group Relations: The social group worker should enable each group member to find and take his part in relationship with other members. He should be skilful in using programmes to strengthen group relations. Trecker has listed the following skills of social group work([http://www.ignou.ac.in/ upload/bswe-02-block1-unit-9-small%20size.pdf](http://www.ignou.ac.in/upload/bswe-02-block1-unit-9-small%20size.pdf)). Skill in Establishing Purposeful Relationship: The group worker must be skilful in gaining the acceptance of the group and in relating himself to the group on a positive professional basis. The group worker must be skilful in helping individuals in the group to accept one another and to join with the group in common pursuits(Skills and Techniques of Group Work – Article1000.Com, n.d.). NSOU ? PGSW-III 140 Skill in Analysing the Group Situation: The worker must be skilful in judging the developmental level of the group to determine what the level is, what the group needs and how quickly the group can be expected to move. This calls for skill in direct observation of groups in a basis of analysis and judgement. The group worker must be skilful in helping the group to express ideas, work out objectives, clarify immediate goals and see both its potentialities and limitations as a group(Skills and Techniques of Group Work – Article1000.Com, n.d.). Skill in Participation with the Group: The group worker must be skilful in determining, interpreting, assuming and modifying his own roles with the group. The group worker must be skilful in helping, group members to participate, to locate leadership among them and to take responsibility for their own activities. Skill in Dealing with Group Feeling: The group worker must be skilful in controlling his own feelings about the group and must study each new situation with a high degree of objectivity. The group worker must be skilful in helping groups to release their own feelings, both positive and negative. He must be skilful in helping groups to analyze situations as part of the working through group or intergroup conflicts(Skills and Techniques of Group Work – Article1000.Com, n.d.). Skill in Programme Development: The group worker must be skilful in guiding group thinking so that interests and needs will be revealed and understood. The group worker must be skilful in helping groups to develop programmes, which they want as a means through which their needs may be met(Skills and Techniques of Group Work – Article1000.Com, n.d.). Skill in Using Agency and Community Resources: The group worker must be skilful in locating and then acquainting the group with various helpful resources which can be utilized by the members for programme purpose. The group worker must be skilful in helping certain individual members to make use of specialized services by means of referral that cannot be met within the group(Skills and Techniques of Group Work – Article1000.Com, n.d.).

NSOU ? PGSW-III 141

Skill in Evaluation: The group worker must have skill in recording the development processes that are going on as he works with the group. The group worker must be skilful in using his records and in helping the group to review its experiences as a means of improvement(Skills and Techniques of Group Work – Article1000.Com, n.d.). On the basis of above discussions and opinions of different social workers on the different types of skills essential for group work practitioners, we may list them as follows. Communication Skills: Communication is at the heart of group work practice. The social group worker makes use of two broad categories of communication skills, one those which are intended to facilitate interpersonal helping and other those intended to facilitate to achieve the groupwork objectives. A number of specific skills may help the group worker to perform his jobs more effectively, which are listed below: Skill of Programme Planning: It is very essential that group worker must be skilful in planning the programmes for the group. It is also essential that the worker must be skilful in communicating the message around the answers of several questions. He/ She should be skilful in communicating his own feelings to the members of the group(Gaurav, 2013). Skill of Identify Self Role: It is an important step in group work practice. The worker must convince the group for his interface in its affairs (Gaurav, 2013). Skill of Explaining the Purpose of Group: Everybody before joining the group wants to know about the benefits of joining the group. If he/she is satisfied, he comes forward and become a member of that group. Therefore, the group worker must be skilful in convincing the people to avail the facilities of the agency by joining the group. The worker, further, explains how communicate in group so that the group may advance in its goal(Gaurav, 2013). Skill in Interpreting Verbal Communication: It is the job of the group worker to keep watch on the verbal communication among the group members because if it is not on the right track, the group may loose

NSOU ? PGSW-III 142

its basic purpose. He/she should always try to direct in proper direction(Gaurav, 2013). Skill of Answering Question: During group process, certain questions, queries or doubts are raised by the group members. If they are not answered in right perspective, the members may disassociate themselves. Therefore, it is essential that the social group worker has the wide knowledge of social work as well as human behaviour(Gaurav, 2013). Skill in Effective Helping Relationship: It is heart of social group work practice. A group worker must genuinely care for the group members. The relationship will be more cohesive and fruitful if the social group worker possesses the following skills(Gaurav, 2013). Skill of Empathy: It refers to the worker's capacity to perceive accurately member's feelings and subjective experiences. The group worker should show in his/her behaviour that he/ she is taking genuine interest in their welfare. It will help in developing confidence between group worker and the group(Gaurav, 2013). Skill of Encouraging the Member's Feedback: It refers to statement that encourages the member to respond to the worker's explanation. This gives the members an opportunity to ask questions and raise disagreement if any(Gaurav, 2013). Skill of Describing the Member's Role: This is common tendency that everybody wants facilities, and rights but less inclined to fulfil their duties. It is the job of the social group worker to explain the member who is joining the group about his role in the group(Gaurav, 2013). Skill of Active Listening: In active listening the worker tends to both the member verbal and non-verbal message. The listening become active listening when it is followed by clarification and explanations needed by the group members(Gaurav, 2013). Skill of Exploring the Member's Silence: Sometimes it happens that one or the other members of the group keeps silence and takes the least interest in the group activities. It is the job of social group worker NSOU ? PGSW-III 143 to find out the reasons for his/her silence and encourage him/ her for active involvement(Gaurav, 2013). Skill of recognizing every Member's Strengths: It refers to expressions of confidence in the member's ability to accomplish some specific tasks in the group process. It will help the group worker in performing different types of activities in the group with the help of its members and thus the group will grow and enrich in achieving its objectives(Gaurav, 2013). Skill in giving priority and gradation of the problem: All the problems of the group and its members cannot be solved at once. Therefore, their gradation and priority is needed. Priority should be fixed by the group worker. It will facilitate the group process in right direction(Gaurav, 2013). 8.3.2 Techniques in Group Work Techniques are interventions aiming at facilitating movement within a group (Corey and Corey 2006). They go on suggesting that almost anything that a worker or leader does in a group can be considered as techniques, including observing silence. Moreover, there are some techniques which are used quite often by the group worker to facilitate their work. Some of the more frequent techniques used by group workers are: • Group Counselling • Group Discussion • Role Play • Programme Media: Games, Story Telling, Drawing, Poster making, etc • Individual sessions • Supervision Let us discuss on the various techniques and how these techniques are importance in group work. Group Counselling: Group counselling refers to activities that are used to enrich members' capacities through skill building or helping them to achieve changes in their behavioural pattern to achieve a better growth. This counselling of course will differ in different groups

NSOU ? PGSW-III 144

and also worker to worker. Some of the areas in which intensive counselling is done is cognitive, behavioural domains and affective change by the group worker. The distinguishing feature of the group counselling is that the group environment is used to accomplish both development of life skills and accomplish and strengthen changes among members. Group counselling therefore is a group process to accomplish changes in the way members think, feel and act. The group participants change in the area of behaviour, attitude, and development are the main concern area for group worker and in this context sufficient counselling is done by the worker. Group Discussion: Group discussion is one of the important techniques for sharing and communicating ideas in a group. The group is a forum for making decisions, solving problems faced by its members both individually and collectively, promoting growth, and accomplishing a variety of objectives. The group discussion as a technique helps in developing appropriate attitude and skills of members since they learn to look at a problem from several perspectives, appreciate diversity in course of discussion and provide equal opportunity to all to express and give due attention to each members opinion . The participation in group discussion helps members to develop self respect and positive self concept. They have the ability to solve problems or take up developmental activities, therefore, each members view points are taken into consideration and consensus decision of the group in the process is taken. Members get good exposure and experience in participating group discussion. Group Worker of course keeps all members engage in a variety of purpose and keep the group moving towards its objectives. Supervision: It is another important technique of working with group. All discussions in the group should be presided over by a group member, leader of the worker depending on the nature of the group. Even in informal talk in the group, it is better to have a person coordinates the discussions. The supervisor should help the members to participate in the group session in a democratic manner. The worker should play the role of a supervisor in the group and he or she should makes arrangements for recording the main points. In informal discussion detailed minutes may not be possible or required but may need to keep major points for assessment of the activities and happenings. Some common problems generally encountered by the worker in the group are, sometime silence of the members, which indicates either NSOU ? PGSW-III 145 lack of interest or lack of adequate communication skills, fear of worker, other factors. This may be termed as hostile environment, which needs appropriate norms, capacity building of the members and networking among themselves. Secondly, lack of movements in participation, needs caring at least to help them to talk, chair, participate in the process of decision making. The worker should deal such situation as expert, otherwise, it can lead to stagnation in the session. Thirdly, supervision also should take care over domination of the members. Not only that, supervisor or worker himself or herself can dominate in the group session, therefore, it is necessary that he or she should be vigilant enough to open up discussion and help other members to participate instead of domination by himself or herself or checking the domination of other members. Group Decision Making: Group decision is one of the key components in group work and the decision may tell us the fact of the functioning of the group. Decision making pattern based on what manner the decision is taken. Group worker understanding on this part is necessary. He or she should be alert to discover that the group environment is conducive enough to take a democratic decision making. The worker should help the group to take decision quickly and rationally. Role Play: Role play is a good technique to help the members to look at their own behaviour and others view it. In role play a real life situation is simulated. But it is necessary to prepare the members for role play. It is also desirable to help members to overcome stress and coping a new learning situation. A good example is child's interaction with a teacher or a parent. A careful selection of an actors to carry out role play and to provide them feedback after seeing their performance will help to improve their quality. A congenial, safe and friendly environment is important to have success in the group. A sensitive training is necessary and useful for roleplay as well. Developing Programme Media: Programme media refers to all activities in the group, such as games, singing, story telling, street play, etc, which generally has been taken for group interaction and participation of the group members. The activities help the members to become active and identify themselves as their own activities of the group. The influence of the group on members lies in three areas: participation in activities, interaction with NSOU ? PGSW-III 146 other members and their interaction with the worker. Games and sports provide an opportunity to members to express their feelings and exhibit their behaviour which is frank and true expression of what is laying dormant inside. A special care should be given to select activities for weak members. Individual Session: Individual sessions are also used by worker while working with groups. It is necessary to assess each member about their liking and interest and to carry out fruitful participation in group. A careful planning is also necessary in the process. The worker should plan in advance for holding individual session for assessing individual capacity. It should be done in a participatory manner. Some members may be given special support for shorting out their difficulties. Evaluation: Evaluation of session/ activities of the group is necessary and members should take part in the evaluation process while working in a group. The feedback from members as such is necessary and accepted method of collecting information. The individual session may be also arranged to make the group members understanding clear about the purpose of the evaluation and why individual session is important for objective assessment of the group. The member however should be given sufficient time to express his or her problem and analysis of the problem should be made and shared with the persons 8.4 Conclusion This unit is mainly concentrated on various skills and techniques in group work practice. In nut shell, the core skills could be summarized that are needed by social workers are the communication skill, listening, observation, analytical thinking, empathy, self control, leadership skills, while in technique part the major techniques generally used in group work are group discussion, group counselling, role play. Programme planning on games, story-telling, singing, poster making, conducting individual sessions, etc. Understanding thorough ideas on those skills and techniques definitely would enrich the group work process and especially helping the members as well as for group development more scientifically. Finally the students of social work of course would be benefitted on such understanding.

leadership in the context of group work. It explains the theories,

styles, factors for successful group leadership and the Importance of group leadership. After reading this unit, learner must be able to: Distinguish between various styles and theories of leadership; • The factors influencing group leadership; • Know about various leadership roles; • Guidelines for forming and leading a group.

NSOU ? PGSW-III 149 9.1 Introduction Leadership

91%**MATCHING BLOCK 282/546****W**

occurs whenever one person in a group influences other members to help the group reach its goals. Because all group members influence each other at various times, each individual excerpts leadership. However, a difference exists between being a designated leader – a president or chairperson – and engaging in leadership behaviour. A designated leader has certain responsibilities, such as calling meetings and leading discussions, while leadership refers to influential behaviour in general(

Zastrow, n.d.). 9.2 Concepts One of the most striking and universal facts about groups is that they almost always have a leader. Even among birds and animals there are group leaders. When food is placed in a small pile before the hungry chicken, one bird will feed actively and prevent others from getting near the pile or even to peck at the scattered grain. The other birds show fear and go away. If the aggressive bird is removed by the experimenter, another bird takes her place and dominates. Thus the group is seen to be composed of individuals which form a hierarchy of precedence. The dominant bird assumes control of food, water, roosting places, choice of maters etc. Similar behaviour can be observed in mammals also. The dominant male monkey excludes the subordinates from breeding. There is also the group territorial system which needs the aggressive and powerful male to protect the territory. Thus, there is not only hierarchical organisation within the group but also definite recognition of in- group members and antagonism to out-group individuals. Similarly it can be observed that one child becomes the leader in a group of six or eight-year old children. There is a leader in each teenage group. There are also leaders in work gang. Thus, despite the fact that the purposes, structure and membership of these groups vary considerably, each group has a leader. Leadership appears to be the ubiquitous feature of group life and is probably a necessary condition for an assemblage of individuals to function as a group. When members of a small group are asked to role each other on leadership, they generally seem to take three factors into account: (a) dominance, (b) likeability and

NSOU ? PGSW-III 150 (c) task success. They pick up a person who is moderately powerful in the group; he must be active physically and verbal, he must possess abilities and resources that enable him to influence others and to give or deny opportunities, rewards or punishments. But he must also be "likable". The person chosen to be a leader must be one whom the members could like and admire. He must be one who gives them opportunities and rewards. But even a combination of dominance and likeability is not normally enough for leadership position. He must be capable of bringing success to their endeavours. Thus "task success" is necessary to make him acceptable as a leader so that he can make rewards available. The central attributes of leadership is influence; the leader is generally the person in the group who has the greatest influence on the activities and beliefs of the members. He is the one who initiates action, makes decisions and gives orders to the members as to what they should do. He is also the person who settles disputes between the members. He serves as an inspiration to the members of the group and is in the forefront of any activity undertaken by the group. 9.3 Definition Leadership is a specialised form of social interaction: a reciprocal, transactional, and sometimes transformational process in which cooperating individuals are permitted to influence and motivate others to promote the attainment of group and individual goals. This definition is cumbersome, but it emphasizes several features noted by many previous definitions. 1. Leadership is a reciprocal process involving the leader, the followers, and the group situation, members; rather, the leader-follower relationship is mutual. 2. Leadership is a transactional, social exchange process. Leader and members work together, exchanging their time, energies and skills to increase their joint rewards. 3. Leadership is often a transformational process. The transformational leader heightens group members and changing their beliefs, values and needs. 4. Leadership is a cooperative process of legitimate influence rather than sheer power.

NSOU ? PGSW-III 151 5. Leadership is an adaptive, goal-seeking process, for it organizes and motivates group members' attempts to attain personal and group goals. 9.4

Approaches to Leadership Four major approaches to leadership theory – trait, position, leadership style and distributed functions – are summarized in the following(Zastrow, n.d.): The Trait Approach: Aristotle observed: "From the hour of their birth some are marked for subjugation, and others for command". This trait approach to leadership, which has existed for centuries, assumes that leaders have inherent personal characteristics or traits that distinguish them from followers. This approach asserts that leaders are born, not made, and emerge naturally instead of being trained. It has also been called the "

great man" or "great woman" theory of leadership.

100%

MATCHING BLOCK 285/546

W

Charisma: Charisma has been defined as "an extraordinary power, as of working miracles". Johnson and Johnson give the following definition of a charismatic leader(

Zastrow, n.d.):

100%

MATCHING BLOCK 286/546

W

The Charismatic leader must have a sense of mission, a belief in the social- change movement he or she leads and confidence in oneself as the chosen instrument to lead the movement to its destination. The leader must appear extremely self- confident in order to inspire others with the faith that the movement he or she leads will, without fail, prevail and ultimately reduce their distress. Some charismatic leaders appear to inspire their followers to love and be fully committed to them. Other charismatic leaders offer their followers the hope and promise of deliverance from distress(

Zastrow, n.d.).

89%

MATCHING BLOCK 287/546

W

Charisma has not been precisely defined and its components have not been fully identified. The qualities and characteristics that each charismatic leader has will differ somewhat from these of

their

charismatic. 2. For the three people you wrote about, identify the charismatic characteristics that all three individuals appear to have in common. 3. Do any of these people have unique charismatic characteristics (that is, characteristics that are not held by the other two)? If "yes", identify the person and describe his or her unique characteristics.

94%

MATCHING BLOCK 292/546

W

The Position Approach: In most large organisations, there are several levels of leadership, such as president, vice-president, manager, supervisor and foreman. The position approach defines leadership in terms of the authority of a particular position. It focuses on studying the behaviour, training and personal background of leaders in high-level positions(

Zastrow, n.d.).

92%

MATCHING BLOCK 293/546

W

Studies using the position approach, however, have revealed little consistency in how people assume leadership positions. Obviously, individuals may become leaders with little related training (for example-

in family business) while

100%

MATCHING BLOCK 294/546

W

others spend years developing their skills. Also, individuals in different leadership positions have been found to display a variety of appropriate

behaviours. The Leadership-Style Approach:

100%

MATCHING BLOCK 295/546

W

While there are various leadership styles, it is generally agreed that leadership styles is in accordance with the circumstances – the ability of members, urgency of the situation and many such crucial factors. The following are a few important

leadership styles: 1. Authoritarian Leaders: The authoritarian leader is characterised by dominance and aggressiveness. He believes in the value of discipline, forcefulness and deference to authority. He likes to display the external symbols of status and power. Since he does not have a high opinion of the intelligence and abilities of the masses he uses many techniques of propaganda to make them believe and do what he wants them to believe and do. He depends more on power and punishment than on persuasion. This

84%

MATCHING BLOCK 296/546

W

leader alone is the purveyor of rewards and punishments and knows the succession of future steps in the group's activities. One of the hazards, however, is that group members may NSOU ? PGSW-III 153 respond out of necessity and not because of commitment to group goals. The authoritarian leader who anticipates approval from subordinates may be surprised to find that backbiting and bickering are common in the group. Unsuccessful authoritarian leadership is apt to generate factionalism, behind the scenes jockeying for position among members and a decline in morale(Zastrow, n.d.). 2. Democratic Leaders: The

democratic leader is one whose basic techniques are persuasion, conciliation and tolerance. He is not preoccupied with the problem of disciplining the members of the group. He trusts the good sense of people and believes that with proper guidance they can be made to work for their goals. He relies on facts and on logical arguments since he has faith in the intelligence of the people. He does not seek to influence them through propaganda. The comparisons of which we shall speak are those between an authoritarian atmosphere and a democratic atmosphere as follows: Democratic 1. All policies a matter of group determination, encouraged and drawn by the leader. 2. Activity perspective given by an explanation of the general steps of the process during discussion at first meeting. Where technical advice was needed, the leader tried to point out two or three alternative procedures from which choice could be made. 3. The members were free to work with whomever they chose, and the division of tasks was left up to the group. 4. The leader was "objective" or "fact-minded" in his praise and criticism and tried to be a regular group member in spirit without doing too much of the actual work. Authoritarian 1. All determination of policy by the leader. 2. Techniques and steps of attaining the goal dictated by the leader, one at a time, so that future direction was always uncertain to a large degree. 3. The leader usually dictated the particular work task and work companions of each member. 4. The leader was "personal" in his praise and criticism of the work of each member without giving objective reasons. He remained aloof from active group participation except when demonstrating.

NSOU ? PGSW-III 154 Differences in the behaviour of the groups were striking. Some of the most interesting differences were as follows: 1. The authoritarian groups tended to be more aggressive or more apathetic than the democratic groups. When aggression was expressed, it tended to be directed toward other group members rather than toward authoritarian leader. In the authoritarian groups two scapegoats were the targets of such concentrated group hostility that they left the club. In the apathetic authoritarian groups it seemed that the lack of aggression was due merely to repressive influence of the leader, for when he temporarily left the group, aggressive outbursts occurred. 2. In the authoritarian groups there were more submissive approaches to the leader and also more attention-demanding approaches. The approaches to the democratic leader were more friendly and work-minded. 3. In the authoritarian groups the relations with other group members tended to be more aggressive and dominating than in the democratic groups. 4. There seemed to be more "we-feeling" in the democratic groups and more "I-feeling" in the authoritarian. Group unity appeared higher in the democratic groups and sub groups tended to be more stable than in the authoritarian atmosphere where they tended to disintegrate (Informační systém, n.d.). 5. Constructiveness of work decreased sharply when the authoritarian leader temporarily absented him, whereas it dropped only slightly when the democratic leader was absent. 6. Under experimentally induced frustrations in the work situation, the democratic group responded by organized attacks on the difficulty, whereas the authoritarian groups tended to become disrupted through recriminations and personal blame.

100%

MATCHING BLOCK 297/546

W

Laissez-Faire Leaders: These leaders participate very little, and group members are generally left to function (or flounder) with little input. Group members seldom function well under a laissez-faire style, which may be effective only when the members are committed to a course of action, have the resources to implement it and need minimal leadership to reach their goals.

or trait, theory of leadership and asserts that every member of a group will be a leader at times by taking actions that serve group functions. Leadership is defined as the performance of acts that help the group maintain itself and reach its goals (

Reborn, n.d.).

93%**MATCHING BLOCK 300/546****W**

Leadership functions include setting goals, selecting and implementing tasks and providing resources to accomplish group goals while maintaining the group's cohesion and satisfying the needs of individual member. The functional approach involves determining what tasks, or functions are essential to achieve group goals and how different group members should participate (Reborn, n.d.). With this approach, the demands of leadership are viewed as being specific to a particular group in a particular situation. For example, cracking a joke may be a useful leadership tactic in certain situations if it relieves tension. But when other members are revealing intense personal information in therapy, humour may be counterproductive and therefore inappropriate leadership behaviour. Many individuals who fear taking a leadership role are uncertain about leadership functions and feel they lack the power qualities of a leader. Amazingly, even the most fearful and anxious students have already taken on many leadership roles and nearly everyone has assumed leadership responsibilities by adolescence. Functional leadership involves a learned set of skills that anyone with certain minimal capabilities can

NSOU ? PGSW-III 156

93%**MATCHING BLOCK 301/546****W**

acquire. Responsible membership is the same thing as responsible leadership because both maintain the group's cohesion and accomplish its goals. Since people can be taught leadership skills and behaviours the implication of this theory is that nearly everyone can be taught to be an effective leader.

Exercise 3: Distributed Functions Approach

100%**MATCHING BLOCK 302/546****W**

The distributed-functions approach asserts that every member of a group will be a leader at times by taking actions that serve group functions. Identify a group that you are currently in or that you were a member of in the past. Describe the actions you took that were useful to the group. 9.5

Leadership Roles Task and

86%**MATCHING BLOCK 303/546****W**

Maintenance Roles: All groups, whether organized for therapeutic reasons, problem solving, or other purposes, rely on members performing task roles and group maintenance roles satisfactorily. Task roles are those needed to accomplish specific goals set by the group. They have been summarized by Johnson and Johnson as follows (Zastrow, n.d.): Information and Opinion Given: Offer facts, opinions, ideas, suggestions and relevant information to help group discussion(

Zastrow, n.d.).

92%**MATCHING BLOCK 304/546****W**

Information and Opinion Seeker: Asks for facts, information, opinions, ideas and feeling from other members to help group discussion(

Zastrow, n.d.).

100%**MATCHING BLOCK 305/546****W**

Starter: Proposes goals and tasks to initiate action within the group(

Zastrow, n.d.).

86%**MATCHING BLOCK 306/546****W**

Direction Giver: Develops plans on how to proceed and focuses attention on the task to be done (Zastrow, n.d.). Summarizer: Pulls together related ideas or suggestions and restates and summarizes major points discussed(

Zastrow, n.d.).

100%**MATCHING BLOCK 307/546****W**

Coordinator: Shows relationships among various ideas by pulling them together and harmonizes activities of various sub groups

83%**MATCHING BLOCK 308/546****W**

and members(Zastrow, n.d.).. Diagnoser: Figures out sources of difficulties the group has in working effectively and the blocks to progress in accomplishing the group's goals.

NSOU ? PGSW-III 157

91%**MATCHING BLOCK 309/546****W**

Energizer: Stimulates a higher quality of work from the group. Reality Tester: Examines the practicality and workability of ideas, evaluates alternative solutions and applies them to real situations to see how they will work. Evaluator: Compares group decisions and accomplishments with group standards and goals. The Johnson has also identified group maintenance roles, which strengthen social/emotional bonds within the group: Encourager of Participation: Warmly encourages everyone to participate, giving recognition for contributions, demonstrating acceptance and openness to ideas of others; is friendly and responsive to group members (Zastrow, n.d.).. Harmonizer and Compromiser: Persuades members to analyze constructively their differences in opinions, searches for common elements in conflicts and tries to reconcile disagreements (

Zastrow, n.d.).

96%**MATCHING BLOCK 310/546****W**

Tension Reliever: Eases tensions and increases the enjoyment of group members by joking, suggesting breaks and proposing for approaches to group work. Communication Helper: Shows good communication skills and makes sure that each group member understands what other members are saying (

Zastrow, n.d.).

100%**MATCHING BLOCK 311/546****W**

Evaluator of Emotional Climate: Asks members how they feel about the way in which the group is working and about each other, and shares own feelings about both (

Zastrow, n.d.).

96%**MATCHING BLOCK 312/546****W**

Process Observer: Watches the process by which the group is working and uses the observations to help examine group effectiveness. (Zastrow, n.d.). Standard Setter: Expresses group standards and goals to make members aware of the direction of the work and the progress being made toward the goal, and to get open acceptance of group norms and procedures. Active Listener: Listens and serves as an interested audience for other members is receptive to others' ideas, and goes along with the group when not in disagreement. Trust Builder: Accepts and supports openness of other group members, reinforcing risk taking and encouraging individuality. Interpersonal Problem Solver: Promotes open discussion of conflicts between group members in order to resolve conflicts and increase group togetherness.

NSOU ? PGSW-III 158

96%**MATCHING BLOCK 313/546****W**

Each of the foregoing task and maintenance functions may be required periodically within a group; end effective group members (and leaders) are sensitive to these needs. A task leader emerges in many groups because he or she has the best ideas and does the most to guide discussions. Since this person concentrates on a task, and generally plays an aggressive role in moving the group toward the goal, hostility is apt to arise and the task leader may be disliked. Concurrently, a second

98%**MATCHING BLOCK 314/546****W**

leader may emerge: a social / emotional specialist who concentrates on group harmony and resolves tensions and conflicts within the group. In groups without an official leader, the leader is expected to be both the task specialist and the social / emotional specialist. In groups without an official leader, these two functions are generally assumed by two different emergent leaders. When social / emotional group maintenance needs are met, a group will continually improve its task effectiveness. However, when maintenance needs are ignored, a group's task effectiveness deteriorates(

Zastrow, n.d.). Exercise 4:

99%**MATCHING BLOCK 315/546****W**

Task and Maintenance Contributions to a group. 1. Identify a group you are currently participating in or have participated in the past. Briefly describe this group, including its goals. 2. Review the list of task roles and then describe your task contributions to this group. 3. Review the list of maintenance roles and then describe your maintenance contributions to this group.

88%**MATCHING BLOCK 316/546****W**

Other Roles: The designated group leader has a special obligation to assume or to assist others in assuming, timely and appropriate task and maintenance roles. Each leader is also responsible for a variety of functions, which range from setting initial policies to planning for termination. To meet the needs and particular developmental stage of a group, a leader may be required to assume any of the previously described roles as well as these (Zastrow, n.d.): Executive: The most obvious role of a

leader in any group is a coordinator of the activities of the group. The leader may not have any direct role in determining policies but it is his responsibility to observe the execution of these policies. In this executive capacity the leader does not himself carry out the necessary work, he assign it to other group members.

NSOU ? PGSW-III 159 Planner: Planning is the intermediate step between determination of policies and their execution. The leader as a planner decides the ways and means by which the group shall achieve its ends. This may not only involves the intermediate steps but the future steps to the goal. Policy maker: One of the most important of all leader functions is the establishment of group goals, objectives and policies. Expert: Besides from functions of policy making, distinguished as a source of readily available information and skills for the group membership. In this sense the leader is the one who is regarded as the best qualified for the technical requirements of the group activities. Group Representative: It is impossible for all members of a group to deal directly with other groups or other people outside the group. The outgoing and incoming demand and contacts are channelled through him. Lewin has called a leader as 'Gate Keeper'. Controller of internal relationship: The leader may functions as the controller of internal interpersonal relations among the group members themselves. More than any other members, the leader knows the specific details of the group structure and by so doing affects the nature of in-group relation. There are some groups where the in- group relations are channelled through the leader. Purveyor of Rewards and Punishments: The leader assumes the power of reward and punishment which enables him to exercise strong disciplinary and motivational control over the group member. The leader may promote a member to higher rank, may give a member special honour and may also take disciplinary action against any group member. Arbitrator and Mediator: The leader should not only act as an important judge to render decisions but also to act as conciliator in re-establish good group interrelations. Exemplar: The leader should be the model of behaviour for the group members. He, in his own person, must exemplify the percept inculcated upon them. A military officer boldly leads the troop in the battle field serve as the exemplar. Symbol of the Group: The leader may enhance the group unity by rightly standing for the group. The king of England is a classic example of this function of symbol providing a kind of cognitive focus for group unity.

NSOU ? PGSW-III 160 Surrogate for individual responsibility: The leader sometimes relieve the responsibilities of any other group members that he wishes to avoid. The individual member puts his trust in the leader and lets him make the decision. In this situation leader play an extremely important psychological role for the individual. Ideologist: The leader furnishes the ideology of the group membership, he acts as a source for the very beliefs of the individual member. Gandhi served in this sense as a "Spiritual leader" in the living conscience and moral guide of million of Hindus. Father figure: The leader serves as a perfect focus for the positive emotional feelings of the individuals; he is the ideal object for identification, for transference, for feelings of submissiveness. Hitler serves as compelling father figure of their followers. Scapegoat: A leader previously loved by the group members may be repudiated and excoriated by the group. A leader sometime constitute an ideal object for positive emotional feelings but he may be a perfect target for the aggressions of the frustrated, disappointed disillusioned group. E.g. The Nazi leadership was rejected by many Germans who were previously loyal and devoted followers: 9.6

Emotional Intelligence And Leadership Effectiveness Individuals, especially leaders, who engage in social interface are expected to emotionally intelligent. Leaders' lows in emotional intelligence are found to be less capable of handling stress, problematic situations and people. There are five components of Emotional Intelligence

which as follows:

100%	MATCHING BLOCK 318/546	W
Self-awareness: exhibited by self-confidence, realistic self-assessment and a self-depreciating sense of humour. Self-management: exhibited by		

trust worthiness

97%	MATCHING BLOCK 319/546	W
and integrity, comfort with ambiguity and openness to change. Self-motivation: exhibited by a strong drive to achieve, optimism and high organizational commitment. Empathy: exhibited by expertise in building and retaining talent, cross-cultural sensitivity and service to clients. Social Skills: exhibited by the ability to lead change, persuasiveness and expertise in building and leading teams.		

NSOU ? PGSW-III 161 9.7

99%	MATCHING BLOCK 320/546	W
Qualities of a Successful Leader Though there are several leadership styles, every leader has to develop a style appropriate to the needs of the group and the situation. It is a universal fact that every person's leadership skills are unique and cannot be borrowed from another. The leader has to grow on her own. To be a good leader one needs to have a positive sense of humour that is not derogatory or distasteful, possess good listening skills, ability to truly enjoy being with people and genuinely accepts the other person's view points. The leader has to be optimistic, unruffled and capable of handling difficult situations deftly. The leader has to be friendly-within the prescribed limits of the societal norms. This friendliness has to be done with appropriateness – not too close or too isolated. Essentially, the leader has to be broad minded, relaxed and open to criticisms.		

100%	MATCHING BLOCK 321/546	W
While working with group members from diverse cultures, a broad cultural background is an advantage. This aids the process of the cultural 'melting pot' further enabling smooth interaction and accomplishment of group tasks. The leader		

has to necessarily control her emotion, temper and has to be extra cautious of imposing her feelings on the group.

95%	MATCHING BLOCK 322/546	W
The leader is a human being too, with all her problems and fears to handle. But a wise leader fully understand that it is essential to keep her problems, especially the personal ones to herself.		

94%	MATCHING BLOCK 323/546	W
Finally, the leader has to be well groomed physically too. The leader has to stick to comfortable, clean outfits, well hair, no clattering trinkets, flashy coburs, heavy costumes or any disturbing accompaniments. The leader has to make sure that his appearance is appropriate to the group's culture and expectations. He has to avoid improper mannerism and gestures. 9.8		

Leadership and Communication In any small group observation reveals that only one or two persons speak a great deal and other say very little. This has been found to be so whether the group is structured or unstructured, whether the problem being discussed is general or specific, whether the members of the group are friends or strangers, whether the size of the

NSOU ? PGSW-III 162 group is small or large. This happens in the house when friends and relatives meet, in the seminar class and in the parliament. This is why in a seminar class or in a group discussion restrictions are placed on those who speak frequently and too long while those who do not speak are persuaded to make their contribution. It has been found that the amount of communication by members of a group follows a logarithmic or exponential curve. Regardless of the size of the group, the most talkative member does about 40 percent of the communicating and the amount of communication by the other members drops off sharply. In an eight-member group two persons contribute 60 percent of the conversation, the third contributes 14 percent and the remaining five members the balance of 26 percent between them. Thus, the fact that one person does most of the talking seems virtually to be a universal characteristic of groups. The most active member in terms of communication also tends to be the leader of the group because he has the most influence on the group. He determines the course of conversation; he initiates interactions by asking questions, he receives most of the replies. Further, he makes most of the suggestions and gives most of the orders. He tends to play the central role, whatever the group is doing. An outside observer would consider him the group's leader and this is confirmed by the members of the group also when they are questioned. Generally, the person who talks the most is perceived as the leader by the rest of the group. Thus, the amount of communication is a critical determinant of leadership. Bavelas et al (1965) demonstrated this effect. Students were divided into four-man groups and were given a problem to discuss for ten minutes. An observer recorded the amount of time each man spoke and the number of times he spoke. After the discussion session, the subjects were asked to fill out a questionnaire in which they were asked to rank the other subjects on general leadership ability and other characteristics. In the second session each subject had a small box with a red and a green light in front of him, which only he could see. Some subjects were told that they would receive feedback on their performance; if the red light went on, it would indicate that they had been hindering the discussion; if the green light went on, it would indicate that their contribution was helpful. Thus they were either negatively or positively reinforced. One subject who was at the bottom on both verbal output and in the ranking by others was selected from each group. He was positively reinforced whenever he spoke by the flash of green light while the rest

NSOU ? PGSW-III 163 of the group were negatively reinforced for most of their interventions. In the third session there were no lights. It was found that the person who contributed only 16 percent of verbal output and who was rated low by other in the first session was able to contribute 37 percent when he was positively reinforced in the second session and was ranked high. In the third session when there was no reinforcement he continued to put in 27 percent of verbal output and was ranked high. Thus, positive reinforcement made him speak more and this made the other to give him a high rank as a leader. And this effect persisted even when he was not receiving any special encouragement. He was not only speaking more, he was perceived by the members as being quite active and dominant and they rated him higher on the leadership scale. Thus, the amount of an individual's communication is one of the determinants of leadership. But the type of his communication is also important. Every interaction or communication can be placed in one of the twelve broad categories: showing disagreement or agreement, tension or tension release, solidarity or antagonism; all these six categories are emotional; the next six categories are cognitive: giving or asking for suggestions, opinions or information. The categories refer only to verbally expressed items. According to Bales, one set of talkative persons tend to make supportive, encouraging, conciliatory and friendly statements; that is, such a person initiates more interactions which fall into the categories of showing solidarity, tension release and agreement than others; he also asks more questions than others, seeking information, opinion or suggestions. The other set of talkative persons come to the forefronts when some task has to be carried out; the communications of such a person fall into the categories of giving suggestions, opinions and information regarding the task on hand. Bales has called the first type the "social" or "socio-emotional" leaders and the second type the "task" leaders. While the former person concentrates more on the social aspects of the situation and tries to keep the group running smoothly and happily, the latter concentrates on getting the work done. Communication Networks: In order to study this aspect communication networks are artificially imposed to vary the direction of permissible communication and the openness of the various channels between group members. Experimentally four- person net works and five person networks have been designed. In the following diagram, the circles represent positions and lines represent communicating channels.

NSOU ? PGSW-III 164 WHEEL CHAIN Y CIRCLE COMCON Figure 5: Five Persons Communication Networks It will be observed that in some networks like the wheel, the chain and Y one person occupies a centralized position; he has access to more information than the persons in any other position. In the contrast, the positions in the circle and common are all equivalent, more being more central than the others. It would be expected that a person in the most central position of the wheel, the chain or Y would assume the functions of a leader in obtaining and in distributing information and will help crucially in solving problems confronted by the group. Bavelas (1948) Leavitt (1951) were the first to investigate systematically the social and psychological consequences of network variations. Leavitt presented the problem of discovering the single symbol that each member held in common on a card containing several symbols. The results showed that stable organizations developed by the fourth or fifth trial in the more centralized network but not in the circle network. The central subject transmitted more messages than any other subject in the centralized groups. It was found that he also enjoyed his job more than those who occupied the peripheral positions. Further, the person occupying the central position was typically designated the leader by the other members on a post experimental questionnaire. The results also showed that the circle was typically the most inefficient network. The persons in the this network sent many more messages than in other kinds of networks. Also they made significantly more errors in attempting to identify the common symbols. However, the subjects in the circle network enjoyed their jobs more than the peripheral members in the centralized groups. 9.9 Leadership and Power

100%

MATCHING BLOCK 324/546

W

Power and leadership are largely interconnected. The effective leader understands that legitimate power and influence are needed to direct the group, especially at the

99%

MATCHING BLOCK 325/546

W

initial stages when the group looks up to the leader for guidance. The leader has to take up a mature use of power rather than being uncomfortable or too much in control. This power should be used to empower the group towards shouldering responsibilities willingly and also in successfully completing them. Groups need leaders to avoid disorganisation and chaos; leadership and power are inseparable. The leader needs to aid power sharing with the group by highlighting the importance of member-to-member communication rather than member-to-leader communication (

Zastrow, n.d.).

94%

MATCHING BLOCK 326/546

W

French and Raven have developed a framework for understanding the extent to which one group member influences another by identifying five bases of power: reward, coercive, legitimate, referent and expert. This framework allows group members to analyze the source of their power and offers suggestions on when, and when not, to use their power to influence others (Zastrow, n.d.).
 Reward Power: Rewards include such things as promotions, pay increases, days off, and praise. Reward power is based on B's (one member's) perception that A (another member or the entire group) has the capacity to dispense rewards or remove negative consequences in response to B's behaviour. This power will be greater if the group members value the reward and believe they cannot get it from anyone else. Group members will usually hard for someone who has high reward power and communicate effectively with her. Reward power can backfire, however, if group members feel they are being canned or bribed. If reward power is used by A in a conflict situation with B, B is apt to feel he is being bribed and controlled and may eventually refuse to cooperate (

Zastrow, n.d.).

96%

MATCHING BLOCK 327/546

W

Coercive Power: The ability to fire a worker who fails below a given level of production is a common example of coercive power, which is based on B's perception that A can dispense punishments or remove positive consequences. Coercive power stems from the expectation on the part of B that he will be punished by A if he fails to conform to the required standards set by A. The distinction between reward and coercive power is important. French and Raven note that reward power will tend to increase the attraction of B toward A, while coercive power will decrease this attraction. If coercive power is used by A to attempt to settle a conflict, it often increases B's hostility, resentment and anger. Threats often lead to aggression and

counter threats, for

90%

MATCHING BLOCK 328/546

W

example, military threats often increase conflict between rival NSOU ? PGSW-III 166 countries. Coercive power may exacerbate conflict by leading both A and B to distrust each other and to retaliate against each other. Therefore, whenever possible coercive power should not be used to settle conflicts (

Zastrow, n.d.).

93%

MATCHING BLOCK 329/546

W

Legitimate Power: Legitimate power is directly related to an internalized value or norm and is probably the most complex of the five power basis. Legitimate power is based on the perception by B that A has a legitimate right to prescribe what constitutes proper behaviour for him and that B has obligation to accept this influence. Cultural values constitute one common basis for legitimate power and include intelligence, age, caste and physical characteristics as factors determining power. For example, in some cultures the aged are highly respected and are granted the right prescribe behaviour for others. The legitimate power inherent in a formal organisation is generally determined by a relationship between positions rather than between people. A supervisor in a factory, for instance, has inherent right to assign work. A third basis for

a

95%

MATCHING BLOCK 330/546

W

legitimate power is a legitimizing agent; for example, an election. The election process legitimates a person's right to a position that already had a legitimate range of power associated with it (

Zastrow, n.d.).

95%

MATCHING BLOCK 331/546

W

The limits of legitimate power are generally specified at the time that power is assigned (e.g., in a job description). The attempted use of power outside of this range will decrease the legitimate power of the authority figure and decrease her attractiveness and influence. Referent Power: Referent power occurs when one individual, A, influences another, B, as a result of identification. Identification in this context means either a feeling of oneness with A or a desire for an identity such as A's. The stronger the identification of B with A, the greater attraction to A and the greater referent power of A. Verbalization of referent power is "I am like A, and therefore I will believe or behave as A does" or "I want to be like A, and will be more like A if I believe or behave as A does". In ambiguous situations (that is, situations where there are no objective right or wrong beliefs or opinions), B will seek to evaluate his thoughts, beliefs and values. In ambiguous situations B is apt to adopt the thoughts, beliefs and values of the individual or group with which B identifies. French and Raven note that B is often not consciously aware of the referents power that A exerts (

Zastrow, n.d.).

100%

MATCHING BLOCK 332/546

W

Expert Power: Accepting a physician's advice in medical matters is a common example of expert influence, which is based on the perception that a person has

NSOU ? PGSW-III 167

95%

MATCHING BLOCK 333/546

W

knowledge or expertise that is the source of power. Another example would be accepting a counsellor's suggestions. Expert can influence B (the responder) only if B thinks that A (the expert) has the right answer and B trusts A. The range of expert power is more limited than that of referent power because the expert is seen as having superior knowledge or ability only in specific areas. French and Raven note that the attempted exertion of expert power outside the perceived range will reduce that power because confidence in the expert seems to be undermined (

Zastrow, n.d.).

95%

MATCHING BLOCK 334/546

W

French and Raven theorize that for all five types, the stronger the basis of power, the greater power. Referent power is thought to have the broadest range. Any attempt to use power outside the prescribed range is hypothesized to reduce the power. Exercise 6: The power Bases in the class. This

class can be reviewed as being a group. For each of the listed power bases, answer the following: Who in this class has this power base? Have these people engaged in actions that demonstrated this power base? If "yes", write down these actions. Reward Power: Coercive Power: Legitimate Power: Referent Power: Expert Power: 9.10 Leadership Styles

96%

MATCHING BLOCK 335/546

W

The following are a few important leader behaviours: Directive: When the task to be accomplished is unclear or difficult to be achieved, the leader insures its successful accomplishment through clearly defining individual tasks and role expectations of members.

93%

MATCHING BLOCK 336/546

W

Supportive: The leader shows high concern towards group members and their needs. This style is suitable for groups working on well defined tasks. Members under the supportive leader are found to be happy and highly satisfied. Participative: Here, the leader involves the group members in decision making and in all functions of the group. Discussion, consultations and group consensus are NSOU ? PGSW-III 168 stressed upon. However, this calls for members who are responsible and who understand the importance of their contribution to the groups success. Charismatic: Medha Patkar pioneer of the Narmada Bachao Andolan (Save the Narmada Movement) is considered to be a charismatic leader for the following reasons: i. Ability to inspire followers towards goals that appears incredible to the common man ii. Vision about the future iii. Understanding followers' needs and limitations. Transformational: "This highlight on leaders who inspire followers to transcend their own self-interests and who are capable of having a profound and extraordinary effect on followers. Seven characteristics were found: sincerity of the leader; bonding effort to develop the organisation as a family by personalized relationships; consultation and participation; collectivization and team work; empowerment and support; serving as a role model; bringing in changes continuously while maintaining continuity and being innovative". – Robbins

and Sanghi: 2005. 9.11 Guidelines For Forming And Leading A Group (Reborn, n.d.)

92%

MATCHING BLOCK 337/546

W

The theory of leadership emphasized in this unit is the distributed – functions approach, which asserts that every group members takes on leadership responsibilities at various times and every effective action by a member is simultaneously an effective leadership action. Being a designated leader is not that different from taking on leadership roles. This unit will summarize a number of suggestions for how to form and lead a group effectively. Home Work: The Key to successful group leadership is extensive preparation. Even experienced leaders carefully prepare for each group and for each group session. In planning for a new group, the following questions must be answered: What

are

96%

MATCHING BLOCK 338/546

W

the purpose or general goals of the group? How can these goals be achieved? What are the characteristics of the members? Do some members have unique NSOU ? PGSW-III 169 individual goals or needs? What resources are needed to accomplish group goals? What is the agenda for the first meeting? What is the best way for members to suggest and decide on the specific goals of the group? Should an ice-breaker exercise be used? Which one? Should refreshments be provided? How should the chairs be arranged? What type of group atmosphere will best help the group accomplish its tasks? What is the best available meeting place? Why has the leader been selected? What do the members expect from the leader? To plan the first meeting, a leader should view the group as a new member would view it. Here are a few questions a new member might have: what will be the goals of this group? Why am I joining? Will my personal goals be met? Will I feel comfortable? Will I accept? Will the other members be radically different in terms of backgrounds and interests? If I do not like this group, can I leave gracefully? Will other members respect what I have to say, or will they laugh and make

for

97%

MATCHING BLOCK 339/546

W

of me? By considering such concerns, the leader can plan the first meeting to help other members feel comfortable and to clarify the goals and activities of the group. Before the first meeting, it is absolutely essential that a leader identified the group's needs and expectations as precisely as possible. A group whose leader and members disagree on goals cannot succeed. There

is

91%**MATCHING BLOCK 340/546****W**

a variety of way to identify what the members want. The leader may have an opportunity to ask them before the first meeting. If that is not possible, the leader can at least talk to the organizer of the meeting, about the group's expectations. The first meeting is always a good time to clarify the group's goals. The leader also needs the answers to the following: 1. How many members are expected? 2. What are their characteristics: age, socio-economic status, racial and ethnic background, gender, educational / professional background? 3. How knowledgeable are the members about the topics the group will be dealing with? 4. What are the likely personal goals of the various members? 5. How motivated are the members to accomplish the purposes for which the group is being formed? Voluntary membership usually indicates greater motivation. Individuals who have been ordered by a court to participate in NSOU ? PGSW-III 170 an alcohol rehabilitation programme, for example, have little motivation and may even be hostile. 6. What values are members likely to have? While being careful to avoid stereotyping, a leader must understand, for example, that teenagers on juvenile probation will differ significantly from retired

priest.

97%**MATCHING BLOCK 341/546****W**

If a group has met more than one, the leader needs to review the following kinds of questions. Have the overall goals been decided upon and clarified? If not, what needs to be done in this clarification process? Is the group making adequate progress in accomplishing its goals? If not, what are obstacles that must be overcome? Is the group taking the most effective course of action to reach its goals? What is the agenda for the next meeting? What activities should be planned? Will successful completion of these activities move the group toward accomplishing its overall goals? If not, which other activities will? Is each member sufficiently motivated to help the group accomplish its goals? If not, why? What might be done to stimulate their interest? Planning a session: In planning a session, the leader must keep the group's over goals.

96%**MATCHING BLOCK 342/546****W**

To be effective, the leader must know exactly what should be accomplished in each session and make sure that all the items on the agenda contribute to the goals. Here is a checklist that may help leaders plan successful group sessions. An effective leader will do the following: 1. Select relevant contest. The material should not only be relevant to the specific goals for the session but also to the backgrounds and interests of the participants. Time management advice for college students, for example, probably will be different from that for business executives. Time saving tips for students will likely focus on improving study habits; business executives will be more interested in how to manage time in an office setting. An excellent way to evaluate possible material is to define precisely how it will be valuable to members of the group. The leader should ask, "If a group member wants to know why he or she should know this, can I give a valid reason?" if that question cannot be answered precisely, the material should be discarded and replaced with more relevant material. 2. Use examples. Examples help to illustrate key concepts and stimulate the participants. People tend to remember examples more readily than statistics NSOU ? PGSW-III 171 or concepts. Vivid case histories that illustrate the drastic effects of spouse abuse, for instance, will be remembered much longer than statistics on the extent of spouse abuse. 3. Present materials in a logical order. It is generally desirable to begin by summarizing the agenda items for the session. Ideally, one topic should blend into the next. Group exercises should be used in conjunction with related theoretical material. 4.

98%**MATCHING BLOCK 343/546****W**

Plan the time. Once the content of a session is selected and organized, the time each segment requires should be estimated. Accurate estimates will help determine whether planned material and activities are appropriate for the allotted time. A good leader also knows what material can be deleted if time is running short and what can be added if the session progresses more rapidly than planned. Substitute activities must also be available to replace speakers who fail to appear or films that fail to arrive. 5. Be flexible. A variety of unexpected events may make it desirable to change the agenda during a session. Interpersonal conflict between members may take considerable time or it may become clear that subjects related to the group's overall purpose are more valuable for the group to focus on than the prepared agenda. 6. Change the pace. People may attention longer if there is an occasional change of pace. Long lectures or discussions can become boring. Group exercise, films, guest speakers, breaks, debates and other activities will help vary the tempo of a meeting or session. In group therapy, one way to change the pace is to move from one member's problem to those of another. Lectures can be more stimulating if the instructor: • Speaks extemporaneously instead of reading material. • Walks around the room occasionally, rather than standing or sitting in one place • Draws out participants by asking questions.

93%**MATCHING BLOCK 344/546****W**

Relaxing before Start a Meeting: Before beginning a meeting, the leader is likely to be nervous about how the session may go. Some anxiety, in fact, is helpful because it increases alertness and that will make the leader more attentive, producing a better NSOU ? PGSW-III 172 meeting. Too much anxiety, however, reduces effectiveness. Relaxation techniques that can alleviate excessive anxiety. They are highly recommended and include walking, jogging, listening to music, meditating and being alone to clear the mind. Effective group leaders generally learn they can reduce their level of anxiety through using one or more relaxation techniques. Practice in leading groups also builds confidence and

reduce

98%**MATCHING BLOCK 345/546****W**

anxiety. Cues upon Entering the Meeting Room: It is essential that a leader be on time, but arriving early is better because it allows the leader to see that materials, seating arrangements, refreshments and any other needs are in place as planned. The leader will also have an opportunity to observe the members before the group begins. He or she can gain information about the interests of the participants from their age, gender, clothes and personal appearance, conversation and interaction with one another. An effective leader observes such cues and uses them to create an initial bond with the participants. For example, this was asked to give a workshop on suicide prevention to a high school class. Upon arriving, I was informed by the teacher that one of the students in the class had recently committed suicide. Instead of beginning with planned presentation, I asked each student to write down, anonymously, one or two concerns or questions that they had about suicide. We then had a lively discussion based on their questions and concerns. Such a discussion was probably more valuable than the formal presentation because it focused on their specific question and concerns. Seating Arrangements: Seating is important for several reasons. It can affect who talks to whom, influence leadership roles, and as a result, affect group cohesion and morale. In most groups members should have eye contact with one another. The group leader must

95%**MATCHING BLOCK 346/546****W**

be able to make eye contact with everyone to obtain nonverbal feedback on what the members are thinking and feeling. A circle is ideal for generating discussion, encouraging a sense of equal status for each member and promoting group openness and cohesion. The traditional classroom arrangement, on the other hand has the effect of placing the leader in a position of authority. It also tends to inhibit communication because members can easily make eye contact only with other members seated nearby. Tables have advantages and disadvantages. They provide a place to be writing and to put work materials and some members feel more comfortable at a table

NSOU ? PGSW-III 173

97%**MATCHING BLOCK 347/546****W**

because they can lean on it. But tables restrict movement and may serve as barriers between people. The leader should thus carefully consider the use of tables. In business meetings or other "working" sessions, for example, tables are necessary. In therapy groups, however, tables are seldom used. When work surfaces written communication are required, small tables in a circle can be an effective arrangement. The shape of the tables can also influence the way group members interact. If the table is rectangular, the leader traditionally sits at one end becomes the head of the table and the "authority", tends to do more talking, and has a greater influence on the discussion than other group members. A round or square table, however, establishes a more equalitarian atmosphere. The "head of the table" effect can also be reduced by placing two triangular tables together to make a square. In new groups or even established ones, members are likely to sit next to friends. If it is important for everyone in the group to interact, the leader may want to ask people to sit next to individuals they do not know. People are most apt to talk to others sitting at right angles to them and them to those next to them. Those sitting directly across receive less communication, and those sitting anywhere else are even less likely to be addressed. Introductions: The leader's credentials should be summarized at the first meeting to give the group a sense of confidence that the leader can fulfil the expectations of the members. If the leader is being introduced, a concise summary of the leader's credentials for the expected role is desirable. If the leader is introducing herself, the important credentials should be summarized in an informative but modest way. The summary should be made in a way that helps create the desired atmosphere – whether it be formal or informal, fun or serious or whatever. An excellent way to handle the introductions in many groups is to use an ice-breaker exercise. It is highly desirable for the leader to learn the names of all group members as quickly as possible. This requires extra attention and name tags can help everyone be more comfortable sooner. Members appreciate being called by name because

if

100%**MATCHING BLOCK 348/546****W**

affirms their importance. If the group is small, the members can introduce themselves individually, perhaps using an ice breaker. In addition to the usual personal information, it is helpful for

NSOU ? PGSW-III 174

97%**MATCHING BLOCK 349/546****W**

members to state their expectations for the group as they introduce themselves. This helps uncover hidden agendas that are incompatible with the goals of the group. If a stated expectation is beyond the scope of the group, the leader should tactfully point this out to avoid later frustration or dissatisfaction. Clarification Roles: The leader of a group should be clear as to his or her roles and responsibilities. If they are unclear, the leader may want to discuss them with the group. One way of doing this is for the group to select goals and then make decisions about the tasks and responsibilities that each member will have in working toward the goals of the group. In most situations it is clearly a mistake for the leader to do the bulk of the

96%**MATCHING BLOCK 350/546****W**

work. Generally, the group will be most productive if all members make substantial contributions. The more members contribute to a group, the more lightly they are to feel a part of the group. Such positive feelings will benefit everyone(

Reborn, n.d.).

95%**MATCHING BLOCK 351/546****W**

If there is any doubt, the leader should explain the roles clearly. If group members indicate different expectations, the group should then make decisions about who will do what. In explaining his or her role the leader should be modest about personal skills and resources, attempting to come across as a knowledgeable person rather than an authority figure who has all the answers. The leader must also be prepared to explain the reasoning behind exercises and other actions or activities. The leader's role will vary from group to group and from situation to situation(Reborn, n.d.). Agenda: Most meetings are more effective if the leader provides an agenda several days before hand. Ideally, all members of the group should have an opportunity to suggest items for the agenda. The agenda should be briefly reviewed at the start of the meeting to give each member a chance to suggest additions, deletions or other changes. In some meetings it may be appropriate for the group to discuss and perhaps vote on, the suggested changes in the agenda. Additional Guidelines for Leading a Group(

Reborn, n.d.): The unit briefly summarizes additional suggestions(Social Work with Groups Chapter 3 & 4 Flashcards | Quizlet, n.d.)

86%**MATCHING BLOCK 352/546****W**

for effectively leading a group. 1. Understand that leadership is a shared responsibility. Every member will take on leadership roles at times. Designated leaders should not seek to dominate a group or believe they are responsible for directing the group in all of its tasks and maintenance functions. In fact, productivity and group cohesion are substantially increased when everyone contributes. 2. Use decision-making procedures best suited for the issues facing a particular group. 3.

100%**MATCHING BLOCK 353/546****W**

Use a problem-solving approach to handle the issues and problems facing the group. 4.

Create a cooperative atmosphere rather than a competitive one. 5. View controversy and conflict as natural and desirable for resolving issues and arriving at good decisions. In resolving conflicts, seek to use no-lose, problems solving approach rather than a win-lose approach. 6. Generally, seek to confront members who are hostile or disruptive. 7. Use appropriate self-disclosure. 8. Seek to create an atmosphere of open and honest

91%

MATCHING BLOCK 354/546

W

communication. 9. Provide stimulating, relevant content and exercises that illustrate the concepts and help members try out suggested new behaviours. In an assertiveness group, for example, theoretical material on how to be more assertive should be followed by practice in being more assertive. 10. Give attention to how to end a session. A few minutes before the session is scheduled to conclude, or when the group has exhausted the subject, a brief summary emphasizing the major points to be remembered leaves the group with a sense of achievement and signals the end of the session. Leaders are not born. They are made through training, practice and experience. By learning how to lead groups effectively individuals become more aware of themselves, grow as people, become more self-confident, feel good about themselves,

91%

MATCHING BLOCK 355/546

W

develop highly marketable skills, learn to improve interpersonal relationship and help themselves and others accomplish important tasks. 9.12

Group Exercises Exercise A: Desensitizing Fears of Leading a Group (Zastrow, n.d.): Goal: To identify the specific fears about being a designated leader

of

96%

MATCHING BLOCK 357/546

W

a group and to provide information to reduce those fears. NSOU ? PGSW-III 176 Sept 1: The group leader should state the purpose of this exercise. Each student should then be handed a sheet of paper and instructed to complete, anonymously, the sentence "My specific fears about being a designated leader of a group are". The leader should emphasize that the completed statements will be collected and discussed. Step 2: The responses should be collected in a way that ensures, anonymity and then read aloud. After a concern is read, the students should suggest ways of reducing the concern. If a concern involves handling hostile members, for example, the class, with help from the instructor, may suggest strategies for coping with them. If a member fears that he or she does not have the traits needed to lead a group, it may be pointed out that research has found that no specific traits distinguish leaders from followers and that the distributed-functions theory of leadership asserts that practically anyone can be trained to be a leader. Step 3: After Step 2 is completed, the group leader or the instructor may want to summarize key points on how to lead a group and explain that future sessions will explore these points in greater depth. Exercise B: Task Functions and Group Maintenance Functions: Goal: To show that at times nearly everyone takes a leadership role in groups that involves performing task and group maintenance functions. Step 1: The group leader should indicate that this exercise will elicit the class's thoughts on what criteria should be used for admitting students into the social work programme at this campus. The leader should then explain that the council on Social Work Education (the national organization that accredits social work programmes) requires every programme to have criteria for admitting students. There is considerable variation in criteria among the programmes in

the

100%

MATCHING BLOCK 358/546

W

country. Common criteria include a minimum grade-point average and a vaguely defined "aptitude for social work".

98%

MATCHING BLOCK 359/546

W

Step 2: The class then forms subgroups of five or six students and each selects an observer. The observers then form a group in another room or hallway. The subgroups should not begin discussing their primary task until the observers return. Step 3: The observers are told that their task is to record significant task and group maintenance functions performed by each member of their subgroup. The leader may need to explain that task functions are statements designed to help the

NSOU ? PGSW-III 177

96%**MATCHING BLOCK 360/546****W**

subgroup accomplish its task and that group maintenance functions are statements made to strengthen the social / emotional aspects of group life, observers should be given a handout that summarizes the task roles and group maintenance roles developed by Johnson and Johnson, which appear in this unit. The observers will be asked after the exercise is over to summarize to their subgroup how each member contributed through certain task and group maintenance functions. Step 4: The leader and observers return to the

sub-groups.

95%**MATCHING BLOCK 361/546****W**

The subgroups are informed that their task is to develop criteria for admitting students to the social work programme at this campus. The subgroup is free to suggest various criteria but should probably begin by discussing: 1) whether a grade-point average should be used for admission and what it should be, and 2) how "aptitude for social work" should be defined and measured. Step 5: The subgroups should work for 20 to 30 minutes, and each should then state and explain its proposed criteria. Time should then be called and each subgroup should be asked to indicate to the class what criteria were arrived at. Step 6: The group leader should indicate that one of the purposes of this exercise is to demonstrate that most members in a group assume leadership roles by carrying out task and group maintenance functions. The leader should then define task and group maintenance functions. Step 7: Each observer summarizes to his or her subgroup, but not to the whole class, the significant task and group maintenance functions performed by each member. Step 8: End the exercise by asking members if they have any thoughts or comments. Exercise C: Power Bases: Goal: To practice analyzing influence attempts in terms of power bases. Step 1: The group leader explains the purpose of the exercise, describes the five bases of power developed by French and Raven, and briefly discusses the effects of using each base. Step 2: The class divides into subgroups of three members each and answers the following questions: NSOU ? PGSW-III 178 1. What bases of power does the instructor of this course have? 2. What bases of power does a student in this class have? 3. What is the primary power base

94%**MATCHING BLOCK 362/546****W**

the instructor has? 4. What is the primary power base a student has? Step 3: The subgroups share their answers to these questions by having one member from each subgroup write the answers on the blackboard. The class then discusses the reason for the similarities and differences between the answers arrived at by the subgroups. Step 4: In all likelihood the instructor will be seen as having much more power than the students. The group leader should summarize the effects of unequal power on communication and on relationships within a group. Students then discuss how they feel when an instructor attempts to present herself on a level equal or superior to students.

Exercise D: Types of Influence: Goal: To increase awareness of feelings toward the following three types of influence: personal challenge, coercive power and manipulation.

84%**MATCHING BLOCK 363/546****W**

Step 1: The instructor explains the purpose of the exercise and asks students to

visualize each of the following situations. The instructor should pause after each situation and allow students time to write their responses. Narrative 1: Visualize an academic situation in which you worked hard on something because it presented a personal challenge and because you expected to grow as a person through meeting this challenge. Briefly describe this situation on a sheet of paper and summarize your feelings about the challenge motivating you to work hard. Narrative 2: Visualize a situation in which someone sought to manipulate you into doing something. Briefly describe this situation on a sheet of paper and summarize your feelings when you discovered this. Step 2: The students then form subgroups of three members each to share what they wrote and discuss how they felt about each situation. If any student does not wish to share these personal thoughts, that is acceptable. Step 3: The students think of situations in which using coercive power and manipulation would be desirable and then discuss the situations. NSOU ? PGSW-III 179 9.13 Conclusion Our

100%**MATCHING BLOCK 364/546****W**

experience in working with groups indicates that there is no 'one size fits all' approach to leadership. Different styles of leadership are relevant to different situations.

88%

MATCHING BLOCK 365/546

W

Thus, effective leaders are highly respected individuals who have a vision. They promote safe, welcoming environments that avoid the extreme of aggressive confrontation of members or passive addiction of leadership to members who attempt to dominate groups. Next, leaders have to understand the abilities, values and personalities of members.

94%

MATCHING BLOCK 366/546

W

Effective leaders must also skilfully deploy the resources they have at their disposal. This includes empowering members and reinforcing feeling of confidence and individual and group efficacy.

100%

MATCHING BLOCK 367/546

W

In a very real sense the right to leadership must be earned again and again. 9.14

Exercise 1. What do you mean by leadership? 2. Write in brief the different approaches to leadership. 3. Elucidate the roles and functions of a leader. 4. What are the qualities of success for leader? 5. Write short notes on: a) Leadership and communication; b) Leadership and power. 9.15 Reference 1. After reading through this unit you must be able to: • Understand the concept and principles of programme planning •

Know the role of group worker in programme planning •

Picture the dimensions

of programme planning process.

85%	MATCHING BLOCK 373/546	W
<p>Introduction Careful planning is necessary for any successful group and it is very important, ongoing group process. A well planned programme gives direction to the group and enables each member to know and prepare his / her responsibility. The group worker should posse's abilities and skills to guide members through an effective programme planning process. The programme planning process includes (i) setting goals, (ii) brain storming with members, (iii) planning the programme in line with the goals, (iv) obtaining the approval of the group, (v) assigning individual and sub-group responsibilities, (vi) implementation of the programme, (vi) periodic evaluation and feedback</p>		

and (vii) follow up(
Nalini, n.d.). 10.2 Concept

90%	MATCHING BLOCK 375/546	SA	MSWS-13 Social Work practice with groups.docx (D117055454)
<p>Planned activities play an important role in social group work practice. These planned activities are the programmes which are organised for many processes. These includes attaining improvement in members' own environmental conditions, promoting a sense of achievement, sublimating and canalizing certain impulses, actualizing problems in an on-going social situation and working through or articulating symbolically problems and feelings which members are unable to express verbally. Programme is a concept which, when broadly conceived, includes the entire range of activities, relationship, interaction and</p>			

experiences – individuals and group which have been deliberately planned and

97%	MATCHING BLOCK 374/546	W
<p>carried out with the help of the worker to meet the needs of the individuals and the group(Rengasamy, n.d.). Social group worker</p>		

translates his knowledge into practice with group through the use of programme as a tool in group relationships. The group worker is not there to "put on a programme" or to "put over a programme" but rather to help the group members develop their own program. There may be many situations in which "putting on" or putting over programme in entirely legitimate but such situation should not be considered as social group work. Because of our belief that persons are much more important than programme and because of our further belief that the process of programme development is of the utmost importance.

NSOU ? PGSW-III 183 10.3 The nature and purpose of programme Simply stated, programme in social group work has come to mean anything and everything that the group does to satisfy its interests. At one time there was a tendency to think of programme as being synonymous with activities or events. The

<p>Programme is thus a process rather than the periodic culmination of a process. The</p>		

festival that the group members have been working on for many weeks is a part of programme but everything that they have done is getting ready for it should be considered as the programme of that group for that period of time. Figure 2.1: Programme as a process in Group Work kk

NSOU ? PGSW-III 184 As illustrated in Figure 2.1,

100%**MATCHING BLOCK 378/546****W**

any discussion of programme in social group work must take into account such items as content and area, media of expression and methods of conducting it. Programme area or

programme

100%**MATCHING BLOCK 379/546****W**

content refers to a segment of life experience that has general meaning for the individuals at their specific point of development.

For example, a great deal of programme content in social group work centres around the area of recreation and wise use of leisure time. This is an important area for everyone because the way in which we use our leisure is of great social significance today. Media of expression in programme refer to the specific means used by group members to plan and experience programme in the area chosen. Parties, social events, dances are means providing leisure time experiences which are recreational. Informal but planned group discussion is a prominent means of helping groups to think through both social and economic problems. The arts and crafts have tremendous significance in this modern era of machine technology. The drama may be not only a means of having a creative experience but also a way of deepening out knowledge of community health problem. Music too becomes an excellent means of helping a group to experience harmonious relationships with other groups when all the members join in choral or orchestral union. Group workers have long realized the great value of "seeing" and have used outings, trips or excursions to help place their groups in firsthand contact with a new and different situation. The worker helps the group to select the areas of content and the media of expression. Even prior to this he may help the group to develop a functional organisation of their members so that they can make responsible decisions. The discovery of interest and needs is, of course, an early step. Helping the group to modify interest by enlarging them or by deepening the interest is also involved. Much of programme planning is discussion; therefore, the worker frequently has to help the group learn how to talk over the many aspects of a single idea. Groups must be helped to discover and use their own resources and those of the agency and the community. There is a great deal involved in stimulating people to action and in timing the work so that it unfolds at a suitable pace. It is no doubt for easier to "put on" a programme for a group that it is to help that group develop its own programme. The group worker who consciously relates the "what" of programme NSOU ? PGSW-III 185 (content) and the "how" of programme (media) with the "why" of programme (purpose) is obviously involved in a highly skilled job. He must have been appreciation of the backgrounds, points of view and aspirations of the group members and must avoid all tendencies to superimpose his ideas and patterns of programme. The programme development process should be a blossoming of the groups own potentialities. 10.4 Understanding Interests and Needs for Programme Arbitrary division of the following material into discovery of interests and needs, group organisation, and guidance of interaction does not imply that

90%**MATCHING BLOCK 380/546****W**

the programme process is itself segmental. In actual work all these are interrelated and almost indistinguishable.

There is a great deal of difference between interests of group members and needs of group members. An interest is a tendency to concentrate attention on an object, an idea, an activity or a situation. This concentration of attention may be fleeting or it may be of sustained duration. We know that the interests of persons are likely to be broad or narrow according to their social backgrounds. Interests are expressed verbally or overtly and frequently near the surface of our consciousness. Needs, however, are less easy to ascertain. Need in a psychological sense refers to something we desire in the way of a personality characteristic, human experience or relationship with our fellows. All of us have common human needs which must be satisfied in a measure if we are to be happy and effective in our social relationships. The relationship between interests and needs may be very close and thus easy to translate. When a youth group develops to the point at which members express strong interests in activities with members of the opposite sex, this expression of interest actually represents a development need associated with their maturation. Thus, the interests of group members and the needs they represent are constantly being sought by the group worker who utilizes such material as a basis for helping the group to develop a programme. When programme interests begin to emerge from within the group, the worker needs to ask himself certain questions before deciding whether or not he has made

NSOU ? PGSW-III 186 a substantial discovery. Does this interest seem to represent in so far as possible the common interests of the group members? Does it seem to be a good starting point when considered against the background of this group? Is it in keeping with the resources and function of this agency? Does it have some possibility of both individual participation and cooperative group activity? Can the group take some responsibility for implementing it? Another way in which interests may be discovered in early meetings with the group is the liberal use of questions. Through friendly inquiry the worker is often able to locate beginning points for programme. Questions may be of an "exploratory" nature, such as "what are some of the fun things that groups like ours do around here? Or questions may be of the "challenge or stimulation" type, such as "How about all of us trying to think up the most exciting thing we could do next week". Then, too, there are "opinion" questions, such as "what would you think of this as an idea?" Workers also ask "data" questions, such as "How many of you have ever played this game?" "Choice or decision" questions on the order of "Now let's see if we can choose among all these possibilities?" Should be used after the group has had time for careful discussion. The job of interest discovery and the relating of interests to needs does not cease with the worker's early contacts with the group. In a sense, programme development is continuous and finding the beginning level is only one part of it. The worker has a function at the point of helping the group to enjoy a progressive series of programme experiences which tend to parallel the group's development. The expansion of interests and the deepening of individual awareness is largely a matter of continuous interpretation and evaluation of programme as they are carried on. In all this the group worker is an active participant who accepts his responsibility to help the group toward self-discovery. His role shifts as the group changes and his duties depend upon the kind of response he is able to foster among the members of the group. A maximum of flexibility and a keen alertness to moment at which the group is ready to act, play a prominent part in the successful discovery of interests and their transaction into needs.

NSOU ? PGSW-III 187 10.5 Role of group worker in programme planning Wilson and Ryland have narrated the following role of the

95%

MATCHING BLOCK 392/546

SA

BSWS-22- ENGLISH 3.4.22.docx (D132411911)

group worker in programme planning: 1. Helping the members plan the programme:

The social group worker helps the group members to plan their own programme. He enables them to engage constructively in the programme planning process. He does this by the following ways. a. Observation, Listening and Action: The social group worker observes the actions and words of the members as they make use of programme media, reveal their needs and interests. He is sensitive not only to the actual words but to the way in which they are spoken. The worker picks up conversations in the midst of activities and helps the members to verbalize their troubled thoughts. b. Analysing and Recording: The worker makes on the spot analyse which changes his procedure with the group. Through the records, he remembers and sees the events of the meeting and the members' reactions in a little different light and finds new leads for the programme related to the needs of the members and the group as a whole. c. Visiting and Counselling: By another way, the worker discovers needs and interests through his contacts with the family, the school and the community resources. He counsels them to plan the activities according to their needs. d. Teaching and Leading: Sometimes the worker leads the activities when it is urgently needed in such a way that members enjoy participating in them. The worker keeps his focus both on the group experience and on the members. He is a catalytic agent between people, programme, ideas, materials and the facilities. 2. Discovering and Arousing Interests: a. Assumed Interests: Because of his general knowledge of the growth and developmental needs of individuals at various age levels, the worker can

NSOU ? PGSW-III 188 assume that a group composed of members having the ordinary development for a certain age will have certain interests. b. Expressed interests: Various devices are used to express their interests. It is worker's responsibility to see what needs lie behind the expressed interests. c. Implied interests: Many interests are implied rather than expressed directly in words. Group worker analyse these interests and brings them on conscious level of the group. 3. Using the Environment: The worker makes extensive use of the environment to stimulate new programme activities. He uses agency's facilities such as gymnasium, swimming pool, game room, record player, library, kitchen, craft, shop etc., to enrich the activities. 4. Using Limitations: Social group worker imposes limitations on the activities on basis of available materials, rules and procedures, resources and facilities. He also limits the activities within the realm of the possibility of successful accomplishment. 10.6 Principles of programme planning In order to achieve the objectives of the group, a number of important principles of programme planning have been identified(Program Planning in Social Group Work, n.d.). Let us take a look at some of these principles: 1. Participation in Activities Depends on Rewards: For the members to remain involved and interested over long period of time, they must received satisfactory rewards. 2. Group Work and Employing Energy of Felt Needs: The only matters on which group members will expend energy are these which they feel are problems, things about which they have feeling which they must deal with. Therefore, the survey of problems suggested by members is the starting point of the group activities. 3. Leadership is by Team: Leadership is an important factor in group activities. This should be within the group. This kind of leadership encourages free expression of feeling and opinions and guides the group into action.

NSOU ? PGSW-III 189 4. Membership should be based on willingness to work and not Ideology: The basis of participation in group activities should be on willingness to work in group. As long as there is willingness to work on problems, ideological differences can be settled or avoided. 5. Activities should be Problem Centred: Members of the group must know that what they are organizing and doing that is for their welfare and for the solution of the problem. 6. Group members should plan their programme. 7. All decisions are subject to revision as a result of taking action: If the decisions are not suited for action, the process of changing decisions plays an important and cohesive role in group work programming. 8. There should be definite rules and regulations of group activities. 9. Group should be formed on the basis of socio-metric measures on mutuality of interests and needs of the individual. 10.7 Group organisation as a part of programme planning Every group that aspires to

100%

W

ways of assigning or delegating responsibility, ways of getting the whole group to participate in the planning, carrying out and evaluation of the activities that make up the programme and ways of handling routine relationships with the agency and other groups.

It is a part of the group

72%

MATCHING BLOCK 386/546

W

worker's job to help groups create the type of functional organization that will make possible the sort of programme the group wishes to conduct (

Sehgal, n.d.). The important thing about organization is its meaning and vitality rather than its form. The group worker does not "organize" the group. Rather, he works with the group at the point of creating a form of organization that will best serve its purpose. NSOU ? PGSW-III 190 In general the details of functional organization of the group should take shape as a natural process, as needs arise, rather than be superimposed by workers or agencies. It is very easy to over organize a group on the theory that "everybody should have a job to do". Unfortunately it is very unfair and even harmful to pretend that people have a job to do when in reality no such job exists. Often workers and groups get satisfaction out of creating complex organizational super structures, only to find that all their time goes into "keeping up the organization" and that there is no time or energy left for the real purpose of the group. A basic dictum would seem to be: keep the form of the organization as simple as possible. The worker has a great deal to do in pointing up what is involved in programme decisions. When he asks, who is going to do the work? Or what jobs are involved here? He is helping the group to accept the fact that programme do not "just happen" but always require people who will take responsibility. In this connection there should be a clear understanding of duties and responsibilities and decision of the time when the job is to be done. It is better to devote time and energy to careful planning than to endless checking up later because of initial misunderstanding. Furthermore, there is a great deal of skill required from the workers in helping officers, committee chairmen and others learn how to do their jobs and to do them in concert with the others. The group worker must learn how to point out things without taking over and must know how to coordinate the separate efforts of a great number of different people, all of whom bear some of the load for the group deal easier for the worker to do it himself, but in so doing he defeats the purpose of group work, which is to get people opportunities to do for themselves and their group. 10.8 Guided Interaction—the heart of the programme planning The social group workers' primary job in programme development is to guide the processes of interaction among group members. Social group work utilizes the interaction of members around programme in an agency setting with worker guidance(Verma, n.d.). It is believed that this group work process results in the

NSOU ? PGSW-III 191 movement of individuals and groups toward objectives that are mutually compatible with the function of the agency. Interaction is illustrated in figure 2.2 Interaction refers to participating behaviour of a reciprocal kind. It is the give- and-take of individuals who act and react. This “giving to and taking from” is really a single process which takes place within the group. The worker is responsible both for stimulating the “to and from” and for helping participation become channelled or focused on the goal to be attained. Interaction itself is not an end but rather a mean to the goal of the group. It tends to take two forms: acts of initiation and response to the initiatory acts. When they seek knowledge, when they volunteers to take responsibility, they are interacting with their group members. Consequently, workers should be alert to the origin of ideas and then make certain that the group has a chance to respond fully. Responses may be positive, negative or neutral. The response of one member may be to accept it with slight modifications: this act then results in a new cycle of consideration. It has been well stated that interaction is not a matter of arithmetic or addition of responses but rather an interweaving or interpretation of responses. Interaction is a matter of degree rather than of type. In some situations, especially in cases in which the group is secure and morale is high, group members work together with surprising speed and thoroughness. Almost everyone participates and has a chance to express himself, and the product of the interaction is substantially a group product. With other groups the reverse is true and the worker has to back up and begin almost at the beginning again. Clearly, the kinds of relationships that exist

100%

MATCHING BLOCK 387/546

W

among the members and between the members and the worker

determine the degree of interaction that will obtain. Until the individuals actually become a group and can communicate with each other, the degree and duration of purposeful interaction will be less than at a later time. Beginning level programme with newly formed groups should concentrate on things that will help such groups to develop a consciousness of one another, a consciousness of being group. Understanding the Dimensions of Interaction: After working with groups for a period of time, the group worker becomes aware that the process of interaction has many dimensions. He begins to watch for certain things to happen and in so doing he understands more fully the meaning of the

NSOU ? PGSW-III 192 behaviour being displayed. Some of the important dimensions of interaction that the worker should have in mind are: 1. Distribution – is participating – should be studied. After a few meetings the worker can recall who is participating and who is not and will become aware of the demanding member and of the members who does not participate at all. 2. Frequency – how often and how many time the member participates – can be observed. Some members soon to be involved in everything that is going on, and others participate less frequently. 3. Duration – how long participation lasts – is considered. Here the workers will not that some members seem to be actively involved throughout most of the meeting while others enter in only now and then and briefly. 4. Order of participation is important to understand. Some members always speak first and others wait a while. Member A may not participate until member B has had his say. Member C may always enter in after the worker has made a comment. Member D may watch for opportunities to insert his specific feelings. 5. Direction of the interaction should be noted. Usually then are two broad categories of direction: toward persons and toward objects. Sometimes the worker will observe that a member always responds to the worker. Sometimes the interaction is directed toward the task at hand and other times it is off the track and seemingly out of focus. 6. Content of the interaction is usually both programme – and personality – centered. Group members may be talking about a forthcoming programme event and simultaneously reveal their preferences for certain persons to be in charge of certain parts of it. 7. Meaning of the interaction is evaluated by the worker, who endeavours to assess the positive and the negative aspects of member responses. Five factors, taken together, influence the interactional capacity of the group: the relationships between group members, the relationship between the worker and the group, the conscious bond of need and interest which holds the group together, the goals for which they work, and the social situation in which they find themselves. As

NSOU ? PGSW-III 193 he gives guidance to group interaction in relation to the programme development process, the group worker is demonstrating the group work process. The group work process is in operation when the group worker consciously guides and utilizes the interaction among group members for individual and group development. It is important to emphasize the fact the in the group work process the worker participates actively in directing the interaction of members so that the experience will meet their needs as individuals and at the same time assist the group to move toward some satisfying group achievement which is mutually determined. 10.9 Programme planning with Large Group The worker can also help the large group divide its members into a number of subgroups of either short-term or long-term duration. The process of planning group programme can be participated in by a large number of members on different occasions. The use of a steering committee or planning or executive committee will enable certain members of the group to take responsibility for the whole group. If there is sufficient rotation of responsibility in jobs of this kind over a period of time, a large number of persons can have experience in doing something for the group. The planned subdivision of a large group engaged in programme activity can amount to the creation of a number of small groups and can help individuals become a part of the small group during the specific event or session. In addition, the group worker has an opportunity to refer individuals from large groups to small groups, and often the large group provides a way for an individual to get started in an agency programme. Alertness on the part of the group worker will frequently result in his locating of individuals who need special help. This may require a specialized interest and a specialized focus, so that the individual can be helped to relate to another resource. Let us bear in mind that group workers should endeavour to use as much of their group work knowledge and skill as possible in all group situations small or large. Programme development is a continuous process that calls for the involvement of as many group members as possible.

NSOU ? PGSW-III 194 Guidance of interaction—the Focus of the Programme Process Figure 2.2

NSOU ? PGSW-III 195 10.10

97%**MATCHING BLOCK 388/546****W**

Factors influencing programme planning All initiatives and efforts of the group in pursuit of fulfilling its goal is considered to be a programme in the social group work context. Though one tends to equate programme with activity, let us be clear that programme is a concept that comprises of not only activities but also emotional aspects such as group bonding, communications

and

88%**MATCHING BLOCK 389/546****W**

experiences etc. One important aspect is that all these should result out of conscious planning by the group under the guidance of the worker. Programme is thus a process rather than the periodic culmination of a process. In the light of the above, let us discuss the factors influencing programme planning ("SOCIAL WORK INTERVENTION IN CORRECTIONAL SETTINGS," n.d.): The primary responsibility for programmes in groups' lives with its group members – the group worker is only a facilitator in the entire process. The programmes have to be person-centered, catering to the requirements of its members. The group members, therefore, have to engage themselves to their best possible extent in programme planning, fully understanding that its successful implementation calls for their cooperation and contribution"

SOCIAL WORK INTERVENTION IN CORRECTIONAL SETTINGS," n.d.).

96%**MATCHING BLOCK 390/546****W**

If a programme has to be person-centered, it has to respond to the wants and welfare of the group members. The group worker has to make the group understand that (i) there is a vast distinction between the wants of the group members and their welfare; (ii) this can be gathered when group members put across their views during programme sessions. However, when group starts spelling out ideas for the programme, the worker needs to carefully evaluate them on the basis of collective interests, firm foundation, feasibility in terms of resources and agency's objectives, feasibility of personal partaking of members and also of group's cooperation. It is of equal importance that the worker consistently taps the wants and welfare of the group from its members. Gathering this vital information is not a onetime affair to be done in the initial stages of the programme, but has to flow at periodic intervals to ensure that the programme is on the right path. The worker has to understand and also convey to the group members that programme planning is an NSOU ? PGSW-III 196 ongoing process – that as the programme evolves in sequence, one could comprehend the group's progress as well. Any discussion of programme in social group work must take into account such times as content and area, media of expression, and methods of conducting it. Programme area or content refers to a segment of life experience that has general meaning for the individuals at their specific point of development. The programme process is not segmental; in actual work all these are interrelated and almost indistinguishable.

99%**MATCHING BLOCK 391/546****W**

The group worker enables the group to understand their role in programme planning and implementation – that programmes are successful largely due to the members' willingness to share responsibilities. During the planning stages, the group members should clearly assign and accept duties and responsibilities – individually, in pairs or through forming smaller committees within the group. The group worker assists the members in functioning in unity towards executing the programme. Healthy, purposeful and friendly communication among group members is the essence of programme planning and development. The group worker's role here is imperative. He steers the group members to meaningful communication which in turn leads to the group working towards aims that reciprocate with the agency's functioning. Thus communication is a fundamental mode on the road to the group's goals. Thus, the programme planning process is influenced by various factors such as: (i) consistent unearthing of the wants and welfare of members, (ii) identification of the point

where in

96%**MATCHING BLOCK 397/546****SA** BSW-22- ENGLISH 3.4.22.docx (D132411911)

the programme shall commence, (iii) studying and scrutinizing work responsibilities involved in programme execution, (iv) delegating duties and responsibilities to various members, (v) synchronization of individual efforts and striving for harmony among the group members and programme evaluation. 10.11 Criteria of

effective process and programme The group work process is operating at its best when the agency, the worker, and the group provide an environmental setting in which the full interplay of

NSOU ? PGSW-III 197 personalities upon one another is not only permitted but definitely encouraged; help individuals to participate in the discussion of goals, the formulation of plans and the carrying out of programme activities; emphasize cooperative, joint activity, in which working together serves to integrate individual, group and agency in a mutually satisfying effort; work for a system of group organization and social control that makes it possible for the individual to function as an individual but at the same time allows him to choose to act collectively with others in socially valid ways. The programme in social group work must meet the following criteria of effectiveness (Jose & Nair, n.d.): •

96%

MATCHING BLOCK 393/546

W

Programme should grow out of the needs and interests of the individuals who compose the group. • Programme should take into account such factors as age of group members, cultural background and economic difference. • Programme should provide individuals with experiences and opportunities which they voluntarily choose to pursue because of their inherent values. • Programme should be flexible and varied to satisfy a variety of needs interests and to afford a maximum number of opportunities for participation. • Programme should evolve from the simple to more complexes with movement coming as a result of group growth in ability and readiness. Movement from initially "personal" to "social" or "community" concerns should be an ultimate objective if our programmes are to have a greater social significance. 10.12

Dimensions of programme planning

process The programme planning process has three dimensions namely: • Programme Formulation • Programme Implementation • Programme Evaluation

NSOU ? PGSW-III 198 Programme Formulation: Programme formulation becomes a large and complex task after a positive decision has been taken on a programme idea. The nine steps are required for programme formulation (see chart). In step 1 'Preparation of Programme Formulation', the group formulate the programme. A term of reference including time dimension, expected results, resource and problems is decided. The group obtain the necessary data required for the concerned programme. In step 2: 'Analysis of Group Situation' a clear picture of the group's environment is carried out, i.e., description of the group, their decision making process, past experiences relating to the success or failure of the programme, need to current or future levels of the resources for the programme etc. In step 3: 'Analysing the socio-economic and Demographic Situation' the present and future analysis is done of the socio-economic situation, and the demographic situation. In step 4: 'Analysis and Projection of the Problems' groups define the problems and projection of the future situation which is worked out on the assumption that existing trends continue without change in the relevant system and their policies. In step 5: 'Getting the objectives and targets' entails a statement of the problem – reduction to be achieved through the programme and translating them into the kind and magnitude of services. In step 6: 'Identification of Potential Obstacles' an attempt is made to predict the potential obstacles that might stand in the way of reaching the operational targets. In step 7: 'Design of Strategies' the key sub-steps involved are the establishment of explicit criteria for strategy design, the selection of flexible strategies, the assessment of their implications in costs and requirements, and their revision of the targets and strategies under consideration in the light of the assessment. In step 8: 'Planning the Programme' the group decides design for efficient performance. The thinking of the group shifts here from 'what is to be developed' to 'how is it to be developed'. In step 9: In the final step a 'Writing Programme Proposal' the products of earlier steps are re-examined, synthesized and documented in the form of a programme proposal.

NSOU ? PGSW-III 199 Steps in programme formulation Figure 2.3 Programme Implementation: Proper implementation of the programme is vital and a great attention and energy are required to ensure this. This purpose of implementation is to ensure that the programme activities have been completed on schedule and within budget, and that there are favourable conditions to maintain the desired changes generated by the programme after the programme as such is terminated. The stages of implementation have been discussed below: Initiating the programme : Obtaining approval for the programme proposal, preparing the interim budget. Specifying and scheduling : Projecting the details of work and deciding what the work tasks are to be done by whom and when.

NSOU ? PGSW-III 200 Clarifying Authority. : Obtaining agreement as to who is responsible for Responsibility and ensuring that the work gets done, distributing Relationships decision-making authority among the group members and establishing formal lines of communication. Establishing the control : Determining what information is necessary for system programme control, identifying sources of such information and setting up reporting system for the programme. Directing and controlling : Motivating group members, executing programme activities, obtaining information for control and take corrective action as necessary. Terminating the programme : Preparing the final report, handing over responsibilities to the group members. Programme Evaluation: All development programmes undertaken need to be evaluated for the results they have achieved or failed to achieve. Careful evaluation is the backbone of all programmes. On

86%

MATCHING BLOCK 394/546

W

evaluating the services provided by a group, there are two dimensions of evaluation – process evaluation and outcome evaluation. I. Process Evaluation: Process evaluation is an assessment, generally by group members, as to the aspects of the group that were useful or detrimental. Feed back about techniques and incidents that blocked or enhanced

process

100%

MATCHING BLOCK 395/546

W

is of immense value to the group leader. With this information, the leader can hone certain skills, eliminate some materials

100%

MATCHING BLOCK 396/546

W

and give direction for approaches and materials to add. Such feedback can aid confidence.

100%

MATCHING BLOCK 398/546

W

Process evaluation can be conducted orally by asking the group members to discuss the aspects, techniques, materials and incidents that were constructive and those that were counterproductive. An advantage of such an oral evaluation is that most members enjoy a verbal discussion.

92%

MATCHING BLOCK 399/546

W

Process evaluation can also be accomplished by a brief questionnaire. There key questions follow: 1. Summarize the strengths of this group. 2.

Summarize the shortcomings of this group. 3. Briefly outline your specific suggestions for change.

NSOU ? PGSW-III 201

91%

MATCHING BLOCK 400/546

W

Another way of evaluating process is by peer review, a form of quality control. Peer review is conducted by having one or more "peers" periodically sit in on a group.

A peer review is a review of a small portion of the total functioning of the

93%

MATCHING BLOCK 401/546

W

group. II. Outcome Evaluation: Outcome evaluation involves assessing the extent to which the goals have been accomplished that was formulated when the group began. Specific approaches to measure goal attainment are single-subject design, task achievement scaling and satisfaction questionnaire. Single-Subject Design:

96%

MATCHING BLOCK 402/546

W

The first step in single-subject design is to specify the outcome of interest. The selected outcome should reflect the needs of the member and what is realistic to achieve. It also must be an outcome that can be defined specifically and measured.

100%

MATCHING BLOCK 403/546

W

The second step in the design process is to select a suitable measure.

There are a variety of ways for measuring

100%

MATCHING BLOCK 404/546

W

client outcomes, including direct observation, self-reports from the client and standardized measures. Standardized measures include tests, questionnaires, rating scales, inventories and checklists.

A variety of

92%

MATCHING BLOCK 405/546

W

standardized measures have been developed to measure variables such as self-esteem, level of assertiveness, level of depression, anxiety level, degree of marital satisfaction, burnout, amount of stress, potential for suicide and generalized contentment. The third step is to record baseline data. Base lining involves collecting data for a period of time before implementing the intervention. The objective of

base-lining

100%

MATCHING BLOCK 406/546

W

is to establish the base rate of the outcome measure before intervention occurs. This

base-lining

92%

MATCHING BLOCK 407/546

W

rate can then be used to provide a basis of comparison for the occurrence of the target behaviour (behaviour to be changed) before, during and after intervention. The fourth step is to implement intervention and monitor the outcomes.

The fifth step is to assess change. This step involves a comparison of the occurrence of the target behaviour before, during and after treatment.

100%

MATCHING BLOCK 408/546

W

The sixth step in the process is to infer effectiveness. This step involves demonstrating logically and empirically that the intervention is the only reasonable explanation for the observed change in client outcome.

NSOU ? PGSW-III 202

100%

MATCHING BLOCK 409/546

W

Task Achievement Scaling: The objective of this approach is to gauge the degree to which group members and / or the leader have completed agreed upon intervention tasks. In this approach, the work toward the goals of the members and of the group is broken down into many separate actions or tasks. The tasks are selected by mutual agreement

for

100%

MATCHING BLOCK 410/546

W

the members, and each member is assigned or selects specific tasks to reach his or her goal and the overall goal of the group. Usually, a deadline is set for the completion of each task. Task Achievement Scaling refers to a procedure for rating the degree to which each agreed-upon task has, in fact, been achieved.

Satisfaction

100%

MATCHING BLOCK 411/546

W

Questionnaire: Still another way to assess the outcome of a group is to have group members fill out a questionnaire that measures level of satisfaction.

95%

MATCHING BLOCK 412/546

W

Such a questionnaire is a relatively simple and inexpensive way to measure the members' satisfaction level with the group. The questionnaire can be filled out at the last meeting of the group or can be mailed to members sometime after the last meeting.

Group Exercise: Exercise A: Evaluating and Ending the Programme. Goal: To bring closure a group. Note: The group worker of the group should lead this exercise. Step 1: The group worker begins by expressing a number of positive thoughts and feelings that she or he has about the group. The group worker may also mention a few memorable experiences. Step 2: The group worker sits in a circle and the worker asks: "Is there anything that anyone wants to express before the programme ends? "Is there any unfinished work that we should deal with?" Step 3: The worker leads a discussion in which the group reflects upon the programme through questions such as: "Do you believe this programme has helped prepare you to lead groups in social work?" "What else might have been done to better prepare you to lead groups?" "What exercises or materials have helped you grow as a person?" "What do you see as the shortcoming of this programme?" "How might this programme be improved?"

Sept 4:

100%**MATCHING BLOCK 420/546****W**

The members express what they will most remember about this course and / or what they feel they have learned. Each member should be given an opportunity to express this.

NSOU ? PGSW-III 205 Sept 5:

89%**MATCHING BLOCK 421/546****W**

Each member expresses nonverbally how she or he felt about being in this class at the first session and how she or he now feels about having been in the group. Step 6: The worker asks each member to give an imaginary gift to the person on his or her right. Each person should take a turn so everyone can hear what the gifts are. When giving or receiving the gift the member extend their hands to symbolize the giving or receiving of the gift. Example of such gifts are the time-management key to ending procrastination, a warm sun for a smiling personality, a heart for happier relationships, positive and rational thinking for handling unwanted emotions, and the gift of meditation for reducing stress. Step 7:

The worker may end the programme / meeting,

by administering a member programme evaluation, by saying some final words, or in some other appropriate way. 10.13

Importance of programme planning The main advantages of programme planning are as follows: 1. Planning increases the efficiency of a group. 2. It reduces the risks involved in activities. 3. It facilitates proper coordination within the group. 4. It aids in organizing all available resources. 5. It gives right direction to the programme. 6. It is important to maintain good control. 7. It helps to achieve the objectives of the group. 8. It motivates the group member of a group. 9. It encourages workers' creativity and innovation. 10. It also helps in decision making. Why programme planning is important? Now let's understand why planning is important for the programme:

1. Increase efficiency: Programme planning makes optimum utilization of all available resources. It helps to reduce the wastage of valuable resources and

NSOU ? PGSW-III 206 avoids their duplication. It aims to give the highest returns at the lowest possible cost. It thus increases the overall efficiency. 2. Reduces program related risks: There are many risks involved in any modern activities. Planning helps to forecast these programme-related risks. It also helps to take the necessary precautions to avoid these risks and prepare for future uncertainties in advance. Thus, it reduces programme-related risks. 3. Facilitates proper coordination: Often, the plans of all of the groups of an organisation are well coordinated with each other. Similarly, the short-term, medium-term and long-term plans of a group are also coordinated with other groups. Such proper coordination is possible only because of efficient planning. 4. Aids in organizing:

Organizing means to bring together all available resources. Without planning organizing is not possible. It is so, since, planning tells us the number of resources required and when are they needed. It means that planning aids in organizing in an efficient way. 5. Gives right direction: Direction means to give proper information, accurate instructions and useful guidance to the group members. It is impossible without planning. 6. Keeps good control: With control, the actual performance of a group member is compared with the plans, and deviations (if any) are found out and corrected. It is impossible to achieve such control without the right planning (programme). Therefore, programme planning becomes necessary to keep and control. 7. Helps to achieve objectives: Every group has certain objectives or targets. It keeps working hard to fulfil these goals. Planning helps a group to achieve these aims, but with some ease and promptness. Planning also helps an organization to avoid doing some random (done by chance) activities. 8. Motivates group members: A good plan provides various financial and non-financial incentives to both worker and group members. These incentives motivate them to work hard and achieve the objectives of the group. Thus, planning through various incentives helps to motivate the group members of a group.

NSOU ? PGSW-III 207 9. Encourages creativity and innovation: Planning helps to express the creativity and innovation of the group members. It brings satisfaction to the worker and eventually a success to the group. 10. Helps in decision-making: A worker makes many different plans. Then the worker selects or chooses the best of all available strategies. Making a selection or choosing something means to take a decision. So, decision-making is facilitated by planning. Therefore, programme planning is necessary for effective and efficient functioning of every group irrespective of its size, type and objectives. 10.14 Conclusion Planning can be defined as "thinking in advance what is to be done, when it is to be done, how it is to be done and by whom it should be done". In simple words we can say, planning bridges the gap between where we are standing today and where we want to reach. By "programme" we generally think of the activities to be performed by agency to satisfy its needs and interests. But modern concept of programme in social group work has come to mean everything that the group does to satisfy its interest. It includes the entire range of activities, relationships, interactions and experiences of individuals and group. The group's programme is the framework within which group experiences occurs. It is

deliberately planned and

Work with Families A family is one category out of a number of categories of small groups.

93%

MATCHING BLOCK 435/546

W

The focus of group work services is often the family, an interacting, interdependent system. The problems faced by people are usually influenced by the dynamics within the family and dynamics within the family are in turn, influenced by the wider social and cultural environment. Because a family is an interacting system, change in any member will affect all others. Tensions between a husband and wife, for example, will be felt by their children who may then respond with disturbed behaviour. Treating the children's behaviour alone will not get to the root of the family problem. Another reason for the focus on the family rather than the individual is that other family members are often needed in the treatment process. They can help identify family patterns. In addition, the whole family, once members perceive the relationships among their various behaviours can form a powerful team in

re-establishing

88%

MATCHING BLOCK 436/546

W

healthier patterns. For example, family members can pressure their alcoholic mother to acknowledge her problem. They may provide important emotional support for her efforts to stop drinking. They may also need counselling themselves to assist in coping with them when she is drinking.

96%

MATCHING BLOCK 438/546

W

Family problems and the nature of social work: An infinite number of problems occur in families.

91%**MATCHING BLOCK 439/546****W**

When problems arise in a family, social services are often needed. The types and forms of services that group workers provide to trouble families are extremely varied. We can group them into two major categories: in-home services and out-of-home services. In-home services are preventive. Although not all are offered literally within the home itself, they are specifically designed to help families stay together. They include financial aid; protective services (services to safeguard children or frail older adults from abuse and neglect); family preservation services (intensive crises intervention within the home setting where children are so seriously at risk that removal to foster care would otherwise be required); family therapy (intensive counselling to improve family relationships); day care (Caretaking services for children or older adults to provide respite for caregivers who might otherwise be overwhelmed our to permit them to work outside the home); home-maker services; and family life education (classes, often offered at traditional family service agencies, that cover such topics as child development, parenting skills, communication issues etc.). Obviously, not all of these services can be provided by group workers, but workers must know where to find them and how to help the family obtain them when needed. Out-of-home services, on the other hand, are those services that must be operationalized when the family can no longer remain intact. They are a manifesta- tion that sometimes has gone seriously wrong, since the breakup of any family amounts to a tragedy that will have ramifications beyond family boundaries. While family members usually received the blame, the larger system (social environment and the level of support it provides to troubled families) may be called into question. Out-of-home

96%**MATCHING BLOCK 440/546****W**

services include foster care, adoption, group homes, institutional care (for example, residential treatment centres), and the judicial system (which provides a different kind of institutional care, prison or jail for family members who have run into difficulty with the law). To perform these services,

group

100%**MATCHING BLOCK 441/546****W**

workers engage in a variety of roles (for example, broker, educator, advocate, supporter,

75%**MATCHING BLOCK 442/546****W**

and mediator). Family Assessment: The two areas in family social work practice that have received the most attention are family assessment and family therapy. NSOU ? PGSW-III 212 There are a variety of ways to assess

91%**MATCHING BLOCK 443/546****W**

to assess families conducting a social history of a family and its members is a widely need approach. With regard to family assessment, however, two techniques have received considerable discussion in record years: eco-maps and genograms. The Eco-Map: The eco-map is a paper-and-pencil assessment tool used to assess specific troubles and plan interventions for clients. The eco-maps, a drawing of the client family in its social environment, is usually drown jointly by the worker and the client. It helps both parties achieve a holistic or ecological view of the client's family life and the nature of the family's relationships with groups, associations, organisations and other families and individuals. The eco-map has been used in a variety of situations including marriage and family counselling and adoption and foster-care home studies. It has also been used to supplement traditional social histories and case records. The eco-map is a shorthand method

of

88%**MATCHING BLOCK 444/546****W**

recording basic special information. The technique helps clients and workers gain insight into the client's problems by providing a "snapshot view" of important interactions at a particular point in time. Ann Hartman is the primary developer of

93%**MATCHING BLOCK 445/546****W**

the tool. The Genogram: The genogram is a graphic way of investigating the origin of a client's or client family's presenting problem by diagramming the family over at least three generations. The client and worker usually jointly construct the family genogram, which is essentially a

94%

MATCHING BLOCK 446/546

W

family tree. Bowen is the primary developer of this technique. The genogram helps the worker and family members examine problematic emotional and behavioural patterns in an intergenerational context. Patterns tend to repeat themselves, what happens in one generation often occurs in the next. Genograms help family members identify and understand family relationship patterns.

100%

MATCHING BLOCK 447/546

W

Family Therapy: One of the many social services provided to families is family therapy (also called family counselling). Strictly speaking, family therapy

92%

MATCHING BLOCK 448/546

W

is a subset of the broader classification of group therapy that is aimed at helping families with whatever interactional, behavioural and emotional problems arise in the course of everyday living. Problems include marital conflicts, parent-child interactional problems and

NSOU ? PGSW-III 213

81%

MATCHING BLOCK 449/546

W

conflicts with grand-parents or other relatives. A wide variety of problems are dealt within family therapy: domestic violence, communication problems, disagreements between family members on drug use and abuse, school performance, money management, sexual values and behaviour, performance of domestic tasks and methods of disciplining the children. 11.2.2

Group Work and Child Welfare The social environment of children like the family, school, peer groups and neighbourhood environment, play a vital part in their overall development. The impact of these social units on children can be both positive and negative. Poor and broken families and deprived neighbourhoods are known for their inability to ensure adequate development inputs for children. The deprived neighbourhoods expose children to a number of stressful situations, which could be very harmful for them. Extreme poverty, broken families leading to poor parenting, family violence, alcoholism and tobacco use at early age leading to health problems, lack of education, and physical and sexual abuse are fairly common problems in such neighbourhoods. The lack of proper guidance and caring are identified as causes of their coming in conflict with law such children constitute a sizeable number in developing countries including India. Even in affluent families children may need capacity building in many life skill area such as accepting diversity, exercising self control and handling conflicts. Group Work can be used for providing timely help to such children in India and other developing countries. Group Work objectives in child welfare agencies are (Varghese, n.d.): 1.

85%

MATCHING BLOCK 450/546

Group Work with parents of mentally challenged children NGOs work with spastics children organizes support group for the parents of the children of mentally challenged. The parents of these children need treatment as much as the children do. Newly enrolled parents are encouraged to join existing groups. These groups are meant for sharing and learning session. Parents are often denial about the condition of their children. They cannot see why this should happen to them and their children. Parents are depressed and anxious about the future of the children. They do not know how to react when their children are unable perform the actions that other children are able to do. Answers to most of the problems are found in the group – shared knowledge and from the experiences of other parents. The group facilitates the process of universalization of experience and the installation of hope (

Varghese, n.d.). Exercise-I (1)

Elderly

73%

MATCHING BLOCK 458/546

W

persons suffer from a number of mental and physical ailments. More importantly, their social situation and their somatic condition affect their physical condition. They need special care and attention. The major characteristics of elderly people are(Varghese, n.d.) – 1. Intense loneliness and social isolation, poverty, feeling of rejection, struggle to find meaning in life, dependency, feeling of uselessness, hopelessness and despair, fear of death and dying, grief over other people's death. 2.

Short attention span(Varghese, n.d.) 3. Poor reality orientation 4. Need for support 5. Greater need for being listened to and understood. Group work activities with elderly are being undertaken by many organisations working with them. Support Group: Support groups for elderly persons are helpful in dealing with depression which is normal in old age. Loss of active life, and reduction in income,

NSOU ? PGSW-III 216 power and physical health, induces a sense of loneliness and depression. Support groups help in overcoming these feelings and sharing in groups help, to reduce tension as well. Recreational Groups: In day care centres of elderly people, recreation groups can be organized for recreational activities. These groups can act as a support groups. Health Groups: These groups can be used to provide information and bring attitudinal changes relating to health among the elderly in India. The old age day care centres that are being run by NGOs in some cities are places where group for the elderly can be formed for the above objectives. Forming a group of elderly is comparatively easier, as they are keen to participate in any activity where they can spend some time in a meaningful way. The participation in group activity gives them a sense of purpose to use their energies creatively. They feel welcome and if the group environment is healthy and creative they can do a lot of things that will meet their own needs and are helpful to others in the community. 11.2.6 Group

Work in Psychiatric Setting Group Work is an important component in the treatment and care of mentally ill people. It is being increasingly used in mental health setting in India. The incidence of mental illness is high in India. A trend in the care of mentally ill which is influencing the practice of group work

in de-

100%

MATCHING BLOCK 460/546

W

institutionalization increasing numbers of mentally ill people were being taken care in the families and in their homes rather than being confined to the hospital(

Varghese, n.d.). The goals of group work in psychiatric settings are(Varghese, n.d.): 1.

84%

MATCHING BLOCK 461/546

W

to socialize including forming satisfying social relations, establishing an awareness of others, learning and re-learning social skills. 2. to offer ego supports and develop ego strengths as well as broadening interest and scope of activities, building self confidence, self-esteem, self- worth, achieving tangible things, acceptance. 3. to test and see cause-and-effect relationship. 4. to increase responsibility, develop good judgements and self control and handle group living problems. 5. to influence one another in a positive way, develop better morale and challenge group hostility. NSOU ? PGSW-III 217 6. to adjust to a new mode of living and interrupt the deterioration process and counteract the regression of institutional living. 7. to

promote insights, develop the proper perspective on problems and feel- ings, release tensions. 8. to accept one's illness and prepare for

the use the individual and other therapies more positively. Practice principles, which have been found useful in the process, are (Varghese, n.d.): 1. Group

94%

MATCHING BLOCK 462/546

W

sessions with the mentally ill should be highly structured, meaning that the group worker should take control of sessions by planning the activity well. 2. Each group

100%

MATCHING BLOCK 463/546

W

session should be a rewarding one in the sense that the members should derive some pleasure and enjoyment from it. 3.

93%

MATCHING BLOCK 464/546

W

The group workers should also be careful that anxiety producing events and actions should be avoided and be prepared to deal with them. 11.2.7

98%

MATCHING BLOCK 465/546

W

Group Work in Hospitals Hospitals are important settings for social work practice. Psychological factors and physical health are related. Adverse negative factors can worsen the health conditions of the patients.

94%

MATCHING BLOCK 466/546

W

Another important factor is the growing importance of multidisciplinary teams which will address the various dimensions of the illness and its effect of the patient.

Team work,

89%

MATCHING BLOCK 471/546

SA BSW-22- ENGLISH 3.4.22.docx (D132411911)

therefore is an important method of work in health care settings. Thirdly, group work is seen as humanizing the bureaucratic system and giving holistic care for the clients. Lastly, group work is effective in disseminating information to the clients. Following groups are used in the hospitals(Varghese, n.d.): 1. Educational Groups: Educational groups disseminate information about the disease and its effects on the patients. They educate the person about the causes of diseases, its effects on the body, its pattern of progression and its debilitating effects. 2.

100%

MATCHING BLOCK 468/546

W

Support Groups: These groups provide the necessary social and emotional support to the

patient.

Group work can enable the patients to have appropriate coping

NSOU ? PGSW-III 218 mechanisms keeping in mind the individual's needs and her environment. It will result in better quality of life and better adherence to

86%

MATCHING BLOCK 469/546

W

treatment programme 3. Training groups: Training groups focus on teaching new social skills to the patients which would help them after they are discharged from the hospitals. Practice principles in health settings(Varghese, n.d.): Firstly, Group work in health setting needs to understand that patients suffer from pain and fatigue due to illness and often due to their treatment. She should therefore encourage patients to attend the meetings but not use excessive pressure. Secondly, the group workers should be flexible in her approach to group. The treatment cycle may vary with person to person and therefore the time period of attending the group sessions cannot be specified. Thirdly, individualization of client's is another important aspect, as

clients characteristics

80%

MATCHING BLOCK 470/546

W

will differ in terms of stages of disease, social support available in family, community and work place and the psychological condition. Fear of death, fear of disease recurrence, problems related to treatment (pain, changes in appearance, fatigue), changes in relationship and economic issues (income, future job prospects, costs of treatment) are important concerns that group workers must address. Exercise-II (1)What are the goals of group work in psychiatric settings? 11.2.8

Social Group Work in Correctional Settings Today Group workers are playing prominent role in the field of correctionalist services as it is emphasised by all correction list that punitive philosophy should be replaced by reformatory philosophy, because goodness is said to be the condition of mind as health is the condition of the body and neither the defects of character nor body can be cured by punishment. Crime today is considered as a product of certain forces within the individual and ungenial environmental factors. So to protect the society from crime, criminals must be treated and rehabilitated. Thus correction is the total process of helping persons who have violated the law to be rehabilitated. Correction in one sense plays a very important role in the administration of criminal justice. It is one of the four social processes utilized in the administration of criminal justice. They include -

NSOU ? PGSW-III 219 1. Law enforcement, which is concerned with the collection of evidence about reported offences and with the detection and arrest of suspected offenders. 2. Prosecution and defence or the preparation and presentation of criminal cases before the court. 3. Judicial process, which is concerned with the legal determination of guilt and the assignment of penalties. 4. Correction, which is responsible for administering the assigned penalties. The Group workers plays a very important role in this total process and the tasks in corrections includes four (4) in particular : (a) Investigation for the purpose of securing information about the client's failure or successes in meeting the obligations of his/her legal status. (b) The use of controls to modify client's behaviour. (c) Acting as a legal authority in the client's life with responsibility for value change. (d) Correct decision making in life: These are all important in working with persons in trouble and in particulars in attempting to help them adjust better to society. Functions of group workers: 1. Helping to strengthen motivations: The group worker through talking sym- pathetically and understandingly, can usually make a person to know that someone is interested and will accept him as his is, is a tremendous moti- vating factor. 2. Allowing for ventilation of feelings is a second service of the group worker. Most youths and adults who come to a probation officer need to share with someone in confidence. Their inner feelings, their fears and frustrations, as well as their hopes and aspirations. 3. The giving of information is another important function of the group worker in the field of corrections. Many youths and adults need help in understand- ing who they are, where they are going and where they should go. Many times they do not comprehend the society to which they belong and the social workers can help them to develop and understanding and to acquire insights into their proper roles. NSOU ? PGSW-III 220 4. Social workers helps offenders to make decisions. They do not make the decision for them but help to consider rationally their problems and the alternatives that help them. 5. The group worker helps the client in modification of the environment with knowledge of community resources. The group worker will able to help persons and families to tap various financial and social resources to meet their individual needs. 6. Another major function is in facilitating referral services, often it is difficult for a person to take personal problems to another and he needs support in doing so. Referral may be made to a psychiatrist or any other resource person who may help to a particular situation. The group workers comprehensive knowledge of community resources is used and makes advantage in making referrals. 11.3 Group Work in Educational Settings Schools and colleges provide significant inputs in developing human capital in the society. The level at which a child drops out from the school will determine whether she or he will work with his or her hands or mind, and what social roles and status she or he will be accorded. Many a time neither parents more the teachers are

66%

MATCHING BLOCK 472/546

SA

MSWS-13 Social Work practice with groups.docx (D117055454)

aware of the fact that child is facing stresses in school. Even if they do, they are not proficient in dealing with the problem. The sources of stresses may vary from scholastic difficulties to the problem of maintaining relationship. The organisational dynamics of schools also makes and impact on the social and academic adjustment of children. School polices such as rules for conduct and manner of the rule enforce- ment, number of teachers, their training and educational status, etc., all of these can be potential sources of stresses. Presence of parents and teachers for achieving high standard of academic performance and social behaviour, are the most common sources of

stresses. The stresses, faced by children if left unattended may lead to mental health problems and drop out. Guidance

85%

MATCHING BLOCK 484/546

educational objectives. Educational groups will enable the students in learning about subjects that are not part of the curricu- lum. The areas of education can be life skill education, HIV/AIDS, public speaking etc. Value education can be taught through stories and parables. Songs that motivate the members can be sung. Competitions like essay writing, handwriting and spelling can be organised. 2) Recreational Groups: Recreational groups

are fairly common where the idea is to engage children in their leisure time to organize outdoor games. Though the major objective is providing recreational activities but the worker helps the group to evolve norms for decision-making, developing a sense of fair play, respecting minority opinions and inculcating an understand- ing of diver- sity.

70%**MATCHING BLOCK 475/546****W**

Group experiences if carefully chosen will help growth in their person- ality. 3) Personality Developed Groups:

78%**MATCHING BLOCK 476/546****W**

Personality development groups seek to de- velop self-confidence and self-esteem. Skills to face interviews, public speak- ing and grooming habits can be improved in groups. 4) Support Groups:

A major focus in support groups, is to provide a forum where these children can come together, either alone or with relevant experts, to discuss the common problems being faced by them and look for ways to cope with these in more personally satisfying and socially acceptable ways. Working with girls facing violence or abuse through support group has been found to be quite effective. There are another five kinds of groups can be formed in the schools such as – 1.

Cluster Groups: These groups were used when one or two isolate or scape- goat were referred to the group worker.

95%**MATCHING BLOCK 477/546****W**

The group sessions are so designed that the dysfunctional students' needs are addressed his / her problem is described, the student's view point is brought to the open and perceptions of the other members are discussed. Support from the other members for the dysfunctional student is encouraged. The interaction between the members and the dysfunctional student is expected to bring about change in the behaviour of the student. NSOU ? PGSW-III 222 2. Classroom Groups: Classroom groups are used when it is found that it is not individuals or group of students that are dysfunctional but the entire class is dysfunctional. Therefore the whole class should be taken as a group and needs to be treated. The causes for these problems can uneasiness with teachers, over scapegoating, over identification with the students who are victimized, conflicts between groups within class and inability to perform as per expectations. The cause of the problem may lie in a few students or the whole class. The group worker uses the whole class as group and address the problem by using group discussions and role plays. 3. Splinter Groups: These groups consist of problematic children who cannot be separated and treated.

94%**MATCHING BLOCK 478/546****W**

In this group the dysfunctional members are iden- tified and his identity revealed. He chooses from the class a smaller group consisting of a few members. The group worker then describes the problem to the group and its effect on the affected student. Certain activities are chosen which will attract the larger student body to the smaller group and interact with it. If successful the smaller group status improves and so does the status of the dysfunctional student. 4. Telescopic Groups: Telescopic groups are groups which meet five or six times in a short period of time. A current problem is taken up as a major issue. For example absenteeism and group formed by members who are found to be excessively absent. The members are made aware of the reason for being part of the group. A plan is made for a group which includes activities which are gratifying and ego supportive. 5. Socio educational groups: These groups involve the other stakeholders like the parents and staff members to improve the school functioning. For ex- ample – suitable parents are depending on their need, aptitude and interest are taken as members of the group. They are informed that the purpose of the groups is to improve their performance as the parents. Sessions are planned which will provide them with new skills and knowledge. Films, lectures, role plays and members presentations are the best means.

Principles to be followed while working with children in the school – 1.

100%**MATCHING BLOCK 479/546****W**

Confidentiality is very important as children are not often able to keep personal information to themselves.

NSOU ? PGSW-III 223 2.

93%**MATCHING BLOCK 480/546****W**

Avoid using sides. Students may blame teacher or parent for some of the difficulties they face. It is important that the group worker describes the problems rather than point fingers at others. 3. Explain the purpose of the group and its goal to the members. 4.

76%**MATCHING BLOCK 481/546****W**

Listen to the opinion of the members even though group worker may disagree with it. 5. Choose those activities and games which will be useful and enjoyable for the members. 6. Prepare for termination as students may become attached

with the worker. 7.

100%**MATCHING BLOCK 482/546****W**

Homogeneity in terms of age, sex and class is a prerequisite for successful group work in children. 11.4

Group Work with Youths The group work offers a lot of possibilities for working with young persons in the age group of 15 to 25 years of age group. This is very formative age when individuals experience changes physically, psychologically and socially. The group work with young persons in rural areas and urban slums offer a very challenging task to social workers. The broad objectives of working with youth can be described as: • The personal development, • Providing support and guidance; • Developing educational and vocational skills; • Community and social action; and • Problem solving. The possible places where social workers can locate the group work interventions will depend on the kind of client group they want to work with. A large numbers of urban young persons are located in schools and colleges. The worker can easily contact them through the college authorities. The workers can design the intervention giving details of objectives, programme activities, expected outcomes, evaluation process, time frame and cost, and make a presentation for the students and

NSOU ? PGSW-III 224 the college authorities. A two week camp for youngsters can be very helpful in starting a process of rediscovering the self and designing better strategies for meeting career goals, modifying self images, developing life skills, sensitizing youngsters about HIV/AIDS, drug abuse or violence and any other need area. There are a large number of out of school young persons in India. These young person's can be located in the deprived communities and in rural areas. They can be contacted by informal visits to the communities and through the non-governmental organisations working in these communities, or by spreading information through posters, organizing sports and cultural activities and addressing community groups informally. A large number of young persons are placed in reform institutions for varying durations. Group work with these persons can help in achieving the desired objectives of mainstreaming them in society. Developing better skills and attitude, meeting recreation needs, fighting depression and aggression are some of the objectives that can be the focus of group work in the setting. Most groups aimed at personal development of youth, use recreational activities as programme inputs. The idea is to engage youth during their leisure time, to organize all kinds of recreational programmes. Sports and physical activity programmes can have a positive impact on young people's behaviour, and may provide an important vehicle for their personal development. Through the major group objective is projected as providing recreational activities but the group work objective is taken as growth and development of individual members. The worker helps the group to evolve norms for decision-making, encouraging wider participation of members in decision-making, developing a sense of fair play and respecting minority opinions. The activity based counselling model can be effectively used to focus upon the values and behavioural outcomes for modifying these. Theatre including skits, street plays, group songs, poster making are some of the other activities with a lot of potential for improving communication, helping young persons to unburden themselves and learn to act as a team. 1. Educational Groups: In educational groups the main focus of the group activities is to pursue some educational objectives. Informal education through groups, helping young persons who are slow learners, out of school youth

NSOU ? PGSW-III 225 being helped to continue their education or skills training, are some popular uses of groups for educational purposes. Helping young persons to acquire vocational skills to become self-employed through the process of group formation is a popular activity. 2. Support Groups: Support groups for young persons are generally formed to discuss problems being faced by them and to look for solutions. Young persons having drug-related problems, adolescents having emotional problems, unemployed young persons, all can be helped through support group activities. The major focus of support groups is to provide a forum where persons with similar problems can come together, either as a self-help group or with relevant experts, to discuss the common problems being faced by them and to look for ways to cope with these in a more personally satisfying and socially acceptable way. 3. Remedial

Groups: Remedial groups are meant to use group interaction and programme activities to modify behavioural responses of members. School social workers, probation officers and social workers working in observation homes and other organisations dealing with young persons coming in conflict with law, are places where remedial group activities are commonly found. 11.5 Group Work with Women Women have been making use of groups since a very long time for a variety of reasons in India. It is common to see groups of women coming together both in rural and urban neighbourhoods to use their leisure time in sharing information about life in general. These groups have acted as forum for recreation, social education regarding ceremonies and rituals to be observed on different occasions for example birth, marriages or deaths and religions festivals, for health education including sex education and so on. The groups have also performed therapeutic functions by acting as support systems to women, who unburden themselves by sharing their problems of all kinds in such groups. These groups have also at times acted as mechanisms of social control as they had power to impose sanctions if people deviated from social norms. The groups acted as sources of spreading information or disinformation in the larger community as well, at times unleashing wider social action unwillingly.

NSOU ? PGSW-III 226 In rural areas in particular women found security in numbers as they had to face extremely difficult circumstances with no other mechanism available to provide them security. It is common knowledge that many women have to travel long distances in search of water, fodder, fuel or even toilet facilities, not available at home. They instinctively resort to go for meeting these needs in groups as they find security in numbers. It is commonly known that, women in India have very low self-esteem and as such lack self-confidence for facing any stressful situation alone. Not many women are comfortable in discussing their problems even with other women individually. They respond better as a group. Talking to an unknown person of the other sex is still a very stressful situation for many young women. As a part of the socialisation process itself women learn to rely on groups rather than facing a situation individually. The Indian cultural values, cutting across religions, caste and class boundaries, are unanimous in keeping women more group oriented. A woman's psyche is specifically constructed to regard herself as secondary in comparison to the family's needs and in particular protecting its honour. Women are trained to be others oriented in all aspects of their lives, a trait which makes the group norms more important for them. A woman is therefore far more suited to becoming a stable member of group than a male. However, her commitment to her family is far more important for her and her participation in other groups is considered secondary and at times forbidden if it conflicts with her family interests. Besides these, the general group work objectives in working with women are: Educational: Providing education to women on different aspects concerning their life beginning from literacy skills to legal, social and political issues through the use of group work activities is emerging as a major area of work in many organisations. Women of all ages and of all kinds belonging to both rural and urban areas and different socio-economic groups, castes and religions are participating in such groups. However, the main focus is deprived groups, both in rural or urban areas. The main objectives are providing information and awareness leading to better handling of their present day situations at work and at home. These groups may or may not consider advocating or mobilizing women for social change. Education and awareness building is the major goal irrespective of what it delivers. Support: Support groups are meant to develop a network of women facing domestic violence and abuse both at home and at work place or any other emotional problem, with the expressed purpose of empowering these women to comfort the

NSOU ? PGSW-III 227 situation rather than remaining silent. Such groups, besides providing a forum for women to share their experiences and receive emotional support, have also been active in advocacy and social action. Support groups of women sex workers and women suffering from HIV/AIDS, are also being formed to help such women. Livelihood: One of the most common objectives of forming groups of women is to provide them economic help. A number of self-help groups are being organized for helping them to learn to save and to create a fund as a source for getting financial help from a more friendly and non-exploitative source for their day to day need. Women are also being helped to acquire economic skills of different kinds to augment their incomes by starting, either individually or collectively, small business enterprises. The group is used as a mechanism to link them with financial institutions and government agencies in order to encourage them to participate in developmental activities. It is expected to enhance their access to resources and to develop cooperative attitudes in their struggle against poverty and exploitation. Legal Aid: Some organisations are using groups to work with women to provide them legal aid concerning marital problems, inheritance matters, sexual harassment and any other aspect concerning their life. The nature of such group interventions may involve group counselling and acting as support network during legal battles to secure justice for members, besides undertaking educational and information sharing activities. Health Groups: Use of groups for providing health related information to expecting mother, mothers with newly born babies or women suffering from various ailments including HIV/AIDS, is also being used by a variety of professionals in India. Besides providing information, the groups are also being used for including behavioural changes or attitudinal changes among women. 11.6 Group Work in Community Settings 3.6.1 Social Action Groups Group work is very useful in the community.

100%	MATCHING BLOCK 483/546	W
Any number of natural groups is found in the community. Most of them are spontaneous efforts by the people themselves to control their lives by helping others and getting help from others.

Protection of the rights of informal labour like domestic workers, brick kilns, glass-manufacturing units. 8. Child labour. 9. Animal rights. 10. Rights of people living in slums. Steps for social action group: According to carr (2008) the following steps can be implemented to create and sustain a social action group: 1. Engaging: The process in which the group worker engages the target group – a community (a village where the National Rural Employment Guarantee Scheme is not implemented properly).

100%

MATCHING BLOCK 493/546

W

The engagement phase will include familiarizing herself with the various dimensions of the problem.

97%

MATCHING BLOCK 494/546

W

Another step in the process is build rapport with the existing leadership in the community and knowing their limitation and strengths. Initial reflections – the group worker must understand the situation and identify the principles that will guide her action and her relationship with the target group. Assessing system barriers – the group assess the various barriers that stand in between the target group and its objectives.

100%

MATCHING BLOCK 495/546

W

Finding allies and making contacts – Networking with like-minded groups, developing contacts

with

96%**MATCHING BLOCK 496/546****W**

the media and academic world and obtaining the support of other communities are important function of the group leader. In India, personal contacts with the police, bureaucracy and professionals (Lawyers, doctors) are also very useful. These allies and contacts can be useful in many ways - increasing the knowledge base, for providing professional guidance, recruiting new members, contributing resources, arranging publicity and giving encouragement. 2. Initiating the Group: Identifying members are seeking ways to motivate them to join the group, finding resources and venue meetings and the important tasks that have to be done.

100%**MATCHING BLOCK 497/546****W**

The group worker must be able to withstand the problems of forming the group before she moves ahead. Recruiting participants: Individuals may initially agree and then refuse or refuse many times before agreeing to join.

NSOU ? PGSW-III 230

96%**MATCHING BLOCK 498/546****W**

Finding a venue and obtaining needed materials: An accessible place for meeting and materials needed have to be organised. It is better if available resources are used. Building trust: Any group has to have a certain level of trust and goodwill among its members.

87%**MATCHING BLOCK 499/546****W**

The level of trust can be increased if opportunities and a climate exist in the group to expone one's opinions and views.

100%**MATCHING BLOCK 500/546****W**

Establishing collegiality: Perfect equality may not be possible in the group as the group worker often is a person with more knowledge and skills. However he should take care that he works with the group rather than for the group. His example will help set norms for the group regarding the rules of participating and engaging. 3.

Facilitating

100%**MATCHING BLOCK 501/546****W**

the Group: Establishing ground rules: Rules and regulations agreed upon by every members help in maintaining the

group. Group discussions and interaction, decision making and other process of the group should be subject to rules. Facilitating consciousness raising: The discussions that take in the group has to raise the level of consciousness in the group member.

88%**MATCHING BLOCK 502/546****W**

The process of waising consciousness will include challenging and removing many of the existing percep- tions of the members on their situation. Supporting action: Action requires the utilization of all available resources – personal and community based. The support network built by the group including personal contacts and community members, concerned students, activists is used. Action should identify the target – the institution or person against whom the action is taken. This target should be carefully chosen as the success of the action depends on the how much change is achieved in the institution. Encourage praxis:

90%**MATCHING BLOCK 503/546****W**

A certain amount of learning takes place in every action even if it fails in achieving its objectives. The learning can be about the group itself, or the community as a whole or about the power structures. These leaning can be analysed by getting the members to talk about it. The sharing of the views will increase the level of consciousness. Based on these learning, future action is planned and taken and process goes on. 4. Transferring power: The ultimate aim of the empowering process is to make the members independent. After a period the group worker should

85%**MATCHING BLOCK 504/546****W**

transfer his skills and information to the group members. Some of the methods used to build the NSOU ? PGSW-III 231 capacity of the members are training; handholding (members perform under close supervision) and delegation of authority. 5. Wrapping up: The group worker must be able to leave the group at the right time. The group members should be prepared for this. Leadership should be created and trained and resources identified for future use. 11.6.2

89%**MATCHING BLOCK 505/546****W**

Group work with Disaster Victims Disasters are sudden events that cause large-scale damage to human being and their property. The victims of a disaster are not only those who die and are injured but also those who survive. Both the category of survivors, injured and the unharmed need psychological support. Another important category of people who are in need of support is the care givers. Caregivers are those who give the survivors emotion and social support. Victims of the disaster care classified into six categories by Taylor and Frazer – 1. The primary victims are those who are directly affected by the disaster, 2. Secondary victim includes the friends and relatives of the primary victims, 3. The tertiary victims are those involved in the rescue and recovery, 4. The fourth category are those in the community that are involved in the disaster work, 5. The fifth categories are those who have not experienced by the disaster but experience grief and pain. 6. The sixth categories of victims are those who could have been victims, but by chance escaped. The cares that the victims need are the following: 1. Shelter temporary and later on permanent if house destroyed. 2. Food and medicines. 3. Medical facility if injured. 4. Livelihood. 5. Legal aid filling for compensation. 6. Compensation. 7. Psycho social care and 8. Self-help leading to self reliance.

NSOU ? PGSW-III 232 The

100%**MATCHING BLOCK 506/546****W**

social worker is involved in every action. But the most important aspect of his work is psycho-social care. The aim of

psycho-social

100%**MATCHING BLOCK 507/546****W**

care is to treat the victims who have undergone a traumatic experience.

All the activities

94%**MATCHING BLOCK 508/546****W**

can be effective if it is done in group. The advantages of group- based treatment of victims are as follows: 1. Sharing the victim's painful experiences in a group where other victims are present. Universalization of experiences and identification with every other problem take place in the group sessions. Knowing that others also have gone through the experiences and knowing how they are coping with the situation is helpful for the victims. 2. Recreational and relaxation activities are more enjoyable if they are done in groups. 3. Engaging in productive work (for example – gardening, basket making, building houses) in team motivates the members to engage in these activities on regular basis. 4. Efforts like starting SHGs for women can be stood for rehabilitation of the victims. A large number of victims can be treated using group work. Secondly, special groups for the vulnerable groups for women and children can take care of their special needs as these sections are more vulnerable than others and need special care. Thirdly, these groups survive even after the social workers and the administrator go and is a source for support for disaster victims after a long time. 11.6.3 Group Work With the Substance Abusers

100%**MATCHING BLOCK 509/546****W**

Group work among the substance abusers can be done in institution as well

88%

MATCHING BLOCK 510/546

W

as in the community. Usually the group members meet in a common place – religions places, school or community centres. There are a number of approaches available to solve the problem of substance abuse alcohol. According to Fisher (in Gravin 2004), group work is an appropriate method to deal with the problem of addiction – 1. Group reduce the sense of isolation often experienced by persons with the substance use disorders, who may experience a sense of relief to discover that other people are struggling with similar problems. NSOU ? PGSW-III 233 2. Groups can

in still

100%

MATCHING BLOCK 511/546

W

hope in the persons that they can recover when they observe

other

100%

MATCHING BLOCK 512/546

W

deal successfully with similar problems. 3. Groups provide opportunity for the members to learn to cope with problems of substance abuse when they observe others coping with similar problems. 4. Groups can give new information to the members given by the group worker, guest lecturer, instructors and other members. 5. Positive feedback about their worth, skills and abilities from other members will improve their self concept (self worth and self image). 6. Groups provide reparative (alternate) family experiences as the group

mem- bers

95%

MATCHING BLOCK 513/546

W

give the support and assurance that they sometimes do not receive from their own families. They may try out new behaviours which can be used in their own families. 7. Groups provide emotional support to the members when they experience stressful and difficult situations outside the group. Encouragement, reinforce- ment and coaching can happen in the group. 8. Groups help the members acquire social skills that are needed to cope with anxiety situations instead of depending on substances for dealing with

diffi- cult situations in life. 9.

96%

MATCHING BLOCK 514/546

W

Group members can confront each other in very powerful ways regarding the substance abuse. Confrontation in substance abuse is important as most of the abusers are in the state of denial. Confrontation by other who had similar problems is particularly powerful. 10. Groups are cost effective as many members can be treated simultaneously. 11. The benefits of group work may exceed beyond the group and benefit others who are in some way related to the members – family members, employers. 11.6.4

Group Work with Self-Help Groups Concept: Self-help groups (SHGs) have become the most popular form of group work that is being used by both governmental and non-governmental organisations in India to accomplish a variety of development goals in recent times. However, the idea of self-help was an inherent part of group work practice right from the very beginning. As Kanopka (1963) noted , "whereas philanthropy was generally of NSOU ? PGSW-III 234 middle class origin,

100%

MATCHING BLOCK 515/546

W

mutual self-help, as the name implies, developed from the need for mutual aid and support".

Similarly, as Mayadas et al. (2004), noted, settlement movement which led to the birth of group work – was a social (collective) response to difficult social conditions, and relied on group (mutual help) to solve problems. The beginning of collective bargaining to improve wages, as an effort to preserve cultural traditions, to promote adult education and to provide growth opportunities to their children through camping, were all initial attempts at using groups to tackle common problems through mutual help. The groups that emerged later on to acquire an international presence, such as Alcoholics Anonymous, were also based on the idea of self-help. The assumptions in these kinds of group were to bring together people facing similar problems, to provide support to each other, along with generating ideas to manage the problems. The experience sharing and the mutual support over seen as major helping factors in these groups. As a document promoting a self-help group claimed, the objective of the group is to provide knowledge about how to receive help, give help and help yourself. Underlying self-help is the basic theme: "you are not alone". Benefits to members are seen as:

- They feel less isolated knowing others share similar problems;
- Exchange ideas and discuss effective ways to cope with problems;
- Actively work on their attitudes and behaviour to make positive changes in their lives; and
- Gain a new sense of control over their lives.

The knowledge base of self-help mutual support groups is experiential, indigenous, and rooted in the wisdom that comes from struggling with problems in concrete shared ways. Self-help groups build on the strengths of their members. Uses of Self-Help Groups: The use of self-help groups in India has been more popular to help women and to a lesser extent small farmers or agricultural workers and other deprived populations. The objectives of these self-help groups have been to meet economic needs of the members. In case of some women's groups objectives such as awareness generation to improve self-help concept, knowledge of laws and sources from where help can be obtained, are some additional ones. Some women's groups provide protection to their members and also other women in the community against domestic violence.

NSOU ? PGSW-III 235 The other notable feature in India has been of conceiving all types of social work interventions in a social welfare perspective, focusing on deprived populations only. Other segments of the populations like the economically well off but facing problems of social functioning, have generally been neglected as a target population needing professional help by social workers. This segment often experience stress, are unsure of their relationships, lack social skills and as such need a variety of services. Group work with working mother facing role overload, sexual harassment, and depression, and children needing help in becoming focused in their studies or facing relationship problems at home or at school, has not been tried in India. Abuse of alcohol and drugs is affecting a sizable section of an upwardly growing population. Children from well-off families are showing symptoms of Attention Deficit Hyper Activity Disorder, resulting in problems at home and at school. Forming self-help groups of many such clients is a distinct possibility. Lesser et al. (2004) give the example of a group of professional middle aged women who have supported members in balancing career and family roles through transition and stressors in their work and family life. The main objectives for forming self-help groups can therefore be summarized as follows:

- For meeting economic needs of the deprived populations.
- For providing psycho-social support to members.
- For dealing with community related problems.

Planning Self-Help Groups: Once the worker or the leader initiating the group decides the general purpose for the formation of the group, the planning for formation of a self-help group shall begin. Meeting the economic needs of the poor is a major priority area. We shall therefore begin with such groups. The general nature of such groups in India is to help them develop a fund through savings and then provide loans to their members. Some groups help their members to start an income generating activity as well. The purpose is to enable groups to help the members to become self-sufficient in managing their economic needs, without relying on any exploitative sources such as money lenders. Many government programmes are providing economic inputs by way of subsidies, land and technical inputs to help these groups to take up small business activities. Despite the fact that the economic condition of the target population is well known, the other characteristics of the population such as education, economic skills,

NSOU ? PGSW-III 236 family size and household responsibilities, time schedule of daily routine, self-perceptions, cultural practices etc., should be carefully studied. Initial pre group discussions with family's rather than individuals should be held using participatory methods to assess their mental preparation for the new experience. The worker should work out the details of capacity building programme for the members such as:

- Organizing literacy programmes,
- Sensitizing males about women's role and status in the society,
- Skill development
- Leadership development.

The preliminary details of the group functioning such as rules for the joining the group, the size of the group, expected roles and responsibilities of members, and likely benefits, can also be discussed at the pre group discussion stage. The worker will have to work out these details in advance in conjunction with the group members. Many schemes providing assistance to self-help groups provide details of the requirements that the groups should comply with [see for example the guidelines provided by the Swarnjayanti Gramin Swarozgar Yojana Guidelines (Government of India, 1999)]. The guidelines suggest that:

1. A self-help group may consist of 10 to 20 persons. In the case of minor irrigation, and in the case of disabled persons, this number may be a minimum of five (5).
2. All members of the group should belong to families living below the poverty line. The group shall not consist of more than one member from the same family. A person should not be a member of more than one group.
3. The group should devise a code of conduct (Group Management Norms) to bind itself. This should be in the form of regular meetings (weekly or fortnightly), functioning in a democratic manner, allowing free exchange of views, and participation of the members in the decision-making process.
4. The group should be able to draw up an agenda for each meeting and take up discussions as per the agenda.

NSOU ? PGSW-III 237 5. The members should build their corpus fund through regular saving. The members themselves should decide the quantum of savings. The group should be able to collect the minimum voluntary savings. The group should be able to collect the minimum voluntary saving amount from all the members regularly. The savings to collect will be the group corpus fund. 6. The group corpus fund should be used to advance loans to the members. The group should develop financial management norms covering the loans sanction procedure, repayment schedule and interest rates. 7. The members in the group meetings should take all the loaning decisions through a participatory decision-making process. 8. The group should be able to scrutinize the loan applications, fix repayment schedules, fix appropriate rate of interest for loans advanced and closely monitor the repayment of the loan instalment from the members getting loan. 9. The group should operate a group account, so as to deposit the balance amounts left with the groups after disbursing loan to its members. 10. The group should maintain simple basic records such as Minutes Book, Attendance Register, Loan Ledger, General Ledger, Cashbook, Bank Passbook and individual Passbooks. The National Bank of Agriculture and Rural Development (NABARD) has developed a project of linking SHGs with the banks for their credit needs. The check list prepared by the organisation to assess the loan worthiness of the SHG, provides a good guideline for the worker to ensure certain standards of SHGs formed for the purpose of meeting economic needs. • SHGs with 12 – 16 very good factors can get loan from the bank immediately. • SHGs with 10 – 12 very good factors need 3 – 6 month to improve before being considered for loan. • SHGs with rating of less than 10 very good factors will not be considered for loan. The banks can sanction a loan of upto four times the saving amount of the group. The loan is sanctioned to the group. The SHG can take a loan from the bank for any purpose such as emergency needs, illness in the family, marriage or purchasing assets for income generating etc.

NSOU ? PGSW-III 238 The worker can prepare a set of model rules for the group to discuss and finalize. Model rules for a self-help group are: • Members will agree to abide by the rules. • Only one member from a family will be enrolled as a member. • The group will have a total of XX members. • New members may be admitted if there is a vacancy. • Members will elect a president to preside over the meeting for a year. • Members will contribute a monthly amount as decided by the group. • The amount collected will be kept in a bank. • Member who fails to pay the consecutive installments will lose his / her membership. • Member will maintain his / her contribution book regularly. • Members will attend meetings of the group regularly. • Member will return the loan in 10 equal instalments. • Member will pay an interest rate of two percent (2%) on the loan. • Group will decide the action to be taken against a member who fails to return the loan. The worker can invite relevant experts from financial, training or other institutions to address from group meetings for the purpose of providing clarity to potential members about the functioning of the groups. Self-help Groups for Providing Psycho-Social Support to Members: Self-help groups for providing psycho-social support to persons facing such problems are not very common in India currently, but can be a useful strategy to provide help. The strategy is very cost effective and can be easily used. Forming a self-help group, for example, for women facing domestic violence can be easily started in a community. Any woman in the community can take the initiative to start such a group. Alternatively, an organisation can initiate the process to raise awareness about the issue of domestic violence. The idea of starting a self-help group can be introduced in these meetings: Pre-group meetings: In these meetings is called pre-group meetings, the concept of self-help group is explained to the women. The worker should explain the purpose

NSOU ? PGSW-III 239 of the group in some detail. Give concrete examples for what the group can do. The worker should encourage the women to discuss whatever doubts they may have and assure them that the decision to do whatever they want is entirely up to them. A beginning can be made by simply finding a place to meet and deciding a convenient time for holding the meetings. The issue of how frequently the group may meet should be left flexible. Even if in the beginning only a few women decide to join, this should not discourage the worker. The same pattern can be followed for women facing other problems, particularly in a poor community. Parents having children disabilities or having problems in school, can be contacted through institutions and hospitals and introduced to the idea of self-help groups. Similarly wives of prisoners can also be helped to form self-help groups, getting the information from the prison authorities. Once the groups get started, the worker will have to facilitate the members in conducting their meetings. The worker can give them some general guidelines such as: • The number of members should not generally exceed ten (10). • Give each member an opportunity to speak. • Do not criticise a member in a negative manner. • Do not interrupt while a person is speaking. • Give your full attention to the person while she/ he is speaking. • Learn to trust each other. • Share the strategies that helped the member in coping with the problem. • Try to be precise in narration. • Avoid talking all the time. • Think about how each member can be of help to the group. Identifying some members who can take over the leadership role and undertaking a programme of training them to conduct group meetings will help in sustaining the groups. The groups can also be provided with some helpline numbers to contact in case they run into any problems or if they have any issues, which they are wish to discuss with the worker.

NSOU ? PGSW-III 240 Self-Help Groups for Meeting Community Needs: Self-help groups can manage many social issues. When properly formed and linked to one another, they are able to provide a broad range of social benefits to members and even to entire villages. With limited external inputs, groups take on community-wide social problems such as dowry and alcohol abuse. Further, they can also attract resources to build roads, bring in electricity and supply credit from government and private institutions. These groups make ideal platforms for launching an emergency prevention programme. Women are confident, organised and have funds saved to invest in protective measures for the households. Starting a self-help group for tackling community problems alone will pose more difficulties in India. A self-help group to deal with community problems is difficult to stabilize unless persons in the community are really committed, which is rarely the case. People in the community are generally struggling with very difficult life situations and find it difficult to spare time and resources. It is therefore easier to widen the scope of the groups already formed for savings and credits or other purposes and link them together to provide a forum for tackling community problems. Some training inputs can help the groups to identify their problems and by using a particular approach, create a priority to deal with problems like water, electricity and roads etc., as these are generally the felt community needs. The worker can facilitate groups which have already taken the first step of holding some informal meetings to discuss the common problems. The worker can help them to :

- Set goals or to identify problems and decide about their priority.
- Clarify the importance of community participation.
- Explain the process of discussing both the problems and the strategies to solve the problems will all concerned people in the community.
- Provide information about possible government departments which could be of help.
- Encourage them to be self-reliant and to generate indigenous resources to meet their problems.
- Develop trust among different sections in the community.
- Develop a system of relating leadership and provide leadership training.
- Help them to review the work of the group.

NSOU ? PGSW-III 241

- Help them to distribute responsibilities.
- Help them to maintain proper records of all financial transactions and all decisions taken by the group.
- Help them to learn to share all the information with the community.

We also examine the different modes, models, roles and functions of supervision in group work. The unit also journeys to recording, types of recording. After reading through this unit you must be able to: • have a general understanding of the definition and functions of supervision within a professional human service setting; • Identify a mode of supervision; • understand the models of supervision • perceive recording and types of recording in group work. 12.1 Introduction The supervision process consists of the face-to-face contact between the supervisor and the supervisee. Supervision defined as the relationship between a supervisee and supervisor who oversees the development of the supervisee throughout the group work process. Writing and maintaining group work records is an essential element of professional social work. Recording in social group work aims to make better the quality of service to the members. The agency could assess the quality of its service, thereby understanding its efficiency. Group records are imperative in study, research and experimentation.

NSOU ? PGSW-III 245 12.2

Supervision in Social Group Work 12.2.1 Concept Supervision is an enabling process in which the supervisor through the medium of his relationships with the supervisee contributes to the supervisee's growth on the job, so that he can perform his functions effectively and efficiently to achieve the purpose of the programme. Supervision is a process by which members are helped by a professional group worker to learn according to their needs to make the best use of their knowledge and skills, and to improve their abilities so that they do their jobs more effectively and with increasing satisfaction to themselves and the agencies. John D. Millet Rightly observes: "Supervision is more than a process, it is a spirit which animates the relationship between levels of organisation and which includes maximum administrative accomplishment, or when unsuccessful, generates administrative paralyses. Effective management is concerned to realize the first and to avoid the second". It may be added here that many words like 'advice', 'inspection', 'counselling', 'guidance', 'help', 'performance audit', and 'investigation', etc., are also used in the context of supervision but in the final analyses, these are the part of the process of supervision. Their meaning though may vary in degree yet all lead to improvement of efficiency and building up a positive relationship between client and the end attainment of objectives according to plans. Supervision includes modifying the behaviour of the supervisee and is measured by the qualitative growth of those being supervised. Supervision is different from inspection – one is more positive and other rather negative. Supervision reports contain constructive suggestions where as inspection reports are an enumeration of faults. The supervision is concerned with staff development and effective implementation of project / programmes. The inspector often behaves more like a prosecutor and treats his subordinates as culprits.

12.2.2 Ingredients of Supervision Supervision has many ingredients. According to Halsey, the supervision, has the following ingredients: NSOU ? PGSW-III 246 1. Selecting the right person for each job; 2. Arousing in each person an interest in his work and teaching him how to do it; 3. Measuring and rating performance to be sure that teaching has been fully effective; 4. Administering correction where this is found necessary and transferring to more suitable work or distributing those for whom this proves ineffective; 5. Commending wherever praise is merited and rewarding for good work, and finally; 6. Fitting each person harmoniously into the working group – all done fairly, patiently and tactfully so that each person is caused to do his work skilfully, accurately, intelligently, enthusiastically and completely.

12.2.3 Models of Supervision There are two primary models of supervision that are generally used by the supervisor in preparing the supervisee to work in various human service professions – the developmental and task models of supervision (Lager, n.d.). The developmental model of supervision is more of a process- oriented model that follows the various stages of learning that a new member generally experiences during his or her development of professional knowledge and skills for work. The primary focus of a developmental model of supervision is on how supervisee change as they gain more training and experience in the field of practice, based on a shift in identity (from learner to worker) and the skills that develop with the experiences gained. In the developmental model of supervision, supervisors primarily attempt to match their behaviour and teaching techniques to the developmental needs of the supervisees (Lager, n.d.). The developmental model generally consists of four stages of development that supervisees follow as they gain experience in the field of social work. At each stage the supervisee's development is strongly influenced by three general themes, all of which have an enormous effect on the other themes. Those themes are (Lager, n.d.):

- The development of the supervisee's professional self and identity.
- The relationship between the supervisor and the supervisee.
- The relationship between the supervisor and the administrative structure within which he or she works.

The stages of development are as follows (Lager, n.d.):

Stage One: During this stage the supervisee is very dependent on the supervisor and lacks the competence needed for independent work. Supervisees also generally lack self-awareness and have little experience in working with clients. Learning takes place by shadowing the supervisor and observing his or her style of practice.

Stage Two: This stage is generally characterised by a dependency – autonomy conflict. As the supervisee's awareness increases, he or she strives for independence but is not ready for complete autonomy. At this stage the supervisee needs more independence and less restrictiveness than the first stage.

Stage Three: This is the stage of conditional dependency in which the supervisee is generally more differentiated, motivated, insightful and empathetic. He or she is more comfortable with a perception of professional self and is able to function with a great deal of autonomy. The supervisee at this stage is also able to formulate assessments well and develop appropriate interventions for clients with minimal input from the supervisor.

Stage Four: At this stage the supervisee has developed a high level of competence and is able to independently formulate accurate assessments with appropriate interventions. Supervisees at this stage are able to take responsibility for their own learning. The Task model of supervision is very similar to the developmental model, however it relies heavily on the assignment of tasks that help supervisees develop to a more advanced level of practice. This model includes a focus on both functions and tasks within supervision which are, respectively, the how and what of supervision. For example, some of the tasks that are included in the model are: monitoring- evaluating; instructing-advising; modelling; consulting; supporting-sharing. Likewise, some of the functions are: counselling skill; case conceptualization; professional role; emotional awareness; self-evaluation. The consequence is a 5 (task) by 5 (function) matrix, with 25 resulting task-function combination (see figure 4.1) A supervisor might, for example, engage in monitoring-evaluating (the how) of the supervisee's counselling skill (the what), or might engage in consulting concerning NSOU ? PGSW-III 248 the supervisee's emotional awareness, and so on. Hypothetically, a supervisor might engage in any task with any function, but realistically there are probably some task and function matches that are more likely to occur in supervision.

Functions (How) Counselling Case Professional Emotional Self skill conceptualization role awareness evaluation Monitoring- Evaluating Tasks Instructing (What) Advising Consulting Supporting- sharing

Figure 4.1: Functions and Tasks in Supervision

Exercise I: 1. What is the primary underlying principle of developmental model of supervision? 2. State how the task model of supervision differs from the developmental model, and provide an illustration of how it might focus on the intersection of the how and what of supervision.

12.2.4 Modes of Supervision Direct observation of the supervisee: Regardless of the particular model of supervision used, there is no substitute for directly observing a supervisee's work with a client. Several arrangements can be used for conducting these observations. One way is for the supervisor to be physically present in the place with the supervisee, or accompanying him or her on

home visits(Lager, n.d.). Another possibility involves the use of special observation rooms equipped with one way mirror. By observing sessions as they occur, supervisors get a better sense of the social work process of assessing and counselling client. They can listen to what is said, watch the non-verbal behaviours of the supervisee and client, note key moments of the session, and get a deeper awareness of the overall "feel" of the interventions. In NSOU ? PGSW-III 249 some arrangements, supervisors can also instruct the supervisee during the interaction. Using a technique known as a "bug in the ear", supervisors observe the sessions from behind a mirror and can speak to the supervisee through a microphone connected to tiny earplug-type speakers(Lager, n.d.). Although direct observation can be one of the best ways for supervisees to learn counselling techniques, a drawback is the fact that they can be intimidated by the supervisor's presence-even if he or she is behind a mirror- and therefore their already existing anxiety can be elevated. In such situation, it is helpful for supervisors and supervisees to establish an agreement about how directly observed sessions will proceed, what the goals and objectives of the session are, and perhaps engage in a role play before the actual client session begins.

Didactic supervision: Didactic or teaching supervision is best chosen when an supervisee wants to learn, or a supervisor wants to teach, specific information about a theory, technique, or some topic relevant to the supervisee's activities. The goal of a didactic approach is to get information across as efficiently as possible so the supervisee can learn and apply the information directly to his or her work(Lager, n.d.). Didactic approaches tend to be particularly appealing to beginning learners because they feel a need for concrete, practical information to help the cope with the anxiety and ambiguity of starting something new.

Case discussion: Case discussion means the supervisee describes a case to the supervisor and the two discuss what is going on. Case discussions can take a variety of formats depending on the goals and preferences of the supervisee and supervisor. Perhaps the most common approach involves supervisees describing what is happening in a case, explaining their actions and offering interpretations for what is happening. The supervisor typically listens, asks questions, and may offer alternative interpretations or suggestions(Lager, n.d.).

Types and Role Plays: Video or audio recordings of sessions with clients enable the supervisor and supervisee to observe the actual interview process with a client. This is an extremely valuable method for clinical training, although some time limitations prohibit reviews of the entire session. This mode of supervision presents an interesting paradox. NSOU ? PGSW-III 250 An alternative to working with recorded sessions is to enact a client session with the supervisor. Role plays involve supervisees taking the roles clients, trainees or other staff members and acting these roles as they portray a situation or interaction of interest. They can be particularly helpful in developing basic helping skills and in learning to deal with difficult clients. Role plays can also help supervisees to become aware of their counselling style and, in some instances, about significant issues in their own lives. Supervisors can also use role plays to learn about issues and techniques in supervision.

Direct observation of the supervisor: The majority of supervisees prefer this mode of supervision above most others. While they recognise that discussion about their own work can only take them so far, they also feel they can learn a great deal when they can watch their supervisor in group or individual sessions, read reports written by the supervisor, and observe him or her in other actions such as meetings, conferences etc. One way to accomplish this is for the supervisor and supervisee to work jointly in counselling clients. This is most commonly practiced in group or couples counselling, but it can also be used with individual client.

Exercise II: 1. What mode of supervision is preferred by supervisees? What activities generally fall under this mode? 2. What are role plays, and how are they helpful in the supervisory process?

12.2.5 Techniques of Supervision According to John D. Millet there are, broadly considered six techniques of supervision. The techniques are presented through a diagram given below:

Inspection of results

98%

MATCHING BLOCK 527/546

SA

Unit 12 Supervision and Recording[13506] new.docx
(D122078278)

Prior approved of individual projects The formulation of service standards Approval of Key subordinate personnel Supervision Budgetary limitations upon the magnitude of operations Reporting system on work progress NSOU ? PGSW-III 251 Techniques of supervision The above diagram shows that supervision needs specialised knowledge and skills in utilizing it to achieve the intended results. This diagram also indicates that the supervisor has to possess certain qualities, while at supervision. Following are the techniques of supervision: Prior approval: Prior approval means that prior approval of the competent authority has to be obtained before the work on a particular programme is started. In this manner, the supervisor will be in a position to gather detailed information about the intentions of the operating organisations. Moreover, the supervisor will come to know about the details of work which his organisation, where he performs his work, is going to execute. Deviations, if any would be corrected and controlled without any misunderstanding, wastage of time, energy in terms of money, manpower and material resources. Service Standards: Service standards means setting up norms of administrative output. Setting up norms is not an easy process. Difficulties lie in striking a balance between quantity and quality, the achievement of targets and the way it has to be done. The supervisor has to work with thoughtfulness, fairness, tact, emotion etc for effectiveness and efficiency of service standards so laid down. Budgetary Limitation: Budgetary limitation means that the operating units work within the budgetary allocations and have to carry out the work within the limited budget provisions. The technique is being followed in day-to-day financial administration of the organization. Approval of Personnel: This means to reserve the right of approval of personnel of the key personnel in the organization by the Chief Executive while leaving the initiative of selection in the hands of the operating head. This technique helps in exercising control over the personnel in a manner stipulated for achieving the objectives of an organisation. Reporting System: Reporting holds a key position for assessing day-to-day performance of an organization. It helps in identifying shortcomings and bottlenecks in execution of the programmes and projects and in turn, ways and means for NSOU ? PGSW-III 252 corrective action. Reporting system works as one of the means for effective monitoring of the progress of an organization. Inspection of Results: Inspection of result is very effective instrument of supervision. The supervisor has to ensure that the inspection is timely, result-oriented, humanistic and problem solving. It helps in building the role conflicts and establishing harmonious contacts between the supervisor and the supervisees in the performance of their work. Inspection has to see that the existing rules and regulations are observed. It is a sort of performance audit. The inspection is related to instructing and guiding the persons working in the organisation as well as improvement of efficiency. 12.2.6 Qualities of Supervisor The supervisor – 1. He is more a leader among the group members than a boss over the subordinates. He substitutes leadership for authority. 2. He should be impartial, objective, fair minded, humane, capable and willing to guide and help the supervisee. 3. He should have HUMAN TOUCH H – Hear him out U - Understand his feelings M – Motivate him A - Acknowledge his efforts N - News-keep him informed T - Train him O – Open his eyes U - Uniqueness – treat him as individual C - Contact him regularly H – Honour him as a person.

MATCHING BLOCK 528/546

SA

Unit 12 Supervision and Recording[13506] new.docx
(D122078278)

Principles of Supervision 1. It should be person-oriented rather than production-oriented. 2. How a job is done is more important than how much done. 3. It is being good and not doing good that counts. 4. It is being on tap rather than on top. 5. For dynamic programmes increased possibility of error must be recognized and allowed for. 6. It should be based on understanding and not fear. 7. Too much of supervision begets mediocrity. 8. Responsibility would always be coupled with authority. 9. No supervisee should receive orders from more than one source. 12.2.8 Functions of the supervisor: Educational, Administrative, Helping Supervisors perform three-pronged functions, namely administrative i.e., operational and discipline related functions; educational i.e. related to professional learning constituted of knowledge, skills and values; and the helping functions that deal with supervisee as a person and are concerned with his personal growth(Lager, n.d.). a) Educational Function(Lager, n.d.): Educational functions include the following: 1. Designing and planning of learning activities and/or programmes of study. 2. Identifying professional skills in daily work. 3. Professional socialization – teaching supervisees to apply values and principles while using social work method. 4. Giving knowledge of micro-macro linkage, legal provisions, government schemes, information about community resources. 5. Teaching the use of tools and techniques of social work practice. 6. Demonstrating use of methods and skills – through lab work. 7. Teaching record-writing, documentation work.

NSOU ? PGSW-III 254 8.

99%

MATCHING BLOCK 529/546

SA

Unit 12 Supervision and Recording[13506] new.docx
(D122078278)

Provide frequent and accurate feed-back. 9. Facilitate reflection and critical thinking through well planned and structured supervisory sessions. 10. Dealing with ethical dilemmas in day to day work. 11. Working with co-workers and utilizing supervision, accepting and utilizing feed-back. 12. Teaching NGO/GO management including maintaining records, working on committees, budgeting, project proposal formulation, inter-agency coordination etc. 13. Guidance on research exercise – catching supervisees to take up any research based assignment – teaching supervisee about research methodology, i.e., data collection, data analysis and reporting. 14. Innovative projects to help individuals / group / families / communities – introducing by direct instruction or encouraging supervisees to take initiatives themselves. b) Administrative Functions(Lager, n.d.): Operational and discipline related duties are categorized as administrative functions. Following are some of the administrative tasks of supervisors: 1. Preparing supervisee for their professional roles is no small task. It requires giving detailed attention to innumerable contingencies. 2. Keeping attendance of supervisee, ensuring submission of records and maintaining log of supervisees' work. 3. Maintaining supervisees' discipline in work place. 4. Planning and holding of supervisory conferences, giving prior intimation to the supervisees so that they can make necessary arrangements for attending the same. 5. As different an on-going educational assessment, supervisors have to formally evaluate supervisees' performance and level of learning in terms of professional skills, knowledge and attitudes. 6. Resolution of work related problems. NSOU ? PGSW-III 255 7. Serving on Governing Boards of relevant organisation. 8. Supervisors have to be vicariously responsible for what their supervisees are doing the work place irrespective of the educative value of allowing supervisees to learn 'by doing', often by trial and error, supervisors have to ensure that this manner of learning does not aggravate the problems of the client groups. Supervisors have, therefore, to be cautions and to critically assess supervisees' work. C. Helping Functions: Supervisees struggle with confusion and self-doubt as they attempt to develop self-efficacy as a professional. The learning process in social work involves a reappraisal of own attitudes and values. In this process, the supervisee needs the support of a supervisor. It is not enough to verse supervisees' work and teach them the use of social work methods. The supervisees are expected to develop the 'professional self' which means that their 'self' is the main tool for offering professional interventions. Social work education aims at bridging the gap between the 'personal self' and the 'professional self' of the supervisees. Reassurance of worth and social integration support from supervisors go a long way towards providing supervisees an anchor which they can hold on to in times of emotional turmoil, anxiety, stress and self-doubt. Supervisory activities with this focus as designated as 'helping' functions which are as follows(Lager, n.d.): 1. Creating an open supervisory environment. 2. Providing encouragement. 3. Attending to supervisees' personal growth. 4. Building confidence. 5. Helping supervisees develop self-awareness, understanding of personal vs professional self. 6. Dealing with personal / family problem having impact on day-to-day work. 7. Referral to counsellors for in-depth personal counselling and to other agencies for addressing family and personal problems. 8. Career counselling. 9. Helping supervisees with their struggle with confusion and self-doubt as they attempt to develop self-efficacy as a professional.

NSOU ? PGSW-III 256 10.

100%

MATCHING BLOCK 530/546

SA

Unit 12 Supervision and Recording[13506] new.docx
(D122078278)

Supervision should certainly become more relaxed and more supportive as time goes on. 11. Creating a bond and communicating before applying supervisory controls is very essential. 12. Professional learning is carried out within the context of the supervisee – Supervisor relationship. The supervisor-supervisee relationship is the primary mechanism through which supervisees develops a professionally reflective and self-evaluative practice stance. Helping dimension of supervisor's function helps nurture and strengthens this relationship. 13. A non-threatening environment of the relationship will help supervisees accept constructing criticism and encourage them to change. 14. We know that mentoring is one of the most highly recommended supervisory strategies. The word mentor infers caring, setting wise example, coaching and identifying mistakes without causing resentment. Supervisors perform all the three kinds of responsibilities but the emphases and supervisory inputs may vary according to the level and stage of professional development of the supervisees, and demands of a particular work situation. 12.2.9 Supportive Functions In Supervision The supportive functions of supervision will be highlighted here as they relate to the process of developing essential skills that will be helpful in dealing with a variety of stressors often associated with social work practice(Lager, n.d.). Prolonged job related stress can ultimately lead to professional burnout and / or compassion fatigue in many helping professions. It is important for supervisors to recognize the symptoms of extreme stress and develop strategies for dealing with them immediately. It is essential that supervisors, supervisees, and other helping professionals learn to manage stress in themselves and to help their clients manage stress. Stress is a contributing factor in a wide variety of emotional and behavioural problems, including anxiety, child abuse, spouse abuse, temper tantrums, feelings of inadequacy, physical assaults, explosive expressions of anger, feelings of hostility, impatience, stuttering, suicide attempts and depression.

Unit 12 Supervision and Recording[13506] new.docx (D122078278)

Stress is also a contributing factor in most physical illness. These illness include hypertension, heart attacks, migraine and tension headaches, colitis, ulcers, diarrhoea, constipation, diabetes, backaches, arthritis, cancer, colds, flu, insomnia, alcoholism, bronchitis, infections, allergies and enuresis. Exposure to cumulative stress, crisis and even traumatic events in our professionals or personal lives can cause physical and / or emotional exhaustion that leads to professional burn out or compassion fatigue. Occupational stressors, when unchecked, can result in worker burnout. Role ambiguity, role conflict, and role overload play a large role in the onset of burnout within the work place. Stress related problems often result from a combination of (1) individual perceptions of the problems, (2) environmental demands placed on the individual that have a direct effect on his or her ability to deal with the problems and (3) one's physiological responses when confronted with stress. When stressors are social or psychological rather than physical, the stress response builds up tension that is not released(Lager, n.d.). As a result, it utilizes energy that is not restored and can ultimately lead to exhaustion. Over a period of time, prolonged exposure to the stress and the resulting exhaustion can cause significant problems to one's physical and psychological well being. Signs and Symptoms of Burn out and Compassion Fatigue:

- Change in behaviour and / or job performance.
- Increased physical complaints of fatigue, irritability, muscle tension, stomach upset and susceptibility to illness.
- Social withdrawal, pulling away from co-workers, press, family members.
- Emotional exhaustion, loss of self-esteem, depression, frustration, loss of commitment and moral purpose in one's work.
- Loss of curiosity and desire to learn, often accompanied by a negative attitude.
- Spiritual change, decline in spiritual beliefs, questioning of the meaning of life.

NSOU ? PGSW-III 258 The following chart indicates the effect of prolonged stress on job performance, interpersonal relationships, morale and behavioural functioning (Greenberg, 1999)

Effects on job	Effect on	Effect on	Effect on
Behavioural Relationship	Functioning	Decrease in Withdrawal from	Decreased Absenteeism quality work colleagues confidence
Decrease in Impatience	Loss of interest	Exhaustion quality of work	Decline in Decrease in quality
relationships dissatisfaction judgement	Avoidance of job	Poor communication	Negative attitude Irritability tasks
Subsumed by own Apathy	Frequent tardiness needs	Establishment of Staff conflicts	Demoralization and

feelings of incompleteness Avoidance of job tasks Lack of appreciation Overworked; frequent job changes Obsession with details Detachment; Substance abuse reduced self-esteem Managing Stress and Preventing Burnout: The following approaches have been useful for helping supervisee reduce stress and prevent burn-out. It is upto each individual to select the ones that will be most helpful. Managing stress is similar to dieting. It will work for those who put forth the effort. Goal Setting and Time Management: Stress and burnout can come from the feeling of "too much to do and too little time in which to do it". Often, this feeling is due to not having clear short-term and lifetime goals and not knowing how to manage time effectively to achieve them. Realistic goals and a plan for achieving them lead to increased self-confidence, improved decision making, a greater sense of purpose, and an improved sense of security.

Unit 12 Supervision and Recording[13506] new.docx (D122078278)

Relaxation: Deep-breathing relaxation, imagery relaxation, progressive muscle relaxation, meditation, and bio feed-back are effective techniques for reducing stress and inducing the "relaxation response" (becoming relaxed). Each of these techniques is facilitated by sitting in a comfortable position in a quiet place and closing one's eyes. Exercise: Stress prepares our body to move or become involved in large-muscle activity refers to the kinds of exercise involving many muscle groups at the same time, such as jumping rope. Through exercise, a supervisee can use up fuel in the blood, reduce his or her blood pressure and heat role, and reverse the other physiological changes set off during the alarm stage of the General Adaptation Syndrome. Exercising helps a person Keep Physically fit and has more physical strength to handle crises. It also reduces stress and relieves tension. For these reasons supervisee should be encouraged by the supervisor to have a daily exercise programme. Many activities are available: walking, stretching, jogging, isometric exercises, jumping rope, swimming, playing tennis, dancing, housework, sex, gardening or golf. Taking Care of Physical self: In addition to exercising, it is important to have nourishing diet, to take appropriate care of one, and to get enough sleeps. Not only does a nourishing diet help keep people fit to resist stress but research shows there are direct links between what individuals eat and how they feel emotionally. Some foods (such as coffee) produce tension, while overeating causes individuals to feel drowsy and even ill. Staying slim and trim helps a person feel good about himself or herself. Social Support Groups: Everyone needs to feel close to others. Support groups allow people to share their lives, have fun with others, let their hair down. These groups are also a resource for help when emergencies and crises arise. These are variety of possible support groups that centre on co-workers, a hobby or sports, a service (such as Rotary), a family, a social club and so on. Taking to others: Every human needs someone with whom to share good times as well as personal difficulties. Sharing concerns with someone helps to vent emotions, and talking a

100%**MATCHING BLOCK 534/546****SA**Unit 12 Supervision and Recording[13506] new.docx
(D122078278)

concern through often generates constructive strategies for resolving it. A good listener is someone who convey caring and understanding. Keep the information confidential, is empathetic, helps explore the difficulty, and encourages the person to select and try out a resolution strategy. Positive Thinking: When anticipated and unanticipated events occur, people can choose to take either a positive or negative view of the situation. If they take a negative view, they are apt to experience more stress and alienate friends and acquaintances. If they take a positive view, they are likely to maintain their composure; stay relaxed, and cope with the situation quickly and easily, minimizing negative consequences. Changing Stress-Producing Thoughts: It is often erroneously believed that emotions, including feelings of tenseness and anxiety, are primarily determined by experiences – that is, by events that occur. However, cognitive therapies have shown the primary source of a person’s emotions to be what she tells herself about her experiences. Changing or Adapting to Distressing Events: There are an infinite number of distressing events: the death of someone, close, the breakup of a romantic relationship, being friend, having an unfulfilling job, failing some courses, getting into an argument, or having unresolved religious questions. When distressing events occur, supervisee should be encouraged by the supervisor to confront them directly to try to improve the situation. Personal Pleasures: Personal pleasures relieve stress, provide a change of pace, are enjoyable, make us feel good, and are (in reality) personal “therapies”. What is pleasurable to one person may not be to another. Common pleasures are being hugged, listening to music, going shopping, and taking a hot bath, going to a movie, having a glass of wine, family and religious get-together, taking a vacation, singing, and so on. Such “treats” remind individuals that they have worth; they also add spice of life. Exercise: Stress Management Techniques for Me Goal: This exercise is designed to familiarize you with available stress management techniques

NSOU ? PGSW-III 261 1.

Review the material in this unit on stress management techniques. List those techniques that you have used. Also briefly describe whether each technique was beneficial to you in helping to reduce the level of stress you were experiences. 2. Specify the stress management techniques that you are planning to use in the future. 12.2.10 Roles of the Supervisor Roles are set of behaviours that the supervisors engage in fulfil their various obligations. Some of the supervisory roles conceptualized by the experts are as follows:

- **Enabler:** In this role, the supervisor is present with the supervisee as a "helper" or "enabler", there to do things with the supervisee rather than for or to the supervisee. His influence is indirect rather than direct. He helps supervisees to articulate their needs, to clarify and identify their problems, to explore resolution strategies, to select and apply a strategy, and to develop their capacities to deal with their own problems more effectively. As an enabler, the supervisor helps supervisees revitalize and mobilize their own strengths and resources to cope with difficult problems.
- **Broker:** In the broker role, the supervisor identifies community resources, government schemes and programmes that may help supervisee to carry out their plans. As a broker, the supervisor helps supervisees become aware of resources, eligibility criteria, and other conditions for using a particular service.
- **Advocate:** It is an active, directive role in which the supervisor advocates for a supervisee. In such a role, the supervisor provides leadership for collecting information, for arguing the correctness of the supervisee's need and request, and for challenging the institution's decision not to provide services.
- **Mediator:** As a mediator, the supervisor helps resolve disputes, conflicts, or opposing points of view within the group or between a member and some other person or organization. The mediator role involves intervention in finding compromises, reconcile differences, or reach mutually satisfactory agreements. He works through the supervisees of the group and occupies a NSOU ? PGSW-III 262 position of liaison between the group and the agency. The supervisors use their value orientations and unique skills in identifying miscommunication and clarifying position.
- **Negotiator:** A negotiator brings together those who are in conflict over one or more issues and seeks to achieve bargaining and compromise to arrive at mutually acceptable agreements, somewhat like mediation, negotiation involves finding a middle ground that all sides can live with. However, unlike a mediator, which is a neutral role, a negotiator usually is allied with one of the sides involved. The supervisors play this role especially while negotiating about time, venue, resources etc., with supervisees, agency or community.
- **Educator:** One of the most important roles assumed by supervisors in helping supervisees achieve their goals is that of the educator. The educator role involves giving information to supervisees and teaching them new skills. To be an effective educator, the supervisor must first be knowledgeable. Additionally, she or he must be a good communicator so that information is clearly conveyed and readily understood by the receiver.
- **Initiator:** An initiator calls attention to a problem or even to a potential problem. It is important to realise that some problems can be recognized in advance. The supervisor with his experience and knowledge can foresee the potential problem areas and draw the supervisees' attention to address the issues. In this role he initiate discussion or action on the problem area.
- **Empowerer:** A key goal of supervision is empowerment. In the role of empowerer the supervisor helps the supervisees and group to increase their personal, interpersonal, socio-economic, and political strength and influence through improving their circumstances.
- **Coordinator:** coordinators bring components together in some kind of organised manner. On behalf of the agency often the supervisor assumes the role of coordinator for helping the supervisees to avail the services from different agencies.
- **Facilitator:** A facilitator is one who serves as a supervisor for group activity. As a facilitator, supervisor provides the methodological help. He does not NSOU ? PGSW-III 263 discuss the method but he uses it for facilitating the group process. When required to express his own opinions, he at all times makes it clear when he is functioning as a facilitator.
- **Communicator and Interpreter:** The supervisor has to act as a communicator or interpreter, where interpersonal relationships have to be dealt with. In this role he actually helps the supervisee to understand what is being communicated.

12.2.11 Conclusion Appropriate supervision is an important component of the group work practice as it provides an opportunity for supervisees to apply the knowledge gained from the group work process. Two key models of supervision that are commonly used in group work to prepare supervisees are the developmental and task models. The varying modes of supervision are conducted within the context of these modes. 12.3 Record Writing in Social Group Work 12.3.1 Concept The record in social group work means a faithful representation of the facts in an orderly manner about the various interaction processes in group settings in connection with the plan and programme. The social work Dictionary (1995) defines "recording" as the process of putting in writing and keeping on file relevant information about the client system; the problem; the prognosis; the intervention; the process of treatment; the social, economic, and health factors contributing to the situation and the procedures for termination or referral. Record is an important working tool and performs the following functions:

- It gives an account of something which has taken place,
- It contains factual descriptions as well as instructions, directions, opinions, recommendation, suggestions etc.,
- It set forth plans for the future.

NSOU ? PGSW-III 264 12.3.2

Elements of Record in Social Group Work In the process of social group work, we generally attempt to record the following points:

1. When we set out to record a group work process, we write about individuals and their responses to one another in a given situation. In other words, we write about the behaviour of the individuals in the group.
2. We write about the type and extent of participation of individual in the process of social group work.
3. We note and record the origin and development of ideas, including their acceptance or rejection by the individuals involved.
4. We put down exactly what the group worker does as he carries out his helping role with the group.
5. We put down movement, growth and change as we see it in individuals and in the group as a whole.
6. We write about the relationship between the group and the agency and include community relationships when these are significant in understanding the group.
7. We write about the individual reaction to the different programmes and the contribution of each individual in programme planning.
8. The difficulties faced in the performance of any activity are also noted down.

Recording in group work process, thus implies that, we shall concentrate upon individuals working together in group situation, relationship among them as reflected by their participation, their interaction within the group and between the groups.

12.3.3 Principles of Recording

While recording the worker should be conscious about some of the basic guidelines or principles of recording. These principles or guidelines are:

1. Principle of Flexibility: The worker should be conscious about the objectives of the agency under which he is working and would maintain the record to adjust with the agency's objectives. He will not follow a rigid form of record writing.

NSOU ? PGSW-III 265 2.

Principle of Selection: Everything should not be recorded in the group work recording. He records significant observation about individuals and their interactions. He selects from movement of the group behaviour patterns of individuals, his own enabling contribution and skills and techniques applied in the group process. 3. Principle of Readability: The most important thing is to keep the record as simple as possible in form, in length. Records must have face sheet, presenting a brief outline of the factual data. If records are in detailed brief summaries should be prepared. In describing individuals, verbatim quotations should be written. Records should be written systematically. 4. Principles of Confidentiality: One of the basic principle of recording in all social work is that records are written on the premise that they will be held in confidence. If records are used for other purpose such as training, all names and other identifying information needs to be carefully obscured, with fictitious ones substituted. The record is a professional document and that as such its contents are guarded by as sense of professional ethics. 5. Principles of Worker Acceptance: The worker must accept his responsibility to write records because of his conviction that records have value in rendering high quality professional service. 12.3.4 Types of Record An important part of the group worker's responsibility is the preparation and writing of records and reports. Though agencies vary in the content and the style of the records, these are similarity as to types. In social group work three (3) types of records are generally used – (1) Statistical record, (2) Programme record and (3) Process record. 1. Statistical Record: In this type of record different statistical information on organisation, enrolment and attendance of individuals are usually kept. We get these information from individual registration cards and group roaster sheet. 2. Programme record: Programme records give the information of the activities in which the group is being engaged. Different information gathered through NSOU ? PGSW-III 266 systematic study is often recorded. In addition, minutes of meetings are also preserved. These minutes are used by the group in reviewing its experience in making plans and in follow up work. 3. Process record: This is the chronological narrative write up of the group work process as it develops. In this kind of records primary attention is given to the participation and interaction of the members, with a view to determining their role in the affairs of the group. In the process record, the emphasis is not only on what happens but how it happens and what has been its impact on the individual. Thus the process record will reveal the gradual change in the situation. 12.3.5 The Importance of Narrative Records The writing of the record is becoming an integral part of social group work practice rather than something separate and distinct from it. It is a tool for the improvement of group work and it has important values for the group, the worker, the agency and the field. The major value of the narrative process record from the standpoint of the worker is that such records help the worker to do a more effective job with his groups. Every other purpose is in a sense a sub-purpose of this major one to improve the quality of experience provided for the group. By writing a complete process record of everything he does while working with the group, the worker is helped to think, to analyse and to evaluate. The record is thus a tool in the process of understanding the group and learning how to help it. When the worker puts in writing what happened in each group meeting, what he did, what problems he faced and what questions arose in his mind, he is thinking into the group situation. Process records are written by the group worker primarily for himself and for his own use continuously throughout his relationship with the group. These records help the worker to become aware of the members of the group as individuals. He can see emerging and changing interests of individuals, he can see evolving needs and how these needs are being met. He can see the development of skills and social attitudes; he becomes sensitive to special problems which may interfere with the individual's full use of the group. Process records show the worker the variety of interpersonal relationship which take shape within the group. The emergence of a group consciousness can be seen as can sub-groupings. The acceptance of the individual by NSOU ? PGSW-III 267 the group is reflected by his change in status which can be discovered from reading accumulated records. The development of the worker's relationship and role can be ascertained from careful recording of what he does while helping the group. Attention becomes focused upon the status of the group in the agency and in the community as intergroup relations are recorded. Changes in the goals of the group become more evident, and member interests outside the group are seen from a review of the record. As the worker writes his records after each meeting, he develops a picture of the group that can be passed on to his superior. Together, worker and supervisor can focus their attention on the group situation as experienced by the worker. The record is thus a stimulus to interaction between the supervisor and the worker. Records enable group work supervisors to keep in touch with many groups for purposes of coordinating the total programme of the agency. Records are useful as a basis for evaluating the group experience of the members and for helping the worker in individual and group supervisory conferences. In worker evaluation records are indispensable. When new a workers are assigned to group, past records become useful at the point of orientation and help new workers to understand the kind of experience the group has enjoyed prior to the coming of the new worker. Records are valuable to other department of the agency if it is large; and they are important in the planning of referrals of individuals to community resource agencies. The underlying function of recording is to improve the quality of service to the individual. Hence, recording enables agency administration to judge the quality of its service, the need for its service and needs of its constituency or potential constituency. Records are useful to administration in determining whether its services meet the deeds of the community, whether the quality of service is in line with purposes and objectives of the agency, and whether there is a need to change policies and practices. Furthermore, well-kept records are useful in interpreting group work as a method in social work. Agency boards and community groups can be helped to appreciate the need for added facilities, equipment, and staff. When a review of the records of several groups reveals common problems, it is possible to utilize such factual information as a basis for the selection of staff members and for staff training. Staff assignments to groups can be made with greater intelligence when there is a record of the development of the group. NSOU ? PGSW-III 268 Recording has value for the group, the worker, and the agency and for the field of social work. Teaching material for in-service training and professional education comes from well-written narratives. Discussion material for professional organizations that conduct institutes and conferences can be provided by workers who have recorded and analyzed their work with groups. Group records are essential in study, research, and experimentation. 12.3.6 Factors That Influence the Keeping of Process Records Because many agencies are at the stage in their development at which they are giving serious

consideration to the matter of improving their systems of record keeping, it is necessary to point out some of the factors that influence an agency's decision to keep process records. Not every agency affords adequate facilities for recording. It is doubtful whether or not agencies should attempt to keep full records on all their groups, especially if there is wide variation in the competence of personnel. The first factor to consider is the function and purpose of the agency. If the agency is committed to the task of providing individualized group experience, then it is absolutely necessary that records be kept. If, on the other hand, the agency conceives its role in more general terms, it may not have need for full records. Another factor to be considered is the level of current group work practice as observed in the agency. If the agency has workers who are adequately prepared to do a good job as group workers, they should be able to assume a responsible role in relation to recording. If, however, workers are not well trained, it is doubtful that they will be capable of keeping records that will be of much value. Workers who have never engaged in record keeping will need special help in developing their skill in this area. It takes time to write records. Unless agencies recognize this and allow for it in determining worker loads, it is impossible to do an adequate job of recording. Facilities and staff services are required as well. Another factor to consider is the nature and purpose of the specific group. If it is a group of indeterminate status, lacking fixed enrollment and definitely conceived as a short-term activity group, it may not require full recording. If the group is considered

NSOU ? PGSW-III 269

99%

MATCHING BLOCK 538/546

SA

Unit 12 Supervision and Recording[13506] new.docx
(D122078278)

permanent, or at least long-term, with definite objectives in the sense of individual development, then records should be kept. The availability of competent supervisory help for workers is another factor. Records take on much more meaning when they are discussed by the supervisor and the worker they are discussed by the supervisor and the worker together. Supervisory staffs must be sufficiently large in relation to the number of workers supervised, so that records, will be read with care and will be utilized regularly in the supervisory process. The departmental organization of the agency will be an influential factor in the setting up of a system of recording. If records are to be used by all departments, there must be agreed-upon uniformity of content and centralization of the material to make it promptly accessible to all. When the agency is a part of a national organization, its records will necessarily be geared to the total requirements of the national scene. The fact of agency membership in local federations or in social welfare councils will influence the form and content of records. If, after analysis of its own situation, an agency decides to move ahead on establishing a system and requirement of narrative process recording on all or some of its groups, the following questions must be studied: what does it mean to record the group work process? What should be included in the record from the standpoint of content? How can workers be helped to learn how to write good records? What can be learned from analysing records, and how can the learning be utilized? 12.3.7 Meaning of the Record in the Group Work Process First, when we set out to record the group work process, we write about individuals and their responses to one another in a given group situation. In other words, we write about the behaviour of the individuals in the group. Second, we write about the type and extent of participation of individuals who are working, playing, thinking or otherwise acting together in the group. We concentrate upon what individuals do as they associate with one another. Third, we note and record the origin and the development of ideas, including their acceptance or rejection by the individuals involved. We look for the interplay of minds and the stimulation of individuals by other individuals. NSOU ? PGSW-III 270 Fourth, we put down exactly what the group worker does as he carries out his helping role with the group. In addition, we record what the worker thinks and feels about the group situation and what he hopes to accomplish as he works with it. Fifth, we put down movement, growth, and change as we see it in individuals and in the group as a whole. Sixth, we write about the relationship between the group and the agency and include community relationships when these are significant in understanding the group. Recording the group work process thus implies that we shall concentrate upon individuals working together in group situations, relationships among individuals as reflected by their participation, interaction within group and between groups, ourselves as workers present to exercise a helping role. This may be restated as who? – the members of the group; what? – the things they do together; how? – the way in which they do things together; why? – the reasons why we think certain things occur or fail to occur. In the beginning, workers who are learning how to record the group work process, discover that their job consists of alert observation and sensitivity to what is happening in the group; selection of what to include; organization of material selected; the actual write-up; analysis of the material written; interpretation and utilization of the material in next steps with the group. 12.3.8 The Content of the Narrative Record The writing of the narrative record is one part of the worker's job in group work. Any outline or list of what to include in the record is a reflection of the group work philosophy of the person or persons drawing up the outline. When workers have good insight as to the basic principles of social group work, the items included in content lists tend to emphasize or illustrate these principles. Because groups are different, any list or outline of what to include in the record must be something to select from and to be guided by in a general way. At the outset, workers should be encouraged to include everything that they see as important in understanding the group. As the worker develops security and skills with a given group, changes will come about in the recording. The worker will see more than he saw at first. He will recognize the importance of his own role within the group and will comment upon it more fully.

NSOU ? PGSW-III 271

100%**MATCHING BLOCK 539/546****SA**Unit 12 Supervision and Recording[13506] new.docx
(D122078278)

He may discover perplexing and conflicting situations which need further study, and so he will include more interpretation and evaluation in the records. Various items which might appear in the records of a group which has been meeting for some time include the following: 1. The record should include basic identifying information about the group, its name, the date, time, and place of its meeting, the names of individuals present and absent should be listed and new members properly noted. The physical setting within the agency or away from the agency should be mentioned at the beginning of the record as well as any important observations on whether or other conditions which might affect the attendance. 2. The record should include mention of individuals by name; what they do, what they say, and how they get along in the group should be recorded along with the sequence of their participation. Specific contributions of individuals should be mentioned as they interact with other members of the group. The emotional quality of participation, as reflected by behaviour toward other individuals or the worker, is important and should be included. 3. As the worker works along with the group he will become aware of the group as a whole. By putting down what the group does in its activity programme, by noting positive and negative response to experience, and by recording what the members say about their group in relation to the agency, the worker becomes conscious of the group as it moves through various phases of its development. 4. The relationship and role of the group worker should be included. When the worker provides materials, makes arrangement, introduces new members, offers suggestions, leads discussion, participates the activities, interprets the agency, or in any other way enters into the affairs of the group it should be recorded. 5. At the close of each meeting's record the worker should include a section of evaluative comments regarding what happened during the meeting. This section can consist of questions, explanations as why things occurred or failed to occur, and tentative plans for the future. Such comments or meeting- by-meeting evaluations are exceedingly important and frequently are longer than the actual meeting record.

NSOU ? PGSW-III 272 6.

100%**MATCHING BLOCK 540/546****SA**Unit 12 Supervision and Recording[13506] new.docx
(D122078278)

The worker should include both planned and informal meetings with individuals before, after, and between group meetings. If the worker works with committees, that are a part of the group, these meetings should also be described. Individual conferences between the worker and offices of the group, and meetings that the worker established for the purpose of locating programme resources should be included. The goal should be to make the record as complete as possible. 12.3.9 Learning How to Write Records The development of skill in recording is fundamentally a matter of becoming capable of observing the group, analyzing what is going on and understanding what it means to the individuals. As workers become more skillful in their work with groups and develop insight into their own role and responsibility with the group, their records reflect this growth. As one worker put it, the recording is not difficult, but the thinking and analysis that precede the actual writing are difficult. Many workers believe that there is value in writing up the factual account of the meeting shortly after it has been held. The analysis of what happened then appears in the section of evaluative comments. This section may not be written until a few days after the meeting when the worker has had more time to think about what occurred. Some suggestions that have proved helpful to workers who are learning how to record are given as possible helps. Some workers find it helpful to prepare a brief topical outline before writing or dictating major record entries. Such outlining helps in the organization of the material and in the selection of the most important items. Worker should endeavour, in so far as possible, to attach the names of group members to the action as it takes place. When workers do this, they avoid phrases such as: "it was felt" without telling who "it" is; "there was a good discussion" without discussing what and why it was good; "several members objected" without telling who discussed what and why it was good, "several members objected" without telling who the "several" were; "details were left to be worked out later" without telling what the "details" were or who would work them out. Simple language, short sentences, frequent paragraphing, and the use of topical headings throughout the record will make it easier to analyse at a later time. Identification of the worker by

NSOU ? PGSW-III 273 "

100%**MATCHING BLOCK 541/546****SA**Unit 12 Supervision and Recording[13506] new.docx
(D122078278)

w" or "worker" is preferable, though some find the use of the personal pronoun "I" easier and more natural for them. The dating of all entries is important because it shows continuity and development. Periodic summaries of individual and group growth are important means of reviewing and group growths are important means of reviewing the record and modifying future entries as to style or content. In reviewing the records that have been accumulated over a period of perhaps several months, the worker might ask such questions as: Have I identified myself and included what I did and why I did it? Have I identified the individuals who make up the group and have I included what they did? Have I included all my contacts or did I overlook some important ones? Have I given enough interpretation of what has happened? How can I improve my recording to make the record more specific and meaningful to me? There is no one way to keep the narrative process record. Most workers will develop a style of their own and will include pertinent material as they become aware of the important uses to which the records are put.

12.3.10 Using Process Records—What We Learn from Analyzing Record The worker's use of records begins when he starts to write, because the primary value of records is in helping the worker think through his work with the group. The record should be reviewed before each meeting with the group, since in so doing the worker will be helped to recall salient features of the group's development. After a period of work with the group the accumulated body of information in the record should be studied with a view to ascertaining trends and movements. Record usage thus centres around both immediate and long-term goals. Good records enable the worker to see and understand the kind of relationship he has established with the group. They show his sensitivity and the way in which he picks up group leads or fails to respond to requests for help. Records make it possible for the worker to learn how his role has changed as the group has developed and reveal the kind of problems the group has encountered in carrying out programme and in meeting specific situations. Records help the worker to deepen his understanding of individual and group behaviour and indicate the point at which the individual and the group have arrived in their development. Individuals who need special attention emerge, and the extent

NSOU ? PGSW-III 274

(D122078278)

to which their needs are being met in the group can be seen. Individuals with leadership abilities can be helped to take greater responsibility for the affairs of the group when they have been located by means of the record. In general, records are most useful at the point of evaluation of the group work process. In fact, it is doubtful whether evaluations of programme, individual growth, or worker performance can be satisfactorily made without records. Although partial judgements can be made on the basis of memory, thorough evaluation is possible only if adequate records have been kept. From time to time it is advisable for the group worker to go back over his records and prepare an analysis and summary. This exercise is extremely rewarding to the worker and is well worth the time required to do it. The worker can learn a great deal about what has happened in the group, and, more important, he can retrace the role he has played in bringing about this group development. Such a review is, of course, essential if the group is being closed. It is also needed if the worker is transferring the group to a new worker. In connection with agency evaluation the summary analysis is indispensable.

12.3.11 Outline For Group Summary In writing the analysis of the group record, it is important to include throughout the place which workers have had in these various aspects of the group behaviour. In describing worker's relation to the group, it is important to indicate not only what he did but what were his purposes, his assumptions and, so far as he can evaluate them.

1. What has been happening to individuals in the group? Add to face sheet material a brief description of the behaviour of the person and his adjustment in the group.
2. How has the group changed in purpose and membership? A. Has the group stated a purpose? If so, what is it? Judging by its behaviour, what seems to be the dominant purposes of the group? What needs are being met? What unavowed purpose do you see evident? How are the group objectives influenced by unconscious motivations in your opinion? How does agency function or purpose affect the purpose of this group? How does the surrounding community affect group's objectives?

NSOU ? PGSW-III 275

(D122078278)

B. What changes in purpose or membership policies have occurred during the period of the record? Why did these come about? C. How is membership determined? What agency policies affect membership? What individual factors of congeniality, etc., are determining membership? D. What social factors are affecting the make-up of the group? Note influence of nationality parochial or public school, occupation, location of residence, financial status of family, parents working away from home etc. E. What relation has worker had to this success of formation, the determining of objectives and membership? What has he aimed to do in this area? What has resulted? 3. How do the members relate to each other? A. Describe the pattern of acceptance and rejection in the group showing changes over the period. B. During the period of the record, how have subgroup's affected the way the group has functioned? Note cliques, conflicts between subgroups, leadership subgroups etc. How have groups based on personal congeniality or personal hostility affected the formation or functioning of authorized groups, such as committees? How have social factors such as occupation or race affected subgroups? C. Does the group treat any of its members consistently in certain roles, such as scapegoats, rebels, clowns, outcasts, or objects of pity to be uplifted by the group? How do you account for the attitudes in these cases – both on the part of the group and from the viewpoint of the individual treated in this way? D. What part has worker played in this process of acceptance, rejection, and status finding? How has he affected the patterns? How has he used it in relation to individuals? To the whole group? 4. How is the group governed? A. Does the group have a formal system of control embodied in a constitution or set of rules? If not, what means has it of control? Is so, how much does the group abide by its own rules? B. How much control do the officers exercise over the programme and behaviour of the group? How much is this affected in total group participations? What limits are set over the power of the officials?

NSOU ? PGSW-III 276

(D122078278)

C. What committees does the group have and what are their functions? What part has worker had in setting up of committees? What were his aims here? D. Are there instances of socially inert or passive members? Of dependent or dominated members? Of fringe members not actively engaged in the group? If so, describe psychological basis of their position as you see it. E. Does the group control its members outside of the meeting? In what respects? How is this done? F. What kinds of issues have produced conflicts in the group? How does the group react when it cannot get what it wants? How was authority used in such situations? What part did worker play in such conflicts? G. Is there any unauthorized group or individual controlling or attempting to control the group? How is it working to do this? How successful is it? What methods were used? H. Who are the indigenous leaders of the group? What contribution do they make which accounts for their rise to headship? What needs or drives of their do you think play into their leadership? How do they use their position as leaders in controlling the group? I. What agency regulations or requirements affect control of the group? How are such controls put into effect? What part does the agency staff other than worker have in such control? J. How do attitudes toward authority, neighbourhood tradition, class, habits etc., affect the reactions of the group toward authority and self-government? K. What has the worker done in regard to the control of the group? At what points has he taken control himself? What methods did he use? What were his aims in doing this? What were the results? How has he attempted to establish democratic method through indigenous, leaders? 5. How does the group make up its mind? A. What kind of questions required group thinking and collective decision during the period of the record? Were these handled in business meetings? If not, how and where did the discussion occur? B. In the business meeting of the group, is formal parliamentary procedure used? Informal discussions? NSOU ? PGSW-III 277 C. How does the group usually come to its decisions? By majority rule? Compromise? Integration? What is the usual attitude of the minorities toward majority decisions? What opportunities are afforded for minority expression of opinion? How does the majority treat minority opinion? D. Has the group had discussions of questions other than those in business meetings? Are they "bull sessions", planned discussions, "round labels", "truth sessions"? What subjects have come up for such discussion? E. In the business meetings or subject discussions of the group, what is the quality of the group thinking in terms of information gained or used in the discussion, clarity of thinking, influence of emotional and irrational factors in reaching conclusions, ability to come to integrated group conclusions where necessary, etc? F. What part has worker played in group deliberation? What educational purposes has he had in mind for such deliberative meetings? With what results? 6. What has happened to esprit corps? A. What is the general social climate of the group in terms of factors, such as the following: friendliness or hostility toward each other; opportunity for free expression opinion and receptive attitude toward such, attitude toward authority as represented by worker, the agency, or the indigenous leaders; ability to cooperate effectively for common ends? What outside factors, such as physical setting of the group, fatigue, home, school, or work situations have in your opinion affected this climate? If the climate has changed markedly during the period of the record, what has produced this change? B. How has spirit do corps of the group fluctuated during this period? What has produced these fluctuations? How has it been affected by programme, conflicts, interpersonal acceptance and rejection, events outside the group? C. Do the members vary in their attachment to the group? How does this show itself? What is the pattern of group attachments? D. Does the group use any symbols or ritual to express its attachments to the group? Where did these come from? What effect do they have on group cohesion? Or individual reactions to the group? What effect do they have on the group's standing with other groups in the agency?

NSOU ? PGSW-III 278

E. What relation has worker to these aspects of the group? What has he aimed to do about it? What resulted? 7. What are the dominant values in the group? A. What evidences are there of commonly accepted values affecting the behaviour of the group? Are these values formulated into a clearly understood code? If so, what does the code require of this members in the way of behaviour? What does it forbid? Do these values deviate from the mores of the neighbourhood? If so, how? At what points are they different from those of worker? At what points do they differ from those of the agency? B. If the group has certain accepted standards, how do they affect individual behaviour? How are they enforced by the group? Are awards or punishment given? C. How are the group values related to its selection of indigenous leaders? Do its stigmatizing of certain members? To what extent does the elected or natural leader embody the group ideal (e.g., in popularity with the other sex, physical powers, prominence in a skill, embodiment of a social purpose, etc.)? In what ways are its values influenced by those of its indigenous leaders? D. Does the group indicate rejection of certain values? Does it have an enemy outside itself in the form of another group, racial grouping, or area? If so, how is this hostility expressed? Does it show evidences of social prejudices, racial, religions, economic, etc.? E. Does the group think of itself as in line with community standards or is it in revolt against them? Or, if the latter, is it consciously antisocial, or does it consider its standards high than those of the community? In any of these situations, how have you as worker dealt with this attitude toward accepted values? F. How is the agency attempting to affect these values? What does worker do about them? What is his aim in doing this? What has resulted? 8. What has been the programme of the group? A. List the major activity of each meeting, i.e., business meeting, trip, party. B. How is programme determined?

NSOU ? PGSW-III 279

C. What activities have met with the greatest response? The least? D. What contribution do you feel the programme activities have made to individuals? E. How did the worker's interests and skills affect programme? What was his part in determining it? 9. What is the relation of group to other groups? A. Has this group had any relation to other groups inside the agency? How has this group been related to programme planned for whole agency? What effect does this have on its own programme? What contacts has it had outside the agency? Describe the contact in each case in terms of activities engaged in an effect on the group. B. What part has worker played in these intergroup activities? What has he aimed to do through them? What has resulted? C. If this is a representative group, what is its relation to this constituent group? 10. What is the relation of worker to members of the group? A. During the group meetings are there certain members who are constantly endangering the effective functioning of the group by such behaviour as bullying weaker members, refusal to carry their share of work, showing off by noisy or irritating behaviour, passively, or day-dreaming, acting tough, monopolizing the leader? What is the relation of worker to these persons? How does he handle this behaviour in the group? How has he used group programme or group pressures to deal with this behaviour? Are there certain members who are normally helpful to the group by such behaviour as making useful suggestions, assuming responsibility, helping or protecting weaker members, quieting noisy members, upholding agency standards, stimulating thinking or control of emotional outbursts of others? What is the relation of worker to these persons? How has he used their behaviour to promote group programme or group relations? How has he used group programme or pressures to develop their capacities? To what extent does the worker work with the officers or committee chairman in planning business meetings or programme? NSOU ? PGSW-III 280 B. Outside of the group meeting, what contacts has worker had with members of the group? In lobbies, streets, homes, etc., in which he saw the person by himself or with one or two others? How did these contacts arise? What occurred in the interviews of significance to the person or to the functioning of the group? C. In dealing with members on an individual basis, has worker referred members to other agencies or used other resources within the agency? II) Statistical Summary: Enrollment at beginning of the period Number of members added during this period Including (a) old members re-enrolled (b) new members enrolled Number of members dropped during period Cumulative enrollment Enrollment attendance Cumulative attendance (Summation of attendance at each regular meeting) Attendance index Cumulative attendance ----- = attendance index Enrollment attendance

12.4 Conclusion The writing of the records is becoming an integral part of social group work method. Since, social group work is the process of working with the people, it needs to maintain record to conduct the group activities perfectly and methodically. Recording is thus a tool for the improvement of the horizon of different activities concerning the group. In short its utilities are: (1) helps the worker in developing skill in terms of better understanding of the individual, and ability to think analyse and evaluate, (2) helps the group worker to understand the groups as a whole because in the record writing process he becomes aware of the whole, (3) the record provides the worker NSOU ? PGSW-III 281 with evidence of growth and change in the part of the members and of himself as a worker, thus record serves as an instrument of evaluation, (4) it provides contents for supervision both on the part of the worker and the agency, (5) the record provides a source of future programme planning because it is a reflection of expressed and unexpressed and unfulfilled interests and needs as well as amount of what actually happened, (6) it provides historical data which may be used by new workers to maintain the continuity of work, (7) the record provides data to the higher opportunities, which gives financial support to the agency, (8) the reports sometimes help to resolve the difficulties arising in the course of group activities, (9) the reports helps the absentee members to follow the discussions in the meeting, (10) lastly, these records are of immense value in social research. Since, WHO in every group is different, the WHAT, HOW and WHY are also different. It is, therefore, impossible to develop a rigid records. Writing records helps the worker to acquire greater skill and sharpen his knowledge and understanding of the complex dynamics of social group work process. The reports must be factual, clear and simple and must fruitfully represent the tempo of group process and the interaction between various people within the group. In the task of evaluating of the work of a group or the agency as a whole, well written and objective reports will go a long way.

12.5 Exercise 1. What do you mean by record? What are the elements of record in social group work? 2. Write in brief the principles of recording. 3. Elucidate the importance of narrative records. 4. What are the meanings of record in the group work process? 5. As a professional gives an outline for group summary records. 6. What is Supervision? What are the functions of supervision? 7. Write in detail the supportive functions of supervision. 8. State how the task model of supervision differs from the developmental model? NSOU ? PGSW-III 282 9. What activities generally fall under the mode of supervision? 10. What are three ways in which prolonged job related stress affects professional performance? 11. Elucidate the role of a supervisor in the group work process.

Mutual Awareness: The members of a social group must be mutually related to one another. A mere aggregate of individuals cannot constitute a social group unless reciprocal awareness exists among them. Mutual attachment, is therefore, regarded as its important and distinctive feature. It forms an essential feature of a group. 2. One or more Common Interests: Groups are mostly formed for the fulfilment of certain interests. The individuals who form a group should possess one or more than one common interests and ideals. It is for the realization of common interests that they meet together. Groups always originate starts and proceed with a common interest. 3. Sense of Unity: Each social group requires sense of unity and a feeling of sympathy for the development of a feeling or sense of belongingness. The members of a social group develop common loyalty or feeling of sympathy among themselves in all matters because of this sense of unity. 4. We-feeling: A sense of we-feeling refers to the tendency on the part of the members to identify themselves with the group. They treat the members of their own group as friends and the members belonging to other groups as outsiders. They cooperate with those who belong to their groups and all of them protect their interests unitedly. We-feeling generates sympathy, loyalty and fosters cooperation among members. 5. Similarity of Behaviour: For the fulfilment of common interest, the members of a group behave in a similar way. Social group represents collective behaviour. The-modes of behaviour of the members on a group are more or less similar. NSOU ? PGSW-III 10 6. Group Norms: Each and every group has its own ideals and norms and the members are supposed to follow these. He who deviates from the existing group-norms is severely punished. These norms may be in the form of customs, folk ways, mores, traditions, laws etc. They may be written or unwritten. The group exercises some control over its members through the prevailing rules or norms. 1.3 Classification of Groups

According to Sumner, "The groups with which the individual identifies himself are his in-groups, his family or tribe or sex or college or occupation or religion, by virtue of his awareness of likeness or consciousness of kind". The individual belongs to a number of groups which are his in-groups; all other groups to which he does not belong are his out-groups. In-group produces among the members the sense of belonging together which is the core of the group life. In-group attitudes contain some element of sympathy and a sense of attachment to the other members of the group. It embodies the collective pronoun 'we'. The members of the in-group display cooperation, goodwill, mutual help and respect for one another's rights (

group Primary Group possesses certain essential traits. The following are the characteristics of Primary group. 1. Closeness or Physical Proximity: Physical proximity or presence provides an opportunity for the development of intimate and close relations. In order that relations of the people may be close, it is necessary that their contacts also should be close.

Smallness: Primary groups are smaller in size. The smaller the size of the group, the greater will be the intimacy among its members. Relationship can be intimate and personal only in a small group. It is a fact that intimacy declines as the size of the group increases.

<p>Large in size: Secondary groups are relatively large in size. These groups comprise a very large number of persons. For example, a political party, a trade union, international associations, such as Rotary Club, Lions Club, the Red cross Society which consists of thousands of members scattered all over the world. 2. Formality: The relations of members in a secondary group are of a formal type. It does not exercise primary influence over its members. Secondary groups exert influence on the members indirectly. They are controlled by formal rules and regulations. Informal means of social control are less effective in regulating the relation of members. Formal social controls such as law, legislation, police, court etc. are very much important for the members. Moral control is only secondary. A formal authority is set up with designated powers in secondary groups. Here man is a legal and not a human entity.</p> <p>SA MSWS-13 Social Work practice with groups.docx (D117055454)</p>

Impersonality: Secondary relations are impersonal in nature. In the large scale organisation, there are contacts and they may be face-to-face, but they are, as says K. Davis, of "the touch and go variety." Here contacts are chiefly indirect. The two persons may never see each other. Relations among them are impersonal, because members are not very much interested in other members as 'persons'. They are more concerned with their self-centered goals than with other persons. There is no sentiment attaching to the contacts. It is not required that the parties know each other. For example, in the large scale factory organisation, the members are known to each other as the boss, the foreman, skilled workers, ordinary workers etc. The secondary relations are viewed as a means to an end and not an end in itself. 4.

Indirect Cooperation: Indirect cooperation is another characteristic of secondary groups. In it, members do different things interdependently. Ali contributes to the same result, but not in the same process. They do unlike things together. In the large scale organisation where division of labour is complex, the members have not only different functions but different powers, different degrees of participation, different rights and obligations. 5. Voluntary Membership: The membership of most of the secondary groups is not compulsory but voluntary. Individuals are at liberty to join or to go away from the groups. It is not essential to become the member of Rotary International or Red Cross Society. However, there are some secondary groups like nation or the State whose membership is almost involuntary (

Role: In secondary groups the status or position of every member depends on his role. The determination of his status is not influenced by ascription or by his birth or personal qualities but by the achievement or the role he plays. For example, the status of the President in a trade union depends upon the role he plays in the union and not upon his birth.

principles of Social Group Work. 3.1 Introduction Social group work is a method of social work that helps individuals improve their social function and better address individual, group, or community problems through targeted group. It is also the process and method by which group life is affected by workers who consciously direct the interaction process towards achieving the goals envisioned within the framework of democratic standards. Its characteristics are that group work with group experience is used as a means of individual development in association with groups and that group workers develop social responsibility and active citizenship for the improvement of democratic society. It is to be interested. Group work is a way of servicing individuals within and through small groups of individuals to make the desired changes to the client's participants. NSOU ? PGSW-III 34 The basic objectives of this unit is to make the learners understand about social group work, its basic purpose, values catering around group work and detailed discussion on various principles one should follow while practicing group work. 3.2 Definition of Social Group Work Social Group work is a psychosocial process which is concerned no less than with developing leadership ability and co operation than with building on the interests of the group for a social purpose (Hamilton, 1949). Kanopka (1960), group work is a method of social work which helps person to enhance their social functioning through purposeful group experiences. 1 (Rengasamy, n.d.) Trecker (1980) says, " Social group is a method in social work through which individuals in groups are helped by a worker who guide their interaction in programme activities so that they may relate to one another and experience growth opportunities in accordance with their needs and capacities to the end of individual, group and community development". 2 (Rengasamy, n.d.) (In Indian context) Social Group Work will refer to working with a small group (members ranging from 7-10) to a medium size group (members ranging from 10- 20) for a variety of purposes beginning from recreation to behaviour modification on the one hand and accomplishing tasks including social change and development on the other, with a variety of clients ranging from children to elderly. The worker makes use of the expertise in human relationships to help these groups to achieve the group goals in a participatory manner while paying adequate attention to individual needs and social norms (Siddiqui,2008) Group Work is well accepted method in social work profession. It basically helps towards improving social functioning of an individuals and groups. It is directed towards bringing about desired changes of individuals, group and community level. The method is applied mainly at two levels, one at individual level and two, entire group as a system level. It helps individual to develop potentialities; identify abilities and help to cope better; enhance social functioning with their environment; to learn to inculcate new behaviour which sustained their life. One should remember that the NSOU ? PGSW-III 35 relationship between Worker to Member, Worker to Group,

try to make the group better. 3.5 Underlying Values in Social Group Work Values refer to our belief that influences our practice on how one should behave. It is therefore influences our practice. There are few core values relating to group work practice as discussed below: 1. Contextual value: The main sources of this value are sponsoring agency and value of social work profession. The core social values in group like equality, democratic participation, group interaction, etc. the agency has its own values that prevail and influences group work. Therefore, it most important to look into the questions: are decision made within the group or outside group? What is the locus-standi of power? Another set of influence come from social work profession. Group worker imbibe professional values like worth and dignity of individual group member, teach respect and fairness in approach, importance of participation, individualization etc. 2. Value of Group Worker: Personal value of worker also influence in the process while working with group. But it is necessary that group worker should inculcate value of cooperation and mutual help enable participation among themselves, promote individual and group initiative, freedom to express thought and feelings, value of members etc. 3. Value of Group Member: Group members also have their own set of values. Worker should be aware about this. It is also a fact that

a) Dignity and worth of individual member; (b) Social Justice (c) Mutual help/responsibility Dignity and Worth: All members should be accepted as they are. We should respect the inherent worth and dignity of member. Group worker should recognize and treat each member as dignified member; Social Justice: fairness in approach should be the cardinal principal. Everyone should get equal opportunities. They have the right to self determination. The worker should understand and take up working on removing causes that created inequalities. Mutual Responsibilities: People are interdependent. They are capable of help- ing with each other. Worker should therefore enable norms, communication, demo- cratic process and taking mutual responsibilities for the development of group and community at large. Principles of Group Work as pointed out by HB Trecker mentioned below with elaborate discussion (Sehgal, n.d.) : The group worker benefits the conscious understanding of the basic principles of social group work because this knowledge provides him/her a frame work to work with the group.

They are basic to all social work methods. A principle is a verbalized statement, general rules or laws, fundamental truths by which we proceed from one situation to another. Principle must be understood to mean a hypothesis so adequately tested by observation and experiment that it may be put forward as a guide to action. Social group work principles are guiding statements that have come from experience and research. Basic principles of working with people in groups to help them grow and change have emerged from the practice of social group work. The objectives of social group work can be fulfilled only within the frame work of principles.

In 1948 H. B. Trecker wrote 10 principles in his book "Social Group Work: Principles and Practice which is still read widely as those are cardinal principles of group work practice. The ten principles are discussed below for our better understanding: 1) The Principle of Planned Group Formation In social group work, a group is a basic unit that an individual can carry out. As a result, organizations and employees responsible for group formation or agency acceptance have factors specific to the group's situation that make a particular group

<p>The Social Group Work process uses group as a medium for providing services to the individual, hence the formation of a group is a prerequisite for a group worker. Whether a group worker works with groups already functioning or forms her own group, s/he should be aware of certain factors while forming a group so that the group becomes a positive potential for individual growth. A group has to be formed in a planned way before initiating the group work process. From what is explained by Trecker we can say this principle comprises the following fundamentals (Sehgal, n.d.) .Groups like individuals are different, evol- ing, developmental and ever-changing and tremendously influential upon the behaviour of individuals.</p> <p>SA Unit 3 _SP_ Final Introduction to Social Group Work_Modified 24th December[14018].docx (D123675973)</p>

<p>The group worker's skill will be evident in the way s/he consciously gives aid at the point of group formation. In India group formation can become a difficult exercise as the people may lack the motivation to join a group and may do so after much persuasion. So the group worker must have the skill to deal with the resistance of such members. The group worker should be equipped with an in-depth under- standing of the client population, and pay attention to inter- personal compatibility and other factors such as age, caste, gender, socio-cultural background etc. 2) The Principle of Specific Objectives. In the work of social groups, specific goals for the development of individuals and groups must be consciously set by employees based on the needs of individuals and groups. Specific objectives of individual and group must be consciously formu- lated by the worker in harmony with group wishes</p> <p>SA Unit 3 _SP_ Final Introduction to Social Group Work_Modified 24th December[14018].docx (D123675973)</p>

<p>and in keeping with agency function. The group worker should help the members achieve the overall objectives of social work through its own specific objectives, which are to assist individuals to grow and change; supplement emotional and social nourishment; promote democratic participation and remedy individual and social disorganization (Sehgal, n.d.) . Agencies and their workers must be aware of what people want from group experiences and help them to get it. The group worker who recognizes the need for consciously formulated specific objectives for individuals and groups becomes a</p> <p>SA Unit 3 _SP_ Final Introduction to Social Group Work_Modified 24th December[14018].docx (D123675973)</p>

purposeful, rather than an unfocused worker and makes the group work in a planned than haphazard exercise. Objectives, thus, become a controlling force in the life of the group and the group worker should have clarity about the specific goals s/he wants to achieve along with the benefits s/he is hoping the members would get. When the worker focuses on individual and group objectives, s/he reduces the likelihood of permitting her/his own needs to get in the way of the group s/he helps the members to see their strengths and limitations and set their objectives accordingly, in alignment with the agency's formulated purposes. The expectations and the aspirations of the members should also be given due weightage while formulating the objectives and activities planned accordingly. 3) The Principle of Purposeful Worker-Group Relationship. In social group work, there is a conscious intentional relationship between workers and group members based on the acceptance of group members as they are and the willingness of the group to accept assistance from workers. There is a need to establish a good relationship

A consciously purpose- ful relationship must be established between the worker and the group members based on mutual acceptance. This principle is based on the premise that it is both possible and necessary to create an effective working relationship with a group before the worker can be of any help(Sehgal, n.d.) . Before the worker helps the group members,

The worker's relationship with the group is a major tool, and the quality and strength of this relationship determine the extent to which the group can be helped to the fullest realization of its potentialities. When the group workers adopt the procedures suggested by this principle, they begin their work motivated by an initial desire to understand the group as a basis for helping it. By encouraging the group to "be itself" and accepting it as it is, the worker becomes accepted and helpful to the group. 4) The Principle of Continuous Individualization. In social group activities, it is recognized that groups are different and individuals use group experiences in different ways to meet diverse needs. Therefore, continuous individualization must be practiced by workers. Groups and individuals within groups must be understood as potential for development and change. Groups

are different and individuals utilize group experiences in a variety of ways to meet their differing needs; consequently, the principle of continuous individualization must be practiced by the group worker. Each group has to be seen as unique, different from any other group, like the members in the group (Sehgal, n.d.). When the group worker individualizes a group, she accepts the fact that human beings are naturally different. To work with groups in awareness of their differences as well as similarities is a reinforcement of the belief that people have a capacity to change, when given adequate opportunities for and help in changing. The worker should be ready for a variety of individual responses rather than a uniformity of response. S/he should accept the differences in individual ability and growth; strive to help individuals understand themselves and help them modify their behaviour towards those who have special needs. Individualization should be a continuous process on the part of the group worker who accepts the certainty of change of individuals and groups (Sehgal, n.d.).

5) The Principle of Guided Group Interaction. In the work of social groups, the main source of energy that drives the group and makes a difference to the individual is the interaction or interaction of the members. Group workers influence this interaction through the type and quality of

Social Group Work is a method through which individuals in groups in an agency setting are helped by a professionally trained worker who guides their interaction in various program activities. The idea is that they relate themselves with others and experience growth opportunities in accordance with their needs and capacities (Sehgal, n.d.). Interaction is a process whereby two or more persons are in a meaningful contact, whereby their behaviour is modified. When people are in groups, the possibility of interaction and inter-stimulation are always present (Sehgal, n.d.). The main source of energy which propels the group is the interaction of the members through planned programme and the group worker influences this interaction by the quality of her/his

383 WORDS

participation. As the possibility of inter-stimulation through interaction is always present in a group, the Social Group Worker must harness and consciously direct and utilize this natural social process. The presence of the worker whose role is to actively influence NSOU ? PGSW-III 42 the type and the degree of interaction, converts the social process into the social group work process. The worker is primarily interested in helping to bring about individual growth and social development for the group as a whole as a result of guided group interaction(Sehgal, n.d.). S/he enhances the potential for interaction by helping members to assume participating roles. The group worker uses methods that stimulate the group to the fullest possible analysis and understanding of their own situation and thereupon influence the social interaction of the constituent members of the society(Sehgal, n.d.). 6) The Principle of Democratic Group Self-Determination. In social group work, groups must take the highest level of responsibility according to their abilities, make their own decisions and help them decide on their own actions. The principle of self-determination is a core value of the social work philosophy and has to be practiced, irrespective of the method of working. In social group work method, as in other methods of social work this principle is of great significance. The idea is to inculcate in the members an ideology of democracy(Sehgal, n.d.). The group must be helped to make its own decisions and determine its own activities, taking the maximum amount of responsibility in line with its capacity and ability. The group has a right to make its own choices and the capacity to make satisfactory decisions. The aim of the group worker is to encourage an ever-increasing capacity on the part of the group to take responsibility for its actions. This principle assumes that groups can develop only when they are given opportunity to behave responsibly but it is to be consciously judged as to how much responsibility a group can be asked to assume at any point in its development (Sehgal, n.d.) . The group worker must first help the group to develop a conscious group-self before it can become responsibly self-determining. The worker should give up any need to dominate the group and instead work with the group on the basis of her/his ability to share her/his wide experience and competence (Sehgal, n.d.). 7) The Principle of Flexible Functional Organisation. In social group work, the processes by which workers lead a group build a formal organization

SA Unit 3 _SP_ Final Introduction to Social Group Work_Modified 24th December[14018].docx (D123675973)**109/546****SUBMITTED TEXT**

215 WORDS

by its members, and function accordingly. Formal organizations need to be able to adapt changes within the group. Every group has some informal organization of its constituent members enables it to function. As the group is formed for specific objectives, it should also have a formal organization to help it achieve these objectives. This formal organization should meet a felt need, be flexible, adaptive and should change as the group changes (Sehgal, n.d.) . The principle does not imply that group worker should organize the group; rather she should help the group organize itself (Sehgal, n.d.) . The group should be encouraged to explore its needs, set its objectives and determine specific functions and helped by the group worker to make its own decisions. The worker should help the group to determine who should take the leadership assignments along with the qualifications and expectations, so that the members are aware of what the group expects from them. Not only the structural details of this formal organization, but the process through which the worker guides the group to have a formal organization is equally important. Group efforts which may be scattered and haphazard become focused when formal organization is made available, as it allows the energies of the group members to be properly channelized. Tasks and duties should be identified and allocated in an orderly manner and members helped and encouraged to assume responsibilities

The process to organize itself is an excellent vehicle for growth. The formal group organization should be simple, stable yet flexible, open to changes as per group needs. The experiences of the group members in solving the organizational problems are no less valuable than the other program experiences. 8) The Principle of Progressive Programme Experience. In social group work, the program experience in which the group participates must begin at the level of progress related to the interests, needs, experiences, abilities of the members, and the developmental abilities of the group. Program in social group work does not only mean the activities or events but is a broad concept that includes the entire range of individual and group relationships, interactions and experiences deliberately planned and carried out with the help of the group worker to achieve the group goals (Sehgal, n.d.) .The group worker should not impose her/ NSOU ? PGSW-III 44 his program plan on the group but

SA Unit 3 _SP_ Final Introduction to Social Group Work_Modified 24th December[14018].docx (D123675973)

group to develop its own program by extending to the group a variety of choices. S/he may only make suggestions as to possible programmes. The program development is a continuous process and grows out of group potentialities. This principle implies that there is starting point for all group programmes. Small beginnings can culminate into bigger and more challenging tasks as the group progresses.

SA Unit 3 _SP_ Final Introduction to Social Group Work_Modified 24th December[14018].docx (D123675973)

The program experiences in which the groups engage should begin at the level of member interest, need, experience and competence and should develop in tandem with the developing capacity of the group (Sehgal, n.d.). The worker should help the group to enjoy a progressive series of program experiences in consonance with the group's potential and capacities. The group cannot be expected to do the same thing all the time (Sehgal, n.d.). After success in simple activities, the group can be encouraged to move to more complex experiences. 9) The Principle of Resource Utilization. In social group work, the entire agency and community environment has resources that should be used to enhance the content of individual and group-wide group experiences. This principle guides the group worker to utilize the available resources to enrich the content of the group experience for individuals and group as a whole. For this it is imperative that the Social group worker should possess knowledge about the resources available in the group, agency and the community (Social Group Work Working With Groups, n.d.). S/he should use her/his skill in locating and then acquainting the group with the various resources which can be utilized by the group for different programs (Sehgal, n.d.). The worker serves as a liaison between the group and the community and her/his ability becomes apparent in the skill with which she draws upon the environment. S/he not only helps to stimulate the group to action but also helps them to discover and use the agency and community resources and those within the group. She must ensure that the members procure the required material for the smooth conduct of the group sessions. S/he should take initiative in mobilizing both material and human resources and oversee the utilization of the available resources by the members for the common good (Sehgal, n.d.). NSOU ? PGSW-III 45 10) The Principle of Evaluation. In social group work, continuous assessment of outcome processes and programs is essential to ensure maximum self-actualization for all. Continuous evaluation of the process and program regarding the results of workers, agencies and members are essential. The social group worker should carry out the evaluation of the outcomes in a carefully planned manner. Maintaining records in a systematic and orderly way aids the evaluation process. Evaluation carried out in an objective and neutral way helps in revealing the extent to which the group has been successful in achieving the group goals. A feedback from the members along with the observation and assessment of the worker help the group members develop insights into their strengths and weaknesses. Evaluation should be done at the end of each session and at the time of the termination. Konopka has described certain principles to work with the groups. Summary of these principles has been narrated here ("Principles of social group work," n.d.): • Social worker's goal is to enable

the group members be given the right of self-direction and self-determination. • The work with the group should be started at the level of group members. It means that proper knowledge of educational, economic, social and other characteristics are essential while working with the group. If the work or programmes are above the mental level of members, they will lose their interest. Social worker must focus not merely on the immediate problem as seen by the group but on relation to the total situation. • Social worker must keep in mind that individual differences exist while dealing with the group members. • It should be kept in mind that the welfare of individual is inextricably interwoven with the welfare of the group. Therefore social worker must be concerned with the development of material, human and social resources to meet all the needs of all the members of the group. 3.6

On the basis of above discussion, one would be very clear about various principles of social group work practice. These are guiding principles and without understanding of such ideas, practice of group work in any set up would be meaningless. One should at least consider HB Trecker 10 principles of social group work, such as principle of planned group formation, principle of specific objectives, principle of purposeful worker group relationship, principle of continuous individualization, principle of guided group interaction, principle of democratic group self determination, principle of flexible functional organization, principle of progressive planning and programme, principle of

<p>Unit 5 ? Theoretical Approaches and Models in Social Group Work Structure 5.1 Objectives 5.2 Introduction 5.3 Theories and Models in Group work 5.3.1 Theories in Group Work 5.3.2 Models in Group Work 5.4 Conclusion 5.5 Exercise 5.6 Reference 5.1 Objectives The objective of this unit is to develop a clear understanding on various social science theories relevant to social group work practiceamong social work students for necessary use in their field work practice. 5.2 Introduction Groups may be defined in many ways as there is no single definition on it. It is also highly problematic and contestable. For the purpose of discussing group work within a context of working with people we may define a group as a small gathering of people. While on the other side group work may be described as the study and application of the processes and outcomes experienced when a small group comes togetherKonopka (1963) defines group work as a method of social work that is utilised in order to 'help individuals to enhance their social functioning and this is possible through purposeful group experiences, and to cope more effectively with their personal, group or community problems. This definition shows a tradition within group work of helping individuals with problems. Brown (1994) provides a</p>		<p>Unit 5 Theoretical approaches and models[13489] new.docx (D122078244)</p>		
<p>SA Unit 5 Theoretical approaches and models[13489] new.docx (D122078244)</p>				

modernised and more comprehensive definition of group work. He is of the opinion that 'group work provides a context in which individuals help each other. It is a method of helping groups as well as helping individuals. It can enable individuals and groups to influence and change personal, group, and organizational and community problems. He then goes on to distinguishing between 'relatively small and neighborhoodcentered' work and 'macro, societal and political approaches' within community work, explaining that only the former may be properly classified as group work. The role of group work can be seen as one which gives emphasis on sharing of thoughts, ideas, problems and activities, in which theoretical understanding is very much essential for the worker to undertake group activities meaningfully.

5.3 Assumptions and Theories Life Skills: One of the assumptions in group work is that many persons lack requisite skills and experiences to cope with stresses in their social relationships. These stresses usually occur in their childhood when children and adolescents move from one status and role position to the other or from one interaction milieu to the other (Rengasamy, n.d.). For example, when a child moves out from secure home environment to a school which is a more open and dynamic environment, from a primary school to middle or higher secondary school, from school to college, etc. These changes can cause stress as a child or an adolescent is expected to adapt to a new set of norms and also rules, meant for regulating behaviour. Adolescents in general experience stress associated with physical development, social acceptance and academic performance (Rengasamy, n.d.). The degree of stress is directly related to the degree of life skills they possess in coping with the change. For example, for a young boy to move from a rural school to an urban higher education institution will cause more stress than for a young person moving from an urban school to a higher education institution in an urban area. Similarly, a child from a family of uneducated parents will face more stress at school and other educational institutions (Siddiqui 2008). The inadequacy of life skills such as verbal and nonverbal communications, asserting, handling feelings and conflicts, functioning of group consisting of members from NSOU ? PGSW-III 62 multicultural background, increases the stress leading to maladjustment problems (Rengasamy, n.d.). This framework would help a group worker to understand the children and adolescents exhibiting stress symptoms and their inability to adjust in the group. The worker can provide these children a support group to discuss their problems and learn from each other and to understand the coping strategies that they are using to deal with the situation. The group worker can help them to learn new life skills to update their competence to cope with stresses and sources of stresses (Rengasamy, n.d.).

Sharing Feedback: The other assumption is that the sharing feedback can influence children and adolescents group very much in building healthy peer relationship. Hence, it is important for them to understand how others relate them. How others view the behaviour of a member? The group can provide an opportunity to children and adolescents to discover how others view them (Rengasamy, n.d.). It can also help them to analyze it objectively and learn to take corrective action if needed. For example, labels to members of a particular religious, linguistic or caste group, which are negative. Also the children and adolescents of these groups experience a high

degree of stress leading to academic and mental health problems (Siddiqui 2008). The group worker can use the knowledge to design a number of programs for children and adolescents indulging in labelling and for those who are at the receiving end(Rengasamy, n.d.). Emotional Support It is observed that a number of persons experience trauma due to a variety of reasons. Some examples are loss of significant persons, family violence, long-term unemployment, retirement, trauma, and loss of shelter or other valuables, etc. These conditions produce stress and could become traumatic. Individual counselling is helpful but emotional trauma shared with fellow sufferers has been found to be of help. There are many studies of children and adolescents affected by disasters indicate that the trauma produces a great deal of anxiety, resulting in loss of concentration and producing incoherent behaviour. The adolescent's reaction to stress may vary such as withdrawal or opting out, depression, loss of control, inability to concentrate, irritability, disturbed sleep or eating patterns, flashbacks and emotional

132 WORDS

numbing. Loss of significant members such as parents or siblings and material resources such as housing will require a different set of life skills and coping strategies to survive. The studies indicate that emotional support from others who have undergone a similar trauma is helpful (Shelby, 1994). The finding is used to form groups of persons having suffered a trauma to provide emotional support to each other. By now it is clear that in order to understand the events taking place within a group, one need to understand the individuals within the group on the one hand and their interaction in the group on the other(Rengasamy, n.d.). There are a number of psychological, sociological and political theories that provides an explanation of individual behaviour and how it can help in understanding the group functioning. Some of these theories are explained below 5.3.1

SA Unit 5 Theoretical approaches and models[13489] new.docx (D122078244)

Theories Learning Theory Learning Theory has raised a lot of controversy in social group work as it focuses more on individual than on group dynamics with reference to influencing individual behaviour. Learning theory also provides a frame work for understanding human behaviour. It provides an understanding of the social functioning of persons within their environments. The person in dynamic interaction with all aspects of the environment is the focus of attention. Further, it emphasizes the importance of assessment of observable behaviour, and advocates the use of specific terms in defining behaviour. And finally it takes a positive approach as if behaviour is learned then it can also be unlearned (Rengasamy, n.d.). It explains that respondent conditioning, which refers to the emission of behaviour in response to a specific stimulus. The stimulus could be a word, sight or a sound. It has been already experimented on dog. The second type of learning here explained to called modelling, which simply refers to learning by observation. The children of parents who smoke are likely to be smokers. Children of parents with ability to control their feelings under stress are likely to learn self-control. However, a number of factors or conditions can affect the effectiveness of modelling. Some of them are similarity of the model to the observer, the prestige, status and expertise of the model, and the diversity of models around the observer(Rengasamy, n.d.). Operant conditioning is a type of learning in which behaviours are altered primarily by regulating the subsequence NSOU ? PGSW-III 64 which follows them. New behaviours could be learned and undesirable behaviours could be weakened and eliminated by regulating the consequences(Rengasamy, n.d.). By using the learning theory framework, social worker can understand how group can provide reinforcements to strengthen behaviour. There are both positive and negative reinforcements. A good example of negative reinforcement in a group situation is to discourage behaviour which are not accepted by others. The learning theory thus provides a framework for group workers to modify behaviour. The context could be achievement of group tasks and development, or helping the members to unlearn behaviours that create problems in their social functioning. Field Theory Kurt Lewin (1946) is one of the pioneers to study group functioning. He focused on the forces that influenced the working of groups. He tried to study leadership styles by creating groups with different styles of leaderships in order to see their impact on the functioning of the group (Rengaswamy, n.d). It is commonly observed that a leader becomes authoritarian when the members are seeking favours, rather than questioning the decisions or even discussing the issues objectively. Lewin argued that the leadership style is a product of leader and member interaction rather than a personality trait of the leader. Further, while developing his Field Theory, he argued that a group has a life space and it has movement. It tries to accomplish goals or group tasks and faces hurdles in its movement. He believed that group was an entity of opposing forces which keep the group members in the group and move them along in achieving group goals. However, the behaviour of individual members and the group itself should be seen as a product of the totality of the group situation (Lewis, 1946). He introduced several concepts to help in the understanding of forces at work in the group. Some of them are • Roles—status rights and duties of group members; • Norms—Rules governing

the behaviour of group members; • Power—the ability of members to influence on another; • Cohesion—The attraction the group members feel towards one another and towards the group; • Consensus—the degree of agreement regarding goals and other group phenomena, and • Valence—the potency of goals and objects in the life space of the group.

SA Unit 5 Theoretical approaches and models[13489] new.docx (D122078244)

Other field theorists have continued to work on the characteristics of group that influence the individual behaviour. Cohesion has been identified as an important factor, defined as, "the totality of forces acting on individual members to keep them in the group. Cohesion reflects the agreement on goals and norms, shared understanding and a greater homogeneity in demographic background, as also the productivity, satisfaction and cooperative interaction patterns (Cartwright and Zander 1968). Lewin developed t-group as a means to observe the effects of group process on group members and as a means to induce changes in behaviour. He thus helped in developing a theory that people change when they see their behaviour as others see it, thus leading to development of the feedback method whereby the group members and the group leader provide feedback to the individual as to how his/her behaviour was affecting them. Role plays and simulations are also used to highlight the group process(Rengasamy, n.d.). The group workers using the field theory framework can design their own interventions in working with the group for achieving the group goals along with individual development(Rengasamy, n.d.).

Systems Theory(Rengasamy, n.d.) The systems theory is helpful to explain the functioning of a group. Talcott Persons explained social system as a set of interdependent elements trying to function as a unified whole to maintain order and a stable equilibrium. The social systems are constantly facing new challenges as the environment around them and within, is constantly changing. Therefore, they must act to maintain the equilibrium if they have to survive. This act of survival depends upon mainly on four basic functions, such as integration; adaptation; pattern maintenance; and goal attainment (Siddiqui, H. Y. 2008). The group viewed as a system would therefore be able to achieve its objectives once it is able to carry out these four functions effectively. It is able to integrate members by achieving individual and group goal matching. It also has the capacity to make changes to adapt itself to outside demands like that of the community and the sponsoring organization and with the internal dynamics as it changes with time. The pattern maintenance would require development of norms and guidelines to regulate its activities and develop well defined objectives, identify and procedures that are able to sustain these over time. The functioning of a system depends to a great extent on the carrying out the role assigned to them. The goal attainment is the final task to ensure the smooth functioning NSOU ? PGSW-III 66 of the system. The members will lose interest and the functioning of the group will be affected if the goals are attainable is an important attribute of group stability and functioning. Parsons pointed out that problems will arise during the functioning of the group; the group, including its leadership must make use of its resources effectively to tackle the problems to maintain the equilibrium of the group(Rengasamy, n.d.). Robert Bales (1950), however, believed that the survival of the group depends on two central tasks. The first he termed the instrumental problems related to tasks or goal related functions and the second, socio-emotional tasks related to the interpersonal relationships between members, and between members and leader, for coordinating and maintaining the emotional unity and morale of the group. While the instrumental problems generally arise on account of the external pressures, the socio emotional problems are rooted in the internal dynamics of the group(Rengasamy, n.d.). The

insights are helpful for workers to deal with both kinds of challenges in their working with groups. It is often seen that exclusive focus on one results in ignoring the other, making the group dysfunctional in the process. The worker can keep in mind that the emphasis on tasks will vary in different groups, depending upon the central purpose of the group. It will be different in a self-help group formed to achieve a specific task, than in a group of children. It is also possible to analyze the interaction between members in a group by using a tool developed by Bales called interaction process analysis (Rengasamy, n.d.).

Conflict Theory Sociologists differ in their understanding of conflict as a social phenomenon in society, yet some of the explanations of conflicts are helpful in understanding the conflicts in groups and in dealing with them (Rengasamy, n.d.). Sociologists have identified two broad categories of conflict, one endogenous conflict, which refers to sources of changes from within a society and other one exogenous conflict, which refers to changes from without or between systems. Endogenous conflict highlights the sources of conflict like inherent predilection to change, conflict over the differential distribution of resources such as wealth, power and prestige, conflict of values, conflict of authority and Conflict between individual and collectively. The exogenous conflict identifies three sources such as wars, cultural invasions and conflict of ideology. Lewis Coser (1973) distinguishes between realistic and non-realistic conflicts. NSOU ? PGSW-III 67

Realistic conflicts are conflicts arising on account of non-fulfilment of specific demands, whereas non-realistic conflicts are rooted in the need for release of tension and are not oriented towards achievement of any specific demand (Rengasamy, n.d.). In every group there are occasions for conflict, since individuals and sub-groups are likely to make rival claims to scarce resources, prestige or power positions. But social structures differ in the way the group allows expression to these claims. Some are more tolerant, others are not. Firstly, it will not aim at resolving the immediate issue as all accumulated grievances will come to force. Secondly, it is because of total personality involvement of the group members. It is important for a group worker to remember that the hostility should not be permitted to accumulate and conflict should be allowed to occur wherever a resolution of tension seems to be allowed to occur. In such cases the conflict is likely to remain focused primarily on the condition leading to its outbreak. Conflicts within a group can also help to revitalize existing norms and help to develop new norms as well (Rengasamy, n.d.).

Social Exchange Theory According to the social-exchange theory, people help because they want to gain in future from the one being helped. People calculate rewards and costs of helping others, and aim at maximizing the former and minimizing the latter, which is known as a "minimax" strategy ("Minimax," 2021). Rewards are incentives, which can be materialistic goods, social rewards which can improve one's image and reputation (e.g. praise) or self-reward. Rewards are either external or internal. External reward is things that obtained from others when helping them, for instance, friendship and gratitude. People are more likely to help those who are more attractive or important, whose approval is desired. Internal reward is generated by oneself when helping others and gaining sense of goodness and self-satisfaction. The central concern of the exchange theory is to find an explanation for the human transactions of giving and receiving. James Frazer suggests that men enter in to institutionalized patterns of exchange to satisfy their economic

needs(Social Group Work | PDF | Social Group | Psychological Trauma, n.d.) But there is a difference between economic exchange and social exchange. Social exchange process can yield for the larger society a moral code of behaviour, which acquires an independent existence outside the social exchange situation and which

322 WORDS

informs all social, economic, and political interpersonal relationships in society(Rengasamy, n.d.). The triple obligations of social exchange- to give, to receive and to repay – are to be understood not as self- interest but in terms of interpersonal, hence inter-group, relations. Social exchange transaction creates social bonds creating ties between individuals and the collectively. Some argue that it is the exchange which is important not the things which are exchanged and the primary function of the exchange is structural integration of the collectively(Rengasamy, n.d.). Homans (1950) and Blau (1964) among others have developed the exchange theory to explain membersbehaviour within a group. They argued that all members in a group will try to maximize individual rewards and minimize punishments. All human interaction according to them is seeking something in return from the other. The behaviour is conditioned to maximize rewards and minimize punishment in all interactions(Rengasamy, n.d.). The cognitive process and the members capacities are not full explained by the exchange theory can be summarized as follows: social –the greatest rewards within a coalition are given to the least dependent member of the coalition. Behaviour– is an exchange of goods, material and non-material, such as approval or prestige. Persons that give to others try to get something in return, and persons who receive from others are under pressure to give in return. This process of exchange tends to create equilibrium to balance the exchanges. Human Capital and Social Capital James Coleman (1988) is one of the advocated for rational choice theory. Coleman believes in a concept known a methodological individualism. The two concepts in Coleman’s theory are actors and resources, and two key resources, according to him are: human capital and social capital. Similar to the creation of physical capital by shaping the material into tools and machines to facilitate production, human capital is created by shaping the individuals by giving them skills and capabilities that gives them power to act in innovative ways to produce(Rengasamy, n.d.). Social capital is Human Capital created by shaping relations between individuals to facilitate action. For example, a group where members trust each other will act

SA Unit 5 Theoretical approaches and models[13489] new.docx (D122078244)

better than the one where there is no trust. The importance of social capital has been exhibited by the acceptance of team development efforts by the corporations. • Skills & Abilities • Creativity • Life Experiences • Knowledge • Human Capital Human capital and social capital can complement each other or they can destroy each other. Social capital as a concept can help the actors to realize the importance and usefulness of those aspects of social to realize the importance and usefulness of those aspects of social structure which will help them to achieve their interests. In a cohesive group where members are willing to help each other and abide by the group norms, the level of trust worthiness of the group environment is a crucial factor in the success of the group. It means that the obligations will be repaid(Rengasamy, n.d.). A simple example is the rotating credit groups. In such groups, each member contributes and amount to a central fund, which is given to a member. Each member gets his/her amount back and in addition gets a loan without interest. However, if obligations and expectations are not balanced the social capital gets diluted. Norms and effective sanction can help in balancing obligations and expectations. Psychoanalytic Theory Sigmund Freud is one of the earliest theorists to provide an explanation of human personality. He conceptualized that the human mind has broad systems. He described these systems as conscious, pre-conscious and unconscious and the other as Id, Ego and super Ego (Daniel K. Lapsley and Paul C 2011). Freud suggested that mind was composed of thoughts (ideas), feelings, instincts, drives, conflicts and motives. Most of these elements were located in the unconscious or preconscious. There is a repressed area which serves as a barrier where a lot of disturbing material (thoughts and feelings), as unresolved conflicts, are placed through the process of defense mechanism. Defense mechanism or repression is a process in which unacceptable desires, memories and thoughts are excluded from consciousness by

SA Unit 5 Theoretical approaches and models[13489] new.docx (D122078244)

sending the material into the unconscious area under the repressed barrier are avoided. He observed that this results in producing irritants such as unwanted emotions and behaviour such as anger, hallucinations, etc. Describing the second system Freud explains that Id is the primitive psychic force hidden in the unconscious. It represents the basic needs and drives such as hunger, thirst, sex and self-preservation, which support other personality factors. Id governed by the pleasure principle primarily seeks to express itself irrespective of the consequences, while Ego acts as the rational component of the mind which controls the thinking of the mind. Super ego serves as the conscience by indicating what is right and wrong socially and morally (Rengasamy, n.d.). Freud conceptualized that people pass through six psychosocial development stages. During any one of the stages conflicts may arise and if it remains unresolved the person's personality development will be affected. He thought that disturbances can arise from several sources. Traumatic experiences which a person's ego is not able to cope with directly are repressed. Similarly internal unconscious processes could also cause disturbances. Freud, in elaborating the group's influence on human behaviour, specifically mentions about the importance of group leader, and the early life experiences of the members (Rengasamy, n.d.). The members use transference in their interactions that occur within the group and try to recreate conflicts. A number of psychologists have contributed in developing learning theory as an explanation of human behaviour, which is very helpful to understand individuals and also helping them, which could be studied first and helped through group activities, counselling, etc.

5.3.2 Models in Social Group Work

Social workers basically utilized four distinct group work models. These are Social Goal Model; Remedial Model; Mediating Model and Developmental Model. Besides, there are other models, which are considered as suitable models for effective practice in social group work such as the Behavioural Model, Kurt Lewin's individual change process, Bale's stages of group development, Tuchman's stage model, Fisher's theory of decision emergence in group, Northen and Kurland's model, etc. A brief of each of these models are given below:

NSOU ? PGSW-III 71

The Social Goals Model: The basic concepts of this model are social consciousness, social responsibility, and social change. It is suggested that by participation with others in a group situation, individuals can affect social change. Social action is the desired outcome, and the group worker is regarded as an influence person and enabler, who personify the values of social responsibility and acts as stimulator and role model without purveying any political viewpoint. Implicit in this model is the emerging leader within the group. The model is concerned with democracy and the enhancement of personal functioning within the social context, heightened self-esteem and an increase in social power for the members of the group collectively and as individuals (Bimal Antony, 07:39:28 UTC).

Remedial Model: Remedial model focuses on the individual's dysfunction and utilizes the group as a context and means for altering deviant behavior. This approach to group work practice emphasizes its utility in removing the adverse conditions of individuals whose behavior is disapproved by the society. Clients of such social group work practice are physically and mentally handicapped, legal offenders, emotionally disturbed, isolated and alienated persons. The Michigan School contributed to this model. Credit

goes to Vinter and his colleagues for developing remedial model. In this model attempts are being made by social worker to bring change in the individual. According to the Remedial Model, the group can be used to treat problems of adjustments in personal and social relations. According to Vinter "attention to such problems reaffirms the profession's historic mission of service to those most in need". The remedial model is considered more as a clinical model that seeks to help the socially maladapted to improve social functioning through guided group interaction experience (Bimal Antony, 07:39:28 UTC). The social worker plays a key role as he/she gives expertise knowledge through the following activities.

- The social worker is the central person. The worker is the object of identification and drives.
- He/she is a symbol and a spokesman. He/she tries to maintain norms and values of the society.

186 WORDS

He/she is a motivator and stimulator. He/she helps the individual and group to understand their goal as a group member.

- He/she is an executive. He/she facilitates the activities of the group in order to gain the said objectives. In this model whatever the changes are brought, they are explicitly limited to organizational and institutional elements that are responsible for individual's dysfunction. Though this model, one can focus on the individual client who is experiencing difficulty in a group situation. The model is helpful for those likely to be affected. It means this model focuses on preventive aspects also.

Reciprocal Model or Mediating Model: Schwartz has introduced this model in 1961. This model is based on systems theory, humanistic psychology and an existential perspective. The chief characteristic of this model is that the people and society are interdependent as due to the reason they have mutual needs. In this model attention is directed towards the relationship of members in the group with each other, with the worker and the group as a whole. It is the relationship among the members that shows the characteristics of the group. It gives importance to the emergent goal and actions, which are based on feelings of the group.

Client and worker together as well as separately challenge the current problems with their total capacity. Basic educative processes are utilized which incorporate particularizing, synthesizing and generalizing the feeling and action components of the problem. In this model distinctions are not made with respect to types and several of group since it is presumed that this model is widely applicable. In this model the individual and the group are significant components. The workers role appears here to be facilitative, relying on the power and potency of mutual aid system to take care of itself. Developmental Model: This model has been developed by the faculty members of Boston University in 1965

over a span of time. The degree of intimacy is taken into account for appropriate worker interventions. This model derives knowledge from Erikson's ego psychology, group dynamics and conflict theory. The worker is connected with community, agency, social group and also with the individual member in our society (Principles, Skills and Models of Group Work Practice - IGNOU, n.d.). The social group worker tries to improve the situations among individual member, group agency and the social environment. In short, it can be said that the developmental model is a compromise between the reciprocal, remedial and traditional approaches. Behavioral Model: In this model some specific group programmes are implemented to alter dysfunctional patterns behavior. The expertise of behavioral group therapist is essential in assessing and devising a treatment plan for each individual member within the context of the group

SA Unit 5 Theoretical approaches and models[13489] new.docx (D122078244)

The group worker calculates the specific elements of the disturbing behavior to be decreased or desired behavior to be developed. Other group members provide assistance and feedback concerning progress throughout the stages of the treatment process. Besides, a number of such theoretical models have been developed to explain the change in group over certain period of time. Some of the important theorists' models are given subsequently. Kurt Lewin's (1947) individual change process: Kurt Lewin is remembered for coining the term 'group dynamics'. His model of individual change is a stepping stone for many pioneers who have contributed theoretically. His model has three stages such as unfreezing, change, and freezing in a change process or small group. The first stage makes effort to remove lethargy or sluggishness and dismantles the existing mind set. The second stage is the transition phase that brings change. In the last phase, the new mind set is crystallized and individual becomes stable (Lewin's 3-Stage Model of Change: Unfreezing, Changing & Refreezing - Video & Lesson Transcript | Study.Com, n.d.). Bales's (1950) stages of group development: Bales noted some stages of group development like orientation stage, evaluation stage and decision making stage, which are described as below:
Orientation: The

SA Unit 5 Theoretical approaches and models[13489] new.docx (D122078244)

first thing in the stages of group development is that the person in a group has to familiarize himself with other people and explore the possibilities that the group has to offer to him. Thus, Bales termed this as orientation stage. Evaluation: Bales went on to suggest next things to members to analyse the information gathered and reach some conclusion about what kind of members are there, whether they are trustworthy, helpful and cooperative and how they look at the other members, its activities, programmes and so on. He therefore termed this stage as evaluation stage. Decision making: According to Bales, the evaluation of members about the people, programmes and benefits would lead to decision making about the participants and action in the group. Bales termed this stage as decision making. Tuckman's (1965) stage model: Bruce Tuckman reviewed about fifty studies of group development (including Bales model) in the mid nineteen sixties and synthesized their commonalities in one of the most frequently cited models of group development. The model describes four linear stages, such as Forming, Storming, Norming and Performing stage. Forming which is the first stage of group process. The forming of the team takes place. The individual's behaviour is driven by the desire to be accepted by the others, and avoid controversy or conflict. Serious illness and feelings are avoided, and people focus on being busy with routines. This is comfortable stage to be in but the avoidance of conflicts and threat means that not much actually get done. The team meets and learns about the opportunities and challenges and then agrees on goals and begins to tackle the tasks. Team members tend to behave quite independently. Storming is the second stage. The members begin to assert the individual personalities and the comfort of the forming stage begins to come under siege. Members experience personal, intra and inter group conflict. Every group enter the storming stage in which different ideas compete for consideration. The team addresses issues such as what problem they are really suppose to solve, how they will function independently and together and what leadership model they will accept. Team members open up to each other and confront each others ideas and perspectives. The activities make in the storming phase are lack of cohesion, subjectivity, hidden agendas, conflicts, confrontation, resentment, anger, inconstancy, failure and so on. The next stage is Norming. During this stage, the group begins to work more constructively together towards formal or informal roles (THEORY | GROUPS & GROUPWORK, n.d.). Some

SA Unit 5 Theoretical approaches and models[13489] new.docx (D122078244)

members may not be comfortable with the role or roles which have been allotted. During norming stage sub-groups are likely to form in order that a supportive environment is once more created. Group members establish rules about how they will achieve their goal (TEAM | Meaning in the Cambridge English Dictionary, n.d.). They address the types of communication that will or will not help the task. Indicators include: questioning, performance, reviewing, clarification objectives, changing/confirming roles, opening risky issues, assertiveness, listening, testing new ground, identifying strengths and weakness. Performing is the 4th stage of group development. This is the best stage for a group to complete the tasks and assuming that task. This stage the group also reach to a conclusion and implement solution to their issues. Indicators in this phase include creativity, initiative, flexibility, open relationships, pride, concern for people, learning, confidence, high morale, success, etc. Last stage is Adjourning. This phase was added when Tuckman and Jensen updated original review of the literature in 1977. The final stage in the group ultimately is the termination. Though often overlooked, this stage in a group development is equally important to positive outcomes. The ending of a group can be very unhappy and distressing tune for some members, as they may feel some extent of dependency on the group. Fisher's (1970) theory of decision emergence in group: Fisher outlines four phases i.e. orientation, conflict, emergence and reinforcement. In the first phase, members get to know each other and experience primary tension. Second phase is meant for conflict and marked by secondary tension. Members there disagree with each other and debate ideas. Group's tasks as well as members' viewpoints become apparent in the emergence phase and group members bolster their final decision in the last phase (Fisher's Model – Small Group Communication, n.d.). Tubbs's (1995) system model of group development: Stewart Tubbs studied small group interaction and developed a system model focusing with four phases of development such as orientation, conflict, consensus and closure (Tubbs' Systems Model, Fisher's Theory of Decision Emergence in Groups, Poole's Multiple-Sequences Model – Organizational Behaviour, n.d.). In the first phase, group members introduce each other, start talking on the problems and examine the strengths as well as weaknesses. Ideas are evaluated through conflict in

SA Unit 5 Theoretical approaches and models[13489] new.docx (D122078244)

the second phase. Conflict ends in the third phase and the last stage announces results. Northen and Kurland's (2001) model: Northen and Kurland focus on a few stages of group development and point out that each stage has its own developmental issues that must be attended and at least partially resolved before the group can move into the next stage. Northen and Kurland proposes a four staged model with emphasis on socio-emotional themes. The different stages are described below. Inclusion-Orientation: The main socio-emotional theme of this stage, as implies, is whether or not group member will feel included. This stage is typically marked by anxiety and uncertainty as the group members become acquainted with the group leader and each other. The major task for the members is to become oriented to the group and to decide to be included in the group's membership. Uncertainty-Exploration: The major theme of this stage has to do with group member's uncertainty regarding issues of power and control. The socio-emotional issue pertains to conflict, especially relationship to the group leader. Group members at this stage explore and test their relationship with the leader and each other in order to establish roles and develop trust and acceptance. Mutuality—Goal Achievement: At this stage, the group is characterized by mutual aid and problem solving. Socio-emotional patterns among group members show greater self disclosure, empathy and mutual acceptance. Conflict and differences are dealt with as a means to achieve both individual and group goals. Separation-Termination: The final stage focuses on the socio-emotional issues of separation and termination. Members at this stage may be reluctant to leave the leader and the group. The task here is to help prepare members for termination, deal with any unfinished business and, most importantly, help group members thereafter what they have learnt in the group to life outside the group. NSOU ? PGSW-III 77 5.4 Conclusion Social group work is a primary method of social work, which believes that the development of individual is mainly dependent on the group experiences. There are number of socio-psychological problems that cannot be solved without the help of the group and understanding of the theory. The development of personality is also dependent on the use of group life to some extent. The group worker should follow various social science theories, some of the theories as discussed like learning, Social Exchange, Field, System Theory, Psychoanalytic, Conflict Theory and Human and Social Capital etc., are very important. But one should not also forget the theory of Sigmund Freud, psychoanalytic theory. Individual behaviour and their problems could be study well when he or she is in conflict situation. So, using all such theories the group worker can be more knowledgeable, skilful, and logical and make themselves scientific in their approach into practice field. This is also equally applicable that the group worker should develop knowledge and follow appropriate model of group work practice, which would definitely help in reaching the objectives that are set for the groups at the beginning stage. Some of the models like Social Goal, Remedial, Developmental, Fisher's theory of decision emergence in group, Tuckman's (1965) stage model, Kurt Lewins individual change model, Northen and Kurland's (2001) model, Tubbs's system model of group development, Bales's stages of group development, etc, all are important in group work practice. These models are helpful in developing and nurturing groups, especially in

understanding individual in a group and a frame of reference. Scientific knowledge about motivations of human behavior not only provided new insights to the problems which individuals experience as individuals, but make interpretation of interaction of individuals in groups much more meaningful. All theories as discussed therefore are helping to group worker to understand small group and its interaction, behavior etc for group growth and development. It is significantly important because it is helping the individual for personality formation and also personality development. So, understanding of all theories and models relating to group work are important. NSOU ? PGSW-III 78 5.5 Exercise 1. Briefly discuss any four small group work theories in social group work practice (use separate page if required) 2. Write how small group work theories help worker in group work practice 3. Write different models in group work practice and discuss how it can help worker in group work activities. 5.6 Reference Bales, R. <p>agency set up. 6.2 Introduction The various types of groups that can be formed by social group workers are classified as a) Remedial groups, b) Growth groups, c) Task groups(Jagadish, n.d.). Remedial groups are mostly to enable the members to sustain their changed behaviour and to cope up with new situations in life. The focus is more on the socio- emotional needs. This type of group is formed with those people who have undergone some treatment for a pathological condition. For example, a group of people who have been discharged from a drug de-addiction centre have to be helped to continue their changed behaviour and the treatment(</p> <p>SA (SP NSOU 12-7-2016) final Content Write up_ for NSOU (1).docx (D21119376)</p>

<p>Task groups focus on certain work or activity the group is to achieve for its own development. The task could be development oriented, solving a problem or a crisis situation or a social disadvantage. Some examples are: a committee formed by an organisation to deliberate on certain strategies to improve the service delivery, an administrative group of heads of different units of an agency to work out ways and means to improve the performance of the staff and bring about coordination among the different units, group formed to tackle water shortage, poor civic amenities and reservation of jobs for women. Therefore, formation of any short of groups should be done with care and as per proper process, which are analyzed in details as below. 6.3 Group Formation</p> <p>SA (SP NSOU 12-7-2016) final Content Write up_ for NSOU (1).docx (D21119376)</p>

<p>The worker should remember the following important areas while going for group formation. 1. Planning and Group Formation The social group worker representing an agency providing services such as residential care, day-care and community work may come across situations where the services of the agency are effectively utilised by the members through a positive group experience. The needs of the group may even be identified. Once the worker identifies the need for formation of group, he/she starts planning for the formation of the group. For this the worker has to answer some questions with his/her professional background very carefully and systematically (</p>

<p>Another aspect that has to be considered is whether to have an open group or a closed group. In open group there are no restrictions on joining the group from the point of the time. One can be enrolled into the group any time during the life of the group. While the closed group stops enrolment of members after the stipulated time of admission. Opting for open or closed group depends on the purpose, the goals and the time frame set for the group. Size of the Group: How many members shall compose the group? What shall be the ideal size? What are the criteria to determine whether the size of the group is too big or small (Participant Manual - Social Welfare - Part 3.Pdf, n.d.)? All these questions are there in the mind of the worker There are no hard and fast rules to determine the size of the group. It basically depends on the purpose of the group and manageability from the point of time, space, funds and some form of controls that need to be introduced. Small size is easy to manage, cohesive</p> <p>SA (SP NSOU 12-7-2016) final Content Write up_ for NSOU (1).docx (D21119376)</p>

<p>Enrolling Members: Once it is decided to form the group and other modalities of the group viz., group's purpose, composition and the size of the group have worked out, then the next step is to enrol the group members. Here, the worker has to make arrangements to inform the potential members about forming the group. The information may be given directly to the potential members or passed through a notice in the agency's notice boards, a circular to the staff and other agencies concerned and by advertising in the media such as newspapers, local channels etc., and seeking applications from the interested members. The prospective members may approach either directly or by sending in their applications (</p>

Finally the worker has to prepare a stage for beginning the group proceedings. She/he has to procure a conducive place for group sessions either in the agency itself or any other suitable place, arrange for monetary back up, and gather necessary information and material. And make such other preparations for launching of the group. Initial Meetings: In this section we are looking into what are the tasks the worker and members have to undertake to begin the group. In fact it is the most crucial stage as the success or failure of the group depends on how well the initial meetings are handled by the worker. The members attend the meeting with a lot of expectations. Member attends the meeting with the hope that time has come to get over the problem that has been affecting them over a (long) period of time. How much of it is going to be solved? They are also enthusiastic to meet and interact with others whom they have not met before and who are also having similar needs/problems. They will look forward to

The steps involved in this stage are self- presentations by the worker and the members, orientation about the group, goal formation, structuring the group session and reviewing the contract Self-presentations: As soon as the group is convened for the first time, the worker takes the initiative of making the group members feel comfortable by friendly greetings with each and every member. Once the members are settled comfortably then the worker introduces himself/herself giving personal and professional details. The worker shall give adequate information about himself/herself as possible so that it not only makes members confident about the worker but it also act as guide as to the details of information they have to disclose when their self –presentations turn comes. After that the members are asked to introduce themselves. This exercise of introductions shall be planned in such a way that it will help the members to feel at ease, and come out with more details about their situation(

SA (SP NSOU 12-7-2016) final Content Write up_ for NSOU (1).docx (D21119376)

The worker should make them understand that the more the details they give the better will be their understanding about each other and will make a way for developing trust which is very important for effective results. There are a number of ways of introductions. The worker can employ any of such introductions keeping in mind the group's purpose and composition of the group. One way is to sit in a circle and introductions start in either clockwise or anticlockwise direction. Another way is the members are divided into pairs and each pair is asked to exchange information about each other and then one member of the pair introduces the other and vice versa.

Orientation about the Group: After the self-presentations the worker shall orient all members about the broad purpose of the group for which it is formed. Here the worker spells out circumstances that paved the way for forming the group. How their disadvantage/s are likely overcome through the participation in subsequent group processes. Members are told explained about the functions and the roles of both the worker and the members. The NSOU ? PGSW-III 88 worker also mentions previous experiences if any, so that members develop confidence in the worker as well as the strategy of adopting group work as a viable alternative. Members are encouraged to seek clarifications as to the relevance of the group's purpose to their needs or problem situation. The worker also explains the agency's background.

Goal Setting: In this step, the goals of the group are framed. Goals are statements of desired levels of change in behaviour or in social situation or in physical conditions to be achieved at some future time. The purpose of the group, agency's purpose, the needs of the individual members and the modalities of conducting the group—Then norms of conduct — determine the goals. The worker assesses the individual needs of the members and in consultation with them frames the goals. Toseland and Rivas (1984) specified three areas of goal formation. First area covers group centered goals that revolve around the conduct and maintenance of the group. Second area consists of common group goals that address to all concerned people worker, members, agency, sponsor, and finally the third area is concerning individual member centered specific goals. The goals are again viewed as ultimate goal and a number of intermediary goals (Rose, 1973; Jagdish, n.d). The ultimate goal indicates what final change in the status quo is to be attained while the intermediary goals that facilitate attainment of ultimate goal. These intermediary goals are formulated session-wise and / or stage-wise that is from the reference of time or progress made (

A parent's specific need is to learn to tackle the aggressive behaviour of his/ her child and to make his/her spouse and other family members to accept the child. • The group centred goal is that all members will share their problems without any reservations and will not waste the group's time by indulging in irrelevant issues. All these are complementing and supplementing each other. For example, if the goal of joining the group is to question the policies of the agencies or to demand for more facilities then the goal is not complementary to other goals and create problems in attaining other goals, therefore, should not be included. Structuring Group Session: Structuring the group session involves two aspects. First is structuring the time and the second addresses to the pattern of interactions. The group has to work out how much time has to be allotted to each session, to each activity and to each member. The group has to evolve the modalities of adhering to the time schedules. It has also to work out alternatives in case of failure to adhere to the time schedules. For example it has to spend 30 minutes for a video show but because of the electricity failure, the video could not be played. Instead of idling away the time the group can have a discussion focused on the theme of the videotape. The interactions among the members and between the members and the worker have to be structured. Structuring the interactions includes how to address each other, how to and when to intervene and interrupt how to encourage docile and shy members to participate and control the domination of some members. It also includes certain group norms that are to be followed strictly by the members. Reviewing the Contract: At the time of enrolling, the members and worker entered into an agreement of working together. At that time the members might not have good understanding about the whole exercise. After attending the orientation and having initial interactions with the worker and with each other, members and worker may feel the need to change some conditions of the contract, for example, the frequency of meetings, time and duration of the meetings, and the fees etc. The contract is reviewed and new clauses are introduced or some clauses are deleted from the original contract with mutual NSOU ? PGSW-III 90 consent. Creating an environment that is conducive for the healthy conduct of the group session is a continuous process. The physical arrangements, financial back up and mobilising resources are the areas the group members and the worker have to work on{

The group gears up for attaining various goals it is pursuing. The worker and the members plan and make preparation for the group meetings. The worker has to spend considerable amount of time in developing the activities and procedures for the conduct of the group meetings. A number of decisions have to be taken with regard to the selection of an activity or task, sequencing of the tasks and activities, assigning responsibilities etc. Materials and equipment to conduct the group activities have to be procured. Resource agencies and persons have to be contacted. For example, a pre-retirement counselling group may plan for exercises that would give them an idea about the possible changes that take place in their social status and roles and how best to cope up with the new situation. The possible exercises could be role-plays, screening of a video followed with a discussion, an orientation lecture session by an expert counsellor in the field etc.

Structuring Time: The worker continues this task of setting the time limits for group sessions and individual tasks which has already been initiated in the previous phase as the life of the group is for specified period. The members and the worker have to be quite conscious of using time to get maximum benefit out of the group meetings. It is often NSOU ? PGSW-III 91 the tendency to delay the start the meetings for the sake of latecomers. Delaying the starting time may encourage late coming and cause inconvenience to others who report in time. It also happens that the meetings are either closed early or late. This is also not healthy as it causes inconvenience to members who have other works to attend and discourage them to attending or they may not pay proper attention to the group activity. Further, it is quite possible to get totally engrossed in a particular group task and lose track of the time. This may spill over into the other activity and giving it insufficient time. Consequently the benefits from the other activity are badly affected. So it is important that members must carefully structure their time and follow it.

Facilitating the Group Sessions: It is not sufficient just to plan and prepare for the group sessions. The very reason for forming the group is to enable the members to come on to one platform to work towards solving their problems, which they could not solve individually. This suggests that the group needs guidance and support to carry out the tasks it has set forth. The worker has to take a lead in this and facilitate the group to perform its tasks successfully. At this stage of group's life, the members seriously pursue the goals of both individual and group. Worker encourages members to actively involved in the group activities, may they be sharing, discussing, and performing a task. The worker develops some insight into their strengths and weaknesses. It may be noticed that some members are performing well and while others do not show progress. Because of this the group's progress is affected. The worker has to facilitate the non- performing members to perform.

Equipped with the sound knowledge base in human behaviour he/she assists each and every member to be aware of their cognitive processes intrapersonal processes that are blocking their progress, and enables them to organise their social transactions interpersonal interactions in the group to establish purposeful relationship. Intrapersonal limitations revolve around feelings, thoughts, beliefs and behaviour patterns of the member. For example when a member is asked to give his feeling about the just concluded group session, if he/she expresses that so and so member is rude in interacting, then the

member is giving his thought but not the feeling which may unhappiness or happiness with the session. Sometimes the member does not understand the association between these cognitive processes. In the above example the link between the thoughts and feelings are not established if NSOU ? PGSW-III 92 the member could link the association between the thoughts of being dealt rudely by others during the course of the session and his/her being unhappy. In another case a member may entertain irrational thoughts and beliefs. In the above example if a member says that he/she feels the behaviour of a particular member is rude towards him/ her because the member resembles somebody in his/ her past with which he/ she had bad relationships. The worker facilitates the member to perform in desired direction by making them to understand these mental states. The worker then make suggestions for reframing and restructuring of the thoughts and expressions, as well as for stopping of the recurrence of unhealthy thoughts to enable the member to deal with these cognitive processes. The worker facilitates interpersonal interactions whenever he/she finds them deteriorating. Deteriorating interpersonal relations are discerned when members fail to communicate with each other, participate in the group activities, avoids some members, differ and pick up quarrels with each other, and form subgroups and work against each other. The worker helps to improve the interpersonal interactions by introducing a number of ice breaking, role-playing, modelling, and simulation exercises. At the environmental level worker connects the members with resources, creates congenial physical and social environment. Examining Group's Performance: The group processes are examined with a view to ensure that group attains its goals. It provides proper direction and guidance to the group. It includes the assessment of the levels of participation and involvement of group members in the group activities, the changes that are taking place in the members' perceptions, attitudes and behaviours, acquisition of new skills and strengthening of existing skills that would help members to deal with their problem areas and grow. It points out the areas for and type of interventions that have to be planned and implemented by the worker at individual level as well as at the group level. The assessment is being done by the worker, members themselves and others who are associated with the group. The tools that help generally helps in the assessment are observations

Evaluation (on going) is an integral component of social group work. The term evaluates simply means to examine the value of. According to Trecker (1955), it attempts to measure the quality of group's experience in relation to the objectives and functions of the agency. Evaluation provides the necessary feedback on the performance of the group. It is carried out after the end of group work activity. It focuses on the worker's performance, agency support, the group process and growth of the members. The evaluation may be entrusted to the worker or to someone in the agency or to an outside expert(

work groups are different from other groups as they come into existence for a specific purpose of enabling people in need to resolve their needs through group experience which under constant guidance from a professional trained social worker. We also have information about the types of social work groups that can be thought of by the worker keeping in mind the needs/problem situation of the members, the interests of the agency, and the availability of resources. We have learnt that the social work group formation has a numbers of phases and each phase has a number of steps, which the worker and members have to carefully involve. We have also examined the role of social group worker in group formation. We have discussed the generic roles group work in different stages. The group worker is the key player in the formation of the group. The worker plays a number of roles. He/ she plays the most widely shared roles of social worker in general viz., enabler, mediator, advocate, educator, and facilitator. The roles specific to social work group are that of a leader and decision maker(

As educator the worker clarifies the misnomers the member/s have about various aspects such as the problem/need, irrational beliefs, unfounded fears etc. He passes on information to the members about the developments taking place in the areas concerning their social situations. NSOU ? PGSW-III 95 As facilitator the worker creates congenial environment for the group to go ahead with its activities and tasks. He/she procures the required material for the smooth conduct of the group sessions/tasks. The worker helps members who are shy and withdrawn type to participate by helping them to identify their intrapersonal and interpersonal shortcomings and assists them in overcoming these. As a Leader the group worker also plays the role of a leader in the group. As a professional with sound knowledge base in human behaviour and social interactions and interpersonal relations, the group worker is automatically assumes leadership role. Till the time the group has its leader from among the members the worker discharges the functions of a leader. Douglas discussed four leadership acts the worker performs viz., preparation, intervention (working), intervention (control) and evaluation. The worker provides directions to group members in planning the group activities, making preparations for carrying out the planned activities and finally in carrying out activities. He exercises controls over those members who are either not cooperative or involving in actions that are detrimental to the group's norms and purposes. As decision maker he performs the role as decision maker. Decision making is to choose among the alternatives available. A number of decisions have to be taken in planning and organising group and its activities. The decision-making process starts from the conception of the group to that of termination of the group. At every stage decisions have to be made. For example, a decision has to be taken to decide the size and composition of the group in the formation stage. They have to be made independently by the worker or made in active consultation with and involvement of members, agency administrators and other staff and at times even with resource and referral agencies. Even though the worker has conviction in the democratic process, still the worker is compelled to take decision as the group is in a fix or dilemma to take decisions. Finally, the worker as a leader develops and promotes Co-leadership in the group. The worker identifies the potential leaders from among the members and creates opportunities for them to take up leadership responsibilities. NSOU ? PGSW-III 96 6.5 Exercise 1. What is group Formation? 2. What are the factors or areas that one should be keep in mind for group formation? 3 What role a social worker

Unit 7 ? Group Development Structure 7.0 Objectives 7.1
Introduction 7.2 Group Development 7.3 Group Process 7.4
Group Dynamics 7.5 Conclusion 7.6 Exercise 7.7 Reference 7.0
Objectives The basic objective of this part is to develop clear
concepts on group development, group process and group
dynamics. This concept is very much essential in order to help
in understanding growth of the group, which generally is the
system to prepare the members to face various challenges, to
tackle problems, to find solutions, to plan work, and to deliver
results. 7.1 Introduction Groups, like individuals, are each unique
with their own experiences and expectations. Many
commentators studying group development and dynamics have
recognized that group development, as a generalization, is more
predictable than individual behavior. Many theories of stages of
group development have been cultivated, and it must be
stressed that no single definitive model of stages of group
development exists. Two of the most useful theories of stages of
group development are those discussed by Tuckman (1965) and
Rogers (1967). These models, like others (for example Heap,
1977), propose as groups develop and change they pass through
stages which may be conceptualized. Tuckman's model has
been used extensively NSOU ? PGSW-III 99 within youth work
theory and practice and is an excellent model for attempting to
analyze individual and group behavior (Groups at Work-Social
Psychology Assignment, n.d.). Before going into those models,
let us try to understand the basic concept of group
development. 7.2 Group Development Group development in
social group work refers to the process of progress of group's
achievement over a period of time. The term generally used to
indicate the pattern in a way the groups of people change over
time and make decisions. Two specific indicators of group
development are: (a) the members feeling settled and happy in
the group; and (b) progress the group is making in achieving its
objectives. Regular meetings of the group, a wider interaction
among members, a free flowing conversation, and language,
general spirit of cooperation and accommodation of members
are some signs of positive environment in a group, reflecting a
clear sign of group development (Siddiqui, 2008). The indicators
of group development are : attendance, punctuality, definite
meeting time and attendance, development of a formal
organization, willingness on the part of the members to
undertake initiative and responsibility, Increased innovation and
motivation, controlled behavior of the members, high level of
participation, emergence of leader, and shift from 'I' and 'Me' to
'We' and 'Us'. The process was first described by Tuckman, an
educational psychologist who came up with the process in the
1960s. Since then group development is known as team
building and team development and have become a generally
accepted pattern of group behavior. In group development,
group is formed; members get to know each other, even if there
are pre-existing relationships, and also closely interact with each
other. Understanding the stages of group development helps in
developing proper intervention in the group process to bring
about group's growth and achieving group goals. Some
theorists have claimed that groups develop through more or
less predefined stages (eg. Kurt Lewin's unfreezing-change-
freezing, Tuckman's Team Development Stages, etc.). Others
have said that group development is cyclic. Yet some have
argued that group development happens while groups may or
may not go through NSOU ? PGSW-III 100 certain phases at

some moment in time. To get an acceptable definition of this phrase is difficult because it has been defined in many ways with varying degrees of depth and complexity.

- Berkowitz (1974) has stated that group development refers to the fact that group process undergoes modification which enables the group to have more alternative ways to solve problems (as cited in Smith, 2001).
- Ridgeway's (1983) definition of group development focuses on the groups need for improved communication patterns (as cited in Smith, 2001).
- Sarri & Galinsky (1974) have defined group development as changes through time in the internal structure, processes and culture of group (as cited in Bission, 1988).

As an outline in this definition (Sarri&Galinsky as cited in Ito et.al., 2008) of group development entails changes within three different dimensions. The first dimension, the social dimension, is concerned with the organization of groups' structure and the pattern of the participants' roles and structures. The second dimension focuses on the group's activities, task and the operative process of the group and is labelled the activity dimension. The other dimension, group culture, includes properties such as group norms, values and a shared group purposes.

7.2.1 Stages of Group Development: An Overview

Tuckman's model (1965) has been used extensively used theory and practice and is an excellent model for attempting to analyse individual and group behaviour. His model is elaborated below

Stage 1: Forming

In the Forming stage, group members rely on safe, patterned behaviour and look to the group leader for guidance and direction. Group members have a desire for acceptance by the group and a need to know that the group is safe. They set about gathering impressions and data about the similarities and differences among them and forming preferences for future sub grouping. Rules of behaviour seem to be to keep things simple and to avoid controversy. Serious topics and feelings are avoided. The major task functions also concern orientation. Members attempt to become NSOU ? PGSW-III 101 oriented to the tasks as well as to one another. Discussion centres on defining the scope of the task, how to approach it, and similar concerns. To grow from this stage to the next, each member must relinquish the comfort of non-threatening topics and risk the possibility of conflict (Stages of Team Development, n.d.).

Oppressive behaviour is least likely within the formation stage of a group as individuals generally look to create a comfort zone and do not wish to rock the boat. Often frustrations will be built upon between individuals who disagree strongly, but this will generally not surface until storming begins. A knowledge and understanding of the feelings and emotions felt by group members in this stage is helpful, if not essential, to the effective structuring of a programme to work towards the desired outcome for the group. The worker should be patients and undertake activities/decisions to show results in the first sessions of group formation and to arouse the interest of members. The members can be briefed about duration of the group, its size, nature, meeting place, etc. Thus, the planning for forming the group in particular should focus on the following details.

Composition of group:

The nature of membership depends on purpose of the group and its goals. The worker must collect details about members on the following points: the socio- economic background of members, geographical location, client group, earlier experience of group participation, reasons for joining the group, and individual needs and interests. Collecting information about these issues will help the worker in carrying out the work.

Size of group:

A decision about the size

of the group should be made keeping the purpose of the group and the needs of members in mind. The decision about the size depends on several factors including the experience of worker and the age group of the clients/members. Frequency of the meeting: Frequency of group meeting is to be fixed depending upon the purpose or convenience of members, the workers own work load, etc. As such, there is no fixed

SA Unit 7 Group development and group dynamics[13491] new.docx (D122077760)

formula to decide the frequency. For example, recreational group of children meet more frequently, support group may be once in a week or once in 15 days and self help group or saving groups weekly or once in a month and so on. Frequency of meeting of treatment group is decided more in accordance with the needs of the members. Place of meetings: A place of group meeting has also to be decided in accordance with the convenience of the members and in convenience of space and other resources needful for group activities. Frequent change of venue of meeting is known to cause difficulties and should be avoided. Members consent about the place of meeting could severely affect the participation. Duration of the group: The decision about the duration is taken considering the experience, capacity of the members to achieve the goal in a given time frame. The duration of the group can be changed depending upon the progress made by the group, such as a certain level of cohesion and the decision of the members to continue in their own. Establish group culture, mutual aid system and social responsibility is also important for a worker in the planning and forming stage. Stage 2: Storming The next stage, which Tuckman refers as storming stage. As the group members attempt to organize for the task, conflict inevitably results in their personal relations. Individuals have to bend and mould their feelings, ideas, attitudes, and beliefs to suit the group organization. Because of "fear of exposure" or "fear of failure," there will be an increased desire for structural clarification and commitment. Although conflicts may or may not surface as group issues, they do exist. Questions will arise about who is going to be responsible for what, what the rules are, what the reward system is, and what criteria for evaluation are. These reflect conflicts over leadership, structure, power, and authority ("Team to Achieve Millennium - PHDessay.Com," 2017). There may be wide swings in members' behavior based on emerging issues of competition NSOU ? PGSW-III 103 and hostilities. Because of the discomfort generated during this stage, some members may remain completely silent while others attempt to dominate. In order to progress to the next stage, group members must move from a "testing and proving" mentality to a problem-solving mentality. The most important trait in helping groups to move on to the next stage seems to be the ability to listen("Team to Achieve Millennium - PHDessay.Com," 2017). The potential for oppressive behaviour is strong within the storming phase as group members preferred roles and release frustrations built within the forming period. This personal oppression should be discouraged whilst it is understood that a degree of conflict is necessary if the group is to further develop(Groups at Work-Social Psychology Assignment, n.d.). It is important to be aware that conflict will take place within all groups, and if handled well this conflict can produce benefits for the group in terms of development, objective and task setting, and ultimate outcome. Thus conflict is not inherently something to be feared or avoided(Groups at Work-Social Psychology Assignment, n.d.). In the exploration stage, the worker must focus on preparation of profile and setting objectives. Hence, the worker must take details of members including their name, age and educational status; general awareness level of group goals; the self confidence level; communication skills; and leadership potential. This profile can serve as the benchmark to see what changes can occur in individuals as a result of their participation in group activities. The success of the group depends to a great

extent on the clarity on setting objectives. The group objectives should be broad enough to cover these individual differences of needs. The objectives of group will however depend on the kind of member the worker is working with. The purpose of the group is also influenced by the sponsoring organization. A number of other objectives can also be identified to work with the groups. Some of the objectives of group work are: to provide recreational services on activities, to provide creative activities among group members, to prepare members for social responsibility, to develop life skills, and to provide helps in dealing with problems of social functioning.

Stage 3: Norming In Tuckman's Norming stage, interpersonal relations are characterized by cohesion. Group members are engaged in active acknowledgment of all members' contributions, community building and maintenance, and solving of group issues. Members are willing to change their preconceived ideas or opinions on the basis of facts presented by other members, and they actively ask questions of one another. Leadership is shared, and cliques dissolve. When members begin to know-and identify with-one another, the level of trust in their personal relations contributes to the development of group cohesion(Stages of Team Development, n.d.). It is during this stage of development (assuming the group gets this far) that people begin to experience a sense of group belonging and a feeling of relief as a result of resolving interpersonal conflicts. The major task function of stage three is the data flow between group members: They share feelings and ideas, solicit and give feedback to one another, and explore actions related to the task (Stages of Team Development, n.d.). Creativity is high. If this stage of data flow and cohesion is attained by the group members, their interactions are characterized by openness and sharing of information on both a personal and task level. They feel good about being part of an effective group. The major drawback of the norming stage is that members may begin to fear the inevitable future breakup of the group; they may resist change of any sort(Stages of Team Development, n.d.). The storming and norming phases of group development are inextricably linked, as it is often through the storming and challenging that acceptable group norms become set. It is important that a youth worker works hard during this stage to ensure oppression against individuals within the group do not become the acceptable norm, as then all group members will oppress these individuals. Thus, individual oppressions must be challenged and emphasis placed on challenging attitudes and opinions but not group members(Groups at Work-Social Psychology Assignment, n.d.). Stage 4: Performing The Performing stage is not reached by all groups. If group members are able to evolve to stage four, their capacity, range, and depth of personal relations expand to true interdependence. In this stage, people can work independently, in subgroups, or

as a total unit with equal facility. Their roles and authorities dynamically adjust to the changing needs of the group and individuals. Stage four is marked by interdependence in personal relations and problem solving in the realm of task functions (FacultyDevelopment_GroupDevelopment.Pdf, n.d.). By now, the group should be most productive. Individual members have become self-assuring, and the need for group approval is past. Members are both highly task oriented and highly people oriented. There is unity: group identity is complete, group morale is high, and group loyalty is intense. The task function becomes genuine problem solving, leading toward optimal solutions and optimum group development. There is support for experimentation in solving problems and an emphasis on achievement. The overall goal is productivity through problem solving and work(FacultyDevelopment_

173 WORDS

Pdf, n.d.). Stage 5: Adjourning Tuckman's final stage, adjourning, involves the termination of task behaviours and disengagement from relationships. A planned conclusion usually includes recognition for participation and achievement and an opportunity for members to say personal goodbyes. Concluding a group can create some apprehension – in effect, a minor crisis. The termination of the group is a regressive movement from giving up control to giving up inclusion in the group. The most effective interventions in this stage are those that facilitate task termination and the disengagement process(FacultyDevelopment_GroupDevelopment.Pdf, n.d.). The ending of a group can be a very unhappy and distressing time for some members, as they may feel some extent of dependency on the group. Garland et al. describe some of the typical responses to the ending phase as(Groups at Work-Social Psychology Assignment, n.d.):

- Denial – 'forgetting' the time of the groups termination.
- Regression – reverting to a less independent state of functioning.
- Need expression – in the hope the group will continue.
- Recapitulation – detailed recall of past experiences within the group.
- Evaluation – detailed discussion on the value of the group experience.

SA Unit 7 Group development and group dynamics[13491] new.docx (D122077760)

Flight – destructive denial of any positive benefit of the group, or a positive disengagement towards other interests. Potential exists within this stage for members to be oppressed as scapegoats, that is blamed or at fault for the ending of the group. This can be minimised by constant focusing and refocusing on group end points and staged celebrations of group achievements. As we have seen the value of a theoretical understanding of conceptualising this group stage theory in youth work and other helping professions, lies in enabling group workers to 'tune into the group's processes and respond appropriately' (Preston-Shoot, 1987).

7.2.2 Role of Social Worker in different stages of group development

There are different roles of social worker according to different stages of development. For our easy understanding we can elaborate this concept as below by keeping reclassified stages of group development vis-a-vis role of a social worker. The social worker practicing this method in the Indian setting following the western theoretical framework may find it an uphill task. Let us try to understand to bifurcate various stages of development in view of the above to outline the role of social worker.

Stage I: Planning and Formation of Group: Under this, the worker has to work hard to form a group. Planning stage refers to contacting the potential members individually or in small groups to share with them the idea of forming a group. The formation stage thus will require careful planning. The worker should contact the members individually and in groups to discuss the idea and purpose of group formation. The members can be briefed about duration of the group, its size, nature, meeting place, etc. Thus, the planning for forming the group in particular should focus on the following details.

(i) **Composition of group:** The nature of membership depends on purpose of the group and its goals. The worker must collect details about members on the following points: the socio-economic background of members, geographical location, client group, earlier experience of group participation, reasons for joining the group, and individual needs and interests. Collecting information about these issues will help the worker in carrying out the work. NSOU ? PGSW-III 107

(ii) **Size of group:** A decision about the size of the group should be made keeping the purpose of the group and the needs of members in mind. The decision about the size depends on several factors including the experience of worker and the age group of the clients/members.

(iii) **Frequency of the meeting:** Frequency of group meeting is to be fixed depending upon the purpose or convenience of members, the workers own work load, etc. As such, there is no fixed formula to decide the frequency. For example, recreational group of children meet more frequently, support group may be once in a week or once in 15 days and self help group or saving groups weekly or once in a month and so on. Frequency of meeting of treatment group is decided more in accordance with the needs of the members.

(iv) **Place of meetings:** A place of group meeting has also to be decided in accordance with the convenience of the members and in convenience of space and other resources needful for group activities. Frequent change of venue of meeting is known to cause difficulties and should be avoided. Members consent about the place of meeting could severely affect the participation.

(v) **Duration of the group:** The decision about the duration is taken considering the experience, capacity of the members to achieve the goal in a given time frame. The duration of the group can be changed depending upon the

progress made by the group, such as a certain level of cohesion and the decision of the members to continue in their own. (vi) Establish group culture, mutual aid system and social responsibility is also important for a worker in the planning and forming stage. Stage II: Exploration Stage: It is critical stage in the group process and group development and it can be a point of making a group or break a group. It is time at which members are searching s individual role and function or one's status in the group. Issues of control and power are prominent and tested in leader-member as well as member-member interaction. The worker at this stage has to offer magical solution to problems. Each group member's needs are to be met and expressed. At the task level there may be

SA Unit 7 Group development and group dynamics.docx (D121776257)

anxiety and uncertainty. So, it is important that all members are involved in the group activity. Thus, in the exploration stage, the worker must focus on preparation of profile and setting objectives. The following details could be mentioned as responsibility of worker in this stage. (i) Preparation of profile: The worker must prepare a profile of members including their name, age and educational status; general awareness level of group goals; the self confidence level; communication skills; and leadership potential. This profile can serve as the benchmark to see what changes can occur in individuals as a result of their participation in group activities. (ii) Setting objectives: The success of the group depends to a great extent on the clarity on setting objectives. The group objectives should be broad enough to cover these individual differences of needs. The objectives of group will however depend on the kind of member the worker is working with. Stage III: Performing Stage: In this stage, the role of the worker is that he or she must have the capacity to develop cohesion, monitoring and a change to be avoided in allocating task, which put too much pressure on individuals as well as to the groups. The feeling of cohesiveness in the group is what members enjoy most i.e. when they feel they belong to the group. Stage IV: Evaluation Stage: In the evaluation stage, the role of worker is to perform the following: (a) record keeping, (b) help members to evaluate what they have achieved and also have failed to achieve, and (c) find out what is the development of individual and group. Evaluation is an essential part of all processes as it helps the worker and member both to assess the outcome of their efforts. The evaluation can be carried out informally or in a formal manner. Stage V: Termination Stage: At the termination of a group in particular, an assessment of the individual's dependence on the group should be carefully done. The worker can help the group NSOU ? PGSW-III 109 to feel good about the success achieved. However, the worker must guard against any emotional over dependence on the part of the member on group as it can undermine the individual's self reliance and coping capacities. In conclusion, it can be said that the worker has an important role to play in group development and its stages. The worker therefore should have a clear concept and thinking as well as decision towards different stages so as to bring a success of group goal.

7.2.3 Conclusion Generally, the well known models of group development have identified a linear arrangement of development stages, where one stage is completed to precede or follow the other stage, such as forming, storming, norming, performing and adjourning, provided by Tuckman (1965). As Konopka (1963) noted, the relationships of the members to each other are taken complex and full meaning and possibilities. They are never static. They change in time and in relation to specific situations and events in the life span of a group. They propose that as groups develop and change they pass through stages which may be conceptualised. This section dealt clearly on Tuckman's stage of development and it very well highlighted the role of social workers in different stages of group development.

7.2.4 Check Your Progress 1. Explain in short what is group development? 2. Write different stages of group development and its characteristics. 3. What role can a social worker play in different stages of group development?

Group Process Objectives The basic purpose of this sub section is to provide basic knowledge on the concept of group process for developing professional competence of handling social groups. This understanding will help a worker to know what to expect in different process of group and how to deal with the situations. The phrase "Group Process" refers to the understanding of the behaviour of people in groups, such as task groups, and the processes used to solve problems or make decisions. A group here is defined as "a collection of individuals that have shared common interests or experiences." A group develops relationships and generates an energy, or identity, that is different together than when individuals are by themselves or with others. When a group comes together they are primarily concerned with the contribution of content to achieve the purpose for which they were formed. Content is defined as the "substantive or meaningful part of something". Group process as the means by which group members interact, make decisions, handle problems, and develop their roles. As the definition implies there are several elements to a group process. Elements, which typically influence group proceedings, include process design, communication, participation, decision making and role fulfilment. As the facilitator your advantage point provides a great opportunity to regularly observe how things are going. Depending on the frequency of meetings and an understanding of what to look for, you can be instrumental in ensuring group and individual success. For the purpose of this paper I am concerned with the "process that the facilitator designs" to help the group accomplish its purpose. 7.3.1 Understanding on group process Ridgeway (1983) about the dynamics of groups listed the following group processes in small group. She identified basic fundamental processes in small group, which are identified as communication, cohesiveness, group development, conformity, deviance, social control, status differentiation, leadership, group culture. The key elements likely to happen in variety of ways and group process could be understood on the following ways:

SA Unit 7 Group development and group dynamics.docx (D121776257)

Interaction; Communication; Cohesion; Conflict; Structuring; Leadership; Decision making; Norming and group culture; Social control; Group development Let us try to understand each of those areas of importance in the group process.

Interaction People join groups for a various purposes. The interaction started rolling as people come face to face in a situation. The interaction process is very fluid and undergoes frequent changes that may lead to either conflict or cohesion of a group. While communication, both verbal and non-verbal, facilitates interaction. Interaction can be person or issue focussed. One person dominated interaction will result in concentration of power in the group. Such a person will determine its purpose and will influence the participation of other members. S/he may impose restriction on interaction of other members among themselves. In such a context the interaction will be focussed but it could be termed as autocratic. This domination can be questioned by other members. The general sociological understanding is that the larger the size of the group, lesser is the interaction among its members. The relationship among members is emotional bond (Toseland and Rivas 2001). Leadership is the key variable in understanding interaction. The low participation among members is indicative of an interaction where some members are keeping a low profile, remaining at eh periphery of the affairs of the group. The subgroup is another interaction pattern inevitable in some groups. The pattern of interaction can be isolated or formation of sub-groups or all round interaction. Some of the possible ways of improving interaction in group can be controlling the size, or reducing distance, developing effective leadership, clarify group goals, explain the nature of interaction pattern, dealing with fairness and resistance, etc.

Communication Communication is another important aspects of group interaction. The nature of communication itself makes difference on group interaction and its various processes. The negative communication may dissatisfied members in fulfilling their desired goal, while positive communication among members makes them happy and interact more freely among them. The communication process needs close monitoring and skilful communicator always is a great asset of the group. Good communication makes a healthy environment in the group. On the other hand communication gap NSOU ? PGSW-III 112 may create misunderstanding among the members. So, the worker should remember that the nature of communication can help in giving a structured form in the group for assigning role and responsibility among group members.

Cohesiveness Group cohesiveness in social group work refers to the willingness of all members to stay together in the group. Secondary groups, like women's groups, SHGs, children's group, neighbours are spontaneous and natural. The members join them in their own. The nature of group formed by social worker is little different from these groups. The cohesiveness of a formed group is more fluid and the situation changes with different events and activities. They external and internal environment of these groups are dynamic in nature. Therefore, cohesiveness is not the simple factors of members liking or disliking or interpersonal interaction. People want to stay in a group because of variety of reasons, group potential for meeting the needs. People stay in the group despite of competing with each other. But the factors that generally helps in the group cohesive are group norms and group culture; group goal; a caring leader; non threatening

group environment; a greater degree of homogeneity among group members. Group Conflict It is natural phenomenon that the members join together in secondary group, other than primary group voluntarily and stay and work together, play or carry out their activities; therefore, it is impossible to move forward without having any conflict among them. Heated exchange of ideas, silence, negative feedback, personal remarks directed against individuals, attacking integrity of individuals, are all symptoms indicative in a group. Some factors that can cause group conflict are like miscommunication, ideological differences, rigidity of group members, cultural differences, leadership styles, group goals not being able to address individual needs, outside environment, lack of resources, and heterogeneity among members. There are various ways in which group worker, group leader or facilitator can be taken care such group conflict for smooth function of the group based on democratic norms. Structuring Group structuring begins with group functioning. Tuckman (1963) refers that storming is one important stage, which is useful to understand the respective positions

SA Unit 7 Group development and group dynamics.docx (D121776257)

of members in a specific group. The structuring is based on ongoing assessment of member's ability and roles which helps in reducing conflict. It emerged as they became aware of the goals and conflict of sharing of sharing rewards. Group Decision Making Group decision is a process of arriving at a decision where more than two individuals are involved. It is therefore, necessary for to understand the process of decision making. It is a pattern, follow some broad models of decision making, such as the Rational Model, the Political Model, and the Process Model. The rational model is based upon grounded goal, objectives, alternatives etc. It takes all available information and the decision makers are capable in assessing the advantages and disadvantages of any alternative goals or consequences of selecting or not selecting any each alternative. But rational model does possess a silent disadvantage. The model assumes that there are no intrinsic biases to the decision making process (Lyles and Thomas, 1988). Therefore, the worker must be conscious on such facts while helping members to arrive at a certain decision. While political model, one should be careful as it tells us to the fact that the decision makers has some interest and are motivated by and act on their own needs and perceptions. It does not believe in making full information available or focussing the optimal viewpoints. Personal interest and biases are common among members and it influences their behaviour. This model cannot be the best for social group work practice. The process model of decision making is more structured. In this model, decisions are made based upon standard operating procedures or pre-establishing guidelines within the group. Leadership in Groups Leadership facilitate in group functioning. A leaderless group face problems in maintaining order and focus in group functioning. Social scientist doesn't however believe that leaders are born. It can emerge from the group. As Lewin suggested leadership is a function of interaction in a group. Some theories identifies as the central factors in leadership and then go on identify power as the central factor of leadership and then gone into identifying different kinds of power. All people who are able to help group or members in a society in getting the things done as seen as people having power. They are respected or fear by others and many of them have emerges as different status than other members in the group, who normally refers as leaders. French and Raven (1968) has identified a few types of power of members

SA Unit 7 Group development and group dynamics.docx (D121776257)

Leadership Styles and Bases of Power - Strategy, Organization, System, Manager, Definition, Model, Type, Hierarchy, Business, n.d.) Norming and Group Culture Norms serve as guideline for acceptable behaviour. Violation of norms invokes social sanctions. All groups establish norms and belief systems. But norming becomes a problem when there is a wide range of belief and commitment to various values. Norms define the group culture. It is difficult to evolve norms of role allocation acceptable to all. But adopting some procedure and system can regulate members and group functioning. In providing freedom to members and helping them in respecting each other can further helps the group growth (Leadership Styles and Bases of Power - Strategy, Organization, System, Manager, Definition, Model, Type, Hierarchy, Business, n.d.). Social Control A system of control is inevitable to enforce compliance. There are formal rules of conduct and violation of rules can evoke penalty. The other kind of rules is not coded but is known to members through process of socialization. It of course is an essential part to work with a group. Group Development The stages of group development help the worker to monitor what is happening in a group. Bale (1950) was perhaps the first person to study the groups. He noted that the first thing that the people in a group do is to familiarize themselves with other members in the group and explore possibilities that the group has to offer them. He called it as orientation stage. The members may review their relationship with others in general and assessment based on experience. He termed this stage as evaluation stage. NSOU ? PGSW-III 115 Besides, by generalizing the elements of the processes one can identify seven common steps of Group Process(Facilitation Center, n.d.). The close observation of these steps can help the facilitator to work more effectively. These steps are (Vick, Wayne. J. 2013): Reference: (Facilitation Center, n.d.) Step 1: Focusing Purpose of group- Focussing purpose of the group forms the foundation of the work of a group and consequently the group worker work as a facilitator. He/she seeks to help a group achieve its purpose or reason for being. So the purpose must be clearly identified. That is often difficult to do particularly in problem solving when participants come to a group event seeing a problem from a completely different perspective. Yet the facilitator must clarify the purpose long before participants step foot into the room. Getting clear on the purpose is absolutely critical to achieving success for the group. Step 2: Planning for Group and its Process The worker helps the group by planning a process that will achieve the purpose of the group. It is during this step that other models, concepts and frameworks are

SA Unit 7 Group development and group dynamics[13491] new.docx (D122077760)

brought to bear on the kind of work that is being done. If we are doing problem solving we must look at the kind of problem the group is facing and to select and use a problem solving model as our guide to planning the event. There are many different types of problem solving models. If we are not doing problem solving and just want to explore, learn more, or understand someone's plan, it works equally well, although there may be group process steps that we spend little to no time on. If we are developing a plan, like a strategic plan, it works equally well.

Step 3: Gathering Data for Group Programme- Information or data is just like a pile of sand one use to make a sand castle. One should understand that the sand will become a beautiful sand sculpture when it is understood and properly formed. But before we work it, it is just a pile of sand. So, data is just information if it is not reviewed or understood or assessed within the proper context.

Step 4: Process Data and information for group decision Data is meaningless until it has been processed or activities are given proper shape. This is where we process the data, through various tools and techniques to squeeze out its meaning and learn what it has to tell us. It is possible, and often likely, that we may decide to collect more data to confirm or complete our understanding of the situation.

Steps 3 and 4 are somewhat meaning that a group's activities rarely flow from one step to another in a simple, four step, and clean process. We may need to gather data and process the information two or three times before we have enough information and understanding to look at options and make a decision.

Step 5: Examine Options In this step of the group process one should ask what group could do about this? Examining options not only assumes the development of the options but could also include the development of criteria used for assessing the value of those options to solving the issues or achieving our goals, and the actual assessment as well.

Step 6: Make Decisions Finally, after obtaining information and its proper understanding the group members need to make a decision. Decision making is the act of choosing a course of action, determining what to do. In addition this step one can also include the

SA Unit 7 Group development and group dynamics.docx (D121776257)

setting of priorities and action planning with success metrics and follow-up requirements. Step 7: Document Results This is often a forgotten step yet it is extremely important for three reasons, one standardization of documenting that changes the group; historical note for future and recognition and celebration: following implementation and verification of the successful project taking time to recognize the accomplishment provides a reward of sorts to the team. Allow them to celebrate for the success they created. Documenting all the results is critical but it is necessary for group process purpose. 7.3.2 Conclusion The understanding of group processes is very meaningful to develop a small group. The process can be identified by highlighting some important areas like interaction, communication, cohesiveness, group development, conformity, deviance, social control, status differentiation, leadership, group culture as part of the group process. While other can also identify the elements of group processes by analyzing seven common steps, which are like focus on the purpose; planning process; gather relevant data of group and activities process information relating to progress: examining options of groups: decision making process; document results. The worker can play an effective in understanding such concept and helping group members scientifically. 3.2.5 Check your Progress (Use the space proved for your answers) 1. What is group process? Discuss the concept briefly by mentioning different points 2. Write roles of a social worker in group processes.

SA Unit 7 Group development and group dynamics.docx (D121776257)

Group Dynamics 7.4.1 Objectives The basic objectives of this sub-section is to give a clear understanding on the concept of group dynamics, which is a system of behaviours and psychological processes occurring within a social group (intra group dynamics), or between social groups (intergroup dynamics). As the study of group dynamics can be useful in understanding decision-making behaviour, tracking the spread of problems in groups, creating effective therapy techniques, etc, it is necessary for worker to understand this concept. Group dynamics are at the core of understanding in psychology, sociology, anthropology, political science, epidemiology, education, social work, business, and communication studies. The group dynamics (or group processes) has a consistent, underlying premise: 'the whole is greater than the sum of its parts.' A social group is an entity, which has qualities that cannot be understood just by studying the individuals that make up the group.

7.4.2 History of Group Dynamics In 1924, Gestalt psychologist, Max Wertheimer identified this fact, stating 'There are entities where the behaviour of the whole cannot be derived from its individual elements nor from the way these elements fit together; rather the opposite is true: the properties of any of the parts are determined by the intrinsic structural laws of the whole' (Wertheimer 1924, p. 7). As a field of study, group dynamics has roots in both psychology and sociology. Wilhelm Wundt (1832–1920), credited as the founder of experimental psychology, had a particular interest in the psychology of communities, which he believed possessed phenomena (human language, customs, and religion) that could not be described through a study of the individual. Ultimately, it was social psychologist Kurt Lewin (1890–1947) who coined the term group dynamics to describe the positive and negative forces within groups of people (as cited in Kariel, 1956). In 1945, he established The Group Dynamics Research Center at the Massachusetts Institute of Technology, the first institute devoted explicitly to the study of group dynamics. Throughout his career, Lewin was focused on how the study of group dynamics could be applied to real-world, social issues.

SA Unit 7 Group development and group dynamics.docx (D121776257)

An increasing amount of research has applied evolutionary psychology principles to group dynamics. Humans are argued to have evolved in an increasingly complicated social environment and to have many adaptations concerned with group dynamics. Examples include mechanisms for dealing with status, reciprocity, identifying cheaters, ostracism, altruism, group decision, leadership, and intergroup relations.

7.4.3 Some Eminent theorists

Gustave Le Bon: Gustave Le Bon was a French social psychologist whose seminal study, *The Crowd: A Study of the Popular Mind* (1896) led to the development of group psychology.

Sigmund Freud: In *Group Psychology and the Analysis of the Ego*, (1922), Sigmund Freud based his preliminary description of group psychology on Le Bon's work, but went on to develop his own, original theory, related to what he had begun to elaborate in *Totem and Taboo*.

Theodor Adorno reprised Freud's essay in 1951 with his *Freudian Theory and the Pattern of Fascist Propaganda*, and said that "It is not an overstatement if we say that Freud, though he was hardly interested in the political phase of the problem, clearly foresaw the rise and nature of fascist mass movements in purely psychological categories."

Jacob L. Moreno: Jacob L. Moreno was a psychiatrist, dramatist, philosopher and theoretician who coined the term "group psychotherapy" in the early 1930s and was highly influential at the time ("Group Dynamics," 2021).

Kurt Lewin: Kurt Lewin (1943, 1948, 1951) is commonly identified as the founder of the movement to study groups scientifically. He coined the term group dynamics to describe the way groups and individuals act and react to changing circumstances over a period of time (Human Communication Processes Session 4.Pdf, n.d.).

William Schutz: William Schutz (1958, 1966) looked at interpersonal relations from the perspective of three dimensions: inclusion, control and affection. This became the basis for a theory of group behaviour that sees groups as resolving issues in each of these stages in order to be able to develop to the next stage ("What Is Group Dynamics Example - Law Essays," 2020). Conversely, a group may also devolve to an earlier stage if

SA Unit 7 Group development and group dynamics[13491] new.docx (D122077760)

unable to resolve outstanding issues in a particular stage. He referred to these group dynamics as "the interpersonal underworld" because they dealt with group processes that were largely unseen, as opposed to "content" issues, which were nominally the agenda of group meetings.

Wilfred Bion: Wilfred Bion (1961) studied group dynamics from a psychoanalytic perspective, and stated that he was much influenced by Wilfred Trotter for whom he worked at University College Hospital London, as did another key figure in the Psychoanalytic movement, Ernest Jones. He discovered several group processes which involved the group as a whole adopting an orientation which, in his opinion, interfered with the ability of a group to accomplish its work (Human Communication Processes Session 4.Pdf, n.d.). His experiences are reported in his published books, especially *Experiences in Groups*. The Tavistock Institute has further developed and applied the theory and practices developed by Bion.

Bruce Tuckman: Bruce Tuckman (1965) proposed the four-stage model called Tuckman's Stages for a group. Tuckman's model states that the ideal group decision-making process should occur in four stages (Bruce Tuckman's Stages for a Group, n.d.).

- Forming (pretending to get on or get along with others)
- Storming (letting down the politeness barrier and trying to get down to the issues even if tempers flare up)
- Norming (getting used to each other and developing trust and productivity)
- Performing (working in a group to a common goal on a highly efficient and cooperative basis)

Tuckman later added a fifth stage for the dissolution of a group called *adjourning*. (Adjourning may also be referred to as mourning, i.e. mourning the adjournment of the group). This model refers to the overall pattern of the group, but of course individuals within a group work in different ways. If distrust persists, a group may never even get to the norming stage.

Richard Hackman: Richard Hackman developed a synthetic, research-based model for designing and managing work groups. Hackman suggested that groups are successful when they NSOU ? PGSW-III 121 satisfy internal and external clients develop capabilities to perform in the future, and when members find meaning and satisfaction in the group. Hackman proposed five conditions that increase the chance and following to such conditions the groups will be successful (Human Communication Processes Session 4.Pdf, n.d.) These include:

- Being a real team: which results from having a shared task, clear boundaries which clarify who is inside or outside of the group, and stability in group membership.
- Compelling direction: This results from a clear, challenging, and consequential goal.
- Enabling structure: which results from having tasks which have variety, a group size that is not too large, talented group members who have least moderate social skill, and strong norms that specify appropriate behavior?
- Supportive context: that occurs in groups nested in larger groups (e.g. companies). In companies, supportive contexts involves a) reward systems that reward performance and cooperation (e.g. group based rewards linked to group performance), b) an educational system that develops member skills, c) an information and materials system that provides the needed information and raw materials (e.g. computers).
- Expert coaching: which occurs on the rare occasions when group members feels they need help with task or interpersonal issues. Hackman emphasizes that many team leaders are overbearing and undermine group effectiveness.

Scott Peck: M. Scott Peck developed stages for larger-scale

groups (i.e., communities) which are similar to Tuckman's stages of group development. Peck describes the stages of a community as: • Pseudo-community • Chaos • Emptiness • True Community Communities may be distinguished from other types of groups, in Peck's view, by the need for members to eliminate barriers to communication in order to be able

SA Unit 7 Group development and group dynamics[13491] new.docx (D122077760)

distinctiveness is necessary for group formation. Through interaction, individuals begin to develop group norms, roles, and attitudes which define the group, and are internalized to influence behaviour. Emergent groups arise from a relatively spontaneous process of group formation. For example, in response to a natural disaster, an emergent response group may form. These groups are characterized as having no pre-existing structure (e.g. group membership, allocated roles) or prior experience working together. Yet, these groups still express high levels of interdependence and coordinate knowledge, resources, and tasks. Group membership and social identity: The social group is a critical source of information about individual identity. An individual's identity (or self-concept) has two components: personal identity and social identity (or collective self). One's personal identity is defined by more idiosyncratic, individual qualities and attributes. In contrast, one's social identity is defined by his or her group membership, and the general characteristics (or prototypes) that define the group and differentiate it from others. We naturally make comparisons between our own group and other groups, but we do not necessarily make objective comparisons. Instead, we make evaluations that are self-enhancing, emphasizing the positive qualities of our own group (see ingroup bias). In this way, these comparisons give us a distinct and valued social identity that benefits our self-esteem. Our social identity and group membership also satisfies a need to belong. Of course, individuals belong to multiple groups. Therefore, one's social identity can have several, qualitatively distinct parts (for example, one's ethnic identity, religious identity, and political identity). Optimal distinctiveness theory suggests that individuals have a desire to be similar to others, but also a desire to differentiate themselves, ultimately seeking some balance of these two desires (to obtain optimal distinctiveness). For example, one might imagine a young teenager in the United States who tries to balance these desires, not wanting to be 'just like everyone else,' but also wanting to 'fit in' and be similar to others. One's collective self may offer a balance between these two desires. That is, to be similar to others (those who you share group membership with), but also to be different from others (those who are outside of your group). NSOU ? PGSW-III 124 Group cohesion: In the social sciences, group cohesion refers to the processes that keep members of a social group connected. Terms such as attraction, solidarity, and morale are often used to describe group cohesion. It is thought to be one of the most important characteristics of a group, and has been linked to group performance, intergroup conflict and therapeutic change. Group cohesion, as a scientifically studied property of groups, is commonly associated with Kurt Lewin and his student, Leon Festinger. Lewin defined group cohesion as the willingness of individuals to stick together, and believed that without cohesiveness a group could not exist. As an extension of Lewin's work, Festinger (along with Stanley Schachter and Kurt Back) described cohesion as, "the total field of forces which act on members to remain in the group" (Festinger, Schachter, & Back, 1950, p. 37). Later, this definition was modified to describe the forces acting on individual members to remain in the group, termed attraction to the group. Since then, several models for understanding the concept of group cohesion have been developed, including Albert Carron's hierarchical model and several bi-dimensional models (vertical v. horizontal cohesion,

distinctiveness is necessary for group formation. Through interaction, individuals begin to develop group norms, roles, and attitudes which define the group, and are internalized to influence behavior.[16] Emergent groups arise from a relatively spontaneous process of group formation. For example, in response to a natural disaster, an emergent response group may form. These groups are characterized as having no preexisting structure (e.g. group membership, allocated roles) or prior experience working together.[17] Yet, these groups still express high levels of interdependence and coordinate knowledge, resources, and tasks.[17] Group membership and social identity The social group is a critical source of information about individual identity.[18] An individual's identity (or self-concept) has two components: personal identity and social identity (or collective self). One's personal identity is defined by more idiosyncratic, individual qualities and attributes.[2] In contrast, one's social identity is defined by his or her group membership, and the general characteristics (or prototypes) that define the group and differentiate it from others.[2] We naturally make comparisons between our own group and other groups, but we do not necessarily make objective comparisons. Instead, we make evaluations that are self-enhancing, emphasizing the positive qualities of our own group (see ingroup bias).[2] In this way, these comparisons give us a distinct and valued social identity that benefits our self-esteem. Our social identity and group membership also satisfies a need to belong.[19] Of course, individuals belong to multiple groups. Therefore, one's social identity can have several, qualitatively distinct parts (for example, one's ethnic identity, religious identity, and political identity).[20] Optimal distinctiveness theory suggests that individuals have a desire to be similar to others, but also a desire to differentiate themselves, ultimately seeking some balance of these two desires (to obtain optimal distinctiveness).[21] For example, one might imagine a young teenager in the United States who tries to balance these desires, not wanting to be 'just like everyone else,' but also wanting to 'fit in' and be similar to others. One's collective self may offer a balance between these two desires.[2] That is, to be similar to others (those who you share group membership with), but also to be different from others (those who are outside of your group). Group cohesion Main Group cohesiveness In the social sciences, group cohesion refers to the processes that keep members of a social group connected.[4] Terms such as attraction, solidarity, and morale are often used to describe group cohesion.[4] It is thought to be one of the most important characteristics of a group, and has been linked to group performance,[22] intergroup conflict[23] and therapeutic change.[24] Group cohesion, as a scientifically studied property of groups, is commonly associated with Kurt Lewin and his student, Leon Festinger. Lewin defined group cohesion as the willingness of individuals to stick together, and believed that without cohesiveness a group could not exist.[4] As an extension of Lewin's work, Festinger (along with Stanley Schachter and Kurt Back) described cohesion as, "the total field of forces which act on members to remain in the group" (Festinger, Schachter, & Back, 1950, p. 37).[4] Later, this definition was modified to describe the forces acting on individual members to remain in the group, termed attraction to the group.[4] Since then, several models for understanding the concept of group cohesion have been developed, including Albert Carron's hierarchical

task v. social cohesion, belongingness and morale, and personal v. social attraction). Before Lewin and Festinger, there were, of course, descriptions of a very similar group property. For example, Emile Durkheim described two forms of solidarity (mechanical and organic), which created a sense of collective conscious and an emotion-based sense of community. Black sheep effect: Beliefs within the

model[25] and several bi-dimensional models (vertical v. horizontal cohesion, task v. social cohesion, belongingness and morale, and personal v. social attraction). Before Lewin and Festinger, there were, of course, descriptions of a very similar group property. For example, Emile Durkheim described two forms of solidarity (mechanical and organic), which created a sense of collective conscious and an emotion-based sense of community.[26] Black sheep effect Beliefs within the

to form true community. Examples of common barriers are: expectations and preconceptions; prejudices; ideology, counterproductive norms, theology and solutions; the need to heal, convert, fix or solve and the need to control. A community is born when its members reach a stage of "emptiness" or peace. Intra-group dynamics: Intra group dynamics (also referred to as in group-, within-group, or commonly just 'group dynamics') are the underlying processes that give rise to a set of norms, roles, relations, and common goals that characterize a particular social group. Examples of groups include religious, political, military, and environmental groups, sports teams, work groups, and therapy groups. Amongst the members of a group, there is a state of interdependence, through which the behaviours, attitudes, opinions, and experiences of each member are collectively influenced by the other group members. In many fields of research, there is an interest in understanding how group dynamics influence individual behaviour, attitudes, and opinions. The dynamics of a particular group depend on how one defines the boundaries of the group. Often, there are distinct subgroups within a more broadly defined group. For example, one could define U.S. residents ('Americans') as a group, but could also define a more specific set of U.S. residents (for example, 'Americans in the South'). For each of these groups, there are distinct dynamics that can be discussed. Notably, on this very broad level, the study of group dynamics is similar to the study of culture. For example, there are group dynamics in the U.S. South that sustain a culture of honour, which is associated with norms of toughness, honour-related violence, and self-defence. Group formation: Group formation starts with a psychological bond between individuals. The social cohesion approach suggests that group formation comes out of bonds of interpersonal attraction. In contrast, the social identity approach suggests that a group starts when a collection of individuals perceive that they share some social category ('smokers', 'nurses,' 'students,' 'hockey players'), and that interpersonal attraction only secondarily enhances the connection between individuals. Additionally, from the social identity approach, group formation involves both identifying with some individuals and explicitly not identifying with others. So to say, a level of psychological

Individuals tend to upgrade likeable in-group members and deviate from unlikeable group members, making them a separate outgroup. This is called the black sheep effect. A person's beliefs about the group may be changed depending upon whether they are part of the in group or out group. New members of a group must prove themselves to the full members, or "old-timers", to become accepted. Full members have undergone socialization and are already accepted within the group. They have more privilege than newcomers but more responsibility to help the group achieve its goals. Marginal members were once full members but lost membership because they failed NSOU ? PGSW-III 125 to live up to the group's expectations. They can re-join the group if they go through re-socialization. In a Bogart and Ryan study, the development of new members' stereotypes about in-groups and out-groups during socialization was surveyed. Results showed that the new members judged themselves as consistent with the stereotypes of their in-groups, even when they had recently committed to join those groups or existed as marginal members. They also tended to judge the group as a whole in an increasingly less positive manner after they became full members. Depending on the self-esteem of individual members of the in-group may experience different private beliefs about the group's activities but will publicly express the opposite—that they actually share these beliefs. One member may not personally agree with something the group does, but to avoid the black sheep effect, they will publicly agree with the group and keep the private beliefs to themselves. If the person is privately self-aware, he or she is more likely to comply with the group even if they possibly have their own beliefs about the situation.

Group influence on individual behaviour: Individual behaviour is influenced by the presence of others. For example, studies have found that individuals work harder and faster when others are present see social and that an individual's performance is reduced when others in the situation create distraction or conflict. Groups also influence individual's decision-making processes. These include decisions related to in-group bias, persuasion (see Asch conformity experiments), obedience (see Milgram Experiment), and group think. There are both positive and negative implications of group influence on individual behaviour. This type of influence is often useful in the context of work settings, team sports, and political activism.

Group structure: A group's structure is the internal framework that defines members' relations to one another over time.

Frequently studied elements of group structure include roles, norms, values, communication patterns, and status differentials. Group structure has also been defined as the underlying pattern of roles, norms, and networks of relations among members that define and organize the group. Roles can be defined as a tendency to behave, contribute and interrelate with others in a particular way. Roles may be assigned formally, but more often are

SA (SP NSOU 12-7-2016) final Content Write up_ for NSOU (1).docx (D21119376)

defined through the process of role differentiation. Role differentiation is the degree to which different group members have specialized functions. A group with a high level of role differentiation would be categorized as having many different roles that are specialized and narrowly defined. A key role in a group is the leader, but there are other important roles as well, including task roles, relationship roles, and individual roles. Functional (task) roles are generally defined in relation to the tasks the team is expected to perform. Individuals engaged in task roles focus on the goals of the group and on enabling the work that members do; examples of task roles include coordinator, recorder, critic, or technician. A group member engaged in a relationship role (or socio-emotional role) is focused on maintaining the interpersonal and emotional needs of the groups' members; examples of relationship role include encourager, harmonizer, or compromiser. Norms are the informal rules that groups adopt to regulate members' behaviour. Norms refer to what should be done and represent value judgments about appropriate behaviour in social situations. Although they are infrequently written down or even discussed, norms have powerful influence on group behaviour. They are a fundamental aspect of group structure as they provide direction and motivation, and organize the social interactions of members. Norms are said to be emergent, as they develop gradually throughout interactions between group members. While many norms are widespread throughout society, groups may develop their own norms that members must learn when they join the group. There are various types of norms, including: prescriptive, proscriptive, descriptive, and injunctive. Prescriptive Norms: The socially appropriate way to respond in a social situation, or what group members are supposed to do (e.g. saying thank you after someone does a favour for you). Proscriptive Norms: Actions that group members should not do; prohibitive (e.g. not belching in public). Descriptive Norms: Describe what people usually do (e.g. clapping after a speech) Injunctive Norms: Describe behaviours that people ought to do; more evaluative in nature than a descriptive norm. Inter member relations are the connections among the members of a group, or the social network within a group. Group members are linked to one another at varying NSOU ? PGSW-III 127 levels. Examining the inter member relations of a group can highlight a group's density (how many members are linked to one another), or the degree centrality of members (number of ties between members). Analyzing the inter member relations aspect of a group can highlight the degree centrality of each member in the group, which can lead to a better understanding of the roles of certain group (e.g. an individual who is a 'go-between' in a group will have closer ties to numerous group members which can aid in communication, etc.). Values are goals or ideas that serve as guiding principles for the group. Like norms, values may be communicated either explicitly or on an ad hoc basis. Values can serve as a rallying point for the team. However, some values (such as conformity) can also be dysfunction and lead to poor decisions by the team. Communication Communication patterns describe the flow of information within the group and they are typically described as either centralized or decentralized. With a centralized pattern, communications tend to flow from one source to all group members. Centralized communications allow consistent, standardization information but they may restrict the free flow

of information. Decentralized communications make it easy to share information directly between group members. When decentralized, communications tend to flow more freely, but the delivery of information may not be as fast or accurate as with centralized communications. Another potential downside of decentralized communications is the sheer volume of information that can be generated, particularly with electronic media. Status differentials are the relative differences in status among group members. When a group is first formed the members may all be on an equal level, but over time certain members may acquire status and authority within the group; this can create what is known as a pecking order within a group. Status can be determined by a variety of factors and characteristics, including specific status characteristics (e.g. task-specific behavioural and personal characteristics, such as experience) or diffuse status characteristics (e.g. age, race, ethnicity). It is important that other group members perceive an individual's status to be warranted and deserved, as otherwise they may not have authority within the group. Status differentials may affect the relative amount of pay among group members and they may also affect the group's

SA Unit 7 Group development and group dynamics.docx (D121776257)

tolerance to violation of group norms (e.g. people with higher status may be given more freedom to violate group norms).

Group Performance: While many daily tasks undertaken by individuals could be performed in isolation, the preference is to perform with other people. Social Facilitation and Performance Gains: In a study of dynamo genic stimulation for the purpose of explaining pace making and competition in 1898, Norman Triplett theorized that "the bodily presence of another rider is a stimulus to the racer in arousing the competitive instinct...". This dynamo genic factor is believed to have laid the groundwork for what is now known as social facilitation—an "improvement in task performance that occurs when people work in the presence of other people". Further to Triplett's observation, in 1920, Floyd Allport found that although people in groups were more productive than individuals, the quality of their product/effort was inferior. In 1965, Robert Zajonc expanded the study of arousal response (originated by Triplett) with further research in the area of social facilitation. In his study, Zajonc considered two experimental paradigms. In the first—audience effects—Zajonc observed behaviour in the presence of passive spectators, and the second—co-action effects—he examined behaviour in the presence of another individual engaged in the same activity. Zajonc observed two categories of behaviours—dominant responses to tasks that are easier to learn and which dominate other potential responses and non-dominant responses to tasks that are less likely to be performed. In his Theory of Social Facilitation, Zajonc concluded that in the presence of others, when action is required, depending on the task requirement, either social facilitation or social interference will impact the outcome of the task. If social facilitation occurs, the task will have required a dominant response from the individual resulting in better performance in the presence of others, whereas if social interference occurs the task will have elicited a non-dominant response from the individual resulting in poor performance of the task and it is a positive impact of group activities. Several theories analyzing performance gains in groups via drive, motivational, cognitive and personality processes, explain why social facilitation occurs.

Nickolas Cottrell, 1972, proposed the evaluation apprehension model whereby he suggested people associate social situations with an evaluative process. Cottrell argued this situation is met with apprehension and it is this motivational response, not arousal/elevated drive, that is responsible for increased productivity on simple tasks and decreased productivity on complex tasks in the presence of others. In *The Presentation of Self in Everyday Life* (1959), Erving Goffman assumes that individuals can control how they are perceived by others. He suggests that people fear being perceived as having negative, undesirable qualities and characteristics by other people, and that it is this fear that compels individuals to portray a positive self-presentation/social image of themselves. In relation to performance gains, Goffman's "self-presentation theory" predicts, in situations where they may be evaluated, individuals will consequently increase for positive image.

Social orientation theory considers the way a person approaches social situations. It predicts that self-confident individuals with a positive outlook will show performance gains through social facilitation, whereas a self-conscious individual approaching social situations with apprehension is less likely to perform well due to social interference effects. Intergroup dynamics: Intergroup dynamics refers to the behavioural and psychological relationship between two or more groups. This includes perceptions, attitudes, opinions, and behaviours towards one's own group, as well as those towards another group. In some cases, intergroup dynamics is pro-social, positive, and beneficial.

SA (SP NSOU 12-7-2016) final Content Write up_ for NSOU (1).docx (D21119376)**261/546****SUBMITTED TEXT**

In other cases, intergroup dynamics can create conflict. For example, Fischer & Ferlie found initially positive dynamics between a clinical institution and its external authorities dramatically changed to a 'hot' and intractable conflict when authorities interfered.

SA (SP NSOU 12-7-2016) final Content Write up_ for NSOU (1).docx (D21119376)

conflict According to social identity theory, intergroup conflict starts with a process of comparison between individuals in one group (the in group) to those of another group (the out group). This comparison process is not unbiased and objective. Instead, it is a mechanism for enhancing one's self-esteem. In the process of such comparisons, an individual tends to favor the in-group over the out-group, exaggerate and over generalize the differences between the in group and the out group (to enhance group NSOU ? PGSW-III 130 distinctiveness), minimize the perception of differences between in-group members, remember more detailed and positive information about the in-group, and more negative information about the out-group, etc. Even without any intergroup interaction (as in the minimal group paradigm), individuals begin to show favouritism towards their own group, and negative reactions towards the out group. This conflict can result in prejudice, stereotypes, and discrimination. Intergroup conflict can be highly competitive, especially for social groups with a long history of conflict (for example, the 1994 Rwandan Genocide, rooted in group conflict between the ethnic Hutu and Tutsi). In contrast, intergroup competition can sometimes be relatively harmless, particularly in situations where there is little history of conflict (for example, between students of different universities) leading to relatively harmless generalizations and mild competitive behaviours. Intergroup conflict is commonly recognized amidst racial, ethnic, religious, and political groups.

SA (SP NSOU 12-7-2016) final Content Write up_ for NSOU (1).docx (D21119376)

Intergroup conflict reduction: There have been several strategies developed for reducing the tension, bias, prejudice, and conflict between social groups. These include the contact hypothesis, the jigsaw classroom, and several categorization-based strategies. Contact hypothesis (intergroup contact theory): Gordon Allport (1954) suggested that by promoting contact between groups, prejudice can be reduced. Further, he suggested four optimal conditions for contact: equal status between the groups in the situation; common goals; intergroup cooperation; and the support of authorities, law, or customs. Since then, over 500 studies have been done on prejudice reduction under variations of the contact hypothesis, and a meta-analytic review suggests overall support for its efficacy. In some cases, even without the four optimal conditions outlined by Allport, prejudice between groups can be reduced. Super ordinate identities: Under the contact hypothesis, several models have been developed. A number of these models utilize a super ordinate identity to reduce prejudice. That is, a more broadly defined, 'umbrella' group/identity that includes the groups that are in conflict. By emphasizing this super ordinate identity, individuals in both subgroups can share NSOU ? PGSW-III 131 a common social identity. For example, if there is conflict between White, Black, and Latino students in a high school, one might try to emphasize the 'high school' group/ identity that students share to reduce conflict between the groups. Models utilizing super ordinate identities include the common in-group identity model, the in-group projection model, the mutual intergroup differentiation model, and the in-group identity model. Interdependence: There are also techniques for reducing prejudice that utilize interdependence between two or more groups. That is, members across groups have to rely on one another to accomplish some goal or task. In the Robbers Cave Experiment, Sheriff used this strategy to reduce conflict between groups. Elliot Aronson's Jigsaw Classroom also uses this strategy of interdependence. In 1971, thick racial tensions were abounding in Austin, Texas. Aronson was brought in to examine the nature of this tension within schools, and to devise a strategy for reducing it (so to improve the process of school integration, mandated under Brown v. Board of Education in 1954). Despite strong evidence for the effectiveness of the jigsaw classroom, the strategy was not widely used (arguably because of strong attitudes existing outside of the schools, which still resisted the notion that racial and ethnic minority groups are equal to Whites and, similarly, should be integrated into schools). 7.4.3 Conclusion Group dynamics are the processes that occur between group members. These dynamics are affected by each member's internal thoughts and feelings, their expressed thoughts and feelings, their nonverbal communication, and the relationship between group members. Group dynamics helps you understand how each person's actions make sense in the context of the group. On the other hand it also refers to a system of behaviours and psychological processes which are occurring within a social group (intergroup dynamics), or between social groups (intergroup dynamics). The study of group dynamics is very useful in understanding decision-making behaviour, tracking the spread of problems in groups, creating effective therapy techniques, and following the emergence and popularity of new ideas and technologies. However, one can understand this concept by analyzing Systems theory describes how individuals behave within a

system. As groups are considered systems, systems theory helps us begin to

understand group dynamics. Systems theory involves understanding that group dynamics is a more complex process than just summing up the individual characteristics of each group member. Instead, group dynamics is best understood by combining the characteristics of each group member, how each group member's actions affect the group, and how these group interactions affect each group member. This creates a cyclical and reciprocal feedback loop which simultaneously impacts all group members and all group members' relationships. 7.4.4 Answers to check your progress 1. What is Group Dynamics? 2. Why understanding on group dynamics is essential for group work? 3. Write dynamics in a social group. 7.6

Skills and Techniques in Social Groupwork Practice Structure 8.1 Objectives 8.2 Introduction 8.3 Topic Name: Skills and Techniques 8.3.1 Skills in Group Work 8.3.2 Techniques in Group Work 8.4 Conclusion 8.5 Exercise 8.6 Reference 8.1 Objectives

The basic objective of this section is to develop knowledge among social work professionals on various skills and techniques that are essential in the process of group work practice. Understanding of such skills and techniques is very much required before undertaking group work practice in any set up, whether community or agency set up.

8.2 Introduction

In a general sense skill means the capacity to perform activities. Virginia Robinson refers skills as "the capacity to set in motion and control a process of change in specific material in such a way that the change that takes place in the material is affected with the greatest degree of consideration for and utilization of the quality and capacity of the material"(Gaurav, 2013). Trecker defines methods and skill as "Methods means the purposeful use of insights and understanding based upon a body of knowledge and principles", and " Skill is the capacity to apply knowledge and understanding to a given situation"(Dhawa: 2014). NSOU ? PGSW-III 138

8.3.1 Skills in Social group work

It is needless to say that skills are essential for a social group worker to become more productive in-group situation. The skills are necessary to mainly exchange ideas among the members freely and clearly, using language understood by everyone and with no fears of starting arguments or hurting feelings, examining objectively how well the group and its members are working, sharing the leadership jobs among the group members and show sensitivity to the feelings of all, accepting new ideas and new members into the group without irreparable conflict, and to disciplining the group to work toward long range objectives and profit from failures, thinking clearly about group problems, findings, causes and working for solutions, adjusting group procedures and plans to meet the feelings and the desires of the members, creating new jobs or committees as needed and to terminate them or the group itself, when the needs are fulfilled.

Phillips has enumerated the following skills for social group workers and its practice settings (Pathare, n.d.).

Skill in Using Agency Functions: The group worker must be skilful enough to carry the functions of agency. He should always try to propagate what the agency in the community wants to do. He does the following activities for this.

The Intake Process: The worker who meets the applicants while carrying out the agency's procedures for intake, will discuss with him as to what exactly the member wants from the agency and what is available in the agency for him/her (Gaurav, 2013).

Connecting the Group with the Agency: The worker relates the group more firmly to the agency by helping it to understand what the agency stands for and what kind of responsible behaviour is expected of them as well as of other groups (Gaurav, 2013).

Serving the Individual through the Group work Process: Since the function of the agency includes helping group units to develop in socially useful ways, as well as helping individuals the social worker's attention must be on the development of the group as a whole and on each individual's use of the group (Gaurav, 2013).

Working with the Individual outside the Group of Meetings:
Although the worker offers his services within the group process he also provides help to the individual if need be for the better use of group experience on the part of member. The Referral Process: An important part of the group work agency's service is to work with members and their parents in a process of considering the use of other community services for help with problems that cannot be dealt within the group work agency. Skill in Communication of Feelings: The social group worker should have the following skills. • The Worker's Feelings: High among the qualities essential to a social worker's skill is the capacity to feel with others(Skills and Techniques of Group Work – Article1000.Com, n.d.). • The Group Member's Feelings: The worker must be skilful in helping the group members to know, accept, express and be responsible for their feelings(Skills and Techniques of Group Work – Article1000.Com, n.d.). • Group Feelings: The interaction of each member with the others and the worker produces group feelings. The worker helps the group in understanding their feelings and its meanings. Skill in Stimulating and Using Group Relations: The social group worker should enable each group member to find and take his part in relationship with other members. He should be skilful in using programmes to strengthen group relations. Trecker has listed the following skills of social group work(<http://www.ignou.ac.in/upload/bswe-02-block1-unit-9-small%20size.pdf>). Skill in Establishing Purposeful Relationship: The group worker must be skilful in gaining the acceptance of the group and in relating himself to the group on a positive professional basis. The group worker must be skilful in helping individuals in the group to accept one another and to join with the group in common pursuits(Skills and Techniques of Group Work – Article1000.Com, n.d.). NSOU ? PGSW-III 140 Skill in Analysing the Group Situation: The worker must be skilful in judging the developmental level of the group to determine what the level is, what the group needs and how quickly the group can be expected to move. This calls for skill in direct observation of groups in a basis of analysis and judgement. The group worker must be skilful in helping the group to express ideas, work out objectives, clarify immediate goals and see both its potentialities and limitations as a group(Skills and Techniques of Group Work – Article1000.Com, n.d.). Skill in Participation with the Group: The group worker must be skilful in determining, interpreting, assuming and modifying his own roles with the group. The group worker must be skilful in helping, group members to participate, to locate leadership among them and to take responsibility for their own activities. Skill in Dealing with Group Feeling: The group worker must be skilful in controlling his own feelings about the group and must study each new situation with a high degree of objectivity. The group worker must be skilful in helping groups to release their own feelings, both positive and negative. He must be skilful in helping groups to analyze situations as part of the working through group or intergroup conflicts(Skills and Techniques of Group Work – Article1000.Com, n.d.). Skill in Programme Development: The group worker must be skilful in guiding group thinking so that interests and needs will be revealed and understood. The group worker must be skilful in helping groups to develop programmes, which they want as a means through which their needs may be met(Skills and Techniques of Group Work – Article1000.Com, n.d.). Skill in Using Agency and Community

Resources: The group worker must be skilful in locating and then acquainting the group with various helpful resources which can be utilized by the members for programme purpose. The group worker must be skilful in helping certain individual members to make use of specialized services by means of referral that cannot be met within the group(Skills and Techniques of Group Work – Article1000.Com, n.d.).

278/546

SUBMITTED TEXT

319 WORDS

100% MATCHING TEXT

319 WORDS

Skill in Evaluation: The group worker must have skill in recording the development processes that are going on as he works with the group. The group worker must be skilful in using his records and in helping the group to review its experiences as a means of improvement(Skills and Techniques of Group Work – Article1000.Com, n.d.). On the basis of above discussions and opinions of different social workers on the different types of skills essential for group work practitioners, we may list them as follows. Communication Skills: Communication is at the heart of group work practice. The social group worker makes use of two broad categories of communication skills, one those which are intended to facilitate interpersonal helping and other those intended to facilitate to achieve the groupwork objectives. A number of specific skills may help the group worker to perform his jobs more effectively, which are listed below: Skill of Programme Planning: It is very essential that group worker must be skilful in planning the programmes for the group. It is also essential that the worker must be skilful in communicating the message around the answers of several questions. He/ She should be skilful in communicating his own feelings to the members of the group(Gaurav, 2013). Skill of Identify Self Role: It is an important step in group work practice. The worker must convince the group for his interface in its affairs (Gaurav, 2013). Skill of Explaining the Purpose of Group: Everybody before joining the group wants to know about the benefits of joining the group. If he/she is satisfied, he comes forward and become a member of that group. Therefore, the group worker must be skilful in convincing the people to avail the facilities of the agency by joining the group. The worker, further, explains how communicate in group so that the group may advance in its goal(Gaurav, 2013). Skill in Interpreting Verbal Communication: It is the job of the group worker to keep watch on the verbal communication among the group members because if it is not on the right track, the group may loose

SA Unit 8 Skills and techniques[13492] new.docx (D122077761)

its basic purpose. He/she should always try to direct in proper direction(Gaurav, 2013). Skill of Answering Question: During group process, certain questions, queries or doubts are raised by the group members. If they are not answered in right perspective, the members may disassociate themselves. Therefore, it is essential that the social group worker has the wide knowledge of social work as well as human behaviour(Gaurav, 2013). Skill in Effective Helping Relationship: It is heart of social group work practice. A group worker must genuinely care for the group members. The relationship will be more cohesive and fruitful if the social group worker possesses the following skills(Gaurav, 2013). Skill of Empathy: It refers to the worker's capacity to perceive accurately member's feelings and subjective experiences. The group worker should show in his/her behaviour that he/ she is taking genuine interest in their welfare. It will help in developing confidence between group worker and the group(Gaurav, 2013). Skill of Encouraging the Member's Feedback: It refers to statement that encourages the member to respond to the worker's explanation. This gives the members an opportunity to ask questions and raise disagreement if any(Gaurav, 2013). Skill of Describing the Member's Role: This is common tendency that everybody wants facilities, and rights but less inclined to fulfil their duties. It is the job of the social group worker to explain the member who is joining the group about his role in the group(Gaurav, 2013). Skill of Active Listening: In active listening the worker tends to both the member verbal and non-verbal message. The listening become active listening when it is followed by clarification and explanations needed by the group members(Gaurav, 2013). Skill of Exploring the Member's Silence: Sometimes it happens that one or the other members of the group keeps silence and takes the least interest in the group activities. It is the job of social group worker NSOU ? PGSW-III 143 to find out the reasons for his/her silence and encourage him/ her for active involvement(Gaurav, 2013). Skill of recognizing every Member's Strengths: It refers to expressions of confidence in the member's ability to accomplish some specific tasks in the group process. It will help the group worker in performing different types of activities in the group with the help of its members and thus the group will grow and enrich in achieving its objectives(Gaurav, 2013). Skill in giving priority and gradation of the problem: All the problems of the group and its members cannot be solved at once. Therefore, their gradation and priority is needed. Priority should be fixed by the group worker. It will facilitate the group process in right direction(Gaurav, 2013).

8.3.2 Techniques in Group Work

Techniques are interventions aiming at facilitating movement within a group (Corey and Corey 2006). They go on suggesting that almost anything that a worker or leader does in a group can be considered as techniques, including observing silence. Moreover, there are some techniques which are used quite often by the group worker to facilitate their work. Some of the more frequent techniques used by group workers are:

- Group Counselling
- Group Discussion
- Role Play
- Programme Media: Games, Story Telling, Drawing, Poster making, etc
- Individual sessions
- Supervision

Let us discuss on the various techniques and how these techniques are importance in group work. Group Counselling: Group counselling refers to activities that are used to enrich members' capacities through skill building or helping them to achieve changes in their behavioural pattern to achieve

a better growth. This counselling of course will differ in different groups

SA Unit 8 Skills and techniques[13492] new.docx (D122077761)

and also worker to worker. Some of the areas in which intensive counselling is done is cognitive, behavioural domains and affective change by the group worker. The distinguishing feature of the group counselling is that the group environment is used to accomplish both development of life skills and accomplish and strengthen changes among members. Group counselling therefore is a group process to accomplish changes in the way members think, feel and act. The group participants change in the area of behaviour, attitude, and development are the main concern area for group worker and in this context sufficient counselling is done by the worker.

Group Discussion: Group discussion is one of the important techniques for sharing and communicating ideas in a group. The group is a forum for making decisions, solving problems faced by its members both individually and collectively, promoting growth, and accomplishing a variety of objectives. The group discussion as a technique helps in developing appropriate attitude and skills of members since they learn to look at a problem from several perspectives, appreciate diversity in course of discussion and provide equal opportunity to all to express and give due attention to each members opinion . The participation in group discussion helps members to develop self respect and positive self concept. They have the ability to solve problems or take up developmental activities, therefore, each members view points are taken into consideration and consensus decision of the group in the process is taken. Members get good exposure and experience in participating group discussion.

Group Worker of course keeps all members engage in a variety of purpose and keep the group moving towards its objectives.

Supervision: It is another important technique of working with group. All discussions in the group should be presided over by a group member, leader of the worker depending on the nature of the group. Even in informal talk in the group, it is better to have a person coordinates the discussions. The supervisor should help the members to participate in the group session in a democratic manner. The worker should play the role of a supervisor in the group and he or she should makes arrangements for recording the main points. In informal discussion detailed minutes may not be possible or required but may need to keep major points for assessment of the activities and happenings. Some common problems generally encountered by the worker in the group are, sometime silence of the members, which indicates either NSOU ? PGSW-III 145 lack of interest or lack of adequate communication skills, fear of worker, other factors. This may be termed as hostile environment, which needs appropriate norms, capacity building of the members and networking among themselves. Secondly, lack of movements in participation, needs caring at least to help them to talk, chair, participate in the process of decision making. The worker should deal such situation as expert, otherwise, it can lead to stagnation in the session. Thirdly, supervision also should take care over domination of the members. Not only that, supervisor or worker himself or herself can dominate in the group session, therefore, it is necessary that he or she should be vigilant enough to open up discussion and help other members to participate instead of domination by himself or herself or checking the domination of other members.

Group Decision Making: Group decision is one of the key components in group work and the decision may tell us the fact of the functioning of the group. Decision making pattern based on what manner the decision is taken. Group

worker understanding on this part is necessary. He or she should be alert to discover that the group environment is conducive enough to take a democratic decision making. The worker should help the group to take decision quickly and rationally. Role Play: Role play is a good technique to help the members to look at their own behaviour and others view it. In role play a real life situation is simulated. But it is necessary to prepare the members for role play. It is also desirable to help members to overcome stress and coping a new learning situation. A good example is child's interaction with a teacher or a parent. A careful selection of an actors to carry out role play and to provide them feedback after seeing their performance will help to improve their quality. A congenial, safe and friendly environment is important to have success in the group. A sensitive training is necessary and useful for roleplay as well. Developing Programme Media: Programme media refers to all activities in the group, such as games, singing, story telling, street play, etc, which generally has been taken for group interaction and participation of the group members. The activities help the members to become active and identify themselves as their own activities of the group. The influence of the group on members lies in three areas: participation in activities, interaction with NSOU ? PGSW-III 146 other members and their interaction with the worker. Games and sports provide an opportunity to members to express their feelings and exhibit their behaviour which is frank and true expression of what is laying dormant inside. A special care should be given to select activities for weak members. Individual Session: Individual sessions are also used by worker while working with groups. It is necessary to assess each member about their liking and interest and to carry out fruitful participation in group. A careful planning is also necessary in the process. The worker should plan in advance for holding individual session for assessing individual capacity. It should be done in a participatory manner. Some members may be given special support for shorting out their difficulties. Evaluation: Evaluation of session/ activities of the group is necessary and members should take part in the evaluation process while working in a group. The feedback from members as such is necessary and accepted method of collecting information. The individual session may be also arranged to make the group members understanding clear about the purpose of the evaluation and why individual session is important for objective assessment of the group. The member however should be given sufficient time to express his or her problem and analysis of the problem should be made and shared with the persons

8.4 Conclusion

This unit is mainly concentrated on various skills and techniques in group work practice. In nut shell, the core skills could be summarized that are needed by social workers are the communication skill, listening, observation, analytical thinking, empathy, self control, leadership skills, while in technique part the major techniques generally used in group work are group discussion, group counselling, role play. Programme planning on games, story-telling, singing, poster making, conducting individual sessions, etc. Understanding thorough ideas on those skills and techniques definitely would enrich the group work process and especially helping the members as well as for group development more scientifically. Finally the students of social work of course would be benefitted on such understanding.

<p>Leadership functions include setting goals, selecting and implementing tasks and providing resources to accomplish group goals while maintaining the group's cohesion and satisfying the needs of individual member. The functional approach involves determining what tasks, or functions are essential to achieve group goals and how different group members should participate(Reborn, n.d.). With this approach, the demands of leadership are viewed as being specific to a particular group in a particular situation. For example, cracking a joke may be a useful leadership tactic in certain situations if it relieves tension. But when other members are revealing intense personal information in therapy, humour may be counterproductive and therefore inappropriate leadership behaviour. Many individuals who fear taking a leadership role are uncertain about leadership functions and feel they lack the power qualities of a leader. Amazingly, even the most fearful and anxious students have already taken on many leadership roles and nearly everyone has assumed leadership responsibilities by adolescence. Functional leadership involves a learned set of skills that anyone with certain minimal capabilities can</p>		<p>Leadership functions include setting goals, selecting and implementing tasks, and providing resources to accomplish group goals while maintaining the group's cohesion and satisfying the needs of individual members. <p>French and Raven have developed a framework for understanding the extent to which one group member influences another by identifying five bases of power: reward, coercive, legitimate, referent and expert. This framework allows group members to analyze the source of their power and offers suggestions on when, and when not, to use their power to influence others (Zastrow, n.d.). Reward Power: Rewards include such things as promotions, pay increases, days off, and praise. Reward power is based on B's (one member's) perception that A (another member or the entire group) has the capacity to dispense rewards or remove negative consequences in response to B's behaviour. This power will be greater if the group members value the reward and believe they cannot get it from anyone else. Group members will usually hard for someone who has high reward power and communicate effectively with her. Reward power can backfire, however, if group members feel they are being canned or bribed. If reward power is used by A is a conflict situation with B, B is apt to feel he is being bribed and controlled and may eventually refuse to cooperate (</p>		<p>French and Raven have developed a framework for understanding the extent to which one group member influences another by identifying five bases of power: reward, coercive, legitimate, referent, and expert.¹⁵ This framework allows group members to analyze the source of their power and offers suggestions on when, and when not, to use their power to influence others. Reward Power Rewards include such things as promotions, pay increases, days off, and praise. Reward power is based on B's (one member's) perception that A (another member or the entire group) has the capacity to dispense rewards or remove negative consequences in response to B's behavior. the purpose or general goals of the group? How can these goals be achieved? What are the characteristics of the members? Do some members have unique NSOU ? PGSW-III 169 individual goals or needs? What resources are needed to accomplish group goals? What is the agenda for the first meeting? What is the best way for members to suggest and decide on the specific goals of the group? Should an ice-breaker exercise be used? Which one? Should refreshments be provided? How should the chairs be arranged? What type of group atmosphere will best help the group accomplish its tasks? What is the best available meeting place? Why has the leader been selected? What do the members expect from the leader? To plan the first meeting, a leader should view the group as a new member would view it. Here are a few questions a new member might have: what will be the goals of this group? Why am I joining? Will my personal goals be met? Will I feel comfortable? Will I accept? Will the other members be radically different in terms of backgrounds and interests? If I do not like this group, can I leave gracefully? Will other members respect what I have to say, or will they laugh and make

the purpose or general goals of the group? How can these goals be achieved? What are the characteristics of the members? Do some members have unique individual goals or needs? What resources are needed to accomplish group goals? What is the agenda for the first meeting? What is the best way for members to suggest and decide on the specific goals of the group? Should an ice-breaker exercise be used? Which one? Should refreshments be provided? How should the chairs be arranged? What type of group atmosphere will best help the group accomplish its tasks? What is the best available meeting place? Why has the leader been selected? What do the members expect from the leader? To plan the first meeting, a leader should view the group as a new member would view it. Here are a few questions a new member might have: What will be the goals of this group? Why am I joining? If a group has met more than one, the leader needs to review the following kinds of questions. Have the overall goals been decided upon and clarified? If not, what needs to be done in this clarification process? Is the group making adequate progress in accomplishing its goals? If not, what are obstacles that must be overcome? Is the group taking the most effective course of action to reach its goals? What is the agenda for the next meeting? What activities should be planned? Will successful completion of these activities move the group toward accomplishing its overall goals? If not, which other activities will? Is each member sufficiently motivated to help the group accomplish its goals? If not, why? What might be done to stimulate their interest? Planning a session: In planning a session, the leader must keep the group's over goals.

To be effective, the leader must know exactly what should be accomplished in each session and make sure that all the items on the agenda contribute to the goals. Here is a checklist that may help leaders plan successful group sessions. An effective leader will do the following: 1. Select relevant content. The material should not only be relevant to the specific goals for the session but also to the backgrounds and interests of the participants. Time management advice for college students, for example, probably will be different from that for business executives. Time-saving tips for students will likely focus on improving study habits; business executives will be more interested in how to manage time in an office setting. An excellent way to evaluate possible material is to define precisely how it will be valuable to members of the group. The leader should ask, "If a group member wants to know why he or she should know this, can I give a valid reason?" If that question cannot be answered precisely, the material should be discarded and replaced with more relevant material. 2. Use examples. Examples help to illustrate key concepts and stimulate the participants. People tend to remember examples more readily than statistics or concepts. Vivid case histories that illustrate the drastic effects of spouse abuse, for instance, will be remembered much longer than statistics on the extent of spouse abuse. 3. Present materials in a logical order. It is generally desirable to begin by summarizing the agenda items for the session. Ideally, one topic should blend into the next. Group exercises should be used in conjunction with related theoretical material. 4.

Plan the time. Once the content of a session is selected and organized, the time each segment requires should be estimated. Accurate estimates will help determine whether planned material and activities are appropriate for the allotted time. A good leader also knows what material can be deleted if time is running short and what can be added if the session progresses more rapidly than planned. Substitute activities must also be available to replace speakers who fail to appear or films that fail to arrive. 5. Be flexible. A variety of unexpected events may make it desirable to change the agenda during a session. Interpersonal conflict between members may take considerable time or it may become clear that subjects related to the group's overall purpose are more valuable for the group to focus on than the prepared agenda. 6. Change the pace. People may attention longer if there is an occasional change of pace. Long lectures or discussions can become boring. Group exercise, films, guest speakers, breaks, debates and other activities will help vary the tempo of a meeting or session. In group therapy, one way to change the pace is to move from one member's problem to those of another. Lectures can be more stimulating if the instructor:

- Speaks extemporaneously instead of reading material.
- Walks around the room occasionally, rather than standing or sitting in one place
- Draws out participants by asking questions.

anxiety. Cues upon Entering the Meeting Room: It is essential that a leader be on time, but arriving early is better because it allows the leader to see that materials, seating arrangements, refreshments and any other needs are in place as planned. The leader will also have an opportunity to observe the members before the group begins. He or she can gain information about the interests of the participants from their age, gender, clothes and personal appearance, conversation and interaction with one another. An effective leader observes such cues and uses them to create an initial bond with the participants. For example, this was asked to give a workshop on suicide prevention to a high school class. Upon arriving, I was informed by the teacher that one of the students in the class had recently committed suicide. Instead of beginning with planned presentation, I asked each student to write down, anonymously, one or two concerns or questions that they had about suicide. We then had a lively discussion based on their questions and concerns. Such a discussion was probably more valuable than the formal presentation because it focused on their specific question and concerns. Seating Arrangements: Seating is important for several reasons. It can affect who talks to whom, influence leadership roles, and as a result, affect group cohesion and morale. In most groups members should have eye contact with one another. The group leader must

because they can lean on it. But tables restrict movement and may serve as barriers between people. The leader should thus carefully consider the use of tables. In business meetings or other "working" sessions, for example, tables are necessary. In therapy groups, however, tables are seldom used. When work surfaces written communication are required, small tables in a circle can be an effective arrangement. The shape of the tables can also influence the way group members interact. If the table is rectangular, the leader traditionally sits at one end becomes the head of the table and the "authority", tends to do more talking, and has a greater influence on the discussion than other group members. A round or square table, however, establishes a more equalitarian atmosphere. The "head of the table" effect can also be reduced by placing two triangular tables together to make a square. In new groups or even established ones, members are likely to sit next to friends. If it is important for everyone in the group to interact, the leader may want to ask people to sit next to individuals they do not know. People are most apt to talk to others sitting at right angles to them and them to those next to them. Those sitting directly across receive less communication, and those sitting anywhere else are even less likely to be addressed. Introductions: The leader's credentials should be summarized at the first meeting to give the group a sense of confidence that the leader can fulfil the expectations of the members. If the leader is being introduced, a concise summary of the leader's credentials for the expected role is desirable. If the leader is introducing herself, the important credentials should be summarized in an informative but modest way. The summary should be made in a way that helps create the desired atmosphere – whether it be formal or informal, fun or serious or whatever. An excellent way to handle the introductions in many groups is to use an ice-breaker exercise. It is highly desirable for the leader to learn the names of all group members as quickly as possible. This requires extra attention and name tags can help everyone be more comfortable sooner. Members appreciate being called by name because

a group and to provide information to reduce those fears. NSOU ? PGSW-III 176 Sept 1: The group leader should state the purpose of this exercise. Each student should then be handed a sheet of paper and instructed to complete, anonymously, the sentence "My specific fears about being a designated leader of a group are". The leader should emphasize that the completed statements will be collected and discussed. Step 2: The responses should be collected in a way that ensures, anonymity and then read aloud. After a concern is read, the students should suggest ways of reducing the concern. If a concern involves handling hostile members, for example, the class, with help from the instructor, may suggest strategies for coping with them. If a member fears that he or she does not have the traits needed to lead a group, it may be pointed out that research has found that no specific traits distinguish leaders from followers and that the distributed-functions theory of leadership asserts that practically anyone can be trained to be a leader. Step 3: After Step 2 is completed, the group leader or the instructor may want to summarize key points on how to lead a group and explain that future sessions will explore these points in greater depth. Exercise B: Task Functions and Group Maintenance Functions: Goal: To show that at times nearly everyone takes a leadership role in groups that involves performing task and group maintenance functions. Step 1: The group leader should indicate that this exercise will elicit the class's thoughts on what criteria should be used for admitting students into the social work programme at this campus. The leader should then explain that the council on Social Work Education (the national organization that accredits social work programmes) requires every programme to have criteria for admitting students. There is considerable variation in criteria among the programmes in

a group and to provide information to reduce those fears. Step 1. The group leader should state the purpose of this exercise. Each student should then be handed a sheet of paper and instructed to complete, anonymously, the sentence "My specific fears about being a designated leader of a group are. . . ." The leader should emphasize that the completed statements will be collected and discussed. Step 2. The responses should be collected in a way that ensures anonymity and then read aloud. After a concern is read, the students should suggest ways of reducing the concern. If a concern involves handling hostile members, for example, the class, with help from the instructor, may suggest strategies for coping with them. If a member fears that he or she does not have the traits needed to lead a group, it may be pointed out that research has found that no specific traits distinguish leaders from followers and that the distributed-functions theory of leadership asserts that practically anyone can be trained to be a leader. Step 3. After Step 2 is completed, the group leader or the instructor may want to summarize key points on how to lead a group and explain that future sessions will explore these points in greater depth. Exercise B: Task Functions and Group Maintenance Functions GOAL: To show that at times nearly everyone takes a leadership role in groups that involves performing task and group maintenance functions. Step 1. The group leader should indicate that this exercise will elicit the class's thoughts on what criteria should be used for admitting students into the social work program at this campus. The leader should then explain that the Council on Social Work Education (the national organization that accredits social work programs) requires every program to have criteria for admitting students. There is considerable variation in criteria among the programs in

The subgroups are informed that their task is to develop criteria for admitting students to the social work programme at this campus. The subgroup is free to suggest various criteria but should probably begin by discussing: 1) whether a grade-point average should be used for admission and what it should be, and 2) how "aptitude for social work" should be defined and measured. Step 5: The subgroups should work for 20 to 30 minutes, and each should then state and explain its proposed criteria. Time should then be called and each subgroup should be asked to indicate to the class what criteria were arrived at. Step 6: The group leader should indicate that one of the purposes of this exercise is to demonstrate that most members in a group assume leadership roles by carrying out task and group maintenance functions. The leader should then define task and group maintenance functions. Step 7: Each observer summarizes to his or her subgroup, but not to the whole class, the significant task and group maintenance functions performed by each member. Step 8: End the exercise by asking members if they have any thoughts or comments. Exercise C: Power Bases: Goal: To practice analyzing influence attempts in terms of power bases. Step 1: The group leader explains the purpose of the exercise, describes the five bases of power developed by French and Raven, and briefly discusses the effects of using each base. Step 2: The class divides into subgroups of three members each and answers the following questions: NSOU ? PGSW-III 178 1. What bases of power does the instructor of this course have? 2. What bases of power does a student in this class have? 3. What is the primary power base

If a programme has to be person-centered, it has to respond to the wants and welfare of the group members. The group worker has to make the group understand that (i) there is a vast distinction between the wants of the group members and their welfare; (ii) this can be gathered when group members put across their views during programme sessions. However, when group starts spelling out ideas for the programme, the worker needs to carefully evaluate them on the basis of collective interests, fine foundation, feasibility in terms of resources and agency's objectives, feasibility of personal partaking of members and also of group's cooperation. It is of equal importance that the worker consistently taps the wants and welfare of the group from its members. Gathering this vital information is not a onetime affair to be done in the initial stages of the programme, but has to flow at periodic intervals to ensure that the programme is on the right path. The worker has to understand and also convey to the group members that programme planning is an NSOU ? PGSW-III 196 ongoing process – that as the programme evolves in sequence, one could comprehend the group's progress as well. Any discussion of programme in social group work must take into account such times as content and area, media of expression, and methods of conducting it. Programme area or content refers to a segment of life experience that has general meaning for the individuals at their specific point of development. The programme process is not segmental; in actual work all these are interrelated and almost indistinguishable.

The group worker enables the group to understand their role in programme planning and implementation – that programmes are successful largely due to the members' willingness to share responsibilities. During the planning stages, the group members should clearly assign and accept duties and responsibilities – individually, in pairs or through forming smaller committees within the group. The group worker assists the members in functioning in unity towards executing the programme. Healthy, purposeful and friendly communication among group members is the essence of programme planning and development. The group worker's role here is imperative. He steers the group members to meaningful communication which in turn leads to the group working towards aims that reciprocate with the agency's functioning. Thus communication is a fundamental mode on the road to the group's goals. Thus, the programme planning process is influenced by various factors such as: (i) consistent unearthing of the wants and welfare of members, (ii) identification of the point

<p>The focus of group work services is often the family, an interacting, interdependent system. The problems faced by people are usually influenced by the dynamics within the family and dynamics within the family are in turn, influenced by the wider social and cultural environment. Because a family is an interacting system, change in any member will affect all others. Tensions between a husband and wife, for example, will be felt by their children who may then respond with disturbed behaviour. Treating the children's behaviour alone will not get to the root of the family problem. Another reason for the focus on the family rather than the individual is that other family members are often needed in the treatment process. They can help identify family patterns. In addition, the whole family, once members perceive the relation- ships among their various behaviours can form a powerful team in</p> <p>W https://vdoc.pub/documents/social-work-with-groups-a-comprehensive-worktext-48n28pk2uda0</p>		<p>The focus of social work services is often the family, an interacting, interdependent system. Because a family is an interacting system, change in any member will affect all others. Tensions between a husband and wife, for example, will be felt by their children, who may then respond with disturbed behavior. Treating the children's behavior alone will not get to the root of the family problem.¹ Another reason for the focus on the family rather than the individual is that other family members are often needed in the treatment process. They can help identify family patterns. In addition, the whole family, once members perceive the relationships among their various behaviors, can form a powerful team in</p>

	<p>When problems arise in a family, social services are often needed. The types and forms of services that group workers provide to trouble families are extremely varied. We can group them into two major categories: in-home services and out-of-home services. In-home services are preventive. Although not all are offered literally within the home itself, they are specifically designed to help families stay together. They include financial aid; protective services (services to safeguard children or frail older adults from abuse and neglect); family preservation services (intensive crises intervention within the home setting where children are so seriously at risk that removal to foster care would otherwise be required); family therapy (intensive counselling to improve family relationships); day care (Caretaking services for children or older adults to provide respite for caregivers who might otherwise be overwhelmed or to permit them to work outside the home); home-maker services; and family life education (classes, often offered at traditional family service agencies, that cover such topics as child development, parenting skills, communication issues etc.). Obviously, not all of these services can be provided by group workers, but workers must know where to find them and how to help the family obtain them when needed. Out-of-home services, on the other hand, are those services that must be operationalized when the family can no longer remain intact. They are a manifesta- tion that sometimes has gone seriously wrong, since the breakup of any family amounts to a tragedy that will have ramifications beyond family boundaries. While family members usually received the blame, the larger system (social environment and the level of support it provides to troubled families) may be called into question. Out-of-home</p>		<p>When problems arise in a family, social services are often needed. The types and forms of services that social workers provide to troubled families are extremely varied. <p>In this group the dysfunctional members are identified and his identity revealed. He chooses from the class a smaller group consisting of a few members. The group worker then describes the problem to the group and its effect on the affected student. Certain activities are chosen which will attract the larger student body to the smaller group and interact with it. If successful the smaller group status improves and so does the status of the dysfunctional student. 4. Telescopic Groups: Telescopic groups are groups which meet five or six times in a short period of time. A current problem is taken up as a major issue. For example absenteeism and group formed by members who are found to be excessively absent. The members are made aware of the reason for being part of the group. A plan is made for a group which includes activities which are gratifying and ego supportive. 5. Socio educational groups: These groups involve the other stakeholders like the parents and staff members to improve the school functioning. For example – suitable parents are depending on their need, aptitude and interest are taken as members of the group. They are informed that the purpose of the groups is to improve their performance as the parents. Sessions are planned which will provide them with new skills and knowledge. Films, lectures, role plays and members presentations are the best means.</p>		<p>In this group the dysfunctional members are identified and his identity revealed. Objectives In this unit, we review the definition and purpose of
supervision in group work and how it is conducted within
varying cultural contexts. We also examine the different modes,
models, roles and functions of supervision in group work. The
unit also journeys to recording, types of recording. After reading
through this unit you must be able to: • have a general
understanding of the definition and functions of supervision
within a professional human service setting; • Identify a mode of
supervision; • understand the models of supervision • perceive
recording and types of recording in group work. 12.1
Introduction The supervision process consists of the face-to-
face contact between the supervisor and the supervisee.
Supervision defined as the relationship between a supervisee
and supervisor who oversees the development of the supervisee
throughout the group work process. Writing and maintaining
group work records is an essential element of professional
social work. Recording in social group work aims to make better
the quality of service to the members. The agency could assess
the quality of its service, thereby understanding its efficiency.
Group records are imperative in study, research and
experimentation.

SA Unit 12 Supervision and Recording[13506] new.docx (D122078278)

Supervision in Social Group Work 12.2.1 Concept Supervision is an enabling process in which the supervisor through the medium of his relationships with the supervisee contributes to the supervisee's growth on the job, so that he can perform his functions effectively and efficiently to achieve the purpose of the programme. Supervision is a process by which members are helped by a professional group worker to learn according to their needs to make the best use of their knowledge and skills, and to improve their abilities so that they do their jobs more effectively and with increasing satisfaction to themselves and the agencies. John D. Millet Rightly observes: "Supervision is more than a process, it is a spirit which animates the relationship between levels of organisation and which includes maximum administrative accomplishment, or when unsuccessful, generates administrative paralyses. Effective management is concerned to realize the first and to avoid the second". It may be added here that many words like 'advice', 'inspection', 'counselling', 'guidance', 'help', 'performance audit', and 'investigation', etc., are also used in the context of supervision but in the final analyses, these are the part of the process of supervision. Their meaning though may vary in degree yet all lead to improvement of efficiency and building up a positive relationship between cliental and the end attainment of objectives according to plans. Supervision includes modifying the behaviour of the supervisee and is measured by the qualitative growth of those being supervised. Supervision is different from inspection – one is more positive and other rather negative. Supervision reports contain constructive suggestions where as inspection reports are an enumeration of faults. The supervision is concerned with staff development and effective implementation of project / programmes. The inspector often behaves more like a prosecutor and treats his subordinates as culprits.

12.2.2 Ingredients of Supervision

Supervision has many ingredients. According to Halsey, the supervision, has the following ingredients: NSOU ? PGSW-III 246

1. Selecting the right person for each job;
2. Arousing in each person an interest in his work and teaching him how to do it;
3. Measuring and rating performance to be sure that teaching has been fully effective;
4. Administering correction where this is found necessary and transferring to more suitable work or distributing those for whom this proves ineffective;
5. Commending wherever praise is merited and rewarding for good work, and finally;
6. Fitting each person harmoniously into the working group – all done fairly, patiently and tactfully so that each person is caused to do his work skilfully, accurately, intelligently, enthusiastically and completely.

12.2.3 Models of Supervision

There are two primary models of supervision that are generally used by the supervisor in preparing the supervisee to work in various human service professions – the developmental and task models of supervision (Lager, n.d.). The developmental model of supervision is more of a process-oriented model that follows the various stages of learning that a new member generally experiences during his or her development of professional knowledge and skills for work. The primary focus of a developmental model of supervision is on how supervisee change as they gain more training and experience in the field of practice, based on a shift in identity (from learner to worker) and the skills that develop with the experiences gained. In the developmental model of supervision, supervisors primarily attempt to match their behaviour and

teaching techniques to the developmental needs of the supervisees (Lager, n.d.). The developmental model generally consists of four stages of development that supervisees follow as they gain experience in the field of social work. At each stage the supervisee's development is strongly influenced by three general themes, all of which have an enormous effect on the other themes. Those themes are (Lager, n.d.):

- The development of the supervisee's professional self and identity.
- The relationship between the supervisor and the supervisee.
- The administrative structure within which he or she works.

The stages of development are as follows (Lager, n.d.):

Stage One: During this stage the supervisee is very dependent on the supervisor and lacks the competence needed for independent work. Supervisees also generally lack self-awareness and have little experience in working with clients. Learning takes place by shadowing the supervisor and observing his or her style of practice.

Stage Two: This stage is generally characterised by a dependency – autonomy conflict. As the supervisee's awareness increases, he or she strives for independence but is not ready for complete autonomy. At this stage the supervisee needs more independence and less restrictiveness than the first stage.

Stage Three: This is the stage of conditional dependency in which the supervisee is generally more differentiated, motivated, insightful and empathetic. He or she is more comfortable with a perception of professional self and is able to function with a great deal of autonomy. The supervisee at this stage is also able to formulate assessments well and develop appropriate interventions for clients with minimal input from the supervisor.

Stage Four: At this stage the supervisee has developed a high level of competence and is able to independently formulate accurate assessments with appropriate interventions. Supervisees at this stage are able to take responsibility for their own learning.

The Task model of supervision is very similar to the developmental model, however it relies heavily on the assignment of tasks that help supervisees develop to a more advanced level of practice. This model includes a focus on both functions and tasks within supervision which are, respectively, the how and what of supervision. For example, some of the tasks that are included in the model are: monitoring- evaluating; instructing-advising; modelling; consulting; supporting-sharing. Likewise, some of the functions are: counselling skill; case conceptualization; professional role; emotional awareness; self-evaluation. The consequence is a 5 (task) by 5 (function) matrix, with 25 resulting task-function combinations (see figure 4.1). A supervisor might, for example, engage in monitoring-evaluating (the how) of the supervisee's counselling skill (the what), or might engage in consulting concerning the supervisee's emotional awareness, and so on. Hypothetically, a supervisor might engage in any task with any function, but realistically there are probably some task and function matches that are more likely to occur in supervision.

Functions (How) Counselling Case Professional Emotional Self skill conceptualization role awareness evaluation
 Monitoring- Evaluating Tasks Instructing (What) Advising Consulting Supporting- sharing

Figure 4.1: Functions and Tasks in Supervision

Exercise I: 1. What is the primary underlying principle of developmental model of supervision? 2. State how the task model of supervision differs from the developmental model, and provide an illustration of how it might focus on the intersection of the how and what of supervision.

12.2.4 Modes of Supervision Direct observation of

the supervisee: Regardless of the particular model of supervision used, there is no substitute for directly observing a supervisee's work with a client. Several arrangements can be used for conducting these observations. One way is for the supervisor to be physically present in the place with the supervisee, or accompanying him or her on home visits(Lager, n.d.). Another possibility involves the use of special observation rooms equipped with one way mirror. By observing sessions as they occur, supervisors get a better sense of the social work process of assessing and counselling client. They can listen to what is said, watch the non-verbal behaviours of the supervisee and client, note key moments of the session, and get a deeper awareness of the overall "feel" of the interventions. In NSOU ? PGSW-III 249 some arrangements, supervisors can also instruct the supervisee during the interaction. Using a technique known as a "bug in the ear", supervisors observe the sessions from behind a mirror and can speak to the supervisee through a microphone connected to tiny earplug-type speakers(Lager, n.d.). Although direct observation can be one of the best ways for supervisees to learn counselling techniques, a drawback is the fact that they can be intimidated by the supervisor's presence—even if he or she is behind a mirror- and therefore their already existing anxiety can be elevated. In such situation, it is helpful for supervisors and supervisees to establish an agreement about how directly observed sessions will proceed, what the goals and objectives of the session are, and perhaps engage in a role play before the actual client session begins.

Didactic supervision: Didactic or teaching supervision is best chosen when an supervisee wants to learn, or a supervisor wants to teach, specific information about a theory, technique, or some topic relevant to the supervisee's activities. The goal of a didactic approach is to get information across as efficiently as possible so the supervisee can learn and apply the information directly to his or her work(Lager, n.d.). Didactic approaches tend to be particularly appealing to beginning learners because they feel a need for concrete, practical information to help the cope with the anxiety and ambiguity of starting something new.

Case discussion: Case discussion means the supervisee describes a case to the supervisor and the two discuss what is going on. Case discussions can take a variety of formats depending on the goals and preferences of the supervisee and supervisor. Perhaps the most common approach involves supervisees describing what is happening in a case, explaining their actions and offering interpretations for what is happening. The supervisor typically listens, asks questions, and may offer alternative interpretations or suggestions(Lager, n.d.).

Types and Role Plays: Video or audio recordings of sessions with clients enable the supervisor and supervisee to observe the actual interview process with a client. This is an extremely valuable method for clinical training, although some time limitations prohibit reviews of the entire session. This mode of supervision presents an interesting paradox. NSOU ? PGSW-III 250 An alternative to working with recorded sessions is to enact a client session with the supervisor. Role plays involve supervisees taking the roles clients, trainees or other staff members and acting these roles as they portray a situation or interaction of interest. They can be particularly helpful in developing basic helping skills and in learning to deal with difficult clients. Role plays can also help supervisees to become aware of their counselling style and, in some instances, about significant issues in their own lives. Supervisors can also use role plays to learn about issues and techniques in supervision. Direct observation of the supervisor:

The majority of supervisees prefer this mode of supervision above most others. While they recognise that discussion about their own work can only take them so far, they also feel they can learn a great deal when they can watch their supervisor in group or individual sessions, read reports written by the supervisor, and observe him or her in other actions such as meetings, conferences etc. One way to accomplish this is for the supervisor and supervisee to work jointly in counselling clients. This is most commonly practiced in group or couples counselling, but it can also be used with individual client.

Exercise II: 1. What mode of supervision is preferred by supervisees? What activities generally fall under this mode? 2. What are role plays, and how are they helpful in the supervisory process? 12.2.5 Techniques of Supervision According to John D. Millet there are, broadly considered six techniques of supervision. The techniques are presented through a diagram given below:

SA Unit 12 Supervision and Recording[13506] new.docx (D122078278)

Prior approved of individual projects The formulation of service standards Approval of Key subordinate personnel Supervision Budgetary limitations upon the magnitude of operations Reporting system on work progress NSOU ? PGSW-III 251 Techniques of supervision The above diagram shows that supervision needs specialised knowledge and skills in utilizing it to achieve the intended results. This diagram also indicates that the supervisor has to possess certain qualities, while at supervision. Following are the techniques of supervision: Prior approval: Prior approval means that prior approval of the competent authority has to be obtained before the work on a particular programme is started. In this manner, the supervisor will be in a position to gather detailed information about the intentions of the operating organisations. Moreover, the supervisor will come to know about the details of work which his organisation, where he performs his work, is going to execute. Deviations, if any would be corrected and controlled without any misunderstanding, wastage of time, energy in terms of money, manpower and material resources. Service Standards: Service standards means setting up norms of administrative output. Setting up norms is not an easy process. Difficulties lie in striking a balance between quantity and quality, the achievement of targets and the way it has to be done. The supervisor has to work with thoughtfulness, fairness, tact, emotion etc for effectiveness and efficiency of service standards so laid down. Budgetary Limitation: Budgetary limitation means that the operating units work within the budgetary allocations and have to carry out the work within the limited budget provisions. The technique is being followed in day-to-day financial administration of the organization. Approval of Personnel: This means to reserve the right of approval of personnel of the key personnel in the organization by the Chief Executive while leaving the initiative of selection in the hands of the operating head. This technique helps in exercising control over the personnel in a manner stipulated for achieving the objectives of an organisation. Reporting System: Reporting holds a key position for assessing day-to-day performance of an organization. It helps in identifying shortcomings and bottlenecks in execution of the programmes and projects and in turn, ways and means for NSOU ? PGSW-III 252 corrective action. Reporting system works as one of the means for effective monitoring of the progress of an organization. Inspection of Results: Inspection of result is very effective instrument of supervision. The supervisor has to ensure that the inspection is timely, result-oriented, humanistic and problem solving. It helps in building the role conflicts and establishing harmonious contacts between the supervisor and the supervisees in the performance of their work. Inspection has to see that the existing rules and regulations are observed. It is a sort of performance audit. The inspection is related to instructing and guiding the persons working in the organisation as well as improvement of efficiency. 12.2.6 Qualities of Supervisor The supervisor – 1. He is more a leader among the group members than a boss over the subordinates. He substitutes leadership for authority. 2. He should be impartial, objective, fair minded, humane, capable and willing to guide and help the supervisee. 3. He should have HUMAN TOUCH H – Hear him out U - Understand his feelings M – Motivate him A - Acknowledge his efforts N - News-keep him informed T - Train

him O – Open his eyes U - Uniqueness – treat him as individual
C - Contact him regularly H – Honour him as a person.

Principles of Supervision 1. It should be person-oriented rather than production-oriented. 2. How a job is done is more important than how much done. 3. It is being good and not doing good that counts. 4. It is being on tap rather than on top. 5. For dynamic programmes increased possibility of error must be recognized and allowed for. 6. It should be based on understanding and not fear. 7. Too much of supervision begets mediocrity. 8. Responsibility would always be coupled with authority. 9. No supervisee should receive orders from more than one source. 12.2.8 Functions of the supervisor: Educational, Administrative, Helping Supervisors perform three-pronged functions, namely administrative i.e., operational and discipline related functions; educational i.e. related to professional learning constituted of knowledge, skills and values; and the helping functions that deal with supervisee as a person and are concerned with his personal growth(Lager, n.d.). a) Educational Function(Lager, n.d.): Educational functions include the following: 1. Designing and planning of learning activities and/or programmes of study. 2. Identifying professional skills in daily work. 3. Professional socialization – teaching supervisees to apply values and principles while using social work method. 4. Giving knowledge of micro-macro linkage, legal provisions, government schemes, information about community resources. 5. Teaching the use of tools and techniques of social work practice. 6. Demonstrating use of methods and skills – through lab work. 7. Teaching record-writing, documentation work.

SA Unit 12 Supervision and Recording[13506] new.docx (D122078278)

Provide frequent and accurate feed-back. 9. Facilitate reflection and critical thinking through well planned and structured supervisory sessions. 10. Dealing with ethical dilemmas in day to day work. 11. Working with co-workers and utilizing supervision, accepting and utilizing feed-back. 12. Teaching NGO/GO management including maintaining records, working on committees, budgeting, project proposal formulation, inter-agency coordination etc. 13. Guidance on research exercise – catching supervisees to take up any research based assignment – teaching supervisee about research methodology, i.e., data collection, data analysis and reporting. 14. Innovative projects to help individuals / group / families / communities – introducing by direct instruction or encouraging supervisees to take initiatives themselves. b) Administrative Functions(Lager, n.d.): Operational and discipline related duties are categorized as administrative functions. Following are some of the administrative tasks of supervisors: 1. Preparing supervisee for their professional roles is no small task. It requires giving detailed attention to innumerable contingencies. 2. Keeping attendance of supervisee, ensuring submission of records and maintaining log of supervisees' work. 3. Maintaining supervisees' discipline in work place. 4. Planning and holding of supervisory conferences, giving prior intimation to the supervisees so that they can make necessary arrangements for attending the same. 5. As different an on-going educational assessment, supervisors have to formally evaluate supervisees' performance and level of learning in terms of professional skills, knowledge and attitudes. 6. Resolution of work related problems. NSOU ? PGSW-III 255 7. Serving on Governing Boards of relevant organisation. 8. Supervisors have to be vicariously responsible for what their supervisees are doing the work place irrespective of the educative value of allowing supervisees to learn 'by doing', often by trial and error, supervisors have to ensure that this manner of learning does not aggravate the problems of the client groups. Supervisors have, therefore, to be cautious and to critically assess supervisees' work. C. Helping Functions: Supervisees struggle with confusion and self-doubt as they attempt to develop self-efficacy as a professional. The learning process in social work involves a reappraisal of own attitudes and values. In this process, the supervisee needs the support of a supervisor. It is not enough to verse supervisees' work and teach them the use of social work methods. The supervisees are expected to develop the 'professional self' which means that their 'self' is the main tool for offering professional interventions. Social work education aims at bridging the gap between the 'personal self' and the 'professional self' of the supervisees. Reassurance of worth and social integration support from supervisors go a long way towards providing supervisees an anchor which they can hold on to in times of emotional turmoil, anxiety, stress and self-doubt. Supervisory activities with this focus as designated as 'helping' functions which are as follows(Lager, n.d.): 1. Creating an open supervisory environment. 2. Providing encouragement. 3. Attending to supervisees' personal growth. 4. Building confidence. 5. Helping supervisees develop self-awareness, understanding of personal vs professional self. 6. Dealing with personal / family problem having impact on day-to-day work. 7. Referral to counsellors for in-depth personal counselling and to other agencies for addressing family and personal problems. 8. Career counselling. 9. Helping supervisees with their struggle

with confusion and self-doubt as they attempt to develop self-efficacy as a professional.

Supervision should certainly become more relaxed and more supportive as time goes on. 11. Creating a bond and communicating before applying supervisory controls is very essential. 12. Professional learning is carried out within the context of the supervisee – Supervisor relationship. The supervisor-supervisee relationship is the primary mechanism through which supervisees develop a professionally reflective and self-evaluative practice stance. Helping dimension of supervisor's function helps nurture and strengthens this relationship. 13. A non-threatening environment of the relationship will help supervisees accept constructive criticism and encourage them to change. 14. We know that mentoring is one of the most highly recommended supervisory strategies. The word mentor infers caring, setting wise example, coaching and identifying mistakes without causing resentment. Supervisors perform all the three kinds of responsibilities but the emphases and supervisory inputs may vary according to the level and stage of professional development of the supervisees, and demands of a particular work situation. 12.2.9 Supportive Functions In Supervision The supportive functions of supervision will be highlighted here as they relate to the process of developing essential skills that will be helpful in dealing with a variety of stressors often associated with social work practice (Lager, n.d.). Prolonged job related stress can ultimately lead to professional burnout and / or compassion fatigue in many helping professions. It is important for supervisors to recognize the symptoms of extreme stress and develop strategies for dealing with them immediately. It is essential that supervisors, supervisees, and other helping professionals learn to manage stress in themselves and to help their clients manage stress. Stress is a contributing factor in a wide variety of emotional and behavioural problems, including anxiety, child abuse, spouse abuse, temper tantrums, feelings of inadequacy, physical assaults, explosive expressions of anger, feelings of hostility, impatience, stuttering, suicide attempts and depression.

SA Unit 12 Supervision and Recording[13506] new.docx (D122078278)

Stress is also a contributing factor in most physical illness. These illness include hypertension, heart attacks, migraine and tension headaches, colitis, ulcers, diarrhoea, constipation, diabetes, backaches, arthritis, cancer, colds, flu, insomnia, alcoholism, bronchitis, infections, allergies and enuresis. Exposure to cumulative stress, crisis and even traumatic events in our professionals or personal lives can cause physical and / or emotional exhaustion that leads to professional burn out or compassion fatigue. Occupational stressors, when unchecked, can result in worker burnout. Role ambiguity, role conflict, and role overload play a large role in the onset of burnout within the work place. Stress related problems often result from a combination of (1) individual perceptions of the problems, (2) environmental demands placed on the individual that have a direct effect on his or her ability to deal with the problems and (3) one's physiological responses when confronted with stress. When stressors are social or psychological rather than physical, the stress response builds up tension that is not released(Lager, n.d.). As a result, it utilizes energy that is not restored and can ultimately lead to exhaustion. Over a period of time, prolonged exposure to the stress and the resulting exhaustion can cause significant problems to one's physical and psychological well being. Signs and Symptoms of Burn out and Compassion Fatigue:

- Change in behaviour and / or job performance.
- Increased physical complaints of fatigue, irritability, muscle tension, stomach upset and susceptibility to illness.
- Social withdrawal, pulling away from co-workers, press, family members.
- Emotional exhaustion, loss of self-esteem, depression, frustration, loss of commitment and moral purpose in one's work.
- Loss of curiosity and desire to learn, often accompanied by a negative attitude.
- Spiritual change, decline in spiritual beliefs, questioning of the meaning of life.

NSOU ?
PGSW-III 258 The following chart indicates the effect of prolonged stress on job performance, interpersonal relationships, morale and behavioural functioning (Greenberg, 1999)

Effects on job performance	Effect on morale	Effect on interpersonal relationships	Behavioural functioning
Decrease in performance	Decrease in morale	Decrease in relationships	Decrease in functioning
Interpersonal dissatisfaction	Withdrawal from work	Decreased quality of work	Decreased confidence
Relationships	Impatience	Exhaustion	Decline in quality
General dissatisfaction	Faulty judgement	Avoidance of job	Poor communication
Negative attitude	Irritability	Tasks	Increase in mistakes
Subsumed by own	Apathy	Frequent tardiness	needs
Establishment of Staff conflicts	Demoralization	and	

SA Unit 12 Supervision and Recording[13506] new.docx (D122078278)

feelings of incompleteness Avoidance of job tasks Lack of appreciation Overworked; frequent job changes Obsession with details Detachment; Substance abuse reduced self-esteem
Managing Stress and Preventing Burnout: The following approaches have been useful for helping supervisee reduce stress and prevent burn-out. It is upto each individual to select the ones that will be most helpful. Managing stress is similar to dieting. It will work for those who put forth the effort. Goal Setting and Time Management: Stress and burnout can come from the feeling of "too much to do and too little time in which to do it". Often, this feeling is due to not having clear short-term and lifetime goals and not knowing how to manage time effectively to achieve them. Realistic goals and a plan for achieving them lead to increased self-confidence, improved decision making, a greater sense of purpose, and an improved sense of security.

SA Unit 12 Supervision and Recording[13506] new.docx (D122078278)

Relaxation: Deep-breathing relaxation, imagery relaxation, progressive muscle relaxation, meditation, and bio feed-back are effective techniques for reducing stress and inducing the "relaxation response" (becoming relaxed). Each of these techniques is facilitated by sitting in a comfortable position in a quiet place and closing one's eyes. Exercise: Stress prepares our body to move or become involved in large-muscle activity refers to the kinds of exercise involving many muscle groups at the same time, such as jumping rope. Through exercise, a supervisee can use up fuel in the blood, reduce his or her blood pressure and heat role, and reverse the other physiological changes set off during the alarm stage of the General Adaptation Syndrome. Exercising helps a person Keep Physically fit and has more physical strength to handle crises. It also reduces stress and relieves tension. For these reasons supervisee should be encouraged by the supervisor to have a daily exercise programme. Many activities are available: walking, stretching, jogging, isometric exercises, jumping rope, swimming, playing tennis, dancing, housework, sex, gardening or golf. Taking Care of Physical self: In addition to exercising, it is important to have nourishing diet, to take appropriate care of one, and to get enough sleeps. Not only does a nourishing diet help keep people fit to resist stress but research shows there are direct links between what individuals eat and how they feel emotionally. Some foods (such as coffee) produce tension, while overeating causes individuals to feel drowsy and even ill. Staying slim and trim helps a person feel good about himself or herself. Social Support Groups: Everyone needs to feel close to others. Support groups allow people to share their lives, have fun with others, let their hair down. These groups are also a resource for help when emergencies and crises arise. These are variety of possible support groups that centre on co-workers, a hobby or sports, a service (such as Rotary), a family, a social club and so on. Taking to others: Every human needs someone with whom to share good times as well as personal difficulties. Sharing concerns with someone helps to vent emotions, and talking a

SA Unit 12 Supervision and Recording[13506] new.docx (D122078278)

concern through often generates constructive strategies for resolving it. A good listener is someone who convey caring and understanding. Keep the information confidential, is empathetic, helps explore the difficulty, and encourages the person to select and try out a resolution strategy. Positive Thinking: When anticipated and unanticipated events occur, people can choose to take either a positive or negative view of the situation. If they take a negative view, they are apt to experience more stress and alienate friends and acquaintances. If they take a positive view, they are likely to maintain their composure; stay relaxed, and cope with the situation quickly and easily, minimizing negative consequences. Changing Stress-Producing Thoughts: It is often erroneously believed that emotions, including feelings of tenseness and anxiety, are primarily determined by experiences – that is, by events that occur. However, cognitive therapies have shown the primary source of a person's emotions to be what she tells herself about her experiences. Changing or Adapting to Distressing Events: There are an infinite number of distressing events: the death of someone, close, the breakup of a romantic relationship, being friend, having an unfulfilling job, failing some courses, getting into an argument, or having unresolved religions questions. When distressing events occur, supervisee should be encouraged by the supervisor to confront them directly to try to improve the situation. Personal Pleasures: Personal pleasures relieve stress, provide a change of pace, are enjoyable, make us feel good, and are (in reality) personal "therapies". What is pleasurable to one person may not be to another. Common pleasures are being hugged, listening to music, going shopping, and taking a hot bath, going to a movie, having a glass of wine, family and religious get-together, taking a vacation, singing, and so on. Such "treats" remind individuals that they have worth; they also add spice of life. Exercise: Stress Management Techniques for Me Goal: This exercise is designed to familiarize you with available stress management techniques

SA Unit 12 Supervision and Recording[13506] new.docx (D122078278)

Review the material in this unit on stress management techniques. List those techniques that you have used. Also briefly describe whether each technique was beneficial to you in helping to reduce the level of stress you were experiences. 2. Specify the stress management techniques that you are planning to use in the future.

12.2.10 Roles of the Supervisor

Roles are set of behaviours that the supervisors engage in fulfil their various obligations. Some of the supervisory roles conceptualized by the experts are as follows:

- **Enabler:** In this role, the supervisor is present with the supervisee as a "helper" or "enabler", there to do things with the supervisee rather than for or to the supervisee. His influence is indirect rather than direct. He helps supervisees to articulate their needs, to clarify and identify their problems, to explore resolution strategies, to select and apply a strategy, and to develop their capacities to deal with their own problems more effectively. As an enabler, the supervisor helps supervisees revitalize and mobilize their own strengths and resources to cope with difficult problems.
- **Broker:** In the broker role, the supervisor identifies community resources, government schemes and programmes that may help supervisee to carry out their plans. As a broker, the supervisor helps supervisees become aware of resources, eligibility criteria, and other conditions for using a particular service.
- **Advocate:** It is an active, directive role in which the supervisee advocates for a supervisee. In such a role, the supervisor provides leadership for collecting information, for arguing the correctness of the supervisee's need and request, and for challenging the institution's decision not to provide services.
- **Mediator:** As a mediator, the supervisor helps resolve disputes, conflicts, or opposing points of view within the group or between a member and some other person or organization. The mediator role involves intervention in finding compromises, reconcile differences, or reach mutually satisfactory agreements. He works through the supervisees of the group and occupies a NSOU ? PGSW-III 262 position of liaison between the group and the agency. The supervisors use their value orientations and unique skills in identifying miscommunication and clarifying position.
- **Negotiator:** A negotiator brings together those who are in conflict over one or more issues and seeks to achieve bargaining and compromise to arrive at mutually acceptable agreements, somewhat like mediation, negotiation involves finding a middle ground that all sides can live with. However, unlike a mediator, which is a neutral role, a negotiator usually is allied with one of the sides involved. The supervisors play this role especially while negotiating about time, venue, resources etc., with supervisees, agency or community.
- **Educator:** One of the most important roles assumed by supervisors in helping supervisees achieve their goals is that of the educator. The educator role involves giving information to supervisees and teaching them new skills. To be an effective educator, the supervisor must first be knowledgeable. Additionally, she or he must be a good communicator so that information is clearly conveyed and readily understood by the receiver.
- **Initiator:** An initiator calls attention to a problem or even to a potential problem. It is important to realise that some problems can be recognized in advance. The supervisor with his experience and knowledge can foresee the potential problem areas and draw the supervisees' attention to address the issues. In this role he initiate discussion or action on the problem area.
- **Empowerer:** A key goal of

supervision is empowerment. In the role of empowerer the supervisor helps the supervisees and group to increase their personal, interpersonal, socio-economic, and political strength and influence through improving their circumstances. •

Coordinator: coordinators bring components together in some kind of organised manner. On behalf of the agency often the supervisor assumes the role of coordinator for helping the supervisees to avail the services from different agencies. •

Facilitator: A facilitator is one who serves as a supervisor for group activity. As a facilitator, supervisor provides the methodological help. He does not NSOU ? PGSW-III 263 discuss the method but he uses it for facilitating the group process. When required to express his own opinions, he at all times makes it clear when he is functioning as a facilitator. •

Communicator and Interpreter: The supervisor has to act as a communicator or interpreter, where interpersonal relationships have to be dealt with. In this role he actually helps the supervisee to understand what is being communicated. 12.2.11

Conclusion Appropriate supervision is an important component of the group work practice as it provides an opportunity for supervisees to apply the knowledge gained from the group work process. Two key models of supervision that are commonly used in group work to prepare supervisees are the developmental and task models. The varying modes of supervision are conducted within the context of these modes.

12.3 Record Writing in Social Group Work 12.3.1 Concept The record in social group work means a faithful representation of the facts in an orderly manner about the various interaction processes in group settings in connection with the plan and programme. The social work Dictionary (1995) defines "recording" as the process of putting in writing and keeping on file relevant information about the client system; the problem; the prognosis; the intervention; the process of treatment; the social, economic, and health factors contributing to the situation and the procedures for termination or referral. Record is an important working tool and performs the following functions: • It gives an account of something which has taken place, • It contains factual descriptions as well as instructions, directions, opinions, recommendation, suggestions etc., • It set forth plans for the future.

SA Unit 12 Supervision and Recording[13506] new.docx (D122078278)

Elements of Record in Social Group Work In the process of social group work, we generally attempt to record the following points: 1. When we set out to record a group work process, we write about individuals and their responses to one another in a given situation. In other words, we write about the behaviour of the individuals in the group. 2. We write about the type and extent of participation of individual in the process of social group work. 3. We note and record the origin and development of ideas, including their acceptance or rejection by the individuals involved. 4. We put down exactly what the group worker does as he carries out his helping role with the group. 5. We put down movement, growth and change as we see it in individuals and in the group as a whole. 6. We write about the relationship between the group and the agency and include community relationships when these are significant in understanding the group. 7. We write about the individual reaction to the different programmes and the contribution of each individual in programme planning. 8. The difficulties faced in the performance of any activity are also noted down.

Recording in group work process, thus implies that, we shall concentrate upon individuals working together in group situation, relationship among them as reflected by their participation, their interaction within the group and between the groups.

12.3.3 Principles of Recording While recording the worker should be conscious about some of the basic guidelines or principles of recording. These principles or guidelines are: 1.

Principle of Flexibility: The worker should be conscious about the objectives of the agency under which he is working and would maintain the record to adjust with the agency's objectives. He will not follow a rigid form of record writing.

SA Unit 12 Supervision and Recording[13506] new.docx (D122078278)

Principle of Selection: Everything should not be recorded in the group work recording. He records significant observation about individuals and their interactions. He selects from movement of the group behaviour patterns of individuals, his own enabling contribution and skills and techniques applied in the group process.

3. Principle of Readability: The most important thing is to keep the record as simple as possible in form, in length. Records must have face sheet, presenting a brief outline of the factual data. If records are in detailed brief summaries should be prepared. In describing individuals, verbatim quotations should be written. Records should be written systematically.

4. Principles of Confidentiality: One of the basic principle of recording in all social work is that records are written on the premise that they will be held in confidence. If records are used for other purpose such as training, all names and other identifying information needs to be carefully obscured, with fictitious ones substituted. The record is a professional document and that as such its contents are guarded by as sense of professional ethics.

5. Principles of Worker Acceptance: The worker must accept his responsibility to write records because of his conviction that records have value in rendering high quality professional service.

12.3.4 Types of Record

An important part of the group worker's responsibility is the preparation and writing of records and reports. Though agencies vary in the content and the style of the records, these are similarity as to types. In social group work three (3) types of records are generally used – (1) Statistical record, (2) Programme record and (3) Process record.

1. Statistical Record: In this type of record different statistical information on organisation, enrolment and attendance of individuals are usually kept. We get these information from individual registration cards and group roaster sheet.

2. Programme record: Programme records give the information of the activities in which the group is being engaged. Different information gathered through NSOU ? PGSW-III 266 systematic study is often recorded. In addition, minutes of meetings are also preserved. These minutes are used by the group in reviewing its experience in making plans and in follow up work.

3. Process record: This is the chronological narrative write up of the group work process as it develops. In this kind of records primary attention is given to the participation and interaction of the members, with a view to determining their role in the affairs of the group. In the process record, the emphasis is not only on what happens but how it happens and what has been its impact on the individual. Thus the process record will reveal the gradual change in the situation.

12.3.5 The Importance of Narrative Records

The writing of the record is becoming an integral part of social group work practice rather than something separate and distinct from it. It is a tool for the improvement of group work and it has important values for the group, the worker, the agency and the field. The major value of the narrative process record from the standpoint of the worker is that such records help the worker to do a more effective job with his groups. Every other purpose is in a sense a sub-purpose of this major one to improve the quality of experience provided for the group. By writing a complete process record of everything he does while working with the group, the worker is helped to think, to analyse and to evaluate. The record is thus a tool in the process of understanding the group and learning how to help it. When the worker puts in writing what happened in each group meeting,

what he did, what problems he faced and what questions arose in his mind, he is thinking into the group situation. Process records are written by the group worker primarily for himself and for his own use continuously throughout his relationship with the group. These records help the worker to become aware of the members of the group as individuals. He can see emerging and changing interests of individuals, he can see evolving needs and how these needs are being met. He can see the development of skills and social attitudes; he becomes sensitive to special problems which may interfere with the individual's full use of the group. Process records show the worker the variety of interpersonal relationship which take shape within the group. The emergence of a group consciousness can be seen as can sub-groupings. The acceptance of the individual by NSOU ? PGSW-III 267 the group is reflected by his change in status which can be discovered from reading accumulated records. The development of the worker's relationship and role can be ascertained from careful recording of what he does while helping the group. Attention becomes focused upon the status of the group in the agency and in the community as intergroup relations are recorded. Changes in the goals of the group become more evident, and member interests outside the group are seen from a review of the record. As the worker writes his records after each meeting, he develops a picture of the group that can be passed on to his superior. Together, worker and supervisor can focus their attention on the group situation as experienced by the worker. The record is thus a stimulus to interaction between the supervisor and the worker. Records enable group work supervisors to keep in touch with many groups for purposes of coordinating the total programme of the agency. Records are useful as a basis for evaluating the group experience of the members and for helping the worker in individual and group supervisory conferences. In worker evaluation records are indispensable. When new workers are assigned to group, past records become useful at the point of orientation and help new workers to understand the kind of experience the group has enjoyed prior to the coming of the new worker. Records are valuable to other department of the agency if it is large; and they are important in the planning of referrals of individuals to community resource agencies. The underlying function of recording is to improve the quality of service to the individual. Hence, recording enables agency administration to judge the quality of its service, the need for its service and needs of its constituency or potential constituency. Records are useful to administration in determining whether its services meet the needs of the community, whether the quality of service is in line with purposes and objectives of the agency, and whether there is a need to change policies and practices. Furthermore, well-kept records are useful in interpreting group work as a method in social work. Agency boards and community groups can be helped to appreciate the need for added facilities, equipment, and staff. When a review of the records of several groups reveals common problems, it is possible to utilize such factual information as a basis for the selection of staff members and for staff training. Staff assignments to groups can be made with greater intelligence when there is a record of the development of the group. NSOU ? PGSW-III 268 Recording has value for the group, the worker, and the agency and for the field of social work. Teaching material for in-service training and professional education comes from well-written narratives. Discussion material for professional organizations that conduct institutes

and conferences can be provided by workers who have recorded and analyzed their work with groups. Group records are essential in study, research, and experimentation. 12.3.6 Factors That Influence the Keeping of Process Records Because many agencies are at the stage in their development at which they are giving serious consideration to the matter of improving their systems of record keeping, it is necessary to point out some of the factors that influence an agency's decision to keep process records. Not every agency affords adequate facilities for recording. It is doubtful whether or not agencies should attempt to keep full records on all their groups, especially if there is wide variation in the competence of personnel. The first factor to consider is the function and purpose of the agency. If the agency is committed to the task of providing individualized group experience, then it is absolutely necessary that records be kept. If, on the other hand, the agency conceives its role in more general terms, it may not have need for full records. Another factor to be considered is the level of current group work practice as observed in the agency. If the agency has workers who are adequately prepared to do a good job as group workers, they should be able to assume a responsible role in relation to recording. If, however, workers are not well trained, it is doubtful that they will be capable of keeping records that will be of much value. Workers who have never engaged in record keeping will need special help in developing their skill in this area. It takes time to write records. Unless agencies recognize this and allow for it in determining worker loads, it is impossible to do an adequate job of recording. Facilities and staff services are required as well. Another factor to consider is the nature and purpose of the specific group. If it is a group of indeterminate status, lacking fixed enrollment and definitely conceived as a short-term activity group, it may not require full recording. If the group is considered

SA Unit 12 Supervision and Recording[13506] new.docx (D122078278)

permanent, or at least long-term, with definite objectives in the sense of individual development, then records should be kept. The availability of competent supervisory help for workers is another factor. Records take on much more meaning when they are discussed by the supervisor and the worker they are discussed by the supervisor and the worker together. Supervisory staffs must be sufficiently large in relation to the number of workers supervised, so that records, will be read with care and will be utilized regularly in the supervisory process. The departmental organisation of the agency will be an influential factor in the setting up of a system of recording. If records are to be used by all departments, there must be agreed-upon uniformity of content and centralization of the material to make it promptly accessible to all. When the agency is a part of a national organization, its records will necessarily be geared to the total requirements of the national scene. The fact of agency membership in local federations or in social welfare councils will influence the form and content of records. If, after analysis of its own situation, an agency decides to move ahead on establishing a system and requirement of narrative process recording on all or some of its groups, the following questions must be studied: what does it mean to record the group work process? What should be included in the record from the standpoint of content? How can workers be helped to learn how to write good records? What can be learned from analysing records, and how can the learning be utilized?

12.3.7 Meaning of the Record in the Group Work Process

First, when we set out to record the group work process, we write about individuals and their responses to one another in a given group situation. In other words, we write about the behaviour of the individuals in the group. Second, we write about the type and extent of participation of individuals who are working, playing, thinking or otherwise acting together in the group. We concentrate upon what individuals do as they associate with one another. Third, we note and record the origin and the development of ideas, including their acceptance or rejection by the individuals involved. We look for the interplay of minds and the stimulation of individuals by other individuals. NSOU ? PGSW-III 270 Fourth, we put down exactly what the group worker does as he carries out his helping role with the group. In addition, we record what the worker thinks and feels about the group situation and what he hopes to accomplish as he works with it. Fifth, we put down movement, growth, and change as we see it in individuals and in the group as a whole. Sixth, we write about the relationship between the group and the agency and include community relationships when these are significant in understanding the group. Recording the group work process thus implies that we shall concentrate upon individuals working together in group situations, relationships among individuals as reflected by their participation, interaction within group and between groups, ourselves as workers present to exercise a helping role. This may be restated as who? – the members of the group; what? – the things they do together; how? – the way in which they do things together; why? – the reasons why we think certain things occur or fail to occur. In the beginning, workers who are learning how to record the group work process, discover that their job consists of alert observation and sensitivity to what is happening in the group; selection of what to include; organization of material selected; the actual write-up; analysis of the material written; interpretation and utilization of the

material in next steps with the group. 12.3.8 The Content of the Narrative Record The writing of the narrative record is one part of the worker's job in group work. Any outline or list of what to include in the record is a reflection of the group work philosophy of the person or persons drawing up the outline. When workers have good insight as to the basic principles of social group work, the items included in content lists tend to emphasize or illustrate these principles. Because groups are different, any list or outline of what to include in the record must be something to select from and to be guided by in a general way. At the outset, workers should be encouraged to include everything that they see as important in understanding the group. As the worker develops security and skills with a given group, changes will come about in the recording. The worker will see more than he saw at first. He will recognize the importance of his own role within the group and will comment upon it more fully.

SA Unit 12 Supervision and Recording[13506] new.docx (D122078278)

He may discover perplexing and conflicting situations which need further study, and so he will include more interpretation and evaluation in the records. Various items which might appear in the records of a group which has been meeting for some time include the following: 1. The record should include basic identifying information about the group, its name, the date, time, and place of its meeting, the names of individuals present and absent should be listed and new members properly noted. The physical setting within the agency or away from the agency should be mentioned at the beginning of the record as well as any important observations on whether or other conditions which might affect the attendance. 2. The record should include mention of individuals by name; what they do, what they say, and how they get along in the group should be recorded along with the sequence of their participation. Specific contributions of individuals should be mentioned as they interact with other members of the group. The emotional quality of participation, as reflected by behaviour toward other individuals or the worker, is important and should be included. 3. As the worker works along with the group he will become aware of the group as a whole. By putting down what the group does in its activity programme, by noting positive and negative response to experience, and by recording what the members say about their group in relation to the agency, the worker becomes conscious of the group as it moves through various phases of its development. 4. The relationship and role of the group worker should be included. When the worker provides materials, makes arrangement, introduces new members, offers suggestions, leads discussion, participates the activities, interprets the agency, or in any other way enters into the affairs of the group it should be recorded. 5. At the close of each meeting's record the worker should include a section of evaluative comments regarding what happened during the meeting. This section can consist of questions, explanations as why things occurred or failed to occur, and tentative plans for the future. Such comments or meeting- by-meeting evaluations are exceedingly important and frequently are longer than the actual meeting record.

SA Unit 12 Supervision and Recording[13506] new.docx (D122078278)

The worker should include both planned and informal meetings with individuals before, after, and between group meetings. If the worker works with committees, that are a part of the group, these meetings should also be described. Individual conferences between the worker and offices of the group, and meetings that the worker established for the purpose of locating programme resources should be included. The goal should be to make the record as complete as possible.

12.3.9 Learning How to Write Records

The development of skill in recording is fundamentally a matter of becoming capable of observing the group, analyzing what is going on and understanding what it means to the individuals. As workers become more skillful in their work with groups and develop insight into their own role and responsibility with the group, their records reflect this growth. As one worker put it, the recording is not difficult, but the thinking and analysis that precede the actual writing are difficult. Many workers believe that there is value in writing up the factual account of the meeting shortly after it has been held. The analysis of what happened then appears in the section of evaluative comments. This section may not be written until a few days after the meeting when the worker has had more time to think about what occurred. Some suggestions that have proved helpful to workers who are learning how to record are given as possible helps. Some workers find it helpful to prepare a brief topical outline before writing or dictating major record entries. Such outlining helps in the organization of the material and in the selection of the most important items. Worker should endeavour, in so far as possible, to attach the names of group members to the action as it takes place. When workers do this, they avoid phrases such as: "it was felt" without telling who "it" is; "there was a good discussion" without discussing what and why it was good; "several members objected" without telling who discussed what and why it was good, "several members objected" without telling who the "several" were; "details were left to be worked out later" without telling what the "details" were or who would work them out. Simple language, short sentences, frequent paragraphing, and the use of topical headings throughout the record will make it easier to analyse at a later time. Identification of the worker by

SA Unit 12 Supervision and Recording[13506] new.docx (D122078278)

w" or "worker" is preferable, though some find the use of the personal pronoun "I" easier and more natural for them. The dating of all entries is important because it shows continuity and development. Periodic summaries of individual and group growth are important means of reviewing and group growths are important means of reviewing the record and modifying future entries as to style or content. In reviewing the records that have been accumulated over a period of perhaps several months, the worker might ask such questions as: Have I identified myself and included what I did and why I did it? Have I identified the individuals who make up the group and have I included what they did? Have I included all my contacts or did I overlook some important ones? Have I given enough interpretation of what has happened? How can I improve my recording to make the record more specific and meaningful to me? There is no one way to keep the narrative process record. Most workers will develop a style of their own and will include pertinent material as they become aware of the important uses to which the records are put.

12.3.10 Using Process Records—What We Learn from Analyzing Record

The worker's use of records begins when he starts to write, because the primary value of records is in helping the worker think through his work with the group. The record should be reviewed before each meeting with the group, since in so doing the worker will be helped to recall salient features of the group's development. After a period of work with the group the accumulated body of information in the record should be studied with a view to ascertaining trends and movements. Record usage thus centres around both immediate and long-term goals. Good records enable the worker to see and understand the kind of relationship he has established with the group. They show his sensitivity and the way in which he picks up group leads or fails to respond to requests for help. Records make it possible for the worker to learn how his role has changed as the group has developed and reveal the kind of problems the group has encountered in carrying out programme and in meeting specific situations. Records help the worker to deepen his understanding of individual and group behaviour and indicate the point at which the individual and the group have arrived in their development. Individuals who need special attention emerge, and the extent

SA Unit 12 Supervision and Recording[13506] new.docx (D122078278)

to which their needs are being met in the group can be seen. Individuals with leadership abilities can be helped to take greater responsibility for the affairs of the group when they have been located by means of the record. In general, records are most useful at the point of evaluation of the group work process. In fact, it is doubtful whether evaluations of programme, individual growth, or worker performance can be satisfactorily made without records. Although partial judgements can be made on the basis of memory, thorough evaluation is possible only if adequate records have been kept. From time to time it is advisable for the group worker to go back over his records and prepare an analysis and summary. This exercise is extremely rewarding to the worker and is well worth the time required to do it. The worker can learn a great deal about what has happened in the group, and, more important, he can retrace the role he has played in bringing about this group development. Such a review is, of course, essential if the group is being closed. It is also needed if the worker is transferring the group to a new worker. In connection with agency evaluation the summary analysis is indispensable.

12.3.11 Outline For Group Summary

In writing the analysis of the group record, it is important to include throughout the place which workers have had in these various aspects of the group behaviour. In describing worker's relation to the group, it is important to indicate not only what he did but what were his purposes, his assumptions and, so far as he can evaluate them.

1. What has been happening to individuals in the group? Add to face sheet material a brief description of the behaviour of the person and his adjustment in the group.
2. How has the group changed in purpose and membership? A. Has the group stated a purpose? If so, what is it? Judging by its behaviour, what seems to be the dominant purposes of the group? What needs are being met? What unavowed purpose do you see evident? How are the group objectives influenced by unconscious motivations in your opinion? How does agency function or purpose affect the purpose of this group? How does the surrounding community affect group's objectives?

SA Unit 12 Supervision and Recording[13506] new.docx (D122078278)

B. What changes in purpose or membership policies have occurred during the period of the record? Why did these come about? C. How is membership determined? What agency policies affect membership? What individual factors of congeniality, etc., are determining membership? D. What social factors are affecting the make-up of the group? Note influence of nationality parochial or public school, occupation, location of residence, financial status of family, parents working away from home etc. E. What relation has worker had to this success of formation, the determining of objectives and membership? What has he aimed to do in this area? What has resulted? 3. How do the members relate to each other? A. Describe the pattern of acceptance and rejection in the group showing changes over the period. B. During the period of the record, how have subgroup's affected the way the group has functioned? Note cliques, conflicts between subgroups, leadership subgroups etc. How have groups based on personal congeniality or personal hostility affected the formation or functioning of authorized groups, such as committees? How have social factors such as occupation or race affected subgroups? C. Does the group treat any of its members consistently in certain roles, such as scapegoats, rebels, clowns, outcasts, or objects of pity to be uplifted by the group? How do you account for the attitudes in these cases – both on the part of the group and from the viewpoint of the individual treated in this way? D. What part has worker played in this process of acceptance, rejection, and status finding? How has he affected the patterns? How has he used it in relation to individuals? To the whole group? 4. How is the group governed? A. Does the group have a formal system of control embodied in a constitution or set of rules? If not, what means has it of control? Is so, how much does the group abide by its own rules? B. How much control do the officers exercise over the programme and behaviour of the group? How much is this affected in total group participations? What limits are set over the power of the officials?

SA Unit 12 Supervision and Recording[13506] new.docx (D122078278)

C. What committees does the group have and what are their functions? What part has worker had in setting up of committees? What were his aims here? D. Are there instances of socially inert or passive members? Of dependent or dominated members? Of fringe members not actively engaged in the group? If so, describe psychological basis of their position as you see it. E. Does the group control its members outside of the meeting? In what respects? How is this done? F. What kinds of issues have produced conflicts in the group? How does the group react when it cannot get what it wants? How was authority used in such situations? What part did worker play in such conflicts? G. Is there any unauthorized group or individual controlling or attempting to control the group? How is it working to do this? How successful is it? What methods were used? H. Who are the indigenous leaders of the group? What contribution do they make which accounts for their rise to headship? What needs or drives of their do you think play into their leadership? How do they use their position as leaders in controlling the group? I. What agency regulations or requirements affect control of the group? How are such controls put into effect? What part does the agency staff other than worker have in such control? J. How do attitudes toward authority, neighbourhood tradition, class, habits etc., affect the reactions of the group toward authority and self-government? K. What has the worker done in regard to the control of the group? At what points has he taken control himself? What methods did he use? What were his aims in doing this? What were the results? How has he attempted to establish democratic method through indigenous, leaders? 5. How does the group make up its mind? A. What kind of questions required group thinking and collective decision during the period of the record? Were these handled in business meetings? If not, how and where did the discussion occur? B. In the business meeting of the group, is formal parliamentary procedure used? Informal discussions? NSOU ? PGSW-III 277 C. How does the group usually come to its decisions? By majority rule? Compromise? Integration? What is the usual attitude of the minorities toward majority decisions? What opportunities are afforded for minority expression of opinion? How does the majority treat minority opinion? D. Has the group had discussions of questions other than those in business meetings? Are they "bull sessions", planned discussions, "round labels", "truth sessions"? What subjects have come up for such discussion? E. In the business meetings or subject discussions of the group, what is the quality of the group thinking in terms of information gained or used in the discussion, clarity of thinking, influence of emotional and irrational factors in reaching conclusions, ability to come to integrated group conclusions where necessary, etc? F. What part has worker played in group deliberation? What educational purposes has he had in mind for such deliberative meetings? With what results? 6. What has happened to esprit corps? A. What is the general social climate of the group in terms of factors, such as the following: friendliness or hostility toward each other; opportunity for free expression opinion and receptive attitude toward such, attitude toward authority as represented by worker, the agency, or the indigenous leaders; ability to cooperate effectively for common ends? What outside factors, such as physical setting of the group, fatigue, home, school, or work situations have in your opinion affected this climate? If the climate has changed markedly during the period

of the record, what has produced this change? B. How has spirit do corps of the group fluctuated during this period? What has produced these fluctuations? How has it been affected by programme, conflicts, interpersonal acceptance and rejection, events outside the group? C. Do the members vary in their attachment to the group? How does this show itself? What is the pattern of group attachments? D. Does the group use any symbols or ritual to express its attachments to the group? Where did these come from? What effect do they have on group cohesion? Or individual reactions to the group? What effcet do they have on the group's standing with other groups in the agency?

SUBMITTED TEXT

322 WORDS

100% MATCHING TEXT

322 WORDS

E. What relation has worker to these aspects of the group? What has he aimed to do about it? What resulted? 7. What are the dominant values in the group? A. What evidences are there of commonly accepted values affecting the behaviour of the group? Are these values formulated into a clearly understood code? If so, what does the code require of this members in the way of behaviour? What does it forbid? Do these values deviate from the mores of the neighbourhood? If so, how? At what points are they different from those of worker? At what points do they differ from those of the agency? B. If the group has certain accepted standards, how do they affect individual behaviour? How are they enforced by the group? Are awards or punishment given? C. How are the group values related to its selection of indigenous leaders? Do its stigmatizing of certain members? To what extent does the elected or natural leader embody the group ideal (e.g., in popularity with the other sex, physical powers, prominence in a skill, embodiment of a social purpose, etc.)? In what ways are its values influenced by those of its indigenous leaders? D. Does the group indicate rejection of certain values? Does it have an enemy outside itself in the form of another group, racial grouping, or area? If so, how is this hostility expressed? Does it show evidences of social prejudices, racial, religions, economic, etc.? E. Does the group think of itself as in line with community standards or is it in revolt against them? Or, if the latter, is it consciously antisocial, or does it consider its standards high than those of the community? In any of these situations, how have you as worker dealt with this attitude toward accepted values? F. How is the agency attempting to affect these values? What does worker do about them? What is his aim in doing this? What has resulted? 8. What has been the programme of the group? A. List the major activity of each meeting, i.e., business meeting, trip, party. B. How is programme determined?

SA Unit 12 Supervision and Recording[13506] new.docx (D122078278)

C. What activities have met with the greatest response? The least? D. What contribution do you feel the programme activities have made to individuals? E. How did the worker's interests and skills affect programme? What was his part in determining it? 9. What is the relation of group to other groups? A. Has this group had any relation to other groups inside the agency? How has this group been related to programme planned for whole agency? What effect does this have on its own programme? What contacts has it had outside the agency? Describe the contact in each case in terms of activities engaged in an effect on the group. B. What part has worker played in these intergroup activities? What has he aimed to do through them? What has resulted? C. If this is a representative group, what is its relation to this constituent group? 10. What is the relation of worker to members of the group? A. During the group meetings are there certain members who are constantly endangering the effective functioning of the group by such behaviour as bullying weaker members, refusal to carry their share of work, showing off by noisy or irritating behaviour, passively, or day-dreaming, acting tough, monopolizing the leader? What is the relation of worker to these persons? How does he handle this behaviour in the group? How has he used group programme or group pressures to deal with this behaviour? Are there certain members who are normally helpful to the group by such behaviour as making useful suggestions, assuming responsibility, helping or protecting weaker members, quieting noisy members, upholding agency standards, stimulating thinking or control of emotional outbursts of others? What is the relation of worker to these persons? How has he used their behaviour to promote group programme or group relations? How has he used group programme or pressures to develop their capacities? To what extent does the worker work with the officers or committee chairman in planning business meetings or programme? NSOU ? PGSW-III 280 B. Outside of the group meeting, what contacts has worker had with members of the group? In lobbies, streets, homes, etc., in which he saw the person by himself or with one or two others? How did these contacts arise? What occurred in the interviews of significance to the person or to the functioning of the group? C. In dealing with members on an individual basis, has worker referred members to other agencies or used other resources within the agency? II) Statistical Summary: Enrollment at beginning of the period Number of members added during this period Including (a) old members re-enrolled (b) new members enrolled Number of members dropped during period Cumulative enrollment Enrollment attendance Cumulative attendance (Summation of attendance at each regular meeting) Attendance index Cumulative attendance ----- = attendance index Enrollment attendance 12.4 Conclusion The writing of the records is becoming an integral part of social group work method. Since, social group work is the process of working with the people, it needs to maintain record to conduct the group

activities perfectly and methodically. Recording is thus a tool for the improvement of the horizon of different activities concerning the group. In short its utilities are: (1) helps the worker in developing skill in terms of better understanding of the individual, and ability to think analyse and evaluate, (2) helps the group worker to understand the groups as a whole because in the record writing process he becomes aware of the whole, (3) the record provides the worker NSOU ? PGSW-III 281 with evidence of growth and change in the part of the members and of himself as a worker, thus record serves as an instrument of evaluation, (4) it provides contents for supervision both on the part of the worker and the agency, (5) the record provides a source of future programme planning because it is a reflection of expressed and unexpressed and unfulfilled interests and needs as well as amount of what actually happened, (6) it provides historical data which may be used by new workers to maintain the continuity of work, (7) the record provides data to the higher opportunities, which gives financial support to the agency, (8) the reports sometimes help to resolve the difficulties arising in the course of group activities, (9) the reports helps the absentee members to follow the discussions in the meeting, (10) lastly, these records are of immense value in social research. Since, WHO in every group is different, the WHAT, HOW and WHY are also different. It is, therefore, impossible to develop a rigid records. Writing records helps the worker to acquire greater skill and sharpen his knowledge and understanding of the complex dynamics of social group work process. The reports must be factual, clear and simple and must fruitfully represent the tempo of group process and the interaction between various people within the group. In the task of evaluating of the work of a group or the agency as a whole, well written and objective reports will go a long way.

12.5 Exercise 1. What do you mean by record? What are the elements of record in social group work? 2. Write in brief the principles of recording. 3. Elucidate the importance of narrative records. 4. What are the meanings of record in the group work process? 5. As a professional gives an outline for group summary records. 6. What is Supervision? What are the functions of supervision? 7. Write in detail the supportive functions of supervision. 8. State how the task model of supervision differs from the developmental model? NSOU ? PGSW-III 282 9. What activities generally fall under the mode of supervision? 10. What are three ways in which prolonged job related stress affects professional performance? 11. Elucidate the role of a supervisor in the group work process.

PREFACE In the curricular structure introduced by this University for students of Post-Graduate degree programme, the opportunity to pursue Post-Graduate course in a subject is introduced by this University is equally available to all learners. Instead of being guided by any presumption about ability level, it would perhaps stand to reason if receptivity of a learner is judged in the course of the learning process. That would be entirely in keeping with the objectives of open education which does not believe in artificial differentiation.

I am happy to note that university has been recently accredited by National Assessment and Accreditation Council of India (NAAC) with grade 'A'.

95%**MATCHING BLOCK 3/61****W**

Keeping this in view, the study materials of the Post Graduate level in different subjects are being prepared on the basis of a well laid-out syllabus. The course structure combines the best elements in the approved syllabi of Central and State Universities in respective subjects. It has been so designed as to be upgradable with the addition of new information as well as results of fresh thinking and analysis. The accepted methodology of distance education has been followed in the preparation of these study materials. Co-operation in every form of experienced scholars is indispensable for a work of this kind. We, therefore, owe an enormous debt of gratitude to everyone whose tireless efforts went into the writing, editing, and devising of a proper layout of the materials. Practically speaking, their role amounts to an involvement in 'invisible teaching'.

layout

95%**MATCHING BLOCK 4/61****W**

of the materials. Practically speaking, their role amounts to an involvement in 'invisible teaching'. For, whoever makes use of these study materials would virtually derive the benefit of learning under their collective care without each being seen by the other. The more a learner would seriously pursue these study materials, the easier it will be for him or her to reach out to larger horizons of a subject. Care has also been taken to make the language lucid and presentation attractive so that they may be rated as quality self-learning materials. If anything remains still obscure or difficult to follow, arrangements are there to come to terms with them through the counselling sessions regularly available at the network of study centres set up by the University. Needless to add, a great deal of these efforts is still experimental—in fact, pioneering in certain areas. Naturally, there is every possibility of some lapse or deficiency here and there. However, these do admit of rectification and further improvement in due course. On the whole, therefore, these study materials are expected to evoke wider appreciation the more they receive serious attention of all concerned. Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor First Print — February, 2022 Printed in accordance with the regulations of the Distance Education Bureau of the University Grants Commission.

Tribal communities 1.6 Summary 1.7 Exercise 1.8 Reference 1.1 Objective The learner would understand about the basic concept of a community, its basic characteristics and also about the various types of communities. 1.2 Introduction The third Method of Social Work, amongst the Primary Methods i.e. Community Organization involves intervention into the community Setting to mitigate the community problems. In order to do this a social worker must be aware of

88%	MATCHING BLOCK 5/61	SA 480E2430_BSW_Social Work with Communit... (D165107508)
the community power structure to carryout community organisation method, which is used for		

developing consciousness amongst the people for their sustainable development. At the time of community organisation one may also apply other methods of social work, like Casework and Group Work to work more effectively in the community level.
 8 NSOU ? MSW-IV However before chalking out any plan it is important for the community Organizer to first understand the power structure of

93%	MATCHING BLOCK 6/61	SA 480E2430_BSW_Social Work with Communit... (D165107508)
the community to practice community organisation method, which is used for empowering people for their development.		

Now we may try to understand the concept of Community, Power structure and also the negative and positive aspects of the Power Structure which lead to integration or disintegration of a community.

100%	MATCHING BLOCK 7/61	SA 480E2430_BSW_Social Work with Communit... (D165107508)
Details are provided for social work students to understand and practice community organisation effectively 1.3		

Concept of Community Generally speaking, a Community is a geographical area (e.g. a country, village, hamlet, town, or neighbourhood) where people share common norms, religion, values, customs, or identity and also interact socially. People living in the community share common interest and Common heritage. Community is an organised social unit in which a group of people live in close proximity and have some common idea, interest, concern, language and culture. In other words we can say that community is the complete organised unit wherein each and every element functions in a related manner and produces comforts for other living beings. Bogardus defines

91%	MATCHING BLOCK 8/61	SA Community Organisation course materials - TNOU ... (D133109690)
community as a social group with some degree of we feeling and living in a given area.		

Socio logically it can be defined as a small isolated centre with a stable population in which all economic and social services necessary to life can be maintained. Community can further be defined as a small localised political, economic and social unit whose members share values in common. Mclver defined community as the term be applied to a pioneer settlement, a village, a city or tribe or a nation wherever the member of any group small or large not this or that in particular interests but with the basic conditions of a community life we call that group in that once life may be lived wholly within it. The basic criterion of community then is that of once social relationships may be found within it. Community as we all know is the oldest form of human social organisation in which- ? Social relations are primary, personal and direct.

NSOU ? MSW-IV 9 ? Common values are not reinforced by legislations but by a rich ritual life and by folkways and mores ? Traditions are treated as very valuable ? Violation of traditional customs results in ostracism. ? Members guard its isolation and culture against contamination by other communities ? People learn and develop the feeling of togetherness and belongingness. ? Develop reciprocal feelings of attachment towards the place. In a study conducted in 1986 by McMillan and Chavis proposed the following four basic "Features of Community " - 1) Membership: Feeling of belonging or of sharing a sense of personal relatedness, 2) Influence: Making a difference to a group and of the group mattering to its members 3) Reinforcement: Integration and fulfilment of needs, 4) Sharing: Share emotional connection. To build a healthy community we need active involvement of the community people. They are the best ones to know the actual problems of the community and may give proper inputs to solve them. Proper application of the Method of Community organization gives opportunity to its community members to improve their community problem and democratically keep their opinion for its development and may even take initiatives for improving their own locality. Thus the Community people are responsible for the growth and development of their communities by adopting a cooperative, collaborative and participatory attitude. Let us now look into some definition of Community, given by some great social thinkers- "Wherever

the members of any group—small or large—live together in such a way that they share, not this or that particular interest, but the basic conditions of life,

we call that group a community." – Maclver and Page.

10 NSOU ? MSW-IV As R.E. Park (1921) writes: "Community, in the broadest sense of the term, has a spatial and a geographical connotation." Weber meant that members "known each other" and have a degree of common consciousness and identity and exclude those unlike themselves. According to Bogardus (Sociology, 1952), "a

100%

MATCHING BLOCK 10/61

SA

Community Organisation course materials - TNOU ... (D133109690)

community is a social group with some degree of we feeling and living in a given area".

A nineteenth century sociologist, F. Tonnies, who has been described as the founder of the theory of community, defined 'community in his book *Geminschaft and Gesalbschaft* (Community and Society) "as an organic, 'natural' kind of social collectivity whose members are bound together by a sense of belonging, created out of everyday contacts covering the whole range of human activities". Systems Perspective : From a systems perspective, a community is similar to a living creature, comprising different parts that represent specialized functions, activities, or interests, each operating within specific boundaries to meet community needs. For example, schools focus on education, the transportation sector focuses on moving people and products, economic entities focus on enterprise and employment, faith organizations focus on the spiritual and physical well-being of people, and health care agencies focus on the prevention and treatment of diseases and injuries (Henry, 2011). For the community to function well, each part has to effectively carry out its role in relation to the whole organism. A healthy community has well-connected, interdependent sectors that share responsibility for recognizing and resolving problems and enhancing its well- being. Successfully addressing a community's complex problems requires integration, collaboration, and coordination of resources from all parts (Thompson et al. 1990). From a systems perspective, then, collaboration is a logical approach to health improvement Social Perspective : A community can also be defined by describing the social and political networks that link individuals, community organizations, and leaders understanding these networks is critical to planning efforts in engagement. For example, 6 tracing social ties among individuals may help engagement leaders to identify a community's leadership, understand its behavior patterns, identify its high-risk groups, and strengthen its networks (Minkler et al, 1997).

NSOU ? MSW-IV 11 Virtual Perspective : Some communities map onto geographically defined areas, but today, individuals rely more and more on computer-mediated communications to access information, meet people, and make decisions that affect their lives (Kozinets, 2002). Examples of computer-mediated forms of communication include email, instant or text messaging, e-chat rooms, and social networking sites such as Facebook, YouTube, and Twitter (Flavian et al, 2005) social groups or groups with a common interest that interact in an organized fashion on the Internet are considered "virtual communities" (Rheingold, 2000; Ridings et al, 2002). Without question, these virtual communities are potential partners for community-engaged health promotion and research.

Individual Perspective : Individuals have their own sense of community membership that is beyond the definitions of community applied by researchers and engagement leaders. Moreover, they may have a sense of belonging to more than one community. In addition, their sense of membership can change over time and may affect their participation in community activities (Minkler et al, 2004). The philosopher and psychologist William James shed light on this issue in his writings. James thought it important to consider two perspectives on identity: the "I," or how a person thinks about himself or herself, and the "me," or how others see and think about that person. Sometimes these two views agree and result in a shared sense of an identity, but other times they do not. People should not make assumptions about identity based on appearance, language, or cultural origin; nor should they make assumptions about an individual's perspective based on his or her identity (James, 1890). Today, the multiple communities that might be relevant for any individual — including families, workplace, and social, religious, and political associations — suggest that individuals are thinking about themselves in more complex ways than was the norm in years past. The eligibility criteria that scientists, policy makers, and others develop for social programs and research projects reflect one way that people perceive a group of proposed participants, but how much those criteria reflect the participants' actual view of themselves is uncertain. Practitioners of community engagement need to learn how individuals understand their identity and connections, enter into relationships, and form communities. Thus we may say that a community is

100%	MATCHING BLOCK 11/61	SA Community Organisation course materials - TNOU ... (D133109690)
a group of people living in the same place or having a particular characteristic in common		

such as norms, religion, values, language or identity. It is a group of people who share the same things, such as: where they live, work and play. It is also a place where people solve problems together.

12 NSOU ? MSW-IV Check your Progress 1 Explain the concept of Community from System's Perspective

..... 2 What are four basic features of a community ?
 1.4

Types of Communities In common parlance, the word 'community' is used for a collection of people who do related kinds of work, such as the "teacher's community" or the "doctors community". It is also used to denote a collection of people who share something in common as the "Hindu community", the "Parsi community", or the "Christian community" without necessarily living in a particular area. Sometimes, it is used to describe a supposedly coherent group, such as 'international community'. There are many ways by which we may categorize communities. On such kind of category is as follows- ? Location Based Communities Communities can be divided into three main types based on their location, interaction and ecology. They are- Urban Community Composed of such people who are mostly of migrated in character of. As a result they may be of various caste, culture, linguistic and religious group. These communities are heterogeneous in nature.

NSOU ? MSW-IV 13 Rural Community This community is small in size. The members of this community speak same language and share the same culture. They live together in the same area for a long period of time. People are interdependent on each others. Tribal community Besides the normal rural community there is tribal community who also live in the rural areas. Generally these communities are quite small in size and isolated from urban or rural communities. Basically such communities are located around or in the forest, coastal, hilly or even desert areas. These communities have their own indigenous culture, language, religious belief occupation and even governance. They are homogeneous community in true sense. ? Identity Based Communities

100%	MATCHING BLOCK 12/61	W
A common experience can bring people together and create a community. Such communities can be seen after unexpected tragedies such as terrorist attacks, natural disasters, and wars.		

100%	MATCHING BLOCK 13/61	W
The way in which community is perceived is likely to depend on a person's attitude, culture, or beliefs.		

100%	MATCHING BLOCK 14/61	W
In extreme cases, communities may remove themselves from the rest of society in search of their own way of life.		

These communities have strong 'community spirit', and the strength of bonds within the community members are the defining feature of such communities, which gives them a separate identity. ? Organization Based Communities People can have their own associations one based on their day to day activities. Individuals who are engaged in business one their own organizations and belong to that particular communities. Thus we may have business communities, educational communities, or Bar council, which comprises of people associated with legal service. These organizations have their own norms and have common interest. Further, Richard Millington mentioned five different types of communities based on the following :- 1. Interest based - Communities of people who share the same interest or passion.

14 NSOU ? MSW-IV 2. Action based - Communities of people trying to bring about desired change. 3. Place based - Communities of people brought together by geographic boundaries. 4. Practice based - Communities of people in the same profession or undertake the same activities. 5. Circumstance based - When people of a Community are brought together by some kind of external events or situations. People living in a particular community share the same kind of custom, tradition and culture. Broadly speaking, communities consist of the people and institutions shared beliefs, cultural ideas and some communities also share similar socio-political environment. Based on this there are three types of Communities i.e -pre-industrial, industrial and post- industrial community. Pre-industrial Communities Pre-industrial communities may be referred to those communities which prevailed Pre Industrial Communities Source- <https://www.google.com/search>

NSOU ? MSW-IV 15 between 1750-1850 which was much before the Industrial Revolution. This was a time when use of machines was not common and simple tools were used for performing various activities. Pre-Industrial communities differ from region to region depending on the cultural pattern, socio-political and historic background of particular geographic location. Pre-industrial communities were predominantly agro-based and limited, with division of labour, and class based stratification. These pre-industrial communities more or less shared these common characteristics features and the two specific forms of pre- industrial communities were hunter-gatherer and feudal communities. The Community people lived by collecting wild plants and hunting wild animals. They were perhaps nomadic and moved from one place to other for gathering food. These communities were perhaps non-hierarchical and egalitarian and there was discrimination on the basis of gender. The kinship character of the society was significant for its cooperative functional character, for the economic support was provided to the dependent and needy. Industrial Period Industrial communities were the communities that came up with the discovery of technology which enabled the people to go for mass production, and supported a large number of people to become economically independent along with a high capacity for division of labour. Such a structure developed in the western world in the period following the Industrial Revolution and replaced the agrarian societies of the pre-modern age. In the eighteenth century, Europe experienced a dramatic rise in the technological invention, ushering in an era known as the Industrial Revolution. This period was remarkable for the number of new inventions that influenced people's daily lives. Within a generation, tasks that had until this point required months of labour became achievable in a matter of days. Before the Industrial Revolution, work was largely person or animal- based, and relied on human workers or horses to power mills and drive pumps. In 1782, James Watt and Matthew Boulton created a steam engine that could do the work of twelve horses by itself. It was during the eighteenth and nineteenth centuries of the Industrial Revolution that sociology was born. Life was changing quickly and the long-established traditions of the agricultural eras did not apply to life in the larger cities. Masses of people were moving to new environments and often found themselves faced with horrendous conditions of

16 NSOU ? MSW-IV filth, overcrowding, and poverty. Social scientists emerged to study the relationship between the individual members of society and society as a whole. It was during this time that power moved from the hands of the aristocracy and "old money" to business-savvy newcomers who amassed fortunes in their lifetimes. Families such as the Rockefellers and the Vanderbilt became the new power players and used their influence in business to control aspects of government as well. Eventually, concerns over the exploitation of workers led to the formation of labour unions and laws that set mandatory conditions for employees. Although the introduction of new technology at the end of the nineteenth century ended the industrial age, much of our social structure and social ideas - like family, childhood, and time standardization - have a basis in industrial society. The United States, for example, was an industrial society because a considerable portion of its economy was tied to jobs that involve mechanized labour, like factory farming or auto-assembly plants, which involved a combination of machines and human employees to produce consumer products. In most cases, the objective of an industrial economy is the mass production of goods, which is the fast and efficient manufacturing of standardized products. For example, if you've ever purchased a car, there is a high likelihood that your car was mass-produced because it operates similarly to other models and its parts can be replaced with other parts because they are identical. Industrial society is one in which technologies of mass production are used to make vast amounts of goods in factories, and in which this is the dominant mode of production and organizer of social life. This means that a truly industrial society not only features mass factory production but also has a particular social structure designed to support such operations. Such a society is typically organized hierarchically by class and features; a rigid division of labour among workers and factory owners. It is important to distinguish the descriptive from the analytical uses of this term 'Industrial society'. At a descriptive level, an industrial society is simply one displaying the characteristic features of industrialism. However, the term is also used in the abstract to denote the thesis that a definite type of society exists whose culture, institutions, and development are determined by its industrial production process. The production of food is shifted to large commercial farms where the products of industry, such as combine harvesters and fossil fuel-based fertilizers, are used to decrease

NSOU ? MSW-IV 17 required human labour while increasing production. Excess labour is no longer needed for the production of food; mechanization is utilized to further increase efficiency. As population grows, and mechanization is further refined, often to the level of automation, many workers shifted to expanding service industries. Steam power began appearing everywhere. Instead of paying artisans to painstakingly spin wool and weave it into cloth, people turned to textile mills that produced fabric quickly at a better price and often with better quality. Rather than planting and harvesting fields by hand, farmers were able to purchase mechanical seeders and threshing machines that caused agricultural productivity to soar. Products such as paper and glass became available to the average person and the quality and accessibility of education and health care soared. One of the results of increased productivity and technology was the rise of urban centers. Workers from rural areas flocked to factories for jobs, and the populations of cities became increasingly diverse. The new generation became less preoccupied with maintaining family land and traditions and more focused on acquiring wealth and achieving upward mobility for themselves and their families. People wanted their children and their children's children to continue to rise to the top, and as capitalism increased, so did social mobility. Industrial society makes urbanization desirable, in part so that workers can be closer to centers of production, and the service industry can provide labour to workers and those that benefit financially from them, in exchange for a piece of production profits with which they can buy goods. This leads to the rise of very large cities and surrounding suburban areas with a high rate of economic activity. Some theoreticians argue that we are located in the middle of a transformation or transition from industrial societies to post-industrial societies. The triggering technology for the change from an agricultural to an industrial organization was steam power, allowing mass production and reducing the agricultural work necessary. Thus, many industrial cities have been built around rivers. Identified as a catalyst or trigger for the transition to a post-modern or informational society is global information technology. Point to Note Preindustrial societies, Durkheim explained, were held together by mechanical

18 NSOU ? MSW-IV solidarity, a type of social order maintained by the collective consciousness of a culture. Societies with mechanical solidarity act in a mechanical fashion; things are done mostly because they have always been done that way. This type of thinking was common in preindustrial societies where strong bonds of kinship and a low division of labour created shared morals and values among people, such as hunter-gatherer groups. When people tend to do the same type of work, Durkheim argued, they tend to think and act alike. In industrial societies, mechanical solidarity is replaced with organic solidarity, which is social order based around an acceptance of economic and social differences. In capitalist societies, Durkheim wrote, division of labour becomes so specialized that everyone is doing different things. Instead of punishing members of a society for failure to assimilate to common values, organic solidarity allows people with differing values to coexist. Laws exist as formalized morals and are based on restitution rather than revenge. Post Industrial Society Information societies, sometimes known as post-industrial or digital societies, are a recent development. Unlike industrial societies that are rooted in the production of material goods, information societies are based on the production of information and services. Digital technology is the steam engine of information societies, and computer moguls such as Steve Jobs and Bill Gates are its John D. Rockefellers and Cornelius Vanderbilts. Since the economy of information societies is driven by knowledge and not material goods, power lies with those in charge of storing and distributing information. Members of the post-industrial society are likely to be employed as sellers of services - software programmers or business consultants. Social classes are divided by access to education since, without technical skills, people in an information society lack the means for success. In sociology, the post-industrial society is the stage of society's development when the service sector generates more wealth than the manufacturing sector of the economy. The term was originated by Alain Touraine. As the term has been used, a few common themes, including the ones below have begun to emerge. The economy in the case of post-industrial society undergoes a transition from the production of goods to the provision of services. Knowledge becomes a valued form of capital. Producing ideas is the main way to grow the economy. Through processes of globalization and automation, the value and importance to the economy of blue-collar, unionized work, including manual labour

NSOU ? MSW-IV 19 (e.g., assembly-line work) decline, and those of professional workers (e.g., scientists, creative-industry professionals, and IT professionals) grow in value and prevalence. Behavioural and information sciences and technologies are developed and implemented. A post-industrial society is a stage in a society's evolution when the economy shifts from producing and providing goods and products to one that mainly offers services. A manufacturing society is comprised of people working in construction, textiles, mills, and production workers whereas, in the service sector, people work as teachers, doctors, lawyers, and retail workers. In a post-industrial society, technology, information, and services are more important than manufacturing actual goods.

1.5 Characteristics of the community Each type of community has some special characteristic features which may be different from other communities. Women now discuss about some of these characteristic features briefly in the following manner- Indian Urban Community-Source <https://indiaclimatedialogue.net/2020/10/13/severe-air-pollution->

20 NSOU ? MSW-IV 1.5.1 Urban communities The urban communities are more populated and with lots of facilities. These are the communities which are more or less heterogeneous in nature. People do not share strong bonding amongst themselves and have a very fast life style. The urban communities are mostly self sufficient with all modern amenities. Following are the basic features of Urban life- ? The social institutions like family, kinship, marriage, caste system etc are less complex in urban communities. Families are generally nuclear in nature. ? People are less superstitious, more educated and social norms and values are not so rigid. ? Size of the urban area is quite large and the density of urban population is very high. ? Bringing changes in the lifestyle, occupation and social economic status is quite common in urban sector. ? Birth rate and death rate is comparatively low except in the slum areas of the urban societies. ? Social interaction is less and more formal in nature. ? Urban life is highly competitive and people are more ambitious. ? People believe in commercial recreation. ? People have more facilities in terms of education, health and commerce. ? Commercial goods are in high demand in urban areas. ? Women of the urban societies enjoy a much higher status compared to the rural societies. ? People speak different languages and have different cultures and tradition because people from various places come and settle down for job and other commercial purposes in urban places. ? Municipality or Municipal Corporation is the local self government of the urban area.

NSOU ? MSW-IV 21 1.5.2 Rural communities ? The rural communities are much complex in nature. Families are joint and extended. Games in rural society Anne size within the relatives even with the very strong. The marriage system is also traditional in nature. ? It is mostly an agricultural society along with animal rearing, cottage industries and small scale industries. Land is the basic means of production and the cottage industry and animal rearing are other subsidiaries. Ordinarily all the members of the family including the children contribute to family business. ? Social norms, values, customs, tradition, superstitious beliefs and taboos are very common in Rural community. However with the influence of education changes are visible in rural communities. ? The rural communities largely depend on nature. Rural Indian Society Source-

<https://www.dreamstime.com/indian-village-life-old-man-run-cow-vizag-india-indian-village-life-old-man-run-cow-image176352525-22>

NSOU ? MSW-IV ? Size of the rural community is smaller in area and the density is much lesser than that of the urban community. Thus the rural communities are not overcrowded. ? Birth rate is high which is due to lack of awareness about family planning, desire to have male child or non availability of contraceptives. ? Social interaction is much more informal in nature. ? It is largely autonomous in character which is evident from the fact that the village council looks after the village defence settles the village disputes. ? Panchayati Raj system is the form of the local self government. ? The village life is less competitive in nature and the ambition of the rural people is not very high. Indian Tribal Community Source - <https://indiantribalimages.com/blog/>

NSOU ? MSW-IV 23 1.5.3. Tribal communities ? Tribal communities are very simple without any stratification on the basis of caste. ? Taboos and superstitions are very much prevalent in tribal communities. ? The relation of the tribal people with mother nature is very strong. The tribal people depend to a large extent on nature for their social, economic and cultural livelihood. ? Some of the tribal communities live by food collection or hunting. ? There is very less chance of maintaining confidentiality in the tribal societies as it is an open community with a lot of interference in the matter of the others. ? The tribal communities in some cases are matriarchal in nature. ? Ambition or competition amongst themselves is almost absent in the tribal communities. ? The life is quite slow and the people have traditionally learned to remain content with whatever little they have. ? The tribal communities have several indigenous skills. ? The tribal communities love their culture and their heritage is their pivotal binding force. ? Consumerism is not at all present in the tribal communities. 1.6 Summary It becomes very important to know about the nature of the communities like the geographic area, sentiments of the people, so that it becomes easier for us to work with in it. Knowledge about the community will help to frame correct strategies and thus work more effectively.

24 NSOU ? MSW-IV 1.7 Exercise 1. Define the term 'Community'. What are its basic types ? 2. Enumerate the characteristics of Indian Community. 3. Differentiate between Urban & Rural communities. 4. 100%

MATCHING BLOCK 16/61

W

For centuries, philosophers, politicians, and social scientists have explored and commented on the nature of power. Pittacus (c. 640–568 B.C.E.) opined, "The measure of a man is what he does with power," and Lord Acton perhaps more famously asserted, "Power tends to corrupt; absolute power corrupts absolutely" (1887). Indeed, the concept of power can have decidedly negative connotations, and the term itself is difficult to define. 26

NSOU ? MSW-IV 2.3 Concept of Power

100%

MATCHING BLOCK 17/61

W

Many scholars adopt the definition developed by German sociologist Max Weber, who said that power is the ability to exercise one's will over others (Weber 1922). Power affects more than personal relationships; it shapes larger dynamics like social groups, professional organizations, and governments. Similarly, a government's power is not necessarily limited to control of its own citizens. A dominant nation, for instance, will often use its clout to influence or support other governments or to seize control of other nation states. Efforts by the U.S. government to wield power in other countries have included joining with other nations to form the Allied forces during World War II, entering Iraq in 2002 to topple Saddam Hussein's regime, and imposing sanctions on the government of North Korea in the hopes of constraining its development of nuclear weapons. Endeavors to gain power and influence do not necessarily lead to violence, exploitation, or abuse. Leaders such as Martin Luther King Jr. and Mohandas

Karamchand

100%**MATCHING BLOCK 18/61****W**

Gandhi, for example, commanded powerful movements that effected positive change without military force. Both men organized nonviolent protests to combat corruption and injustice and succeeded in inspiring major reform. They relied on a variety of nonviolent protest strategies such as rallies, sit-ins, marches, petitions, and boycotts.

Systems Perspective <https://pixabay.com/users/openclipart-vectors-30363/>
NSOU ? MSW-IV 27

100%**MATCHING BLOCK 19/61****W**

Some groups often use their power to accumulate privileges over the groups they oppress.

The concepts of oppression and power are not only multi-dimensional but also involve multifaceted, complex means of being executed.

100%**MATCHING BLOCK 20/61****W**

Oppression may occur on any level from individual to societal. It also has a psychological piece. Those in power oppress individuals and groups by reducing their opportunities for education, work, housing, and health care. Then those on the receiving end of this oppression may take part in negative activity due to feelings of hopelessness and helplessness. In addition to the experience of exclusion and marginalization on a societal level, the problem of oppression is compounded when those oppressed engage in self-destructive patterns due to the internal feelings of hopelessness.

In order to effectively conceptualize dismantling and disrupting power and oppression, it is important to delve further into looking at systems by which power and oppression exist and are maintained. Bronfenbrenner's ecological systems theory provided a framework for us to examine how power and oppression are carried out and perpetuated in individual and community environments. Yet, human behavior is not simply nested as Bronfenbrenner theorized, but our behavior is also networked, where each system is defined in terms of the social relationships surrounding a targeted individual, and where systems at different levels relate to one another in an overlapping fashion (Neal & Neal, 2013). Thus, dismantling power and oppression is a difficult task that requires a community systems approach. It is also important to note that historical events such as colonialism and change across time necessitate that idea that power/oppression must be continually re-examined and monitored.

2.4 Sources of Power Having power and using power are two different things. For example, imagine a manager who has the power to reward or punish employees. When the manager makes a request, he or she will probably be obeyed even though the manager does not actually reward the employee. The fact that the manager has the ability to give rewards and punishments will be enough for employees to follow the request. What are the sources of one's power over others? Researchers identified six sources of power, which include legitimate, reward, coercive, expert, information, and referent (French & Raven, 1960). You might earn power from one source or all six depending on the situation. Let us take a look at each of these in turn, and continue with Steve Jobs from the opening case as our example.

28 NSOU ? MSW-IV Having power and using power are two different things. For example, imagine a manager who has the power to reward or punish employees. When the manager makes a request, he or she will probably be obeyed even though the manager does not actually reward the employee. The fact that the manager has the ability to give rewards and punishments will be enough for employees to follow the request. What are the sources of one's power over others? Researchers identified six sources of power, which include legitimate, reward, coercive, expert, information, and referent (French & Raven, 1960). You might earn power from one source or all six depending on the situation. Let us take a look at each of these in turn, and continue with Steve Jobs from the opening case as our example.

Legitimate Power Legitimate power is power that comes from one's organizational role or position. For example, a boss can assign projects, a policeman can arrest a citizen, and a teacher assigns grades. Others comply with the requests these individuals make because they accept the legitimacy of the position, whether they like or agree with the request or not. Goenka has enjoyed legitimate power as the CEO of CESE, a principal of a school may assign. He could set deadlines and employees comply even if they think the deadlines were overly ambitious. Start-up organizations often have founders who use their legitimate power to influence individuals to work long hours week after week in order to help the company survive.

Reward Power Reward power is the ability to grant a reward, such as an increase in pay, a perk, or an attractive job assignment. Reward power tends to accompany legitimate power and is highest when the reward is scarce. Anyone can wield reward power, however, in the form of public praise or giving someone something in exchange for their compliance. When Steve Jobs ran Apple, he had reward power in the form of raises and promotions. Another example of reward power comes from Bill Gross, founder of Idealab, who has the power to launch new companies or not. He created his company with the idea of launching other new companies as soon as they could develop viable ideas. If members could convince him that their ideas were viable, he gave the company a maximum of \$250,000 in seed money, and gave the management team and employees a 30% stake in the company and the CEO 10% of the company. That way, everyone had a stake in the company. The CEO's salary was capped at \$75,000 to maintain the sense of equity. When one of the companies, Citysearch, went public, all employees benefited from the \$270 million valuation.

NSOU ? MSW-IV 29 Coercive Power In contrast, coercive power is the ability to take something away or punish someone for noncompliance. Coercive power often works through fear, and it forces people to do something that ordinarily they would not choose to do. The most extreme example of coercion is government dictators who threaten physical harm for noncompliance. Parents may also use coercion such as grounding their child as punishment for noncompliance. Steve Jobs has been known to use coercion—yelling at employees and threatening to fire them. When John Wiley & Sons Inc. published an unauthorized biography of Jobs, Jobs's response was to prohibit sales of all books from that publisher in any Apple retail store (Hafner, 2005). In other examples, John D. Rockefeller was ruthless when running Standard Oil Company. He not only undercut his competitors through pricing, but he used his coercive power to get railroads to refuse to transport his competitor's products. Expert Power Expert power comes from knowledge and skill. Steve Jobs has expert power from his ability to know what customers want—even before they can articulate it. Others who have expert power in an organization include long-time employees, such as a steelworker who knows the temperature combinations and length of time to get the best yields. Technology companies are often characterized by expert, rather than legitimate power. Many of these firms utilize a flat or matrix structure in which clear lines of legitimate power become blurred as everyone communicates with everyone else regardless of position. Information Power Information power is similar to expert power but differs in its source. Experts tend to have a vast amount of knowledge or skill, whereas information power is distinguished by access to specific information. For example, knowing price information gives a person information power during negotiations. Within organizations, a person's social network can either isolate them from information power or serve to create it. As we will see later in this chapter, those who are able to span boundaries and serve to connect different parts of the organizations often have a great deal of information power.

30 NSOU ? MSW-IV Referent Power Referent power stems from the personal characteristics of the person such as the degree to which we like, respect, and want to be like them. Referent power is often called charisma—the ability to attract others, win their admiration, and hold them spellbound. Steve Jobs's influence as described in the opening case is an example of this charisma. 2.5 Understanding Oppression and Power Power and oppression can be seen as two sides of the same coin. Where power causes harm, then it may be likely seen as oppression. Thus oppression emerges as a result of power. The segment of the society who are powerless are exploited and victimized in a variety of ways by agents of oppression and/or systems and institutions. They are subjected to restrictions and seen as expendable and replaceable—particularly by agents of oppression. This philosophy, in turn, minimizes the roles certain populations play in society. Sadly, agents of oppression often deny that this injustice occurs and blames oppressive conditions on the behaviours and actions of the oppressed group. Oppression subsequently becomes a system and patterns are adopted and perpetuated. Additionally, socialization patterns help maintains systems of oppression. Members of society learn through formal and informal educational environments that advance the ideologies of the dominant group, and how they should act and what their role and place are in society. Power is thus exercised in this instance but now is both psychologically and physically harmful. This process of constructing knowledge is helpful to those who seek to control and oppress, through power, because physical coercion may not last, but psychological ramifications can be perpetual, particularly without intervention. As shared, knowledge is sustained through social processes, and what we come to know and believe is socially constructed, so it becomes ever more important to discuss dominant narratives of our society and the meaning it lends to our culture. It is our role as community Organiser to challenge the power hierarchy, to advocate, and to raise the voice and consciousness of those who lack power and /or the capacity to do so themselves. It is also our role to raise the consciousness of those who oppress and disempower. A social structure is a set of long-lasting social relationships, practices and institutions that can be difficult to see at work in our daily lives. They are intangible NSOU ? MSW-IV 31 social relations, but work much in the same way as structures we can see: buildings and skeletal systems are two examples. The human body is structured by bones; that is to say that the rest of our bodies' organs and vessels are where they are because bones provide the structure upon which these other things can reside. Structures limit possibility, but they are not fundamentally unchangeable. For instance, our bones may deteriorate over time, suffer acute injuries, or be affected by disease, but they never spontaneously change location or disappear into thin air. Such is the way with social structures. Overlaying these social structures are structures of power. By power we mean two things: 1) access to and through the various social institutions mentioned above, and 2) processes of privileging, normalizing, and valuing certain identities over others. This definition of power highlights the structural, institutional nature of power, while also highlighting the ways in which culture works in the creation and privileging of certain categories of people. Power in Indian society is organized along the axes of gender, caste, economic status, and religious identities. Some identities are more highly valued, or more normalized, than others—typically because they are contrasted to identities thought to be less valuable Community Power Structure "Social Structure" by Shane is licensed under CC BY-SA 4.0

32 NSOU ? MSW-IV or less "normal." Thus, identities are not only descriptors of individuals, but grant a certain amount of collective access to the institutions of social life. This is not to say, for instance, that all white people are alike and wield the same amount of power over all people of color. It does mean that white, middle-class women as a group tend to hold more social power than middle-class women of color. This is where the concept of intersectionality is key. All individuals have multiple aspects of identity, and simultaneously experience some privileges due to their socially valued identity statuses and disadvantages due to their devalued identity statuses. At the higher level of social structure, we can see that some people have greater access to resources and institutionalized power across the board than do others. Sexism is the term we use for discrimination and blocked access women face. Genderism describes discrimination and blocked access that transgender people face. Racism describes discrimination and blocked access on the basis of race, which is based on socially-constructed meanings rather than biological differences. Classism describes discrimination on the basis of social class, or blocked access to material wealth and social status. Ableism describes discrimination on the basis of physical, mental, or emotional impairment or blocked access to the fulfillment of needs and in particular, full participation in social life. These "-isms" reflect dominant cultural notions that women, trans people, people of colour, poor people, and disabled people are inferior to men, non-trans people, white people, middle- and upper-class people, and non-disabled people. Yet, the "-isms" are greater than individuals' prejudice against women, trans people, people of colour, the poor, and disabled people. For instance, in the founding of the United States the institutions of social life, including work, law, education, and the like, were built to benefit wealthy, white men since at the time these were, by law, the only real "citizens" of the country. Although these institutions have significantly changed over time in response to social movements and more progressive cultural shifts, their sexist, genderist, racist, classist, and ableist structures continue to persist in different forms today. Similar-sounding to "-isms," the language of "-ization," such as in "racialization" is used to highlight the formation or processes by which these forms of difference have been given meaning and power (Omi and Winant 1986).

Economic inequality also limits opportunities for employment, housing, health care, and education. These conditions can only be eliminated by changing unequal power relations and with the redistribution of wealth. Attention to the distribution of power and wealth is consistent with the principles of social justice, respect for diversity, and promoting social change. As

Social Workers, Community Organizers are equipped with the skills and training, practice, and lived experience needed to address the most pressing of social issues and concerns in our communities today. The continuation of structural systems of oppression and power, and its effect on our communities, families, and individuals is a matter of concern and it is no easy task to engage in dismantling and addressing such structural power systems.

99%

MATCHING BLOCK 23/61

Paulo Freire (1970), Suggests most people who experience social oppression do not necessarily act to change their reality. This is because they have been taught to accept the dominant, or oppressors', narrative. That narrative has placed them in an inferior position and their oppressor's in a superior one. Over time, the oppressed come to believe in their inferiority and thereby internalize their oppression. The inferiority is now a part of their identity and affects the actions they take and the decisions they make in life. In turn, their acceptance of an inferior position in society enhances the dominance of their oppressors. Freire also argues that marginalized individuals do not have a critical awareness that allows them to see the injustices in their lives. They tend to be passive and unable to recognize their own capacity to transform their social realities, in part, because their condition of marginalization and oppression keeps them in a state of helplessness. Someone forced to the margins of society who lacks critical awareness may accept their low position. They may see it as the result of fate, bad luck or supernatural forces. This is why helping people develop critical awareness and understanding of the factors that contribute to their situation is an important early step in the process of empowerment.

Thus the process of Empowerment may only initiate

100%

MATCHING BLOCK 24/61

once people understand the reasons for their situation and the importance of taking action(s) in order to address their own problems. 2.6

Community Empowerment Concept of community-level empowerment has now started receiving attention from Social Workers, who are working in various community settings. Community
34 NSOU ? MSW-IV

100%

MATCHING BLOCK 25/61

W

empowerment means a community has the resources and talent to manage its affairs, to control and influence relevant groups and forces within and outside the community, and to develop empowered leaders and community organizations. One example of developing empowered leaders is community members learning to organize so they can take part in improving their communities and take actions toward these improvements. Empowerment may be particularly important for communities rebuilding after trauma, such as survivors of a natural disaster, or for individuals in a war-ravaged country (Anckermann et al., 2005). Indicators of community empowerment include processes such as collective reflection, social participation, and political discussions, as well as outcomes such as having obtained adequate resources for improving community well-being and social justice (Anckermann et al., 2005). Collective reflection means that community members get together and jointly examine the issues that have mattered to them over time.

Community participation and social interactions

W

are ways in which these communities can take the actions needed to empower themselves.

100%

MATCHING BLOCK 27/61

W

Community empowerment works through increasing the community's influence over the structures and policies that affect the lived experiences of the community and its members. Increases in influence often occur through partnerships between those in power and other community members. These partnerships may take place in advisory boards, coalitions, or broader community inclusion initiatives (Fawcett et al., 1994). At times, community empowerment may mean that members of the community become empowered with the help of the community leaders and vice versa. Such "co-empowerment" may be challenging, yet can be very beneficial to communities (Bond & Keys, 1993).

Along with the empowerment, the Social Workers working in the communities

100%

MATCHING BLOCK 28/61

W

may use a variety of strategies to address power imbalances (Fawcett et al., 1994). These strategies can help reduce or eliminate barriers, develop networks, and educate others in the community (see Practical Application 10.1). They can also create opportunities for capacity building and allow participants to advocate for changes in policies, programs, or services. To promote empowerment at the environmental and societal level, it is important to examine national, state, and local policies. Many programs and services unexpectedly place barriers and stressors on oppressed groups, such as people with disabilities. Ultimately, empowerment efforts are directed at promoting social justice. The strategies highlighted in this chapter can serve as a guide for individuals interested in promoting empowerment in their communities. It should be noted that there are many tactics that have been used to promote change over time.

NSOU ? MSW-IV 35 Community Integration is the opportunity to live in the community and be valued for one's uniqueness and abilities, like everyone else. (Salzer, 2006). Community Integration creates an environment that facilitates individual well-being. Community Integration is the right of all people. The process of Community integration helps people to optimize their personal, social and vocational competency to live successfully in the community. It also provides opportunities for community engagement, by either building practical skills or increasingly social access and participation for the people living in a community. The community integration enables participants to strive to learn, work, and socialize successfully in their local environment, all while enjoying the benefits of an active, engaged lifestyle. Each individual in the community possesses unique potential to create, grow, learn and adapt to various situation thus Community Integration allows people to participate in various community according to their own choice and capabilities. Thus Community Integration focuses on empowering the community people to enjoy a meaningful lifestyle and become more self-sufficient. 2.7 Summary The knowledge of power in a community talks us about its structure community can take enough step to diamant be the power structure which is oppressive in nature and thus the process of Community Integration is much inclusive in nature where everyone of the community, irrespective of their status in the power hierarchy within the society, may participate in their own developmental activities. 2.8 Exercise 1. Define the term 'Power'. What are the various sources of power ? 2. Analyse the community power Structure particularly in Indian context. 3. Discuss briefly about the notion of Paulo Freire. 4. What do you mean by Community Empowerment & Community Integration. 2.9 Reference

Understand why and how communities organize ? Explain bottom-up and top-down approaches to community organization 3.2 Introduction Community organization, we know is more like a movement which is carried out for the enhancement and betterment of the community life. It is done with the active participation and initiative of the community people by creating awareness through providing information and raising their consciousness level. This approach is meant for the improvement of the general status and condition of the community as a whole. It is

38 NSOU ? MSW-IV coordinated by community organizers who, works with the groups of people, helps the community to consult and implement social projects and programmes for the benefit of the entire community. The basic aim of community organization is to promote self-reliance and collective socio-economic development within the community. 3.3 Definition of Community Organization Community organisation is a methodological process of providing, building and enhancing opportunities of community life to people. It is one of the accepted methods of social work. It is helping process like casework and group work. It helps communities to cope with situation and problems they face from time to time. Community organisation is an enabling process. It helps in adjustment between people and environment in a community. The term organisation means an arrangement of persons or part. They function in a coordinated manner to accomplish a goal. Exist together for existing together remains as the ultimate goal of community organisation. Community organisation is known as a complete method of social work since it is inclusive of casework and group work processes. It attempts to build, re-organise, strengthen, assist, ensure and develop in communities the sense of belongingness and togetherness. Specifically we can say that community organisation is the process of dealing with individuals or groups who are or may become concerned with social welfare services or objectives, for the purpose of influencing the volume of such services, improving the quality or distribution or furthering the attainment of such objectives'. It has again been NSOU ? MSW-IV 39 defined in the following manner. The term '

92%

MATCHING BLOCK 31/61

SA

Community Organisation course materials - TNOU ... (D133109690)

community organisation' is best defined as 'assisting a group of people to recognise their common needs and helping them to meet these needs'. 3.4 Scope of Community Organization

In the present day context scope of community organisation is enormous. With the pace of time nature, depth and dimension of community problems are significantly increasing. In one hand already existing problems are increasing and on the other hand new problems are taking place. The old community infrastructure is getting weakened. Mutual help and services are disappearing slowly. Coordination among the members of the community is becoming fade day by day. Mutual interaction is also decreasing. It is in this backdrop that scope of community organisation has significantly increased. The supportive technique of community organisation can play an effective role to bring improvement in the overall situation of the community. The problems, which exist as a threat to the community can be successfully dealt with through the community organisation process. Thus, it is needless to say that the scope of community organisation is widening day by day. 3.5 Objectives of Community Organization Various social scientists have described the objectives of community organisation some of which are enumerated below. (i) Community organisation aims at re-establishing and maintaining the community relations among the people for their happier living together. -Dr. S. Singh (ii) The objectives of community organisation are to find ways of improving the community environment and to improve on the methods of community organisation for community welfare. -Mac Miller (iii) It is bringing into (people's) participation in all phases of the process, individuals and representatives of groups concerned and of promoting interactions of attitudes ... With the object of reaching agreement through mutual understanding. -M. C. Neil

40 NSOU ? MSW-IV (iv) Inculcation of community consciousness, protection of community from unwanted pressure and development of leadership. -Polson & Anderson Based on the above mentioned ideas one can say that the principal objective of community organisation is to help the members of community to lead a life on the basis of good understanding, coordination, interaction and participation. 3.6 Principles of Community Organisation Principles are based on values. These are developed as a result of experience. Community organisation principles are based on social work values and long term experience of working with the communities. The aim of formulating principles in the practice of community organisation is making communities capable to take care of their needs or problems in more effective manner. According to M. G. Ross and K. D. Gangrade. principles of community organisations are-

- (i) It should deal with the problems, which are recognised as problems by the community concerned.
- (ii) It should help the community to go for self-determination.
- (iii) It should involve the community actively to find solution of its problems.
- (iv) It should move at a pace that is comfortable for the community.
- (v) It should encourage and ensure development of the community by solving or minimising the problems.
- (vi) It should inspire the community to have sound intergration and understanding.

Dr. Gangrade added that 'Great stress should be laid on the exercise of self-determination and self-realisation in the people. Another Dunham has mentioned four major principles of community organisation which include :

- (i) Principles of need-based programme planning.
- (ii) Involvement of people in programme planning.
- (iii) Voluntary cooperation as key to community organisation
- (iv) Emphasis on prevention in welfare programmes.

McNeil has suggested the following principles of community organisation:

- (i) Community organisation is related with people and their needs.
- (ii) Community is the main client in community organisation.
- (iii) It is essential to understand the environment of the community to be able to accept the community as it is.
- (iv) All the members of the community should remain involved in the process of community organisation.
- (v) No agency should work in isolation. There should be coordination and interdependency of social welfare agencies.
- (vi) Training should be imparted to the relevant persons through social work educational institutions.

Based on the principles mentioned above it can be summarised that the principles of community organisation process are :

- (i) To accept the community as it is.
- (ii) To undertake programmes on the basis of felt needs of the people.
- (iii) To discourage the idea of imposition in any sense.
- (iv) To avoid taking drastic action. Community people should get time for psychological preparation.
- (v) To organise programmes in harmony with economic, social and cultural background of the community concerned.
- (vi) To encourage the community to have understanding integration interpersonal relations.
- (vii) To keep in mind that communities are individualised.
- (viii) To show non-judgemental attitude.

42 NSOU ? MSW-IV (ix) To ensure right of self-determination. (x) To utilise the resources properly for the welfare of the community. (xi) To move at a pace that is comfortable for the society. (xii) To ensure that it is practised by the professionally qualified persons. 3.7 Methods/Process of Community Organisation To make any effort successful, process adopted to do the job plays a pivotal role. In fact, it is as important as the programme component. Poet Rabindranath. who was also one of the pioneers of rural development in this country, emphasised that community organisation is a must for initiating any sustainable development programme. It includes the following processes :

1. Identification of Problem Each community is unique. All communities are liable to confront some problems. For organising the community these problems are to be identified. These can be on caste, illiteracy, unemployment or such other issues. Unless the basic problems are known with their depth and dimension, effort for community organisation cannot be taken seriously. Problems can be of different nature like – ? Lack of resources for promoting economic status ? Lack of ideas/awareness thereby creating socio-economic problems ? Lack of cohesiveness which is the basis for development ? Superstition and taboos-the great barriers of development ? Lack of initiative ? Atrocities on lower castes ? Unemployment and underemployment ? Basic health hazards, malnutrition ? High birth rate

NSOU ? MSW-IV 43 ? Alcoholism, drug addiction ? No community-based institution. 2. Programme Planning Community organisation is not a casual work. It is scientific. Hence no programme should be taken without adequate planning. All programmes should be planned before initiation. Since community organisation always remains as a tough task programme of organising the community is needed to be planned properly. Working with human being is always difficult compared to working with machine. Organising any small thing also (e.g. a cultural evening, observation of days of national importance like 15th August. etc.) requires proper planning. In case of community organisation process is naturally very important for which proper planning is a must. 3. Formation of Community Groups For community organisation community groups need to be formed. These can be youth organisations or mahila mandals. In absence of such groups mobilisation of community resources will not be possible. Community participation will also remain non-available. In West Bengal situation groups are there in both rural and urban areas. In Manipur, mahila samities are in good numbers. In Bihar formal groups are less but castewise informal groups are there, in Punjab group culture is missing. Situation-wise decision is to be taken- ? To form groups where it is not existing ? To strengthen the groups where these exist. In Chile, Morocco, Philippines. Uganda the youth organisations are strengthened to address the health need of youth. In Malaysia youth groups are extremely strong. 4. Organisation building Formation of group does not help much until some organisation is formed. Organisation provides umbrella to the group. For example, Swamiji formed a group of the disciples of Sri Ramkrishna. But he realised that this group should have the support of an organisation. So the Ramkrishna Math and Ramkrishna

44 NSOU ? MSW-IV Mission was established in 1987. Now with its more than 150 branch centres it is working for the development of people, particularly the downtrodden and distressed. From micro-level to macro-level everywhere efforts are marked for organisation building, e.g. Islamic countries organisations, SAARC, Commonwealth, Tea Board, AIFF, European Community, Chamber of Commerce, etc. Hence supreme importance should be given to build organisation of the community concerned.

5. Evaluation and Feedback The activities initiated as a result of community organisation should be evaluated properly to assess the result as well as to get feedback from the exercise. This evaluation can be formal or informal. It can be done by self or by outsider. The feedback received as a result of evaluation helps in bringing necessary modifications in programme content, methodology etc. For example, CD programme was initiated on 2nd October 1952. The programme was evaluated in 1962. This evaluation helped in getting a number of important feedbacks, which ultimately contributed in bringing a number of modifications in different areas of programme implementation including proper training of officials. This is true in case of any community work also. Any action of evaluation may provide feedbacks, 'which are of immense importance. Hence continuous evaluation of process and programmes in terms of outcomes is essential. Recording becomes the only means through which proper evaluation can be done.

6. Networking The objective of community organisation is development. And for sustainable development networking of organisations and services is a must. Networking helps in optimum utilisation of resources. In a community set up there may be youth organisations, mahila mandals, panchayats, educational institutions etc. A networking of all such agencies is considered as one of the processes of community organisation.

7. Follow-up In community organisation followup is also extremely essential. Community consists of individuals. Any individual human being is subject to commit mistakes. Follow up services help in preventing those mistakes. Secondly, experiences NSOU ? MSW-IV 45 say that result of any action is likely to remain incomplete in absence of regular follow up action. Follow up gives back up support in effective implementation of any programme. Besides the above mentioned methods, the following methods should also be adopted. ? Continuous central recording ? Budgeting (planning applied to finance) ? Execution of joint financial campaign ? Promotion of voluntary agreements ? Evaluation and feedback taking. The Cycle of Community Organizing Successful community organizing tends to follow a cycle: assessment, research, mobilization (action), and reflection (Speer et al., 1995). Let's assume that a Community Organizer has a desire to improve the access to health facilities within a community.

In 46 NSOU ? MSW-IV this situation, he/she may first assess what resources already exist within the community. One-on-one or small group meetings with the stakeholders may be organized to better understand their experiences. If they can, they may also do a survey of a representative sample of community people. Their main questions may be things like: What issues do they face when dealing with their own health issues? Are they able to meet with the health workers when they need to? Are there differences in what groups readily have access to resources? After this assessment stage, the Community organizer will want to enter the research stage. Here, it will be important to meet with local leaders to understand what funding and other resources are allocated for health centres. They may meet them to discuss different such aspects. They may even hold public meetings on the issue with the community members to raise concerns or to build up public support. This will help them move into the action phase. In the action phase, the Community Organizer may host events raising awareness of various health concerns and how to address them. They may create and distribute a petition calling for administrators and the board of trustees to allocate more funding to hire more health workers or provide the health centre better infrastructural facilities with updated equipments and encourage the community members to demand for their Health Rights. After these actions have been taken, the community will move into the reflection stage. Here, community leaders and their allies will want to reflect on what happened. What went well? What didn't go well? What's next? This would help to increase the bargaining quality of the community leaders' and also their reflections about their experiences, and they will also be looking forward to the next assessment stage. It is important to recognize that time may be needed for communities to see the full effects of their efforts, as systemic change often takes time. As changemakers are considering what actions to take, they should always be mindful of intended impact. What outcomes would the community hope for? Perhaps the goal is shorter wait times for students needing access to services, or a reduction in the number of medical withdrawals for mental health concerns. These are easy to measure and track, assuming the students have access to these metrics. Some outcomes, however, are harder to measure: how do we measure a reduction in stigma against those with mental health-related diagnoses? For something like that, it will be important to consider change over time, both on campus and nationally. Perhaps it would be good for students to work with faculty to develop NSOU ? MSW-IV 47 a yearly survey to estimate attitudes surrounding mental health issues and maybe even prevalence of common mental health diagnoses. As you might be able to see, measuring impact can get complicated pretty quickly, and often requires change leaders and others to think ahead and envision what factors will positively and negatively affect their ability to judge how things have gotten better or worse as a result of the actions they take. Some of the common obstacles found when trying to measure outcomes of coalitions include: ? Issues surrounding how representative their coalition and outcomes are compared to coalitions and outcomes generally ? Control of the independent variable (the coalition) ? Identification of extraneous variables and interactions between other extraneous variables ? Figuring out what outcomes to measure and how to measure them ? Changes over time in understanding and measurement of issues, and ? Fighting the desire to present results in a favourable way (Berkowitz, 2001). As we have learned throughout this textbook, communities can vary widely in their membership, the contexts they inhabit, and their access to resources. While the complexity of working on and measuring the impact of community work makes this work challenging, Berkowitz encourages us to rise to that challenge and find new ways to measure what we need to measure in a reasonable and scientifically valid way.

3.8 Community Organizing Techniques Typically, when communities organize, their goals fall within two broad categories: resource provision, or ensuring a community is provided with a resource it is lacking (a form of first-order change), and transformation, or fundamentally changing a community and its structures such that resources and power are more equitably distributed (a form of second-order change; Hale, 2014). For example, a community may be interested in improving the educational outcomes of its children. If the community's focus is on resource provision, they may push for smaller student-to-teacher

48 NSOU ? MSW-IV classroom ratios or better pay for teachers. If the community's focus is on transformation, they may push for a change in culture whereby community members share ownership of students' educational outcomes with teachers and create programs that engage all members of the community. Those who put transformational change above resource provision argue that resources are necessary for communities and community change, but without attention to changing the systems that caused the lack of resources, there is a danger of recreating systems that allow for some groups to be left behind. For instance, if a community pushes for better pay for teachers, this may benefit teachers in some schools or school of the district more than others. A key consideration for someone interested in community organizing is finding ways to keep volunteers engaged; organizations can only be as effective as their volunteers are when working together over an extended period. Some estimates suggest only one-third of first-time meeting attendees show up to later meetings. So, what factors affect whether someone stays involved? Some factors that seem to positively influence attendance include face-to-face meetings designed to build interpersonal relationships and attendance at research-related action. 3.9 Capacity Building For change to happen, a community must engage in a process known as capacity building, or

100%

MATCHING BLOCK 30/61

W

a process in which communities or organizations work to improve their collective skills and resources.

In other words, before actions happen, communities need to make sure they can do the things they need to do to make that action happen and sustain the results they want. These things can include tangible resources like money or space, power, leadership, or the networks of people who care about an issue. But why is capacity building important? Engaging in capacity building can improve community readiness for members to do the things they need to do for change to happen. For example, one study of seven Kansas communities trying to reduce underage drinking found that increasing a community's readiness through capacity building resulted in new programs, policies, and practice changes being more easily facilitated (Anderson-Carpenter et al., 2017).

NSOU ? MSW-IV 49 Table 1. Stages of Community Readiness ? Community has no knowledge about the issue or local efforts to address it. No Awareness ? Leadership and community members believe the issue is not a concern. ? There are no resources available for dealing with the issue. ? Leadership and community members believe this issue is not a concern or think it can't or shouldn't be addressed. Denial/Resistance ? Only a few members know about the issue, and there may be misconceptions among community members about the issue and current efforts. ? Community members and/or leaders do not support using available resources to address this issue. ? A few community members have at least heard about local efforts but know little about them. ? Leadership and community members believe this issue may be a concern in the community. They show no immediate motivation to act. Vague Awareness ? Community members have only vague knowledge about the issue. ? There are limited resources that could be used for further current efforts. ? Some community members have at least heard about the issue and local efforts but know little about them. Preplanning ? Leadership and community members acknowledge this issue is a concern and that something must be done to address it. ? There are limited resources for further efforts to address the issue.

50 NSOU ? MSW-IV ? Most community members have at least heard about local efforts. ? Leadership is actively supportive of continuing or improving current efforts or in developing new effort. Preparation ? The community is concerned and wants to do something about it. ? Community members have basic knowledge about causes, consequences, signs, and symptoms. ? There are some resources for further efforts to address the issue; community members or leaders are actively working to secure these resources. ? Most community members have at least basic knowledge of local efforts and current efforts. ? Leadership plays a key role in planning, developing and /or implementing new, modified, or increased efforts. Initiation ? The community feels a sense of responsibility, and some community members are involved in addressing the issue. ? Resources have been obtained and/or allocated to support further efforts. ? Most community members have more than basic knowledge of the issue and local efforts, including names and purposes of specific efforts, target audiences, and other specific information. Stabilization ? Leadership is actively involved in ensuring or improving the long-term viability of the efforts to address this issue. ? The community has taken responsibility and is involved. ? A considerable part of allocated resources for efforts are from sources that are expected to provide continuous support.

NSOU ? MSW-IV 51 ? Most community members have considerable knowledge of the issue and local efforts, including the level of program effectiveness. Expansion/Confirmation ? Leadership plays a key role in expanding and improving efforts. Adapted from Tri-Ethnic Centre of Preventive Research 2014 Community readiness typically moves through nine stages and can increase or decrease depending on the community issue, the intensity of community efforts, and external events. Community readiness to implement interventions to prevent suicide amongst the school children. 3.10 Some relevant terminologies in Community Organization Collective Efficacy and Participatory Efficacy As we have learned throughout this chapter, the work of community psychologists relies heavily on community members acting collectively and intentionally (Foster-Fishman, et al., 2001). It also relies on a sense of collective efficacy, that is, the belief that the actions of the group can be successful in creating change (Zimmerman, 2000). Collective efficacy depends on many factors, such as the task at hand, access to resources, and leadership. It also depends on personal participatory efficacy—your own belief that you can effectively participate in community organizations. Both vary from situation to situation. For example, you may feel that the student group you belong to can effectively change the campus housing visitor policy (collective efficacy) and that your research skills will contribute to the group's efforts (participatory efficacy). On the other hand, you may feel that the local homeless coalition you volunteer for will effectively establish partnerships for affordable housing (collective efficacy) but feel that you cannot contribute effectively to that mission (participatory efficacy). Burnout in Community Organizing We can all relate to feelings of stress. In community partnerships and coalitions, stress can lead to burnout – that feeling of overall exhaustion when there's too much pressure (stress) and not enough sources of satisfaction or feelings of support (Maslach

52 NSOU ? MSW-IV et al., 2000). When coalition or team members experience burnout, it comes as no surprise that the quality of their work or willingness to participate deteriorates. Researchers have found six organizational factors that contribute to burnout: high workload, little influence in decision making, inadequate rewards (e.g., compensation, recognition), lack of social support, lack of fairness, and disagreement on values (Maslach & Leiter, 2008). Effective leadership and organizational capacity can aid in preventing many of these factors, and the way in which you define the social problem and decide how to change it can make a difference. Small Wins Approach Successes, and the recognition of those successes, can go a long way in community organizing. When the social issue your organization is tackling has opposition, seems insurmountable, or is controversial, it is important to identify and establish small wins early in the planning phase. Organizational theorist Karl Weick (1986) found that when proposed changes are wide-sweeping and extensive, it tends to increase feelings of threat, and hence, increases a community's resistance to change, and inaction among change agents. However, when proposed changes are small, concrete, and of moderate importance, risks seem more tolerable and manageable. These "small wins" also have the added benefit of attracting allies, preventing inaction, and deterring opponents.

MATCHING BLOCK 32/61

W

Distinction between Community Organisation and Community Development. There are many similarities between community organisation and community development. But for theoretical purpose it is possible to differentiate community organisation and community development. a) Community organisation is a method of social work but community development is a programme for a planned change. b) Community organisation emphasizes the processes, but community development emphasizes the end or goals. c) Community organisers are mostly social workers and social change agents, but community development personnel can be from other professions including agricultural experts, veterinary experts, and other technical experts. d) Community organisation is not time bound. It is achieved step by step according to the pace of the people. But community development is time bound and time is specified for achieving the development objectives. NSOU ? MSW-IV 53 e) In community organisation people's participation is important. But in community

development people's development is important. f) In community organisation governments and external agencies assistances are not important or needed.

of Community Organisation 4.5 Relevance of Community Organisation in Different spheres of Social Work Intervention 4.6 Models of Community Organization 4.6.1 Locality Development Model 4.6.2 Social Planning Model 4.6.3 Social Action Model 4.7

Summary 4.8 Exercise 4.9 Reference 4.1 Objective ? Understanding the application of Community Organization in the different areas of Social Work Practice ? To know the Models of Community Organization Practice and its utility. 4.2 Introduction Social work consists of a number of methods of which Community Organisation is

56 NSOU ? MSW-IV one. The Community Organisations method has immense scope of working in total development of the community, Thus it has relevance to various spheres of social work intervention, The present unit is written to give a basic idea with regard to the same to the student social workers. 4.3 Meaning of Social Work Social Work is a known and established profession in today's world. It provides services to the individuals, groups and communities for better adjustment and better living. According to Friedlander, it is a professional service which is based on scientific knowledge and skill with regard to interpersonal relations which helps individuals and groups. According to Konopka, social work is an identity which is reflected in three separate but inter related units such as network of social services, carefully adopted methods and social principles expressed through social institutions and persons. According to the resolution adopted in the conference of Professional Social Workers (1957), social work is rendering welfare services based on human philosophy. Scientific knowledge, professional skill etc. so that the individuals. groups and communities can lead meaningful life. 4.4 Concept of Community Organisation In previous chapters the concept of community organisation has already been defined. However, in brief it can be said that community organisation is a method of social work which identifies the problems of the community, fixes them on the basis of priority, creates awareness and desire in the mind of the concerned people to fight out the problems, mobilises necessary resources, initiates adequate steps/ actions and promotes community integration for the betterment of the community. 4.5 Relevance of Community Organisation in Different spheres of Social Work Intervention Community Organisation is such a method of social work which plays a significant role in promoting the well-being of the community.

NSOU ? MSW-IV 57 In the lines below its relevance to different spheres of social work intervention can be briefly described. (i) Health sphere: Health is one of the basic spheres where social work intervention is necessary. Traditional ideas, superstitions and dogmas create serious deadlock in improving the level of community health. Community organisation services are quite relevant in such situation. Community people can be made aware to diagnose it as a problem of the community and initiate necessary actions to bring attitudinal change in the mind of the people by enlightening them with modern ideas and outlook. This will immensely help in bringing change in the practice of immunization, small family norms, modern health and so on. It will also make the concerned people free from mental handicap resulting thereby poor health condition. (ii) Sanitation sphere: Many Indian communities do not bother much about the hygienic practices. Open defecation is a common practice. Habit of cleanliness is also missing seriously in most of the communities, particularly in rural areas. Particularly this is true in case of tribal pockets, urban slums, most of the rural pockets. This naturally compels them to live in an situation which is not desirable. Community Organisation as a method of social work has relevance in the social work intervention in this sphere also. Through continuous effort it can create an environment where community people will go for bringing change in their practices. (iii) Education sphere: It is another sphere where community organisation has relevance. There are communities where education is not considered as important. Particularly in some section of population, who are socioeconomically backward, education did not find place in the priority list. As a result, illiteracy is still a problem along with high rate of school drop out cases. Several Govt. and non-Govt agencies have played positive role. Nevertheless. problems are there. Here lies the scope of community organisation method which can effectively tackle the situation by ensuring peoples participation in minimising the depth and dimension of the problem. (iv) Housing sphere: House is one of the determining factors of quality of life. If the houses are built in a planned manner maintained properly, hygienic aspects

58 NSOU ? MSW-IV are kept in mind, people can live in a better manner. Better use of homestead land is also very necessary. The living condition in many communities is extremely poor. Through the process of community organisation a continuous effort can be made to orient the people and initiate joint effort to bring positive change in the housing condition. (v) Displacement: Due to various reasons such as earthquake, devastating flood, partition, riot, drought, etc. people are displaced. In such a situation the concerned people break down economically and psychologically. It becomes difficult for them to adjust with the new situation. Community Organisation method can be useful in such situation also. By involving them in various constructive activities meant for their own welfare it can help them to overcome the trauma. It can also help them to get settled in life keeping behind the helplessness. (vi) Income Generation: Poverty among a section of people in each community of this country is more than a reality. Lack of resources, improper use of resources, no forward backward linkage between market and the production, unemployment and under employment, general apathy, lack of modern ideas and skill are some of the reasons responsible for poverty. Community Organisation as a process has relevance in poverty eradication by income generation also. It can effectively help the community to identify and properly use the available resources, upgrade the skill, overcome the apathy etc. An organised community can fight against the exploitation and under-employment also. It can also help in finding out new areas of income generation. Thus, it can be said that community organisation process is relevant in different spheres of social work intervention. 4.6 Models of Community Organization Jack

Rothman developed three models of community organization in 1970, which are locality development, social planning and social action. Locality development is the model that most closely subscribes to the values and outcomes of what is typically

100%

MATCHING BLOCK 38/61

SA

480E2430_BSW_Social Work with Communit...
(D165107508)

referred to as "community development." In practice however, many community development workers employ a range of techniques and approaches from locality development, social planning and social action models in their work with communities.

The major focus of these models is community building and community empowerment. 4.6.1 Locality Development Model This model of community organization

99%

MATCHING BLOCK 39/61

SA

480E2430_BSW_Social Work with Communit...
(D165107508)

practice is based on the belief that in order to effect change, a wide variety of community people should be involved in planning, implementation, and evaluation. Key themes include the use of democratic procedures, voluntary cooperation, self-help, the development of local leadership, and educational objectives. 4.6.2 Social Planning Model A rational, deliberately planned, technical process of problem-solving with regard to substantive social problems, characterizes this model. The degree of community participation may vary. However, building community capacity or fostering radical or fundamental social change is not a major goal of this model of community practice. 4.6.3 Social Action Model Practitioners practising this model assume that a disadvantaged segment of the population needs to be organized in order to make demands on the larger community for increased resources or improved treatment. Key themes in this model are social justice, democracy, and the redistribution of power, resources, and decision making.

Purpose in Considering the Various Models To identify and make explicit the assumptions and conditions that influence the selection of a model (or mixing models) of organizing, as it effects the process and the outcomes of the community assessment. ? To integrate theory with the practice of community work. 60 NSOU ? MSW-IV ? To facilitate discussion and reflection on the process of community work. ? To identify the types of skills and roles required by a community worker in different projects and the focus of how one spends his/her time. ? To structure the tasks and techniques that will aid in achieving the process goals of community development. To assist community workers in understanding how their orientation towards a particular model has affected the kinds of community projects they have become involved in and how they have chosen to work within a community. To provide a framework for community workers to revisit those decisions and do future planning.

Strengths, problems and application of Rothman's Model Strengths While these three models are not exhaustive, this has been somewhat of a useful lens from which to conceptualize and develop and evaluate community change efforts. Each model has been utilized to some degree to help create and measure community change, has mobilized community members and has provided useful ways for people to address systemic problems. Problems In today's rapidly moving and complex social environment not all of the three models produce positive community change. In fact, they are likely outdated (Boehm & Cnaan 2012). To meet the challenges of today's societal demands, scholars and community practitioners have called for a hybrid approach due to the problems inherent in each modality. For example the locality approach emphasizes helping people help themselves, but this approach is often to blind to the larger factors of national, state or local government which often overshadows the ability of the localized population to mobilize for themselves see themselves as relevant actors (Carlton-LaNey, &Burwell, 1995). The social planning approach is criticized for being overly, rigorous, rational, and technical. In communities where the populace has less educational opportunities data driven strategies may leave people behind. Finally, one of the problems associated with the

NSOU ? MSW-IV 63 social action approach is that is highly militarized (Hoefer & Chigbu). The use of confrontational tactics and pitting one group against another usually requires the use of a third-party to resolve the inherent conflicts. Newer Approaches The literature suggests newer models which have been developed in recent years including the community advocacy model, community engagement and feminist models, as well as a number of others (Boehm & Cnaan, 2012). While all these models have relevance and are more useful than previous ones, they are primarily rooted in the classical models so many of the original limitations exist. One of the main criticisms is the overall lack of community involvement from the beginning stages. Newer approaches will need to include community members and community practitioners' perspectives from conceptualization, implementation through evaluation. This empowers participants to share and build strengths as active initiators based on their perspectives on what needs to change, how it will change and when change will take place (Hoefer & Chigbu). A new conceptual approach to community intervention is called the MAP- Motivation and Persuasion Process, which is a hybrid configuration that addresses most of the gaps in the 3 classic models . (Hoefer & Chigbu). A major criticism of all three classic models is the lack of community involvement of its members in decision-making (Boehm & Cnaan, 2012). Bundled in a theoretical framework of empowerment, the MAP brings together persuasive psychology, motivational counseling, and principled negotiation to integrate community involvement as central to the model. A number of studies indicate these approaches have been successful in working with communities, institutions and individuals (Cialdini, R.,2009; O'Donohue & Beitz, 2007; Plois, 2007). The MAP helps community members develop skill in self- negotiation with institutions and is built on principles which are central to social work: self-determination and community empowerment (Goldworthy, 2007). Community members work alongside community practitioners and policy makers to learn a variety of skills leading to positive outcomes including use of authority, maintenance of consistency, demonstration of commitment, maintenance of objectivity, tactful response to resistance, display of empathy, and pursuit of self efficacy. These components comprise a model of community change by empowering community members to collectively come together with a skill set that can lead to successful outcomes (Hoefer and Chigbu).

64 NSOU ? MSW-IV 4.7 Summary In this unit we came to know about the application of Community Organization in different field of Social Work, the models described here would enable us to develop techniques to work in the community. 4.8 Exercise 1 Discuss the Relevance of Community Organization in various sphere of Social Work intervention. 2 Explain the strengths, problems and application of Rothman's Model. 3 Discuss locality Development Model and Social Planning Model. 4 Discuss the MAP approach. 4.9 Reference <https://macrosw.com/2017/06/01/community-intervention-models-problems-strengths-and-future-applications/> NSOU ? Determining data collection methods or sources ? Identifying key informants

66 NSOU ? MSW-IV 5.2 Introduction – Learners having interest and exposure in learning about community and its needs – Learners having graduate and above level education may apply their skill to exercise this. Community organisation is treated as an important method of social work education. This is also considered as an important process of community development. In this process there are four important components. Such as identification of needs of the community, prioritization of the needs, identification of all forms of both local and external resources available to address the needs of the communities concerned, convergence of the inter agencies working for the cause of the community, taking action with the community participation to meet up the need. Besides, there are other important issues in community organisation process. 5.3 Concept of Community Need Assessment In relation to improving human and organizational performance, needs are simply the differences between our current achievements and our desired accomplishments. Thus, most commonly needs represent the differences between our ambitions and the results of our current performance; though needs can in the same way represent an overabundance of success when your current achievement surpass our desired accomplishments. Assessment is generally performed prior to taking any particular action. In case of need assessment it is said that an action is taken up to determine current situations and to identify various issues for taking appropriate step to mitigate. Need assessments establish the essential foundation for suitable planning to bring out community development step by step. Therefore- Needs: Discrepancies between the results currently be achieved and the desired results to be accomplished. Assessment: A process for assigning value or worth to someone or something in order to make decisions.

NSOU ? MSW-IV 67 Needs Assessments: A process to define, measure, and prioritize needs based on the cost to meet the need (or close the gap) versus the cost of not meeting the need (or not closing the gap). 5.4 Importance of Need Assessment Community based need assessment provides community workers a snapshot of the local situation, community systems and environmental strategies currently in place and helps to identify areas for which improvement is required. With the help of skilled and trained manpower, community people can map out a line of actions for a positive and sustainable change in their communities. A community need assessment is a task which helps to understand what the community people have and what do they need to have. It is beneficial task for taking up any kind of development project, restructuring of ongoing projects as well as to undertake new projects. It is important to analyse that community people have worked together to fulfil one by one their needs so as to make themselves organised better towards bringing out community development. There are other importance also. Such as- Defining the scope of work Need assessment helps in identifying the community we want to serve. For instance, someone could assess the needs of children within the neighbourhood surrounding a local elementary school. Helps to develop partnership/fellow feelings It is imperative that to better start up a project we should consider community relationships as well as the partnerships. There are so many local organizations or non profit making organisations who can lend hand for becoming a development partner or for being with the people as fellow. Perhaps the Parent Teacher Organization of the elementary school would assist to understand the need of an elementary school. Sharing information of common concern In case the survey is conducted for collecting data in many forms, we need to frame a structure to understand what to do first. Someone may decide to host a community meeting and invite individuals to express the needs they see. Some other may decide to

68 NSOU ? MSW-IV send a survey to key community organizations to gather their input. Perhaps one could attend a meeting to learn what parents and teachers think in a guardians meeting. Determination of start up activity Once we have received information from the community concerned, we can review it and determine the key findings – such as community's strengths and gaps, as well as the opportunities and challenges it faces. Those key findings may be used to make informed decisions. Create an action plan with goals and objectives for a suitable project. Helps to generate/ mobilise fund Don't forget to share your findings. Other community entities will be interested to know what you've learned and may even want to partner with you. A complete community needs assessment can be especially helpful when approaching potential funders for a project. In fact, it is a critical part of the community organisation to make grant application. We can learn more about conducting a community needs assessment by hand at the grass root which may help to determine why and how they need us. Thus a community needs assessment in the process of systematically collecting, analyzing and using information to: – educate and mobilize communities – develop priorities – gather resources plan actions to impact the target population, neighborhood or community. Need Assessment helps us to provide a basis for planning by identifying assets, service gaps, needs, trends and priorities to advocate for change or provide a service across the country or within an identified at-risk neighborhood or population. Thus needs assessments are based on the assumption that groups of people have needs that are not being met or addressed adequately. It seeks to uncover unmet needs, both recognized and latent. It is a good idea to involve the local stakeholders like-service population, Service providers, Community leader, Faith based community leaders, Government and Non Governmental organizations, Business leaders, Community people, and other community

NSOU ? MSW-IV 69 groups so that they may give their opinions and inputs from their perspectives in order to make the assessments more meaningful and effective. Since needs assessment helps inform decisions, they can be used proactively to identify opportunities to improve performance, reactively in response to the consequences of less than desirable results, or continuously as an integrated component of a continual improvement program. This makes needs assessments a valuable tool for decision makers at all levels of an organization and in any role. From those wanting to improve individual performance or working to create a new initiative within the organization to those charged with developing complex programs with external partners or improving the outcomes of long-running organizational undertakings, needs assessment can be used to either formally or informally guide decisions. Nevertheless, whether the needs assessment is proactive, reactive, or continual, the needs assessment processes are best applied to inform performance-related (or results-focused) decisions. Needs assessment can also help you avoid missteps. Often, the simple answers to your professional challenges don't provide the systemic solutions that you are ethically responsible to provide. After all, for every performance problem there is a solution that is simple, straightforward, acceptable, understandable... and WRONG. For instance, human resource officers commonly hear managers requesting new or additional training in a variety of organizational areas. While training may initially seem to be a reasonable solution to the organizational problems being faced by the manager, an informed decision about how to improve performance requires that additional information be considered before rushing ahead with any single solution. Most often, organizational challenges are not linked to any single cause; such as the perceived inadequate knowledge or skills of others. Systems of solutions focus on building the capabilities of individuals and the capacity of the organization. These multi-activity systems are typically required to change behavior and improve results. Thus a need assessment can guide decision makers in evaluating the complex needs (or performance gaps) of an organization in order to come to solutions that address the systemic issues related to performance rather than merely the symptoms. The following statements are often good indicators that a need assessment may be the appropriate next step before making any decisions: "They really want this program to be put in place by next year."

70 NSOU ? MSW-IV "We need to provide more training to people working in the Ministry of Agriculture." "At last week's meeting you decided that introducing [insert current title of best selling management book] would be a good place to start building capacity." "They need to go to leadership training." "If you had [insert latest technology gadget] then you would be more productive." "You need to do an evaluation as part of that project." When you hear these, or similar statement about what should be done, it is usually a good time to step-back and ensure that you know where you are headed before you take the first step. After all, if you are not headed in the right direction you could end up someplace other than where you want to be. In addition to being reactive, needs assessments can, and should, also be a proactive or continuous part of your professional decision making. You can, for instance, use a needs assessment as an integrated part of a strategic or annual planning effort. In these situations the needs assessment provides continual feedback on the gaps between current and desired results to the planning process. These gaps will commonly fluctuate greatly from year-to-year, or as organizational goals and objectives shift in relation to external pressures or opportunities. Yet, without needs assessment data it is challenging for plans to provide essential direction for an organization; long-term goals that are only related to current realities (such as improved customer service or being #1) are rarely of value to the individuals and teams in the organization that must complete tasks for the organization's results to be accomplished. Thus a needs assessment can help you find alignments between the long-term strategic objectives of the organization and what the people — inside and outside of the organization — find of value. As you all know, for better or worse most strategic plans only sit on bookshelves gathering dust. But this should not be the case; strategic plans should be used to guide decisions in your organizations. And by pairing strategic planning with needs assessments you can help bring plans into action. Then, while strategic planning efforts ensure that the organization knows where it is going, regular needs assessments will provide critical information for applying those plans to valuable decisions.

NSOU ? MSW-IV 71 Use needs assessments proactively, continually, and reactively - 1. Proactively to identify potential opportunities for improving individual or organizational performance. 2. Continually to monitor your progress toward accomplishing desired results. 3. Reactively when new strategic, tactical, or operational objectives are to be achieved. Need Assessments can be of various types like ? Normative Need (defined by experts in the field) ? Perceived Need (as seen by those experiencing the need) ? Expressed Need (as seen by those who seek out the services) ? Relative Need (needs and resources in one geographic area or population compared with needs and resources in another) Need Assessment vs Need Analysis ? A needs assessment is a process for both identifying and prioritizing needs (or gaps in results). Therefore, the assessment must distinguish and measure needs by collecting information through processes such as interviews, focus groups, surveys, document reviews, performance observations, and other techniques. Subsequently, in order to prioritize needs, the assessment must also analyze the identified needs to determine their contributing factors, the related costs, as well as estimates for improving performance in relation to the needs. The later process, of prioritizing needs, requires that you delve further into the identified needs in order to make reliable estimations of what factors are leading the performance gap and what it could take to close the discrepancy. ? As part of your needs assessment, therefore, a needs analysis process will guide one in the examination of each gap in results (need) to determine its component parts and how to do those contributing factor influence the discrepancy between current and desired performance. Based on this information, along with estimates of the cost to meet the need versus the cost to ignore the need, you will then have information for making decisions about which needs should be high and low priorities. Consequently, a needs analysis is a practical, useful, and fundamental step in the completion of a needs assessment.

72 NSOU ? MSW-IV ? When one considers the differences between assessment and analysis, the relationships between needs assessment and various analysis processes is clarified. An assessment is simply a process used to identify and appraise the importance, size, value, or worth of something in comparison to other similar items. In the case of needs assessment you are identifying and appraising performance gaps in order to make decisions about what actions should (or should not) be taken to improve human and organizational performance. ? An analysis, by comparison, is a process to separate a whole into its parts in order to identify the components, and their relationships. Thus, when one considers needs analysis, front-end analysis, root-cause analysis, or performance analysis he/she can see that these are processes that apply the results of a needs assessment in determining the details of why the needs are present in the organization. ? With this in mind, needs assessments become an essential precursor to analysis procedures. One must, in other words, go through a process for identifying and comparing his/her performance needs before he/she can enter into a set of procedures to analyze performance, needs, or even root-causes. In serving the role of providing a process for collecting information and guiding decisions, a needs analysis is nevertheless an essential part to any needs assessment. Without the analysis processes you would simply have identified needs without procedures, tools, or techniques for prioritizing those performance discrepancies for closure.

5.5 Components of a Need Assessment The main components of a community needs assessment are ? Policy Change: This involves laws, regulations, rules, protocols, and procedures that are designed to guide or influence behaviour. Policies can be either legislative or organizational. Policies often mandate environmental changes and increase the likelihood that they will become institutionalized or sustainable. ? Systems Change: Examples of legislative policies include taxes on tobacco products, provision of county or city public land for green spaces or farmers' markets, regulations governing a national school lunch program, and clean indoor air laws.

NSOU ? MSW-IV 73 ? Environmental Change: This involves change that affects all community components including social norms of an organization, institution or system. It may include a policy or environmental change strategy. This type of change relates to the physical, social or economic factors designed to influence people's practices and behaviours. Examples of alterations or changes to the environment include: the presence of programs or services, including the presence of healthy food choices in restaurants or cafeterias, improvements in the built environment to promote walking (e.g., walking paths), the availability of smoking cessation services to patients or workers, and the presence of comprehensive school health education curricula in schools. ? Economic changes: The presence of financial disincentives or incentives to encourage a desired behaviour including charging higher prices for tobacco products to decrease its use or the provision of non smoker health insurance discounts. These indirectly influence the change in economic pattern of the community. Policies are often the driving force behind systems change. For example, implementing a national school lunch program across a region or provincial school system, or ensuring a hospital system becomes tobacco free.

5.6 Methods of Need Assessment A proper assessment can help a community make decisions that are appropriate to its unique set of circumstances. Rick Maurer (Adapted from Tom Ilvento, Lori Garkovich, Gary Hansen and Ron Hustedde) has pointed out community need assessment in light of following six important issues. He has considered these useful in: ? Identifying community resources, opinions and goals ? Planning for the future ? Identifying local resources ? Encouraging local participation ? Marketing the community ? Identifying community needs.

74 NSOU ? MSW-IV As per Maurer, there are different methods of need assessment at community level. Such as ? Secondary data analysis ? Primary data Collection ? Key informants interview ? Focus group interview ? Expert presentation and testimony ? Environment scanning ? Community forum study ? Social Survey

5.7 Planning for a Community Need Assessment ? Identify and assemble a diverse community team ? Develop a team strategy ? Define the community to assess (e.g., school, districts, city limits) ? Identify community sectors to assess (e.g., health care, schools) ? Identify community components to assess (e.g., nutrition, tobacco use) ? Develop questions to ask for each component, including how the responses will be measured ? Select sites and number of sites to visit within each sector ? Determine existing data to use or methods for collecting new data ? Identify key informants to contact

Identifying 10-12 individuals maximum for the community team is recommended to ensure the size is manageable and to account for attrition of members. A community needs assessment should focus on a particular geographic area, sectors within that area such as health care and work sites, and community components to assess within each sector such as nutrition, chronic disease management, and tobacco use. A combination

NSOU ? MSW-IV 75 of two or more data-collection methods is recommended at each site to confirm or support initial findings. Keep a comprehensive file of all sources of information, key contacts, and data to review at a later date or to share with coalition members. Training for needs assessment Opting for a need assessment in a training-only context is a fundamentally flawed way to begin your assessment. After all, training is just one of many activities that one will want to consider when making performance improvement decisions. Yet, a training needs assessment intentionally defines the improvement activity before the assessment process begins; leaving us with a solution in search of problem. In the 1980s, the phrase "training needs assessment" became a popular way to describe most any process for determining what content should go into a training course. While making decisions about the content of training course is important, this is not the best use of needs assessment processes, tools, or techniques. Just as one would not want to conduct a mentoring needs assessment or a lay-off needs assessment, one does not want to prematurely select training as the hammer for every nail in your organization. Conduct the needs assessments without any preconceived notions about which improvement activities will be most valuable to the organization; listening to others inside and outside of the organization, maintaining an open perspective to creative ideas, and collecting information that will justify the recommendations or decisions in the end. Similar to the evaluation perspective described previously, one can nevertheless use many of the tools and techniques described in this book to determine what content should go into a training course. Use focus groups, fishbone diagrams, task analyses, and other techniques to collect valuable information to inform those decisions; but only after you have completed a needs assessment that finds training is an appropriate activity to achieved desired results. Many times it is part of an effective performance improvement system, but an impartial needs assessment is the best process for informing that decision. 5.8 Summary Need assessments are not about choosing one improvement activity from a list; you should compare and contrast numerous activities — and differing combinations of activities — to determine which are accomplish desirable and sustainable results. Systems Theory tells us that there are always numerous options for accomplishing results within an open

76 NSOU ? MSW-IV system, that each of the systems are both interdependent and interconnected, and that success in one subsystem has the potential to sub-optimize the success of the whole system. Thus, single-solutions or "quick fixes" are rarely going to achieve desired results in complex organizational systems. 5.9 Exercise 1. What is need assessment ? What is its importance ? 2. Enumerate the Components of Need Assessment. 3. Explain the methods of Need Assessment. 5.10 Reference

NSOU ? MSW-IV 77 UNIT- 6 Programme Planning Structure 6.1 Objectives 6.2 Introduction 6.3 Concept of Programme Planning 6.4 Importance of Programme Planning 6.5 Techniques of Programme Planning 6.6 Summary 6.7 Exercise 6.8 Reference 6.1 Objectives After completion of the workbook, learners will be able to: – Plan for a community organisation by: – Identifying a common need – Defining the scope of the planning – Listing the components for planning – Selecting areas of community settings – Nature of community resources – Identifying key functionaries 6.2 Introduction – Learners having interest and exposure in learning about programme planning – Learners having graduate and above level education may apply their skill to exercise community based programme planning.

78 NSOU ? MSW-IV 6.3 Concept of Programme Planning Community planning is an issue which has been evolved over many years. It is associated at the grass root level plan of action for community, plan of joint actions at the inter-agency level for the community and at the state and national level plan for public bodies/councils associated for community development. Public Bodies/Council level Planning for Community Dev. Programme Agency level Planning for Community Development Programme Grass root level Planning Besides, a program planning is the outline of events and activities that community members undertake to reach the goals in an organised way. A successful program plan provides detail and shows how each activity supports the main objectives of community organisation. Literally, plan is an outline/drawing, showing the proportion and relation of a community as well as arrangements of schemes beforehand of the community to achieve its target. The clarification of the objective of community organisation, action to be taken up, method to be followed, time frame to be fixed and by whom actions to be taken up are basic consideration for a programme planning in community organisation. There are different domains of programme planning in community organisations. Such as planning for a blood donation camp, community health programme, planning for welfare of elderly, planning for fund raising for renovation of school building, etc. Programme – It is a written statement which describes proposed developmental activities, the problems they address, the actions & resources. Plan – Plan is schedule of development work outting different activities in a developmental activities in a stipulated time period. Programme planning – It is thus a process of making decision about the direction and intensity of development education efforts to bring about desirable change amongst the community members.

NSOU ? MSW-IV 79 6.4 Importance of Programme Planning In community organisation of social work practice, programme planning is very much important. There are many reasons behind it which may be learnt from the following. Achieve the aims Each and every programme is undertaken to fulfil certain aims and objectives during the course of operation or at the end of the programme. The success of the programme depends on various issues and factors that have been taken into consideration in the planning of such programme. Avoid overlapping of resources In some cases it has been found that different agencies give thrust on a particular community with all their resources and benefits. People in this particular community are benefited for single purpose from multiple sources. For example, a particular family is given tailoring machine from one agency, another agency is also giving same to that family, some other is giving cash benefit, technical benefit and similar machines, also. This is overlapping of services and benefits being provided without proper planning. We may avoid this with suitable programme planning for the community concerned and establishing coordination between the agencies. Increase efficiency It helps to make optimum utilisation of resources available at the community level and ensures highest return at the lowest possible cost of the programmes planned for effective implementation. The efficiency of staff, target group and service providing agency will increase in case there is proper planning of suitable programmes for the people. Enhance proper coordination Suitable planning of a programme helps to develop better coordination among the beneficiaries, implementing agencies and the other support services meant for the community. Each and every part of the programmes are better tied up due to its planning made well in advance. For example, in a school mid day programme, there are schools, students, guardians, cooking agency, teachers and school authority. There will be better coordination among all these in case they are taken care with due importance during planning for mid day meal programme for the school.

80 NSOU ? MSW-IV Helps in decision making Decision making helps every plan of action to be undertaken in time for the targeted people with the resources allotted for it. It is in reverse, programme planning itself helps all stakeholders to decide on what to do, how to do and for whom to do. Motivate people's participation In almost every planning for the programmes under community organisation process, there is a motivational force which helps community people come together, sit, meet and decide for suitable need based programme planning. Reduces the risks There are different types of risks in planning of programmes for the community. It may be risk of fund availability, risk of trained persons availability, risk of other resources availability. These may be addressed properly in case programme planning is done professionally. Ensure proper direction Planning of each programme includes the operational procedure, time frame, target and allotment of resource which in other term may be said as the directions of the programmes being set in its planning. Anybody abiding by the planning of the programmes during its implementation may not have any confusion on how is it to proceed for. Good control over resources It is not desirable under a particular programme that any agency at any time can decide on how the programme can be done, personnel will be hired as and when required and they can incur expenses as per their wish. In that case, the said programme will not achieve success. Good control will automatically be exercised in terms of fund, manpower, agency administration and management of beneficiary which may be according to the planning as drafted earlier well in advance. Encourage innovation Programme planning helps to utilise both the internal and external resources for the betterment of the community concerned but that may not be confined in a routine

NSOU ? MSW-IV 81 exercise. Need based and resource based community development planning always gives scope to encourage those who will carry out designed activities with innovations and professional expertise. In addition to above, there is importance of programme planning for the betterment of community people as there is scope for monitoring and evaluation of the activities under a particular programme from time to time as the same has been articulated in the planning. Planning is also important for the programmes since it helps proper mapping of resources and documentation under various forms of data base, progress reports and audio-visual evidences through which progress of the programme can be judged following the components of planning. 6.5 Techniques of Programme Planning It is always said that planning for a programme involves three important stages such as, pre programme stage, programme implementing stage and programme ending stage. It is a process since when conceptual framework for a programme has been developed. There are different techniques in planning of a programme for community organisation. We may have the outline of the techniques generally adopted for planning of programme as per diagram presented herewith as follows. Brainstorming, research, discussion, workshop, learning appraisal, sharing ideas, story-telling, mapping of resources, motivation Leadership development decision making, communication, cooperation and facilitation, training, capacity building, management of staff, fund and resources. Evaluation, record keeping, conflict resolution, fund mobilisation, future planning, leadership development, generating community support Diagram showing various techniques of community programme planning – by Author Programme Beginning Stage Implementing stage Programme closing stage

82 NSOU ? MSW-IV Different types of techniques are applied for planning at the stage of beginning of the programme, such as: ?

Brainstorming: It a technique applied to refresh mind and spirit for a common task of the participants assembled for planning in a common platform, meeting, work, seminar, drawing, mapping etc. Generally it is done through game, role play, music, playing audio-visual, film etc so that participants concentrate their mind. ? Research/field survey: It is an effective technique to understand what the community situation is, their language, culture, beliefs, norms, education, skills, knowledge and resources available to them both physical and financial. ? Public Discussion/Meeting: Public meeting or discussion in open stage situation may be held on the issues pertaining to need and feasibility of the community. It is generally held with different categories of community such as for women, men, younger generation, elderly, specially challenged and socially weaker sections for different agenda as will be fixed for planning a programme. Major tasks required for this are selecting a venue, target number of people, topic of discussion, time and date, nature of refreshment to be required, documentation of the discussions, etc. ? Workshop /Seminar: The technique of workshop some times yields good result for planning a programme in the community. Some important issues are clubbed together and concerned community people are invited to have learning about by taking part in the workshop. Subject matter experts are invited to discuss and deliver lecture for clarification and people are asked to discuss and sharing their views on that particular issues for better understanding. ? Learning appraisal: This is somewhat different from the workshop and discussion. In this technique, community people are invited to discuss and work out some special issues prevailed in the community systematically e.g., drawing a map of their village/ward/community using chart and posters, sketch and markers indicating the location of social institutions, households, forests, river, ponds, water bodies, tap water point/tube well/well, waste land, play ground, temple/church/gurudwara etc., so that anybody can easily understand/learn what the community is by putting a glance over the map.

NSOU ? MSW-IV 83 ? Sharing ideas and story-telling: These are helpful technique for the people as well as for the planner to learn about the prevailing community culture, barriers, languages, beliefs. It helps involvement of adults and elderly with more confidence to share their views on the programmes planned to be implemented. ? Resource Mapping: Resources are varied from community to community as well as from region to region. For making an effective planning, all sorts of available resources need to be identified through intensive home visit, community interaction, collecting information from community leaders as well as opinion leaders. Key functionaries may make themselves divided into team and carry out this exercise with drawing and drafting the strength and figures of resources including physical, financial, human and natural resources. ? Motivational Camp : In each and every step of exercising routine tasks of planning a programme, motivation plays a very crucial role. It is important technique for bringing people together to plan programme. It helps to stimulate their participation, generating their support to fulfil common goal of the programme planning. The stimulation for motivation varies from individual to individual. Sometimes, people are motivated to join a meeting as there is a good lunch, time set for it or other peer groups are coming to that. Some others are motivated as their is arrangement of travelling allowance, rewards for participation or famous personality of their interest is coming, and so many other different sources but it is to apply for the purpose of planning effectively. Planning is also done for smooth running of the programme at the entire implementing stage so that no such incidents like, manpower shortage, fund shortage, problem in the operational areas and lack of effective participation of target groups are not taken place. Considering the importance of the programme in its implementing process, some techniques may be applied as mentioned below: ? Technique of leadership development : It is a technique as well as a process through which a group of people is mobilised and encouraged to perform certain tasks by inspiration from a leader. He/she may be a person whose behaviour influences others for a common purpose to achieve. Planning is never possible unless, in due process leadership is developed and unless an efficient leader is there to make the tasks required for drafting it.

84 NSOU ? MSW-IV ? Promoting decision making : It is important to take decision in every stage of planning the programme. There are different opinions, needs and issues likely to be brought up and taking decision one by one can make the situation more effective and useful. Every one may get their problems/needs addressed properly in case decision is taken in time and according to the need of the people. Mainly, it is exercised observing best possible way out in hand or in the given situation to decide for optimum utilisation of the time and resources. There are different areas in community organisation practices where programme planning is largely accepted as an important method of exercise. A gist of such areas may be put down herewith as follows; Housing, health, nutrition, sanitation, awareness building, literacy, education, skill development, training and self employment, drinking water, rainwater harvesting, natural resource mobilisation and management, human development, etc. 6.6 Summary Programme planning is thus an avoidable task. without a proper programme planning, the community organizer will fail to work efficiently and much of the important aspects would remained unaddressed, and the whole idea will get ruined. A well planned programme would increase community participations and ensure a greater success. 6.7 Exercise 1. Discuss the concept of programme planning why is it important. 2. What are the technique of programme planning. 3. How will you plan for an Anti-trafficking Awareness Programme in a rural community. 4. Write short notes on a) Technique of leadership development b) In what ways can motivate people to participate in a programme.

Concept of Networking The term “networking” refers to the systematic establishment and use (management) of internal and external links (communication, interaction, and co-ordination) between

88 NSOU ? MSW-IV people, teams or organisations with an objective to improve performance. There are different elements for better defining the term of networking. However, key elements of this definition include, - (i) Systematic management (ii) communications, interactions and co-ordination between groups or individuals or institutions. (iii) improved performance. In literature various definitions of a network can be found. Often, it is described as a structure of relations and connections created by organizations due to the fact these organizations are mutually dependent to each and others. A network can be compared to a road or railway network. It contains various nodes like, stations, cities, traffic centres which are interconnected by lines of communications. This is also, found in community development in which setting the nodes like schools, colleges, universities are interconnected by the noble task of spreading education among all. As organisational structures are to improve their effectiveness, the use of network since then, has been increasing as sources of knowledge in themselves in the form of sources for innovation. More and more of the innovation process takes place in networking as opposed to hierarchies only a small minority of firms and organisations innovate alone. There are many reasons that have been deep rooted in fundamental changes in the global economy, including the increasing importance of societal knowledge and the global scale of knowledge exchange, and so are on. Inexpensive, powerful electronic communication is becoming widely available and accelerating the process of networking. Scholar (Butler et. al 1997) argues that this factor may mean that the traditional role of intermediaries will disappear or be transformed primarily into support for market operations. In earlier times, organisations needed intermediaries to reduce transaction costs; as transaction costs fall, more consumers do their own searching network using the new media and on-line search agents. Learning in networks represents a special mode of knowledge production, which cannot easily occur within organisations or in the open 7.4 Characteristics of Networking Networking has the following characteristics: ? Networks open access to a variety of sources of information. ? They offer a broader range of learning opportunities than is the case with hierarchical organisations.

NSOU ? MSW-IV 89 ? They offer a more flexible and, at the same time, more stable base for co-ordinated and interactive learning than does the anonymity of the market. ? They represent mechanisms for creating and accessing tacit knowledge. We are beginning to understand that part of the knowledge base for policies and innovation cannot easily nor only be captured in written form, whether reports are based on academic research or on best practice and experience. ? Much knowledge is embedded in social structures, and within or between organisations. It is very difficult and sometimes impossible to make that knowledge explicit. In education for example, there were high and optimistic expectations thirty years ago that research would provide the knowledge base for policy and practice. ? The community expectations are to be tempered in the light of experience and expertise. The reasons for this are not in the first place the poor quality of educational research or its insufficient volume or even lack of transfer mechanisms. A more basic factor is that educational knowledge is for a large part tacit in nature. ? Exchange and development of tacit knowledge require different processes and structures than doing and implementing research. The use made of written reports for innovation is often disappointing. One reason for this is that users need to share a tacit understanding of the process of codification with those who have constructed the report. This condition is often not fulfilled. ? Those engaged in the process of production have learned to analyse and combine data, to report in a coherent and attractive way, and so forth. Others, who have not been engaged in that work, find it difficult to understand what can be learned because they do not possess the necessary clues. Networking may help to mediate codified knowledge by developing the needed complementary knowledge and interpretative meanings. It may establish the social life of documents. So, networking may complement written, codified information, and it may help to make documents more rational and reasonable. 7.5 Importance of Networking (i) Large networks tend to be effective when they create and maintain a sense of belonging, cohesion and reinforcement of values.

90 NSOU ? MSW-IV (ii) The participants involved in the process of networking share a common purpose among them. This may be a vision, a mission or a more concrete goal of the organisational setting. (iii) Networks enjoy a degree of self-management. This does not mean that there are no leaders, or that the processes are not managed, as indeed these are even more critical than in traditional organisations. (iv) Participants stay active in the network so long as it delivers a benefit for them, which ultimately is also an advantage for the clients of the participants. In networked organisations, the profit is achieved while participants stay autonomous. (v) Networks come and go as they are moved in the dynamic structures. They change – in terms of type and number of participants, roles of participants, etc. – and they come to an end. (vi) Electronic means underpin and enhance networking such as internet, cell phone may have wide range of networking, but it is last of all accepted that networks are human. Electronic discussions require a high level of agreed codes concerning respect, for example, and trust contributes to their success. Virtual teams are only successful if their electronic communication is backed regularly by face-to-face contacts, contacts that may have more a social than a task-oriented purpose. (vii) To be more directly productive, larger groups tend to break into smaller networks, and virtual teams often have a small active core of 5-7 people at the centre, even if there are extended memberships. (viii) Networking may be controversial because of conflicts of values that characterise many Western organisations. It adds to and thus changes traditional management styles, and it reflects a shift in what is perceived as valued knowledge. The importance is externalised between codified and codified is the combination. Networking may also replace the production of codified information because it is more cost-effective than producing books or databases. Networks can facilitate exchange of tacit knowledge in a direct way – avoiding the effort and cost of first codifying it. The

NSOU ? MSW-IV 91 emerging networks for in-service training of teachers and school leaders in the community, for example, tend to be very effective compared with courses based on academic evidences. 7.6 Types of Networking Formal-vs-informal: There are many types of networks. We may have very familiar forms of networking in community setting. It may be of two types which include the formal and the informal networking. Arrangements like clubs, mentorships, joint seminars, email networking and conferencing are the parts of formal networking. Informal networking may be the arrangements like sports, cultural events, gossip of club members, typical daily dialogue of the community leaders, relationship of inter community. Vertical-vs-horizontal: It may be in vertical arrangements between clients and organisations and horizontal among participants, target group, beneficiaries of each programmes. Local-vs-regional: It may have regional or a local character. Regional networks deals with among organisations and key officials while local networks deal with individual to individual, individual to organisations etc. Also, global networks frequently organise interactions between enlisted agencies and knowledgeable in other parts. There are also three other types of networks which are found in practice of community organisation. Such as, (i) need based network is driven by the need of practitioners to find solutions of the practical problems. (ii) Knowledge embedded networks for the purpose of improvement of the organisational performance, knowledgeable persons are kept in close networking. (iii) data based networks, through which knowledge exchanged and embedded in such networks is often combined a well-organised database of communication 7.7 Steps of Networking For those who will go for setting a formal network among the organisations, beneficiaries and the community itself, need to adopt certain steps for making such network more purposeful and need based. Few steps have been pointed out herewith as flows:

92 NSOU ? MSW-IV Step-1: Identifying key persons/officials In case the networking requires among agencies, first and foremost work is to have identification of the key officials of the agencies otherwise key persons of the community may be identified for inter community network setting. Step-2: Setting the goal It is the first and foremost duty to all concerned stakeholders to set a common goal for establishing network between or among them. Once it is decided to set the network among, and all concerned are adhered to keep all their programmes and policies in operation according to that. Step-3: Brainstorming the officials At the initial stage there might have been knowledge gap, information gap and motivational gap among all the stakeholders being associated under a particular network. As a result of that time to time key officials/ persons may be brought together for face to face interaction, brainstorming and better knowledge sharing among them. This may brought resultant effect during the course of its operation Step-4: Selection of support members In general, all officials of all networking agencies will not have better understanding at the initial stage. Not even, there will have interests of all officials or persons of the organisations under a particular network to keep it continued. For this, it is essential to select those who are keen to keep network continued with their self guiding motivational forces. Step-5: Justification of significance There is always a scope to justify the significance of network established between or among the agencies in terms of its further need and fulfilment of the purpose. Necessary modifications can be done in case there is lack of establishing suitable network at any stage of the programmes of the organisations is in operation.

NSOU ? MSW-IV 93 Step-6: Mapping of network zone The establishment of network is always process oriented. It is varied in reference to place, programmes and participating organisations with their beneficiaries under target programmes. There is also, chance to map it out properly for enhancing the further scope and opportunity beyond the places, programmes and partners. Step-7: Network situation analysis It is important to analyse the outcome of network in terms of problem identification, interests served, resources mobilised and influence created so far for strengthening network situation. Step-8: Strategy development Strategy is essential for time to time development of existing network set up so that scope of given time, place, programmes and policies are in operation according to the target framework. There should have enough scope for time to time revision of the purposes and targets for which networks among organisations and individuals have been set up. 7.8 Concept of Supervision The term supervision is commonly used in the welfare administration. It is an enabling process in which one designated person through the medium of his/her organisation effort looks after the work and assignment being accomplished properly by the supervisees or not. According to Williamson, 'supervision is a process by which workers are helped by a designated staff member to learn according to their needs to make best use of their knowledge and skills and to improve their abilities so that they can do their jobs more effectively and with increasing satisfaction to themselves and the agencies.' In brief we can put down certain aspects that have been observed in the definition. Such as – It is a process through which workers of an agency are helped by someone of superiors

94 NSOU ? MSW-IV – Learn to best use of knowledge and skills according to the need of assigned work – Improvement of the abilities and effectiveness of staff for job satisfaction – It is a teaching learning process – Best use of human capacities in an agency for fulfilling its goal It is something like rendering certain enrichment of education, knowledge, oversight, control and surveillance which are necessary to better bridge between senior level management and frontline workers. 7.9 Principles of Supervision Principles always help to move in a professional direction to the supervisor as well to the community organisor having deployed for a community setting. They are to observe certain principles while supervising to their subordinate staff members for a particular work and assignment. Such as- ? Principle of person centric supervision rather than product oriented, ? How the work done is more important than how much is done, ? Work should be assessed by better understanding not by making fearful environment, ? Responsibility of staff should be entrusted with required authority, ? One employee should have not more than one point of direction towards the work, ? Increasing possibilities of errors should be assessed and encouraged with suitable steps. ? Directed towards fact finding not fault findings, ? Re building and re-generating is in natural process of supervision.

NSOU ? MSW-IV 95 7.10 Types of Supervision In community based organisations and welfare institutions we generally found two types of supervision. (i) Substantive- it is related to actual work done by the subordinates in an organisation and (ii) Technical- it is concerned with the technical methods hired or adopted from outside agencies as per requirement. In addition to that according to the style of functioning in various organisational set up supervisors are classified in three categories. Such as (i) Autocratic- in this type, supervisor is the all in all and it leads to no initiative of work by subordinates, no productivity, no responsibility, no self esteem/ security, no delegation and decision making power. (ii) Laissez faire- in this type, supervisor is within and among the subordinates to take initiative for work, equal responsibility, increase self esteem/security, decision making power and maintain productivity. (iii) Democratic- in this type, supervisor allows delegation of power, initiate fully, work with full responsibility, maximization of productivity, self esteem and security is full. 7.11 Methods of Supervision John D. Millet has suggested six methods of supervision. Such as (i) Prior approval- supervisor needs to have prior approval to start supervision from his/her agency authority. (ii) Standard supervision- it is to set the standard quality of supervision, its target, time frame and equality of work should always be kept in consideration.

96 NSOU ? MSW-IV (iii) Approval of personnel- in case of need of work and target of achievement, supervisor may engage staff if required for which there will be no delay of work and achievement. (iv) Reporting system- what is supervised and the result of that should be kept in black and white. Proper documentation is important to keep and update from time to time. (v) Inspection- it is very essential to visit the spot and interact with sub ordinates for effective supervision. (vi) Budgetary limitation-- the supervisor needs to take appropriate measures to keep all duties and assignment of supervision within stipulated budgetary limit of the organisation. Besides the above, there are other methods of supervision in community organisation process. Such as, ? Visit to spot for observing real life situation. ? Holding group meeting of staff, beneficiaries, community workers, etc. ? Organising staff conference/workshop/open conference for community people. ? Scrutinizing daily work diary/reports of the staff, ? Holding focus group discussion ? Eliciting the reports of earlier supervisors. In this way supervision in community organisation is done. 7.12 Role and functions of Supervision Supervisor in a community based organisation has to perform various functions in different time of his/her work and assignments. These are put down in the following way, (i) Administrative function: supervisor has to receive assignment of work of what and of whose work to be supervised. Also, he/she needs to have necessary facilities from the agencies.

NSOU ? MSW-IV 97 (ii) Function of teaching: there is certain scope of providing necessary counselling and guidance to subordinates as well as to build up skills and capacity to do work with more efficiency in order to achieve the target. (iii) Linkage function: supervisor has to act as the linkage between higher officials/ management and lower officials/ front line workers of the organisation they are working with. (iv) Assisting function: there is human in the organisation so that supervisor has to maintain good relationship applying well knit channels of communication. This helps to the organisation avoiding overlapping of human resources by assessing actual work done and work targeted to be done. (v) Function of evaluation: It is always desirable that personnel engaged at present may be sustained in future but there may be further requirement of staff in case further expansion is made by the organisations. Keeping in mind of all these, assessment of performance of the staff from time to time may be done and necessary actions may be suggested to the decision making point of the organisations. 7.13 Qualities of Supervision The effectiveness of supervision always depends upon the quality of the supervisor as a person he will have for the fulfilment of his/her duties in an organisation. An efficient supervisor will always be an organiser, controller, friend and philosophical student of human psychology. He/ she will be- – A dynamic person – Helpful in nature – Expert in human resource development – Expert in work and assignment – Great deal of human sensitivity – Good observer

98 NSOU ? MSW-IV – Fair minded and – Cooperative. Besides, he/she should have qualities of three main directions as noted below: Personal: Good education, ability and desire to learn, strong common sense, fair judgemental and open mindedness. Developing personalities: Having self confidence, social sensitivity and initiative nature. Leadership skill: Integrity, responsibility, ability to delegate and administrative ability. 7.14 Do(s) and Do Not(s) in Supervision Do(s): encourage workers in difficult situation, praise them when they solve the problems, showing sympathy when they are in disturb and understand them in different situations. Do not(s): No criticise in front of others, no demoralise in presence of subordinates, no favouritism. 7.15 Monitoring and Evaluation In every welfare organisation there are some programmes either arranged by own source of fund or the financial support of the external sources. In all such programmes some routine work are done to see the progress of the programme as well to identify the gap for suitable measures to be taken up to minimize the gap. Monitoring is a routine and continuous assessment of the functioning of the programme activities in the context of its timeline, objectives, target areas as designed in each programme/project. It is simplest method of knowing where we are in relation to targets of the programmes. Monitoring is defined as, 'the process of routine collection and analysis of information to enable the assessment of the progress of the project during the course of its implementation.

NSOU ? MSW-IV 99 7.15.1 Concept of Evaluation Evaluation means to assess the progress and benefit achieved during and after the particular project is implemented. It is 'a systematic and objective oriented assessment of an ongoing or complete project'. ILO in its Technical Cooperation Manual has stated that Evaluation is an instrument in- – Providing key stakeholder with information needed to guide the project strategy towards achieving the set goals and objectives. – Providing early warning of activities and processes that need corrective action. – Help improvement of project partner by creating opportunities for them to reflect critically on the project's direction and decide on improvement. – Building understanding, motivation and capacity amongst those involved into the project. – Assessing the progress to enable reporting requirement to be met. 7.15.2 Objectives of Monitoring and Evaluation Major objectives of monitoring of the community based projects/programmes are as follows. ? To judge the effectiveness of the programme in view of the changing needs of the community. ? To avoid mistake, overlapping and duplication of resources. ? To ensure better coordination. ? Judicious allocation of funds and resources. ? To make administrative control ? To identify the priority of need and action taken up. ? To introduce remedial, corrective mid-course action for better implementation of the programmes.

100 NSOU ? MSW-IV 7.15.3 Components of Monitoring and Evaluation Major components deal with monitoring and evaluation of the project/programmes and its activities are as follows. ? Number of project, purposes, area of operation and their objectives ? Various units of the projects and personnel ? Standard of work both qualitative and quantitative aspects ? Coordination among various units and staff ? Controlling mechanism of the programmes ? Short falls of the programmes and positive forces ? Triangular relation among organisation, staff and beneficiaries ? Nature of communication and sharing information ? Community relation and participation ? Operating methods and procedures ? Future plan of actions These components need to be taken care of while going to monitor the programmes and to evaluate in different span of time. 7.15.4 Types of Evaluation There are three types of evaluation in the development of community. Such as (i) Bench Mark Evaluation (En Ante)- This is mainly carried out the study the baseline situation before the project is implemented better to state when the project is in planning stage. This is in other term called as Bench Mark evaluation. It is prospective. (ii) Concurrent Evaluation- This is exercised at the stage of project has been in operation for a certain periods. This type of evaluation is also called as on- going or midterm evaluation. It helps to identify the short fall or pit falls of the project and to suggest the remedial measures to the implementing agency.

NSOU ? MSW-IV 101 (iii) Post Term Evaluation (Ex Post facto)- After the project has been completed in order to assess the achievement of the objectives, this type of evaluation is conducted which influence the impact of the project so far been created to its totality. It is retrospective. 7.15.5 Methods of Monitoring and Evaluation Monitoring and evaluation can be done by the internal support staff having adequate knowledge and skills required for it or it can be done taking help of the experts of outside agencies. Different methods involved with the monitoring and evaluation are as follows. ? Identification of units of the project during the planning and implementation need to be done so that different units involved with the project may be well shorted out for monitoring. ? Information network may be taken into consideration so that communication gap, work and achievement of the project are given due importance for monitoring. ? Study of performance need to be done with professional competency to assess the performance of staff, requirement of future staff position as well as listing out the excessive manpower in an organisation during the course of programme implementation. ? Developing proforma is also an important method to keep every unit, staff, beneficiaries and operational areas well tie up with the monitoring mechanism. ? Meeting/seminar may be arranged from time to time to share the feedback collected from monitoring to the decision making point of the organisation so as to transmit the decision to different decision making points. ? Determining the periodicity also needs to be taken into consideration for smooth operation of the monitoring in different timeframe. The system of reporting from time to time is captured through this mechanism. ? Report writing is an important tools for proper segmentation of what is monitored and what are different feedbacks received from different corner of the organisations. Also, analysing report may be made following suitable methods of reporting the monitoring work.

102 NSOU ? MSW-IV 7.16 Record Keeping 7.16.1 Concept of Record Keeping Record means keeping something in visible or in evidence which is asset to any individual and organisation settings. It is a persistent representation of activities created by someone, participants of the concerned activities or observers. A record is a visible state of information, facts whether it is in printed form, on file and electronic means or a book, a plan, a map, a drawing, a pictorial, a graphic work, a film, a sound recording and any other documentary materials. International Standard Organisation (ISO) has given standard definition 'a record as recorded information created, received, and maintained as evidence by an organisation or by person in pursuance of legal obligation or in transaction of business.' 7.16.2 Elements of Record Keeping In case of community organisation practice, record keeping usually observed to have the following elements. In field work situation with community based organisation we keep records and write on- (i) Responses of the individual with others in the community work (ii) Background and type of participants in various programmes (iii) Acceptance and rejection of ideas, knowledge and opinions of the community people (iv) Community organisation and its helping role (v) Relationship between different groups and communities in agency settings (vi) Growth and change of individual life in community work practice (vii) Physical, financial and other contribution of the people in different programmes (viii) Fund utilised and nature of benefits received by the communities (ix) Nature and types of difficulties faced in programmes or in any such activity (x) Type of data collection on various facts and issues of community interests.

NSOU ? MSW-IV 103 7.16.3 Types of Record Keeping The information, facts and field level data whether it is in printed form, on file and electronic means are generally classified in three different categories. Such as, statistical records, process records and programme records. In brief description we may narrate them individually herewith as follows. (i) Statistical record- it is a document prepared with statistical data sheet mainly the numerical records in terms of number of beneficiaries, age, status of education, caste, occupation, number of participants, financial status etc. are kept as statistical records in community organisation practice. (ii) Process record- chronological narrative write up of the community organisation such as basic information about the situation, facts and circumstances took place in the community life are kept in this types of record. (iii) Programme record- in this type of record details are given about what types of people are involved in different programmes, their baseline condition, training, meeting, workshop, target group, inputs, outputs and others pertaining to particular programmes are kept. Besides, there are audio-visual records, electronic device based live documentation as part of records keeping in organisational set up which are used in social work practice particularly in practice of community organisation. 7.16.4 Importance of Record Keeping Record keeping is very important practice in every development work undertaken by community based organisations. It is in the context of that - (i) It helps the worker to develop skills as required from time to time in working with the community. (ii) In every type of record, an idea will be developed about the community, groups and their different situations for better understanding about them. (iii) It provides the extent of changes occurred among the community people since their involvement have been maintained in day to day records with timely updating.

104 NSOU ? MSW-IV (iv) Provides feedback and elements of monitoring, supervision and evaluation done earlier. (v) Give sources of information for future planning of action. (vi) Provides historical information and facts to new entrants of the organisations. (vii) Helps sharing necessary information to authority of the organisation, funding agencies and other supportive organisations. (viii) Resolves difficulties with the help of records maintained previously on similar incidents. (ix) Helps to carry out research, evaluation study and further improvement of records of the organisations. (x) In each training, workshop and seminar it helps absentees to follow the discussion and progress. (xi) Helps for staff development, fund generation and organisational development in its desired direction.

7.16.5 Basic Principles of Record Keeping As a part of social work practice, record keeping in community organisation practice, also have some principles which need to be taken care while keeping records for community work. These are (i) Principle of confidentiality (ii) Principle of flexibility (iii) Principle of selection of records to be kept as per priority (iv) Principle of lucidity/readability of the records (v) Principle of workers' acceptance of records 7.17 Summary To carry out effective community organisation, must work in a team, for which proper Networking is extremely important. Constant supervision, Monitoring, conduction & Record keeping & follow-up will further enhance the quality of work.

NSOU ? MSW-IV 105 7.18 Exercise (1) Differentiate between Supervision & Monitoring (2) What are the basic principles of Record keeping. (3) What are the different types of Evolution. (4) Discuss the concept of Networking write down the characteristics of Networking. (5) What are the steps Netowrking (6) What are the elements of Record keeping. (7) What are keeping the components of Monitoring & Evolution. 7.19 References <https://www.emarld.com> E. 106 NSOU ? MSW-IV UNIT- 8 Advocacy Structure 8.1 Objectives 8.2 Introduction 8.3 Concept of Advocacy 8.4 Types of Advocacy 8.5 Principles of Advocacy 8.6 Techniques/Method of Advocacy 8.7 Summary 8.8 Exercise 8.9 Reference 8.1 Objectives After completion of the workbook, participants will be able to: – Understand the advocacy and its characteristics in community organisation process – Types of advocacy and its importance – Principles of advocacy – Tools and techniques of advocacy 8.2 Introduction – Learners having interest and exposure in learning about community and its network – Learners having graduate and above level education may apply their skill to exercise this.

NSOU ? MSW-IV 107 8.3 Concept of Advocacy Advocacy can be defined in the context of practical use of knowledge for the purpose of bringing out social changes. These can be directed to government policies, laws, procedures, or sometimes to ourselves so that it is therefore an act of supporting an issue that violates or deprives the masses and persuading the decision makers on how to act in order to support that issue. It is about motivating and mobilizing the community. It starts with a small group of people who share concerns about a specific problem and are willing to devote time, their expertise and resources available to reach the desired change. It has been observed that advocacy can help community based organization achieve its development goals.

108 NSOU ? MSW-IV Basic purpose of advocacy may be put down in the following manner ? improving public services such as transportation, information, etc. ? education ? accessibility ? development of community based services ? public health ? greater accountability of elected representatives of local and national authorities, ? decentralization of government decision-making process and public services, ? new laws that better protect the civil rights associations, including the legal recognition and other civil society organizations. It is generally said that drawing attention to an important issue and helping decision- makers to make its solution so that accountability and transparency of local governments and public services/institutions are ensured. 8.4 Types of Advocacy Advocacy can be divided into three types of activities, including: Representation: to speak on their own or in other's name in public Mobilization: to encourage others to speak in public with you Empowerment: to let others know they have the right to speak in public and have the right to be heard. 8.5 Principles of Advocacy Australian Psychiatrist Christine Brown has defined eleven principles of advocacy. Those are as follows. Principle of Clarity of purpose: There should have enough scope to make clarity of purpose of advocacy among the participants and among the advocates.

NSOU ? MSW-IV 109 Principle of independence: Exercising right to speak independently in public or in the in-house discussion and to motivate people on the issues of public interests so as to undertake appropriate actions. Principle of confidentiality: The advocates should maintain confidentiality in every steps of promoting advocacy towards bringing out social change through necessary policy decisions. Principle of person centric approach: This should be kept in mind that for generating mass mobilisation, individual approach or the person centric approach may be adopted first which may be group and community centric in later phases. Principle of empowerment: During the process of advocacy both the advocates and the people will be able to get clear understanding about the issues, agents, administrative tools and policy related points of actions for which their empowerment will be a part during the course of action. Principle of equal opportunity: In every stages of public awareness, opinion generation and leadership development, the principle of equal opportunity for all may be followed. Principle of accountability: Who are involved, how the advocates are working and what are the methodologies are being applied need to be accountable as these are for larger interest of the community.

110 NSOU ? MSW-IV Principle of accessibility: Accessibility in terms of information, resources and services required for successful advocacy of a particular policy formulation. Principle of purposeful complaint making: There are different types of sub issues and units associated in the matter of advocacy for a particular issue for which several complaints may be required to lodge. These are to be properly sorted out in terms of their purposes and therein after necessary complaints may be made to respective bodies. Principle of supporting advocates: Advocates are not alone moving against the issue for which mass mobilisation and public support need to be generated to ensure that the issue is concerned of common masses. Principle of safeguarding: While working for a larger interest or on such issues having concerned of greater number of community people, it is, therefore, possible that in some cases there may be incidents of fear of threat and challenges. Necessary mechanism should be planned well in advance for safeguarding the advocates as well as the leaders in the process of working. 8.6 Techniques/Method of Advocacy We have observed that there are two main methods of advocacy applied in community organisation practice, such as : Lobbying or direct communication: involves influencing through direct, private communications with decision-makers. Lobbying, particularly through personal meetings with decision-makers, can be a powerful and cost-effective advocacy tool. Campaigning: involves speaking publicly on an issue with a view to generate public opinion and using a variety of techniques for it. Such as, chain e-mail or letter, opinion pieces and letters to the editor in newspapers, newsletters, celebrity endorsements, media partnerships with newspapers, journalists and film-makers, web-based bulletins and online discussions, public events, large-scale advertising campaigns. The application of other suitable method depends on the issue/problem specified, target audience, the message to be conveyed, the resources available in the community. However, the other methods may be very useful which include- i. Letter Writing: It is important method through which clear message is put forward to the notice of respective authority and to keep them aware about

NSOU ? MSW-IV 111 the situation, to seek their support and to request them to meet the concerned people. ii. Education: Making people educated to such an extent that they can understand the genesis of the issues or facts for which their support, participation and formation of pressure group for suitable policy making or for change in administrative directions are taken place. iii. Legal Advocacy: Legal advocacy means the provisions of legal support system are available to the people generating mass movement with the help of community leaders, better to say the advocates so that necessary policy documents are made maintaining close proximity to legal framework. iv. Communications: The method of communication is commonly used in community development programmes. This method helps the advocates or the community leaders disseminate information, decision, direction, orders, message, etc., from one point to another and ensure receipt of necessary feedback to its source. v. Symbolic Acts: This method is also very effective to build up awareness among the people who are just literates or illiterates. Role playing, street corner, road shows are some kind of symbolic actions generally followed in the advocacy at community level work. vi. Negotiations: In case of conflict arises out, sustained and disputes occurred among the leaders in community advocacy, this method comes to a fruitful resolution. There are some experts like counsellor, middleman or the negotiator who are asked to work for this and the advocates keep close notice on them for resolutions on the facts. vii. Demonstrations: It is such a method through which advocates can arrange workshop or seminar and demonstration on successful advocacy may be a method of discussion through case studies and documentation of live events. viii. Boycotts: It is applied only then since when other formal methods fail to yield desired success and the policy makers remain hands off on the facts / issues for which mass mobilisation has been occurred. Boycotts are very effective for activation of service delivery system as felt necessary by the policy makers.

112 NSOU ? MSW-IV ix. Model Programs: In the model programme method, community people are brought under various services delivered through it and the advocates try to sensitize the people to be a part and parcel of advocacy. x. Fact Finding Forums: Creating fact finding forum is also an important method through which time to time study can be conducted and necessary progress of advocacy along with shortfalls can be sorted out. xi. Demystifying: This method helps to understand any difficult issues into easier one which are essential as there is involvement of different backgrounds of community people. In this method audio-visual systems are used to mobilise the community. 8.7 Summary Advocacy is an important instrument where by we may mobilize and motivate an entire community to bring about a constructive change. People may vouch for their legitimate rights through Proper Advocacy. It may be done to even reach out the policy makers to review and over change the policies for interest of the society. 8.8 Exercise 1. Define the term 'Advocacy, what are the various kind of Advocacy. 2. Give an account of the methods of Advocacy. 3. What are the basic Principles of Advocacy. 4. Write short notes on – Campaigning – Advocacy for mobilization of the community. 8.9 Reference Anna Krausova, The network Analysis in Social Work, Department of Social Work, Medico-Social Faculty, University of Ostrava, www.oxford.academia.edu/annakraus

114 NSOU ? MSW-IV Unit- 9 Communication Structure 9.1 Objective 9.2 Introduction 9.3 Concept of Communication 9.4 Variables 9.5 Types of Communication 9.6 Importance of Communication 9.7 Determinants 9.8 Forms of Communication 9.9 Principles of Communication 9.10 Methods of Communication 9.11 Barriers of Communication 9.12 Preconditions to effective communication 9.13 Skills and Qualities of Effective Communicator 9.14 Summary 9.15 Exercise 9.16 Reference 9.1 Objective The basic objective of the present unit is to explain the strategies in community organization practice so that learners get the benefit of knowing the basic of its different issues such as communication, community participation, social Action, Sarvodaya movement and Leadership etc, in the context of community organization. particularly, its

NSOU ? MSW-IV 115 objective is to help them to know the concept of communication, types, methods etc. so that they can take initiative to make themselves good communicator, which is a must for them. 9.2 Introduction The learners of this programme are mostly in their youthhood. Everyday they interact with many people – known or unknown, purposefully or without any purpose. In the process they gain practical knowledge of various types which may be good or bad. This is one way of learning. There are few other ways of learning of which reading text books is one. For social work students such reading materials are prepared with a view to help them to learn a good number of topics which are very much important for would be Social Workers. The topics are carefully dealt so that learners all over the State or even outside the state can be equally benefitted. Keeping the all possible odds in mind, it is planned to cover even the minor details of the unit so that learners feel it truly useful. 9.3 Concept of Communication Communication is a must in case of all living beings. In case of human beings it is one of the important factors based on which human society survives and progresses. By communication we mean : – flow of information – exchange of ideas and feelings – sharing of data, information, views, sentiments etc. – effecting an interchange of understanding between two or more people (Howland) – those processes by which people influence one another. (Warrar Weaver) – exchange of information, knowledge, ideas or feelings taking place between two individuals. (Dhama and Bhatnagar)

116 NSOU ? MSW-IV – the transmission of information, ideas, emotions from one person or group to another. (Hogman) – attempt to affect a transfer between minds. – the transfer of commonly meaningful information. Thus, it can be summarised as transfer of commonly meaningful information by a person or group to another person or group or community or even the larger society. It has been derived from the Latin word 'Communis' which means to make common. It is essentially a continuous process and a two way traffic. It varies on the basis of mental make up, outlook, experience, situation and thinking process etc. In case of community organisation, "Communication is understood as a means of exchanging messages. Democratic processes (community organization) are evolved along with the objectives of developing understanding among and between the people through exchanges. In community organisation, need meeting processes are built through communication. Building relations with community people, Strengthening interrelationship among community people, making people aware of their own needs are possible through appropriate use of communication methods." – Dr. Mrs. Banmala 9.4 Variables There are four variables in communication. They are : (i) Sender, which means the person concerned through whom the information generates or who shares the ideas, information etc. (ii) Receiver, which means the person or persons receiving the information. (iii) Message, facts, information, which means the issue that is being shared, and (iv) Method, which means the way being followed to pass the information. All the four variables are equally important in the exercise of communication. If any one of them is missing, communication can not be made or it will remain highly ineffective.

NSOU ? MSW-IV 117 9.5 Types of Communication Generally communication is of the following types. A. Formal and informal communication Formal communication is one in which one communicates with other formally. They may or may not know each other but for some reason need of communication arises and to fulfill that need one party communicates to the other party mostly in written form. For example, an individual sends an application for a position in an office and he receives an interview letter against that is a formal communication from both ends. On the other hand, informal communication is one in which a person communicates something informally without maintaining any record of that : For example, two persons met each other while inspecting the level of growth of their crops, exchange the radio news that on that particular day heavy rainfall is expected. This is informal communication and it has no official status. B. Upward, Downward and Horizontal Upward communication is that when a junior / subordinate / dependant communicates anything to his boss/senior/parents etc. Upward communication occurs when the person who is communicating and the person to whom he is communicating are not of same status. For example, when a student makes any communication to his Principal or a common citizen makes an application to the rationing authority, slum dwellers make a prayer to their Municipal Chairman, a girl requests her father to provide some books to her is upward communication. In absence of appropriate upward communication, downward communication may also look ineffective. Downward communication is just opposite to upward communication. It may take several forms and relate to information / instructions on various issues. In an office it defines the parameter within which an employee functions. In organizational set up it involves ideology of the organization. This can further be explained by using some examples such as : When a Headmaster instructs his students to take part in a cleanliness drive, an Army Major directs a group of soldiers to move forward, a doctor advises his patient

118 NSOU ? MSW-IV to take full rest, an Engineer instructs his labourers to do the construction work in a particular manner or a chief secretary sends order to the district magistrates to maintain law & order properly – all these are downward communication where the persons to whom communication is made will have to obey the same. Here the communicators are in superior position, formally or informally. C. Horizontal : Horizontal communication is that which takes place between the people of somewhat same status. For example, the communication that takes places between the co- passangers, viewers of a cultural programme, discussion on political and other issues at a tea stall, propaganda by the members of a trade union and so on are horizontal communication. Besides, there are one way and two way communication. When information or message comes from one person or one side and the other person(s) / side plays the role of receiptient then it is called as one way communication. But when both the persons / sides take part in the interaction then that is two-way communication. And if many people take part in the process then that is many way communication. In any community all types of communication are liable to take place based on the situation. 9.6 Importance of Communication Communication is a must in humanlife. Even the animals, birds and other creatures also communicate in their own way. Human society can not survive without communication. One just can not think of a situation in a human society where communication does not exist. In the context of community organization and organization building etc., proper communication is a must. To form and strengthen the community based institutions, to diagnos the basic problems of the community trace out the resources available, making plan of action, initiating actions, leadership development, coordinating with relevant agencies, rendering monitoring and followup services, keeping records of the entire process etc. continuous communication is necessary, creating awareness among the people, creating motivation in them, integrating all sections of the community people also largely depend on adequate amount of communication. Thus communication is immensely important in the process of community organization.

NSOU ? MSW-IV 119 9.7 Determinants There are several determinants of effective communication, such as : ? Age of the communicator and receiver ? Gender of the communicator ? Caste and creed ? Educational background ? Level of general awareness ? Experience of communicating things ? Emotional status ? Sense of humour ? Interrelationship ? Socio-economic status ? Mental balance ? Presence of mind ? Social, political, physical condition. All the above mentioned determinants are important in making effective communication. 9.8 Forms of Communication Communication has various forms such as : ? Written (newspaper, book, magazines, letter, office order, forms, notices etc). ? Oral or vertual (face to face interaction between two or more persons) ? Pictorial (charts, diagrams, groups, signs etc)

120 NSOU ? MSW-IV ? Physical expression (gesture, smile, angerness, willingness, lappiness, drowsy, tiredness etc. These are bodily reactions and reflex actions) ? Electronic media (T.V., radio, telephone, record player, film etc.) ? Physical contact (sand shaking, patting on the back, pushing, kissing, touching, embracing, slapping, touching foot etc). All the above mentioned forms are used in human society. However, all are not useful to every individual. For example, an illiterate person can not use the written form of communication, a deaf & dumb can not use oral form of communication, a person suffering from object poverty has very less chance of using electronic media to communicate or to be communicated. Besides the above forms, communication can be done by observing silence also. According to quantum theory, 'even if we do not talk, even if we do not look at each other, you affect me, I affect you.' So, silence can also be termed as one of the forms of communication. 9.9 Principles of Communication Communicators should be guided by certain principles such as (i) Understand yourself which means the communicators should have knowledge about self. They should have proper idea about their areas of strength and weaknesses based on which they can decides the issue on which they can speak, methods that they can follow etc. Suppose a person who does not feel comfortable to face a big gathering he should avoid communicating there before he gains courage to do so. (ii) Maintaining intellectual honesty is another important principle of communication. One should communicate based on the theory 'What I say I mean'. (iii) Demonstrating seriousness is also one of the principles of communication. The communicator should remain careful about 'it matters what I say'. If seriousness is not there, communication in the true sense of the term is missing. (iv) It should be participatory and democratic. Efforts should be made not to make it one way traffic. Others may also have something to share, something to

NSOU ? MSW-IV 121 debate or something to ask for better clarification. They should also get the opportunity to do so. (v) Not abruptly disapproving the views or statements of others since that hurts the persons concerned. In such a situation communication does not reach to the person/persons concerned. (vi) Issue of communication should be of immediate importance. If it is not so, none will attach importance to it and thus communication will remain unsuccessful. A community organizer or would be social worker needs to keep these basic principles of communication in mind while communicating to others or helping community people to become effective communicator. 9.10 Methods of Communication Using proper method of communication significantly contributes to achieve the objective of community organization. It also depends on the manner in which the method are used and the skill with which ideas, views, information are exchanged. The methods of communication are principally the followings : (i) Lecture method in which community leader or community organizer will formally speak out the ideas / information etc. before a gathering of community members. (ii) Organising debate sessions on various relevant issues involving thereby the community members. (iii) Organising conference wherein various stakcholders would be invited to share their views. (iv) Meeting is another important method that should be used in the process of community organisation with a view ot achieve the objectives. (v) making people of the community inviolved in formal and informal dialogue as and when required. (vi) Songs are also very important instrument for communication. If this can be used in a planned manner it can produce effective result.

122 NSOU ? MSW-IV (vii) Using audio-visual aids of various kinds can be another method of communication. To use this method there should be a person who can handle the same properly. (viii) Organising seminar is also a method of communication. Through it a large number of people can be benefitted at a time by listening to the views of various experts on the subject. (ix) Street corner play is also known as one of the methods of communication. A professional person/group of persons can be hired to do the job. Through this method message can reach to anybody who pass through the road during that period. (x) Role play method can also be used to communicate ideas. The person giving the performance should have knowledge on the subject and skill of acting. (xi) Drama, specially written centering specific issues, can be another method of communication. (xii) Art on roadside wall, which gives specific messages is another important method of communication. (xiii) Group discussion is also very useful method of communication. Based on this method community participation can be enhanced, problems like casteism and alcoholism can be controlled, group conflicts can be arrested. (xiv) Story telling, particularly success stories of any community development initiative is also a good method of communication in the context of community organization. In the modern society communication quickly and effectively reaches through news papers, journals, magazines, advertisements etc. All these have impact on different degrees. Communities are also intelligent enough to develop their own method of communication. All the above mentioned methods are equally important but they need to be properly used. Since use of method depends on the social, economic, cultural background of the communities concerned, it is necessary to make the choice properly. Use of wrong method may not produce proper result, rather it may invite problems of various nature.

NSOU ? MSW-IV 123 9.11 Barriers of Communication Communication, as we have already said, is not an easy task to accomplish. Effective communication is hampered because of various reasons concerning the sender, receiver, environment, methods used etc. Those are as below : A. Sender Centric barriers : Sender centric barriers are of various nature such as : – he/she is not adequately knowledgeable about the subject on which he/she is talking. – he/she is not serious enough to deal the issue properly. – he/she does not have idea about the background of the receiver. – he/she picks the wrong time and place for communication. – he/she shares ideas in a wrong forum. – he/she does not maintain intellectual honesty. – he/she abruptly disapproves the views of receiver. – he/she does not make it democratic. – he/she uses difficult and technical languages. – he/she uses improper method. – he/she is arrogant and hot headed. – he/she speaks even if listeners are not ready to listen – he/she is not a person of pleasing personality. These are certain factors related to the sender of the ideas/information etc. to any person – known or unknown. These factors create serious problems in communication. B. Receiver Centric Barriers : Several issues relating to the receiver can also create problem in smooth communication such as :

124 NSOU ? MSW-IV – the receiver, at the point of communication, can remain preoccupied – physically and mentally as a result of which he/she fails to concentrate. – he/she is not interested in the message that is being passed. – he/she is having emotion an problem. – because of some reason he/she is mentally disturbed. – he/she is distracted. – he/she pretends to understand when he/she does not. – he/she does not feel comfortable with the communicator. C. Other factors : There are some otehr factors which are equally responsible for non-effective communication. They are : – Socio-economic situation of the person, group, community. – Traditional values, customs and superstition of the people concerned. – Pressure of work – Physical illness – Status and charisma of the communicator or the receiver. – Hidden agenda of communicator, if any. – Improper time and place etc. 9.12 Preconditions to effective communication The objectives of community organisation are achieved if communication is made effectively. Naturally it is desirable that the community organiser and community leaders make planned and sincere effort to communicate ideas and information to the community fruitfully. The factors that play important roles in insuring effective communication are the followings : (i) The communicator needs to have adequate knowledge on the subject concerned. He/She can share the idea effectively only if his/her knowledge on the subject is not poor. Knowledge helps a lot to communicate convincingly,

NSOU ? MSW-IV 125 skillfully and confidentially. This naturally suggests the communicator to make effort to enrich his/her knowledge bases on the issues he wants to discuss. (ii) He/she should be open-minded regarding the issues and sub-issues of discussion. If there is any rigidity on this, the communication is lost. If the communicator thinks that his/her decision is final and there is no reason to bring any modification in that, then communication remains ineffective. (iii) There can be some sensitive issues to deal with. In such cases, the communication is to be made very carefully so that no body feels hurt, injured and insulted. he/she should be very careful while communicating something on sensitive issues. (iv) He/she should do some home work to deal with the subject effectively. (v) Communication is to be made very clearly and without any ambiguity. If the people to whom the information is given become confused then the objective of communication remains unfulfilled. Hence one will have to express the ideas/ information very clearly. (vi) The communicator needs to have adequate idea about the overall background of the people to whom and with whom he is communicating. Knowledge base, awareness level, attitude, outlook, receiving capacity etc. are likely to differ from community to community, group to group and person to person. (vii) While communicating the communicator needs to keep it in mind that the issue has relevance to the community. If not, people will show no interest in the matter. (viii) Communication should be made according to the level of the receiver. Coming down or going up to the level of receiver is a must to make communication effective. (ix) Effective communication also demands a proper place, environment and time. Wisely choosing a proper place, time and condition immensely helps in communicating and sharing information and ideas. (x) Tossing around technical terms is to be avoided to the extent it is possible. People in general do not prefer to listen technical terms which are not that popular to them.

126 NSOU ? MSW-IV (xi) Communicator must not make any effort to give many ideas at a time. This is totally an unwanted plan and execution. (xii) For making the communication effective the communicator will have to concentrate on the issue. This is a special skill which he/she should develop properly. In many cases the communicator goes out of context and he/she fails to feel that and in the process the very objective of communication remains unfulfilled. So one should remain careful about this tendency. (xiii) The communicator should make effort to make the communication process easy interesting and encouraging. The way of passing information, giving ideas, using proper words and examples, sharing quotations, using proverbs, narrating something relevant and maintaining pleasant personality are some important tips that help a communication to become effective. (xiv) The communicator should follow a natural way of expression. He should not make it artificial since anything artificial does not produce positive results. (xv) The communicator should be a good listener. It makes the communication two way traffic and democratic. Besides, it helps the communicator to have idea about the outlook and attitude of the otherside. And it helps in creating an environment where every one would feel that he and his opinions are honoured. (xvi) The length of communication period should be reasonable. If it is very lengthy the receiver would be bored and disgusted. In that case he/she may not give proper attention. On the otherhand, if it is very brief the message may not reach to them properly. Therefore, the communicator should remain careful about the time frame while sharing any idea/information/data. (xvii) Observing and looking for feedback is yet another factor responsible for effective communication. If any gaps are marked, necessary modification in the process can be made. (xviii) The communicator should remain careful that he is properly audible. Keeping eye contact is also equally important. (xix) The communicator should have capacity to integrate different pieces of information properly. (xx) Deciding about the suitable medium is also important to make the communication effective.

NSOU ? MSW-IV 127 (xxi) Demonstrating assertiveness or firmness as well as sense of responsibility also helps in effective communication. (xxii) Communication method should be chosen properly based on the type of community to whom communication is to be made. (xxiii) The communicator should examine the actual purpose of communication. (xxiv) He/she should consider the total physical and human setting. (xxv) Consult others, wherever necessary, in planning communication. (xxvi) The communicator should keep it in mind that he/she is communicating for today as well as for tomorrow. (xxvii) He/she should remain sure that his/her actions support his/her communication. If the points mentioned above are taken care of by communicator, the process of communication would be smooth and effective. It is therefore essential that each communicator in the setting of community organization needs to attach proper importance to them.

9.13 Skills and Qualities of Effective Communicator Communication is a difficult job to do. To do it effectively one needs to have certain skills and qualities which are as below :

- (i) He/she should have people facing quality. It needs steadiness. If fear psychosis is developed in the mind of communicator, he/she will remain ineffective. So, having mental strength to face people is very necessary. Through continuous practice one can develop this quality.
- (ii) He should also have some quality of using healthy jokes, appropriate proverbs, varieties of relevant examples to make the communication attractive. This also demands a special quality.
- (iii) The communicator should be skilled in using various methods of communication, traditional and modern. Weakness in this may create serious problem in communicating anything.

128 NSOU ? MSW-IV (iv) The communicator should have strong presence of mind. In absence of the same none can make himself/herself a successful communicator. (v) The communicator needs to be adequately skilled in language since weakness in language creates barrier in the proper expression of ideas and information. Thus, command over language is considered as one of the most essential qualities of a communicator. (vi) He/she should have positive and constructive outlook. This quality of a communicator makes all the difference in making the communication effective. (vii) The communicator should also have the quality of being impartial and unbiased. Needless to say that without this quality none can be a successful communicator. (viii) A communicator must not allow his/her spirit to be dampened. Success and failures are there in life but he/she should have the guts to face and digest failures and make effort to overcome the weaknesses. (ix) He/she should have the quality of being good listener. Through practice only this can be developed. (x) He/she should have the capacity of making good beginning, purposeful middle and nice ending of communication.

9.14 Summary Exchange of necessary & appropriate information is pre-requisite for any democratic process. While working in a community therefore we must be very careful when we share information, the people must know about it with full clarity and they may also get their doubts clear through proper communication.

9.15 Exercises

1. Define the term 'Communication'. What is its importance ?
2. Enumerate the types of communication and explain each one of them.
3. What are the variables of communication ?
4. Give an estimate of principal determinants of communication.

NSOU ? MSW-IV 129

5. Communication has various forms. What are those?
6. Examine the principles of communication. Why one should follow these principles while communicating any idea/information etc?
7. Give an account of the methods of communication that are generally used.
8. What are the principal barriers of communication?
9. Analyse the factors responsible for making communication effective.
10. Communicator should have certain skills and qualities to communicate effectively. What are those ?

II. Analyse the following terms :

- (i) Variables
- (ii) Sender
- (iii) Formal Communication
- (iv) Downward Communication
- (v) Physical expression
- (vi) Intellectual honesty
- (vii) Stake holders
- (viii) Role play
- (ix) Barriers
- (x) Pleasing personality
- (xi) Sensitive issues
- (xii) Two way traffic
- (xiii) Outlook
- (xiv) Presence of mind
- (xv) Assertiveness
- (xvi) Democratic process
- (xvii) Technical terms
- (xviii) Receiving capacity

130 NSOU ? MSW-IV (xix) Fear Psychosis (xx) Language skill

III. Fill in the gaps

- (i) Communication is a process in which more than _____ person is involved.
- (ii) Communication is _____ of ideas and information.
- (iii) Receiver means the _____ receiving the information.
- (iv) Method is the way to _____ the information.
- (v) Downward communication is just _____ upward communication.
- (vi) An _____ person can not use the written form of communication.
- (vii) Communication should be made according to the _____ of receiver.
- (viii) Anything artificial does not _____ positive results.
- (ix) The communicator should remain _____ about the time frame.
- (x) The Communicator should have _____ personality.

IV. Match the followings

- (i) Communication means – Sending signals – Sharing information – Self talking
- (ii) Receiver is one who – Shares idea – Sends message – Receive the information
- (iii) Method means – the principles – the forms – the process

NSOU ? MSW-IV 131 (iv) Horizontal Communication means – Communication with boss – Communication with subordinate – Communication with a person of same status (v) Motivation means – Strong eagerness – drive – determination – all of these 9.16

132 NSOU ? MSW-IV UNIT- 10 Important Movements Structure 10.1 Objective 10.2 Introduction 10.3 Concept 10.4 Philosophy 10.5 Characteristic features 10.6 Objectives or goals 10.7 Major elements 10.8 Development or Emergence 10.9 Methods 10.10 Fundamental Principles 10.11 Programmes for Sarvodaya 10.12 Sarvodaya and Social Work 10.13 Sarvodaya vis-a-vis Community Organisation 10.14 Essential Qualities of a Sarvodaya Worker 10.15 Concept of Bhoodan 10.16 Genesis 10.17 Philosophy 10.18 Objective 10.19 Methods 10.20 Impact 10.21 Limitations 10.22 Gramdan 10.23 Concept 10.24 History 10.25 Objectives

NSOU ? MSW-IV 133 10.26 Process 10.27 Impact 10.28 Weaknesses 10.29 Summary 10.30 Review Questions 10.31 Reference 10.1 Objective The objective of the present unit is to help the students of Social Work Master Degree course to have idea about the concept of Sarvodaya – Bhoodan – Gramdan, their importance in the context of bettering the community life, their objectives & methods, impact created and limitations etc. This unit has been so planned that students will enrich their idea about the basic philosophy of Sarvodaya – Bhoodan – Gramdan as well as their link with social work in general and community organisation in particular. 10.2 Introduction This subunit is an issue that needs to be known by the community development agencies and community organisation workers. Sarvodaya is a unique movement for the literacy of all sections of population. So, knowing about the details of it is absolutely necessary for any agency or worker dealing with the community organisation initiatives. In this backdrop the present unit has been developed so that it can meet that need of the students who are going to be the community organizers. Thus the unit is expected to make them knowledgeable, skilled and competent to handle the job effectively in future. 10.3 Concept The word Sarvodaya has been derived from two Sanskrit words – ‘Sarva’ and ‘uday’, which means ‘welfare of all’ or ‘rise of all’, or ‘progress of all’ or ‘universal upliftment’. It is the ‘greatest good of all’. It seeks happiness of all. It is ‘Social upliftment, economic emancipation and moral resurrection of all’. It is a process by which socially and economically deprived individuals or groups can be steered towards development. Sarvodaya is ‘an ideal of vision and a movement in Gandhian

134 NSOU ? MSW-IV philosophy’. And it ‘demands commitment of its followers to the care and the uplift of humanity’. A person may be a man or woman, educated or illiterate, a member of upper caste or lower caste, a resident of rural, tribal or urban area he has every right to progress in all respects. So, Sarvodaya is to ensure that everyone has balanced diet, a proper house to live in, adequate facilities for education, opportunity of getting medical services and so on. Everyone must ‘have enough for his own needs’. Sarvodaya is realization of true democracy and not making any distinction between (i) Community and Community (ii) Caste and out caste (iii) intellectual and physical labour. In a Sarvodaya environment use of liquor and opium is also forbidden and swadeshi will be considered as rule of life. It is based on Gandhiji’s realization that (i) Development of all is possible if others are developed (ii) All kinds of development efforts should be of some importance (iii) Each individual should play his role to develop the society. 10.4 Philosophy The philosophy of Sarvodaya is based on the philosophy of life and action of Gandhiji. People, as Gandhiji opined, are basically good. Such goodness is reflected in truthfulness, courage, sacrificing attitude, non-violence etc. Nevertheless many of them do not get opportunity of living a meaningful life. In this backdrop the working philosophy of Sarvodaya is solving individual and social problems by using the principles of non-violence and truth. For this one must have “living faith in God.” It is based on various constructive programmes also which are appropriate to the area concerned for making the communities self-propelling and self-reliant. The work of Sarvodaya is viewed as an offering to the God. Its philosophy is ‘progress together without collision of interest’. It is also to make attempt to reorient human mind to reconstruct human society. But consumerism, unhealthy competition, lack of safety, mistrust have eaten away the goodness of people. Values are also eroding day by day. People are facing various kinds of exploitation and becoming prey of administrative biasness. No matter whether the country is ruled by this or that party desired results. Two sayings of Gita – ‘he who eats without putting labour eats stolen food’ and ‘needs of body must be supplied by the body’ are also considered as philosophy of Sarvodaya. Gandhiji also emphasised that Standard of life is fundamental, not the standard of living.

NSOU ? MSW-IV 135 Gandhiji’s philosophy behind Sarvodaya thus was based on dignity and worth of each individual. He firmly believed in dignity of labour as well as right of all to earn a livelihood. He never supported the idea of imposing views on others. Rather he demonstrated love and understanding for the people. His constructive programme not only emphasised on the betterment of all but also with all aspects of life and living. The philosophy of Sarvodaya which was imbibed by Gandhiji from John Ruskin’s ‘unto the last’, thus rests upon the followings. (i) An individual can progress only when he thinks that progress of others is an important parameter in determining his progress and welfare. (ii) Every activity carried out by any individual is equally important and of equal value. (iii) Every individual should fulfill his obligation to the society through his own labour. (iv) Special emphasis should be given on the welfare of the lowest and underprivileged such as Harijan, Women, destitute and rural folk. (v) It is also giving emphasis on ‘Swarajya’ and ‘Lokaniti’ (vi) This philosophy is based on dignity and worth of individuals. Nothing should be by anybody on anybody. (vii) People should remain satisfied with minimum wants and simple food and clothes. (viii) People should make it a habit to adopt just means to achieve anything. (ix) All have capacity which needs to be harnessed and promoted. (x) People have basic knowledge about their situation and the way to manage their life properly if necessary resources are provided. 10.5 Characteristic features The basic characteristics of Sarvodaya movement are the followings : (i) Dignity of labour : Every individual should remain engaged in some kind of work. And a farmer or a lawyer, a barber or a public servant – work of all have dignity.

136 NSOU ? MSW-IV (ii) Active participation : To bring essential changes in the society active involvement of the people is a must. Since life should be led meaningfully nobody should remain idle. (iii) Non-violence : People should demonstrate. 'Ahimsa' in their everyday life. This will help to create an environment of positive development. (iv) Adherence to truth : People must be truthful. They should not have any hidden agenda and must not speak a lie. (v) Comprehensive programme : Its another characteristics is that it believes in initiating comprehensive nature of programme, which has universal significance for achieving desirable objectives. (vi) Swadeshi : It means using the home made goods and rejecting the foreign goods. All people should develop this habit. (vii) A strong spirit : Chastity, fearlessness, honesty and self sacrifice are the important elements of sarvodaya movement. (viii) Untouchability : Characteristics of Sarvodaya movement also includes stopping the practice of untouchability. Discrimination on the basis of caste should not be there. (ix) Respect for all religions : This is another important characteristics of Sarvodaya movement. It never considers any religion higher or lower in grade. All are equal. (x) Happiness of all : It firmly believes that none can be happy alone. Happiness can be achieved only through actions aiming at welfare of all. No one can enjoy happiness by himself. 10.6 Objectives or goals Sarvodaya movement has the following objectives : (i) To set up an ideal society together with decentralization of power from the hands of the people belonging to the higher strata of the society. (ii) To make it possible to establish a Society that is casteless and classless.

NSOU ? MSW-IV 137 (iii) To establish communal harmony by removing the communal feelings. (iv) To ensure economic inequality to all. Homeless, landless, wealthless people should be promoted to 'haves' level. (v) To give due emphasis on the welfare measures to be undertaken for the scheduled castes, scheduled tribes and other backward classes. Special initiative should be taken to promote their overall status. (vi) To see that self-supporting village communities are established. (vii) To establish gram Swaraj in real sense of the term, which means self- governance. (viii) To organise the students as well as youth groups to make themselves involved in various constructive activities for the welfare of all. (ix) To insist on duties also, not enjoying rights only. (x) To give emphasis on Lokniti than Rajniti. (xi) To stop exploitative practices. (xii) To promote spiritual development. (xiii) To promote sense of belongingness. (xiv) To develop Cottage & Village industries. (xv) To develop and use appropriate technology for meeting basic needs of life. (xvi) To give equal job opportunity and rights to female members of the society to empower them. (xvii) To form organisation of labour to generate employment. (xviii) To develop agriculture for making the economy self sufficient. (xix) To make people convinced to 'live in order to help others to live'. (xx) To ensure total and integrated life. (xxi) To promote the idea of trusteeship.

138 NSOU ? MSW-IV 10.7 Major elements Cetering the objectives or goals cited above the major elements of Sarvodaya movement are the followings : (i) Each member of the society has the right to get the taste of progress. (ii) Each one's capacity has to be developed so that he can fight out the problems and enjoy a better status. (iii) Society needs to be free from obstacles of various nature. (iv) Autocracy has to be stopped. (v) A process of heart changing has to be adopted since that has been considered by Gandhiji as the principal means to make the movement successful. (vi) Bhoodan, Gramdan and Gram Swaraj Should be considered as the other process of sarvodaya movement. 10.8 Development or Emergence It was developed by Gandhiji for social reconstruction. The rural reconstruction movement of Tagore and Gaekwad as well as Social Reform movement of Raja Rammohan Roy were transformed into a national movement by Gandhiji based on the principles of truth and non-violence. He believed that Sarvodaya Society is the alternative to the existing society of exploitation and unhealthy competition. Hence he worked for establishing Sarvodaya Society. He was inspired to work for Sarvodaya particularly after he read John Ruskin's book 'unto the last'. He felt that (i) individuals have capacities (ii) the same has to be harnessed and utilised for their own welfare, and (iii) by so doing overall scenario of the society would be changed towards positive. After Gandhiji's death a Sarvodaya Samiti was formed in 1948 to ensure that Sarvodaya movement continues. Gandhiji's foremost disciple Vinova Bhave by then was seriously involved in it. In 1951, under the leadership of him some landlords of Telengana donated some amount of their land to the landless people of the area. In 1963 initiative was taken to integrate Gramdan, Khadi and Shanti Sena as components of Sarvodaya movement.

NSOU ? MSW-IV 139 Vinovaji worked for Sarvodaya throughout his life. Jaiprakash Narain also extended his support in the exercise. Vinovaji gave an outline of Sarvodaya. According to him the Indian villages (i) must become Self supporting. (ii) they should be free from fluctuations (iii) the villagers need to manufacture those goods which they require (iv) there must not be any 'intervening agency between production and ultimate distribution' (v) Village industries must thrive. (vi) all the villagers must work and (vii) each and every member of the society should get food. Thus it can be said that Gandhiji floated the idea of Sarvodaya movement and vinobaji renewed the same. 10.9 Methods The methods that should be followed to achieve success in Sarvodaya movement are : (i)

Demonstration of fearlessness : Since Sarvodaya is just not a programme but a movement, it needs fearless mind. Expected challenges can not be faced by the people who are fearful. Naturally it demands fearless mind. (ii) Non-violent approach : To make Sarvodaya achievable it is desirable to work on non-violence method. Unjust aggressiveness has no place in Sarvodaya. Tolerance and advocacy are necessary which will ultimately lead to non-violence. (iii) Justice : Since injustices are reality in our society it is necessary to give justice to all the people belonging to various religious groups, caste and economic background. (iv) Practicing celibacy : It is another method that should be followed in Sarvodaya movement. If it is practiced with determination one can be mentally strong enough to play effective role in this exercise. (v) Feeling of nearness : This is also considered as an important method since feeling of nearness or oneness adds strength to the society and create an environment conducive to Sarvodaya. (vi) The spirit of true nationalism : To make Sarvodaya movement successful it is also necessary to have the spirit of true nationalism. Such a spirit definitely helps the process to go ahead.

140 NSOU ? MSW-IV (vii) Giving importance to physical labour : Giving physical labour should be considered as must by all individuals – rich or poor, illiterate or educated, men or women. By making people motivated to do physical labour Sarvodaya movement can be made successful. (viii) Tendency to do good for others : Such a tendency needs to be developed in the mind of all. Such an attitude will immensely help in making the movement successful. (ix) Non-violent non-cooperation : In the context of aggressive oppression by the administration of British regime, it was considered as one of the important methods of Sarvodaya. By taking part in such non-cooperation each individual can significantly contribute to propel the movement in right direction. (x) Attaching importance to equality of all religions : It also acts as an effective method of achieving Sarvodaya. No one should have any negative feeling about other religions. By so doing one can help in bringing integration which is so very necessary in Sarvodaya. (xi) Giving rights to all in the goods produced is yet another method that should be followed in the process of Sarvodaya. All should enjoy right to the products of the country without any discrimination. (xii) Simple living : Standard of living should not be made high because that will promote the tendency of consumerism. Such a practice will ultimately help in giving opportunity to all to fulfill minimum needs. (xiii) Proper Planning : To give success to any effort proper planning is necessary. Since without need-based planning nothing positive can be achieved, it is a must that we give priority to make necessary planning. 10.10 Fundamental Principles K. G. Mashruwala has enumerated the basic principles of Sarvodaya as mentioned below : (i) Respect for life which means 'health and all-round development of the life and personality of India's living beings'. (ii) Development of natural resources which can be considered as means for the development of life. The natural resources should not be extravagantly used. Rather nature has to be developed for our betterment.

NSOU ? MSW-IV 141 (iii) Providing opportunity of job to every individual based on his knowledge skill and capacity. (iv) 'The standard of life' should be distinguished from the standard of living'. Since standard of life is the fundamental issue and not the standard of living, one must make efforts to rise his standard of life. (v) While planning for the development of people efforts should be made to remove natural or man-made hindrances from its path. (vi) Efforts should be made of make people self-sufficient in respect of food as well as nutrition. (vii) People should be provided with training appropriate to our nation building. It should be planned in such a manner so that it really develops the capacity of persons concerned to play their role properly. (viii) Politics would not be the instrument of power and there will be no party system. (ix) There will be no private property and profit motive. 10.11 Programmes for Sarvodaya Vinobaji and other constructive leaders have suggested the following five-fold programmes to achieve success in Sarvodaya movement. They are : (i) Maintaining internal purity which means leading a honest life by avoiding unfair ways of earning money for comforts. (ii) Maintaining external purity which means cleanliness – both at personal level as well as public level. For making Sarvodaya drive effective maintaining cleanness is extremely needed. (iii) Putting physical labour is another important condition for Sarvodaya. We must give due weightage to the dignity of labour. All of us should put some physical labour and give due respect to those who are working as labour for generation after generation. Respect can not be assigned to property, power and formal education only.

142 NSOU ? MSW-IV (iv) Establishing peace is the fourth condition for Sarvodaya. Peace does not mean abolition of war only. it is to live in amity, stop inculcating fear and jealousy, solve minor disputes only. (v) The last factor is dedication or Samarpana to the Samarpana ideal, non-violence, non-exploitation, use of physical labour, equal status of all etc. On the other hand for building a Society of Sarvodaya following 18 fold programmes were suggested. (i) Removal of untouchability (ii) Communal harmony (iii) Use of khadi (iv) Giving emphasis on rural industries (v) Attaching importance to village Sanitation (vi) Conducting adult education programme (vii) Introducing Nai Talim (viii) Taking care of women upliftment (ix) Uplifting the condition of Kisans (x) Improving the condition of labour (xi) Promoting the condition of tribals (xii) Students upliftment (xiii) Establishing economic equality (xiv) Awareness generating on health and hygiene (xv) Giving importance to provincial languages (xvi) Attaching due importance to National language (xvii) Taking care of Leprosy patients (xviii) Prohibition on ill practices.

NSOU ? MSW-IV 143 10.12 Sarvodaya and Social Work Sarvodaya and Social work both are for human welfare. Similarities and dissimilarities between the two can be cited as below : Sarvodaya ? It is a philosophy ? It is a broader concept ? Betterment of weakest and others is the goal ? Initiating programmes of various nature is the main way ? It is not a product of intellectual theorization ? It is a movement ? It is done by volunteers or Sanchalaks who are believers of Sarvodaya. ? It is not a job-oriented work. ? Training of Sanchalaks is informal and apprentice based. ? It has spiritual basis ? It strengthens the Social consciousness first followed by Gram Sankalpa and Lokniti. Social Work ? It is a problem solving process ? It is somewhat specific concept ? It is same ? Helping people to help themselves is the basic issue. ? It is product of intellectual theorization. Based on the knowledge from other branches of social sciences it has 'developed into a science of its own.' ? It is not a movement. ? It is done by professionally trained persons and community people. ? It is a job-oriented work. ? Training is formal and class based. ? It is not based on spirituality as such. ? It helps individuals, groups and communities by using various methods of social work aiming at furthering the social welfare objectives.

144 NSOU ? MSW-IV Thus it is evident that there are both similarities and dissimilarities between the two. 10.13 Sarvodaya vis-a-vis Community Organisation Both Community Organisation and Sarvodaya aims at the welfare of the community. However, there are some differences also between the two. They are as below : Sarvodaya ? It is a movement based on certain philosophy. ? It is based on certain methods. ? Change of heart of rich gets emphasis ? No professional person is engaged. ? It is considered as a movement. ? It is a political action to some extent. ? It is volunteer based known as 'Sarvodaya Mitra'. ? It collects and enrolls members ? It encourages its members to lead a life of Tapas. ? It advocates equal rights of all. ? Basic education programme is considered as one of the means to achieve the objectives. ? It forms tier based organs from village to national level. ? Non-possession and non-violence is emphasised Community Organization ? It is a method of working with community for the welfare of the same. ? Itself is a method. ? No such specific emphasis is there. ? Professionally trained persons are needed. ? It is not a movement. ? It is not considered as such. ? It is not cadre or volunteer based. ? No such effort is made. ? No faith in such system. ? It is same. ? Awareness generating is emphasised, not educational programme. ? There is no tier based organisation. ? It is same.

NSOU ? MSW-IV 145 Thus it depicts that there are both differences and similarities between these two. However, we can say that objectives of the two are almost similar. It can be concluded that Sarvodaya has a great influence in community organisation practice. Since it releases potentialities of the community and enable it to work together to overcome discrimination, apathy, vested interest etc. it can be said that Gandhiji and his brain child Sarvodaya played a significant role in preparing an intellectual climate for the growth of both community organisation process and professional Social work in our country. 10.14 Essential Qualities of a Sarvodaya Worker Sarvodaya workers will have to transform themselves and acquire the following qualities : (i) Truthfulness ? It believes in democratic decentralisation. ? It has five segments – Shramdan, Premdan, Sevedan, Bhoodan and Gramdan. ? Based on Gita following six are considered as essentials in Sarvodaya – clear mind (piousness) – Energy – Self-confidence – Strong step – Positive outlook – Calmness ? It aims at uplifting the people in social, economic, political and moral aspects. ? It is same. ? Community organisation is not based on such 'Dan' philosophy. ? In community organisation cohesiveness and we feeling are the important aspects. ? It also takes care of overall development of people.

146 NSOU ? MSW-IV (ii) Non-violent (iii) Chastity (Brahmachairya) (iv) Fearlessness (v) Honesty (vi) Non-possessive (vii) Avoider of drinks and drugs (viii) Self-sacrificing (ix) Eager to do body labour (x) Satisfied with minimum wants (xi) Tolerant (xii) Cooperatives (xiii) Knowledgeable (xiv) Believer of God (xv) Disciplined (xvi) Have sense of dignity (xvii) Have living touch with masses (xviii) Good anticipator (xix) Attitude to do good of others (xx) Non-egoistic (xxi) Clear vision (xxii) Strong determination (xxiii) Dedication The success of a movement like Sarvodaya depends on the following pillars : – Truth – Love

NSOU ? MSW-IV 147 – Non-violence – Physical labour and – Proper supervision, utilization and distribution of property. Besides, Sarvodaya movement will have to keep the target of establishing classless society, exploitationless society and a society which is self-reliant and believes in cooperative living. The Society will constantly try to make it free from dishonest practices. All these sounds very noble but difficult to practice. The world as a whole is competitive. In that environment, India alone can not have a noncompetitive and classless society. And bringing change in the heart of people also has very bleak possibility. Nevertheless it can be said that Sarvodaya can create some impact in the Society. 10.15 Concept of Bhoodan Bhoodan means donation of some portion of their land by land owners for the common good. The farmers who have more than three acres of land should donate one sixth of their land so that the same can be shared with others for helping them to co-exist properly. 10.16 Genesis Acharya Vinoba Bhave is the founder of this movement. The movement began its journey in the year 1951. On 18th april 1951 Acharya Vinoba Bhave made an appeal to the rich farmers of Pochampalli Village in Telengana to donate some amount of their land to the landless people of the area. Some farmers positively responded to his appeal. Once Ramchandra Reddy alone donated 100 acres of land. That was the beginning of Bhoodan movement. It ultimately spread over different areas under various states. Thus within 1967 about 42,64,096 acres of land was received from 5,76,000 big farmers, 90% of which was received between 1951 and 1957. In the first few years of movement, rate of success was considerably good particularly in Bihar and U.P. As a result, by 1956 it received 4 million acres of land as donation. It became 4.5 million acres by 1957. The movement, thus, contributed to

148 NSOU ? MSW-IV reduce the gap between haves and have nots in rural india. This voluntary and unofficial movement aiming at land reform directly helped to promote Gandhian idea of trusteeship and a novel idea that 'all land belonged to God'. 10.17 Philosophy The basic philosophy based on which Bhoodan movement was initiated is that anything which a person has, is not his property. Actually it is the property of the Society. According to this philosophy Bhoodan is not only donating some land to landless. It encompasses two other concepts also – 'Shramdan' and 'Premdan'. Like Bhoodan these two are also very important in the life of people. It makes people to look around so that none suffer. Naturally distribution of land is not the only issue here. 10.18 Objective The basic objective of Bhoodan is to make 'a voluntary transformation in the distribution of land in rural india according to the principles of equality.' More specifically to say, its objectives are : (i) to initiate social and economic revolution, (ii) to transform the socio-economic scenario of India where everybody will have equal access to economic and other resources of the country. (iii) to take care of moral regeneration of the people of India. (iv) to improve the overall position of the landless people of the country. (v) to make people free from exploitation. 10.19 Methods The methods that were adopted to carry out Bhoodan movement were : (i) Generating awareness among community people about how creating of just society is possible.

NSOU ? MSW-IV 149 (ii) Motivating rich farmers to donate a portion of their land to the needy people. (iii) Encouraging poor people to utilise the land that they received as donation in such a manner that they can promote their status. (iv) Giving ideas to the villagers and volunteers that initiative should be taken to bring social, economic and cultural revolution through Bhoodan. (v) Approaching Central and State Governments to implement some policies to augment this movement. Keeping those methods in mind Acharya Vinoba Bhave and his followers made padayatras from village to village for persuading the farmers who have large amount of land to donate at least one sixth of their land. Thus they kept a target of collecting 50 million acres of land which is one sixth of India's total cultivable land. When a particular farmer decides to donate, a deed would be prepared and signed by the donor and Vinobaji. There after a survey would be conducted to have data regarding the beneficiaries with the help of Panchayat. While donating the land first preference was given to the landless agricultural labourers followed by the farmers with insufficient land. At the time of giving the land, entire village population used to be invited to gather on the specific date and time to witness the distribution process. The receivers were suppose to sign a printed application. On receipt of the same certificates of having received the land was issued. For completing the entire process no fees were charged from the beneficiaries. Three important conditions of Bhoodan are : (i) The beneficiary should start cultivating the land within 3 yrs. of receiving the same. (ii) He is expected to cultivate it at least for ten years. (iii) The donors will not get any compensation. Considering the local situation and prevailing culture these procedures were relaxed from time to time. Some state governments such as Bihar, U.P. Orissa, Punjab, Rajasthan, Karnataka, M. P., Andhra Pradesh and Himachal Pradesh enacted legislations to facilitate the process of Bhoodan.

150 NSOU ? MSW-IV 10.20 Impact Though success rate of this movement is not that praiseworthy and the movement became short-lived, still Bhoodan has made some contribution. The unsuccessfulness of the movement was in terms of material achievement but in spiritual sense Bhoodan is definitely successful. At least it has created a sense in the mind of the people that those who are capable should contribute something to those who are resource poor. People also got this message that Bhoodan is one of the ways based on which society can survive and progress. This is the biggest impact of Bhoodan movement. 10.21 Limitations Bhoodan movement suffered from the following limitations. (i) Within a very few years of initiation of the movement it lost the momentum. (ii) Distribution of land was also a problem. Out of 6.5 million acres of land that was received barely 4.5 lack acres could be distributed. (iii) For certain reasons some of the donors took back their land. (iv) Such a situation created doubts in the mind of many people. (v) Sometimes allotting authorities demanded money for recommending their names. Thus some undeserving people also got land. (vi) Same family applied for land in the name of different members. (vii) In some cases Bhoodan Workers became members of different political parties. (viii) In some cases disputed land was donated. (ix) In many cases almost unuseable land was donated. (x) Government officials did not show much interest. (xi) Beneficiaries got small piece of land which did not help them to become self-sufficient. (xii) Cultivation of land involves some expenditure. Most of the receivers did not have that fund.

NSOU ? MSW-IV 151 (xiii) It was a kind of one man show and there was dearth of well-knit organisations to take care of the movement. (xiv) Some of the states remained untouched. So it could not become nationwide movement. (xv) This was more an emotion based project than logic based. Changing the heart of people is a very challenging task. (xvi) There was no administrative back up to the movement. 10.22 Gramdan 10.23 Concept It is donating 80% of their land by land owners of a particular village for the welfare of its landless population. Thus if at least 51% of the total land of the concerned village is donated then it is considered as Gramdan. Gramdan is biproduct of Bhoodan. Bhoodan was widened into Gramdan. It is the extended mission of Bhoodan. The ultimate idea of Gramdan is that the entire residents of the village would own the total property of the same village. 10.24 History Gramdan, which is considered as last phase of Bhoodan movement first grew at Mangroth village in U.P. which was followed by several other villages in different states. In 1953, Gramdan was witnessed in Manpur under Cuttack district of Orissa. By 1955, altogether 26 villages went for Gramdan in 10 districts of Orissa alone. Some States passed legislation for the management of Gramdan villages. 10.25 Objectives The basic objectives of Gramdan are the followings : (i) Social reconstruction (ii) Economic upliftment

152 NSOU ? MSW-IV (iii) Building a new social order based on equality and cooperation. (iv) Developing a culture of collective ownership. (v) Removing problem of rural indebtedness. (vi) Increasing standard of morality, and (vii) Ending the litigation 10.26 Process It starts with creating collective will among the entire population of the village concerned. Followed to that efforts are made to create Gram Sankalpa so that the Villagers accept the Gramdan movement, which will ultimately result in generating Lokshakti and then Lokniti. The concerned village needs to take three steps to become gramdan village. Those are : (i) A village assembly should be constituted. (ii) A village fund will be created. (iii) The village would transfer the deeds of their land to the village assembly which is legally constituted. It has three stages such as (i) Prapti – to get the landed property (ii) Pusti – to distribute the same among landless (iii) Nirman – to reconstruct through Gramsabha. 10.27 Impact Gramdan has created a definite impact. Gramdan and Bhoodan are two “most far reaching” programmes of redistribution of land. A good amount of land was received from various donors across the country for effectively using the same by the villagers. In the process many downtrodden families of concerned villages got the opportunity to be co-owner of village property. Through Gramdan it became possible to give the taste of being landowner to a good number of socially and economically backward people.

NSOU ? MSW-IV 153 10.28 Weaknesses Though gramdan has created some impact around the country this movement has not been able to get desired results. The reasons behind not being able to get very effective result are the followings : (i) People suspected the initiative. So they did not show interest in donating the village. (ii) Inadequacy of trained and properly motivated workers to effect the transfer of land. (iii) Lack of necessary cooperation from the government departments. (iv) Lack of adequate plan to utilise the landed property properly. (v) Since religion and caste feeling was in the blood, cooperative living was a very difficult task to achieve. Thus, Gramdan movement failed to achieve success. By 2009 only 500 gramdan villages remained. People throughout the country did not accept this idea and after the death of Vinobaji and Jaiprakashji the movement came to an end. 10.29 Summary The learner will now be able to understand the ideologies behind the important movements like Sarvodaya, Gramdan, Bhoodan. They are now in the position to borrow these concepts and link it up with Social work ideologies, thus making the whole curriculum of field practices ever more meaningful and understand the Community and its Sentiment in a better way. 10.30 Review Questions 1. Underline the Similarities and differences between Sarvodaya and Community Organisation. 2. What is Bhoodan? What are its limitations ? 3. Define the term Gramdan and analyse its process.

154 NSOU ? MSW-IV 4. Enumerate the essential qualities of a Sarvodaya worker. 5. What do you mean by Sarvodaya. Analyse its basic philosophy. 6. Give an account of the objectives of Sarvodaya. 7. What are the basic characteristic features of Sarvodaya ? 8. Write short notes on (i) Untouchability (ii) Active participation (iii) Economic equality (iv) Feeling of nearness (v) Non-cooperation 9. Fill in the gaps (i) An individual can progress when others are allowed to _____. (ii) People should remain satisfied with simple _____ and _____. (iii) People should follow the path of _____ in their everyday life. (iv) important elements of Sarvodaya are _____ and _____. (v) Gramdan is biproduct of _____. 10. Match the followings : (i) Justice should be given particularly to – Economically backward people – All people (ii) In Sarvodaya it is necessary to maintain – High standard of life. – Internal purity

156 NSOU ? MSW-IV Unit- 11 Leadership Structure 11.1 Objective 11.2 Introduction 11.3 Concept of Leadership 11.4 Types of Leader 11.5 Traits of good Leader 11.6 Objectives or goals 11.7 Role of a leader 11.8 Summary 11.9 Reference 11.10 Exercises 11.1 Objective The main objective of this unit is to enhance the knowledge-base of the social work students on the topic concerned. Since the students of this course are expected to play the role of development workers as well as community organizers they are in need of developing their knowledge and properly shaping their attitude and outlook. Ultimately they will have to play to role of a leader and hence the objective of the present unit is to equip them with the knoweldge and skill that are required to do justice to their role of leader. 11.2 Introduction Through the present unit attempt will be made to bring in light various aspects of leader and leadership. A community organizer is a friend, philosopher and guide to a given community. He plays the role of a leader in true sense of the term. No body can deny that to bring a substantial change in the life and living of the people at a given community, strengthening the community is of importance. And to do that leadership role is to be played by some including the community organiser. There is no doubt that the NSOU ? MSW-IV 157 entire process of community organization will remain unsuccessful if community leaders and community organizer do not play their role properly. Here the community Organizer has a significant role to play. Keeping that in consideration the present unit will deal with all the relevant issues that will help the community Organizer to play his/her role effectively. It will deal with the subject in such a manner that his/her competencies are developed to the extent those are needed. The following pages are expected to meet the need of the students concerned to become effective community organizer by playing the leadership role properly. 11.3 Concept of Leadership The word 'Leader' or 'Leadership' is known to everyone. Community organization practice largely depends on the quality of leadership. This compels the students of social work to study the various apects of leadership including the concept, type, skill and qualities needed etc. Let us first deal with the concept of leadership and leader. According to H. K. Coons "Leadership is the behaviours of an individual when he is directing the activities of a group towards a shared goal". According to W.G. Bennis "Leadership is the capacity to translate vision into reality." A chinese proverb says "A leader is one who knows the way, shows the way and goes the way." According to Sri Ramakrishna, 'he who sacrifices most is the leader'. According to some social scientists leadership is an activity through which the behaviour of others is influenced. To some others leadership is an instrument for coordinating the group efforts and channelising them into concrete action. Peter Drucker said "The only defination of a leader is someone who has followers". The core points, that rrun through all these definitions constitute the following : (i) He is a person who can – influence others – Make decisions – initiate action

158 NSOU ? MSW-IV – advice the members (ii) Who is – Acceptable to others – Knowledgeable – Physically and mentally fit – moderately powerful in the group (iii) Who possess – a set of qualities – Some charisma – some 'divine grace' – abilities and resources to influence others. – pleasing personality (iv) Who keep faith – in the capacity of others – in his/her own capacity – in the organization (v) Who has – risk taking ability – good communication skill – honesty and transparency – Positive outlook – Strong we feeling – Patience – Courage and Commitment – Inovativeness

NSOU ? MSW-IV 159 – Spirit – Basic discipline – mental make up to learn from mistakes – flexibility (vi) Who remains – loyal – energetic – active – intelligent – punctual – responsible (vii) Who is able to – Co-ordinate group efforts – change behaviour of others – help people to move towards achievement of goals. – remain first among equals. – express himself properly. One thing should be mentioned here that leadership does not flourish in vacuum. It always envisages followers. Secondly, one should keep it in mind that leader is the person and leadership is the role he/she plays. 11.4 Types of Leader In our day to day life we see different types of leader. On the basis of style of functioning and selection process etc. We can classify them in the following manner. (A) On the basis of style of working : (i) Democratic leader : A democratic leader is one who has firm faith in the

160 NSOU ? MSW-IV capacity and initiative of each individual member. He also keeps faith in the theory of giving due importance to the opinion expressed by co-workers while taking any decision. He never tries to impose anything. He will consider himself as one of them (the members) with some additional responsibility. A democratic leader believes that people would put in their best efforts in the tasks if they feel that the programmes are in line with their interest and they get due respect and appreciation from the leaders. Such leadership also believes that the programmes are development oriented and motivational aspect is taken care of adequately then active participation of the members is forthcoming. He/she acts accordingly. (ii) Authoritarian Leader : Such leader is just opposite to the democratic leader. He/she believes in dictating others or issuing instructions to the members. He/ She does not attach any importance to the community or group members as well as co-workers. Such leader has only one concern – task and performance. He/She considers people as unreliable and incompetent and hence they should always be controlled. Such leadership feels that members should be constantly pushed so that under threat they run for achieving to goal. He/She also believes in punishment theory and guiding/teaching the members whenever he/she feels likes. Believing in the idea that leadership is to enjoy power that comes through position. Thus a thoroughly directive approach is followed by such leader. (iii) Laissez – Faire leader : This type of leader gives higher degree of freedom to his/her co-workers and members of the group or community. He/she keeps full faith in the capacity of them to work independently, and naturally do not make unnecessary intervention. Such behaviour is known as laissez-faire behaviour. This provided opportunity to all concerned to work with higher degree of independence. They are permitted to get involved in any kind of activity they think fit for the group or community. No procedures as well as policies are framed. In this leadership style no one influences others. It marks absence of formal leadership. Any leadership that is being exhibited is informal in nature and emergent. (B) On the basis of system of Selection : (i) Elected : Some become leader on the basis of election. They contest in the election – formal or informal and become leader by getting majority of votes.

NSOU ? MSW-IV 161 This method helps in getting opinion of the members concerned in a reliable way. (ii) Selected : In small organizations and groups leaders are generally selected. The members sit together and discuss the issue of leadership and select somebody to lead the group/community on the basis of choice of majority. (iii) Nominated : In such process leaders are decided on the basis of the decision of the higher authority. In that case his/her length of association, commitment, efficiency trustworthiness are considered. Leaders of this type are neither elected nor selected. They are imposed by the authority. (C) On the basis of success rate : (i) Successful leader : He/she is a successful leader who is capable of fulfilling the objectives or vision-mission of the organization / group / community. He/ she can motivate people to go ahead, can keep them integrated, mobilise resources, make reality oriented plan and so on. He/she is not ready to compromise with failure. (ii) Unsuccessful leader : The leader who does not have the capacity to motivate the members properly, create workable environment, keep members integrated, create good image of the group/community / organization is known as unsuccessful leader. (iii) Effective leader : Effective leader is one who not only produces good results but can make the objectives of the organization clear to the members, create an enthusiasm in them to initiate appropriate actions to fulfill those, involve everyone in the process of development, promote leadership quality in members, achieve the target, remain unbiased and transparent, keep continuity and promote the image of the group/organization / community. Such leaders will demonstrate courage and wisdom to make the development process self propelling. D. Based on relationship : (i) Leader who maintains good rapport with all concerned but he may be poor performer. (ii) Leader who fails to maintain good rapport but is a good performer.

162 NSOU ? MSW-IV (iii) Leader who is good in rapport building as well as is excellent performer. (iv) Leader who is bad in rapport building and at the same time gives poor performances. 11.5 Traits of good Leader The effects of good leaders should have the following traits. (i) Proactiveness (ii) Straight talking (iii) commitment keeper (iv) Loyalty demonstrator (v) Transparent (vi) Owner of learning mind (vii) conceptualizer (viii) Respect shower (ix) Result producer (x) Constantly improver (xi) Reality confronter (xii) Courageous (xiii) Expectation clarifier (xiv) Trust extender (xv) Activator 11.6 Role of a leader Leaders in any set up have varieties of role. In the practice of community organization also leaders need to play various role. They are as below : (i) Team building : By establishing rapport with the group or community members

NSOU ? MSW-IV 163 he/she will build the team that will take care of the welfare of the group / community. (ii) Promoting team work : He/she inculcates sense of collectivism in his followers and helps them to work as a team. A leader has to understand the varied interests and multiple goals and reconcile those conflicting goals and restore equilibrium as far as possible. Thus his role is to ensure team work. (iii) Ground rule establishing : He/she will take care of establishing ground rules for the group/community members which are so very necessary. (iv) Planning : As a planner the leader is responsible for chalking out proper plans for attaining the group/community goal. (v) Rendering advocacy services : One of his/her main role is to work for awareness generation with regard to the group/community situation and the nature of involvement needed from the members to bring necessary change in the overall situation. (vi) Helping to understand methods of work : The leader is expected to help the members of the community/ group to perceive the methods to be applied to achieve the goal. He/she also helps them to understand the diverse effects of unwanted situations. (vii) Role of Therapist : The leader, in the context of community organization, also performs his role as therapist. Once the problems are diagnosed, he/she will suggest the process of treatment by organising people, mobilising resources, initiating activities and closely monitoring the same. (viii) Helping to Realise Potentials : The leader will extend his support to make people coming together and realise their own potentials and power. He may also offer suggestions to the community people in their decision making process. (ix) Promoting leadership qualities : His/her another important role is to promote leadership qualities among the existing and prospective leaders of the group/ community. Since one of the pre-conditions for any effective community organisation is the availability of good leadership, developing community leaders is a must. The leader, therefore, has a very special role to play in the area. (x) Role of worker : Leader is expected to play the role of a worker. He/she will not only dictate or guide only to the members but also take part in the

164 NSOU ? MSW-IV actual work. By doing so he/she can create an example which will inspire general members to be more involved in the work undertaken. (xi) Ensuring democratic functioning : he/she should also ensure democratic functioning of the group/community. He will look into the matter that all the members get the opportunity of taking part in all stages of community organisation as well as getting the benefit of community welfare initiatives. (xii) Helping the community to establish coordination with various appropriate agencies is also considered as one of his/her roles. Such agencies can be local self government institutions, non-govt organizations, Govt. Department etc. (xiii) Empowering : The leader will assist the community in preparing and maintaining reports, records, proceedings of the meeting etc. He/she will make effort to check the dependency syndrome which is against the spirit of development. (xiv) Managing programme execution and fund : The leader is also responsible to take care of programme execution and fund management. (xv) Representing the group/community : The leader is linking pin between his community/group and other communities/groups. They leader serves the role of representative here. He will directly communicate with others and carry the voice of his community/group to others. (xvi) Role of Counsellor : Members of the group/community sometimes suffer from emotional disequilibrium. In such cases leaders play the role of counsellor. By rendering counselling services he/she makes effort to remove the barriers and instil confidence in them. (xvii) Protector of Ideas : Members may ventilate ideas of different types at different time. The same may be attacked by some others. The leader protects each member and their ideas from attack by other group members. (xviii) Keeper of discussions on track : In all meetings there remains possibility of going out of track. The role of leader in such circumstances into keep the discussions on track. (xix) Resource mobiliser : The leader should play the role of resource mobilizer in true sense of the term. Resources as we all understand, are both manpower and material.

NSOU ? MSW-IV 165 (xx) Role of Monitor and Supervisor : He/she should also play the role of monitor and supervisor of all programmes initiated for the welfare of the concerned group / community. It is through him that this process will revolve. (xxi) Responsibility Fixed : The leader's another important role is to fix responsibility to each member so that responsibility is shared. He/she should do it wisely so that it suits well to the quality and skill of the members concerned. (xxii) Promoter of participation : He/she should also play the role of promoting an environment of full and equal participation by every group member. (xxiii) Planner and implementor : The leader should remain actively involved in planning and implementing programmes. He/she should make endeavour to plan meticulously and implement the same with all seriousness. Everything in the society is dynamic and prone to changes. For keeping track with the changes, additions and alterations to existing plans and strategies is essential. The leader has to be vigilant about it. From the points discussed above, one can understand that a leader in the context of community organisation has to play varied roles which can be broadly divided into the following categories. (i) Acting as a guide, Advocator, Counsellor, facilitator etc. to help the community in problem situation and effective communication between all members of the community. (ii) Promoting the level of awareness of all members of the community, getting them involved in the process of community organisation, pooling internal and external resources for the fulfillment of community goal, holding meetings and keeping the discussion in track, preparing and maintaining reports and records properly. (iii) Maintaining a favourable environment in the community, fixing responsibilities of different members, motivating and encouraging the members to get involved in the process of community organisation, establishing and maintaining coordination with others. So, in brief it can be said that in the context of community organisation a leader has multi dimensional roles to play aiming at taking care of the wellbeing of his members.

166 NSOU ? MSW-IV In fact, he is a father figure in the community since many things depend on the qualitative role played by the leader. Factors responsible for ineffective leadership : There are several factors behind the causation of ineffective leadership. They are : (i) Poor knowledge base (ii) Inadequate problem solving skill (iii) Poor managerial insight (iv) Low level of creativity (v) Poor skill of interpersonal communication skill. (vi) Lack of visible personal commitment (vii) Fails to learn from mistakes (viii) Does not practice what he preaches (ix) Absence of innovativeness and risk taking ability. (x) Becoming prisoner of system (xi) Raising false expectations (xii) Not able to get confidence of others (xiii) Not developing realistic time table and not fixing responsibilities. (xiv) Not keeping track with what is happening (xv) Not maintaining good image (xvi) Behaves like an officer and not like a leader (xvii) Have less adjustability, etc. 11.7 Essential skills and qualities of a leader To play his/her role effectively, a leader needs to have certain skills and qualities in absence of which he/she can not play the role properly. The following skills and qualities are needed by a leader engaged in the process of community organization :

NSOU ? MSW-IV 167 (i) He should be knowledgeable. Strong knowledge base is the added advantage to the leader. It is a factor that makes a person strong. The sound knowledge base helps the leader to perform more effectively as well as to get respect from the members and agencies with whom networking is done. This also promotes the level of self-confidence of the leader. (ii) He/she should have proper outlook, attitude, general awareness and presence of mind. These are the qualities that contribute in the improvement of performance level of a leader. (iii) Honesty, transparency and leading a simple life is another important quality of a leader. In absence of the above cited traits the leader can not expect confidence and respect from his team/community members. Hence, to be an effective leader one will have to have the qualities mentioned above. (iv) Another very important quality of a leader is to have better communication skill. To be an effective leader in any field of life, good skill of communication is an added advantage. In the process of community organisation also this skill is highly essential to the community leaders. (v) He/she should pose pleasing personality. If he is a boring personality, coworkers will not feel attracted to him and naturally question of being influenced and motivated does not arise. The leader should also be extrovert. (vi) The behavior of the leader needs to be balanced one. He/she should act as a model. He should know how to be rational in expressing emotion, articulating views and facing difficulties. He should be a man of initiative and drive. (vii) The leader should be a good listener too. By becoming good listener the leader can establish good rapport, know the opinion of members on various issues, understanding the outlook and attitude of them which has its own importance. (viii) The leader should have good health. Since he/she has to put more physical and mental labour than others maintaining good health is very necessary. (ix) A leader should have the quality of choosing and adopting appropriate method of working.

168 NSOU ? MSW-IV (x) Since working with people and considering himself as one of them are pivotal aspects of getting success in any community welfare activities the leader should have the quality of becoming like that. (xi) He should have the patience and tenacity so that he becomes capable of making effort to constantly encourage the members to remain involved in the process of development. (xii) Risk taking ability is another important quality of a leader. It is not expected that a leader will play his role without facing a situation where he needs to take some risk. If he/she has the mental strength to take that risk she/he will get respect from the community members and co-workers. (xiii) He/she should keep firm faith in the goodness of the coworkers as well as capacity to perform. The leader should create an environment where all members would feel that leader has full faith in them. (xiv) His/her involvement would be such that people would consider him as a guide, helper, expert and therapist. Besides the above mentioned points the leader should possess the following skills and qualities also. – Capacity to control meeting, conflict situation and plan of action in cooperation with the members. – Capacity to work under pressure – Maintaining proper work culture – Power of decision making – Remaining attentive – Attitude of sacrifice – Creativity – Quality to mix with others – Style of working that does not make things complicated. – Wiseness to initiate capacity based and need based programmes.

NSOU ? MSW-IV 169 – Becoming a practitioner of innovative ideas and not the follower of traditions. – Quality of actualizing the process of decentralization. – Developing attitude of working based on values and unbiased attitude. – Having tendency to show respect to the Organizational discipline. – Maintaining a good image of himself. – Having capacity to influence others. – He/she should be the user of proper dress since “clothes make the person”. – He/she should have the quality to manage self, managers, others, programme execution and fund. – Risk searching capacity – Quality of becoming proactive – Quality to be Conceptualizer, Analyser, Affiliator and Activator. – He/she should be biased towards opportunities over problems. – The leader needs to be a team builder. – He/she should have the quality of becoming good judgementer. – He/she should be critical and quick thinker. – The leader should have the skills and qualities for accessing to technologies and resources. We rarely find a leader who possesses all the skills and qualities mentioned above. However, leaders must make effort to acquire as more qualities and skills as possible. Since effective leadership is the pre-condition for better functioning of group community, leader has no other way but to promote his/her skills and qualities to the extent it is possible. 11.8 Summary A good leader can be the torch bearer and keep the community to choose the right path. A leader has to bear a lot of responsibilities. He must possess special qualities to motivate people and must be capable to take right decision to successfully manage various programmes.

170 NSOU ? MSW-IV 11.9 Exercises 1. What do you mean by 'Leadership'? What are its various types? 2. Make a comparison between the Authoritarian leader and a Democratic leader. 3. Enumerate the basic traits of a good leader. 4. Analyse the important roles of a leader in the context of community organisation. 5. Examine the factors responsible for ineffective leadership. 6. What are the essential qualities and skills of an effective leader? 7. What is the importance of leader in the process of Community Organisation? 8. Write short notes on (i) Laissez-faire leader (ii) Transparency (iii) Advocacy services (iv) Empowerment of people (v) Role of counsellor (vi) Communication skill (vii) Risk taking ability (viii) Work culture (ix) Team building (x) Risk searching capacity 9. Analyse the following terms (i) Innovativeness : (ii) Selected leader : (iii) Effective leader : (iv) Learning mind :

NSOU ? MSW-IV 171 (v) Counselling (vi) Resource mobilization : (vii) Balanced behaviour : (viii) Decentralization of power : (ix) Analysing and activating : (x) Conflict management skill : 10. Fill in the gaps (i) Leader is one among the _____. (ii) To a leader _____ attitude is needed. (iii) Maintaining intellectual honesty is one of the _____ of a leader. (iv) He/she is a _____ leader who does not dominate others. (v) a leader should have _____ image. (vi) _____ should be physically _____ and mentally _____. (vii) He/she should have _____ personality. (viii) To a leader programme _____ skill is necessary. (ix) Successful leader is one who can _____ the objectives. (x) Unsuccessful leader is one who does not produce _____. 11. Match the followings (i) Leader can – Study the mind of the people – forget easily – react strongly (ii) Leader is – Very introvert

172 NSOU ? MSW-IV – generally silent type – extrovert (iii) He knows – how to threaten others – how to overuse power – how to bring people closer (iv) A leader should have – negotiation skill – advocacy skill – both of them (v) Leader fails to perform if he is – less educated – a person of ordinary physique – a person of poor image (vi) Strong leadership is necessary for – fulfilling objectives – producing desired results – Both of them (vii) Gandhiji was a unique leader because of – his innovative ideas – Simplicity – Both of them. 11.10 References 1. 174 NSOU ? MSW-IV UNIT- 12 Community Participation Structure 12.1 Objective 12.2 Introduction 12.3 Topic Name : Community Participation 12.4 Importance 12.5 Methods to be used 12.6 Types of Participation 12.7 Reasons Behind Lack of Participation 12.8 An Example of People's Participation 12.9 Summary 12.10 Review Questions 12.11 Reference 12.1 Objective The principal objective of the present sub topic under unit 3 is to help the learners to understand the meaning of community participation, importance of the same, its types as well as the methods to be used to achieve participation of community members in the process of community organization so that they can achieve the same while working with some organization in their future life. It can further be said that the objective of the present unit is to promote the skill and the level of self-confidence of the would-be Social Workers so that they can perform properly in their future life. 12.2 Introduction The present sub unit under unit 3 is on one such issue that needs to be taken care of by the community organization workers/agencies. Community organization is a tough job and it is not anybody's cup of tea to make people agreeable to be involved in the process of community development/welfare even if it is for their own wellbeing. Lots of

NSOU ? MSW-IV 175 motivation is necessary which can be generated only by properly trained personnel through appropriate measures. Keeping that in mind the present sub unit is so designed that it helps the social work students to make themselves competent and adequately skilled to achieve community participation in the endeavours of changing the overall condition of the community towards positive.

12.3 Topic Name : Community Participation As regards the concept of community participation there are diverse opinion. However, it can be defined as an active involvement of majority of people of any community in the process of community organization aiming at community welfare. According to Keith Devis "Participation is defined as mental and emotional involvement of persons in group situation that encourage them to contribute to group goals and share responsibility for them". For social work practitioners it is the involvement of people of the concerned community "in a situation or action meant to enhance their well being'. It further means creating a genuine and trusting partnership and working together for betterment of the entire community. For better clarification of the concept it can be said that when the people of a given community take part in the following activities aimed at community welfare, then it is termed as community participation. (i) Setting the objectives. (ii) Designing the programmes based on the felt-needs of the area concerned. (iii) Fixing the priorities considering the depth and dimension of the problems. (iv) Planning the budget and mobilizing resources to match the budget. (v) Planning the details of actions to be initiated to fight out the problems. (vi) Fixing responsibility of different activities to different persons or group of persons. (vii) Finalising monitoring arrangements. (viii) Deciding about benefit shareing. (ix) Making arrangements of follow-up and in house evaluation.

176 NSOU ? MSW-IV (x) Forming Subgroups based on the prevailing situation. Thus, it can be said that when people of any given community voluntarily come togetehr to make planned effort to initiate programmes for the welfare of the entire community is termed as community participation.

12.4 Importance Pelple's participation has immense importance in the process of development of any community and even the nation as a whole. it's importance can be enumerated as below : (i) It helps the people of the concerned community to avoid dependency Syndrome. By nature we love to depend on others for our welfare which is never a qulity or welcome situation. Such a mental make up needs to be changed and make community people involved in the initiatives for their own welfare can be one of the methods through which culture of dependency can be brought under control. (ii) It contributes in developing the capacity of individual members of the community. (iii) It creates an environment of co-operation which is so very necessary for the welfare of any community. (iv) It gives opportunity to utilise community resources. Generally people expect resources from outside and forget to identify and utilise its own resources. By encouraging people to participate in community organization process, identification and utilization of resources available within the community can also be ensured. (v) It helps to ascertain public opinion about any development proposal to make the same a realistic planning. As we all know, unrealistic planning never yields results, making realistic planning by involving people is very necessary. (vi) It makes the implementation process much easier and self-propelling. (vii) It improves the level of self-confidence and self-desire to develop in absence of which real welfare of any community is just not possible. (viii) it promotes the sense of belongingness.

NSOU ? MSW-IV 177 (ix) It helps people to be more active, vibrant and creative because togetherness is very positive. (x) It brings under control the level of gaps based on religion, caste, social status, economic status, gender etc. Since people work togetehr to achieve a common goal it naturally wither away the narrow barriers. (xi) It helps in the capacity development of the people. Capacity is a mental phenomenon and it can be enhanced only if somebody achieves success and give mental strength to the individual members of the community. Considering the above mentioned points it can be firmly said that people's participation has its own importance in the field of community organization and community development – be that a slum community, a rural community, a tribal community or any other community.

12.5 Methods to be used Achieving community participation is always a challenging task. It never flows automatically. To make it success one needs to follow certain methods. By adopting such methods an environment can be created in which community participation would be forthcoming. The methods that can be adopted to achieve community participation include the followings : (i) Identification with the people of the areas : The community organizer/the agency concerned needs to establish a sound working rapport with the people of the concerned community people so that he/the agency can be treated as one of them by the community members. This mutual trust building is considered as one of the important methods since in absence of it, participation will remain in word's only "Those for whom and with whom we work, we know not, neither they do know us" kind of culture should be abolished if whole hearted participation of the community members is to be achieved. 'I-they' feeling should be eliminated from the very core of the mind of both the community organizer and community members. (ii) Programme planning on the basis of felt needs of the community : While working in any community our common practice is to plan the programme at a higher level and implement the same at the grassroot in the way they think

178 NSOU ? MSW-IV appropriate. But the characteristics, problems, awareness level, attitude and outlook of the people of different communities are not same. Their priorities are also likely to differ. If programmes are planned keeping these in mind the members of the community will show interest to participate in the whole exercise of community welfare. Therefore, the method of formulating programmes on the basis of actual felt-needs of each community should be adopted for achieving active and effective participation of community people. (iii) No tendency to bring drastic change : A community organizer, after visiting a community, may feel that there are lots of ill practices that need to be addressed immediately. But he should not be desirous of bringing changes drastically since that produces negative result. Hence, instead of making effort to bring overnight changes, efforts should be made to help the community people to become adequately aware about their problems as well as reasons behind the causation of the same. They should also be made conscious that for better living they need to bring certain changes step by step by themselves. Making effort for bringing drastic change in the community's overall situation will never help a community to develop and hence the community organizer should not follow that path. (iv) Making culture-bound approach : Culture is one of the important aspects in human life. Cultural practices differ from religion to religion, caste to caste and community to community. The taboos, superstitions, faith, traditional way of life, status of women etc. naturally differ from community to community. Culture is very much the part of life and dearer to everyone. So, adequate care should be taken so that we do not give any scratch on the cultural fabric of the community concerned. The various aspects of culture of a particular community may not be liked by the community organizer or his agency but he can not go against it directly. If any change is to be made, the members of the community themselves will take care of the same based on the slow but steady changes in their awareness level and outlook. The community organiser/his agency can help them of feel the areas which are weak points in their culture but they must not dictate the community to bring changes in those areas. If such efforts are made, relationship between the community and the agency/community organizer will be strenuous. To ensure the community participation the NSOU ? MSW-IV 179 community organizer will have to accept their cultural situation or background as it is and his approach must not disturb their cultural faith and practices. (v) Authority delegation Without any exception all the members of any community have some sense of dignity. All the members – rich or poor, educated or illiterate, upper caste or lower caste men or women have some capacities too. Hence, the development agency/community organizer should delegate some authority to them without concentrating the same in its/his own hand. More the authority is delegated, more the people's participation is expected. By giving authority trust of the people towards the agency/community Organizer can be increased. In the process they will also feel it obligatory on their part to make themselves involved in the work for the development of the community. (vi) Active and dedicated leadership development : Leader plays a prominent role in shaping the destiny of any group or community. He makes sincere effort to involve the community people in the entire process of community betterment. By playing an effective role in leadership development one can help in the process of sustainable community development. To play his role effectively, both the community organizer and community leaders need to develop requisite skill and qualities through formal and informal training and work experience. (vii) Effective communication : It is another important method that should be followed to ensure people's participation in a given society or community. Until and unless the ideas/information/ messages/objectives are made clear to the community members they will not readily come forward to be involved in the process of community organization. To convey the same in the right perspectives, one should adopt proper communication method appropriate to the social set up of the concerned community. Therefore the community organizer/ Leaders of the locality should be equipped with knowledge and skill of communicating ideas etc. to the people of the concerned community. (viii) Joint Supervision : Supervision of the work should be done jointly by the development agency / community organizer and the community leaders / representatives. By doing so, a mentality of joint responsibility can be created which will ultimately lead to the higher

180 NSOU ? MSW-IV degree of people's participation. In absence of such joint supervision, effective monitoring would not be possible. Considering this, the present method should also be followed with all seriousness. (ix) Improving status of women of the community : Women are almost half of any community. Naturally it warrants their participation also in the community welfare activities. Involving only the male members can not be a right approach. Women also have positive ideas, desire to promote the condition of the community, own assessment of the community problems and the ideas about ways & means to improve the situation. Therefore, efforts should be made to have their full participation in the entire process of community welfare through community organization. In absence of the same human resources of the community will not be harnessed properly. (x) Maintaining Continuity in the work : This is also an important method of community organization. Any initiative that has been adopted should not find gaps in between. Continuity adds strength to the programme and tendency to show eagerness to participate effectively. Thus, it can be said that just initiative is not enough. It should be supported by appropriate methods of work. If the above mentioned methods are properly followed there is every possibility that level of participation of the members of any given community including the women will be enhanced causing thereby positives impact on the community. 12.6 Types of Participation The participation in the context of community organization is generally of two types. They are : (i) Active Participation, and (ii) Passive participation In active participation people continuously get actively involved in the entire process of development of the community concerned which includes need identification, resource

NSOU ? MSW-IV 181 identification and mobilization, Programme planning, programme management, working out modalities of implementation etc. The community people will voluntarily come forward to demonstrate their concern for the welfare of the community and feeling of togetherness. On the otherhand, passive participation would mean awareness regarding the benefits and actual receipt of the same. They support the idea and initiatives but due to various reasons don't get involved in the process. 12.7 Reasons Behind Lack of Participation Participation is generally not forthcoming. Even after making sincere efforts many a times it is found that participation is not achieved at the desired level. Sometimes it remains at very poor level. There are definite reasons behind it which include the followings : (i) Lack of adequate knowledge and experience on various issues relating to life & living. (ii) Not feeling comfortable in sharing ideas and also working together with other members of the community. (iii) Lack of mutual trust and understanding as a result of century old socio-economic and religious practices. (iv) The programmes that are planned for implementation do not match with the actual needs of the community concerned. (v) Weaknesses in the arrangement of discussion sessions, resource mobilization and implementation strategy of the programmes designed. (vi) Experience of failure in the past. Since it creates mental set back, the people concerned remain demoralised. Such a mental condition do not help any person to join hands in any common endeavour for common welfare. (vii) Pressure of vested interest groups is yet another factor responsible for the causation of non-participation in community welfare activities. Since such groups are always there in communities a section of population become disgusted and feel like avoiding such groups.

182 NSOU ? MSW-IV (viii) Sometimes no planned and organised effort is made to build community feeling. In absence of such feeling a section of community people keep themselves away from the community organization process. (ix) Lack of proper community leader is also a barrier in the process. If the leader or leaders are biased, lazy, skillless, short of ideas, poor in communication, shy of facing people, not having clean image then he can't attract people to join hands in the community welfare activities. (x) Lack of ambition, spirit and determination is further a cause of non-participation. If, by nature the community people are like that, the level of participation will naturally remain poor. (xi) People are basically self-centric and indifferent towards community welfare issues. Such a situation does not create an atmosphere in which people will come forward to participate. (xii) Factlessness on the part of the community organizer / the agency concerned can be treated as another problem in achieving participation. Such a situation arises when the agency or the community organizer is new in the field, lacks experience and knowledge, lethargic, not sincere enough to deal the issue properly. (xiii) Conflict between the sub groups within the community is yet another factor responsible for non participation or poor participation of people. Sometimes it is so nasty that withdrawal of a section of community people is seriously marked in any community welfare activity. (xiv) Lack of community based institution is also a vital reason behind lack of participation in community welfare activities. If exists, these institutions can play a significant role in community organization. But if it does not exist or exists in name only then a player in the field is missed out and mobilization process of people is hampered resulting thereby low rate of participation. (xv) Absence of inner urge of the development agencies to involve the community to the extent it should be involved. If the agency works with such a hidden agenda because of fear to face the large number of people the participation level is bound to be poor.

NSOU ? MSW-IV 183 (xvi) The communities, both in rural and urban areas, are generally segregated on the basis of religious background, caste, economic status etc. They maintain distance with each other, knowingly or unknowingly. This creates hindrances to come together and jointly work for the welfare of the community. (xvii) Poverty and apathy is also considered as one of the important reasons of lack of participation. The poor people generally suffer from apathy. They hardly believe that their condition will ever be changed. With that kind of a mental make up it is very challenging to get them involved in the process of community organization. (xviii) Absence of feeling of social responsibility is also a reason behind poor or no participation. Until and unless people feel that all individual members of a given community have some social responsibility or responsibility towards others nothing positives can be achieved. Due to various reasons in most cases this feeling is seriously missing as a result of which participation of people lacks. (xix) Not attaching priority to it is yet another factor responsible for poor participation rate. People one generally confined to their own family affairs and does not give priority to community affairs. This type of a culture reduces the possibility of community participation. (xx) Lastly, it can be stated that even if participation becomes available at the initial stage at some points of time it disappears or becomes weak. If proper monitoring is not done, sustainability aspect is not taken care of participation aspect will naturally remain low. The paragraphs cited above give some indication about the possible reasons behind lack of participation in the context of community organization. Keeping these in mind if adequaty precautions are taken rate of participation is expected to go high. Therefore, the development agency and its community organizer need to remain careful about the steps that are to be taken to avoid the negatively contributing factors as mentioned earlier. 12.8 An Example of People's Participation On the side of High way in Sibsagar district of Assam there are four-five villages in a cluster. While making the High way, deep ditches came into being on both sides of the road. Rainfall rate of this part of Assam is comperatively high. As a result, almost

184 NSOU ? MSW-IV about eight-nine month these ditches used to remain full or half full with water. No bridge was constructed over it. This compelled the villagers of the concerned villages to cross it by wearing local handmade towels. Particularly for women crossing the water full ditch was a nightmare. At a point of time the community people of the concerned villages seriously felt it essential to construct some bridge. They approached the elected leaders, govt officials starting from block level to district level but nothing positive lappened. It took two more years, Then they sat together and decided to do it by putting their own efforts and resources. They collected some wood from the Forest dept., mobilised fund to purchase other essentials and meet the cost of skilled labour. One adult member from each family gave voluntary labour for 10 days. ultimately the wooden bridge was constructed. This gave them impetus to go further. Next year they repaired both the primary schools of the area. Thus, through active community participation two problems of the area could be addressed effectively. 12.9 Summary Much of he success of any programme depend on the participation of the community members. If the people feel that their rights & entitlements will be fulfilled, by being a part of a action programme, they will definety come forward, otherwise they will not. Thus to increase community participation one must keep in mind the interest of the people only then it would enhance the effectiveness any programme & be fruitful in true sense. 12.10 Review Questions 1. What do you mean by Community participation ? 2. Explain the importance of community participation. 3. What are the reasons behind the lack of community participation in the process of community organization ? 4. Briefly describe the type of community participation. 5. Give an account of the methods that can be followed to achieve community participation.

NSOU ? MSW-IV 185 6. Analyse the following terms (i) Sub groups : (ii) Felt-needs : (iii) Monitoring : (iv) Evaluation : (v) 'I-they' feeling : (vi) Dependancy syndrome : (vii) Realistic Planning : (viii) Identification with people : (ix) Culture-bound approach : (x) Sense of dignity : (xi) Self-propelling : (xii) Supervision ; (xiii) Active participation (xiv) Resource mapping : (xv) Resource mobilization : (xvi) Vested interest : (xvii) Segregated life style : (xviii) Apathy : (xix) Self-centric and indifferent ; (xx) Social responsibility : (xxi) Socio-economic practices : 7. Fill in the gaps (i) _____ is the primary reason behind apathy.

186 NSOU ? MSW-IV (ii) _____ participation is that in which people come forward to take part whole heartedly. (iii) If community organizer can establish proper _____ with the community level of participation is likely to improve. (iv) _____ is another important factor responsible for non- participation. (v) _____ is a must to initiate any community welfare programmes. (vi) _____ are to be assessed before planning any community welfare programme. 8. Match the followings (i) Joint supervision should be done by : – Govt. and NGO – Panchayat and development agency – Community leader and community organizer. (ii) The method is : – How we work – Who works – Why works (iii) Skill means : – expertise – Knowledge – Working ability (iv) We evaluate because – We want to find the faults – We want to examine the achievent level – We want to see the qualitative aspect

NSOU ? MSW-IV 187 (v) Felt-needs are those (in C. O. practice) – Which are felt by community organizer – Which are felt by the agency concerned – Which are felt by the community people (vi) Segregation is the result of – Caste – Religion – Economic condition – Geographical loction – All of them. 12.11 References 1. 188 NSOU ? MSW-IV UNIT- 13 Social Action Structure 13.1 Objective 13.2 Introduction 13.3 Concept 13.4 Initiator 13.5 Characteristics of Social Action 13.6 Importance 13.7 Goals, Steps and Procedures 13.8 Strategies of Social Action 13.9 Methods of Social Action 13.10 Principles of Social Action 13.11 Summary 13.12 Exercise 13.13 Reference 13.1 Objective The principal objective of this unit is to assist the students of social work to get clear idea about the concept of Social Action, its importance in the context of community welfare, methods to be applied to make Social Action movement fruitful, its characteristics, principles and strategies etc. The present unit will also provide them idea with regard to goals, steps and procedures. Thus the present unit has been planned in such a manner that students will get thorough ideas about why and how Social Action movement is undertaken and the ways that should be adopted to make it fruitful. 13.2 Introduction The present sub-unit is one such issue that needs to be taken care of by the community organisation worker/agency concerned and the community leaders. Initiating

NSOU ? MSW-IV 189 Social Action movement is no doubt a challenging job. Hence one should have clear perception about it, learn the principles and mthods and apply the same properly. It is in this background that the present unit has ben designed to meet that need of the students who are the would-be-social workers. The unit is expected to make them skilled and competent to do the job successfully. 13.3 Concept Social Action is a process by which a large number of public is oriented towards creating a change for community welfare. This process is initiated either by an individual or a group of people who has a sound understanding regarding the desired change. The power of the social Action movement lies in the motivation of the mass and in the belief of the common people that what they are going to do is social and right. It is said that Social Action "is an organised effort to bring change in the social and economic institution of the society and unlike social work and social welfare which aims at social change but not any change in the established order of the society." Social Action is a process by which – People are organised and oriented towards bringing desireable change in social and economic institution. – People work against change that is detrimental to them. – People bring change contributive to them. – People are reorganised to take action against some acute problems of the society. Social Action, as has been stated by Elizabeth Wiokneden, is "a term commonly applied

is individual, group or community effort within the framework of social work philosophy and that aims to achieve social progress, to modify social policies and to improve social legislation and health & welfare activities. Social Action

is considered as one of the secondary methods of professional social work. It is new addition to the list of social work methods. Nevertheless both welfare and development of any community largely depend on Social Action. Gandhi, Marx, Chaitanya, Martin Luther King, Jayprakash Narayan, Mother Teresa, Sundarlal Bahuguna, Medha Patekar, Aruna Roy and Anuradha Talwar led various kinds of movements for Social Action resulting thereby for reaching transformations in the social psyche. Grace coyle has defined

76%

MATCHING BLOCK 49/61

W

Social Action as "the attempt to change the social environment in ways, Which we believe will make life more satisfactory. It aims to effect not individuals but social institutions, laws, customs, communities."

And according to Keneth Pray Social Action is the "Systematic conscious effort directed to influence the basic social conditions and policies out of which arise the problems of social adjustment and maladjustment to which our service as social workers is addressed."

NSOU ? MSW-IV 191 13.4 Initiator Social Action is generally initiated by some individual or a group. Sometimes it takes place without serious planning. But generally the change agent or initiator gives enough time to study the problem, motivate people, establish coordination with various institutions, arrange fund before initiating the action. Though in some cases it is naturally evolved, leadership is found to be present in all the cases of Social Action. Whether the initiator or leader is an individual or a group he/she/it needs to have – Foresightness – Public relation skill – Research skill – Negotiation skill – Motivation skill – Advocacy skill – Skill of effective communication – Fund raising capacity – Challenge facing capacity – Capacity to play the role of spokes person. 13.5 Characteristics of Social Action The basic characteristics of Social Action are the followings (i) The action might begin with the initiation of one or more individual, and group action and active involvement of the communities concerned is essential to fulfil the objectives. (ii) Action should be initiated in accordance with the established rights of the citizens and democratic practices. (iii) Belief in the social welfare and social progress is one of the principal motivating factors and naturally it should form the motivation force of the participants. 192 NSOU ? MSW-IV (iv) The force behind the Social Action lies in the group compulsion. It involves an element of group pressure or Loka-Sakti. It is the group which will determine whether Social Action is for change or against change. (v) Social Action does not take place until majority of the community people come forward and support the remedial measures. So the objective of the initiator would be to create strong social awareness among the target group. Social awareness is not restricted only to make people aware about the problem but it also includes moral, emotional and physical support for remedy. (vi) Social Action leaves final decision with regard to strategy, method, timings etc. on the target population for whom the action is directed. (vii) Social Action is fundamental in nature and it tackles the problems at its root and makes effort to remove the very cause of the problem. (viii) It encourages to bring about action by some person other than the social actionist. The social actionist has an objective but that can be fulfilled only if group or community support is achieved. (ix) For initiating any Social Action programme knowledge regarding depth and dimension of the problem, root causes behind, awareness level of the problem etc. is essential. And to get this knowledge properly some amount of research work is necessary. (x) For launching an action programme it is necessary to embrace educative method and non-violent approach. The above mentioned characteristics are associated with Social Action along with a few more. But at this juncture it should be mentioned here that there is some confusion about whether Social Action is a part of the social work methods or a separate method. There are some who believe that it is a part of community organisation. As early as in 1922 Social Action was recognised as a method of social work by Mary Richmond. However, it did not receive much attention of social workers. It was more true in case of developing countries where it was perhaps more relevant. But slowly people in the field have started believing that it is one of the methods of social work and not a part of any other method. Both Nanavati and Moorthy believed that though Social Action is used for Community Organization, its scope is wider and hence it is a separate method.

NSOU ? MSW-IV 193 Thus, the characteristics mentioned earlier are associated with the Social Action which is an independent method of social work. 13.6 Importance In all communities problems of various nature existed in all ages. At some point of time people of the concerned community may start thinking that its negative impact on the socio-economic life of the people is very acute. They start believing that without fighting it out, life of people will become miserable. Then they adopt the method of Social Action to rescue themselves from such situation. Since Social Action is a kind of method which is very much appropriate in such situation the people of concerned communities have naturally felt its importance. 13.7 Goals, Steps and Procedures Social Action could be of various types. And it can be carried on in different settings. All Social Action movements have a common goal. They are, for example, the power that controls community welfare should be transferred to the poor people and oppressed for making them capable of controlling their own destiny and guide their welfare all by themselves. The goal of Social Action here is to see that the welfare goods reach the poor. So, the goal of Social Action is to ensure that power of establishment is taken away from the establishment and transfer of the welfare measures to the distant consumers or to those whom it does not reach. Now, what about the steps and procedures? They are tracing out the nature and depth of problem, number of people being affected, creating awareness in them, deciding strategy and methods etc. Procedures include : (i) Sensing the problem (ii) Identification of problem (iii) Finding a support base (iv) Problem diagnosis 194 NSOU ? MSW-IV (v) Gathering of detailed information (vi) Setting goals of action (vii) Deciding about approaches (viii) Weighing alternative approaches (ix) Making final plans (x) Going ahead with the action (xi) Assessing and evaluating. 13.8 Strategies of Social Action To make it effective several strategies are to be adopted but there is no consensus on the strategies that can be adopted. However, the strategies that form the core of any social action practice are of the following three categories. (i) Collaborative (ii) Bargaining, negotiation advocacy (iii) Conflictual and confrontational Under collaborative strategies efforts are being made to bring change in the institution through education, persuasion, demonstration as well as experimentation. This strategy is based on the assumption that no one stands to lose power, authority or wealth. All would prefer to protect their interest at any cost if they are convinced that their interests are challenged. While working with

based on the assumption that one anticipates resistance to change. Thus the activity of social activist or change agent should be accompanied by appropriate tactics, which are not persuasive but affect change through pressure.

These strategies could include bargaining and negotiation, publicity that leads to discomfort for the persons or agencies responsible, advocacy through the media etc. and attempts to isolate the target group from the opinions of the community at large. This strategy also includes dramatising the situation for creating public opinion.

NSOU ? MSW-IV 195 The next set of strategy is based on the expectation that in the struggle between pro-change and pro status quo. This dynamics of conflict is a reality in the social action effort, that may include fasting, sit ins, boycotts etc. According to Richard Bryant there are

65%

MATCHING BLOCK 53/61

W

two sets of strategies. They are bargaining and confrontation. Bargaining includes submitting petitions, lobbying, information sharing, publicity campaigns etc.

On the otherhand, confrontation means strikes, demonstrations and sit ins. According to khinduka and Coughlin "Social Actionists employ both norm – adhering and norm – violating strategies, his social philosophy and theoretical starting point are neither the consensus or integration model of socieity nor the conflict or coercion model. To social actionists both models are useful.". It is difficult to "conceive of a society unless we realise the dialectics of stability and change, integration and conflict, function and motive force, consensus and coercion". The above mentioned strategies and techniques are selected basically depending on the existing situation, target group and the goal to be achieved. Sometimes rather than maintaining watertight compartments the strategies go on overlapping. Sometimes social action movement may start with collaborative or bargaining strategies but ultimately move on to the confrontational strategy. In this context one may find it logical to give some reference to Gandhian strategy of social action considering its effectiveness. In the Gandhian approach

76%

MATCHING BLOCK 54/61

W

non-cooperation, pursuation and non-violent intervention have been incorporated as the broad categories of

strategy and emphasis has been given on strategic wisdom in their use. How the strategies are decided? These are generally decided on the basis of the factors for action such as social situation, people's tradition, extent and depth of knowledge, experience of non-violent action possessed by the concerned population, appraisal about resources at the disposal of opponent, possibility of coalition with any other forces to achieve the goal, risks involved and the aftermath of movement. Strategies may also differ from area to area. While concluding this portion of discussion it should be clearly mentioned that the strategies are bound to remain ineffective if they fail to take care of people's active participation in the entire process of social action. People's participation means harnessing the power of people that generally lie dormant in them. It is the "process of creative

196 NSOU ? MSW-IV involvement of the concerned people in defining and fulfilling the objective. It is not a passive taking part in activities designed by others, not an act or mere consuming the fruits of economic and social activity. It is the taking of initiatives to decide. What is to be done and how, and to do it" Thus Social Action is considered as the learning and experiencing of people's participation rather than the achievement of goal. The social activist needs to keep it in mind that no strategy fits well in all situations. Wise decision will have to be taken after considering various issues mentioned above before going for any social action. 13.9 Methods of Social Action The methods of Social Action are mainly the followings. (i) Proper identification of problem. It should be of immediate concern and felt by the people concerned. (ii) Doing research on that which means collection of data regarding the problem. It may take some time to gather relevant information concerning the issue but it should definitely be done at the initial stage of Social Action. (iii) Educating people of the area concerned with a view to create inner urge to go for Social Action. It is very essential since without their active involvement in the process this movement can not go ahead properly. (iv) Having dialogue with resourceful persons whose opinion, suggestion, cooperation and good wishes matters. (v) Mobilising man, money and materials which are so very necessary to make the movement successful. This is one of the principal methods since without resources nothing can really be done. (vi) Conferring people before drawing up plan. This method should be adopted because if it is not done people may feel that they are neglected. And if such feeling exists in the mind of the people then movement can not be made successful. Besides, views of the people concerned may give some more light on how aspect of the movement. (vii) Developing capacity before jumping for remedy. The capacity development initiative should be made based on definite planning so that it remains productive.

NSOU ? MSW-IV 197 (viii) Slow but steady change will be the objective of the movement. It should take reasonable time to give proper direction to the movement. (ix) Making the mass effort sustainable by not allowing the momentum to go down. Generally it so happens that after some time the initial initiative of the people comes down. The leaders should remain careful about that and do not allow the level of participation and spirit go down. (x) All the players should labour through a solution. Undirected effort has no future and hence people should put their energy to see the face of solution. (xi) Collecting feedback and bringing changes wherever necessary. This is also an important method in the process of Social Action since at different stages of the movement bringing some changes or modifications would be necessary on the basis of the feedbacks received form time to time. We may further mention the methods suggested by some social thinkers / Scientists. As per Clearke and Helen there are some main methods or techniques of Social Action. They are : – Acquisition of facts and use of the same – Education, interpretation of facts and situation and public relation. – Administration and enacting legislation of appropriate nature. Dr. Kirpal Singh and Shrivastava have mentioned the following three methods of Social Action. – Study of social issues, formulation of judgement as well as recommendation of programmes thereof. – Organising aehocacy and gaining public support – Influencing policy wokers And according to less the methods of Social Action are : – Research – Education – Co-operation

95%	MATCHING BLOCK 55/61	W
Arbitration – Negotiation – Mild coercion – Violation of legal norms – Joint Action The		

points mentioned in above few paragraphs are the principal methods of Social Action. 13.10 Principles of Social Action The basic principles of Social Action are the followings : (i) Credibility building : This principle calls for building

71%	MATCHING BLOCK 58/61	SA 480E2430_BSW_Social Work with Communit... (D165107508)
a public image of the leadership, the organization concerned and even the participants of the movement as champions of justice and truth. Good image helps in securing due recognition from the opponents and the peripheral participants of the movement.		

Since without such image movement can not gear up, the principle of image or credibility building should always be followed. (ii) Legitimization : It

64%	MATCHING BLOCK 59/61	SA 480E2430_BSW_Social Work with Communit... (D165107508)
is the process of convincing the reference people as well as the general public that the movement		

is a right kind of action. Legitimization

86%	MATCHING BLOCK 57/61	W
is a continuous process. Before launching the programme, the leaders justify their action. As the		

movement grows and some new dimensions are added to it, the leaders and their co-workers put forward fresh arguments. This principle has been extensively used by the Satyagrahis to get social approval and support of the non-committed people for the cause of the struggle. The classic example fo this is the situation of strikes and lockouts in which both the management and the unions make serious effort to get sympathy of the public. (iii) Demonstration : It

73%	MATCHING BLOCK 60/61	SA 480E2430_BSW_Social Work with Communit... (D165107508)
is the principle of mass mobilization by which the leaders of this movement galvanize the population into action by emotional appeals, sensational news management, catchy songs and such other techniques.		

NSOU ? MSW-IV 199 For creating enthusiasm use of appropriate songs is very important. Powerful speeches also can be used to make people aware about the situation that campelled to go for Social Action as well as feel motivated to support the movement. Slogan is another way to get the support of the common people. Boycott is also a dramatic way of influencing public opinion. Attempt should also be made to involve women in all the stages of social action programme. (iv) Making dual approach : Any Social Action

75%	MATCHING BLOCK 61/61	SA 480E2430_BSW_Social Work with Communit... (D165107508)
activist has to build counter system which is beneficial to the needs of the mobilized public		

of the area on a self help basis without involving the opponent. It is a common experience that constructive programmes, in absence of conflictual programmes can not achieve the goal. Therefore, non-conflictual constructive actions should be set in motion simultaneously with conflictual process. (v) Undertaking manifold programmes : To mobilize targeted population, a variety of programmes should be undertaken such as : – Social programmes which include eradication of prejudices against untouchables, prevention of early marriage, ensuring women’s rights etc. The main purpose of such initiative is to build up the human resources. Removal of oppressive patterns of social interaction is an important aspect in the consolidation of any movement including Social Action. – Economic Programme should also be initiated for encouraging people to actively support the movement. Gandhiji initiated khadi & village industries to the people with the ultimate objective to ensure their participation in the freedom movement. – Political Programme : Along with the social and economic programmes political programme should also be undertaken to build up cohesion among various sections of the people fighting for a common cause. The activists need to suppress the tendency of divisive nature through political programmes of various kind. 13.11 Summary This unit explained clehorately one of the secondary method of social work. The

200 NSOU ? MSW-IV ideal given in the unit will help the learner the mohilize the community and take appropriate steps in addressing social problem & establish justice in the society. 13.12 Review Questions 1. Define the term Social Action. 2. What are the characteristics of Social Action ? 3. In Social Action some principles are followed. What are those ? 4. Illustrate the strategies of Social Action. 5. The initiator of Social Action should have some skills and qualities. What are those ? 6. What are the steps and procedures of Social Action ? 7. Analyse the methods of Social Action. 8. Write short notes on : (i) Dual approach (ii) Goals of Social Action (iv) Collaborative Strategy (v) Credibility building 9. Analyse the following terms : (i) Reforms (ii) Social institutions (ii) Social climate (iv) Social change (v) Coordination (vi) Challenge facing capacity

NSOU ? MSW-IV 201 (vii) Spokesperson (viii) Social Progress (ix) Problem diagnosis (x) Negotiation (xi) Active participation (xii) Research (xiii) Mild coercion (xiv) Demonstration (xv) Mobilization 10. Fill in the gaps (i) In Social Action people are _____ and oriented towards bringing desirable change. (ii) Social Action is _____ betterment. (iii) It is generally initiated by _____. (iv) The initiator of Social Action should have _____. (v) Social Action was recognised as early as in _____. (vi) Identification of _____ is one of the procedures of Social Action. (vii) No strategy _____ well in all situations. (viii) Having dialogue with _____ persons is essential in the process of Social Action. (ix) Slow but _____ change should be the objective of Social Action. (x) Good image helps in securing due _____ from the opponents. (xi) Mass _____ is must in Social Action. (xii) Along with socio-economic programmes, _____ programmes should also be undertaken.

202 NSOU ? MSW-IV 11. Match the followings (i) In Social Action efforts are made to – bring change – Stop some change to come – both (ii) Social Action is applied to – modify the social institution – bring positive change in social environment – both (iii) The leader of Social Action movement should have – foresightness – selfishness – biasness (iv) Initiator of Social Action can be – an individual – a group – even a community (v) Steps of Social Action include – deciding about approaches – finding a support base. – problem diagnosis (vi) Social actionists employ – norm-adhering strategy – norm - violating strategy – both (vii) Social Action methods are : – Arbitration – Negotiation – Education

of the materials. Practically speaking, their role amounts to an involvement in ‘invisible teaching’. For, whoever makes use of these study materials would virtually derive the benefit of learning under their collective care without each being seen by the other. The more a learner would seriously pursue these study materials, the easier it will be for him or her to reach out to larger horizons of a subject. Care has also been taken to make the language lucid and presentation attractive so that they may be rated as quality self-learning materials. If anything remains still obscure or difficult to follow, arrangements are there to come to terms with them through the counselling sessions regularly available at the network of study centres set up by the University. Needless to add, a great deal of these efforts is still experimental—in fact, pioneering in certain areas. Naturally, there is every possibility of some lapse or deficiency here and there. However, these do admit of rectification and further improvement in due course. On the whole, therefore, these study materials are expected to evoke wider appreciation the more they receive serious attention of all concerned. Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor First Print — February, 2022 Printed in accordance with the regulations of the Distance Education Bureau of the University Grants Commission.

	<p>Paulo Freire (1970), Suggests most people who experience social oppression do not necessarily act to change their reality. This is because they have been taught to accept the dominant, or oppressors', narrative. That narrative has placed them in an inferior position and their oppressor's in a superior one. Over time, the oppressed come to believe in their inferiority and thereby internalize their oppression. The inferiority is now a part of their identity and affects the actions they take and the decisions they make in life. In turn, their acceptance of an inferior position in society enhances the dominance of their oppressors. Freire also argues that marginalized individuals do not have a critical awareness that allows them to see the injustices in their lives. They tend to be passive and unable to recognize their own capacity to transform their social realities, in part, because their condition of marginalization and oppression keeps them in a state of helplessness. Someone forced to the margins of society who lacks critical awareness may accept their low position. They may see it as the result of fate, bad luck or supernatural forces. This is why helping people develop critical awareness and understanding of the factors that contribute to their situation is an important early step in the process of empowerment.</p>		<p>Paulo Freire (1970), most people who experience social oppression do not necessarily act to change their reality. 	<p>empowerment means a community has the resources and talent to manage its affairs, to control and influence relevant groups and forces within and outside the community, and to develop empowered leaders and community organizations. One example of developing empowered leaders is community members learning to organize so they can take part in improving their communities and take actions toward these improvements. Empowerment may be particularly important for communities rebuilding after trauma, such as survivors of a natural disaster, or for individuals in a war-ravaged country (Anckermann et al., 2005). Indicators of community empowerment include processes such as collective reflection, social participation, and political discussions, as well as outcomes such as having obtained adequate resources for improving community well- being and social justice (Anckermann et al., 2005). Collective reflection means that community members get together and jointly examine the issues that have mattered to them over time.</p>		<p>empowerment means a community has the resources and talent to manage its affairs, to control and influence relevant groups and forces within and outside the community, and to develop empowered leaders and community organizations. <p>Community empowerment works through increasing the community's influence over the structures and policies that affect the lived experiences of the community and its members. Increases in influence often occur through partnerships between those in power and other community members. These partnerships may take place in advisory boards, coalitions, or broader community inclusion initiatives (Fawcett et al., 1994). At times, community empowerment may mean that members of the community become empowered with the help of the community leaders and vice versa. Such "co-empowerment" may be challenging, yet can be very beneficial to communities (Bond & Keys, 1993).</p> <p>W https://press.rebus.community/introductiontocommunitypsychology/chapter/empowerment/</p>		<p>Community empowerment works through increasing the community's influence over the structures and policies that affect the lived experiences of the community and its members. <p>may use a variety of strategies to address power imbalances (Fawcett et al., 1994). These strategies can help reduce or eliminate barriers, develop networks, and educate others in the community (see Practical Application 10.1). They can also create opportunities for capacity building and allow participants to advocate for changes in policies, programs, or services. To promote empowerment at the environmental and societal level, it is important to examine national, state, and local policies. Many programs and services unexpectedly place barriers and stressors on oppressed groups, such as people with disabilities. Ultimately, empowerment efforts are directed at promoting social justice. The strategies highlighted in this chapter can serve as a guide for individuals interested in promoting empowerment in their communities. It should be noted that there are many tactics that have been used to promote change over time.</p> <p>W https://press.rebus.community/introductiontocommunitypsychology/chapter/empowerment/</p>		<p>may use a variety of strategies to address power imbalances (Fawcett et al., 1994). <p>practice is based on the belief that in order to effect change, a wide variety of community people should be involved in planning, implementation, and evaluation. Key themes include the use of democratic procedures, voluntary cooperation, self-help, the development of local leadership, and educational objectives. 4.6.2 Social Planning Model A rational, deliberately planned, technical process of problem-solving with regard to substantive social problems, characterizes this model. The degree of community participation may vary. However, building community capacity or fostering radical or fundamental social change is not a major goal of this model of community practice. 4.6.3 Social Action Model Practitioners practising this model assume that a disadvantaged segment of the population needs to be organized in order to make demands on the larger community for increased resources or improved treatment. Key themes in this model are social justice, democracy, and the redistribution of power, resources, and decision making.</p>

PREFACE In the curricular structure introduced by this University for students of Post-Graduate degree programme, the opportunity to pursue Post-Graduate course in a subject is introduced by this University is equally available to all learners. Instead of being guided by any presumption about ability level, it would perhaps stand to reason if receptivity of a learner is judged in the course of the learning process. That would be entirely in keeping with the objectives of open education which does not believe in artificial differentiation. I am happy to note that university has been recently accredited by National Assessment and Accreditation Council of India (NAAC) with grade 'A'.

Keeping this in view, study materials of the Post-Graduate level in different subjects are being prepared on the basis of a well laid-out syllabus. The course structure combines the best elements in the approved syllabi of Central and State Universities in respective subjects. It has been so designed as to be upgradable with the addition of new information as well as results of fresh thinking and analysis. The accepted methodology of distance education has been followed in the preparation of these study materials. Co-operation in every form of experienced scholars is indispensable for a work of this kind. We, therefore, owe an enormous debt of gratitude to everyone whose tireless efforts went into the writing, editing, and devising of a proper lay-out of the materials. Practically speaking, their role amounts to an involvement in 'invisible teaching'. For, whoever makes use of these study materials would virtually derive the benefit of learning under their collective care without each being seen by the other. The more a learner would seriously pursue these study materials the easier it will be for him or her to reach out to larger horizons of a subject. Care has also been taken to make the language lucid and presentation attractive so that they may be rated as quality self-learning materials. If anything remains still obscure or difficult to follow, arrangements are there to come to terms with them through the counselling sessions regularly available at the network of study centres set up the University. Needless to add, a great deal of these efforts are still experiment—in fact, pioneering in certain areas. Naturally, there is every possibility of some lapse or deficiency here and there. However, these do admit of rectification and further improvement in due course. On the whole, therefore, these study materials are expected to evoke wider appreciation the more they receive serious attention of all concerned.

NSOU ? PGSW-V 8 1.0 Objective Sociology is a very important of Social Science discipline. As a Social workers we must gain detail knowledge about this subject an this in a branch of Social science which deals with human behaviour and various aspects of Societal life. 1.1

94%**MATCHING BLOCK 3/185****W**

Introduction Sociology, as compared to other social sciences, like economics and political science, is a young discipline. One could say, it is about a hundred-and-fifty years old but there has been a more rapid development of the subject in the last fifty to sixty years. This is partly due to desire, particularly, after the Second World War, to understand more about the behaviour of people in social situations. All social science subjects are concerned with the behaviour of people but each of them studies different aspects. Sociology, however, is concerned with social relations in general, and with social

group is and institutions in particular. 1.2 Definition of Sociology The first social scientist to use the term sociology was a Frenchman by the name of Auguste Comte who lived from 1798-1857. As coined by Comte, the term sociology is a combination of two words. The first part of the term is a Latin, socius- that may variously mean society, association, togetherness or companionship. The other word, logos, is of Greek origin. It literally means to speak about or word. However, the term is generally understood as study or science (Indrani, 1998). Thus, the etymological, literal definition of sociology is that it is the word or speaking about society. A simple definition here is that it is the study of society and culture. Sociology is the scientific study of society, which is interested in the study of social relationship between people in group context. Sociology is interested in how we as human beings interact with each other (the pattern of social interaction); the laws and principles that govern social relationship and interactions; the /influence of the social world on the individuals, and vice versa (Ibid.). It deals with a factually observable subject matter, depends upon empirical research, and involves attempts to formulate theories and

NSOU ? PGSW-V 9 generalizations that will make sense of facts (Giddens, 1982). Regarding the detective and expository nature the science, Soroka (1992:34) states that "Sociology is a debunking science; that is, it looks for levels of reality other than those presented in official interpretations of society and people's common sense explanations of the social world. Sociologists are interested in understanding what is and do not make value judgments." 1.

Auguste Comete, the founding father of sociology, defines sociology as the science of social phenomena "subject to natural and invariable laws, the discovery of which is the object of investigation". 2. Kingsley Davis says that "Sociology is a general science of society". 3. Harry M. Johnson opines that "sociology is the science that deals with social groups". 4. Emile Durkheim : "Science of social institutions". 5. Park regards sociology as "the science of collective behavior". 6. Small defines sociology as "the science of social relationships". 7. Marshal Jones defines sociology as "the study of man-in-relationship-to-men". 8. Ogburn and Nimkoff : "Sociology is the scientific study of social life". 9. Franklin Henry Giddings defines sociology as "the science of social phenomena". 10. Henry Fairchild : "Sociology is the study of man and his human environment in their relations to each other". 11. Max Weber defines sociology as " the science which attempts the interpretative understanding of social action in order thereby to arrive at a casual explanation of its course and effects". 12. Alex Inkeles says, "Sociology is the study of systems of social action and of their inter-relations". 13. Kimball Young and Raymond W. Mack say, "Sociology is the scientific study of social aspects of human life". 14. Morris Ginsberg: of the various definitions of sociology the one given by Morris Ginsberg seems to be more satisfactory and comprehensive. He defines sociology in the following way: "In the broadest sense, sociology is the study of human interactions and inter-relations, their conditions and consequences".

Concept of Society and Culture Society has been defined as a relatively self sufficient, usually large group of people nwho maintain direct or indirect contact with each other through a culture. Culture is generall understood as the shared language, beliefs, goals, artefacts and experiences that combine together to form a unique pattern. In other words, culture is a society's way of life (Stebbins, Robert A. 1987) 1.2.2 Emergence of Sociology During the 19th century sociology emerged as separate social science in Europe and its objective was the study of society. Auguste Comte, Spencer and Emile Durkheim besides several other social thinkers sought to establish the idea of society as a matter of study, unique in itself. They examined society as a whole which is more than the sum of its parts. Society is more than the actions, thoughts, values, belief and wish of its individual members. It is a complex and abstract reality; yet all human beings live in a society. A sociologist is interested in the general study of social behaviour as it occurs in groups, large or small, and lays special stress on understanding social life in the contemporary world. The word 'general' has been used as other social science disciplines deal with more specific areas. For example, a political scientist studies governmental functions and activities and an economist studies production

and

W

distribution of goods. It is, however, difficult to draw an exact line of difference. Social psychology, social anthropology, political science and economics, all in a sense, have human social life as their general subject. As sociology is a relatively young discipline compared with the discipline of philosophy, economics and political science, sometimes, people confuse it with social work. Sociology is used in the discipline of social work to analyse and understand social problems. Social work is concerned with the uplift of those socially deprived, physically handicapped, etc. Sociology is not concerned with the reformation of society as such nor is it directly involved in social planning or directed change. The sociological understanding and research can help in better planning and in finding ways and means of acceptance of improved practices, in the formulation of development policies and programmes. It is generally accepted that sociologists do not interfere with

social

W

of the social behaviour. There are, however, at present, some, who question this and feel that sociologists must take an active role in the development process. We have defined sociology as the study of social life and group interaction and social behaviour. In order to understand social life, sociology is interested in the study of the organisation and the functioning of societies or social groups. 1.3

Major concerns of Sociology Sociology seeks to study the society and to analyse it in terms of the social relations that have a pattern. Sociology addresses itself to three basic questions : i) how and why societies emerge? ii) how and why societies persist? iii) how and why societies change? Sociology has been concerned with the evolution of society. It has tried to analyse the factors and forces underlying the historical transformations of society. For example, societies have evolved from primitive tribal state to rural communities. How villages have become important centres of commercial activity or of art and culture and grown into towns and cities. Sociology has also been concerned with the units of social life. The attempt has bean to look at various types of groups, communities, associations and society. The effort has been to study the pattern of social relationships in these units. An important area which sociology deals with is social institutions. The institutions provide a structure for the society and perform functions, which enable the society to meet its needs. In any society, there are five basic social institutions; family, political institutions, economic institutions, religious institutions and educational institutions. However, in more complex societies, there may be many other institutions such as bureaucracy, military organisations, welfare and recreational organisations, etc. Caste is also an institution, which is more or less peculiar to India. Another area of study and analysis by sociologists is social processes. In one sense, the social institutions provide the stability and order whereas social processes are the dynamic aspects of social relations. Among the various processes that will be dealt with in the latter units are socialisation, social control, co operation, conflict, social deviation and social change. NSOU ? PGSW-V 12 1.3.1 Concept of Culture Culture is another very important concept. As mentioned earlier, we are immersed in culture from birth onwards, we take culture for granted. It is difficult to imagine what life would be like without culture. Culture provides summing up

of the

97%

MATCHING BLOCK 10/185

W

past experiences, which are the necessary foundation for living in the present. Culture is learned and shared among members of the group. Culture in a sense, can seem to be the chief means of survival and adaptation. On each of the topics mentioned, which are concerns of sociology there will be units which will deal in much greater detail. The society is dynamic and is changing consequently the areas of interest of sociologists are increasing. Today, there is sociology of knowledge, sociology of science and art, sociology of health, sociology of development, etc. This indicates the expanding nature of sociology. 1.4 Sociology and Science At times, sociology has been defined as the science of society. This raises the question as to what

science

98%

MATCHING BLOCK 11/185

W

is. Some have thought of science as an approach whereas others have thought about it in terms of the subject matter. Simply stated, we might say that the scientific approach consists of certain assumption that the phenomena studied have a regularity and hence, a pattern. The method emphasises observation and verification of social phenomena. This involves a systematic approach to the study of phenomena. The systematic approach consists of : i) defining a problem for study; ii) collecting data on the problem defined; iii) analysing and organising the data; which would help in formulation of hypothesis; and iv) further testing of the hypothesis and on the basis of this, develop new concepts and theories. Sociology has been using a systematic approach in the study of social life. On the basis of the knowledge gathered through the systematic approach, it has tried to build body

of reliable

100%

MATCHING BLOCK 12/185

W

knowledge. From this knowledge, it has tried to establish the patterns of relationships from which effort can be made at understanding social behaviour. If we look at sociology from the point of view of its approach to the study of society, then sociology can be considered to be a science.

Some founding fathers Later on, in various units of this course you will come across the names of many early

sociologists. A brief introduction

94%

MATCHING BLOCK 14/185

W

is given of early sociologists, whose contribution to sociology is lasting. All of them wrote on the nature of human behaviour. In a way, they tried to understand profound changes taking place in society. 1.5.1 Auguste Comte (1798-1857) Auguste Comte is regarded as the founder of modern sociology. He is the first one to have used the word 'Sociology'. He tried to create

a new

95%

MATCHING BLOCK 15/185

W

science of society which could not only explain the past of mankind but also, predict its future course. He felt that society moves through definite and fixed stages and that, it progresses towards ever-increasing perfection. The three stages, according to him, in which the society moves, were : i) the theological or the religious ii) the metaphysical or the philosophical iii) the positive or the scientific stage. In the first stage people thought, all phenomena were caused by supernatural forces. Abstract forces of either a religious or secular type were considered to be the source of knowledge in the second stage. In the last stage, scientific laws were supposed to determine both the natural and the social worlds. He also talked about two broad areas-'social statistics', which deals with the orderly and, stable aspects of social life and patterns of behaviour (family, occupational, polity. etc.). The second area called 'social dynamics' emphasises the study of changes in a social system. According to him, sociology was to be the queen of all sciences.

1.5.2 Emile Durkheim (1858-1917) Emile Durkheim was also interested in sociology being a scientific discipline. He wrote a (1858-1917) book in 1895 entitled : Rules of Sociological Method. To him, social solidarity was one of the main principles of human life. He distinguished between two kinds NSOU ? PGSW-V 14 of solidarity: 'mechanical solidarity' based on common assumptions, beliefs, sentiments like those found in traditional societies and 'organic solidarity' based on the division of labour and inter-related interests as found in industrial societies. When solidarity is broken, there would be social disorganisation and confusion in society. He considered sociology as having wide interests, which includes sociology of religion, sociology of knowledge, sociology of law. sociology of crime, economic sociology, and sociology of education, art and aesthetics. An important concept given by Durkheim was social facts, which, according to him, are external to the individual but they exert pressure on the individual in the behaviour pattern. Customs, traditions, folkways and mores are social facts. He felt that sociology should be involved in the reformation of society. For him society was a reality in itself, that is, it is more than its parts.

1.5.3 Max Weber (1864-1920) Max Weber used the concept of social action rather than social relations. A comprehensive Max Weber study of social action, to him, meant understanding the meanings human beings give to (1864-1920) their behavioural pattern. The social behaviour was not merely a mechanical learning of norms but how people interpreted the social values. Sociology studies all kinds of social action without making any value judgements. Weber was concerned with understanding of inter- relations between parts of society and also, with comparative studies of different societies. He studied religion in different societies. His work Protestant Ethics and the Spirit of

NSOU ? PGSW-V 15

MATCHING BLOCK 16/185

W

Capitalism is one of the well known works in sociology. Through both these approaches, he tried to develop propositions having general validity. For example, he classified authority into three types - charismatic, traditional and rational. These concepts are still used in the study of leadership authority and power.

1.5.4 Karl Marx (1818-1883) Marx has helped through his ideas in understanding the nature of society, particularly, how conflicts occur. . Marx writes in 1848 that all history is a history of classes and class struggles.

The

98%

MATCHING BLOCK 17/185

W

society gets divided between the oppressors and the oppressed masters and slaves, lords and serfs and in the modern times, capitalists and workers. To analyse the structure of society, it was necessary to understand the forces of production and relations of production. The contradiction between the forces and the relations of production leads to class struggle. According to him, each society dies in time because of internal conflicts and contradictions and is replaced by a higher one. In time, capitalism would be destroyed and there would emerge a classless society characterised by absence of conflict, exploitation and alienation from this world

1.5.5

Herbert Spencer (1820-1903)

93%

MATCHING BLOCK 18/185

W

Herbert Spencer covers the fields of family, politics, religion and social control, division of labour and social stratification. He emphasised the study of whole more than the study of parts. The individual institutions have significant relations. It is through a study of these inter-relations that one can hope to understand society. He indicated that the inter dependence of the various parts was functional, i.e., each of the part performs different functions, which is necessary for the total well being of society. A large number of sociologists, who are "functionalists", use Spencer's idea of the

NSOU ? PGSW-V 16

functional inter dependence as a basis for their approach to the study of society. Above descriptions of the contributions of founding fathers of sociology are sketchy. The main purpose is to introduce their names and to give you some idea of their concerns in sociology.

1.6

100%**MATCHING BLOCK 19/185****W**

The nature and meaning of social development Development is a broad concept and, though interrelated, it differs from social change. Change is a value-neutral concept whereas development is a value-laden concept. The notion of development is, in other words, the process of desired change. All cases of change do not indicate development. Only planned and desired changes can be described as development. Thus, it is important to keep in mind the distinct character of the concept of development. Secondly, we also need to distinguish between economic and sociological notions of development. This point becomes clearer as you read this unit. While speaking of social development, we emphasise the sociological understanding of the process of development. As a broad concept, social development refers to the overall transformation of individuals and society, which may enable every person to achieve moral, social physical and material well-being. Egalitarian development is a desired goal, but it remains only an 'ideal'. In spite of development efforts, disparities in various dimensions of development continue to widen between societies, regions and groups. Variations are observed when we compare various regions or countries. Out of such comparisons have emerged the concepts of underdevelopment mainly in economic terms, such as per capita income, gross national product, level of the standard of living and degree of technological advancement. There are many criteria of 'over' and 'under' development. The simplest one of them is the ratio of industrial capacity to social utility. It means that the countries which are unable to produce, sufficient goods to meet the requirements of their population, may be considered as underdevelopment and those which produce more than what is required, as overdeveloped. In the overdeveloped category may be placed the countries such as America, and in the underdeveloped category, many Asian and African countries. It is, however, a controversial point whether underdevelopment and over development can be identified with any particular country. Further the term underdevelopment is not acceptable, to some of the economically less developed countries, such as India. These countries consider

NSOU ? PGSW-V 17

100%**MATCHING BLOCK 20/185****W**

themselves quite developed from social and cultural points of view. They prefer to be designated as 'developing' rather than as 'underdeveloped' countries. An important idea implicit in the classification of countries, into developed and developing, is that the former became a 'model' for the latter. The developing countries may like to imitate or adopt the economic and technological systems of developed countries. What is more important about this classification, with regard to the conceptual meaning of development, is the fact that the developing countries depended upon the developed ones for technology, skills and monetary aid. The latter tried to exploit the former. This is known as the dependency theory of development. Having realised the exploitative tendencies of the developed countries, the developing countries tried to be self-reliant in economic terms. Thus, substitution of economic dependence by self-reliance emerged as an important indicator of development. The greater the self-reliance, the higher the levels of development. Endeavours towards self-reliance resulted in import substitution by stopping the purchase of goods from developed countries and producing them in their own country. 1.7

98%**MATCHING BLOCK 21/185****W**

The prevailing notions of social development For a discussion of the contemporary sociological concerns about development, we can begin by outlining some of the views based on historical events, on the socio-cultural dimensions of development. But before we examine these dominant concerns regarding development, it would be useful to undertake a brief description of the "three worlds of development" as it had existed prior to the break-up of the Soviet Union. This had become an important part of the social scientists parlance since the middle of the 20th century. Earlier the world was divided into two i.e. it was a bipolar world with the capitalist block of United States of America (USA), on the one side and the socialist block of the Soviet Union, on the other. After the break-up of Soviet Union, the 'Cold War' has ended and the world has become unipolar, with USA as the most powerful nation of the world. 1.7.1 The Three Worlds of Development The First World consists of North America, Western and Southern Europe. The countries were seen to be following mainly a capitalist model of development. The Second World had consisted of Soviet Union and the East European group such as, Poland, East

NSOU ? PGSW-V 18

99%

MATCHING BLOCK 22/185

W

Germany, Hungary etc. Many socio-political changes have occurred in these countries now and they do not remain a communist bloc any more. They were associated with the socialist model of development. The Third World was and to certain extent still is generally used to refer to the less developed or developing societies of Asia, Africa and Latin America. Most of these countries emerged out of colonial rule to attain political independence only in the middle of the 20th century. The majority of the third world countries are characterised by low per capita income, high rates of illiteracy and infant mortality. These were generally agriculture-based economies where people had short life expectancies, low degree of social mobility and strong attachment to tradition (Estes, R.J., p. 92). The countries, though subject to influence by the erstwhile First and the Second World countries, have devised their own national strategy and path of development. The First and the Second World's models of development had laid primary emphasis on economic growth.

1.7.1.1 The Capitalist Model of Development of the First World : The main characteristics of the capitalist model of development are : a) provision for private ownership of property and means of production, b) promotion of economic activities through private enterprises, and c) minimum possible state regulation and control on private enterprises. Thus the capitalist model is characterised by a free economy regulated by competition.

1.7.1.2 The Socialist Model of Development of the Second World The socialist path of development adopted by the Second World, was seen to be opposite or dichotomous to the capitalist path of development. The former, contrary to the latter, is characterised by state ownership of property and means of production, public enterprises and complete state regulation of economic activities. Thus, the socialist model refers to a regulated economy. The main allegation against the capitalist model is that, since it permits minimum state regulation, its economic system becomes exploitative in the sense that the working class people (proletariat) do not get their due share. The capitalists enjoy a major share of the nation's resources. Hence it contributes to inequalities so that a few are very rich and the majority is very poor.

NSOU ? PGSW-V 19

97%

MATCHING BLOCK 23/185

W

The capitalist model is, therefore, alleged to be exploitative and non-egalitarian. On the contrary, the socialist model was ideally considered as non-exploitative and egalitarian. Private ownership and the lack of state regulation, were considered to be important measures of exploitation of the weaker sections and hence the causes of income inequalities. Since, the socialist state did not allow private ownership of property, there was a strong belief that there was no room for exploitation and inequality in it. However, historical events proved this belief to be incorrect as the Soviet Union could not survive for long. The period of "Glasnost" and "perestroika" led by Gorbachev, the erstwhile Russian Prime Minister during the 1980's, dismantled the communist political and economic structure. The Soviet Union broke-up into several small countries and the socialist ideology gave way to capitalist tendencies. However, China still follows a socialistic socio-political order. The two models had also differed in their conception of development. Whereas the capitalist model lays greater stress on economic growth, than on equal distribution of the fruits of economic growth. The socialist model laid equal stress on both resource generation and equal distribution of income, and tried to change the social system in such a way that greater social justice could be ensured. In reality, socialist model did not give much space to individual initiative and consumerist desires. The foregoing discussion implies another difference between these models. The capitalist model does not see any major conflict in the interests of the two classes workers and capitalists. In its eyes both the classes are complementary to each other, they are functionally interdependent. The rules of society, particularly about ownership of property and distribution of income, are supposed to be based on consensus. Hence according to this model, there is no need to change the economic structure. On the contrary, the socialist model saw inherent conflict in the interests of the workers Social Development and the capitalists. According to it, rules are not based on consensus but are imposed on the weaker section by the stronger one. This leads to the exploitation of the weak by the strong, which is likely to result in conflicts, and in revolution by the exploited people who want radical change in the system itself. Thus, the capitalist model is NSOU ? PGSW-V 20 sometimes designated as functionalist or consensual, and the socialist as a conflict, radical or revolutionary model. In practice, as observed by some researchers, these two models have entered a process of convergence. For instance now, there is an increased state regulation on private economic enterprises in the USA. There has been a relaxation in grants to private enterprises in Russia. One could see income inequalities, and a tendency to resist alterations in political and economic systems in both the Worlds.

In recent times there has developed a new concept of "fourth world" of development as identified first by Manuel and Posluns (1974) and Hamalian and Karl (1974). They used this concept to describe "a community of the powerless, the oppressed and the dispossessed". According to them all the other "worlds of development" i.e. the First, the Second and the Third, share the people who belong to the Fourth world of development. In current usage, the countries which belong to the First world are referred to as "developed Market Economies" (DMEs); those belonging to the Second World are referred to as the "Eastern Trading Area (ETAs); and those belonging to the Third World are referred to as the "Developing Countries". The countries of the Fourth World are referred to as "least Developing Countries" (LDCs). (Quoted in Estes, Richard J.'s "World's of Development, www. google.com website). 1.7.1.3

Development of the Third World It is difficult to specify the model of development, adopted by the majority of the. Third World countries as there are variations among them, dictated mainly by their historical and socio-cultural circumstances. What they seem to share in common is that : a) They are economically and technologically underdeveloped in comparison to the countries of the so called developed world. b) Social planning is a key element in their development process. Their plans of development incorporate not only economic concerns, especially removal of poverty, but also concerns regarding nation building, national culture and social transformation. They have been seeking technological and economic aid from the developed countries. The developed countries have given them economic assistance, but they have also been NSOU ? PGSW-V 21 increasingly attempting to extend their political influence in the developing countries. It has been noted that the global military defence strategy is, the major consideration of the developed countries, in extending their economic and political influence to the developing countries. In fact, the idea of the Third World is associated with the emergence of consciousness among developing countries, of being exploited by the developed countries in the garb of monetary help and expert advice. Some nations had become conscious of exploitation much earlier, but others, understood this fact only after seeing the disastrous role of big powers in the developing countries, e.g., the role of the USA in Vietnam or the USSR in Afghanistan. The social analysts have played a very significant role both in appreciating the help, as well as analysing the "games" of the big powers in the developing countries. Against this background of information about the First, the Second and the Third Worlds we will now proceed to look at some of the prevailing conceptions about development across the world. 1.7.2

Socio-cultural Dimensions of Development The concept of development has encompassed many dimensions over the years. One of the popular notions that economic growth, was a sufficient and a necessary condition to stimulate development of all the sections of a society has been proved incorrect. Economic advancement of a class of people has not, and does not trickle down to the entire population. Similarly, the attainment of high levels of economic growth by some of the developed countries has not helped to solve some of their serious problems. In fact affluence has given rise to new and more social problems. It is, therefore, now realised that if the ultimate aim of development is the improvement of the quality of life of every human being in society, it cannot be achieved as a consequence of economic growth or capital accumulation. Sociologists now believe that it is necessary to lay stress on socio-cultural dimensions of development. To elaborate, social development includes : a) Proper satisfaction of basic needs, such as, food, shelter and clothing. b) Availability of essential amenities such as electricity, transportation, communication and water. c) Good physical and mental health, measurable in terms of increased life chances, abolition of environmental pollution, nutritious diet, medical care etc. NSOU ? PGSW-V 22 d) Economic welfare i.e. opportunities for employment in economic activities and high level of living. e) Development of human beings i.e. enhancement of literacy, vocational education, moral education, creative personality etc. f) Social integration i.e. involvement and participation of people in social, political and economic processes and establishment and maintenance of effective social institutions. g) Minimisation of disparities in access to various resources and opportunities- economic, social and political. Some sociologists have laid a special emphasis on the psychological, social and moral dimensions while talking about the "holistic" approach to development. They look at development as an improvement in the overall quality of life including physical, psychological, social and cultural. They emphasise that these dimensions are very closely interlinked. For instance, an improvement in the psychological quality of life entails the idea of life satisfaction including positive mental health. This requires a proper and effective balance between material and non-material life-goals of people and between instrumental and intrinsic values of society. This subjective dimension is very closely linked with the social quality of life. The improvement in social quality means an increase in the strength of family stability, interpersonal bonds and social solidarity. An improvement in the cultural quality of life signifies the upsurge of the moral dimensions. A concern for others is the essence of social morality. They have pointed out that in many developed societies there is more concern 'for self than for others', hence no true development (Sharma, 1986). Thus, the sociological approach to development looks upon the development process as alterations that affect the whole socio-cultural matrix of society. In the modern sense, development refers to the planned, stimulated movement of the entire system in the direction of the overall desirable goals of a given society. Today we have a "Sociology of Development" which is seen to be growing in two directions – towards the analysis of internal structures and of historical linkages. A look at the studies in this field provides us with an idea of the following approaches to social development. NSOU ? PGSW-V 23 1.7.3 Approaches to Social Development

Approaches to development may be discerned on the basis of two criteria, (i) centralisation versus decentralisation of development schemes and resources, and (ii) Unit of development, i.e., the focus of development – individual, group, village etc. The first criterion gives rise to two approaches, namely, development from the top and development from the bottom. The second criterion gives rise to the three approaches- sectoral development, areas development and target group development. Let us now review briefly the five approaches. 1) Development from the top The approach of development from the top envisages the planning and execution, of development schemes by the central or apex bodies of administration. In other words, the central organisations decide the nature and direction of plan formulate projects and impose them on the people. For instance, the ministers and high officials sitting in the capital, make the development plans for rural people without fully realising their problems. Implicit in this approach is the assumption that the people who need development are incapable of understanding their needs, of devising development schemes and of executing them on their own. Hence, the need for experts and outside agencies in fact, this assumption is baseless. The elite at the top have a vested interest in making such assumptions. Their major interest is to hold control on resources and mobilise them for their own benefits. The people accept the development schemes, because they have neither sufficient resources of their own, nor any control on the resources of the community. As a result, most of the schemes imposed from the top fail to yield the desired results. This happens in most of the cases. A large part of the funds of development schemes is eaten up in one way or the other, by the experts and executive personnel deputed or employed by the sponsors of the scheme, be it own government or any foreign agency. The major drawback of this approach is that it fails to involve the beneficiaries, in the development process. Instead, it generates a feeling of alienation among them. For these reasons this approach has been characterised by a higher degree of centralisation and bureaucratisation. NSOU ? PGSW-V 24 2) Development from bottom Social Development The exponents of second approach of development from the bottom, on the contrary, believe the fairness of intentions and abilities of the people who need development. They are given an opportunity to articulate their problems as well as the ways to solve them. They are trained and made capable, and are prepared for self-help. Utilisations of resources for development schemes

are

decided, by the concerned people themselves or by their representatives at the local level. Thus, there is a greater decentralisation of plans and higher participation of people. While the planners realise the importance of development from the bottom, and claim that they adopt this approach, in practice, they often adopt the approach of development from the top. The result is ineffectiveness of the development schemes. 3) Sectoral development On the basis of 'unit' of development, as mentioned earlier, three approaches are envisaged, viz., sectoral development, area development and target group development. Sectoral development approach refers to formulation and execution of schemes for development, of a particular sector of economy like agriculture or industry. For instance, the Indian planners thought of developing industries just after the Independence. Therefore they made plans to develop technology or borrow it from other countries. Stress was laid on technological education. Many institutes and colleges were established, independently or in collaboration with other countries, such as the United States of America, Russia and England. On the other side, funds were made available for heavy industries such as textile, steel and cement. Later on, when the country faced a food problem in the early sixties, the planners thought of developing the agricultural sector. As a result, many agricultural universities were set up, which helped in evolving high yielding varieties of crops, insecticides and pesticides, and farm implements, like threshers. Extension services were made available to educate and persuade farmers, to adopt new agricultural technology, and loans were advanced to farmers quite liberally. You have seen the results of these efforts in the form of the green revolution. The country is now almost self-reliant in food NSOU ? PGSW-V 25 4) Area development All regions are not equally developed. Some are more affluent than others. The underdevelopment of regions is due to the lack of infrastructural development- roads, railways, electrification etc. or due to the problems of floods and drought. When schemes are devised for the infrastructural development of an area or region, we call it area development approach. The Command Area Development Scheme, introduced in India in 1974 for the development of irrigation resources in certain regions, illustrates this approach. 5) Target group development Target group approach has its focus on a particular category of people, such as small farmers, women and farm labourers. Schemes, such as Small Farmers Development Agency (SFDA) and reservation of seats in schools and colleges, and in employment for scheduled castes, exemplify the target group approach. There is another approach to development, which has its focus on the overall development of the people residing in a locality – village or town. This is known as a community development approach. This approach lays stress on the development of education, health facilities, economic and social activities, and other infrastructural facilities. 1.7.4

W

Indian experience of development after independence There have been schemes and plans of development in almost all dimensions of socio economic life, such as health, education, population control, industry, transport, irrigation communication and agriculture. It is neither possible to present here a list of all the development schemes, nor are you expected to know about all of them. Therefore our main objective is to present a synoptic view of the development schemes in India, introduced after Independence with a view to illustrate some of the approaches to development, discussed in the preceding section. After Independence, India did not follow either the First or the Second World, it

Social Development

100%

MATCHING BLOCK 29/185

W

adopted neither the capitalist (North American) nor the socialist model of development. It adopted a path of development in-between the two models, which is known as 'mixed economy'. On the one hand, India encouraged private business and industry and gave opportunity to big business houses, such as the Birla's and Tata's, and other medium and small size entrepreneurs. On the other

NSOU ? PGSW-V 26

100%

MATCHING BLOCK 30/185

W

hand it has almost full control, at least in principle, over all the entrepreneurial and business activities. 1.74.1 Socialist Path and Mixed Economy The state also acts as an entrepreneur in setting up heavy industries, such as the manufacture of steel and generation of electricity. The banks have been nationalised. The state has full control over railways and postal departments. These measures are illustrative of a socialist path of development. On the other hand, certain industries are reserved for private entrepreneurs – both small and large. In some industries, such as textile and cement, both private and state enterprises have been allowed to operate. In many other activities, too, such as education, health and transport both private and state agencies work, either independently or in collaboration. It is true that India adopted a 'mixed' path of development, but scholars differ in their opinion about the real functioning of the economy. One view is that India's path of development is a capitalist one. Entry of state in heavy industries was, in fact, meant to support private enterprise, in the sense that these industries did not yield high profits and required a long gestation period and high capital investment. Hence they did not attract private entrepreneurs, and at the same time industrial development was not possible without basic industries. Similarly, it has been argued that big enterprises still dominate over the small ones, and the industrial sector over the agricultural one. Also there is a concentration of economic power in a few big business houses. The other view is that our bias has been increasing towards a socialist model, as is evident from the facts such as nationalisation of banks. These are controversial arguments which cannot be sorted out here. The fact remains that India pursues a 'mixed' path of development. 1.74.2 Sectoral Development No doubt India has progressed a lot in industrial and agricultural sectors, but there has been relatively less progress in the latter. Many policies and plans were adopted, which showed results that were far below the expectations. The major policies for the development of agriculture after Independence were: abolition of landlordism (zamindari), consolidation of land holding, and land ceiling. Whereas the first two policies succeeded, the last one was made ineffective due to several factors including the vested interests of large farmers. However, due to increase in population there has a natural curtailment of farm size, and it

NSOU ? PGSW-V 27

97%

MATCHING BLOCK 31/185

W

has been that further ceiling on farm size, will come in the way of raising the productivity. All these policies reflect a sectoral development approach. The sectoral approach got further accentuated in the 'green' and 'white' revolutions, i.e., development of cash crops, and dairy products, respectively. Such revolutions have not been widespread. They are confined to a few states, such as Punjab, Haryana, Tamil Nadu, Gujarat and Maharashtra. The important thing is that the farmers, even in these states, do not get remunerative returns from farm produce, because of an absence of check on the rise of prices of farm inputs – machines, fertilisers, insecticides, pesticides etc., which come from industrial sector, and also because of a strict control on the prices of farm outputs, with the rationale that high rise in the prices of food grains will adversely affect the masses. This indicates discrimination against the farm sector. The majority of people depend upon agriculture even today. Therefore non-remunerative farm return keeps the agricultural sections in poverty.

Picture depicting Green Revolution and White Revolution an example of sectoral development

97%**MATCHING BLOCK 33/185****W**

in India. 1.7.4.3 Community Development and Cooperative Movement Besides this sectoral approach, a community development scheme was initiated in 1952 for overall development of villages. The philosophy of this programme was to educate, encourage and enable the people to develop themselves, with their own efforts and resources. But the programme was not very successful. It was realised that a greater

NSOU ? PGSW-V 28

98%**MATCHING BLOCK 34/185****W**

participation of the rural people in the preparation and execution of development schemes was essential. In other words, it required a greater administrative decentralisation. Hence Panchayati Raj System was introduced in 1957. It envisaged a three-tier system, viz., Village Panchayat (village level), Panchayat Samities (block level) and Zila Parishad (district level). This system involved the people at local level, in both planning and execution of development schemes. It was an effort towards development from the bottom. But unfortunately the unholy alliance between the rural elite (rich farmers), on the one hand, and the administrative and political elites, on the other, at the block and district levels made the system weak. The same fate met the cooperative movement. India wanted cooperative cultivation on the Chinese pattern, in which the land is owned by the community (village) and the farmers have their shares. But this did not work in India due to the country's

Social Development

100%**MATCHING BLOCK 35/185****W**

political system which did not permit abolition of private ownership of land, and because the farmers did not surrender land to the community voluntarily, in spite of the appeal of "Bhoo Dan" (land donation) movement of Vinoba Bhave. However, credit societies which granted short term agricultural credit did become popular. But today many of the credit societies have become defunct, or are not functioning effectively. The member borrowers usually become defaulters. The important point is that there is no spirit of cooperating among the local people, because most of the affairs of these cooperatives are managed by the government or semi-government officials, such as the Registrar, Managing Director,

Administrat or

100%**MATCHING BLOCK 36/185****W**

etc. In many cases the nationalised banks provide funds to cooperatives for advancing loans to their members. The rural credit cooperative are relatively effective in Maharashtra, particularly among the sugarcane producers, who also have cooperative sugar mills. In other fields, too, there are exceptionally successful cases of cooperative, viz., Milk Producers Cooperative at Anand in Gujarat. Anand Milk Producers' Union Limited (AMUL) emerged out of the farmers' cooperative efforts at the village of Anand which now has an important place among the rural cooperatives in Asia. 1.7.4.4 Target Group Planning There are many other rural development programmes for certain target groups, under the 20-point economic programmes. Integrated Rural Development Programme (IRDP) is one of them which combines both the area development and target group approaches,

NSOU ? PGSW-V 29

100%

MATCHING BLOCK 37/185

W

since it includes the Command Area Development Programme. Drought Prone Area Programme and Small Farmers' Development Agency. As a target group programme, its focus is on the poorest of the poor, and the unit of assistance is the 'family', and not a person. It proposes to cover about 3,000 families in each block over a period of five years. Under IRDP there are special programmes for employment, like Training Rural Youth for Self-employment (TRYSEM). Besides there are other programmes such as the National Rural Employment Programme (NREP). Evaluation reports of these programme, however, indicate the failure of the programme in reaching the real beneficiaries and in raising their economic status. The blame is laid on the executive personnel, and the rural elite who consume a large share of the resources, meant for these programmes. In other fields also India has made a good deal of progress. We have big hospital and primary healthcare centres. Life expectancy has increased and many diseases such as malaria, Polio and small pox have been controlled, and infant mortality reduced. Now we have a large network of transport and communication. . But the results of development have reached largely the urban population. Rural people still do not have good schools, proper electrification, clean water and hospitals. There are no good teachers, or proper infrastructure in schools, such as furniture, including blackboards in many schools, and no doctors, nurse or medicines in many primary healthcare centres. Besides this we find increased unemployment, a state of lawlessness, an increase in social and communal tension, and a lack of social and national concern. This shows that the country has achieved more of a quantitative than qualitative development. However, in terms of social political and economic awareness India and its villages are doing fairly well. Being one of the largest Democratic nations of the world, with an extremely vibrant political and economic structure, some amount of social unrest is inevitable. The policies of the Government are geared towards removing extreme inequalities and bringing about social justice. 1.8

Conclusion In this unit we got a detailed information about Sociology and how it may be related to other branches of social science discipline. We also become familiar with the thoughts of favour Sociologists. We came across with the concept of social development and other developmental aspects of our society & nation as a whole.

NSOU ? PGSW-V 32 2.1 Introduction

100%

MATCHING BLOCK 39/185

W

Sociology is a science of society. As a social science it attempts to study social life as a whole. But for the understanding of social life as a whole sociology requires the help of other social sciences which studies a particular aspect of society. Economics studies the economic aspects whereas political science studies political aspects.

99%

MATCHING BLOCK 46/185

W

Hence it is obvious that other social sciences are closely related to sociology. Sociology is considered as the mother of social sciences. Besides sociology synthesizes other social sciences. Hence there exists a very close and intimate relationship between Sociology and other social sciences. For our precise understanding of the relationship between sociology and other social sciences we have to discuss them individually, which are discussed below :

2.2 Sociology and Political Science As a mother of social sciences Sociology has close and intimate relationship with all other social science. Hence it has close relationship with political science as well. Their relationship is so close and intimate that led G.E.C. Catlin to remark "Political Science and Sociology are two faces or aspects of the same figure." Similarly other scholars could not find any difference between the two disciplines. NSOU ? PGSW-V 33

Sociology is a Science of society. It is a science of social groups and social institutions. It is a general science of society. It studies human interaction and inter-relations their conditions and consequences. Political Science is a science of state and Government. It studies power, political processes, political systems, types of government and international relations. It deals with social groups organised under the sovereign of the state. In the words of Paul Junet, "Political Science is that part of social science which treats the foundation of the state and principles of government." It studies the political activities of man. It only studies the organised society. However their inter-relationship and inter- dependence can be known from inter-dependence and mutual relationship. Sociology depends on political science. In the words of Morris Ginsberg, "Historically Sociology has its main roots in politics and philosophy of history." Sociology greatly benefited by the books written by political scientists like Plato, Aristotle and Kautilya such as The Republic, The Politics and Arthashastra respectively. Each and every social problem has a political cause. Political Science is a part of sociology. Hence sociology depends on political science to comprehend itself. To understand different political events sociology takes the help from political science. Sociology to draw it's conclusions depends on political science. Any change in the political system or nature of power structure brings changes in society. Hence Sociology takes the help of political science to understand the changes in society. Hence both are inter-dependent. Similarly political science also depends on Sociology. Political Science is a part of sociology. To understand the part it is necessary to understand the whole. Almost all political problems has a social cause and for the solution of these political problems political science takes the help of sociology. State frames its rules, regulations and laws on the basis of social customs, tradition and values. Without Sociological background the study of political science will be incomplete. Political Scientists largely benefited by the researches and research methods of the Sociologist. Some consider political science as a branch of Sociology. State is considered as a social group hence is a subject of Sociology. Besides, there are some common topics which are being studied by both the subjects. These topics are War, Propaganda, authority, communal riots and law. With the help of both political science and sociology a new subject comes into existence which is known as political sociology. Some political events like war are also significant social events.

NSOU ? PGSW-V 34

99%

MATCHING BLOCK 40/185

W

Thus both political science and sociology contribute to each other. But inspite of their inter-relationship and inter-dependence both the sciences differ from each other in the following way. 2.2.1 Differences :

- (1) Sociology is a science of society and social relationship whereas political science is a science of state and government.
- (2) The scope of sociology is very wide but scope of political science is limited.
- (3) Sociology is a general science but political science is a special science.
- (4) Sociology studied organised, unorganized and disorganized society whereas political science studies only politically organised society.
- (5) Sociology studies the social activities of man whereas political science studies political activities of man
- (6) Sociology is a new or young science but political science is an older science.
- (7) Sociology studies man as a social animal whereas political science studies man as a political animal.
- (8) Sociology studies both formal and informal relations whereas political science studies only formal relations.
- (9) Sociology analyses both conscious and unconscious activities of man whereas political science analyses only conscious activities of man.
- (10) Sociology deals with all forms of association whereas political science deals with only one form of association named state.

2.3 Sociology and History As a mother of social sciences sociology has close and intimate relationship with all other social sciences. Accordingly it has close relationship with history. Because present society bears symbols of past. Relationship between the two is so close and intimate that scholars like G. Von Bulow have refused to acknowledge sociology as a science distinct from history. Sociology is the science of society. It is a study of systems of social action and their inter-relations. Sociology is a science of social groups and social institutions. History studies

NSOU ? PGSW-V 35

the important past events and incidents. It records men past life and life of societies in a systematic and chronological order. It also tries to find out the causes of past events. It also studies the past political, social and economic events of the world. It not only studies the past but also establishes relations with present and future. That is why it is said that "History is the microscope of the past, the horoscope of the present and telescope of the future. However, both the sciences are closely inter-related and inter-dependent on each other. Both study the same human society. Their mutual dependence led G.H. Howard to remark that, "History is past Sociology and Sociology is present history." Both takes help from each other. At the same time one depends on the other for its own comprehension. History helps and enriches Sociology. History is the store house of knowledge from which Sociology gained a lot. History provides materials sociologists use. History is a record of past social matters, social customs and information about different stages of life. Sociology uses this information. Books written by historians like A. Toynbee are of great use for Sociologists. To know the impact of a particular past event sociology depends on history. Similarly Sociology also provides help to history and enriches it. A historian greatly benefited from the research conducted by Sociologists. Historians now study caste, class and family by using sociological data. Sociology provides the background for the study of history. Now history is being studied from Sociological angle. Every historical event has a social cause or social background. To understand that historical event history need the help from Sociology and Sociology helps history in this respect. Sociology provides facts on which historians rely on. Thus history and Sociology are mutually dependent on each other. History is now being studied from Sociological angle and Sociology also now studied from historical point of view. Historical sociology now became a new branch of Sociology which depends on history. Similarly Sociological history is another specialized subject which based on both the Sciences. But in spite of the above close relationship and inter-dependence both the sciences differ from each other from different angles which are described below. 2.3.1 Differences : (1) Sociology is a science of society and is concerned with the present society. But history deals with the past events and studies the past society. NSOU ? PGSW-V 36 (2) Sociology is a modern or new subject whereas history is an older social science. (3) Sociology is abstract whereas history is concrete in nature. (4) The scope of Sociology is very wide whereas the scope of history is limited. Sociology includes history within its scope. (5) Sociology is an analytical science whereas history is a descriptive science. (6) Attitude of sociology and history differ from each other. Sociology studies a particular event as a social phenomenon whereas history studies a particular event in it's entirety. (7) Sociology is a general science whereas history is a special science. 2.4 Sociology and Economics Sociology is mother of all social sciences. Hence it has close relationship with all social sciences and so also with Economics. The relationship of sociology with economics is very close, intimate and personal. There exists close relationship between these two because economic relationships bear a close relation to social activities and relationships. Likewise social relationships are also affected by economic relationships. Economic activities to a great extent are social activities. Hence both are mutually related. Sociology is a science of society. It is concerned with the association of human beings. Sociology is the study of human inter-actions and inter-relations their conditions and consequences. But Economics deals with economic activities of man. It is a science of wealth and choice. According to Prof. Robbins Economics is a social "science which studies human behavior in relation to his unlimited ends and scarce means which have alternative uses." It is concerned with the activities of man such as production, consumption, distribution and exchange. It also studies the structure and functions of different economic organizations like banks, markets etc. It is concerned with the material needs of man as well as his material welfare. However, there exists a great deal of inter-relationship between these two sciences. Both are interdependent and inter-related with each other. Because of this inter-relationship Thomas opines that, "Economics is, in fact, but one branch of Sociology." Similarly Silverman opines Economics is regarded as offshoot of sociology which studies the general principles of all social relations. Their inter-relationships are as follows : NSOU ? PGSW-V 37 Economics takes the help of Sociology. For its own comprehension economics takes the help of sociology and depends on it. Economics is a part of Sociology hence without the help from sociology economics can't understand itself completely. Economics is concerned with material welfare of man which is common welfare. Economic welfare is a part of social welfare. For the solution of different economic problems such as inflation, poverty, unemployment etc. economists takes the help of sociology and takes into account the social events of that particular time. At the same time society controls the economic activities of man. Economics is greatly benefited by the research conducted by Sociologists like Max-weber, Pareto etc. Some economists also consider economic change as an aspect of social change. Economic draws its generalization basing on the data provided by Sociology. Thus economics cannot go far or develop without the help of Sociology. Similarly Sociology also takes the help from economics. Economics greatly enriches sociological knowledge. An economic factor greatly influences each and every aspects of social life. Economics is a part of sociology hence without the help of economics we can't understand sociology properly. Knowledge and research in the field of economics greatly contributes to sociology. Each and every social problem has an economic cause. For the solution of social problems like dowry, suicide etc. Sociologists take the help from economics. Marx opines economic relations constitute the foundation of Society. Economic factors play a very important role in every aspect of our social life that is why Sociologists concerned with economic institutions. For this reason Sociologists like Spencer, Weber, Durkheim and others have taken the help from economics in their analysis of social relationships. Thus both sociology and economics are very closely related with each other. There are some problems which are being studied by both sociologists and economists. Economic changes results in social changes and vice versa. However, inspite of the above closeness, inter-relationship and inter-dependence both the sciences have certain differences which are described below : 2.4.1 Differences : (1) Sociology is a science of society and social relationships whereas economics is a science of wealth and choice. NSOU ? PGSW-V 38 (2) Sociology is a much younger science which has very recent origin whereas economics is comparatively an older science. (3) Sociology is an abstract science whereas economics is concrete in nature. (4) Sociology is a general social science whereas economics is a special social science. (5) The scope of sociology is very wide whereas the scope of economics is very limited. (6) Sociology is concerned with the social activities of man whereas economics is concerned with the economic activities of man. (7) Society is studied as a unit of study in Sociology

whereas man is taken as a unit of study in economics. (8) Both Sociology and economics differ from each other in respect of the methods and techniques they use for their study. 2.5 Sociology and Psychology Sociology is a science of society. Hence it is closely related to other social sciences and so also with psychology. Sociology and Psychology are very closely interlinked interrelated and interdependent. Relationship between the two is so close and intimate that Psychologist like Karl Pearson refuses to accept both as special science. Both depend on each other for their own comprehension. Their relationship will be clear if we analyze their inter-relationship and mutual dependency. Sociology is a science of social phenomena and social relationship. It is a science of social group and social institutions. It is a science of collective behavior. It studies human behavior in groups. But psychology is a science of mind or mental processes. It is a science of human behavior. It analyses attitudes, emotions, perception, process of learning and values of individuals and process of personality formation in society. In the words of Thouless 'Psychology is the positive science of human experience and behavior.' But both the sciences are closely related to each other which can be known from the following. Sociology receives help from Psychology. Psychology is a part of sociology hence without the help from Psychology Sociology can't understand itself fully and properly. There are many psychologists like Freud, MacDougal and others who have enrich

NSOU ? PGSW-V 39

100%

MATCHING BLOCK 42/185

W

Sociology in many respects. They opines that the whole social life could be reduced finally to psychological forces. Each and every social problems and social phenomenon must have a psychological basis for the solution of which sociology requires the help from psychology. A new branch of knowledge has developed with the combination of sociology and psychology which is known as social psychology. Similarly, psychology depends on Sociology to comprehend itself fully. Psychology also requires help from sociology in many cases. As human mind and personality is being influenced by social environment, culture, customs and traditions hence psychology take the help from Sociology to understand this. To understand human nature and behaviour properly psychology depends on sociology. There are many Psychological problems which must have a Social Cause. Psychology requires the help from Sociology to understand these social problems. A research in Sociology richly contributes to psychology. Contributions and theories of many Sociologists also are of great help to Psychologists. Thus Sociology and Psychology are mutually dependent on each other. One can't comprehend itself without the help from others. Besides there are some common area of study such as social disorganization, public opinion etc. which are being studied by both Sociologists and Psychologists. Social Psychology a branch of Psychology is developed with the combination of the two. In the words of Kretch and Crutchfield Social Psychology is the science of behaviour of the individuals in society.

MATCHING BLOCK 43/185

W

Social psychology is the study of social and cultural influences on the individual. It focuses on the behaviour of a single person and hence, differs from sociology, which is more concerned with relations among groups. However, there are areas of common interest such as socialisation, norms and values. Moreover, the influences of the group on the individual and of the individual on the group are also of interest to both social psychology and sociology. 2.5.1

Differences : However, inspite of the mutual relationship and dependence both the sciences differ from each other in the following ways. (1) Sociology is a science of society but Psychology is a science of mind. (2) Scope of Sociology is wide whereas scope of Psychology is limited. (3) Society is the unit of study in sociology but individual is the unit of study in case of Psychology. NSOU ? PGSW-V 40 (4) Sociology studies social processes whereas Psychology studies mental processes. (5) Sociology studies and analyses human behavior from Sociological angle whereas psychology studies and analyses human behavior from Psychological angles. 2.6 Sociology and Anthropology Sociology is the mother of all social sciences. Hence it has close and intimate relationship with Anthropology. The relationship is so close that Anthropologists like A.L. Kroeber consider Sociology and Anthropology as twin sisters. They often appear as two names for the same subject. R. Reddfield recognizes the closeness between these two social sciences. Sociology is a science of society. It studies behavior of man in groups. The term Sociology has been derived from the Latin word 'Socius' means society, companion or association and the Greek word 'logos' means study or science. Hence Sociology is concerned with the association of human beings. It is a science that deals with social groups. Similarly the term Anthropology is derived from two Greek words 'anthropos' meaning man and 'logos' meaning study or science. Accordingly anthropology means study of man. As a science of man it deals with man, his works and behavior. Anthropology studies the biological and cultural development of man. Anthropology has a wide field of study which can be broadly divided into three main divisions such as physical anthropology. Archeology cultural anthropology and social anthropology. Physical anthropology studies bodily characteristics of early man and thereby try to understand both primitive and modern cultures. Archeology studies cultures of pre-historic period. This study facilitates sociologists to make a comparative study of present social structure. It is concerned with the early periods of human existence. It reconstructs the origin, spread and evolution of culture by examining the remains of the past societies. Social anthropology deals with the behaviour of man in social institutions. Social anthropology and sociology are one and the same. Evan Pritchard considers social anthropology as a branch of Sociology. 2.6.1 Mutual Help : However there exists a very close and intimate relationship between Sociology and Anthropology. Both contribute to the growth of others. Both are mutually related to each

NSOU ? PGSW-V 41

100%

MATCHING BLOCK 45/185

W

other. Of course Sociology studies society whereas anthropology studies man. But as man and society are mutually interrelated hence it is very difficult to distinguish two. However their close relationship can be known from the following. Anthropology contributes to the growth of Sociology. Without the help of anthropology the study of Sociology can't be complete. It is a part of Sociology. Anthropology provides knowledge about ancient societies. To have a comprehensive understanding of present society Sociology takes the help of anthropology. Contributions of many Anthropologists like R. Brown, Linton, Mead and Pritchard enriches sociological knowledge's. The origin of family, marriage, religion etc. can be better understood through anthropological knowledge. The concepts like cultural area, cultural traits, and cultural lag etc. sociology accept from anthropology. Sociology accepts the anthropological conclusion that 'racial superiority is not responsible for mental development.' Thus Sociology is greatly benefited by anthropological studies. Similarly, Sociology contributes richly towards the growth of anthropology. Anthropology accepts many concepts of Sociology. Research and contributions of many Sociologists like Emile Durkheim, Herbert Spencer is of great help to anthropology. Anthropologists greatly benefited by the Sociological researches. Ideas and conclusions of Sociology contributes to the research in anthropology. 2.7

Sociology and Geography It has been realised from ancient times that Geography has a great impact on human society, the influences of geographical conditions on human society are predominant and that there is a close relationship between physical conditions and social phenomena. Geographical environment as defined by MacIver consists of those conditions that nature provides for man. It includes the earth surface with all its physical features and natural resources, the distribution of land and water, mountain and plains, minerals, plants and animals, the climate and all the cosmic forces, gravitational, electric, radiational that play upon the earth and affect the life of man. There is no denying the fact that there is a correspondence between physical conditions and modes of living e.g., inhabitants of tropical regions exhibit characteristic differences from those of temperate or of Arctic regions: the sea-farer is typically distinct

NSOU ? PGSW-V 42

100%**MATCHING BLOCK 48/185****W**

from the inlanders. One can also observe the differences between the modes and exigencies of human life in mountains, in the plains and by the seaboard, in the desert and in the forest. Some of the thinkers have attributed a dominant role to Geography, regarding it as the primary determinant of wealth and health, the size or energy of populations, of their customs and social organisations, of their creeds and philosophies. The relationship between man's physical environment and his social life has led to a geographical school of Sociology. One of the pioneers of modern social geography was a Frenchman Le Play who in his important study of European workers had developed the thesis that locality determines work and thus has a great influence on the economic organisation of the family and this social institutions of the people. The emphasis of Le Play and his successors upon the relationship between the characteristics of the physical environment and social development has influenced the sociologists at other places also. The Regional School of American Sociology under the leadership of Howard W. Odum and his colleagues has been seeking the interaction between man's physical environment and man's social life. The writers of this school have thus added tremendously to our knowledge of the role of geography in man's development. They have made us aware of the inter-play between climate and topography and the various aspects of the physical environment on the one side and the political and economic, technological and cultural phenomena on the other. But we should not lay too much stress on geographical factors determining the social life in a particular region. It is not necessary that similar environments should produce similar cultures. We have even in primitive societies different occupations being followed by different people in the same regional setting. The geographical environments alone never explain the rise of a civilization. The growth of civilization changes and minimises the direct influence of local geographical conditions. Many of the occupations of the modern man have no relation to the geographical environments. As the social heritage grows the immediate geographical factors would assume a less determinant role in the interpretation of society. Man has assumed great control over natural factors so that the overall influence of geographical forces is no longer overpowering. The fact, however, remains that geography is a contributing, if not a determining, factor of human progress and, therefore, the relation between Sociology and Geography is intimate.

NSOU ? PGSW-V 43 2.8

100%**MATCHING BLOCK 49/185****W**

Sociology and Ethics Ethics is the science of morality. It is concerned with the moral rightness and wrongness of human action. Ethics and Sociology are intimately related to each other. Man is a social being. He acquires moral standards notions of right and wrong as a member of a social group. In other words, it is the society which influences the mental and moral development of the individual and it is the individual who in return seeks to conform his actions to the moral standards of his social group. Thus the real significance of moral life lies amidst a social group or in society. Sociology is primarily concerned with the study of the social groups and it investigates into all aspects of human life—economic, political, religious, moral and cultural. Ethics throws light on the moral life of the primitive individuals and institutions. This provides a background of human conduct and may thus serve a good purpose for contrasting and comparing the moral conduct of the modern life with that of the primitive man. Further, the personal good of the individual must at the same time be in harmony with the general good of the society as a whole. It is here that both Sociology and Ethics come close to each other. This close relationship between the two has induced some ethical thinkers to regard Ethics as a branch of Sociology. Charles A. Ellwood rightly remarks, "It is the business of sociology to furnish a foundation for scientific ethics and on the other hand, it is the business of ethics to take the ethical implications which a scientific knowledge of human society affords, develop them, criticise and harmonize them. An ethics worked out upon the basis of the knowledge furnished by the sciences will make a larger use, therefore, of sociological knowledge than of any other form of scientific knowledge." But the two sciences also differ in some essential aspects. Firstly, Sociology is a positive science, while Ethics is a normative science. Sociology studies institutions, customs and manners as they are or have been while Ethics looks upon them as they ought to be. Secondly, Sociology studies men and their social relations collectively while Ethics studies men individually as moral agents of the society. Thirdly, Sociology is merely speculative and has no practical bearing on any field of social life. Ethics, on the other hand, has some practical bearing on our conduct.

NSOU ? PGSW-V 44

It seeks to formulate the rules of conduct which all people should observe. Fourthly, Sociology employs mainly historical

method in

the investigation of its problems. Ethics, on the other hand, seeks to explain human conduct with reference to an end or ideal. Finally, while Sociology is concerned- with the study of progress of social groups from the point of view of time, Ethics is concerned with the progress of society

97%

MATCHING BLOCK 50/185

W

from the point of view of morality. 2.9 Sociology and Jurisprudence Jurisprudence is the science of law. It is concerned with the study of the entire body of legal principles. Jurisprudence and Sociology are intimately related to each other. Sociology is the study of man in society. Law controls and regulates actions of human beings in society and it is, therefore, a subject of great importance for the sociologists. There is, however, difference of approach of a sociologist and of a lawyer to the subject of law. A lawyer is concerned with the rules that men ought to obey; he is not interested in knowing how and to what extent these rules govern the behaviour of ordinary citizens. A sociologist, on the other hand, is interested in law as a social phenomenon. His chief concern is not with the rules themselves but with whether they are observed or not and in what way. A sociologist's study of law from this angle has been given title of Sociology of Law or Sociological Jurisprudence. Criminology and Penology are its important branches. Criminology is concerned with the systematic study of crime and criminal behaviour from the social point of view. Penology studies the effects of various penal systems of punishment and the efficacy of reform and rehabilitation schemes in changing criminal behaviour. 2.10

98%

MATCHING BLOCK 51/185

Sociology and Biology Biology is the science of man's biological development, his sexual, anatomical and personal peculiarities. It tells us how man's body and mind evolved, how his system reacts to the outside world and what part his physical constitution plays in the overall build up of his whole being. NSOU ? PGSW-V 45 Sociology is the study of human interaction and inter-relation. According to N. G. Muller, "Our ideas of what sort of progress is possible or desirable for man must depend in part at least upon our views of his nature, his manner of origination, the method by which changes have occurred and can occur in him and the relation which he bears with the rest of nature." It is not possible to determine the modes and limits of man's social progress without being acquainted with his physical capacities and limitations. According to Mischa Titiev, "It is impossible to gain a full understanding of man's culture without knowing something of his biology." Darwinian Theory of evolution has been very useful in sociology. Spencer, a leading sociologist, explained his theory of the evolution of society on the principle of natural evolution. Human ecology is based upon biological ecology. Genetics, which is of major importance in Sociology, is an important branch of biology. In knowing the effects of heredity upon man's behaviour much help is sought from biology. Knowledge of biology is also essential for understanding the problems concerned with marriage and family. Sociology on its part inspires biology to search knowledge in new directions, for example, the need to limit the population has led to search for the means of birth control. However, biological principles should not be indiscriminately applied to sociology. In this regard Ginsberg writes, "Biological factors are clearly of importance to the students of society, since the unit of society is a living organism. Great confusion has, however, resulted from the too facile application of biological categories to social facts, and in particular, a tendency to overemphasize the purely racial factors in social evolution or change."

Thus there exists a great deal of relationship between Sociology and Anthropology. Both study human society and both are concerned with all kinds of social groups like families, friends, tribes etc. Many of the ideas and concepts are used in both the discipline. Hence both are interrelated and interdependent. But in spite of the inter-relationship both differ from each other. Differences : (1) Sociology is a science of society whereas anthropology is a science of man and his behavior. (2) The scope of Sociology is very wide whereas the scope of Anthropology is very NSOU ? PGSW-V 46 limited. Because anthropology is a part of Sociology. (3) Sociology studies society as a whole whereas anthropology studies man as a part of society. (4) Sociology studies civilizations which are vast and dynamic on the other hand Anthropology studies cultures which are small and static. (5) Sociology studies modern, civilized and complex societies whereas Anthropology studies ancient and non-literate societies. (6) Sociology is concerned with social planning whereas anthropology is not concerned with social planning. On the basis of social planning sociology make suggestion for future but anthropology do not make any suggestion for future. (7) In the words of Kluckhohn, "The Sociological attitude has tended towards the Practical and Present, the anthropological towards pure understanding of the past." 2.11

Conclusion This unit gave us an idea about the relationship as well as the differences between the various branches of Social Sciences with Sociology. These could help us become familiar with so many social phenomenon & then work with lot of confidence & with a right approach.

100% **MATCHING BLOCK 53/185** **W**

These branches of Legal Sociology have rendered great service to the law makers and law executors by adding to their knowledge how the laws actually work and how the crime can be effectively dealt with. Sociology has thus shed considerable light and understanding on the various problems that the society has to solve, particularly, from the point of view of Criminal Jurisprudence. Consequently Jurisprudence has assumed a new meaning that laws are to be made for men and the law makers and its executors are to take into consideration the human and the social aspect while making or executing it. 2.12

Social group Just as every human being is born in a society, everywhere, social life is lived in groups, whether large or small. The term 'group' is used in different ways. There might be a group, which is watching a game in progress, there might be a group of people crossing a street. In sociology, the group is viewed in a different way. It has already been mentioned that the basic interest of sociology is human social behaviour. This leads to a study of how people relate to each other or interact with each other.

The

100%

MATCHING BLOCK 58/185

groups are formed in order to satisfy some human needs. A basic need is survival and a family, which is an example of a group, enables us to meet this need. As individuals, it is not possible to fulfil all the needs. It is through the groups that the needs are met. We derive many satisfactions from living in groups and therefore, being a part of the group becomes important. The solidarity of a group is dependent upon the frequency of interaction and the emotional attachment. 3.3

Primary groups and Secondary groups According to Horton and Hunt groups are described in many ways. Some define a group as a collection of individuals who live in close physical proximity. Other definition emphasizes the need for common characteristics among the members if a collection of individuals has to be called a group. Yet another set of definitions require the members to have common consciousness and regular interaction in order to be called a group. We will describe a collection of individuals as a group if it is marked by the following characteristics :

NSOU ? PGSW-V 50

98%

MATCHING BLOCK 61/185

W

A group should have a given number of individuals : One or two members cannot be called a group. Similarly a very large number of individuals cannot be called a group. It would be more appropriate to call it a community, crowd, mob or a society. You will learn about these concepts later. The group members should have regular interaction between themselves : Interaction between the members should be purposeful and considered as such by the members. Thus individuals waiting for a bus and having casual conversations cannot be called a group by these standards. Awareness about each other : The members are conscious about other members' behaviour, emotions, needs and their own behaviour is influenced by this consciousness. Members are aware of themselves being a unit : Group members see themselves as distinct from others. They acknowledge that their membership in the group makes them different from others. Common goals : A group, if it has to sustain itself has to have goals. Goals can be same for all members or in some cases goals can be different. It is also possible that the stated goals of the group may be different from the actual goals. A group may declare that its aim is to help the poor but members may join it primarily to meet and socialize with each other.

Primary Group Secondary Group Characteristics of Primary and Secondary It is small in size High level of intimacy among members relationship is very personal Interaction among members is very frequent and takes place on a face to face basis Members are accepted regardless of who they are it is more about what the members mean to each other It is usually Large in size Less intimacy among members relationships are usually impersonal and formal Less frequent interaction among members leading to limited contact with each other Members are accepted on the basis of what they can do for the group FAMILY GROUP OF FRIENDS AT SCHOOL CHURCH POLITICAL PARTY

NSOU ? PGSW-V 51

Common ideals and values : When the above conditions are met it is likely that as far as the group purpose is concerned, the members will have shared values. In matters not concerned with group, the members can have different views. For example, members of group dedicated to promoting wildlife photography will agree with each other on the importance of promoting such a cause. But, they may belong to different political parties and adhere to different ideologies. Established group patterns : Regular purposeful interactions give rise to group patterns. These interactions can be formal or informal depending on the nature of the groups. In case of formal interactions, rules, regulations and procedures are followed while in case of informal relations, there is spontaneity. 3.3.1 Primary Groups Primary groups are those groups whose members have face to face contacts, intimate, personal and non-formal relationship with each other. They have the following characteristics : Primary groups are of small size : The size of the group is important as in larger groups it is difficult for the member to have intimate contacts with everyone. Small groups allow qualitatively and quantitatively better interactions. Therefore, members have personal relationship with each other. Primary group members share common goals : Members of a primary group may have different characteristics. For example, a family may have an adult male and adult female and their children. Though they are different in many ways they share common goals, which they all think are important and contribute towards their happiness. Primary group offers its

members

a total experience : Total experience means that it affects the members in a number of ways. Individuals are accepted as total personalities. For example, the family is a primary group, which has face to face and intimate relationship. It is also a total relationship in the sense that members benefit in a number of ways. Children are given love and affections, provided with education and taken care of when there are sick etc. The husband and wife help each other in more than one way. Hence a very important part of the lives of the members is spent in the family. Peer groups are another example of primary groups. Primary group has relationship as an end in itself : Primary group members see the relationship as an end in itself. In other words, the relationship is valued for what it is NSOU ? PGSW-V 52 i.e. more than any specific benefit the members may get because of their membership. For example, if a man marries only because he wants somebody to cook for him then it cannot be called a 'genuine marriage'. Basic Social Concepts Primary groups generally have long life : Families and peer groups exist as long as the members of the group live. If any member dies or leaves the group the group itself ends. For example, if the father of the family dies, the group in its original form also come to an end. The surviving members may continue to act as group but roles and interaction patterns undergo a major change. It is, therefore, correct to call it a new group. Primary groups play an important role in determining the individual's personality : The family and the peer group are important agencies of socialisation. Both of them are primary groups and apart from the services they provide they also give the members emotional support and education. While other agencies of socialisation do play an important role, it is the unique experiences that the individual experience in the primary groups which becomes basis of his or her personality. Primary groups sometimes compete for individual loyalty : Primary groups seek high degree of loyalty from its members and in certain cases may advocate different values. In such a situation, the individual may be in a dilemma as to which group value to adopt. For example, a teenager's family may want the individual to dress conservatively while his peer group may want him to dress according to the latest fashion and style. This can lead to personality conflicts. Some sociologists have held that primary groups must have members living in close proximity with each other and having face-to-face relationships. But it need not be so as even when there is physical distance between the members, if they can still be emotionally close to each other and thus satisfy the criteria of the primary group. 3.3.2 Secondary Groups Secondary groups are generally larger than primary groups. Members in secondary groups have formal, impersonal, and need based relationship with each other. A secondary group has the following characteristics : Secondary groups have relatively large number of members : Secondary groups consist of many members who share common interests. Some secondary groups may have

NSOU ? PGSW-V 53

lesser number than a large joint family. But the manner in which they relate with each other is different, as we will see now. The members can also be spread over large distances. Now a days, there are secondary groups whose members are all around the globe. They interact through the web and conduct effective global campaigns without meeting each other face to face. Secondary groups have specific interests : While primary groups have relationship as an end in itself, in secondary groups, relations are maintained so that some other ends can be achieved. Members are also aware of this condition and as such, their emotional involvement is much less as compared to secondary groups. Secondary group has clear objectives : The aim of forming a secondary group is to attain some objectives which the members feel are important. In most cases, the objective is such that an individual cannot attain it alone. He/she needs the cooperation from others. A secondary group is conceptually closer to the concept of association. Secondary group members relate to each other formally : Since secondary members have specific objectives in mind there is no need for them to know each other intimately. There is no need of meeting each other face-to-face either. A common newsletter or a website as is the case now a days, is all that is needed to share information and pool resources. Once the objective is attained, the secondary group may end its existence. Secondary groups play an important role in furthering members' interest : In democratic societies like ours, there is a need for mobilizing people on the basis of common interests. People can influence decision making at different levels only if they organize themselves and make their voices heard. Secondary associations are used to articulate the demands of various groups. 3.3.3 Relationship between Primary and Secondary Groups Primary and secondary groups are related in more ways than one. Firstly, primary groups like family provide the secondary groups with members. They also prepare them to cooperate and interact with others. Some behavioural problems among individuals occur when families do not prepare their children to deal with the demands of secondary groups. Secondly, primary groups like sub-groups and cliques which are part of secondary groups play a vital role in their decision making process. Their influence on the performance

NSOU ? PGSW-V 54

of the secondary groups may be positive or negative depending on their intentions, their power and the power of those who may oppose them. Thirdly, primary groups within the secondary group give emotional support to the members. Most secondary groups cannot give its members a real sense of identity and nor can they give them individual attention. This can be seen in a college or even in the army and in such places, the primary groups of peers give support to the member. 3.3.4 Differences and Similarities in Concepts You have been introduced to the basic sociological concepts. You would have noticed that these concepts have some similarities and some differences. Any social group is seen as being more than sum total of its members and in that way comes to have a distinct life of its own. You should keep in mind that a sociologist's major interest is in the way human collectivities function as a whole and exercise their influence on the behaviour of the individuals. The difference between the various collectivities are due to the following factors: size of the group, that is, the number of members; geographical area over which the members are located; type of relationship between the members; relationship of the members to the collectivities; the nature of goals of the collectivities the duration of their life and finally collectivities, influence on The individual members. We shall differentiate the various concepts based on these factors as it will help in better understanding of the same. Size : The society is the largest collection of individuals. It consists of a number of communities, associations, institutions, primary groups and secondary groups. A community is always a part of the larger society. Associations and secondary groups are often smaller than a community. The primary group is the smallest social unit. Geographical location : The society is spread over the largest area, followed by the community and primary group. Associations and secondary groups may have members from a wide area but all people living in the area need not be members of the association. For example, everybody living in India is an Indian and every body living in a village is part of the village community. But a political party while having members from all over India cannot claim that all Indians are its members. Voluntary nature of membership : The above stated difference is due to the type of membership of the various collectivities. An individual becomes a member of a society

NSOU ? PGSW-V 55

99%

MATCHING BLOCK 66/185

W

and a community naturally, that is, by being physically present in the area and sharing essential characteristics. On the other hand an individual has to formally apply to be a member of an association or a secondary group. Nature of interaction : The interaction between the members is most frequent and intense in a primary group. Community, associations and secondary groups have less frequent and less intense interaction. Individuals are considered in their wholeness in a primary group while in a secondary group and association only a few aspects of the personality are taken into consideration. A political party is not concerned whether a member is healthy or educated as long as he or she performs useful work for the party. The primary group, however is concerned about many aspects of the personality and does not just keep in view the usefulness of the member. Goals of the collective : The goals of secondary groups and associations are specifics while the goals of the society and community are general and broad in nature. Primary groups have many gods and perform many functions for their members. The existence of primary groups is crucial for the continuance of other collectivities of social life. Relationship between the members and the larger whole : The loyalty and sense of identity the members feel in primary groups is greater than the feelings of identification among members in a community or a secondary group. In a society, these feelings are weaker still and more imagined than real. Duration of the collective : The duration of groups and collectivities varies. The family as primary group exists as long as the members are alive or do not leave. On the other hand, secondary groups, associations, community and society exist for long durations even as members die or leave. The persistence of these collectivities is irrespective of the presence and absence of any member or group of members. 3.4

94%

MATCHING BLOCK 67/185

W

Society Before we understand these concepts, it is important that we clarify what a concept means. A concept is expressed in one or more words. Also concepts are abstractions, which mean that these are derived from experience and are mentally created. Once the scientific community accepts a concept, all those who use it accept the meaning assigned to it. For example, in everyday language a road means a way. NSOU ? PGSW-V 56 Sometimes there is need for further clarification of the concept. For example, a road can be a street, a pukka road or kachn one or even a highway. In scientific language also, we qualify concepts, when we want to say something more specific. For example, communities can be further classified into rural community, urban community and tribal community. In some cases, social scientist; do not agree with the meaning attached to a specific concept and after a debate among them, meanings attached to the concept undergo a change. According to Horton and Hunt, concepts are used for the following reasons. One, it enables scientific discussion to take place. Concepts help social scientists find common ground for initiating discussions on theories. Secondly. New knowledge is also created when concepts and theories are debated and its limitations are identified. Thirdly, concepts allow easy communication by 'reducing need for elaborate description. Otherwise, the communicator would have to explain the social phenomena every time he/ she has to use it. According to Horton and Hunt society is an organization of people whose associations are with one another. MacIver describes society as a web of relationships. There are a number of definitions of society. Most of them point to the following characteristics of society. Society involves mutual awareness : The first condition for calling a set of individuals a society is the awareness among them about each other. It is only when individuals are aware about the presence of others that they can form a social relationship. Society consists of social relationships : Any two individuals or

objects are

that guide these social relationships : Social relationships are guided and controlled by the values and norms of a society. Every individual has a specific role assigned to him / her by the society. The performance of these roles is guided by the values and norms of the society associated with the particular role. These values are taught to the individuals through the process of socialization. They become part of the individual personality. Apart from this, there are informal and formal agencies of social control which apply positive and negative sanctions on the individual for making

him / her

conform to the societal values and norms. Society has general goals : Every society wants to perpetuate itself. Certain functions have to be performed if the society has to maintain itself and prevent its own NSOU ? PGSW-V 57 destruction. These are called functional prerequisites. Some of the most common functions identified are the following; common goals; common orientation towards environment.; communications; set of common values; reproduction and rearing of children, socializing the children, attaining food and other resources require\$ for its members' survival, protecting its members from natural and man-made disasters and specific ways to deal with conflicts and disagreements within the

members. The ways

91%

MATCHING BLOCK 72/185

these functions are performed vary from society to society. Society has a number of complementary social processes : We find a variety of social processes and attributes in the society. We find instances of association, cooperation, competition

and

97%

MATCHING BLOCK 73/185

W

conflict in society. Similarly we find that in many ways the members of society are alike and in many other ways they are different. There are groups and subgroups with these groups that have their respective dynamics. All these different social processes make up the society. Society has division of labour : One individual cannot perform all functions required to maintain a society. The work has to be divided among the members. The criteria by which the functions are divided among the members and its social consequences are important part of study for the sociologist. Division of labour can be based on sex, education, profession, ethnicity, caste or class. Division of labour depends on the level of complexity of the society. Society is more than the sum total of its members : The society influences individuals in many ways. It is the environment along with hereditary factors that determine the personality of the individual. Thus the society comes to have a force of its own by which it influences the members. This force is applied through social institutions like laws, religion and family. 3.5 Classification of Societies Sociologists have classified societies according to different criteria. Societies classified ort their geographical location : Examples of this classification are Western society, Indian society, Chinese society and so on. This kind of classification is used broadly like in western societies. It is felt for example that all societies in the west share certain common and significant characteristics. It can also be used narrowly when we

NSOU ? PGSW-V 58

95%**MATCHING BLOCK 74/185****W**

want to refer to a regional group, for example we talk of Manipuri society or Rajasthani society. Societies classified on the basis of the language : Examples of this classification are Tamil society and Telugu society. Language is a medium which unites people and one of the modes by which the culture of the people is expressed. So language is sometimes used to distinguish societies from each other. Societies classified based on core values : Sometimes opinions regarding the nature of the society are based on essential core-values which the members adhere to. For example, Western society is considered modern, rational, individualistic and consumerist while Indian society is considered to be traditional, religious, group-oriented and spiritual. In most cases such classification is the result of stereotyping and labeling. It is based on insufficient and inaccurate information on the societies other than one's own. Social workers should be able to see how such images, often negative, about other societies, influence the behavior of members. Societies based on level of complexity of social life : Simple societies are those societies that have the following characteristics: small-sized with fewer members; relatively isolated from other societies-spatially, culturally and economically, means for obtaining food is hunting and gathering; low level of technology used in production of articles; division of labour is limited and based on age and sex; barter and gift taking and giving are the major ways for exchange of goods between the members; political system is based on heredity principle and traditional authority; group consciousness dominates individual consciousness and unity in the group is maintained by the likeness among the members. On the other hand, complex societies are based on the following characteristics: large numbers of members and, therefore; close relationship with other societies mainly due to advanced technology used in communication and transport; high level of technology used in producing all goods including foodstuffs; division of labour is highly diversified; market is the main form of exchange of goods while other forms of exchange like barter play a marginal role; political system is highly advanced with different competing interests; a large bureaucracy based on rational-legal values: individual consciousness and individual freedom is promoted; diversity in life-styles is encouraged and unity is based on interdependence of members. Societies based on its economic system : Sociologists influenced by Marxism maintain that economic factors have predominant influence on how the society is structured and how society functions. Based on these criteria societies are classified as capitalistic societies and socialistic societies. Both these societies are complex in nature, but in NSOU ? PGSW-V 59 capitalistic society, the forces of production (land, factories) are privately owned. Workers working in these factories are paid wages in exchange of the labour they contribute. Markets determine the costs of the goods and services that are produced. Private property-ownership and profit-making are encouraged. The state has no or minimal role in the economy of the country. In a socialistic society, all or significant part of the forces of production are owned by the state in different forms. The state uses its ownership of industries to influence the economy. Equally important is the role of planning in a socialistic economy The market is only allowed to have limited influence on the economy. The supply of goods and services are determined by the plan which the government prepares after assessing the needs and demands' of different sections of the society. The government through its policies tries to ensure that the differences in income between various sections of the society are not very large. After the collapse of the Socialist, bloc planning has lost much of its appeal for governments around the globe. Most countries have started giving significant role to market and private entrepreneurs in their economies. Nevertheless, it is also true that classical capitalist society no longer exists as all governments in the modern times play a significant role in the economy of the country. Societies based on the political system : Societies can be classified also on the basis of the nature of political system into democratic or authoritarian.. A democratic society has a state whose leaders are elected by popular vote. Regular elections are held to elect the leaders. Though free and fair elections are important, other conditions needed for democratic society are: freedom of association, freedom of speech, tolerance of different opinions, protection of minority rights, equality before law and respect for human rights. Authoritarian society neither allows dissent nor freedom of association. No other organization is allowed to challenge the authority of the state. Societies classified based on historical periods : Ancient societies, medieval societies and modern societies are some of the societies based on historical periods in which they existed. 3.6

100%**MATCHING BLOCK 75/185****W**

Community Like society, different sociologists have also defined 'community' differently. Horton and Hunt define a community as a local grouping within which people carry out a full round of life activities. Explaining it in greater detail they include the following characteristics.

NSOU ? PGSW-V 60 Community

95%**MATCHING BLOCK 76/185****W**

is a grouping of people : Community consists of a number of people living together and sharing a common life. They interact with each other frequently and purposefully. A fixed geographical area : This is an important characteristic of the community. A community has well-defined boundaries that are recognized by the members of the community as well as outsiders. To become a member of the community, one needs to have some relationship with the specific geographical area. In some cases, membership of the community can be had if one's parents belong to the specific community. Division of labour : In every group, many functions have to be performed, so that the group survives. No individual or group can do all these functions by themselves. There are also differences in the skill and aptitude of the individuals. These factors lead to division of labour and occupational specialization. Members are conscious of their unity and of belongingness to the community : Members are aware of their membership in a particular community. It affects their behaviour in many ways. They take pride in the achievements of their fellow-members and are concerned when undesirable things happen to them. Members act collectively in an organized manner to achieve common goals : Members live in a particular area and share common interests. Therefore, they can be easily organized to achieve common objectives. This, condition enables the practice of social work method-community organization. Also, many programmes are implemented because it is felt that the community as a whole will participate and benefit from the programme, for example, the community development programme. Common culture : Culture of any group develops as a result of group living. A common way of thinking about the different aspects of life develops and this is transmitted from one generation to other. Cultural influences from outside the group are accepted or rejected collectively by the group. As a result of common experiences, a common culture develops and regulates the group behaviour. Use of the Concept 'Community' The concept also helps in describing and differentiating existing communities. The most commonly used classification is to distinguish between urban community and rural community. Rural communities are characterized by the following attributes: strong community sentiment;

NSOU ? PGSW-V 61

99%**MATCHING BLOCK 77/185****W**

importance of neighbourhood; relatively high incidence of extended families; predominance of primary relationships; majority of community members' occupations are related to the primary sectors like fishing, agriculture, hunting, etc; high degree of informal social control; greater degree of homogeneity. On the other hand urban community is defined as characterised by the following: weak community sentiments and lesser importance of neighbourhood; predominance of lower degree of informal social control; major occupations of the members are related to industry and services sector and heterogeneity. Further when the community is taken as a unit for action, it simplifies the formulation and implementation of programmes. Without delineating the boundaries of the community and understanding its structure it would be difficult to analyze the needs of the community. Limitations in the Use of the Concept 'Community' Though the concept is quite clear on paper, in real life its application is confusing due to these reasons. Firstly, no community seems to fulfill all the characteristics required to be termed as a community. Also, the distinctions between different types of communities are not clear. We find that characteristics that are attributed to the rural characteristics are also found in the urban areas and vice versa. Secondly, in some Indian villages, there is less or even no 'We feeling' among the members because the community is divided on the basis of caste. Thirdly, it is observed that when people say 'community' they seem to have in their minds only the male members of the community. In many village communities, women do not have a public voice and sometimes are not even seen. 3.7

97%**MATCHING BLOCK 78/185****W**

Associations Modern societies are characterized by presence of numerous associations. These associations are of different varieties, of different types, of different sizes and with different objectives. Maclver defines an association as 'an organization deliberately formed for the collective pursuit of some interest or set of interests, which its members share'. The following are the characteristics of associations : Associations are groups of individuals : Associations consist of a number of

NSOU ? PGSW-V 62

100%**MATCHING BLOCK 79/185****W**

individuals who share common interest or common interests. They relate to

each other

99%

MATCHING BLOCK 80/185

W

so that they can promote the group's interests. Attaining group interests will eventually mean that the individual member's interests are also promoted. Associations have objectives : These interests are specific and all the members are aware of these interests. In most cases, the objectives of the association will reveal those interests of the members, which it wants to pursue. Objectives are framed after taking into consideration the reality of the situation. The success and failure of the association depends on whether it attains its objectives or not. Association has formal rules and regulations : A small association may not have any formal rules as members may be functioning based on the personal relationship they have with each other. But if the association grows larger and its functioning becomes complex, then normal rules and regulations are formulated. Formal rules and regulations of the association determine how the members will act in specific situations. In many associations, these rules and procedures are written down. In your fieldwork agency you can request the officials to allow you to show the 'Memorandum of Association'. This document will show you the objectives of the agency, its mode of functioning and other relevant information. Membership is voluntary : Associations are product of modern societies. Membership is voluntary, that is, members join the association out of their own desire. The association can set standards for allowing members to join. Once the aspirant meets these standards he or she is allowed to join the association. Associations survive as long as it has members : Unlike families, associations survive even if the original members leave or expire. The only condition is that new members should join the association and replace those who're leaving. Associations and their relevance in modern society : Modern societies freely allow and even encourage the formation of the associations. Therefore, we find that there are associations that have serious objectives like influencing government policy and there are associations that want to promote bird watching. Tocqueville, a prominent social thinker, who studied the American society in the eighteen century, was the first to point out that associations promote democracy. Modern thinkers have agreed with these observations. Associations allow citizens to organize themselves, articulate their demands, thereby restricting the authority of the government. This prevents the government from accumulating all authority in itself at the cost of individual freedom. Two, associations allow for plurality

NSOU ? PGSW-V 63

100%

MATCHING BLOCK 81/185

W

of opinions. Associations also provide a number of services, which improve the quality of life of the people. In traditional society, individuals become part of the groups on the basis of their ascribed status. For example, medieval cities had merchant guilds whose membership was based on the caste of the individuals. In modern India, there is a proliferation of caste associations. These associations have characteristics of both traditional groups and modern associations. Its objectives are related to that of a

modern society

like influencing government policies and building educational institutions. However, membership is based on primordial considerations like caste and religion. So these associations cannot be called fully modern or fully traditional. However, they play a significant role in

94%

MATCHING BLOCK 82/185

W

the lives of most Indians. 3.8 Institutions In everyday language, people use institutions to mean organizations. For example, college is called educational institution. But in sociology the concept 'institution' has a specific meaning. According to Maclver, institutions are 'established forms or conditions of procedures characteristics of group activity'. According to Horton and Hunt, an institution is a system of norms to achieve some .goal or activity that people feel is important, or more formally an organized cluster of folkways and mores centered around a major human activity. Institutions have the following characteristics. Institution emerges out of social interactions within a group : According to Sumner there are two types of institutions - crecive institutions and enacted institutions. Crescive institutions are those norms that emerge unconsciously in society. Its origin is unclear and cannot be dated. On the other hand, enacted institutions are consciously created for specific purposes. Modern day laws, which are rationally formulated, are an example of enacted institutions. Institutions are structural processes that control human behaviour : Any member of society is expected to follow the rules, regulations and usages prevalent in the society. These rules, regulations and usages can be informal or formal. If it is formal, then it is codified and in most cases will have an organization responsible to see that individuals

NSOU ? PGSW-V 64

99%

MATCHING BLOCK 83/185

W

follow these rules. For example: in Indian society, if a person wants to get married she can do so only under one of the Marriage Acts formulated by the government. There will be an agency for conducting marriage and to see that conditions needed for marriage are fulfilled. The male and female agree to perform the duties of husband and wife respectively. In cases of conflict between the partners, there are police and courts to deal with them. The totality of these processes can be called the institution of marriage in India. All institutions have roles and status : Every institution gives a particular role and status to the individuals involved in it. Role is a set of behaviour expected of an individual in particular social context. Status is the position of the individual in society. In an educational institution, for example, there are individuals who come to learn and are given the status of students, and the individuals who teach are given status of teachers. In

his/ her

100%

his/her role as a teacher as he or she

99%

MATCHING BLOCK 86/185

W

has to take classes, evaluate students' notebooks, control the students and follow the principal's instructions. Institutions operate through the means of roles. Institutional roles are learnt by socialization : Every institution prescribes specific roles for the particular individual. The different roles individuals perform are learnt through the process of socialization. Main agencies of socialization are family, educational institutions, peer group, state and religion. Institutions influence each other : There are many institutions in a society and they influence each other. For example, the school teaches the students how to behave like a good citizen. When they grow up they become good citizens who are aware of the laws and their responsibilities. At times various institutions give contradictory norms, which result in confusion in the individual. For example, feudalism and modern democracy co-exist in some parts of India, each of which makes opposing demands on the individual. Democracy advocates equality while feudalism advocates structured inequality. The major institutions which are the subject of the sociological study are political, economic, family, educational and religious. Other important institutions in society are bureaucracy , welfare institutions and military. Relationship* between an institution and organization : As mentioned in the start of the section, institutions and organizations are different conceptually. Institutions are recognized way of thinking while organizations are formal groups created to achieve

NSOU ? PGSW-V 65

100%

MATCHING BLOCK 87/185

W

specific objectives. At the same time they are related to each other as every organization has an institutional framework, which allows it to survive. 3.9

Conclusion To work efficiently, we must have a complete knowledge about the groups & community to know the sentiments & trycle of the people thus colse study of these societies will enhance our understanding about the system in a much better way. 3.10 Exercise

NSOU ? PGSW-V 67 Unit 4 ? Social Structure : Meaning and Forms, Forms of society : Rural, Urban, Tribal Society Structure 4.0 Objective 4.1 Introduction 4.1.1 Concept/Definition 4.1.2 Elements 4.2 Types of Social Structure 4.3 Types of society 4.3.1 Preindustrial Societies 4.3.2 Industrial Society 4.4 Defining a complex society 4.5 Social Work with Rural Communities 4.6 Social Work with Urban Communities 4.7 Social Work with Tribal Communities 4.8 Conclusion 4.9 Exercise 4.10 Reference 4.0 Objective Society in a basic unit. It is of distinct nature & may be of various nature. In this unit we will learn about the social structure, & also get an idea about the former societies. 4.1 Introduction : Social Structure As individuals we all know a great deal about ourselves and about the societies in which we live. We have fairly good understanding of why we act as we do. Many of things that we do in our day-to-day lives, because we understand the social conventions involved. From the above discussion on socialization we have come to conclusion that there is social

NSOU ? PGSW-V 68 process of social ordering or discipline. The static pictures of social order are description of social structure. 4.1.1 Concept/Definition The social environments in which we exist do not just consist of random assortment of events or actions. There are underlying regulations, or patterning, in how people behave and in the relationships in which they stand with one another. It is these regulations to which the concept of social structure refers. To some degree it is helpful to picture the structural characteristics of societies as resembling the structure of building. But this metaphor can be applied to social structures strictly because, social structures are made up of human actions and relationships. We should understand human societies to be like buildings that are every moment being reconstructed by the very brick that compose them. The actions of all of us are influenced by the structural characteristics of the societies in which we are brought up and live; and at the same time, we recreate those structural characteristics in our actions. In short, Social structure is patterned social order as we observe it. You would be clearer about the concept as we proceed in this unit. 4.1.2 Elements Social structure refers to arrangement of social activities that are seen to exist over some period of time and that is believed to depict underlying patterns of social order. Social structure results from process that means they are not static. That means that Social structures are relatively bounded and stable occurrence of social order together with associated culture. To recapitulate from the concepts we talked at the beginning of this unit Social structure refers to the pattern of interrelations between individuals. Every society has a social structure, a complex of major institutions, groups, and arrangements, relating to status and power. Social structure is an arrangement of social activities that is seen to exist over some period of time and that is believed to depict underlying pattern of social order. 4.2 Types of Social Structure From the above discussion it is fairly clear there are different types of social structures in a society and each one of us a member of more than one social structure. Be it a family, economic structure, religious structure, political structure etc.

NSOU ? PGSW-V 69 i) Social Institutions We have seen above that social institution is a procedure, practice and an instrument, hence an ensemble of a variety of customs and habits accumulated over a period of time. Institutions are instruments and tools of human transactions. An institution is thus a stable cluster of norms, values and roles. ii) Family The family is an organized group based on a network of relationships. These relationships provide assignment of rights and duties between members. iii) Economic Institution Social institutions concerned with the management, production and distribution of human resources are referred to as economic institutions. Economic institutions have also been defined by Kingsley Davis, as those 'basic ideas', norms and statutes that govern the allocation of scarce goods in any society, whether society is primitive or civilized. The economic institutions thus govern the activities of the individuals with regards to production, distribution and consumption of goods and services in society. The property and the contract are the most fundamental economic institutions. The economic institutions that constitute the economic system are wages, the system of exchange and division of labour, the property and the contract. iv) Religious Institution Religion has existed throughout the history of human society. It is an important aspect of human social life. Religion has been defined as 'a belief in supernatural being', by the anthropologist E. B. Tylor. These beliefs are associated with emotional state of mind such as fear, awe, happiness, reverence etc. As regards, to the social structure, every religion involves its specific rituals such as playing, dancing, chanting, fasting and eating certain kinds of food and so on. Religious institutions have believed to have been evolved into an organized forms based on a system of beliefs and ritual practices. There are different forms of the communities of believers such as the church, the sect and the cult. Church is well-established organization, and has a bureaucratic structure with hierarchy of office bearers among the believers. Hinduism also has some organized body in important temples of the country and the body of persons entrusted with the responsibility of management of temples.

NSOU ? PGSW-V 70 As compared to well-established organized groups such as church, sects are smaller in size. They generally originate as remonstrate against the old established religion. It is initiated by a few and gradually others join it. The sect rejects the tenets of the conventional religion and attempts to convince people about the weaknesses of the traditional religion. Arya samaj is an example of sect of Hinduism. v) Educational Institution A child is born only as a biological being but soon becomes social being through socialization and education. Education is an effort of the senior people to transfer their knowledge to the younger members of the society. It is, therefore, also an institution that plays vital role in integrating an individual with his society and in maintaining the perpetuation of culture. Emile Durkheim, the French sociologist defines education as 'the influence exercised by the adult generation upon those who are not yet ready for adult life'.

He maintains that 'society can survive only if there exists among its members sufficient degree of homogeneity.

The homogeneity is perpetuated and reinforced by education. A child learns basic rules, regulations, norms and values of society through education. Sociologists mainly focus on the influence of social situations on the nature of education system and the role of education in social change. Durkheim argues that in complex industrial society, school serves important functions which the family or peer group may not be able to do. In the family or peer group, a person has to interact with his kin or with his friend, but in a society at large, one has to interact with a person who is neither a kin nor a friend. School teaches an individual to learn to cooperate with strangers. vi) State/Political Institutions According to Max Weber, State is the most fundamental institutions of a political system. The state means the institution which exercises the monopoly over the legitimate use of power within a given territory. It can use force to implement its policies. To exercise political power, state has sub institutions that are involved to implement its policies. The judiciary and the legislature are the instruments that cooperate in the distribution of power. The essential elements of the state are a population, a defined territory, a government and sovereignty. Legitimate power is NSOU ? PGSW-V 71 the most significant element of political institution. Political institutions are also defined as those holding monopoly in the exercise of legitimate force. The political system in the remote past were such that the political power of rulers were relatively unqualified but state which emerged after Enlightenment and Industrial Revolution was endowed with qualified power. 'The state' according to Max Weber, 'is a human community which successfully claim the monopoly of the legitimate use of physical force within a given territory'. The Constitution of a state/country defines the limits of power of the state and its different organs. The power is legitimate so long as presents the 'general will' of the people and is voluntarily accepted by them. There are three bases of legitimization of power and can be classified into three corresponding types of authority. The authorities are: the traditional authority, the charismatic authority, and the legal rational authority. The traditional authority is that which people obey by habit. They accept the power of someone simply because it has been done so in the past. For example, the tribal chief Charismatic authority is the second type. People also behave voluntarily under the influence of a person who possesses some extraordinary qualities. They obey the person due to their faith in and respect for him. The authority in the modern industrial society is legal rational type. This authority is formal and its privileges are limited and defined by law. The actual power lies not in the person but in the position he occupies. The administrative staffs of the state are an example of this category. This kind of authority is impersonal and rational in nature. 4.3 Types of society

97%

MATCHING BLOCK 88/185

W

Hunting and gathering tribes, industrialized Japan, Americans each is a society terms, society refers to a group of people who live in a definable community and share the same culture. On a broader scale, society consists of the people and institutions around us, our shared beliefs, and our cultural ideas. Typically, more-advanced societies also share a political authority. Sociologist Gerhard Lenski (1924–) defined societies in terms of their technological sophistication. As a society advances, so does its use of technology. Societies with rudimentary technology depend on the fluctuations of their environments, while industrialized NSOU ? PGSW-V 72 societies have more control over the impact of their surroundings and thus develop different cultural features. This distinction is so important that sociologists generally classify societies along a spectrum of their level of industrialization—from preindustrial to industrial to post industrial. 4.3.1 Preindustrial Societies Before the Industrial Revolution and the widespread use of machines, societies were small, rural, and dependent largely on local resources. Economic production was limited to the amount of labor a human being could provide, and there were few specialized occupations. The very first occupation was that of hunter-gatherer. Hunter-Gatherer Hunter-gatherer societies demonstrate the strongest dependence on the environment of the various types of preindustrial societies. As the basic structure of human society until about 10,000–12,000 years ago, these groups were based around kinship or tribes. Hunter-gatherers relied on their surroundings for survival—they hunted wild animals and foraged for uncultivated plants for food. When resources became scarce, the group moved to a new area to find sustenance, meaning they were nomadic. These societies were common until several hundred years ago, but today only a few hundred remain in existence, such as indigenous Australian tribes sometimes referred to as “aborigines,” or the Bambuti, a group of pygmy hunter-gatherers residing in the Democratic Republic of Congo. Hunter-gatherer groups are quickly disappearing as the world’s population explodes. Pastoral Changing conditions and adaptations led some societies to rely on the domestication of animals where circumstances permitted. Roughly 7,500 years ago, human societies began to recognize their ability to tame and breed animals and to grow and cultivate their own plants. Pastoral societies, such as the Maasai villagers, rely on the domestication of animals as a resource for survival. Unlike earlier hunter-gatherers who depended entirely on existing resources to stay alive, pastoral groups were able to breed livestock for food, clothing, and transportation, and they created a surplus of goods. Herding, or pastoral, societies remained nomadic because they were forced to follow their animals to fresh feeding grounds. Around the time that pastoral societies emerged, specialized occupations began to develop, and societies commenced trading with local groups.

NSOU ? PGSW-V 73

100%**MATCHING BLOCK 93/185****W**

Horticultural Around the same time that pastoral societies were on the rise, another type of society developed, based on the newly developed capacity for people to grow and cultivate plants. Previously, the depletion of a region's crops or water supply forced pastoral societies to relocate in search of food sources for their livestock. Horticultural societies formed in areas where rainfall and other conditions allowed them to grow stable crops. They were similar to hunter-gatherers in that they largely depended on the environment for survival, but since they didn't have to abandon their location to follow resources, they were able to start permanent settlements. This created more stability and more material goods and became the basis for the first revolution in human survival.

Agricultural While pastoral and horticultural societies used small, temporary tools such as digging sticks or hoes, agricultural societies relied on permanent tools for survival. Around 3000 B.C.E., an explosion of new technology known as the Agricultural Revolution made farming possible—and profitable. Farmers learned to rotate the types of crops grown on their fields and to reuse waste products such as fertilizer, which led to better harvests and bigger surpluses of food. New tools for digging and harvesting were made of metal, and this made them more effective and longer lasting. Human settlements grew into towns and cities, and particularly bountiful regions became centers of trade and commerce. This is also the age in which people had the time and comfort to engage in more contemplative and thoughtful activities, such as music, poetry, and philosophy. This period became referred to as the "dawn of civilization" by some because of the development of leisure and humanities. Craftspeople were able to support themselves through the production of creative, decorative, or thought-provoking aesthetic objects and writings. As resources became more plentiful, social classes became more divisive. Those who had more resources could afford better living and developed into a class of nobility. Difference in social standing between men and women increased. As cities expanded, ownership and preservation of resources became a pressing concern.

Feudal The ninth century gave rise to feudal societies. These societies contained a strict hierarchical system of power based around land ownership and protection. The nobility, known as lords, placed vassals in charge of pieces of land. In return for the resources that the land provided, vassals promised to fight for their lords.

NSOU ? PGSW-V 74

100%**MATCHING BLOCK 89/185****W**

These individual pieces of land, known as fiefdoms, were cultivated by the lower class. In return for maintaining the land, peasants were guaranteed a place to live and protection from outside enemies. Power was handed down through family lines, with peasant families serving lords for generations and generations. Ultimately, the social and economic system of feudalism failed and was replaced by capitalism and the technological advances of the industrial era.

4.3.2 Industrial Society In the eighteenth century, Europe experienced a dramatic rise in technological invention, ushering in an era known as the Industrial Revolution. What made this period remarkable was the number of new inventions that influenced people's daily lives. Within a generation, tasks that had until this point required months of labor became achievable in a matter of days. Before the Industrial Revolution, work was largely person- or animal- based, and relied on human workers or horses to power mills and drive pumps. In 1782, James Watt and Matthew Boulton created a steam engine that could do the work of twelve horses by itself. Steam power began appearing everywhere. Instead of paying artisans to painstakingly spin wool and weave it into cloth, people turned to textile mills that produced fabric quickly at a better price and often with better quality. Rather than planting and harvesting fields by hand, farmers were able to purchase mechanical seeders and threshing machines that caused agricultural productivity to soar. Products such as paper and glass became available to the average person, and the quality and accessibility of education and health care soared. Gas lights allowed increased visibility in the dark, and towns and cities developed a nightlife. One of the results of increased productivity and technology was the rise of urban centers. Workers flocked to factories for jobs, and the populations of cities became increasingly diverse. The new generation became less preoccupied with maintaining family land and traditions and more focused on acquiring wealth and achieving upward mobility for themselves and their families. People wanted their children and their children's children to continue to rise to the top, and as capitalism increased, so did social mobility. It was during the eighteenth and nineteenth centuries of the Industrial Revolution that sociology was born. Life was changing quickly and the long-established traditions of the agricultural eras did not apply to life in the larger cities. Masses of people were moving to

NSOU ? PGSW-V 75

100%**MATCHING BLOCK 90/185****W**

new environments and often found themselves faced with horrendous conditions of filth, overcrowding, and poverty. Social scientists emerged to study the relationship between the individual members of society and society as a whole. It was during this time that power moved from the hands of the aristocracy and "old money" to business-savvy newcomers who amassed fortunes in their lifetimes. Families such as the Rockefellers and the Vanderbilts became the new power players and used their influence in business to control aspects of government as well. Eventually, concerns over the exploitation of workers led to the formation of labor unions and laws that set mandatory conditions for employees. Although the introduction of new technology at the end of the nineteenth century ended the industrial age, much of our social structure and social ideas— like family, childhood, and time standardization—have a basis in industrial society.

100%**MATCHING BLOCK 91/185****W**

Postindustrial Society Information societies, sometimes known as postindustrial or digital societies, are a recent development. Unlike industrial societies that are rooted in the production of

NSOU ? PGSW-V 76

100%**MATCHING BLOCK 92/185****W**

material goods, information societies are based on the production of information and services. Digital technology is the steam engine of information societies, and computer moguls such as Steve Jobs and Bill Gates are its John D. Rockefellers and Cornelius Vanderbilts. Since the economy of information societies is driven by knowledge and not material goods, power lies with those in charge of storing and distributing information. Members of a postindustrial society are likely to be employed as sellers of services—software programmers or business consultants, for example—instead of producers of goods. Social classes are divided by access to education, since without technical skills, people in an information society lack the means for success. 4.4

96%**MATCHING BLOCK 94/185****W**

Defining a complex society Technological advances from the stage of hunting and gathering to landing on the moon have given birth to a technologically advanced complex society in modern times. Described as 'complex societies', modern industrial nation-states are contrasted with the simple societies in various important ways: 1. larger territory and population membership; 2. greater occupational differentiation, and specialisation of work and social groups;

Farmer Services Industry Data- bases Working units Field data Climate data Automation I NTERNE T
NSOU ? PGSW-V 77 3.

95%**MATCHING BLOCK 95/185****W**

advanced technology for production of consumer items, building of houses, work places, etc; 4. greater co-ordination in the management of the complex society; 5. quick rate of change in terms of consumer goods, forms of education, and so on; 6. Faster modes of mass communication, such as, radio, TV, computers internet etc. 7. Initially it was technological advances that ushered in change. Huge markets sprang up, occupational opportunities and population increase created the nation- state. This is far more inclusive in organisation than anything in simple societies. 4.5

98%**MATCHING BLOCK 96/185****W**

Social Work with Rural Communities Features of the Rural Community ? In majority of the villages, the economy is based on agriculture. The life-cycle of a village community would centre on the specific nature of agriculture. Indian Agriculture is dependent on monsoons for most parts of the country, leading to a great degree of uncertainty. The labourers do not have work throughout the year, while the farmers are unsure of a good crop. This uncertainty would be reflected in the life of the people – long term planning to spend and save becomes difficult, affecting children's education, health and other long-term expenditures. ? The main occupations are cultivation and labour work. With the onset of monsoons, for tilling and ploughing the land, and during the harvesting season, the demand for labour goes up pushing up the wages. During the off- season, not only would the wages come down, but the families may also have to migrate in search of jobs. The cultivator, who is dependent on market prices, gains if the prices are high and vice-versa; with falling prices, he tends to loose. ? Compared to an urban community, the population of a village would be much smaller. Occupationally, and in terms of residence, people would be less mobile. In a rural community, occupations tend to be inherited—a cultivator's son would turn to farming, while children from a landless household would turn to labour work. Occupational changes are easier when a person migrates to an urban centre. Members of a rural community share similar cultural patterns, such as, the same language, religion, food habits, etc. Overall, a village has a great degree of homogeneity.

NSOU ? PGSW-V 78 ?

99%

MATCHING BLOCK 97/185**W**

The social structure of the village is based on the caste system and the traditional family structure. The primary ties would be important with a strong sense of belonging. A person's role and perceptions would emerge as an outcome of his position in the local society. There would be a fundamental acceptance of the normative and perceptual values of the group. Members of the same caste tend to stay close to each other in the village. Institutional Structures in a Rural Community Institutional structures refer to organisations with policies, programmes, finances and administrative hierarchy; and in the last fifty years, a number of them emerged undertaking different functions. Powerful castes and economic categories control them. They affect the life of the local community in various ways and it is necessary to understand how they work. They can be of three types: a) Governmental Organisations A number of departments of the state Government affect the life of the local community, such as the Revenue, Forest, Irrigation, Health, General Administration, Public Works Department, etc. The Government exercises direct control and takes all decision related to recruitment, working conditions, payment of salary, work allotment, supervision, etc. Then, there are autonomous organisations like the State Electricity Boards and the Police Department. b) Non-Governmental Organisations Local communities have a number of formal and informal organisations. They could be of different types—social, political, religious, etc., undertaking different functions in the community. Most villages may have one or two Mahila Mandals and a committee managing the affairs of the local shrine. Members of political parties tend to be more active than members of other organisations and could be mobilised for some of the social work issues. A major characteristic of NGOs is that the Government does not exercise direct control over them. c) Statutory and Public Institutions In the last half a century of development, a number of statutory organisations have emerged, such as, Panchayati Raj Institutions and co-operative organisations in the area of credit, agriculture processing and marketing, supply of agriculture inputs,

NSOU ? PGSW-V 79

97%

MATCHING BLOCK 110/185**W**

etc. Milk co-operatives have been set in many rural areas. They are public bodies reflecting local interests with political overtones. Since the leadership emerges after fighting elections, these bodies have strong local roots. The most widespread of such organisation is the Panchayati Raj Institution, which works at the District (Zilla Parishad), Block (Panchayat Samiti) and the Village (Gram Panchayat and Gram Sabha) level. Each state has passed it's own legislation for the implementation of Panchayati Raj. In the area of rural banking, the National Bank for Agriculture and Rural Development has been set up under the NABARD Act, 1981, which is a Central legislation. Problems in a Rural Community The problems in a rural community can be understood in the following manner : a) Problems at the level of Individuals Family conflicts of various types will come under this category. The most common would be conflicts between the spouses or conflicts between two generations of the family members. These conflicts are more in the nature of value-conflicts, centered on one or two individuals in which the role of the human personality is important. b) Problems at the level of Groups The problems at the group level could be more in the nature of socio-economic conditions. These could be the problems of the aged, single parents, marginal farmers, landless households, illiterates, school drop-outs, teenagers, etc. c) Problems at the level of Communities The defining element here would be a section of population larger than a group being affected. This could be a large segment of the community or the whole community. At this level, there are implications on policies affecting the village community and the working of the local institutional structures. In terms of issues, it could be that of alcoholism, sanitation, health, violence, environmental degradation, drinking water, matters related to land and forest, problem of wages, infrastructural problems, problem of exploitation and oppression, below poverty line families etc. An important area of work could be the functioning of the Gram Panchayat and Gram Sabha. The Gram Sabha is supposed to be the base of the Panchayat Raj System and, in principle, exercises the maximum powers at the village level. All adult villagers constitute the Gram NSOU ? PGSW-V 80 Sabha and are supposed to meet four times a year to review the work done by the Gram Panchayat and make new plans to be implemented by the Gram Panchayat. In practice, this never happens and a small group controls and monopolises both the Gram Panchayat and the Gram Sabha. The identified problems have to be developed in the format of an 'Issue'. To implement this process, the following steps should be undertaken : 1. Identify the problem to be worked upon; 2. Decide on the target group – the quantitative dimension; 3. Operationalise the objectives, which could have both quantitative and qualitative dimensions; 4. Identify local institutional structures for collaborative work; 5. Decide on a line of action; 6. List out a few qualitative and quantitative indicators to evaluate the work done. Once these steps are undertaken, then the broad outline of the intervention measure is ready. Now, specific steps have to be decided upon, for which the following details of the proposed line of action would be helpful : ? What specific steps have to be taken? ? What resources are required for the proposed steps? ? From where the resources are to be obtained? ? Discussion with the personnel of the institutional structures on the nature of collaboration to be undertaken. 4.6 Social Work with Urban Communities Features of an Urban Community ? The occupational pattern of an urban community would be dominated by non- agricultural occupations. The working hours would be regulated and monetary compensation would be in the form of wages and salaries. A segment of the population would be linked to the formal economy where rules and regulations operate, and a greater element of economic security operates. There would also

NSOU ? PGSW-V 81

be provisions for social security measures in the form of old age pensions, savings schemes and provisions for taking loans. ? Low-Income households would be tied to the urban informal economy where economic insecurity is higher and the scope of rules and regulation is lower. The provision for social security measures is very poor in the urban informal economy. Generally, low-income households stay in slums, which are of two types. Those slums recognised by the municipal ? Authorities not only get civic facilities, but the residents become owner of their plot of land/house and become taxpayers. But non-recognised slums suffer from a double disability. Since they are not recognised by the municipal authorities, they are not eligible for civic amenities and could, at any time, be removed from their houses/sites. In addition, they cannot create an asset by improving the house-site. ? A portion of the urban community would be migrants. In smaller towns, the migration would be from the nearby villages, while in bigger towns and industrial cities, the migrants could be from far off places. The migrants would be coming with their own culture and, possibly, could be from a different linguistic group, caste group or religion. ? The population of urban communities would be large in size and also exhibit a great deal of heterogeneity. ? The social structure would see greater influence of secondary ties and the nuclear family. Geographic and occupational mobility in an urban community would be greater than in a rural community. ? Owing to influences from a variety of sources, a member of an urban community need not share the normative and perceptual values of his/her group of origin in its totality, and also, his sense of belonging to the group need not be very strong. Institutional Structures in an Urban Community Urban communities will see a wide variety of organisations as compared to rural communities. Part of the variety will be due to the heterogeneous nature of urban communities and partly because urban areas tend to be centres of industries and local administration. They impinge on the life of the local community in various ways and it is necessary to understand how they work. They can be of three types: a) Governmental Structures NSOU ? PGSW-V 82 A number of governmental departments undertake their functions, which are important in an urban community. The Department of Revenue, the General Administration Department, the Town Planning authorities, the Rationing Department, Department of Industries, etc., are some of the examples of government departments. b) Non-Governmental Structures Urban communities have a number of Non- Governmental organisations. Educational bodies, starting from the primary level till the highest level, would be seen in urban areas. The Chambers of Commerce, Merchant's Associations, religious bodies, social organisations, student organisations, women's group, etc. are some of the other common organisations. Commercial Institutions, such as industries and banks play an important role in urban setting. Political parties and social work organisations are other notable organisations in the urban communities. c) Statutory and Public Structures The most prominent public structure would be the municipality. In the field of cooperatives, many organisations are to be found – the most common would be co-operative housing societies and credit co-operative bodies. In many states, town planning is entrusted to statutory bodies. Problems in an Urban Community a) Problems at the Level of Individuals Family conflicts of various types will come under this category. The most common would be conflicts between the spouses or conflicts between two generations of the family members. These conflicts are more in the nature of value-conflicts and the focus is on one or two individuals, in which the human personality plays a role. Problems of children could become a separate area of work. Inter-generational conflicts are likely to be more common in urban families. b) Problems at the Level of Groups The problems at the group level could be more in the nature of socio-economic conditions. This could be the problems of the aged, single parents, unemployed, beggars, school drop-outs, destitute, orphans, victims of crime, juvenile delinquents, AIDS affected group, mentally ill patients, differently-able, etc. c) Problems at the Level of Communities The defining element here would be a section of population larger than a group being affected. This could be a large segment of the community or the whole NSOU ? PGSW-V 83 community. In terms of issues, it could be that of alcoholism, sanitation, health, violence, environmental degradation, drinking water, problem of wages, infrastructural problems, problem of exploitation and oppression, etc. The other issues could be of poverty and employment; getting the names of poor people included in the BPL list. The identified problems have to be developed in the format of an 'Issue'. To fulfill this process, the following steps should be undertaken : 1. Identify the problem to be worked upon; 2. Decide on the target group – the quantitative dimension; 3. Operationalise the objectives, which could have both quantitative and qualitative objectives; 4. Identify local Institutional structures for collaborative work; 5. Decide on a line of action; 6. List out a few qualitative and quantitative indicators to evaluate the work done. Once these steps are undertaken, then the broad outline of the intervention measure is ready. Now specific steps have to be decided upon, for which the following details of the proposed line of action would be helpful. 1. What specific steps have to be taken? 2. What resources are required for the proposed steps? 3. From where are the resources to be obtained? 4. Discussion with the personnel of the institutional structures on the nature of collaboration to be undertaken. 4.7 Social Work with Tribal Communities Features of a Tribal Community ? The problem of defining a tribe has long defied administrators, anthropologists and sociologists, all of whom have given different definitions. The International Labour Organisation (ILO) in its report of 1953 stated that, "there can be no standard, which can apply to all indigenous or aboriginal groups throughout the world" (Deogaonkar, 1994). NSOU ? PGSW-V 84 However, any group displaying the following characteristics can be treated as a tribe : a) A definite habitat and area. b) A unified social organisation based primarily on blood relationship (Consanguinity).

c)

A cultural homogeneity. d) A common scheme of deities and common ancestors.

e)

MATCHING BLOCK 100/185

W

A common dialect with a shared folk-lore. ? Under Article 366 of the Indian Constitution, the tribal community has been declared as Scheduled Tribes and it includes 212 tribes from 14 states. The President of India is empowered by Article 342 (i) To notify and specify any tribe/tribal community from any area as a 'Scheduled Tribe'. On such notification, the tribe so specified is added to the list of Scheduled Tribes in the Fifth Schedule and is, thus, entitled to all the Constitutional Safeguards and Protection. ? The constitution of India contains many provisions for the protection and welfare of the tribal population. Article 46 mentions that the state is committed to the welfare of the scheduled castes and Scheduled Tribes and their protection from all types of socio-economic exploitation. Article 275 provides for special grants for tribal welfare from the Government of India to some states and forms part of the Sixth Schedule. Article 164 makes it obligatory to appoint a Minister-in-Charge of Tribal Welfare in the states of Bihar, Madhya Pradesh and Orissa. Article 244 makes applicable the provisions of the Fifth Schedule to the administration and control of the Scheduled Areas and Scheduled Tribes. Jharkhand, Chhatisgarh and Orissa have the largest scheduled tribe population in our union followed by Maharashtra and Rajasthan. As per the 1991 Census, the scheduled tribes constitute 8.01 per cent of the total population of the country. ? According to Verrier Elwin, tribals can be classified into four categories. First, those still residing in forests and following old life-styles. Secondly, those staying in rural areas and dependent on agriculture. Thirdly, those who have migrated to urban areas and have taken up modern industrial occupations. NSOU ? PGSW-V 85 Fourthly, those who have been completely absorbed and become a part of the Indian mainstream. The well-known Indian sociologist Ghurye has a different scheme of classification. The first category comprises those who have struggled and attained a high position in Hindu society, such as Rajgond. Secondly, those who have become partially

Hindu

100%

MATCHING BLOCK 101/185

W

and thirdly, those who reside in forests and are opposed to outside culture. ? In terms of size, tribal communities are small. Traditionally, tribals were land- owners and in spite of the problem of landlessness, large sections of them still own land. ? Traditionally,

tribal's

98%

MATCHING BLOCK 102/185

W

were governed by notions of collective ownership of property including land and meeting many of their needs from the forest. Even today, tribals are less integrated with the market structures as compared to members of other communities. ? The status of women in tribal communities is better and they enjoy more decision-making powers. This is indicated from the fact that in olden times, a 'bride-price' had to be paid rather than 'dowry', as the case is with mainstream society. In the pre-British period, the tribals had an autonomous culture and were a nature loving community. Starting with the British period onwards, the tribal community is getting assimilated into the mainstream Indian society, but at the lower end of the society. This process is called acculturation, which "is the process by which a whole way of life is in a process of change under the influence of another culture. This cultural change may be slow or rapid, and in due course, it may lead to partial or even total assimilation with other cultures. Each tribal group may be at a different level" (Deogaonkar, 1994). Institutional Structures in a Tribal Community Traditional Institutions like the Ghotul, which helped in the socialisation of youth, is weakening, while modern structures are emerging. The Panchayati Raj System, Co- operative bodies, educational institutions and market structures are now slowly being formed in tribal areas. Many government departments, some of which have specialised in tribal affairs, are functioning among tribal communities. In many tribal areas, social work organisations, mostly NGOs, have made important contributions in the field of education and health.

NSOU ? PGSW-V 86

98%

MATCHING BLOCK 103/185

W

Problems in a Tribal Community Land Alienation A large section of tribals own land, which is cultivable. Starting from the British period, tradesmen, moneylenders and hardy farmers have entered tribal areas and unscrupulously grabbed the tribal lands. Thus, the tribals, who were traditional farmers became farm servants and in many cases bonded labour in their own land. Later on, legislation was passed to prohibit any land transaction between a tribal, and a non-tribal monetary or otherwise, which, to an extent, has checked the process. Forest and Tribals Since time immemorial, tribals have cohabited with nature and depended upon the forests for fuel, fodder and other necessities of life. By collecting minor forest produce, they could sell it to itinerant tradesmen or in nearby markets to buy necessary things from the market. Right from the British regime, these traditional rights, known as nistar rights, were accepted and given official recognition by the Government. The tribal use of the forest was purely for home-based consumption and the forest cover was preserved. The British period saw the beginning of commercial exploitation of forest, which continued in the post- Independence period as well. This process led not only to the abridgment of tribal rights over forest, but unscrupulous contractors, in nexus with bureaucrats, cut vast stretches of forest. The tribal access to forest was reduced and a right for limited use was granted, requiring permission from local forest officials necessitating bribes and harassment. Currently, there has been some change in the forest policy and moves have been taken to entrust the management of forest to local communities under the Joint-Forestry Management Schemes. Displacement A major problem which the tribal community is facing

is of them staying in remote areas, and

97%

MATCHING BLOCK 104/185

W

the problem of displacement. In the post-Independence period, a number of projects were set up, which took away tribal lands and the forest where they were staying. The social movements from 1980s onwards have focussed on this problem and now a rehabilitation package is included, while implementing any big project. Apart from the difficulty of an adequate rehabilitation package and problems of proper implementation; there is the larger problem where a tribal loses land and is awarded a

NSOU ? PGSW-V 87

99%

MATCHING BLOCK 105/185

W

monetary compensation. She/He has problems in investing the compensation in a secure way or in buying an equivalent piece of land. When entire tribal communities are uprooted, then the loss is of a way of life for which no monetary compensation can suffice. Poverty and Unemployment The tribal way of life was based on 'use' and on a subsistence mode. Ownership of property, increasing production, saving and dealing with market forces was relatively unknown. The onset of modernization can be traced back to the British period. The growth of urbanization and industrialization, the emergence of modern education and new skills left the tribal community at a disadvantage. While the Old World was disintegrating, they were ill-equipped to deal with the demands of a modern age. Poverty and unemployment is rampant among the tribal community. In the last two decades, a small section of tribals has emerged, who are educated and have got good jobs. The socio-economic policies of the last few decades have led to the setting up of schools, hostels, scholarships being awarded, developmental projects, and a small stratum of tribals have taken the benefits of these programmes – they are educated and have got stable jobs in the public sector. But these changes have not taken place among a large number of tribals. A majority of poor tribals are either landless or are subsistence farmers. Owing to the poor spread of irrigation, farming in India is dependent on monsoons. Growing a single crop leaves the tribal farmer no surplus to build up some savings, while for half of the year, there are no jobs for the landless tribals. Language and Identity A majority of tribals are spread throughout the country, and in most places, do not enjoy a numerical majority. Perforce, they have to learn the language of the state to which they belong in addition to Hindi and English and in the process, the tribal language and scripts are dying. Along with the loss of their language is the loss of their way of life and the question of identity crisis. In some places, tribal movements have taken place to protest against their exploitation by outside forces and also to assert their tribal identity. One outcome of these processes has been the creation of the state of Jharkhand carved out of Bihar. Apart from the North- Eastern states, Jharkhand is the only state where the tribals form a numerical majority.

Conclusion Traditionally, community was the context in which people lived, learnt about their own culture and related to other human beings. The modern world based on industrialisation and urbanisation is eroding the concept of community. In India, the word community could also mean a caste, religion or language based group. In this unit, we have examined one area of social work practice, that is, 'social work with community' with reference to rural, urban and tribal communities.

99%

MATCHING BLOCK 107/185

W

To develop an understanding of the various dimensions of community, a framework of three subsystems has been presented. The economic subsystem deals with occupation, income, etc., while the political subsystem discusses the distribution of power in the community. The social subsystem studies the social and cultural life of the community. The three sub-systems are inter-related to each other. Political matters will have roots in economic issues and vice versa. All matters have a social context. The definitions, characteristics and the subsystems enable the learner to grasp the conceptual nature of the community, preparing them for the next stage, that is, the methodology of social work intervention. The intervention has been discussed in the context of urban, rural and tribal communities. Prior to the intervention measures information has to be gathered and an understanding has to be developed of each of the setting. To do this, we examine the main features, the institutional structures and the problems, which the community faces. An understanding of these three aspects would help us to go to the third stage, that is, to design effective and relevant intervention measures. To further the understanding, a few examples have been cited. 4.9

Unit 5 ? Economic Systems : Capitalism, Socialism, Mixed Economy and Welfare States Structure 5.0 Objective 5.1 Introduction 5.2 Capitalism 5.2.1 Merits of Capitalistic System 5.2.2 Demerits of Capitalistic System 5.3 Socialism and its features 5.3.1 Merits of Socialism 5.3.2 Demerits of Socialism 5.4 Mixed economy and its features 5.5 Welfare State 5.5.1 Features of Welfare State 5.5.2 Functions of Welfare State 5.5.3 Criticism of Welfare State 5.5.4 Is the concept of welfare states implemented effectively? 5.6 Conclusion 5.7 Exercise 5.8 Reference 5.0 Objective The learner would develop a clear concept about the various economic system. i.e. capitalism, socialism, mixed country & welfare states from this unit. 5.1 Introduction Our discussion in the first module of this course was too general and broad in nature to allow us understand the concept called economy. Therefore our task in the present module would be to look at the basics of economic systems in its ramification and

NSOU ? PGSW-V 92 applicability. An economic system is a system of production, resource allocation, exchange, and distribution of goods and services in a society or a given geographic area. It includes the combination of the various institutions, agencies, entities, decision-making processes, and patterns of consumption that comprise the economic structure of a given community. As such, an economic system is a type of social system. For the above reasons, we shall familiarize ourselves with the classifications of the economy based on the ownership of resources, decision making and then make comparisons of the economic system. It is therefore intended to pay proper attention to the explanations and discussions in this module and this unit. 5.2 Capitalism Capitalism is often defined as an economic system where private actors are allowed to own and control the use of property in accord with their own interests, and where the invisible hand of the pricing mechanism coordinates supply and demand in markets in a way that is automatically in the best interests of society. Government, in this perspective, is often described as responsible for peace, justice, and tolerable taxes. Capitalism is a system of governance for economic affairs that has emerged in different settings and continues to evolve over time. As a consequence it evades simple definition. The Macmillan Dictionary of Modern Economics defines capitalism as a: Political, social, and economic system in which property, including capital assets, is owned and controlled for the most part by private persons. Capitalism contrasts with an earlier economic system, feudalism, in that it is characterized by the purchase of labor for money wages as opposed to the direct labor obtained through custom, duty or command in feudalism. Under capitalism, the price mechanism is used as a signaling system which allocates resources between uses. The extent to which the price mechanism is used, the degree of competitiveness in markets, and the level of government intervention distinguish exact forms of capitalism. Capitalism is the private controlled and ownership of factors of production. It is an economic system where private individuals controls the economic resources of the economy. It stands in direct contrast to government-controlled economies, where production and prices are set by a central decision-making body. Economist Adam Smith famously compared free markets to an invisible hand pushing producers toward goods and services for which there is greatest need. In a capitalist market economy, decision-making and NSOU ? PGSW-V 93 investment is determined by the owners of the factors of production in financial and capital markets, and prices and the distribution of goods are mainly determined by competition in the market. Economists, political economists, and historians have adopted different perspectives in their analyses of capitalism and have recognized various forms of it in practice. These include laissez-faire or free market capitalism, welfare capitalism, and state capitalism. Capitalism has existed under many forms of government, in many different times, places, and cultures. Following the decline of mercantilism, mixed capitalist systems became dominant in the Western world and continue to spread. The question now is how does capitalism emerged? However, history tells us that early Islam promulgated capitalist economic policies, which migrated to Europe through trade partners from cities such as Venice. The 16th, 17th and 18th centuries witness the era of feudalism that is economic system of land ownership, mercantilism that is trade profits economic system and industrial revolution era which culminated into people owning and determining their production by themselves in England and later spread to some part of Europe and the USA. 5.2.1 Merits of Capitalistic System : The main merits of this system are : (i) Economic Freedom : The foremost advantage of this system is that everybody enjoys' economic freedom as one can spend one's income according to one's wishes. Producers have complete freedom to invest in any business or trade. (ii) Automatic Working : Another advantage according to classical economists is an automatic system. Equilibrium point is automatically come with the forces of demand and supply. (iii) Variety of Goods and Services : All the basic decisions of

85%

MATCHING BLOCK 111/185

W

what to produce, how to produce and for whom to produce are taken by

producers. Every producer gives attention to consumers' taste and preferences. Hence, there are large variety of goods and services; produced in the economy.

NSOU ? PGSW-V 94 (iv) Optimum Use of Resources : All natural resources are used to their optimum level as production is undertaken with a sole purpose: of earning profit and no scope for wastages at all. (v) Efficient Producer : There is very tough competition among entrepreneurs. They are always encouraged to produce best quality of products. Thus, technical development will lead to increase in higher productivity as well as efficiency. (vi) Higher Standard of Living : Varieties of goods at cheap rates make it easy to be within the reach of poor and weaker sections of society. This results in rise in their standard of living. (vii) Incentive to efficient : In this system, incentives are given to the efficient workers in cash or kind. This means every worker should get reward according to his ability. Hence, workers will try to work more and more, therefore, total output will also increase. (viii) New Inventions : In this type of economy, there is ample scope of new invention. To get more profit every producer takes initiative to develop new techniques in production.

5.2.2 Demerits of Capitalistic System : According to Karl Marx, "Capitalism contains the seeds of its own destruction." The main demerits of this system are given below : (i) Labour Exploitation : The main defect of capitalism is the exploitation of labour. Labourers get less wages in comparison to their working hours. The wages less than their marginal productivity are not sufficient for their livelihood. (ii) Class Struggle : A lion's share of income and resources is controlled by the upper sections of the society, while others remain deprived of the basic amenities of life. Thus, the entire society is divided between 'haves and 'have not's. Hence, the continuous class struggle spoils the health environment of the economy. (iii) Wasteful Competition : Capitalism is a wasteful competition. A lot of money is spent on advertisement and

NSOU ? PGSW-V 95 publicity for pushing the sale of the commodity. Its burden ultimately is borne by the poor consumers in the form of increased price. (iv) Threat of Over-Production : The production is made on a large scale which cannot be changed in a short period. Therefore, under capitalism, fear of over-production always exists. The Great Depression of 1930s in USA is an example of it. (v) Economic Fluctuations : Being automatic in nature, capitalist economy always faces the problem of economic fluctuations and unemployment. This means the state of instability and uncertainty, (vi) Unbalanced Growth : All the resources are put only to those channels where there is maximum profit. Other sectors of the economy are neglected. As there is no check on the economic system, the growth is unbalanced in nature. (vii) No Welfare Activities : In capitalism, the sole motive is maximum profit, but not the public welfare. Variety of goods are produced according to market demand, not for any welfare activity. (viii) Monopoly Practices : This economic system has been criticized on the fact that it develops monopoly activities within the country.

5.3 Socialism and its features Socialism is an economic and political system based on public or collective ownership of the means of production. Socialism emphasizes equality rather than achievement, and values workers by the amount of time they put in rather than by the amount of value they produce. The decisions as to how much to produce, which methods of production to employ and for whom to produce are taken by the planning authority. That is why a socialist economy is also called a planned economy. It also makes individuals dependent on the state for everything from food to health care. A socialist economy is an economic organization in which the means of production are owned and regulated by the state. The

NSOU ? PGSW-V 96 production and distribution of goods and factors of production are done by the state under the direction of the planning commission. China, Vietnam, North Korea and Cuba are examples of modern-day socialist societies. Twentieth-century socialist governments were overthrown in Czechoslovakia, East Germany and the U.S.S.R. We shall now examine the features of socialism. The main features of this system are detailed below. (1) Public Ownership : A socialist economy is characterized by public ownership of the means of production and distribution. There is collective ownership whereby all mines, farms, factories, financial institutions, distributing agencies (internal and external trade, shops, stores, etc.), means of transport and communications, etc. are owned, controlled, and regulated by government departments and state corporations. A small private sector also exists in the form of small business units which are carried on in the villages by local artisans for local consumption. (2) Central Planning : A socialist economy is centrally planned which functions under the direction of a central planning authority. It lays down the various objectives and targets to be achieved during the plan period. Central economic planning means the making of major economic decisions of what and how much is to be produced, how, when and where it is to be produced, and to whom it is to be allocated for by the conscious decision of a determinate authority, on the basis of a comprehensive survey of the economic system as a whole. And the central planning authority organizes and utilizes the economic resources by deliberate direction and control of the economy for the purpose of achieving definite objectives and targets laid down in the plan during a specified period of time. (3) Definite Objectives : A socialist economy operates within definite socio-economic objectives. These objectives may concern aggregate demand, full employment, satisfaction of communal demand, allocation of factors of production, distribution of the national income, the amount of capital accumulation, economic development...and so forth. For achieving the various objectives laid down in the plan, priorities and bold targets are fixed covering all aspects of the economy. (4) Freedom of Consumption : Under socialism, consumers 'sovereignty implies that production in state owned industries is generally governed by the preferences of consumers, and the available commodities are distributed to the consumers at

NSOU ? PGSW-V 97 fixed prices through the state-run department stores. Consumers 'sovereignty under socialism is confined to the choice of socially useful commodities. (5) Equality of Income Distribution : In a socialist economy, there is great equality of income distribution as compared with a free market economy. The elimination of private ownership in the means of production, private capital accumulation, and profit motive under socialism prevent the amassing of large wealth in the hands of a few rich persons. The unearned incomes in the form of rent, interest and profit go to the state which utilizes them in providing free education, public health facilities, and social security to the masses. As far as wages and salaries are concerned, most modern socialists do not aim at complete and rigid equality. It is now generally understood that the maintenance offered choice of occupation implies wage differentials. (6) Planning and the Pricing Process : The pricing process under socialism does not operate freely but works under the control and regulation of the central planning authority. There are administered prices which are fixed by the central planning authority. There are also the market prices at which consumer goods are sold. There are also the accountings prices on the basis of which the managers decide about the production of consumer goods and investment goods, and also about the choice of production methods. In view of the above features, there is need for us to also look at the merits and demerits of socialism. The following are the advantages of socialism as advanced by Prof, Schumpeter. 5.3.1 Merits of Socialism : (1) Greater Economic Efficiency : Economic efficiency under socialism is greater than under capitalism. The means of production are controlled and regulated by the central planning authority towards chosen ends. The central planning authority makes an exhaustive survey of resources and utilizes them in the most efficient manner. Economic efficiency is also achieved by utilizing resources in producing socially useful goods and services which satisfy the basic wants of the people, like cheap food, cloth, and housing. (2) Greater Welfare due to Less Inequality of Income : In a socialist economy there is less inequality of income as compared with a capitalist economy because of the absence of private ownership of the means of production, private capital

NSOU ? PGSW-V 98 accumulation, and private profit. All citizens work for the welfare of the state and each is paid his remuneration according to his ability, education and training. All rents, interests and profits from various sources go to the state which spends them for public welfare in providing free education, cheap and congenial housing, free public health amenities, and social security to the people. (3) Absence of Monopolistic Practices : Another advantage of socialism is that it is free from monopolistic practices to be found in a capitalist society. Since under socialism all means of production are owned by the state, both competition and monopoly are eliminated. The exploitation by the monopolistic is absent. Instead of private monopoly, there is the state monopoly of the productive system but this is operated for the welfare of the people. In the state-owned factories, socially useful commodities are produced which are of high quality and are also reasonably priced. (4) Absence of Business Fluctuations : A socialist economy is free from business fluctuations. There is economic stability because

95%

MATCHING BLOCK 112/185

W

production and consumption of goods and services are regulated by the

central planning authority in accordance with the objectives, targets and priorities of the plan. Thus there is neither overproduction nor unemployment. 5.3.2 Demerits of Socialism : A socialist economy has also certain disadvantages : 1.

82%

MATCHING BLOCK 115/185

W

Loss of Consumers' Sovereignty : There is loss of consumers 'sovereignty in a socialist economy. Consumers do not have the freedom to buy whatever commodities they want.

They can consume only those commodities which are available in department stores.

94%

MATCHING BLOCK 113/185

W

Often the quantities which they can buy are fixed by the state. 2. No Freedom of Occupation : There is also no freedom of occupation in such a society. Every person is provided job by the state. But he cannot leave or change it. Even the place of work is allotted by the state. All occupational movements are sanctioned by the state. 3. Misallocation of Resources :

Under socialism, there is arbitrary

91%

MATCHING BLOCK 114/185

W

allocation of resources. The central planning authority often commits mistakes in resource allocation because the entire work is done on trial and error basis.

NSOU ? PGSW-V 99 4. Bureaucracy : A socialist economy is said to be a bureaucratic economy. It is operated like a machine. So it does not provide the necessary initiative to the people to work hard. People work due to the fear of higher authorities and not for any personal gain or self-interest. There is no doubt that a socialist economy is better than a capitalist economy because of its overwhelming merits. But it is disliked for the loss of political, economic and personal freedoms. 5.4 Mixed economy and its features A mixed economy is variously defined as an economic system consisting of a mixture of Markets and economic planning, public ownership and private ownership, or free markets and economic interventionism. However, in most cases, "mixed economy" refers to market economies with strong regulatory oversight and governmental provision of public goods, although some mixed economies also feature a number of state-run enterprises. In general the mixed economy is characterized by the private ownership of the means of production, the dominance of markets for economic coordination, with profit-seeking enterprise and the accumulation of capital remaining the fundamental driving force behind economic activity. But unlike a free-market economy, the government would wield indirect macroeconomic influence over the economy through fiscal and monetary policies designed to counteract economic downturns and capitalism's tendency toward financial crises, unemployment, and growing income and wealth disparities, along with playing a role in interventions that promote social welfare. Subsequently, some mixed economies have expanded in scope to include a role for indicative economic planning and or large public enterprise sectors.

98%

MATCHING BLOCK 116/185

SA BECS 22 Planning and Development.doc (D136172554)

There is mixture of private and public ownership of the means of production and distribution. Some decisions are taken by households and firms and some by the planning authority. All developing countries like India

and Nigeria are mixed economies. We shall now look at the features of mixed economy : 1. Public Sector : The public sector is under the control and direction of the state. All decisions regarding what, how and for whom to produce are taken by the state. Public utilities, such as rail construction, road building, canals, power supply, means of communication, etc., are included in the public sector projects. They are operated for public welfare and not for profit motive. The public sector also operates basic, heavy, and strategic and defense production industries which

NSOU ? PGSW-V 100 require large investment and have long gestation period. But they earn profits like private industries which are utilized for capital formation. 2. Private Sector : There is a private sector in which production and distribution of goods and services are done by private enterprises. This sector operates in farming, plantations, mines, internal and external trade, and in the manufacture of consumer goods and some capital goods. This sector operates under state regulations in the interest of public welfare. In certain fields of production, both public and private sectors operate in a competitive spirit. This is again in the interest of the society. 3. Joint Sector : A mixed economy also has a joint sector which is run jointly by the state i.e public and private enterprises. It is organized on the basis of a joint stock company where the majority shares are held by the state. 4. Cooperative Sector : Under a mixed economy, a sector is formed on cooperative principles. The state provides financial assistance to the people for organizing cooperative societies, usually in dairying, storage, processing, farming, and purchase of consumer goods. 5. Freedom and Control : A mixed economy possesses the freedom to hold private property, to earn profit, to consume, produce and distribute, and to have any occupation. But if these freedoms adversely affect public welfare, they are regulated and controlled by the state. 6. Economic Planning : There is a central planning authority in a mixed economy. A mixed economy operates on the basis of some economic plan. All sectors of the economy function according to the objectives, priorities and targets laid down in the plan. In order to fulfill them, the state regulates the economy through various monetary, fiscal and direct control measures. The aim is to check the evils of the price mechanism. 7. Social Welfare : The principal aim of a mixed economy is to maximize social welfare. This feature incorporates the merits of socialism and avoids the demerits of capitalism. To remove inequalities of income and wealth, and unemployment and poverty, such socially useful measures as social security, public works, etc. are adopted to help the poor. On the other hand, restrictions are placed on the concentration of monopoly and economic power in the hands of the rich through various fiscal and direct control measures.

NSOU ? PGSW-V 101 We shall again consider the merits and demerits of mixed economic system Merits of Mixed Economy are : (1) It has best allocation of resources (2) There is a general balance between the public sector and the private sector (4) There is presence of Social security (5) There is freedom criticism by the citizen Demerits of Mixed Economy are A mixed economy also has certain defects which are stated below : (1) Non-Cooperation between the Two Sectors (2) Inefficient Public Sector (3) Economic Fluctuations is inevitable (4) Decision making can be hampered or delayed (5) Resources may not be evenly distributed Therefore, let it be known to you that a mixed economy contains all the features of a welfare state. There is no exploitation either by the capitalists as under a free enterprise economy or by the state as under a socialist economy. The United States, Nigeria and India are said to have a mixed economic system because privately owned businesses and government both play important roles in the economy. 5.5 Welfare State A welfare state is a state that is committed to providing basic economic security for its citizens by protecting them from market risks associated with old age, unemployment, accidents, and sickness. The term 'welfare state' first emerged in the UK during World War II. It has since been used much more broadly to describe systems of social welfare that have developed since the nineteenth century. Welfare state studies have sought to create typologies that group countries into categories based on variations in the role that state, market, and family play in ensuring well-being. A second line of research has sought to account for welfare state development and variation, by examining economic, political, institutional, and ideological factors. These studies are broadly cross-disciplinary. Contemporary research examines welfare state restructuring as economic globalization, and changes in the family and gender roles have placed new pressures on welfare states. Welfare state, concept of government in which the state or a well-established network of social institutions

plays a key role in the protection and promotion of the economic and social well-being of citizens. It is based on the principles of equality of opportunity, equitable distribution of wealth, and public responsibility for those unable to avail themselves of the minimal provisions for a good life. The general term may cover a variety of forms of economic and social organization.

NSOU ? PGSW-V 102 A fundamental feature of the welfare state is social insurance, a provision common to most advanced industrialized countries (e.g., National Insurance in the United Kingdom and Social Security in the United States). Such insurance is usually financed by compulsory contributions and is intended to provide benefits to persons and families during periods of greatest need. It is widely recognized, however, that in practice the cash benefits fall considerably short of the levels intended by the designers of the plans. The welfare state also usually includes public provision of basic education, health services, and housing (in some cases at low cost or without charge). In these respects the welfare state is considerably more extensive in western European countries than in the United States, featuring in many cases comprehensive health coverage and provision of state-subsidized tertiary education. Antipoverty programs and the system of personal taxation may also be regarded as aspects of the welfare state. Personal taxation falls into this category insofar as its progressivity is used to achieve greater justice in income distribution (rather than merely to raise revenue) and also insofar as it is used to finance social insurance payments and other benefits not completely financed by compulsory contributions. In socialist countries the welfare state also covers employment and administration of consumer prices.

5.5.1 Features of Welfare State : The following are the basic features of the Welfare State :

1. A welfare state ensures social security. In a welfare state of economy, though the traits of capitalism are also seen, it is mainly a mixed economy. Even when a combination of capitalistic and socialistic features exists, the government plays a dominant role in controlling the economic activities and in the social welfare of the people.
2. A welfare state is socialistic in nature. It is based on the principles of equality and is keen to provide equal opportunity to all. It also aims to ensure equitable distribution of wealth.
3. It exercises control over all the economic activities. In a welfare state, all the private enterprises are regulated by the government.
4. It provides even the basic facilities to its citizens. Furnishing services to each and every individual is its duty. A welfare government is keen in providing economic

NSOU ? PGSW-V 103 and social services such as general education, public health, public transport, housing, and other financial assistance to its people.

5. It undertakes and runs various enterprises. Ownership and operation of industrial enterprises, business and other commercial activities are also done by welfare governments.
6. It ensures justice to all. In a welfare state, common man has to deal with the authorities for many of their needs. For example; administrative officers, controlling officers, sanctioning authorities, officers of social services, executives of public sector undertakings etc. In all such dealings, a welfare state has the responsibility to ensure justice and fulfillment of their requirements.
7. Planning of activities : Economic activities include production and distribution. It is the duty of the welfare state to formulate national policies and to plan every economic activity in a balanced manner. Industrial policy, trade policy, commercial and banking policy etc are framed in order to control those activities.
8. It is the function of a welfare state to regulate and control all private enterprises engaged in economic activities. Such control includes registration, licensing, taxation etc.
9. Welfare of labourers also comes under the purview of the duties of welfare state. They are bound to make legislations to prevent exploitation of workers, and to ensure the security and welfare of those who work in industrial enterprises, factories, companies and all other sectors of employment.
10. Emphasises the worth of man Welfare State emphasises the worth and dignity of the individual and helps and assist him to lead a respectable life in the society. It regards all individuals on an equal footing irrespective of their social and economic status.
11. Undertakes progressive measures Welfare State tries to implement progressive measures like land reforms, agricultural development, price control, public distribution system of essential commodities, provision of health, education, sanitation, communications etc.
12. Undertakes wide-range of Social Services Welfare State undertakes wide-range of social services for the betterment of its citizens. They include measures like eradication of untouchability, dowry, child

NSOU ? PGSW-V 104 marriage, sati, etc. It takes steps to abolish illiteracy, poverty and unemployment. It established schools, hospitals and other institutions to meet the needs of the people. It provides unemployment relief, maternity benefit, old-age and other social benefits.

5.5.2 Functions of Welfare State Welfare State undertakes numerous functions which are divided into A. Regulative B. Protective and C. Welfare functions

A. Regulative Functions These include :

- (i) maintaining law and order, (ii) promoting peace (iii) curbing anti- social elements and their activities, (iv) putting down communal, caste and class clashes, (v) checking exploitation of labourers by passing necessary legislation etc.

B. Protective Functions These include :

- (i) maintenance of internal order, (ii) protecting territorial integrity, (iii) maintenance of basic institutions, (iv) maintenance of sound net-work of postal system, transport and communication systems (v) regulation of trade, markets, weights and measures, (vi) prevention of theft, decoity and other criminal activities, (vii) conducting foreign relations with other countries, (viii) administering justice and punishing criminals, and (ix) safeguarding the country's territories sovereignty and independence against external attacks and invasions etc.

C. Welfare Functions These include :

- (i) eradicating the spread of contagious diseases like malaria, cholera etc. (ii) eradicating illiteracy by establishing educational institutions (iii) reducing the economic inequalities by taking steps for distribution of national income, (iv) providing employment opportunities to all qualified persons (v) improving the working conditions of the workers by fixing hours of work, compensation etc. (vi) creating healthy atmosphere in and outside industries. (vii) providing adequate social services such as unemployment benefits, disability benefits, maternity benefits etc. (viii) introducing jail reforms for speedy disposal of cases and reducing the cost of judicial litigation, (ix) introducing land reforms, (x) encouraging cottage and small-scale industries, (xi) undertaking Community Development Programmes, and (xii) checking social evils etc. In brief Welfare State provides full employment, social security, housing, health and education for all people.

NSOU ? PGSW-V 105 5.5.3 Criticism of Welfare State The principal problems in the administration of a welfare state are: determining the desirable level of provision of services by the state; ensuring that the system of personal benefits and contributions meets the needs of individuals and families while at the same time offering sufficient incentives for productive work; ensuring efficiency in the operation of state monopolies and bureaucracies; and the equitable provision of resources to finance the services over and above the contributions of direct beneficiaries. There are a few writers who criticized the idea of Welfare State on the following grounds : 1. Very expensive Welfare State, is an expensive state and is beyond the reach of poorer nations. Providing a wide range of social services involves a lot of expenditure. 2. Kills individual initiative and freedom It is said that Welfare State curbs the individual freedom, initiative and self-help. It retards moral development because it makes a man inferior and dependent on charity. It develops in him proper mentality. 3. Undue importance to Bureaucracy It is also argued that Welfare State gives undue importance to bureaucracy because it is bureaucracy which makes policies and implements them. 4. Leads to inefficiency It is pointed out that Welfare State undertakes too many functions which in turn results in administrative inefficiency and mismanagement of human and natural resources. 5. Retards the work of Association Finally, it is said that Welfare State regulates the work of voluntary organizations in the society. They are pushed back and the willingness to undertake social service activities on the part of the associations are undermined. Importance Most of the criticisms given above, are not correct. In order to make the Welfare State an ideal system, some steps have to be taken. They are : (1) Defining the objectives and laying down the means to achieve them; (2) Avoiding red-tapism (3) Periodic evolution of Welfare Schemes (4) Checking totalitarianism and (5) Encouraging voluntary associations etc., If the above measures are adopted the Welfare State may certainly become heaven of peace because it reconciles individual freedom with the authority of the state, brings NSOU ? PGSW-V 106 about a fair degree of equality of income among all people and recognizes the dignity and worth of the human beings. 5.5.4 Is the concept of welfare states implemented effectively? To a great extent, the concept of welfare states is effectively implemented by our democracies and this has helped governments in improving the scope for betterment of the citizens. But as in any other political policy, the concept of 'welfare states' too has loopholes and is contaminated by improper management and corruption. From the grass roots levels to the highest levels of the political system, the common man is compelled to bribe the officers in order to get his work done. From the critics' point of view, the functions of welfare states have made the citizens more lethargic and less hard working. Even then, in the present context, welfare states are effective in our democracies and it functions as a protector, dispenser of social services, industrial manager, economic controller and an arbitrator. From our discussion so far on the classification of the economy according to ownership of resources, we can conclude as follows : ? That

97%

MATCHING BLOCK 118/185

W

capitalism is an economic system based on private ownership of the means of production and their operation for profit.

It is an economic system in which the free market alone controls the production of goods and services. ? That socialism is an economic and political system based on public or collective ownership of the means of production. It emphasizes the steps as to how much to produce, which methods of production to employ and for whom to produce are taken by the planning authority. ,h That communism, also known as a command system, is an economic system where the government owns most of the factors of production and decides the allocation of resources and what products and services will be provided. It is a political and economic ideology based on communal ownership and the absence of class. ? That mixed economy refers to market economies with strong regulatory oversight and governmental provision of public goods, although some mixed economies also feature a number of state run enterprises. 5.6 Conclusion In this unit, we have attempted to show the classification of the economy according to ownership of resources, covering Capitalism and its features, Socialism and its features, NSOU ? PGSW-V 107 Communism and its features and mixed economy and its features, showing their contributions to resources ownership in the economy and the countries that practice them. You have learnt that an economic system consists of the institutions and the method by which resources are allocated and products and services are distributed. Economic systems differ primarily in who owns the factors of production, how the allocation of resources is directed and the method used to direct economic activity and how the government participates in the economy. Your understanding of this unit should encourage you to be familiar more with the topics in this module as you read ahead against the next unit. 5.7 Exercise 1. Briefly explain your understanding of capitalisation as an economic system. 2. Explain the term socialism. Write down its salient feature. 3. What are the merits & demerits of Socialism. 4. What are the functions of a welfare state. 5. Is the concept of welfare state implemented effectively. Give your reassurance. 6. Give the Merit & demerit of capitalism. 5.8 Reference Economic Systems: Capitalism, Socialism, Mixed Economy and Welfare States. NSOU ? PGSW-V 108 Unit 6 ? Factors & Models of Economic Growth Structure 6.0 Objective 6.1 Introduction 6.1.2 Comparing Recent Growth Rates 6.1.3 Growth Calculation 6.2 Growth Rates 6.2.1 Factors of Economic Growth 6.2.2 Explaining Growth in Productivity 6.3 What about Natural Resources? 6.4 Institutions 6.5 Models of Economic growth 6.5.1 Beyond Harrod–Domar : Other considerations 6.5.2 The Solow model 6.6 Conclusion 6.7 Exercise 6.8 Reference 6.0 Objective The learner would understand the term Economic Growth. They will also get to know about the various factors which leads to Economic growth and also learn about the Models Economic growth. 6.1 Introduction The key statistic used to track economic growth is real GDP per capita—real GDP divided by the population size. GDP measures the total value of an economy’s production of final goods and services as well as the income earned in that economy in a given year. Gross Domestic Product measures the monetary value of final goods & service, that is bought by the final users.

NSOU ? PGSW-V 109 We use real GDP because we want to separate changes in the quantity of goods and services from the effects of a rising price level. We focus on real GDP per capita because we want to isolate the effect of changes in the population. For example, other things equal, an increase in the population lowers the standard of living for the average person—there are now more people to share a given amount of real GDP. An increase in real GDP that only matches an increase in population leaves the average standard of living unchanged. Although growth in real GDP per capita should not be a policy goal in and of itself, it does serve as a very useful summary measure of a country’s economic progress over time. Figure 1 shows real GDP per capita for the United States, India, and China, measured in 1990 dollars, from 1900 to 2010. The vertical axis is drawn on a logarithmic scale so that equal percent changes in real GDP per capita across countries are the same size in the graph. India achieved independence from Great Britain in 1947, becoming the world’s most populous democracy—a status it has maintained to this day. For more than three decades after independence, however, this happy political story was partly overshadowed by economic disappointment. Despite ambitious economic development plans, India’s performance was consistently sluggish. In 1980, India’s real GDP per capita was only about 50% higher than it had been in 1947. The gap between Indian living standards and those in wealthy countries like the United States had been growing rather than shrinking. Since then, however, India has done much better. As Figure 2 shows, real GDP per capita has grown at an average rate of 4.3% a year, more than tripling between 1980 and 2013. India now has a large and rapidly growing middle class.

NSOU ? PGSW-V 110 6.1.2 Comparing Recent Growth Rates The average annual rate of growth of real GDP per capita from 1980 to 2013 is shown here for selected countries. China and, to a lesser extent, India and Ireland achieved impressive growth. The United States and France had moderate growth. Once considered an economically advanced country, Argentina had more sluggish growth. Still others, such as Zimbabwe, slid backward. What went right in India after 1980? Many economists point to policy reforms. For decades after independence, India had a tightly controlled, highly regulated economy. Today, things are very different: a series of reforms opened the economy to international trade and freed up domestic competition. Some economists, however, argue that this can’t be the main story because the big policy reforms weren’t adopted until 1991, yet growth accelerated around 1980. Regardless of the explanation, India’s economic rise has transformed it into a major new economic power—and allowed hundreds of millions of people to have a much better life, better than their grandparents could have dreamed. The big question now is whether this growth can continue. Skeptics argue that there are important bottlenecks in the Indian economy that may constrain future growth. They point in particular to the still low education level of much of India’s population and inadequate infrastructure—that is, the poor quality and limited capacity of the country’s roads, railroads, power supplies, and health and sanitation infrastructure. Pollution is a

NSOU ? PGSW-V 111 severe and growing problem as well. But India’s economy has defied the skeptics for several decades and the hope is that it can continue doing so. 6.1.3 Growth Calculation Let us first specify the measurement of growth in a little more detail. A growth rate is defined as the change in a quantity—here, GDP per capita—between two dates, relative to the baseline (beginning of period) quantity. Let’s choose two dates, say t and $t + 1$, and denote GDP per capita in these two dates by y_t and y_{t+1} , respectively. Then the growth rate of GDP per capita between these two dates is defined as $\text{Growth}_{t, t+1} = (y_{t+1} - y_t)/y_t$. Let us focus on annual differences, so that, for example, t and $t + 1$ correspond to the years 2005 and 2006, respectively. The Indian economy had GDP per capita of Rs. 42,482 in 2005 and Rs. 43,215 in 2006, so the growth rate between 2005 and 2006 can be computed as $\text{Growth}_{2005, 2006} = (\text{Rs. } 43,215 - \text{Rs. } 42,482)/\text{Rs. } 42,482 = 0.017$ (Or equivalently, $0.017 \times 100 = 1.7\%$). Using this formula, we can compute growth rates of GDP for any country. Thus, the growth rate is the change in a quantity, for example, GDP per capita, between two dates, relative to the baseline (beginning of period) quantity. How did the United States manage to produce over eight times as much per person in 2013 than in 1900? A little bit at a time. Long-run economic growth is normally a gradual process in which real GDP per capita grows at most a few percent per year. From 1900 to 2013, real GDP per capita in the United States increased an average of 1.9% each year. 6.2 Growth Rates To have a sense of the relationship between the annual growth rate of real GDP per capita and the long-run change in real GDP per capita, it’s helpful to keep in mind the Rule of 70, a mathematical formula that tells us how long it takes real GDP per capita, or any other variable that grows gradually over time, to double. The approximate answer is : Number of years for variable to double = $70/\text{Annual growth rate of variable}$ (Note that the Rule of 70 can only be applied to a positive growth rate.) So if real GDP per capita grows at 1% per year, it will take 70 years to double. If it grows at 2% per

NSOU ? PGSW-V 112 year, it will take only 35 years to double. In fact, U.S. real GDP per capita rose on average 1.9% per year over the last century. Applying the Rule of 70 to this information implies that it should have taken 37 years for real GDP per capita to double; it would have taken 111 years—three periods of 37 years each—for U.S. real GDP per capita to double three times. That is, the Rule of 70 implies that over the course of 111 years, U.S. real GDP per capita should have increased by a factor of $2 \times 2 \times 2 = 8$. And this does turn out to be a pretty good approximation of reality. Between 1899 and 2010—a period of 111 years— real GDP per capita rose just about eightfold.

6.2.1 Factors of Economic Growth

Long-run economic growth depends almost entirely on one ingredient: rising productivity. However, a number of factors affect the growth of productivity. Let's look first at why productivity is the key ingredient and then examine what affects it. The Crucial Importance of Productivity : Sustained economic growth occurs only when the amount of output produced by the average worker increases steadily. The term labor productivity, or productivity for short, is used to refer either to output per worker or, in some cases, to output per hour. (The number of hours worked by an average worker differs to some extent across countries, although this isn't an important factor in the difference between living standards in, say, India and the United States.) Labor productivity, often referred to simply as productivity, is output per worker. You might wonder why we say that higher productivity is the only source of long-run growth. Can't an economy also increase its real GDP per capita by putting more of the population to work? The answer is, yes, but For short periods of time, an economy can experience a burst of growth in output per capita by putting a higher percentage of the population to work. That happened in the United States during World War II, when millions of women who previously worked only in the home entered the paid workforce. The percentage of adult civilians employed outside the home rose from 50% in 1941 to 58% in 1944, and you can see the resulting bump in real GDP per capita during those years in Figure 1.

NSOU ? PGSW-V 113 Over the longer run, however, the rate of employment growth is never very different from the rate of population growth. Over the course of the twentieth century, for example, the population of the United States rose at an average rate of 1.3% per year and employment rose 1.5% per year. Real GDP per capita rose 1.9% per year; of that, 1.7%—that is, almost 90% of the total—was the result of rising productivity. In general, overall real GDP can grow because overpopulation growth, but any large increase in real GDP per capita must be the result of increased output per worker. That is, it must be due to higher productivity. So increased productivity is the key to long-run economic growth. But what leads to higher productivity?

6.2.2 Explaining Growth in Productivity

There are three main reasons why the average U.S. worker today produces far more than his or her counterpart a century ago. First, the modern worker has far more physical capital, such as machinery and office space, to work with. Second, the modern worker is much better educated and so possesses much more human capital. Finally, modern firms have the advantage of a century's accumulation of technical advancements reflecting a great deal of technological progress. Let's look at each of these factors in turn.

Increase in Physical Capital

Economists define physical capital as manufactured resources such as buildings and machines. Physical capital makes workers more productive. For example, a worker operating a backhoe can dig a lot more feet of trench per day than one equipped only with a shovel. The average U.S. private-sector worker today is backed up by more than \$350,000 worth of physical capital—far more than a U.S. worker had 100 years ago and far more than the average worker in most other countries has today. Physical capital consists of human-made resources such as buildings and machines.

Increase in Human Capital

It's not enough for a worker to have good equipment—he or she must also know what to do with it. Human capital refers to the improvement in labor created by the education and knowledge embodied in the workforce.

NSOU ? PGSW-V 114 Human capital is the improvement in labor created by the education and knowledge embodied in the workforce. The human capital of the United States has increased dramatically over the past century. A century ago, although most Americans were able to read and write, very few had an extensive education. In 1910, only 13.5% of Americans over 25 had graduated from high school and only 3% had four-year college degrees. By 2015, the percentages were 88% and 33%, respectively. It would be impossible to run today's economy with a population as poorly educated as that of a century ago. Analyses based on growth accounting, suggest that education—and its effect on productivity—is an even more important determinant of growth than increases in physical capital.

Technological Progress

Probably the most important driver of productivity growth is technological progress, which is broadly defined as an advance in the technical means of the production of goods and services. We'll see shortly how economists measure the impact of technology on growth. Technological progress is an advance in the technical means of the production of goods and services. Workers today are able to produce more than those in the past, even with the same amount of physical and human capital, because technology has advanced over time. It's important to realize that economically important technological progress need not be flashy or rely on cutting-edge science. Historians have noted that past economic growth has been driven not only by major inventions, such as the railroad or the semiconductor chip, but also by thousands of modest innovations, such as the flat-bottomed paper bag, patented in 1870, which made packing groceries and many other goods much easier, and the Post-it® note, introduced in 1981, which has had surprisingly large benefits for office productivity. Experts attribute much of the productivity surge that took place in the United States late in the twentieth century to new technology adopted by service-producing companies like Walmart rather than to high-technology companies.

NSOU ? PGSW-V 115 6.3 What about Natural Resources? In our discussion so far, we haven't mentioned natural resources, which certainly have an effect on productivity. Other things equal, countries that are abundant in valuable natural resources, such as highly fertile land or rich mineral deposits, have higher real GDP per capita than less fortunate countries. The most obvious modern example is the Middle East, where enormous oil deposits have made a few sparsely populated countries very rich. For example, Kuwait has about the same level of real GDP per capita as Germany, but Kuwait's wealth is based on oil, not manufacturing, the source of Germany's high output per worker. But other things are often not equal. In the modern world, natural resources are a much less important determinant of productivity than human or physical capital for the great majority of countries. For example, some nations with very high real GDP per capita, such as Japan, have very few natural resources. Some resource-rich nations, such as Nigeria (which has sizable oil deposits), are very poor. Historically, natural resources played a much more prominent role in determining productivity. In the nineteenth century, the countries with the highest real GDP per capita were those abundant in rich farmland and mineral deposits: the United States, Canada, Argentina, and Australia. As a consequence, natural resources figured prominently in the development of economic thought. In a famous book published in 1798, *An Essay on the Principle of Population*, the English economist Thomas Malthus made the fixed quantity of land in the world the basis of a pessimistic prediction about future productivity. As population grew, he pointed out, the amount of land per worker would decline. And this, other things equal, would cause productivity to fall. His view, in fact, was that improvements in technology or increases in physical capital would lead only to temporary improvements in productivity because they would always be offset by the pressure of rising population and more workers on the supply of land. In the long run, he concluded, the great majority of people were condemned to living on the edge of starvation. Only then would death rates be high enough and birth rates low enough to prevent rapid population growth from outstripping productivity growth.

NSOU ? PGSW-V 116 It hasn't turned out that way, although many historians believe that Malthus's prediction of falling or stagnant productivity was valid for much of human history. Population pressure probably did prevent large productivity increases until the eighteenth century. But in the time since Malthus wrote his book, any negative effects on productivity from population growth have been far outweighed by other, positive factors—advances in technology, increases in human and physical capital, and the opening up of enormous amounts of cultivable land in the New World. It remains true, however, that we live on a finite planet, with limited supplies of resources such as oil and limited ability to absorb environmental damage. 6.4 Institutions Rich countries may be rich because of their physical capital, human capital, and state-of-the-art technologies, but we still need to ask: Why do they have these advantages? What keeps poor countries from enjoying similar high levels of capital and technology? Differences in institutions may be an important part of the answer. Mancur Olson, in a lecture published in the *Journal of Economic Perspectives* in 1996, provided one of the most compelling demonstrations of the importance of institutions. Olson observed that accidents of history, especially wars, provide us with interesting "natural experiments" relating to institutions and government policies. For example, consider North and South Korea, East and West Germany, and Hong Kong and mainland China. Historically, each pair was once a single country (and, in the case of Germany, is today). The people in each region share similar cultures, and there are no obvious advantages in geography on one side or the other. Moreover, these neighbors had relatively similar incomes. At the end of various wars, though, the regions were separated into distinct countries with different governments and institutions. What explains these sharp differences in economic performance? The obvious answer—obvious largely because this is the only clear difference between the neighboring countries—is the differences in government policies and in the rules and regulations that economists call "institutions." To see the importance of institutions, imagine that you set up two computer companies, one in a rich country and the other in a poor country. In a typical rich country, there is a

NSOU ? PGSW-V 117 well-defend set of laws you have to follow to establish your business, and the rules are the same for everyone. You may have to pay license fees and taxes, but these are long-standing and explicit. To a great extent, your company succeeds or fails on its own merit, and you profit directly from your own success. In contrast, you may run into numerous obstacles in the poor country. Corruption and bribes may make it difficult to set up the business in the first place. Importing the computer components may be a challenge—once the parts have arrived into port, they may be held hostage for additional "fees." Profits that you earn may not be secure: they may be taxed away or even stolen because of insufficient property rights. If your company succeeds, it may even be taken over by the government—as Bolivia did to foreign firms when it nationalized the oil and gas industries in 2006. Finally, even if your profits are secure for several years, a coup or war could change the environment overnight. Not only your profits but even your life may be at risk. Thus, economic growth results from an economy increasing its physical capital, raising the human capital of its workers (so that it has greater efficiency units of labor for a given size of the workforce), and improving its technology. Because of the diminishing marginal product of physical capital and limits to how much each worker can invest in his or her human capital before joining the workforce, sustained growth is generally impossible to achieve just by building up physical and human capital. Rather, the most plausible driver of sustained growth is technological progress. Empirical evidence also suggests that technological progress accounts for the bulk of the increase in GDP per capita (or per hour worked) in the United States. Property rights, the rule of law, contract enforcement, and the separation of powers are essential for economic success. In their absence, the costs of investing in physical capital, human capital, and technology may exceed the benefit, and as a result the investments may not be made. These institutional differences appear to be an important part of the explanation for differences in TFP and capital across countries. The study of the relationship between institutions and economic performance is at the frontier of current research in economics. At the moment, elegant and quantifiable models like our production model do not exist in the study of institutions. It's to be hoped that this research will reach a point in the near future where its insights can be gleaned as easily as those of the production model (or the growth models in the next two chapters). But unfortunately, we are not there yet.

NSOU ? PGSW-V 118 6.5 Models of Economic growth The Harrod–Domar model : In its simplest terms, economic growth is the result of abstention from current consumption. An economy produces a variety of commodities. The act of production generates income. The very same income is used to buy these commodities. Exactly which commodities are produced depends on individual preferences and the distribution of income, but as a broad first pass, the following statement is true: commodity production creates income, which creates the demand for those very same commodities. Let's go a step further and broadly classify commodities into two groups. We may think of the first group as consumption goods, which are produced for the express purpose of satisfying human wants and preferences. The mangos you buy at the market, or a fountain pen, or a pair of trousers all come under this category. The second group of commodities consists of what we might call capital goods, which we may think of as commodities that are produced for the purpose of producing other commodities. A blast furnace, a conveyor belt, or a screwdriver might come under the second category. Looking around us, it is obvious that the income generated from the production of all goods is spent on both consumer goods and capital goods. Typically, households buy consumer goods, whereas firms buy capital goods to expand their production or to replace worn-out machinery. This generalization immediately raises a question: if all income is paid out to households, and if households spend their income on consumption goods, where does the market for capital goods come from? How does it all add up? The answer to this question is simple, although in many senses that we ignore for now, deceptively so: households save. No doubt some borrow too, to finance current consumption, but on the whole, national savings is generally positive. All income is not spent on current consumption. By abstaining from consumption, households make available a pool of funds that firms use to buy capital goods. This is the act of investment. Buying power is channeled from savers to investors through banks, individual loans, governments, and stock markets. How these transfers are actually carried out is a story in itself. Later chapters will tell some of this story. By entering a new business, by expanding a current business, or by replacing worn- out capital, investment creates a market demand for capital goods. These goods add to the

NSOU ? PGSW-V 119 stock of capital in the economy and endow it, in the future, with an even larger capacity for production, and so an economy grows. Note, however, that without the initial availability of savings, it would not be possible to invest and there would be no expansion. This is the simple starting point of all of the theory of economic growth. Implicit in this story is the idea of macroeconomic balance. If you think of a circuit diagram with income flowing "out" of firms as they produce and income flowing back "into" firms as they sell, you can visualize savings as a leakage from the system: the demand for consumption goods alone falls short of the income that created this demand. Investors fill this gap by stepping in with their demand for capital goods. Macroeconomic balance is achieved when this investment demand is at a level that exactly counterbalances the savings leakage. If you understand the basic concept of macroeconomic balance, you understand the foundations of all models of economic growth. Economic growth is positive when investment exceeds the amount necessary to replace depreciated capital, thereby allowing the next period's cycle to recur on a larger scale. The economy expands in this case; otherwise it is stagnant or even shrinks. This is why the volume of savings and investment is an important determinant of the growth rate of an economy. It is easy to see that our simplified concepts hide important elements of reality. For instance, we have neglected, for now, the deeper question of which factors govern the amount of savings and investment. Nevertheless, the story so far does illuminate some Firms Outflow Inflow Investment Inflow Outflow Households Savings Consumption Expenditure Wages, Profits, Rents

NSOU ? PGSW-V 120 aspects of reality in a stark way, and therein lies its value. For now, let us see where it takes us, and then we will expand the analysis once we feel comfortable with the basics. A little algebra at this stage will make our lives simpler. It will also enable us to include some more features with a minimum of fuss. Divide time into periods $t = 0, 1, 2, 3, \dots$. We will keep track of dates by tagging the appropriate variable with the date. Here is standard economic notation: Y denotes total output, C denotes total consumption, and S denotes total savings. Remember that these variables are aggregates over the population. In particular, S nets out those who are borrowing for current consumption. Then the following equation must be true as a matter of accounting : $Y(t) = C(t) + S(t)$ (1) for all dates t . In words, national income is divided between consumption and savings. The other side of the coin is that the value of produced output (also equal to Y , please note) must be matched to goods produced for consumption plus those needed by investors; that is, $Y(t) = C(t) + I(t)$ (2) where I denotes investment. Equations (1) and (2) are one step away from the famous macroeconomic balance equation $S(t) = I(t)$ (3) or "savings equals investment," which you must have seen in an introductory macroeconomics course. We can use this equation to complete our basic argument. Investment augments the national capital stock K and replaces that part of it which is wearing out. Suppose that a fraction δ of the capital stock depreciates. Then, of course, $K(t + 1) = (1 - \delta) K(t) + I(t)$ (4) which tells us how the capital stock must change over time. Now we introduce two important concepts. The savings rate is just savings divided by income: $S(t)/Y(t)$ in our model. Call this s . The savings rate depends on a multitude of characteristics in the economy. Our second concept is also a ratio: the capital–output ratio, which we call k .

78%

MATCHING BLOCK 119/185

SA Economics Book.pdf (D143309763)

It is the amount of capital required to produce a single unit of output

in the economy, and it is represented by the ratio $K(t)/Y(t)$. Combining (3) and (4), using these new concepts, and moving terms around a bit, we arrive at a very influential equation indeed :

NSOU ? PGSW-V 121 $s/\delta = g + n$ (5) where g is the overall rate of growth that is defined by the value $[\delta(t + 1) - \delta(t)]/\delta(t)$. This is the Harrod–Domar equation, named after Roy Harrod and Evsey Domar, who wrote well-known papers on the subject in 1939 and 1946, respectively. It isn't difficult to see why the Harrod–Domar equation was influential. It has the air of a recipe. It firmly links the growth rate of the economy to two fundamental variables: the ability of the economy to save and the capital–output ratio. By pushing up the rate of savings, it would be possible to accelerate the rate of growth. Likewise, by increasing the rate at which capital produces output (a lower δ), growth would be enhanced. Central planning in countries such as India and the erstwhile Soviet Union was deeply influenced by the Harrod–Domar equation. A small amendment to the Harrod–Domar model allows us to incorporate the effects of population growth. It should be clear that as the equation currently stands, it is a statement regarding the rate of growth of total gross national product (GNP), not GNP per capita. To talk about per capita growth, we must net out the effects of population growth. This is easy enough to do. If population (P) grows at rate n , so that $P(t + 1) = P(t)(1 + n)$ for all t , we can convert our equations into per capita magnitudes. (The chapter appendix records the simple algebra involved.) Instead of (5), we now get $s/\delta = (1 + g^*)(1 + n) - (1 - \delta)$ (6) where g^* is now the rate of per capita growth. This is an expression that combines some of the fundamental features underlying growth: the ability to save and invest (captured by s), the ability to convert capital into output (which depends inversely on δ), the rate at which capital depreciates (δ), and, last but not least, and the rate of population growth (n). Actually, equation (6) looks a little complicated. There is an approximation that makes quick estimates far easier. To see this, expand the right-hand side of (3.6) to get $s/\delta = g^* + n + \delta - g^*n$. Now both g^* and n are small numbers, such as 0.05 or 0.02, so their product is very small relative to the other terms and can be ignored as an approximation. This gives us the approximate equation $s/\delta =$ (APPROXIMATELY) $g^* + n + \delta$ (7) which goes well with (5) and can be used in place of (6) without much loss of accuracy.

NSOU ? PGSW-V 122 6.5.1 Beyond Harrod–Domar : Other considerations The story of the Soviet experiment with growth (see box) brings home the message that investment and savings are not just aggregate objects, but themselves have important components that may need to be controlled separately. Some key sectors may need more investment than others, and these may well spark a growth spurt in other sectors. Of special importance is the balance between urban and rural sectors, or more narrowly, between agriculture and industry. The question of sectoral balance is complicated enough to merit separate inquiry. Even at the level of the aggregative simplicity of the Harrod–Domar model, there remains much to understand. Take another look at the basic Harrod–Domar model, captured by equation (6). It tells us that if savings rates, capital–output ratios, population growth rates, and depreciation rates are such and such, then the resulting growth rate is so many percentage points. We are, of course, entitled to make such “if–then” statements and in many cases, they make good sense, but in many cases they do not. The reason they may not always be useful is that the very parameters (savings rates, capital–output ratios) that are used to predict growth rates may themselves be affected by the growth process. Put another way, such variables may not be exogenous to economic growth, but may be themselves be endogenously determined. Our study of growth theory began with the fundamental notion of macroeconomic balance. Savings equals investment: abstention from current consumption paves the way for increases in capital equipment. More capital creates more output. Thus two parameters are immediately relevant: the savings rate, which tells us how much an economy “abstains,” and the capital–output ratio, which tells us how the resulting increase in capital translates into output. This allows us to derive an equation that relates the savings rate and the capital– output ratio to the rate of growth, which is the basic feature of the Harrod–Domar model. The Harrod–Domar equation can be extended to include depreciation of capital and to allow for a growing population. In the Harrod–Domar model, population growth unambiguously eats into per capita growth, because the role of labor as a factor of production is not captured adequately by a fixed capital–output ratio. This leads us to consider more seriously the possible endogeneity of parameters such as the savings rate, the population growth rate, and (of course) the capital–output ratio itself. Both the savings rate and the rate of population growth vary with different levels of per capita income. This introduces the possibility that the rate of per capita growth may itself vary depending on the current level of per capita income. In extreme cases, these considerations lead to development traps and thresholds. Per capita income may be stuck (or spend very long periods of time) in traps, but there may be critical thresholds as well, beyond which sustained growth occurs. This is the first demonstration of the possibility that initial conditions may drive long-run outcomes. 6.5.2

The Solow model Solow's twist on the Harrod–Domar story

is based on the law of diminishing returns to individual factors of production. Capital and labor work together to produce output. If there is plenty of labor relative to capital, a little bit of capital will go a long way. Conversely, if there is a shortage of labor, capital-intensive methods are used at the margin and the incremental capital-output ratio rises. This is exactly in line with our previous discussion: according to the Solow thesis, the capital-output ratio, is endogenous. In particular, $\frac{y}{k}$ might depend on the economy wide relative endowments of capital and labor. The Solow equations To understand the implications of this modification, it will help to go through a set of derivations very similar to those we used for the Harrod-Domar model. We may retain equations (3) (savings equal investment) and (3.4) (capital accumulation) without any difficulty. Retaining, too, the assumption that total savings $S(t)$ is a constant fraction s of total income $Y(t)$, we may combine (3) and (4) to get $k(t+1) = (1 - \delta)k(t) + sy(t)$ (8) If we divide through by population (P_t) and assume that population grows at a constant rate, so that $P(t + 1) = (1 + n)P_t$, (8) changes to $(1 + n) K(t + 1) = (1 - \delta) k(t) + sy(t)$ (9) where the lowercase k s and y s represent per capita magnitudes (K/P and Y/P , respectively). Before going on, make sure you understand the economic intuition underlying the algebra of (9). It is really very simple. The right-hand side has two parts, depreciated per capita capital [which is $(1 - \delta)k(t)$] and current per capita savings [which is $sy(t)$]. Added together, this should give us the new per capita capital stock $k(t + 1)$, except for one complication: population is growing, which exerts a downward drag on per capita capital stocks. This is why the left-hand side of (9) has the rate of growth of population (n) in it. Note that the larger the rate of population growth, the lower is per capita capital stock in the next period.

NSOU ? PGSW-V 124 To complete our understanding of the Solow model, we must relate per capita output at each date to the per capita capital stock, using the production function. The production function, as you know, represents the technical knowledge of the economy. In this model, capital and labor work together to produce total output. With constant returns to scale, we may use the production function to relate per capita output to per capita input. Figure 2(a and b) Figure-1 Capital Per Capita (k) Output-Capital ratios Production Function Output Per Capita (y) O (a) $(1+n)k$ $(1+n)k$ $(1-\delta)k + sy$ $(1-\delta)k + sy$ k $k(96)$ $k(97)$ $k(98)$ k^* $k(96)$ $k(97)$ $k(98)$ (b) NSOU ? PGSW-V 125 Figure 1 shows a typical production function with diminishing returns to per capita capital. Notice that as per capita capital increases, the output-capital ratio falls because of a relative shortage of labor. Note that output per person continues to rise, of course. It is just that with a relative shortage of labor, the ratio of output to capital used in production falls. In Figure 2, we use this production function to determine what the per capita capital stock must be at date $t + 1$ if the current per capita stock is k . Simply translate equation (9) into the diagram. To do so, multiply the output from any given capital stock by s , which gives us fresh investment, and add the result to the depreciated capital stock. The end product is the curved line in Figure 2, which looks very much like the production function itself (and indeed, is closely related), but has been transformed in the way we just described. Figure 2 also plots the left-hand side of (9), the straight line $(1 + n)k$ as k changes. Observe that because of diminishing returns, the curved line initially lies above this straight line and then falls below. The steady state Armed with this diagram, we can make some very strong predictions about growth rates. Figure 2 shows us two initial historical levels of the per capita capital stock—one “low” (Figure 2) and one “high” (Figure 2b)—starting in the year 1996. With the low stock, the output-capital ratio is very high and so the per capita capital stock can expand quite rapidly. How do we see this in Figure 2? Well, we know from (9) that the supply of per capita capital is read off by traveling up to the point on the curved line corresponding to the initial stock $k(1996)$. However, some of this supply is eroded by population growth. To find $k(1997)$, we simply travel horizontally until the line $(1 + n)k$ is touched; the capital stock corresponding to this point is 1997’s per capita capital stock. Now just repeat the process. We obtain the zigzag path in Figure (2a). Note that the growth of per capita capital slows down and that per capita capital finally settles close to k^* , which is a distinguished capital stock level where the curved and straight lines meet. Likewise, you may trace the argument for a high initial capital stock, as in Figure 2b. Here, there is an erosion of the per capita stock as time passes, with convergence occurring over time to the same per capita stock, k^* , as in Figure 2a.. The idea here is exactly the opposite of that in the previous paragraph: the output-capital ratio is low, so the rate of expansion of aggregate capital is low. Therefore, population growth outstrips the rate of growth of capital, thus eroding the per capita capital stock.

NSOU ? PGSW-V 126 We can think of k^* as a steady-state level of the per capita capital stock, to which the per capita capital stock, starting from any initial level, must converge. In other words, growth in the Solow model loses its momentum if capital is growing too fast relative to labor, which is precisely what happens to the left of k^* in Figure 2a. The reason is diminishing returns to capital, which creates a downward movement in the capital-output ratio as capital is accumulated faster than labor. The lower output-capital ratio then brings down the growth of capital in line with the growth of labor. This means that the long-run capital-labor ratio must be constant (and this is captured by the ratio k^*). However, if the per capita capital stock settles down to some “steady-state” level, then so must per capita income! Thus in this version of the Solow model, there is no long-run growth of per capita output, and total output grows precisely at the rate of growth of the population. In particular, the savings rate has no long-run effect on the rate of growth, in sharp contrast to the prediction of the Harrod-Domar model. Matters seem confusing at this point. We just studied the Harrod-Domar model, where the rate of savings most certainly affected the growth rate, and now the Solow model tells us that there is no such effect, at least in the long run. Yet these confusing discrepancies melt away once we recall that the Solow model brings in a feature that the Harrod-Domar model did not possess : diminishing returns to capital, which create endogenous changes in the capital-output ratio. This is the feature that chokes off growth in the Solow model. Look again at Figure 2 and observe that the smaller the degree of diminishing returns, the closer is the curve in that diagram to a straight line and the longer it will take for the per capita stock of capital to settle down— k^* becomes larger. The Harrod-Domar model studies the limiting case of this process where there is no diminishing returns at all and consequently no such steady state k^* : in that case, the per capita capital stock can grow indefinitely. Therefore, whether the Solow model or the Harrod-Domar model is more relevant is ultimately an empirical question and, as we shall soon see, the jury is still out on the issue. In any case, as long as we appreciate that the different predictions are driven by different assumptions (in this case, with regard to the nature of technology), there is absolutely no reason to be confused. The Solow model studies a situation where the capital-output ratio changes with the per capita availability of capital in the economy. The change is driven by the postulate of diminishing returns, so that a higher per capita stock raises the capital-output ratio. This

NSOU ? PGSW-V 127 contrasts with the Harrod–Domar model, where the assumption of a constant capital– output ratio essentially rules out diminishing returns. The relative validity of these two models is open to empirical scrutiny and the theoretical predictions are very different. In particular, the Solow model tells us that parameters such as the savings rate have only level effects, in contrast to the growth effects of savings in the Harrod–Domar model. Indeed, in the simple version of the Solow model studied so far (but soon to be extended), there is a steady-state level of per capita income to which the economy must converge, irrespective of its historical starting point. More dramatically, the Solow model infers that regardless of the initial per capita capital stock, two countries with similar savings rates, depreciation rates, and population growth rates will converge to similar standards of living “in the long run”! This is the hypothesis of international convergence, and it has led to a large literature, which we will come to in due course.

The endogeneity of the capital–output ratio led us to a classical theory: the Solow model. In Solow’s twist on the Harrod–Domar story, the capital–output ratio adjusts with the relative availability of capital and labor. This adjustment occurs because of diminishing returns to each of these inputs, and we can use production functions to capture such effects. To continue, if capital grows faster than the labor force, then each unit of capital has less labor to man it, so that output divided by capital falls. Thus savings fall relative to the capital stock, and this slows down the rate of growth of capital. Exactly the opposite happens if capital is growing too slowly relative to labor. This mechanism ensures that in the long run, capital and working population grow exactly at the same rate, and per capita growth ultimately vanishes. Capital and labor maintain a constant long-run balance that is known as the steady-state capital stock (per capita).

We showed how different parameters affect the steady-state level of the capital stock and (thus) the steady-state level of per capita income. We drew a distinction between level effects and growth effects.

Growth dies out in the simple Solow model because there is no technical progress. If you think of technical progress as a steady growth in knowledge that continually increases the productivity of labor, it becomes important to distinguish between the working population and effective labor, which is the working population multiplied by (the changing level of) individual productivity. Thus effective labor grows as the sum of population growth and technical progress. With this amendment, the Solow arguments apply exactly as before, with all per capita magnitudes reexpressed per units of effective labor. This means, for NSOU ? PGSW-V 128 instance, that while the long-run capital stock, relative to effective labor, settles down to a steady-state ratio, the capital stock per person keeps growing and it does so at the rate of technical progress. Likewise, per capita income keeps increasing in the long run precisely at the rate of technical progress. 6.6

Conclusion Dear learner thus you got a detailed understanding about the Economic growth and factors affecting the Economic growth. You also developed an idea about the models of Economic growth. This unit will thus help you to know the issuer which reduces or accelerates the Economic growth & affects the society as a whole. 6.7 Exercise 1. Explain the term Growth rate. Discuss the factors responsible for Economic growth rate. 2. Discuss the Harrod-Domar model of Economic growth. 3. Differentiate between the Solow model & Harrod-Domer model of Economic growth. 6.8 Reference Factors of Economic Growth and Growth Model Introduction to Economic Growth: Charles I. NSOU ? PGSW-V 129 Unit 7 ? Changing Pattern of Economic Planning in India after 1990 Structure 7.0 Objective 7.1 Introduction 7.2 Institutional Structure of Planning in India 7.3 Early Experience with Five Year Plans 7.4 Economic Policy in the 1980s 7.5 Economic Reforms after 1991 7.6 Conclusion 7.7 Exercise 7.8 Reference 7.0 Objective Our learner will get an overview about the changing Pattern of Economic planning in Indian since 1990. 7.1 Introduction Most developing countries emerging from colonial rule in the middle of the last century adopted some form of economic planning reflecting a conviction, common even among non-communist countries that the state had to intervene actively to promote economic development. India was no exception to this trend—indeed it was in many ways a forerunner. The Indian National Congress, as early as 1938, although fully engaged in the struggle for Independence, had set up a National Planning Committee under Jawaharlal Nehru (later to become India’s first Prime Minister) to work out concrete programmes of development covering the major segments of the economy. The belief that planning and state intervention were necessary for development was shared even by the private sector at the time as evidenced by the fact that in 1944 some of India’s leading businessmen produced the so called ‘Bombay Plan’, outlining a programme of economic development in which the state and the public sector were expected to play an important role.

NSOU ? PGSW-V 130 7.2 Institutional Structure of Planning in India Planning was institutionalized as a part of normal government activity when the Government of India, shortly after Independence in 1947, established the Planning Commission in March 1950 under the Chairmanship of the Prime Minister. This was followed by the establishment of the National Development Council (NDC) consisting of all Chief Ministers of the states and members of the Union Cabinet and full-time members of the Planning Commission, and chaired by the Prime Minister. The NDC is a forum that allows state governments to be consulted on the process of formulating plan objectives and strategies. The nature of planning in India and the role of the Planning Commission have changed considerably over time. In earlier decades, planning relied on establishing quantitative targets for individual sectors derived from multi-sectoral planning models with a variety of instruments of control being deployed by the government to ensure that targets were achieved. In subsequent decades, planning became much more indicative, reflecting the growing recognition that investment should respond to market forces and entrepreneurs must have freedom to determine expansion plans, and technology choices. While the practice of preparing Five Year Plans continued, the Plans increasingly focused on broad national targets for growth, poverty alleviation, and social-sector development. Sectoral investment decisions were left largely to the private sector, although the investment requirements of critical infrastructure sectors such as energy received special attention. The role of public investment in these sectors remained important since these sectors were dominated by public sector enterprises. Changes in the political environment over the years that also had an impact on planning are the emergence of regional parties and the associated phenomenon of state governments being run by a variety of regional political parties with the central government in the hands of a coalition. This has led to a loosening of the control that can be exercised by the central government on state governments and has also generated pressures for greater financial devolution. As a result, state governments today have greater freedom of maneuver relative to the centre. A more recent development is the pressure for further decentralization to local governments, which are the most important level of government for delivering essential services in health and education. Since government is increasingly focusing on these

NSOU ? PGSW-V 131 activities as the critical activities for public intervention, implementation of devolution to the local level has become an important issue in Plan implementation. The Planning Commission after 1990s performed several different functions, operating much like a Ministry in some respects, but with some important differences. It is responsible for preparing Five Year Plans that outline broad economic and social targets and indicate the requirements of public-sector expenditure on plan programmes in individual sectors for both the centre and states. Since the role to be played by the private sector has increased, recent Plans have also focused attention on the policy environment needed for the private sector to perform its expected role. The Plans also indicate the manner in which public-sector expenditures are to be financed, including the extent of assistance from the centre to the states. The Five Year Plans are implemented year by year through the annual budgets of the central government and the budgets of the governments of states and union territories. The Planning Commission negotiates with the Finance Ministry the total volume of financial resources to be provided in the central budget to support plan programmes of the central government and transfers to the state governments. Once the budgetary provision is finalized, the Planning Commission is responsible for dividing this total between the centre and the states, reflecting the broad pattern approved in the Five Year Plan, and also for the division of the central share among the central ministries. The Commission also holds discussions annually with the states, when it reviews states' performance and approves the level and sectoral composition of state Plans. In practice this role is more akin to advising the states. The Commission acts as a think tank for the government proposing policy initiatives that are necessary to achieve Plan targets and providing advice and critical evaluation of the effectiveness of policies in all sectors. This aspect of its role has also evolved considerably. In the early years, it was the only forum, other than the Finance Ministry, for articulating economic strategy and policy. Over the years, other economic ministries have become much more active in determining sectoral policies. Most policy decisions today are evolved through inter-ministerial groups in which the Planning Commission also participates. Unlike other ministries that typically take a sectoral view, the Planning Commission is expected to inject a broader cross-sectoral perspective on policy formulation, viewing policies in individual sectors in the light of other sectoral policies also in a longer-term time frame.

NSOU ? PGSW-V 132 7.3 Early Experience with Five Year Plans The First Five Year Plan (1951–2 to 1955–6) was little more than a collection of ongoing public investment projects, most of which were taken from the post-War reconstruction programme evolved before Independence. The Plan aimed at a general increase in the standard of living and also emphasized wider objectives such as full employment and removal of inequalities, but there was no specific analytically directed strategy for development. The Second Five Year Plan (1956–7 to 1960–1) first articulated a strategy for development based on analytical work by Professor P.C. Mahalanobis using a two-sector model that distinguished between the capital-goods producing sector and the consumer-goods-producing sector. Economic growth was viewed as a function of investment, and investment was seen to be constrained by the availability of capital goods. Since it was assumed that India could not expect to import capital goods freely because of limits on its ability to earn foreign exchange—an assumption which reflected export pessimism that was fairly common at the time—the availability of capital goods depended on domestic capacity to manufacture capital goods. On these assumptions, accelerated growth could be best achieved if as much investment as possible was devoted to creating capacity in the capital goods sector (and the associated metals-producing sectors) as this would enable higher levels of investment to be sustained. Since these sectors were both capital and technology intensive, and since private-sector entrepreneurial capacity was limited and in any case was more likely to be directed to the production of consumer goods, it was felt that public-sector units should be set up in the capital goods and metals-producing sectors. Political developments at the time also favoured expansion of the public sector. The Congress Party in 1955 adopted a resolution in favour of the socialist pattern of society which was later also adopted by Parliament. It was also felt that the strategy of expanding the public sector would have the advantage that surpluses generated by the public sector would be directed entirely to raising the rate of investment whereas profits in the private sector would partly lead to higher consumption. The Second Plan strategy ran into difficulties in the late 1950s because of severe balance-of-payments problems and food shortages, both of which were arguably linked to

NSOU ? PGSW-V 133 the neglect of export possibilities and of agriculture. Inflationary pressures intensified. Population growth also turned out to be a larger problem than was originally anticipated. The Third Plan (1961–2 to 1965–6) sought to address these problems, but without changing the basic strategy of industrialization based on promoting the so called 'heavy industries' with a strong emphasis on the public sector, while providing protection from import competition through quantitative restrictions on imports. Planning methodology in the 1960s was dominated by two considerations. The first was the perception that certain sectors were of strategic importance and investment resources must be consciously directed towards expanding capacity in these sectors instead of responding to market forces, which were more likely to draw investment into 'non-priority sectors' such as consumer goods. The desire to achieve quantitative targets for individual sectors led to a progressive expansion in sectoral detail in planning models from 4 sectors in the Second Plan to 60 in the Third Plan and 186 later. Sectoral expansion targets in turn provided the intellectual basis for the system of investment licensing, which was designed to direct resources towards expansion in strategic areas. In practice, the system proved to be highly inefficient, often leading to suboptimal scales of production, and forced adoption of suboptimal technology. It also served to protect existing private-sector investors who, having obtained permission to create capacity, were then able to argue against licensing additional capacity to others on the grounds that this would promote wasteful competition. The second consideration dominating Indian planning methodology was the perceived need to deal with the scarcity of foreign exchange. Export pessimism led to unwillingness to deal with foreign exchange scarcity by depreciating the exchange rate. Instead, a twofold approach was adopted of mobilizing external assistance to meet foreign exchange needs and rationing scarce foreign exchange by restricting import demand through import licensing. Since import licenses were typically not given if domestic production capacity had been set up, it gave tailor-made protection to domestic industry. Not surprisingly, the industrial structure that emerged was high cost and highly inefficient. Although the controls over investment and imports that evolved in the 1960s and 1970s were intellectually justified by planning models used by the Planning Commission, they were administered not by the Planning Commission but by the Ministries concerned. In practice, the linkage of these controls to Plan targets was tenuous at best, since the latter were in any case much more aggregative than the level at which controls were operated.

NSOU ? PGSW-V 134 In the early 1960s Indian planning came in for criticism on the grounds that the benefits of development had not accrued to the masses whose essential needs remained unmet. Responding to this criticism, the Perspective Planning Division of the Planning Commission produced an influential paper in 1962 outlining a strategy for guaranteeing a minimum level of living to everyone by 1975 (Planning Commission 1962). Recognizing that income distribution tended to be relatively stable, the paper argued that rapid growth of GDP would have to be the major part of the solution. Accordingly, it suggested a GDP growth target of 6 per cent per year which, with a relatively stable distribution, would lead to a broad-based improvement in living standards. The paper recognized that growth would not be a sufficient condition because many groups were likely to be left out from the growth process and it would be necessary therefore to have special programmes of employment generation and income support for these groups. This strategy of 'growth plus distribution and poverty alleviation' was subsequently adopted by the World Bank and other multilateral development banks in the 1970s. While India's planning strategy in the 1960s clearly emphasized rapid growth, it did not succeed in generating growth at the level targeted. It can also be argued that it did not pay sufficient attention to examining why growth targets were not being achieved and whether changes in economic policies were needed to achieve the stated objectives. There was constant focus on the need for higher levels of investment, especially in the public sector, but not enough attention was paid to factors affecting the efficiency of investment. The war with Pakistan in 1965 was followed by two severe droughts which delayed the formulation of the Fourth Plan. However, this period saw a major restructuring of policies in agriculture triggered largely by political developments. In 1966, India was highly dependent on imports of food grains from the United States under PL 480 and the US Administration, irritated by India's criticism of the US position on Vietnam, imposed a strict policy under which each shipload of food shipment required separate Presidential approval. Determined to overcome vulnerability on this score, Prime Minister Indira Gandhi gave top priority to achieving food self-sufficiency, and authorized the import of Mexican high-yielding wheat seeds, a controversial decision at the time because it reversed the traditional preference for technological self-sufficiency. The high yielding wheat was successfully adapted to Indian conditions by Indian agricultural research universities and together with supportive market support policies led to the Green Revolution in wheat in the early 1970s.

NSOU ? PGSW-V 135 An important episode in industrial and trade policy in the second half of the 1960s was the devaluation of the rupee in 1966 combined with measures of import liberalization as part of an agreement with the World Bank and the IMF aimed at mobilizing a much needed external assistance from the international donor community. As it happened, the additional assistance promised did not materialize, leading to considerable resentment at being forced to devalue. The import liberalization was reversed and the resentment at being forced to devalue lingered for many years, and contributed to a prolonged suspicion of all advice on liberalization. The problems of managing foreign exchange scarcity dominated the policy agenda in the 1970s. The denial of external assistance promised as part of the devaluation package, led predictably to the Fourth Plan (1969–70 to 1974–5) emphasizing self-reliance and reduced dependence on external aid, which in practice meant a tightening of import controls and increased inward orientation. However, performance in the Fourth Plan period was again disappointing and this also meant little progress in achievement of the minimum needs objectives laid down ten years earlier. The inability to reduce poverty was obviously linked to the failure to achieve rapid growth and should have led to a re-examination of the growth strategy itself. Instead, it led many participants in the public debate to argue that rather than push for elusive targets of growth, greater attention should be paid to implementing a direct attack on poverty through targeted schemes to help the poor. A number of targeted anti-poverty schemes were evolved in this period, including especially programmes for rural employment and small and marginal farmers, and these were incorporated into the Fifth Plan (1975–6 to 1979–80). As it happened, this Plan was terminated after the third year as there was a change of government when Mrs. Indira Gandhi lost the election in 1977. This was followed by two years of Annual Plans in 1978–9 and 1979–80. 7.4 Economic Policy in the 1980s The 1980s saw the beginning of changes in economic policy, prompted by the recognition that the East Asian countries which followed somewhat different policies with greater outward orientation were performing much better. This led to some important modifications in policy, giving greater flexibility to the private sector and freer access to NSOU ? PGSW-V 136 imports for exporters, combined with a conscious effort at managing the exchange rate to avoid exchange rate appreciation in real terms. These changes were reflected in the Sixth Plan (1980–1 to 1984–5) but it is important to note that the planning process had changed significantly by this time. Policy formulation was no longer the outcome of a planning process centralized in the Planning Commission. Instead, it came from multiple inter-ministerial committees that also took into account the views of ministries and non-government experts. The Planning Commission was actively involved in all these deliberations, but it was not the principal policymaking body. The policy changes introduced in the Sixth Plan were associated with a markedly improved performance in the Sixth Plan period and the growth rate of the economy exceeded the target for the first time. These policy changes were further intensified in the Seventh Plan period (1985–6 to 1989–90). Import licensing was eliminated in a growing range of areas where domestic protection concerns were not significant. More importantly, import licenses were also much more freely granted in areas where import licensing remained in place. Import availability to exporters was liberalized significantly and the exchange rate was managed in a way that brought about a significant but gradual real depreciation. This helped exporters and also made import licensing restrictions less binding. The overt commitment to a strong public sector remained unchanged, but there was a distinct shift away from the earlier policy of nationalizing loss-making private sector units to protect employment, and there was much less pressure to expand public-sector investment in areas where private investment was forthcoming. The Seventh Plan period saw continued strong economic growth, further reinforcing confidence in the new approach to policy. However, an important weakness in performance in this period was the steady increase in the fiscal deficit accompanied by unsustainable short-term external borrowing in an environment where export performance remained weak. These weaknesses led to a balance-of payments crisis in 1991. 7.5 Economic Reforms after 1991 Planning and Integration after economic liberalization What have been the consequences of economic liberalization for economic planning? The liberalization of 1991 did mark a rupture with the earlier economic regime insofar as NSOU ? PGSW-V 137 the hallmark of the regime of economic planning was the subordination of the market to the state whereas economic liberalization was intended to liberate the market from the control of the state. In most eyes, the target of economic liberalization was precisely the earlier regime of economic planning, that is, the aim was to release the market from the grip of economic planning, from the hegemony of the public sector, and from the system of discretionary controls over the economy. In actuality, despite the appearance of a sudden rupture, considerable ambivalence and ambiguity surrounded the turn to liberalization, principally because of the high moral value placed on the earlier economic strategy. This is apparent in the stance of the then Prime Minister, P.V. Narasimha Rao, who favored both economic liberalization and economic planning. Rao, undoubtedly, wanted removal of unnecessary controls and regulations in many areas for the sake of national advance, but he also believed that “the growth and development of the country cannot be left entirely to the market mechanism” since the market basically responded to existing purchasing power, and not need. Consequently, for him “Planning is necessary to overcome such limitations of the market mechanism. Planning is essential for macro-economic management, for taking care of the poor and the downtrodden, who are mostly outside the market system and have little asset endowment.” He therefore opted for both the market mechanism and planning, asking in effect that the two be dovetailed. The break with the previous economic regime was therefore not as comprehensive and thoroughgoing as it appeared at the time or as its opponents painted it to be. The state with its particular leadership was thus critical to the kind of economic liberalization that was acceptable. There are therefore elements of both continuity and discontinuity with the previous regime after economic liberalization. Those who had favored Nehru’s socialist project thought that the reforms of 1991, with their sharp turn to the market, would mean the end of economic planning. In fact, however, the entire apparatus of planning that had existed before liberalization has continued to be an essential part of the government and has operated, in functional terms, pretty much as it did before. The two decades after liberalization have seen the launching and completion of four Five Year Plans (Eighth, Ninth, Tenth and Eleventh), while formulation of the Twelfth Plan (2012–17) commenced in 2011. The fact that the planning structure has persisted so far suggests that there is no inevitability to liberalization’s consequences; instead, public policy is key. India’s economy had earlier been proclaimed to be a “mixed economy,” and it is still so regarded—or can be so regarded—even after liberalization. On the other hand, there

NSOU ? PGSW-V 138 has occurred little privatization after liberalization, while there continues to exist a vast public sector. In that light, India's economy was and continues to be a mixed one. At that level of generality, then, not much appears to have changed. The mixed economy continues, and so does economic planning. Continuity with the past is therefore one aspect that is apparent in respect of the question of the impact of liberalization. At the same time, there can be no denying that economic liberalization did mark a sharp shift in the relations between the state and market, and could not leave planning unaffected. The pertinent issue, then, is: what has changed and how much has changed in respect of economic planning? At base, economic planning is a political and administrative mechanism of the nation- state to develop a consensus over the essential economic tasks for the center, the states, and the market for a finite period of time (say, five or fifteen years), and it is equally also a site where these three forces intersect and interact. Four changes are striking in planning as regards the relationship between the center, the states, and the market. From Comprehensive Planning to Indicative Planning Economic planning in India may not have been as thoroughgoing as it was in the Soviet Union, but it was comprehensive insofar as it covered the entire economy and its various sectors. It was detailed, with meticulous multi-sector models employed to work out input- output balances with some degree of internal consistency for a largely closed economy. It was prescriptive also, particularly for the public sector, with the plans serving as an allocation mechanism. In great measure, it was prescriptive for the private sector, too, with the state using policy instruments like licensing and controls to implement plans. Occupying "the commanding heights" of the economy, the state was able to exert control over the entire economy through its vast and far-flung public sector, its regulatory framework for the private sector, and its hold over private sector savings in the nationalized banking and insurance industry. With the dismantling of a substantial part of the licensing and controls system and the opening up of vast areas of the economy to the private sector after economic liberalization, economic planning could no longer be comprehensive. Nor, with the opening up of the economy internationally, were input-output balances of much relevance any more since foreign trade could serve as a balancing mechanism. Detailed planning could, however, continue for the non-tradable sector, primarily in the area of infrastructure, largely the responsibility of the public sector. On the other hand, with the increased empowerment of NSOU ? PGSW-V 139 the private sector, planning could no longer be prescriptive for much of that sector. In this fashion, comprehensive planning was transformed into indicative planning, particularly in relation to the private sector. However, economic planning as a focused activity of the state has continued into the post-liberalization period, and it is not limited to the public sector alone, contrary to popular perception. Planning encompasses, as it did earlier, the entire economy within its scope, determining the overall strategy, the desired or acceptable rate of growth, and the thrust areas and priorities. The PC establishes and approves allocations for the public sector, while it expects policy to provide the enabling environment or incentives to accomplish what is desired in the private sector. But, that is precisely what it did before liberalization. The decisive difference with the period prior to economic liberalization is that the state no longer wields discretionary controls in most areas of concern to the private sector. Rather, the state is now conceptualized, ideally at least, as a facilitator, while the market is the arena where the private sector competes and carries the national economy forward. In practice, however, besides its influence through the regulatory agencies headed by bureaucrats or former bureaucrats, the state continues to exercise considerable discretionary controls over the private sector in certain areas, such as approval of telecommunications licenses, space allocations in special export zones, land acquisition for entrepreneurs, mining licenses, and especially environmental clearances. Not surprisingly, in all these areas there is an abundance of rent-seeking behavior. The change from comprehensive planning to indicative planning was heralded by the Eighth Plan (1992-97), which saw itself as marking and facilitating the transition from the former to the latter. Declaring that it had redefined PC's role, the Plan announced, "From a highly centralized planning system, we are gradually moving towards indicative planning." It is arguable whether the Eighth Plan itself was, indeed, indicative. If one sets aside the household sector, the public sector's investment was projected at over 70 percent of total "planned" investment and, since planning had to be detailed for this sector, the plan was heavily weighted toward the comprehensive side. However, public sector investment did not live up to the expectations of the Eighth Plan, and that by a wide margin. In any case, the Eighth Plan saw itself as being a transitional plan, and subsequent plans have been more in accord with the indicative variety. The shift to indicative planning did not, however, mean an end to the use of formal economic modeling for planning. Indeed, in place of the traditional single in-house model,

NSOU ? PGSW-V 140 the Eleventh Plan (2007–12), employed five models based on different analytical approaches, four of them having been farmed out to economic think-tanks, in order to determine the possibilities and feasibility of different rates of economic growth and the consequent sectoral composition so as to develop a coherent and consistent overall planning framework. Similarly, the Approach Paper to the Twelfth Plan relied on several macroeconomic models in figuring out alternative growth scenarios. The particular merit of formal modeling is that it serves as “an effective disciplining device in the exercise of choice of policy-makers and users.’ Indeed, the Planning Commission has been using the plan model to enforce discipline on the central and state governments, their ministries, departments, and undertakings. Detailed planning in the Eleventh Plan, however, was limited to the infrastructure sector while aggregate “indicative projections” were worked out for the sectors of agriculture, industry, and services.²⁴ As a PC member at the time, Kirith Parikh, claimed, PC “no longer sets sector-wise targets as it used to.” Nonetheless, “it does provide a broad picture of the economy, its likely direction and pace, a consistent macro-picture, the plans for the development of infrastructure and the provision of public goods and services. All these help private entrepreneurs in their decisions.” He further justified the continuing need for planning: “Even in a market economy governments continue to spend substantial amounts, and inclusive development requires government programs and projects to deliver public goods and services to all peoples and regions. This calls for allocating public investment, designing implementation strategies to see that outcomes are realized cost-effectively and monitoring them to see that targeted outcomes are in fact realized. In sum, then, PC continues to perform its role of articulating an economic vision for the country, developing the overall economic strategy for a period of five years at a time (against the canvas of a perspective plan for a fifteen-year time span), charting out the thrust areas over that period, laying out the roles of the public sector and private sector, and specifying the policy instruments to accomplish the goals of a given five year plan. To the extent that there is thus a substantial continuity in economic planning into the post- liberalization period, it follows that the integrative implications of such planning continue also to hold in substantial measure after liberalization. The future role of planning, however, undoubtedly remains a strongly contested terrain. India ran into a severe balance-of-payments crisis in 1991 triggered by the sharp, though temporary, rise in oil prices on account of the Gulf War in 1990. There was a loss of confidence leading to a reversal of external flows reflecting the winding down of short-

NSOU ? PGSW-V 141 term external debt which had built up in earlier years. The crisis became an opportunity for unveiling more systemic economic reforms by Dr Manmohan Singh, then Finance Minister, who later became Prime Minister in 2004. The reforms introduced in 1991 were initially led by the Finance Ministry, but in due course they became a broader government initiative in which other ministries, including the Planning Commission, were intimately involved. The reforms were broadly similar to those attempted by most developing countries, but with some important differences. The thrust of the reforms was (a) to place greater reliance upon the role of the private sector building on India’s considerable entrepreneurial tradition, (b) open the economy to foreign trade and foreign direct investment, (c) restructure the role of the government to concentrate on functions not likely to be performed by the market (for example expanding supply of public goods such as primary health services and education and also developing infrastructure) and also to regulate markets where necessary to ensure competition, and (d) to ensure that macroeconomic parameters remain in balance and the financial sector is well run. However, while these features are common to reform efforts elsewhere, there were also important differences. First, India’s reforms were much more gradualist than in other countries reflecting the compulsions of India’s highly pluralist and participative democratic policy. The resulting slow pace of change has also meant that benefits have been derived more slowly. Second, privatization of existing public-sector enterprises has not been a major feature of the reform effort which has focused instead on selling only minority stakes in profit- making public enterprises while trying to close down chronic loss makers. Economic performance in the post reforms period has been mixed. The balance-of- payments crisis of 1991 which led to the reforms was quickly overcome and economic growth resumed after 1992 yielding an average growth rate of 6.7 per cent for the Eighth Plan period (1992–3 to 1996–7). The economy slowed down thereafter partly because of a global slowdown following the East Asian crisis of 1997 combined with a string of poor monsoons which depressed agricultural performance, and partly also because of a slowing down in the pace of reforms. As a result, the growth rate dipped to 5.7 per cent in the Ninth Plan period (1997–8 to 2001–2).

NSOU ? PGSW-V 142 The Tenth Plan called for a renewed effort at pushing economic reforms to achieve a growth rate of 8 per cent. After an initially weak start, the economy accelerated significantly and the growth rate in the Tenth Plan period (2002–3 to 2006–7) is expected to be a little over 7 per cent. The improvement in economic performance reflects the gradual maturation of the economy in response to economic reforms. The investment rate in the economy has increased to 28 per cent in 2004–5. The gradual opening of the economy to trade and foreign investment has improved the competitiveness of Indian industry. Foreign direct investment has increased from virtually nothing to US\$ 6 billion in 2001–1. The Planning Commission has proposed a target of 8.5 per cent growth in the Eleventh Plan period (2007–8 to 2011–12). Eighth Five Year Plan (1992-97) : The eighth five year plan was for the period of April 1992 to March 1997. The political changes at the centre thwarted the commencement of the Eighth Plan. In line with the changed international and domestic circumstances, the role of the Planning Commission was redefined from a highly centralized planning system to gradually moving towards ‘indicative planning’. Indicative planning attempts to combine the advantages of decentralization and central planning. It is an attempt to promote economic growth by influencing expectations. Indicative planning is a form of central economic planning implemented by a state in an effort to solve the problem of imperfect information in economies, and thus increase economic performance. Objectives : Based on the approach, the following objectives were accorded priority in Eighth Plan period : (i) Generating adequate employment to achieve near full employment level by the turn of the century. (ii) Containing population growth through active people’s cooperation and an effective scheme of incentives and disincentives. (iii) Universalization of elementary education and complete eradication of illiteracy among the people in the age group of 15 to 35 years. (iv) Provision of safe drinking water and primary health facilities including immunization for all villages and entire population and complete elimination of scavenging.

NSOU ? PGSW-V 143 (v) Growth and diversification of agriculture to achieve self-sufficient in food and generate surpluses for exports. (vi) Strengthening the infrastructure (energy, transport, and communication, irrigation) in order to support the growth processes on a sustainable basis. (vii) The withdrawal of the state from these industrial activities where its presence is not essential and encouraging private sector initiative to fill the vacuum. (viii) Encouraging all-round productivity and efficiency in the public sector enterprises compelling them to rely on internally generated resources rather than on budgetary support. Growth Rate : The Eighth Plan had set a target of 5.6 per cent but it revealed from Economic Survey of 1998-99 that the growth rate, which was only 0.5 per cent in 1991-92 gradually increased to 5.2 per cent in 1992-93 and then increased to 6.2 per cent provisional in 1993-94.

In 1994-95, the CSO estimates show that the growth rate of GDP would be around 6.8 per cent. Again, in 1995-96, the CSO estimate shows that the growth rate of GDP would be around 6.8 per cent. Again, in 1995-96, the CSO estimate shows that the growth rate of GDP at factor cost would be around 7.3 per cent. Moreover, in 1996-97, the same growth rate of GDP was around 7.8 per cent. Thus the Eighth Plan is likely to end with an average growth rate of 6.8 per cent per annum. Gross Domestic Savings and Investment : Gross domestic savings as per cent of GDP at current prices, during the first four years of the Eighth Plan

has increased from 22.1 per cent in 1992-93, to 24.9 per cent in 1994-95

and then to new peak of 26.1 per cent in 1996-97. The average gross domestic savings (GDS) as per cent of GDP during the Eighth Plan is estimated at 24.3 per cent and these surpassed the target of 21.6 per cent. The rise in domestic savings in 1996-97 to a peak level of 26.1 per cent of GDP was primarily due to rise in private savings to 24.2 per cent of GDP. The gross domestic investment as per cent of GDP at current prices has also

increased from 23.9 per cent in 1992-93 to 25.7 per cent in 1996-97. The

average gross domestic investment as per cent of GDP during the Eighth Plan reached the level of 25.7 per cent.

NSOU ? PGSW-V 144 The average of saving-investment gap during the first four years of the Eighth Plan (1992-96) stood at (-) 1.4 per cent. The Eighth Plan recognized the essential need to involve people in the process of development. The attitude of passive observance and total dependence on the government for developmental activities had become all-pervasive. It needed to be altered to a pro-active attitude of people taking initiative themselves. In the process of development, people must operate and government must cooperate. In this Plan, therefore, for the first time a new direction was given to achieve these objectives by adoption of an institutional approach. India's Ninth Five-Year Plan (1997-2002) The Eighth plan period ended in 1997. Implementation of the Ninth plan was to begin from the same year. But a series of political crises in the country delayed the formulation and approval of the plan by two years. The NDC finally approved the plan in February 1999, envisaging a GDP growth rate of 6.5 percent per annum. Though delayed by two years in approval, the plan was to run its period through to 2002. The ninth plan aimed at growth with social justice and equity. Objectives : (i) Priority to agriculture and rural development with a view to generating adequate productive employment and eradication of poverty; (ii) Accelerating the growth rate of the economy with stable prices; (iii) Ensuring food and nutritional security for all, particularly the vulnerable sections of the society; (iv) Providing basic minimum services of safe drinking water, primary healthcare facilities, universal primary education, shelter and connectivity to all in a time-bound manner, (v) Containing the growth of populations; (vi) Ensuring environmental sustainability of the development process through social mobilization and participation of people at all levels; (vii) Empowerment of women and society's disadvantaged groups such as the scheduled castes, scheduled tribes and other backward classes and minorities as agents of Socio-economic change and development;

NSOU ? PGSW-V 145 (viii) Promoting and developing people's participatory institutions like Panchayati Raj Institutions, Co-operatives and self-help groups. (ix) Strengthening efforts to build self-reliance; The special feature of the Ninth Plan was the priority set out by the Prime Minister in the list titled 'Special Action Plan' (SAP). It concentrated on five areas: food and agriculture; physical infrastructure; health, education and drinking water; information technology and water resources. Outlay : The size of the plan was estimated to be Rs. 8,59,000 crore at 1996-97 prices. This included plans of the Centre, States and public sector undertakings. The gross budgetary support to the plan from the Centre was fixed at Rs. 3,74,000 crore. Resources from public sector undertakings and states were estimated to be Rs. 2,90,000 crore and Rs. 1,95,000 crore respectively. Assessment : The rate of growth of GDP during the ninth plan dropped to 5.3 percent from 6.7 percent during the Eighth plan. This was against the target of 6.5 percent. The rate of growth declined particularly in the agriculture and manufacturing sectors, whereas in the services sector there was a marginal increase in the growth rate. In the agriculture three of the five years of the Ninth Plan witnessed poor performance due to weather-related shocks. The Asian crisis in 1997 and slowdown in the world economy, coupled with poor performance of agriculture during 1997-2000, led to a reduced demand for industrial goods and consequent reduction in the growth rate in the industrial sector. Some other development during the ninth plan, such as cyclone in Orissa, earthquake in Gujarat, Kargil war etc. also resulted in diversion of resources from investment and consequent decline in the growth rates. The rate of investment was 24.2 percent of GDP at market prices. The rate of saving has been worked out to 23.3 percent of GDP. The bulk of the savings was accounted for by the private sector. The excess of investment over savings resulted in a current account deficit of 0.9 percent for the Ninth Plan.

NSOU ? PGSW-V 146 In the Ninth Plan, the importance of public participation was highlighted, and it was argued that the process of social mobilization and development of peoples' initiatives cannot be achieved without the active support and involvement of the political system at all levels. It was clearly stated that the Panchayati Raj bodies in rural areas and Nagar Palikas in urban areas will have to be directly involved in the developmental process, and therefore people's involvement via their elected representatives will be realized through genuine democratic decentralization. However, it was argued, other forms of people's participation also need to be strengthened. Tenth Five Year Plan (2002-2007) : The Tenth Five Year Plan (2002-2007) aimed at an indicative target of 8% GDP growth for the plan period. It covered the issue related to growth, investment and employment, and certain general observations on institutional design, governance and implementation methodologies. The Tenth Plan set before itself the annual growth rate of 8%, which was much higher than 5.5% achieved during the Ninth Plan. Since economic growth was not the only objective, the plan aims at harnessing the benefits of growth to improve the quality of life of the people by setting the following key objectives : i. Reduction in poverty ratio; ii. Providing gainful high quality employment to the additional labour force over the tenth plan period; iii. All children to be enrolled in schools and complete 5 years of schooling; iv. Reduction of gender gaps in literacy and wage rates by at least 50%; v. Reduction in decadal rate of population growth between 2001 and 2011 to 16.2%; vi. Increase in literacy rate to 75% within the plan period; vii. All villages to have sustained access to potable drinking water within the plan period; viii. Cleaning of major polluted rivers and other notified stretches; ix. Reduction in Infant Mortality Rate (IMR) and Maternal Mortality Rate (MMR); x. Around Rs.800 billion of disinvestment over 5 years and increasing FDI inflows annually to at least \$7.5 billion; and xi. All main rivers should be cleaned up between 2007 and 2012.

NSOU ? PGSW-V 147 In the Tenth Five Year Plan, the importance of accountability was highlighted. The then Prime Minister, Atal Bihari Vajpayee pointed out in the Forward of the Tenth Five Year Plan document that effective delivery of basic social services to our people cannot be ensured unless the institutions that are charged with these functions are made accountable to the people themselves and for this it is necessary to empower the Panchayati Raj Institutions by transferring to them both functions and resources. He believed that the PRIs must become the cutting edge of our three-tier political structure and the focal point of democratic decentralization. Eleventh Five Year Plan (2007-12) : The National Development Council approved the Eleventh Five Year Plan setting 'a faster more broad based and inclusive' growth at the average annual rate of 9 per cent. The Plan points out, it requires a substantial increase in the allocation of public resources for plan programmes in critical areas' including education, health, agriculture and infrastructure. The central vision of the Eleventh Plan is to improve the quality of life of the people, especially the poor, SCs and STs, OBCs, minorities and women. The Plan can be broadly divided into the following components : ? Reduction of poverty and creation of employment opportunities; ? Providing access to essential services like health and education, especially for poor; ? Providing equal opportunity to all, empowerment through education and skill development; ? Ensuring environmental sustainability; ? Good governance. As many as 27 detailed national targets have been set in the Plan ranging from enhancing income and reducing poverty, to education, literacy, health, infant mortality, maternal mortality and child development. These can be classified into the following six categories : a) Income and poverty ? Average GDP growth of 9 percent ? Agricultural growth rate of 4 per cent.

NSOU ? PGSW-V 148 ? Generation of 58 million new work opportunities ? Reduction of unemployment among the educated to less than 5 per cent; ? 20 per cent rise in the real wage rate of unskilled workers ? 10 percent reduction in the head-count ratio of consumption poverty b) Education ? Reduction of dropout rates of children at the elementary level from 52.2 per cent in 2003-04 to 20 per cent by 2011-12 ? Ensuring minimum standard of education in elementary schools; ? Increasing the literacy rate to 85% for people of the age seven years or more ? Reduction of gender gap in literacy to 10% by 2011-12; ? Increasing the percentage of each cohort going to higher education to 15 per cent by 2011-12. c) Health ? Reduction of infant Mortality Rate (IMR) to 28% and Maternal Mortality Rate (MMR) to 1 percent per 1000 live births by the end of the Eleventh Plan ? Total Fertility Rate (TFR) to be reduced to 2.1 ? Providing clean drinking water to all by 2009 ? Reduce by half malnutrition among children of age group 0-3 ? Reduce by half anemia among women and children d) Women and Children ? Raising the sex ratio to 935 for the age group 0-6 years by 2011-12 and to 950 by 2016-17 ? To ensure that at least 33 per cent of the beneficiaries of all government schemes are women and children. ? To ensure that all children enjoy a safe childhood, without any compulsion to work e) Infrastructure ? Electricity connection to all villages and BPL households by 2009

NSOU ? PGSW-V 149 ? Road connection to all habitation with a population 1000 and above (500 and above in hilly and tribal areas) by 2009, and all significant habitations by 2015 ? Connect every village by telephone and provide broadband connectivity to all villages by 2012 ? Provide homestead sites to all by 2012 and step up the pace of the construction of houses for rural poor. f) Environment ? Increase forest and tree cover by 5 per cent. ? Attain WTO standards of air quality in all major cities by 2011-12 ? Treat all urban waste water by 2011-12 to clean river waters ? Increase energy efficiency by 20 per cent by 2016-17. A key feature of the inclusive growth strategy in the Eleventh Plan is that growth should not be treated as an end in itself, but only as a means to an end. This is best done by adopting monitorable targets, which would reflect the multi-dimensional economic and social objectives of inclusive growth. One of the basic objectives of the Eleventh Plan is to use Panchayati Raj Institutions (PRI) as the primary means of delivery of the essential services that are critical to inclusive growth. The 73rd and 74th Amendments to the Constitution have led to the establishment of about 2.5 lakh elected institutions of local self-government (about 2.38 lakh in rural areas and rest in urban areas). It is absolutely critical for the inclusiveness of our growth process that these large numbers of elected representatives in our PRIs are fully involved in planning, implementing and supervising the delivery of the essential public services. The Eleventh Plan recognizes the need to build incentives that may help in encouraging the states to devolve functions, funds and functionaries to the PRIs. In order to capture the extent to which this process and empowerment of PRIs has actually progressed in each state, a suitable Devolution Index will be developed and will be called PRI-empowerment Index. The plan promises to create productive employment at a faster pace than before, and targets agricultural growth at 4 per cent per year. It seeks to reduce disparities across regions and communities by ensuring access to basic physical infrastructure as well as health and education services to all. It recognizes gender as a cross-cutting theme across all sectors and commits to respect and promote the rights of the common person.

NSOU ? PGSW-V 150 7.6 Conclusion The unit thus gave us a clear idea about the objectives & overview about the various plan period in India since 1990. 7.7 Exercise 1. Give a brief account of Institutional structure of planning in India. 2. Write about the Economic Reform after 1991. 3. Write about the Eight five year plane. 4. Discuss about the Eleventh five year plane. 7.8 Reference Concept of National Income and Inequalities in Distribution of National Income. Concept of National Income and Inequalities in Distribution of National Income Structure 8.0 Objective 8.1 Introduction 8.2 Leakages and injections 8.3 How is national income measured? 8.4 Definition of GDP 8.5 Inequality around the World 8.6 Conclusion 8.7 Exercise 8.8 Reference 8.0 Objective The learner would learn about the concept of National income & other factors which influences the National economy. 8.1 Introduction To start, we look at the very simple model of the nation's economy. In this model there are two sectors. Households are the people who buy the nation's output of goods and services and the owners of all of the economy's factors of production. They supply these factors of production to the firms and, in turn, they receive payment for their factors. The firms hire the factors of production from households and use these factors to produce the nation's output of goods and services. The factors of production provided and income received are shown in a simplified form in Table 1. Payment to the factors of production Factors of Production Payment to the Factor (Provided by Firms) (Provided by Households) Labour Wages Land Rent Capital Interest Entrepreneurship Profit

NSOU ? PGSW-V 152 This is the basis for the circular flow of income two-sector model shown in Figure 1. Households provide the factors of production (1) and receive income (2). They buy the goods and services (3) produced by the firms by using the income received (4), and in this way the income circulates throughout the economy. 8.2 Leakages and injections The two-sector model described is very much a simplified model of the economy. Common sense is likely to tell you that households do not behave in this very simple way— that is, they do not spend all of the money that they receive in income as suggested by the model. Households can save some of their income. By definition, saving means foregoing current consumption to allow for consumption in the future. People can save by putting money in banks or other financial institutions. Saving is known as a leakage from the circular flow, as it is income received but not used to finance expenditure on goods and services. If households do not buy all the output that is produced by the firms then firms will have unsold stocks of goods and, as a result, they will reduce their output. To reduce output the firms will use fewer factors of production and thus pay less income. This shows how saving will cause the amount of income circulating in the economy to fall. However, firms will have access to the savings of households by borrowing money from financial institutions such as banks or pension funds. They can use the money to increase their stock of capital and expand their output. This is known as investment and Figure 1 : Two-sector circular flow of income model

NSOU ? PGSW-V 153 is an injection into the circular flow of income, as it involves income that does not come straight from the households through their spending on goods and services. Investment allows the amount of income circulating in the economy to rise. Even though we have made the model slightly more realistic by adding saving and investment into the circular flow, the model is still limited by the fact that there are only two sectors. In reality, of course, there are other sources of income flow in an economy. If households buy goods and services from other countries, then some of their income flows out of the economy's circular flow. Thus imports are also known as a leakage because they represent expenditure of income not returning to the firms. People in foreign countries buy the country's exports of goods and services. Exports are an injection into the circular flow because they represent a source of income not coming directly from the households. There is no reason to assume that exports will be equal to imports. Countries usually have trade imbalances. Clearly, households and firms are not the only two sectors acting in an economy. We now introduce the government sector. Some of the income earned by households must be paid to the government in the form of taxes. Thus, taxes are a leakage from the circular flow. Governments spend money in the economy on a wide range of things—schools, roads, campaigns to reduce smoking, and hospitals, to name a few examples. Government spending on goods and services represents an injection into the circular flow. There is no reason to assume that government spending will be equal to tax revenues. It should be noted here that governments are able to spend more than they earn in order to deliberately influence the level of leakages and injections in an economy and thereby affect the level of national income. It is important to point out that there is a category of government spending known as transfer payments that are not included as an injection into the circular flow. Transfer payments are payments to individuals that are not the result of an increase in output. Examples of transfer payments are pensions, unemployment benefits, and child allowance payments. Governments tax the income of some households and transfer this income to others through the payments. As it is a transfer of income, rather than income in exchange for output, this spending does not represent an injection. Figure 2 shows the circular flow of income model with the four sectors—households, firms, the foreign sector, and the government sector—taking into account the leakages and injections.

NSOU ? PGSW-V 154 Even the four-sector model remains a simplification of a complex economy, but it serves to illustrate some important conclusions. The economy is in equilibrium where leakages are equal to injections. If leakages rise, without a corresponding increase in injections, then national output will fall to a new equilibrium, as there will be less income circulating. If injections rise with no corresponding rise in leakages, then the economy will move to a new equilibrium. 8.3 How is national income measured? The most commonly used measure of a country's national income is gross domestic product (GDP). There are three different methods that are all used to calculate this figure. 1. The output method : This measures the actual value of the goods and services produced. This is calculated by summing all of the value added by all the firms in an economy. When we say value added it means that at each stage of a production process we deduct the costs of inputs, so as not to "double count" the inputs. The data is usually grouped according to the different production sectors in the economy: agriculture and mining (primary sector), manufacturing (secondary sector), and services (tertiary sector). The output method measures the value of the arrow marked as number (3) in Figure 1. Figure 2 : Four-sector circular flow with leakages and injections

NSOU ? PGSW-V 155 2. The income method : This measures the value of all the incomes earned in the economy. This method measures the value of the arrow marked as number (2) in Figure 1. 3. The expenditure method : This measures the value of all spending on goods and services in the economy. This is calculated by summing up the spending by all the different sectors in the economy. These include: ? spending by households, known as consumption (C) ? spending by firms, known as investment (I) ? spending by governments (G) ? spending by foreigners on exports minus spending on imports. This is known as net exports (X-M). ? The expenditure method measures the value of the arrow marked as number (4) in Figure 1. ? Each approach measures the value of a nation's output differently by looking at different sets of data. Nonetheless, since they are measuring the same thing, their values are necessarily an equal amount. One common and highly acceptable definition of GDP is that it is

88%

MATCHING BLOCK 123/185

W

the total value of all final goods and services produced in an economy

in a year. This clearly reflects the output method of calculation. Another widely used definition is that GDP is the total value of all spending in the economy, algebraically expressed as $GDP = C + I + G + (X-M)$. This reflects the expenditure method. ? Thus, regardless of the method chosen, in theory, accounting will result in the same final figure, whether we call it national output, national income, or national expenditure. ? In practice, however, the data that are collected to calculate each of the three values come from many different and varied sources, and inevitably there will be inaccuracies in the data, leading to imbalances among the final values. Some of these inaccuracies are the result of the timing of the data gathering; often figures have to be revised at later dates when full information is collected.

NSOU ? PGSW-V 156 8.4 Definition of GDP National output = National income = National expenditure Gross domestic product (GDP) and gross national product (GNP)/gross national income (GNI) : Two definitions for gross domestic product (GDP) were given above. A third is useful to be able to make a comparison between GDP and gross national product (GNP) /gross national income (GNI). GDP may be defined as the total of all economic activity in a country, regardless of who owns the productive assets. For example, if an Indian multinational company (MNC) is operating in Canada and earning profits, then this income is included in the Canadian GDP and not in the Indian GDP. If the production takes place on Canadian land then it is recorded on the Canadian GDP. Gross national product (GNP)/gross national income (GNI) is the total income that is earned by a country's factors of production regardless of where the assets are located. In the example above, the profits earned by the Indian MNC would be included in Canada's GDP but not Canada's GNI because Canada does not own the assets. Similarly, Canada's GDP would not include profits earned by a Canadian MNC operating in Brazil but its GNI would include such profits. Thus, GNI is equal to GDP plus income earned from assets abroad minus income paid to foreign assets operating domestically. The income earned by assets held in foreign countries is known as property income from abroad and the difference between incomes earned from assets abroad minus income paid to foreign assets operating domestically is known as net property income from abroad. $GNI = GDP + \text{net property income from abroad}$ Gross national income (GNI) and net national income (NNI) Throughout the course of a year a country's capital stock will lose some of its value. This is known as depreciation of capital or capital consumption. This is due to several factors. It may simply be due to wear and tear as machinery is used, there may be damage to capital equipment, or technology might make machinery obsolete. In effect, capital gets "used up" and the GDP does not take into account this depreciation of capital. The measure that does take this into account is called net national income (NNI), which is simply gross national income minus depreciation (capital consumption). While NNI gives

NSOU ? PGSW-V 157 a more realistic view of the real economic activity of a country, in practice it is very difficult to account for depreciation. Thus gross figures are the more widely used measures. $NNI = GNI - \text{depreciation}$ Nominal GDP and real GDP If we were to compare the GDP of a country from one year to another we would have to take into account the fact that prices in the economy are likely to have risen. If prices of goods and services rise (inflation) then this will overstate the value of GDP. That is, GDP will rise, even if there hasn't actually been an increase in economic activity. In order to get a true picture of the change in economic activity we take the nominal GDP, which is the value at current prices, and adjust it for inflation to get the GDP at constant prices. This is done through the use of a "GDP deflator" and the value is known as real GDP. To compare GDP data over time it is necessary to use the real value so that price changes cannot distort the information. $\text{Real GDP} = \text{Nominal GDP} \text{ adjusted for inflation}$ Note : Whenever you see the adjective "real" in front of an economic variable, it means that the variable has been adjusted for inflation. This makes it possible to compare data over time. GDP per capita This is the easiest of the national income statistics to measure. It is simply the total GDP divided by the size of the population. While the total economic activity of a country is appropriately measured using the GDP figure, if one is to make any judgment about the progress of a country in comparison with other countries in terms of raising living standards then the GDP per capita figure is much more appropriate. For example, the GDP of China is US\$ 5,365 billion, significantly higher than that of Canada, with a GDP of US\$ 1,556 billion. This says that the output of China is approximately three and a half times larger than that of Canada. However, when we take the population into account we find that China's GDP per capita is US\$ 3,678, while the GDP per capita of Canada is US\$ 45,658. Thus the output per person in Canada is almost twelve and a half times that of China's output per person. Why are national income statistics gathered? Definitions of national income are fairly straightforward, but the job of compiling accurate accounts is extremely complicated and necessarily expensive. Every country has

NSOU ? PGSW-V 158 an organization that is responsible for calculating and reporting on the country's national accounts. The United Nations provides guidelines for such work in the System of National Accounts (SNA). The data gathered are used in myriad ways. ? National income statistics can be seen as a "report card" for a country. Economic growth is a stated objective of governments. Economic growth is an increase in a country's national income over time. Therefore, people use the statistics to judge whether or not a government has been successful in achieving its macroeconomic objective of increased growth. ? Governments use the statistics to develop policies. ? Economists use the statistics to develop models of the economy and make forecasts about the future. ? Businesses use statistics to make forecasts about future demand. ? The performance of an economy over time can be analyzed (as long as real data are used). ? Because rising national income is often equated with rising living standards, people often use national income accounts as a basis for evaluating the standard of living or quality of life of a country's population. ? National income statistics are often used as a basis for comparing different countries. Limitations of the data Given the importance of national income statistics and their wide use, it is important to be aware of possible limitations of the data, both in terms of the accuracy of the data, in terms of their uses for making comparisons, and in terms of their appropriateness in making conclusions about living standards. ? Inaccuracies : As noted above, the data that are used to calculate the various measures of national income come from a vastly wide range of sources, including tax claims by households and firms, output data, and sales data. Figures tend to become more accurate after a lag time as they are revised when additional data are included. Statisticians in national statistics agencies make every effort to make their data as reliable as possible and in the more developed countries they can be assumed to be fairly reliable. The United Nations SNA works with all countries to improve the methods of gathering data. This improves the validity of comparisons.

NSOU ? PGSW-V 159 ? Unrecorded or under-recorded economic activity—informal markets : It is important to note that national income accounts can only record economic activity that has been officially recorded. They therefore don't include any do-it-yourself work or other work done at home. If you paint your own home, your work will not be included in the country's GDP, but if you pay a house-painting company to do so the activity will be recorded, and GDP will rise, even though the output is identical. This is perhaps most significant for developing countries, where much of the output does not make it to any recorded market. For example, much of the food consumed in developing countries may be produced by subsistence farmers. These are people who grow their own food. Although estimates of the value of this are made, it is likely that GDP figures are undervalued. Comparisons may be difficult. Apart from the do-it-yourself work and subsistence farming, there is another category of economic activity that goes unrecorded or under-recorded. This may be referred to as the hidden economy. This includes activity that is unrecorded because the actual work is illegal, such as drug trafficking. It also includes unrecorded activity that is legal, but the people are doing it illegally. For example, if foreign workers do not have the appropriate work permits to do work such as cleaning, building, or working in restaurants, then their work will go unrecorded. It also includes work that is not recorded because people want to evade paying taxes. For example, when governments impose high taxes on cigarettes, this provides smokers with additional incentive to buy their cigarettes illegally to avoid paying the taxes. High indirect and direct taxes, along with government health and safety regulations, give employers the incentive to avoid the "official" economy and hire workers unofficially. High income taxes give people the incentive to understate their full income. For example, a lawyer will have to declare some official income, but may then pursue work that she does not declare. If she accepts cash for the extra work, then she can avoid officially claiming the income. Statisticians try to estimate the extent of the hidden economy from country to country. ? External costs: GDP figures do not take into account the costs of resource depletion. Cutting down trees leads to an increase in GDP, but there is no measure to account for the loss of these trees. GDP figures do not make deductions for the negative consequences of air and water pollution and traffic congestion, as

NSOU ? PGSW-V 160 these are external costs. Such external costs are almost certain to compromise the quality of life, even as GDP increases. ? Other quality of life concerns: GDP may grow because people are working longer hours, or taking fewer holidays. While people may earn higher incomes as a result, they might not actually enjoy higher standards of living. GDP accounting does not include free activities such as volunteer work or people caring for the elderly and children at home. These are all activities that can lead to a better society, but might even be discouraged in the pursuit of economic growth. ? Composition of output: It is possible that a large part of a country's output is in goods that do not benefit consumers, such as defense goods or capital goods. If this is the case, then it would be hard to argue that a higher GDP will raise living standards. 8.5 Inequality around the World Before we can understand the variation of income across the world, our first step is to define our measurements. How do we quantify the differences in standards of living and economic conditions across countries? Income per capita is one robust measure. Measuring Differences in Income per Capita We learned in the last section how to measure aggregate income or GDP. We can do so by approaching it from the production side, from the expenditure side, or from the income side. From the national income accounting identity, all three give exactly the same answer: gross domestic product, or GDP for short. Dividing GDP by the total population in the country gives us income per capita (per person) or GDP per capita. We use the two terms interchangeably in this textbook because they represent the same number. (Often we use income per capita when we wish to emphasize that the number is the average income of the citizens of a country and GDP per capita when we wish to emphasize that the number is what the economy produces per person.) More formally, we have : $\text{Income per capita} = \text{GDP per capita} = \text{GDP} / \text{Total population}$ For example, the United States in 2010 had GDP equal to about \$14.45 trillion. With a total population of approximately 310 million, income per capita was approximately \$46,613.

NSOU ? PGSW-V 161 How does this compare to the income per capita of other countries? Let us look to a neighboring country : Mexico. Income in Mexico is, of course, not calculated in U.S. dollars but in pesos. Thus with a similar computation, we find income per capita in Mexico in the same year, 2010, to be approximately 116,036 pesos. This number is not directly comparable to the \$46,613 for the United States because it is expressed in different units. But we can convert it to the same units by using the exchange rate. For example, on January 1, 2010 one U.S. dollar was worth 12.9 pesos, or one peso was worth $1/12.9 = 0.078$ dollars. Using this ratio, we can convert the average income in Mexico into dollars as follows (where p.c. stands for "per capita") : $\text{Mexican income p.c. in } \$ = \text{Mexican income p.c. in pesos} * \$/\text{peso exchange rate} = 116,036 * 0.078 = \$9,051$ So the average Mexican had an income per capita of approximately \$9,051. This number would be useful if you wanted to think about how much an individual with the average Mexican income per capita, all of which was earned in Mexico, would be able to consume in the United States. Using this exchange-rate-based measure, we can compute income per capita in every country for which we have data on GDP and population. For example, in 2010, income per capita in Sweden was \$50,549 and in Switzerland it was \$69,167. While income per capita in Sweden and Switzerland is similar to that in the United States, large disparities emerge when we compare the United States to several other countries. For example, we have already seen that the U.S. income per capita is about 5 times that of Mexico. It is also 30 times greater than income per capita in India, 43 times greater than income per capita in Senegal, and approximately 155 times greater than income per capita in Ethiopia. Exchange rates allow us to compare GDP across countries using the same units, but we favor a tool that provides even better comparisons of income per capita across countries: purchasing power parity (PPP). Exchange rates convert currencies into the same units but fail to account for the fact that the prices of many goods and services will differ across countries. For example, some things—like phone calls—are cheaper in the United States than in Mexico because better technology is available in the United States and because there is a telecommunications monopoly in Mexico, keeping prices relatively high. But other goods—like guacamole and haircuts—are cheaper in Mexico, often because labor and other inputs are cheaper.

NSOU ? PGSW-V 162 We saw in the previous chapter how to adjust economic variables like GDP to correct for changes in prices over time (which led to the notion of real GDP). We should make a similar adjustment when comparing GDP between countries. But the exchange rate between dollars and pesos doesn't do this. To see why, recall that the exchange rate between the peso and the dollar was 12.9 on January 1, 2010. If instead we had used the exchange rate on January 1, 2009, which was 13.8 pesos per dollar, the average income in Mexico would have been \$8,408 rather than \$9,051. But this fluctuation has little to do with changes in prices households face in Mexico or the United States. Rather, it is just a consequence of converting Mexican income into dollars using the current exchange rate, which fluctuates for a variety of reasons unrelated to differences in the cost of living. Purchasing power parity provides a better way to convert GDP in domestic currencies into common units. The idea here is very similar to the adjustment we developed for converting nominal GDP into real GDP in the previous chapter. Specifically, the purchasing power parity (PPP) constructs the cost of a representative bundle of commodities in each country and adjusts GDP so that a dollar in each country can purchase this representative bundle. The resulting measure is a country's GDP in PPP-adjusted U.S. dollars. For example, this representative bundle cost \$1 in the United States and 8.64 pesos in Mexico in 2010. On this basis, the PPP factor between U.S. dollars and pesos is \$1 for 8.64 pesos or 1 peso for $0.116 = 1/8.64$ U.S. dollars. Using this procedure, income per capita in Mexico in PPP would be : $\text{Mexican income p.c. in PPP } \$ = \text{Mexican income p.c. in pesos} * \$/\text{peso PPP} = 116,036 * 0.116 = \$13,460$ Comparing this result for Mexico with the \$9,051 obtained using the peso/\$ exchange rate, we see that there is often a significant difference between exchange-rate-based measures and PPP-based measures of income per capita, with the gap between the United States economy and poorer economies generally being smaller when we use PPP-based measures. This pattern reflects the lower cost of living in countries with lower income per capita— that is, the fact that exchange-rate-based measures of GDP ignore the fact that many commodities are cheaper in poorer countries.

NSOU ? PGSW-V 163 Inequality in Income per Capita There are still very large disparities across countries when we use PPP-based measures. Exhibit 1 shows a graph of PPP-adjusted income per capita across countries in 2010 (expressed in terms of 2005 constant dollars, where the notion of constant dollars was defined in the previous chapter). Note that there are 19 countries with less than \$1,000 per capita, including the Democratic Republic of Congo, Ethiopia, Liberia, Madagascar, and Togo, and another 23 with incomes of between \$1,000 and \$2,000, including Afghanistan, Haiti, Kenya, Tajikistan, Uganda, and Zambia. These measures contrast sharply with those of the United States (\$41,365), France (\$31,299), and Germany (\$34,089) in the same year. There are wide disparities in income per capita across countries. Nineteen countries had income per capita less than \$1,000 in 2010 (in PPP-adjusted 2005 constant dollars) while only a few countries had income per capita above \$40,000. The large disparities in income per capita across countries are easily visible on this map, which also shows that the poorest countries are concentrated in Africa, parts of Asia, Central America, and the Caribbean. Exhibit 2 complements Exhibit 1 by showing a map of the world with different ranges of income per capita shaded in different colors. Reds, oranges, and yellows correspond to Exhibit 1 : Income per Capita around the World in 2010 (PPP-adjusted 2005 Constant Dollars)

NSOU ? PGSW-V 164 Exhibit 2 : A Map of Income per Capita across the World lower income per capita, and greens correspond to relatively high income per capita. The overall picture is similar to that shown in Exhibit 1, yet we can now more easily identify where the rich and the poor countries are. There are some striking patterns to the differences in incomes. For example, the African continent appears to be uniformly poorer, except for a few spots. Much of South Asia and Latin America is also quite poor. In contrast, North America and Western Europe are relatively prosperous. This map makes it clear that there are indeed major economic disparities throughout the world, and one of our purposes in this chapter is to understand the causes behind them. Equity in the distribution of income One of the characteristics associated with free market economies is an unequal distribution of income. For example, the principal of a school is likely to earn a greater income than a cafeteria worker. Inequality obviously occurs to different extents in different countries. The reasons for difference in income and the consequences of inequality are many and complex. They can form the basis of massive debate among economists, politicians, sociologists, colleagues, parents and children, friends, and even classmates in an economics lesson!

NSOU ? PGSW-V 165 There is one argument that suggests that huge inequalities in income are unfair. People with low incomes will experience relatively low living standards and fewer opportunities than people with high incomes. They may live in a state of absolute poverty, whereby they do not have access to the basic necessities needed to sustain life. Or they may live in relative poverty, whereby their living standards are well below an observed "average" in an economy. There are a number of reasons why incomes may be low and so people live in poverty : ? they may have been born into a household where incomes were low ? they may have received poor, or no, education ? they may have suffered in terms of poor health care and malnutrition ? they may have found it necessary to find work before completing an education The consequences of poverty include : ? low living standards ? lack of access to sufficient health care ? low levels of education The consequences lead to low levels of human capital and that in turn makes it likely that people will continue to be poor, so the situation tends to be cyclical. People are poor and so have low levels of education and health care. Because they have low levels of education and health care, they are unlikely to find work or may only have access to low paid jobs. Because of this they remain poor. These are some of the issues that result in fierce debate. Even if it is perceived that an unequal distribution of income is unfair, economic reasoning will show that higher incomes act as an incentive for people to work harder. If people did not believe that their hard work in school or at work would allow them to raise their human capital and provide them with the opportunity to earn higher incomes, then this would have huge implications for the supply side of an economy, resulting in a lower overall level of economic activity. Purely economic analysis will not lead to an answer as to exactly how much inequality is acceptable or appropriate. This is very much a normative issue. What can be agreed

NSOU ? PGSW-V 166 upon is that fact that market economies do result in inequality of income. In this chapter, we will look at the ways in which governments use their policies on taxation and government spending to affect the distribution of income in an economy. It is important that you understand the difference between equity and equality from the outset. Equity means fairness. Governments attempt to redistribute income to make the distribution more fair. They are not aiming for equality, where everyone would receive the same income, since, as we noted earlier, this would destroy the incentive to work harder for many people. Lorenz curve and Gini index Income inequality in an economy can be measured. The most common representation of inequality comes in the form of a Lorenz curve. This takes data about household income gathered in national surveys and presents them graphically. Consider the following data : Table-1 Country Survey Lowest 2nd 3rd 4th Highest Gini index year 20% 20% 20% 20% 20% (2002-2007)

Country	Year	Lowest 20%	2nd 20%	3rd 20%	4th 20%	Highest 20%	Gini index
Bolvia	2007	2.7	6.5	11.0	18.6	61.2	58.2
Brazil	2007	3.0	6.9	11.8	19.6	58.7	55.0
Croatia	2005	8.8	13.3	17.3	22.7	37.9	29.0
Madagascar	2005	6.2	9.6	13.1	17.7	53.5	47.2

Sources : World Bank & UN Human Development Report 2009 Households are ranked in ascending order of income levels and the share of total income going to groups of households is calculated. For example, if we look at Brazil, we see that the poorest 20% of households receive only 3.0% of total household income while the richest 20% of the households receive 58.7%. This contrasts with Croatia, where the data suggest more equality in distribution, with the poorest 20% receiving 8.8% of total household income, and the richest 20% receiving 37.9%. The information can be graphed using Lorenz curves shown in Figure 1. The x-axis shows the cumulative percentage of the total population divided up in the quintiles shown in Table 1. The y-axis shows the cumulative percentage of total income earned by the quintiles. The line of absolute equality indicates a perfectly equal distribution of income

NSOU ? PGSW-V 167 where, for example, 10% of the population earns 10% of the income, and 90% of the population earns 90% of the income. Each country has its own Lorenz curve based on the income data. The farther away a country's curve is from the line of absolute equality, the more unequal is the distribution of income. In our example, the curve drawn for Brazil is farther away than that of Croatia. We can quickly observe from the diagram that income is less equally distributed in Brazil than it is in Croatia. An indicator that neatly summarizes the information presented in the table and on the Lorenz curve is the Gini index. The Gini index is derived from the Lorenz curve and is a ratio of the area between the line of equality and a country's Lorenz curve (a) to the total area under the line of equality (a) + (b). The higher the Gini index, the more unequal is the distribution of income. Gini index values are given in Table 1. Although a reduction in income inequality may be an important objective of development, one must be very careful in using Gini index numbers as a basis for evaluating a country's development progress. While low-income countries tend to have higher levels of inequality than high-income countries, there is no hard and fast correlation between the level of development of a country measured by its HDI and its Gini index. There are countries with a high level of human development, such as the US (HDI rank 13), that have a relatively Figure 1 : Lorenz curves for Brazil and Croatia

NSOU ? PGSW-V 168 high Gini index (40.8) and countries with a low level of human development, such as Ethiopia (HDI rank 171), with a much lower Gini value (29.8). Moreover, it would not be correct to assume that it is necessary to have more equality in order to raise living standards. Assume that the poorest 20% of the population earns 3.0% of the national income as in Brazil. If the national income rises and the income distribution pattern remains the same, then the poorest will receive a larger amount, even if their share remains the same. They get the same proportion of a larger amount! 8.6 Conclusion The learner got an idea about National income, how it is calculated and also the concept of GDP. The learner also had a detailed idea about the inequalities in distribution of National income in our society. 8.7 Exercise 1. Explain the concept of National Income. 2. Discuss about Nominal GDP & real GDP. 3. How is national income measured. 4. Write a short note on— a) Lorenz curve. the study of groups and group interactions, societies and social interactions, from small and personal groups to very large groups.

They would gain knowledge about some other crucial terms of sociology. 9.1 Introduction

100%

MATCHING BLOCK 125/185

W

A group of people who live in a defined geographic area, who interact with one another, and who share a common culture is what sociologists call a society. Sociologists study all aspects and levels of society. Sociologists working from the micro-level study small groups and individual interactions, while those using macro-level analysis look at trends among and between large groups and societies. For example, a micro-level study

might look at the accepted rules of conversation in various groups such as among teenagers or business professionals. In contrast, a macro-level analysis might research the ways that language use has changed over time or in social media outlets. 9.2

Society

100%**MATCHING BLOCK 128/185****W**

As a functionalist, Émile Durkheim's (1858-1917) perspective on society stressed the necessary interconnectivity of all of its elements. To Durkheim, society was greater than the sum of its parts. He asserted that individual behavior was not the same as collective behavior and that studying collective behavior was quite different from studying an individual's actions. Durkheim called the communal beliefs, morals, and attitudes of a society the collective conscience. In his quest to understand what causes individuals to act in similar and predictable ways, he wrote, "If I do not submit to the conventions of society, if in my dress I do not conform to the customs observed in my country and in my class, the ridicule I provoke, the social isolation in which I am kept, produce, although in an attenuated form, the same effects as punishment" (Durkheim 1895). Durkheim also believed that social integration, or the strength of ties that people have to their social groups, was a key factor in social life.

Base (economy) Superstructure (government, family, religion, education, culture)

94%**MATCHING BLOCK 132/185****W**

Karl Marx (1818-1883) is certainly among the most significant social thinkers in recent history. While there are many critics of his work, it is still widely respected and influential. For Marx, society's constructions were predicated upon the idea of "base and superstructure." NSOU ? PGSW-V 171 This term refers to the idea that a society's economic character forms its base, upon which rests the culture and social institutions, the superstructure. For Marx, it is the base (economy) that determines what a society will be like. -

100%**MATCHING BLOCK 129/185****W**

Additionally, Marx saw conflict in society as the primary means of change. Economically, he saw conflict existing between the owners of the means of production—the bourgeoisie— and the laborers, called the proletariat. Marx maintained that these conflicts appeared consistently throughout history during times of social revolution. These revolutions or "class antagonisms" as he called them, were a result of one class dominating another. Most recently, with the end of feudalism, a new revolutionary class he called the bourgeoisie dominated the proletariat laborers. The bourgeoisie were revolutionary in the sense that they represented a radical change in the structure of society. In Marx's words, "Society as a whole is more and more splitting up into two great hostile camps, into two great classes directly facing each other—Bourgeoisie and Proletariat" (Marx and Engels 1848). In the mid-nineteenth century, as industrialization was booming, industrial employers, the "owners of the means of production" in Marx's terms, became more and more exploitative toward the working class. The large manufacturers of steel were particularly ruthless, and their facilities became popularly dubbed "satanic mills" based on a poem by William Blake. Marx's colleague and friend, Frederick Engels, wrote *The Condition of the Working-Class in England* in 1844, which described in detail the horrid conditions.

100%**MATCHING BLOCK 130/185****W**

Another idea that Marx developed is the concept of false consciousness. False consciousness is a condition in which the beliefs, ideals, or ideology of a person are not in the person's own best interest. In fact, it is the ideology of the dominant class (here, the bourgeoisie capitalists) that is imposed upon the proletariat. Ideas such as the emphasis of competition over cooperation, or of hard work being its own reward, clearly benefit the owners of industry. Therefore, workers are less likely to question their place in society and assume individual responsibility for existing conditions.

98%

MATCHING BLOCK 131/185

W

In order for society to overcome false consciousness, Marx proposed that it be replaced with class consciousness, the awareness of one's rank in society. Instead of existing as a "class in itself," the proletariat must become a "class for itself" in order to produce social change (Marx and Engels 1848), meaning that instead of just being an inert strata of society, the class could become an advocate for social improvements. Only once society entered this state of political consciousness would it be ready for a social revolution. NSOU ? PGSW-V 172 While Karl Marx may be one of the best-known thinkers of the nineteenth century, Max Weber is certainly one of the greatest influences in the field of sociology. Like the other social thinkers discussed here, he was concerned with the important changes taking place in Western society with the advent of industrialization. And, like Marx and Durkheim, he feared that industrialization would have negative effects on individuals. Weber's primary focus on the structure of society lay in the elements of class, status, and power. Similar to Marx, Weber saw class as economically determined. Society, he believed, was split between owners and laborers. Status, on the other hand, was based on noneconomic factors such as education, kinship, and religion. Both status and class determined an individual's power, or influence over ideas. Unlike Marx, Weber believed that these ideas formed the base of society. Weber's analysis of modern society centered on the concept of rationalization. A rational society is one built around logic and efficiency rather than morality or tradition. To Weber, capitalism is entirely rational. Although this leads to efficiency and merit-based success, it can have negative effects when taken to the extreme. In some modern societies, this is seen when rigid routines and strict design lead to a mechanized work environment and a focus on producing identical products in every location. Another example of the extreme conditions of rationality can be found in Charlie Chaplin's classic film *Modern Times* (1936). Chaplin's character performs a routine task to the point where he cannot stop his motions even while away from the job. Indeed, today we even have a recognized medical condition that results from such tasks, known as "repetitive stress syndrome." Weber was also unlike his predecessors in that he was more interested in how individuals experienced societal divisions than in the divisions themselves. The symbolic interactionism theory, the third of the three most recognized theories of sociology, is based on Weber's early ideas that emphasize the viewpoint of the individual and how that individual relates to society. For Weber, the culmination of industrialization, rationalization, and the like results in what he referred to as the iron cage, in which the individual is trapped by institutions and bureaucracy. This leads to a sense of "disenchantment of the world," a phrase Weber used to describe the final condition of humanity. Indeed a dark prediction, but one that has, at least to some degree, been borne out (Gerth and Mills 1918). In a rationalized, modern society, we have supermarkets instead of family-owned NSOU ? PGSW-V 173 stores. We have chain restaurants instead of local eateries. Superstores that offer a multitude of merchandise have replaced independent businesses that focused on one product line, such as hardware, groceries, automotive repair, or clothing. Shopping malls offer retail stores, restaurants, fitness centers, even condominiums. This change may be rational, but is it universally desirable? 9.3

Socialization

100%

MATCHING BLOCK 133/185

W

Socialization is the process through which people are taught to be proficient members of a society. It describes the ways that people come to understand societal norms and expectations, to accept society's beliefs, and to be aware of societal values. Socialization is not the same as socializing (interacting with others, like family, friends, and coworkers); to be precise, it is a sociological process that occurs through socializing.

Socialization is how culture is learned, but socialization is also important for another important reason. To illustrate this importance, let's pretend we find a 6-year-old child who has had almost no human contact since birth. After the child was born, her mother changed her diapers and fed her a minimal diet but otherwise did not interact with her. The child was left alone all day and night for years and never went outside. We now find her at the age of 6. How will her behavior and actions differ from those of the average 6-year-old? Take a moment and write down all the differences you would find. In no particular order, here is the list you probably wrote. First, the child would not be able to speak; at most, she could utter a few grunts and other sounds. Second, the child would be afraid of us and probably cower in a corner. Third, the child would not know how to play games and interact with us. If we gave her some food and utensils, she would eat with her hands and not know how to use the utensils. Fourth, the child would be unable to express a full range of emotions. For example, she might be able to cry but would not know how to laugh. Fifth, the child would be unfamiliar with, and probably afraid of, our culture's material objects, including cell phones and televisions. In these and many other respects, this child would differ dramatically from the average 6-year-old youngster in the United States. She would look human, but she would not act human. In fact, in many ways she would act more like a frightened animal than like a young human being, and she would be less able than a typical dog to follow orders and obey commands.

NSOU ? PGSW-V 174 9.3.1 Role of Socialization ? Socialization prepares people for social life by teaching them a group's shared norms, values, beliefs, and behaviors. ? The role of socialization is to acquaint individuals with the norms of a social group or society. ? Socialization is an important process for children, who are socialized at home and in school. ? Second, socialization teaches individuals how to prepare for and perform certain social roles—occupational roles, gender roles, and the roles of institutions such as marriage and parenthood. ? The term "socialization" refers to a general process, but socialization always takes place in specific contexts. 9.4 Social

Deviance If we want to reduce violent crime and other serious deviance, we must first understand why it occurs. Many sociological theories of deviance exist, and together they offer a more complete understanding of deviance than any one theory offers by itself. Together they help answer the questions posed earlier: why rates of deviance differ within social categories and across locations, why some behaviors are more likely than others to be considered deviant, and why some kinds of people are more likely than others to be considered deviant and to be punished for deviant behavior. As a whole, sociological explanations highlight the importance of the social environment and of social interaction for deviance and the commission of crime.

According to sociologist William Graham Sumner (1840–1910), deviance is a violation of established contextual, cultural, or social norms, whether folkways, mores, or codified law (1906).

The study of social deviance is the study of the violation of cultural norms in either formal or informal contexts. Social deviance is a phenomenon that has existed in all societies. Sociological theories of deviance are those that use social context and social pressures to explain deviance. Let us now examine these theoretical aspects to understand the concept of Deviance from various perspectives NSOU ? PGSW-V 175

Social ecology Certain social and physical characteristics of urban neighborhoods contribute to high crime rates. These characteristics include poverty, dilapidation, population density, and population turnover Strain theory According to Robert Merton, deviance among the poor results from a gap between the cultural emphasis on economic success and the inability to achieve such success through the legitimate means of working. According to Richard Cloward and Lloyd Ohlin, differential access to illegitimate means affects the type of deviance in which individuals experiencing strain engage. Deviant subcultures Poverty and other community conditions give rise to certain subcultures through which adolescents acquire values that promote deviant behavior. Albert Cohen wrote that lack of success in school leads lower-class boys to join gangs whose value system promotes and rewards delinquency. Walter Miller wrote that delinquency stems from focal concerns, a taste for trouble, toughness, cleverness, and excitement. Marvin NSOU ? PGSW-V 176 Wolfgang and Franco Ferracuti argued that a subculture of violence in inner-city areas promotes a violent response to insults and other problems. Social control theory Travis Hirschi wrote that delinquency results from weak bonds to conventional social institutions such as families and schools. These bonds include attachment, commitment, involvement, and belief. Conflict

behavior is learned by interacting with close friends and family members who teach us how to commit various crimes and also about the values, motives, and rationalizations we need to adopt in order to justify breaking the law. Labelling theory Deviance results from being labelled a deviant; non legal factors such as appearance, race, and social class affect how often labelling occurs.

Major Theory Related explanation Summary of explanation

NSOU ? PGSW-V 177 Thus Deviance is behaviour that violates social norms and arouses negative social reactions. Some behaviour is considered so harmful that governments enforce laws to ban such behaviour. There are

100%

MATCHING BLOCK 139/185

W

two key insights of the sociological approach to deviance (which distinguish it from moral and legalistic approaches). Firstly, deviance is defined by its social context. To understand why some acts are deviant and some are not, it is necessary to understand what the context is, what the existing rules are, and how these rules came to be established. If the rules change, what counts as deviant also changes. As rules and norms vary across cultures and time, it makes sense that notions of deviance also change.

100%

MATCHING BLOCK 144/185

W

The second sociological insight is that deviance is not an intrinsic (biological or psychological) attribute of individuals, nor of the acts themselves, but a product of social processes. The norms themselves, or the social contexts that determine which acts are deviant or not, are continually defined and redefined through ongoing social processes — political, legal, cultural, etc. One way in which certain activities or people come to be understood and defined as deviant is through the intervention of moral entrepreneurs. 9.5

Social Control Social control refers to ways in which a society tries to prevent and sanction behavior that violates norms.

100%

MATCHING BLOCK 145/185

W

All societies practise social control, the regulation and enforcement of norms. Social control can be defined broadly as an organized action intended to change people's behaviour (Innes, 2003). The underlying goal of social control is to maintain social order, an arrangement of practices and behaviours on which society's members base their daily lives. Think of social order as an employee handbook, and social control as the incentives and disincentives used to encourage or oblige employees to follow those rules. When a worker violates a

the norms of their

97%

MATCHING BLOCK 140/185

W

workplace, then the manager steps in to enforce the rules. One means of enforcing rules are through sanctions. Sanctions can be positive as well as negative. Positive sanctions are rewards given for conforming to norms. A promotion at work is a positive sanction for working hard. Negative sanctions are punishments for violating norms. Being arrested is a punishment for shoplifting. Both types of sanctions play a role in social control.

Not

all forms of social control are adequately understood through the use of sanctions, however. Donald Black (b. 1941) identified four key styles of social control, each of which defines deviance and the appropriate response to it in a different manner (1976).

NSOU ? PGSW-V 178 Penal social control functions by prohibiting certain social behaviours and responding to violations with punishment. Compensatory social control obliges an offender to pay a victim to compensate for a harm committed. Therapeutic social control involves the use of therapy to return individuals to a normal state. Conciliatory social control aims to reconcile the parties of a dispute and mutually restore harmony to a social relationship that has been damaged. While penal and compensatory social controls emphasize the use of sanctions, therapeutic and conciliatory social controls emphasize processes of restoration

MATCHING BLOCK 141/185

W

and healing. Michel Foucault (1926-1984) notes that from a period of early modernity onward, European society became increasingly concerned with social control as a practice of government (Foucault, 2007). In this sense of the term, government does not simply refer to the activities of the state, but to all the practices by which individuals or organizations seek to govern the behaviour of others or themselves. Government refers to the strategies by which one seeks to direct or guide the conduct of another or others. In the 15th and 16th centuries, numerous treatises were written on how to govern and educate children, how to govern the poor and beggars, how to govern a family or an estate, how to govern an army or a city, how to govern a state and run an economy, and how to govern one's own conscience and conduct. These treatises described the burgeoning arts of government, which defined the different ways in which the conduct of individuals or groups might be directed

or controlled. Foucault describes these forms of government as disciplinary social control.

100%**MATCHING BLOCK 142/185****W**

Recent types of social control have adopted a model of risk management in a variety of areas of problematic behaviour. Risk management refers to interventions designed to reduce the likelihood of undesirable events occurring based on an assessment of probabilities of risk. Unlike the crime and punishment model of penal social sanctions, or the rehabilitation, training, or therapeutic models of disciplinary social control, risk management strategies do not seize hold of individual deviants but attempt to restructure the environment or context of problematic behaviour in order to minimize the risks to the general population..

NSOU ? PGSW-V 179 Finally,

100%**MATCHING BLOCK 143/185****W**

Travis Hirschi's (b. 1935) control theory. According to Hirschi, social control is directly affected by the strength of social bonds (1969). Many people would be willing to break laws or act in deviant ways to reap the rewards of pleasure, excitement, and profit, etc. if they had the opportunity. Those who do have the opportunity are those who are only weakly controlled by social restrictions. Similar to Durkheim's theory of anomie, deviance is seen to result where feelings of disconnection from society predominate. Individuals who believe they are a part of society are less likely to commit crimes against it. Hirschi identified four types of social bonds that connect people to society (1969) : 1. Attachment measures our connections to others. When we are closely attached to people, we worry about their opinions of us. People conform to society's norms in order to gain approval (and prevent disapproval) from family, friends, and romantic partners. 2. Commitment refers to the investments we make in conforming to conventional behaviour. A well-respected local businesswoman who volunteers at her synagogue and is a member of the neighbourhood block organization has more to lose from committing a crime than a woman who does not have a career or ties to the community. There is a cost/benefit calculation in the decision to commit a crime in which the costs of being caught are much higher for some than others. 3. Similarly, levels of involvement, or participation in socially legitimate activities, lessen a person's likelihood of deviance. Children who are members of Little League baseball teams have fewer family crises. 4. The final bond, belief, is an agreement on common values in society. If a person views social values as beliefs, he or she will conform to them. An environmentalist is more likely to pick up trash in a park because a clean environment is a social value to that person. 9.6

Social Institution

97%**MATCHING BLOCK 146/185****W**

An institution is any structure or mechanism of social order and cooperation governing the behavior of a set of individuals within a given community. Institutions are identified with a social purpose and permanence, transcending individual lives and intention by enforcing rules that govern cooperative behaviour. While institutions are obviously comprised of

NSOU ? PGSW-V 180

99%**MATCHING BLOCK 151/185****W**

individuals and create rules through these individuals' agentic actions, institutions act as forces of socialization, meaning that they teach individuals to conform to their norms. Institutions can be either formal or informal. Formal institutions are those that are created with the intention of governing human behaviour. Examples include the United States Congress, an institution that is designed to create the laws of the United States. However, formal institutions do not have to have the force of the law at their disposal. Another example is the Roman Catholic Church. While violating the tenets of the Catholic Church is not in violation of law, the Church expects its members to adhere to its religious codes. Informal institutions are those that are not designed to regulate conduct, but often end up doing so as members seek to conform to communal standards. Institutions can also be abstract, such as the institution of marriage. This means that marriage has become a social expectation, with informal rules for how married people are expected to behave.

100%**MATCHING BLOCK 147/185****W**

While institutions tend to appear to people in society as part of the natural, unchanging landscape of their lives, sociological studies of institutions reveal institutions a social constructs, meaning that they are created by individuals and particular historical and cultural moment. Sociology traditionally analyzes social institutions in terms of interlocking social roles and expectations. Social institutions are created by and defined by their own creation of social roles for their members. The social function of the institution is the fulfillment of the assigned roles. Institutionalization refers to the process of embedding something, such as a concept, a social role, a value, or a logic within an organization, social system, or society as a whole. The process of institutionalization elucidates how values norms, and institutions are so closely intertwined.

Essentially, any disruptive shift in the status quo, be it intentional or random, human-caused or natural, can lead to social change. In this unit we will learn in detail about Social change.

NSOU ? PGSW-V 183 10.1 Introduction

83%

MATCHING BLOCK 152/185

W

Social change, refers to the transformation of culture, behaviour, social institutions, and social structure over time. As we know the basic types of society: hunting-and- gathering, horticultural and pastoral, agricultural, industrial, and post-industrial. In looking at all of these societies, we have seen how they differ in such dimensions as size, technology, economy, inequality, and gender roles. In short, we have seen some of the ways in which societies

have transformed itself over a period of

95%

MATCHING BLOCK 157/185

W

time. Another way of saying this is that we have seen some of the ways in which societies change as they became more modern. To understand social change, then, we need to begin to understand

the various factors of social change : 10.2 Factors of Social Change Changes to technology, social institutions, population, and the environment, alone or in some combination, create change. Below, we will discuss how these act as agents of social change, and we'll examine real-world examples. We will focus on four agents of change that social scientists recognize : technology, social institutions, population, and the environment. 10.2.1 Social Institutions Each change in a single social institution leads to changes in all social institutions. For example, the industrialization of society meant that there was no longer a need for large families to produce enough manual labor to run a farm. Further, new job opportunities were in close proximity to urban centers where living space was at a premium. The result is that the average family size shrunk significantly. This same shift toward industrial corporate entities also changed the way we view government involvement in the private sector, created the global economy, provided new political platforms, and even spurred new religions and new forms of religious worship like Scientology. It has also informed the way we educate our children: originally schools were set up to accommodate an agricultural calendar so children could be home to work the fields in the summer, and even today, teaching models are largely based on preparing students for industrial jobs, despite that being an outdated need. A shift in one area, such as industrialization, means an interconnected impact across social institutions.

NSOU ? PGSW-V 184 10.2.2 Population Population composition is changing at every level of society. Births increase in one nation and decrease in another. Some families delay childbirth while others start bringing children into their folds early. Population changes can be due to random external forces, like an epidemic, or shifts in other social institutions, as described above. But regardless of why and how it happens, population trends have a tremendous interrelated impact on all other aspects of society. In the United States, we are experiencing an increase in our senior population as baby boomers begin to retire, which will in turn change the way many of our social institutions are organized. For example, there is an increased demand for housing in warmer climates, a massive shift in the need for elder care and assisted living facilities, and growing awareness of elder abuse. There is concern about labor shortages as boomers retire, not to mention the knowledge gap as the most senior and accomplished leaders in different sectors start to leave. Further, as this large generation leaves the workforce, the loss of tax income and pressure on pension and retirement plans means that the financial stability of the country is threatened. Globally, often the countries with the highest fertility rates are least able to absorb and attend to the needs of a growing population. Family planning is a large step in ensuring that families are not burdened with more children than they can care for. On a macro level, the increased population, particularly in the poorest parts of the globe, also leads to increased stress on the planet's resources. 10.2.3 Technology Some would say that improving technology has made our lives easier. Imagine what your day would be like without the Internet, the automobile, or electricity. In *The World Is Flat*, Thomas Friedman (2005) argues that technology is a driving force behind globalization, while the other forces of social change (social institutions, population, environment) play comparatively minor roles. He suggests that we can view globalization as occurring in three distinct periods. First, globalization was driven by military expansion, powered by horsepower and wind power. The countries best able to take advantage of these power sources expanded the most, and exert control over the politics of the globe from the late fifteenth century to around the year 1800. The second shorter period from approximately 1800 C.E. to 2000 C.E. consisted of a globalizing economy. Steam and rail NSOU ? PGSW-V 185 power were the guiding forces of social change and globalization in this period. Finally, Friedman brings us to the post-millennial era. In this period of globalization, change is driven by technology, particularly the Internet (Friedman 2005). 10.2.4 Modernization Modernization describes the processes that increase the amount of specialization and differentiation of structure in societies resulting in the move from an undeveloped society to developed, technologically driven society (Irwin 1975). By this definition, the level of modernity within a society is judged by the sophistication of its technology, particularly as it relates to infrastructure, industry, and the like. However, it is important to note the inherent ethnocentric bias of such assessment. Why do we assume that those living in semi- peripheral and peripheral nations would find it so wonderful to become more like the core nations? Is modernization always positive? One contradiction of all kinds of technology is that they often promise time-saving benefits, but somehow fail to deliver. How many times have you ground your teeth in frustration at an Internet site that refused to load or at a dropped call on your cell phone? Despite time-saving devices such as dishwashers, washing machines, and, now, remote control vacuum cleaners, the average amount of time spent on housework is the same today as it was fifty years ago. And the dubious benefits of 24/7 e-mail and immediate information have simply increased the amount of time employees are expected to be responsive and available. While once businesses had to travel at the speed of the U.S. postal system, sending something off and waiting until it was received before the next stage, today the immediacy of information transfer means there are no such breaks.

100%

MATCHING BLOCK 153/185

The terms modern and modernization have positive connotations; it sounds good to modernize and to be modern. Modernization implies that progress has been made and is continuing to be made, and who would not want progress? Yet modernization also has a downside, as we will see in this section and in the later discussion of the environment. A related problem with the terms and concepts of modern and modernization is that many people think of Western nations when considering the most modern nations in the world today. This implies that Western society is the ideal to which other societies should aspire. While there are many good things about Western societies, it is important to avoid the ethnocentrism of assuming that Western societies are better because they are more modern. In fact, one reason that many people in the Middle East and elsewhere dislike the

NSOU ? PGSW-V 186

100%**MATCHING BLOCK 154/185****W**

United States is that they resent the “Westernization” of their societies from the influence of the United States and other wealthy Western nations. When they see Coca-Cola and Pepsi logos and the McDonald’s golden arches in their nations, they fear Western influence and the loss of their own beliefs and traditions. These caveats notwithstanding, societies have become much more modern over time, to put it mildly. We thus cannot fully understand society and social life without appreciating how societies have changed as they have become more modern. Not surprisingly, sociologists have recognized the importance of modernization ever since the discipline of sociology began in the 19th century, and much of the work of sociology’s founders—Émile Durkheim, Max Weber, Karl Marx, and others—focused on how and why societies have changed as they became more modern. We can draw on their efforts and related work by later sociologists and by anthropologists to develop an idea of the differences modernization has made for societies and individuals. Several dimensions and effects of modernization seem apparent (Nolan & Lenski, 2009). First, as societies evolve, they become much larger and more heterogeneous. This means that people are more different from each other than when societies were much smaller, and it also means that they ordinarily cannot know each other nearly as well. Larger, more modern societies thus typically have weaker social bonds and a weaker sense of community than small societies and place more of an emphasis on the needs of the individual.

98%**MATCHING BLOCK 155/185****W**

We can begin to appreciate the differences between smaller and larger societies when we contrast a small college of 1,200 students with a large university of 40,000 students. Perhaps you had this contrast in mind when you were applying to college and had a preference for either a small or a large institution. In a small college, classes might average no more than 20 students; these students get to know each other well and often have a lot of interaction with the professor. In a large university, classes might hold 600 students or more, and everything is more impersonal. Large universities do have many advantages, but they probably do not have as strong a sense of community as is found at small colleges. A second aspect of modernization is a loss of traditional ways of thinking. This allows a society to be more creative and to abandon old ways that may no longer be appropriate. However, it also means a weakening or even ending of the traditions that helped define the society and gave it a sense of identity. NSOU ? PGSW-V 187 A third aspect of modernization is the growth of individual freedom and autonomy. As societies grow, become more impersonal, and lose their traditions and sense of community, their norms become weaker, and individuals thus become freer to think for themselves and to behave in new ways. Although most of us would applaud this growth in individual freedom, it also means, as Émile Durkheim (1895/1962) recognized long ago, that people feel freer to deviate from society’s norms and thus to commit deviance. If we want a society that values individual freedom, Durkheim said, we automatically must have a society with deviance. Is modernization good or bad? This is a simplistic question about a very complex concept, but a quick answer is that it is both good and bad. We see evidence for both responses in the views of sociologists Ferdinand Tönnies, Weber, and Durkheim. Tönnies said that modernization meant a shift from *Gemeinschaft* (small societies with strong social bonds) to *Gesellschaft* (large societies with weaker social bonds and more impersonal social relations). Tönnies lamented the loss of close social bonds and of a strong sense of community resulting from modernization, and he feared that a sense of rootlessness begins to replace the feeling of stability and steadiness characteristic of small, older societies. Weber was also concerned about modernization. The hallmarks of modernization, he thought, are rationalization, a loss of tradition, and the rise of impersonal bureaucracy. He despaired over the impersonal quality of rational thinking and bureaucratization, as he thought it was a dehumanizing influence. Durkheim took a less negative view of modernization. He certainly appreciated the social bonds and community feeling, which he called mechanical solidarity, characteristic of small, traditional societies. However, he also thought that these societies stifled individual freedom and that social solidarity still exists in modern societies. This solidarity, which he termed organic solidarity, stems from the division of labor, in which everyone has to depend on everyone else to perform their jobs. This interdependence of roles, Durkheim said, creates a solidarity that retains much of the bonding and sense of community found in premodern societies. We have already commented on important benefits of modernization that are generally recognized: modernization promotes creativity and individual freedom and autonomy. These developments in turn usually mean that a society becomes more tolerant of beliefs and behaviors that it formerly would have disapproved and even condemned. Modern

NSOU ? PGSW-V 188

100%**MATCHING BLOCK 156/185****W**

societies, then, generally feature more tolerance than older societies. Many people, undoubtedly including most sociologists, regard greater tolerance as a good thing, but others regard it as a bad thing because they favor traditional beliefs and behaviors. Beyond these abstract concepts of social bonding, sense of community, and tolerance, modern societies are certainly a force for both good and bad in other ways. They have produced scientific discoveries that have saved lives, extended life spans, and made human existence much easier than imaginable in the distant past and even in the recent past. But they have also polluted the environment, engaged in wars that have killed tens of millions, and built up nuclear arsenals that, even with the end of the Cold War, still threaten the planet. Modernization, then, is a double-edged sword. It has given us benefits too numerous to count, but it also has made human existence very precarious.

Further, the Internet brought us information, but at a cost. The morass of information means that there is as much poor information available as trustworthy sources. There is a delicate line to walk when core nations seek to bring the assumed benefits of modernization to more traditional cultures. For one, there are obvious procapitalist biases that go into such attempts, and it is short-sighted for western governments and social scientists to assume all other countries aspire to follow in their footsteps. Additionally, there can be a kind of neo-liberal defense of rural cultures, ignoring the often crushing poverty and diseases that exist in peripheral nations and focusing only on a nostalgic mythology of the happy peasant. It takes a very careful hand to understand both the need for cultural identity and preservation as well as 10.2.5 Urbanization An important aspect of social change and population growth over the centuries has been urbanization, or the rise and growth of cities. Urbanization has had important consequences for many aspects of social, political, and economic life (Macdonis & Parrillo, 2010). Macdonis, J. J., & Parrillo, V. N. (2010). *Cities and urban life* (5th ed.). Upper Saddle River, NJ: Prentice Hall. The earliest cities developed in ancient times after the rise of horticultural and pastoral societies made it possible for people to stay in one place instead of having to move around to find food. Because ancient cities had no sanitation facilities, people typically left their garbage and human waste in the city streets or just outside the city wall (which most cities had for protection from possible enemies); this poor sanitation led to rampant disease and

NSOU ? PGSW-V 189 high death rates. Some cities eventually developed better sanitation procedures, including, in Rome, a sewer system (Smith, 2003). Smith, M. L. (Ed.). (2003). *The social construction of ancient cities*. Washington, DC: Smithsonian Institution Press. Cities became more numerous and much larger during industrialization, as people moved to be near factories and other sites of industrial production. First in Europe and then in the United States, people crowded together as never before into living conditions that were often decrepit. Lack of sanitation continued to cause rampant disease, and death rates from cholera, typhoid, and other illnesses were high. In addition, crime rates soared, and mob violence became quite common (Feldberg, 1998). Feldberg, M. (1998). Urbanization as a cause of violence: Philadelphia as a test case. In A. F. Davis & M. H. Haller (Eds.), *The peoples of Philadelphia: A history of ethnic groups and lower-class life, 1790–1940* (pp. 53–69). Philadelphia: University of Pennsylvania Press. Views of the City Are cities good or bad? We asked a similar question—is modernization good or bad?—earlier in this chapter, and the answer here is similar as well: cities are both good and bad. They are sites of innovation, high culture, population diversity, and excitement, but they are also sites of high crime, impersonality, and other problems. In the early 20th century, a group of social scientists at the University of Chicago established a research agenda on cities that is still influential today (Bulmer, 1984). Bulmer, M. (1984). *The Chicago school of sociology: Institutionalization, diversity, and the rise of sociological research*. Chicago, IL: University of Chicago Press. Most notably, they began to study the effects of urbanization on various aspects of city residents' lives in what came to be called the human ecology school (Park, Burgess, & McKenzie, 1925). Park, R. E., Burgess, E. W., & McKenzie, R. (1925). *The city*. Chicago, IL: University of Chicago Press. One of their innovations was to divide Chicago into geographical regions, or zones, and to analyze crime rates and other behavioral differences among the zones. They found that crime rates were higher in the inner zone, or central part of the city, where housing was crowded and poverty was common, and were lower in the outer zones, or the outer edges of the city, where houses were spread farther apart and poverty was much lower. Because they found these crime rate differences over time even as the ethnic backgrounds of people in these zones changed, they assumed that the social and physical features of the neighborhoods were affecting their crime rates (Shaw & McKay, 1942). Shaw, C. R., & McKay, H. D. (1942). *Juvenile delinquency and urban areas*. Chicago, IL : University of Chicago Press. Their work is still useful today, as it helps us realize that the social environment, broadly defined, can affect our attitudes and behavior. This theme, of course, lies at the heart of the sociological perspective. Urbanism and Tolerance One of the most notable Chicago sociologists was Louis Wirth (1897-1952), who, in a well-known essay entitled "Urbanism as a Way of Life" (Wirth, 1938), Wirth, L. (1938). *Urbanism as a way of life*. *American Journal of Sociology*, 44, 3-24. discussed several differences between urban and rural life. In one such difference, he said that urban residents are more tolerant than rural residents of nontraditional attitudes, behaviors, and lifestyles, in part because they are much more exposed than rural residents to these nontraditional ways. Supporting Wirth's hypothesis, contemporary research finds that urban residents indeed hold more tolerant views on several kinds of issues (Moore & Ovadia, 2006). Moore, L. M., & Ovadia, S. (2006). *Types of Urban Residents* The quality of city life depends on many factors, but one of the most important factors is a person's social background: social class, race and ethnicity, gender, age, and sexual orientation. As earlier chapters documented, these dimensions of our social backgrounds often yield many kinds of social inequalities, and the quality of life that city residents enjoy depends heavily on these dimensions. For example, residents who are white and wealthy have the money and access to enjoy the best that cities have to offer, while those who are poor and of color typically experience the worst aspects of city life. Because of fear of rape and sexual assault, women often feel more constrained than men from traveling freely throughout a city and being out late at night; older people also often feel more constrained because of physical limitations and fear of muggings; and gays and lesbians are still subject to physical assaults stemming from homophobia. The type of resident we are, then, in terms of our sociodemographic profile affects what we experience in the city and whether that experience is positive or negative. This brief profile of city residents obscures other kinds of differences among residents regarding their lifestyles and experiences. A classic typology of urban dwellers by sociologist Herbert Gans (1962) Gans, H. J. (1962). *The urban villagers: Group and class in the life of Italian-Americans*. New York, NY: Free Press. is still useful today in helping to understand the variety of lives found in cities. Gans identified five types of city residents.

NSOU ? PGSW-V 191 The first type is cosmopolites. These are people who live in a city because of its cultural attractions, restaurants, and other features of the best that a city has to offer. Cosmopolites include students, writers, musicians, and intellectuals. Unmarried and childless individuals and couples are the second type; they live in a city to be near their jobs and to enjoy the various kinds of entertainment found in most cities. If and when they marry or have children, respectively, many migrate to the suburbs to raise their families. The third type is ethnic villagers, who are recent immigrants and members of various ethnic groups who live among each other in certain neighborhoods. These neighborhoods tend to have strong social bonds and more generally a strong sense of community. Gans wrote that all of these three types generally find the city inviting rather than alienating and have positive experiences far more often than negative ones. In contrast, two final types of residents find the city alienating and experience a low quality of life. The first of these two types, and the fourth overall, is the deprived. These are people with low levels of formal education who live in poverty or near-poverty and are unemployed, are underemployed, or work at low wages. They live in neighborhoods filled with trash, broken windows, and other signs of disorder. They commit high rates of crime and also have high rates of victimization by crime. The final type is the trapped. These are residents who, as their name implies, might wish to leave their neighborhoods but are unable to do so for several reasons: they may be alcoholics or drug addicts, they may be elderly and disabled, or they may be jobless and cannot afford to move to a better area. Problems of City Life By definition, cities consist of very large numbers of people living in a relatively small amount of space. Some of these people have a good deal of money, but many people, and in some cities most people, have very little money. Cities must provide many kinds of services for all their residents, and certain additional services for their poorer residents. These basic facts of city life make for common sets of problems affecting cities throughout the nation, albeit to varying degrees, with some cities less able than others to address these problems. One evident problem is fiscal : cities typically have serious difficulties in paying for basic services such as policing, public education, trash removal, street maintenance, and, in cold climates, snow removal, and in providing certain services for their residents who are poor or disabled or who have other conditions. The fiscal difficulties that cities routinely

NSOU ? PGSW-V 192 face became even more serious with the onset of the nation's deep recession in 2009, as the term fiscal crisis became a more accurate description of the harsh financial realities that cities were now facing (McNichol, 2009). McNichol, D. A. (2009, May 1). Revenue loss putting cities in fiscal vise. *The New York Times*, p. NJ1. Another problem is crowding. Cities are crowded in at least two ways. The first involves residential crowding: large numbers of people living in a small amount of space. City streets are filled with apartment buildings, condominiums, row houses, and other types of housing, and many people live on any one city block. The second type of crowding is household crowding: dwelling units in cities are typically small because of lack of space, and much smaller than houses in suburbs or rural areas. This forces many people to live in close quarters within a particular dwelling unit. Either type of crowding is associated with higher levels of stress, depression, and aggression (Regoeczi, 2008). Regoeczi, W. C. (2008). Crowding in context: An examination of the differential responses of men and women to high-density living environments. *Journal of Health and Social Behavior*, 49, 254-268. A third problem involves housing. Here there are two related issues. Much urban housing is substandard and characterized by such problems as broken windows, malfunctioning heating systems, peeling paint, and insect infestation. At the same time, adequate housing is not affordable for many city residents, as housing prices in cities can be very high, and the residents' incomes are typically very low. Cities thus have a great need for adequate, affordable housing. A fourth problem is traffic. Gridlock occurs in urban areas, not rural ones, because of the sheer volume of traffic and the sheer number of intersections controlled by traffic lights or stop signs. Some cities have better public transportation than others, but traffic and commuting are problems that urban residents experience every day (see the "Learning From Other Societies" box). Urbanization varies around the world. In general, wealthy nations are more urban than poor nations. In 1950, less than one-third of the world's population lived in cities or towns; in 2008, more than half the population lived in cities or towns, representing the first time in history that a majority of people were not living in rural areas (United Nations Population Fund, 2007). United Nations Population Fund. (2007). By 2030, almost two-thirds of the world's population is projected to live in urban areas.

NSOU ? PGSW-V 193 The number of urban residents will increase rapidly in the years ahead, especially in Africa and Asia as people in these continents' nations move to urban areas and as their populations continue to grow through natural fertility. Fertility is a special problem in this regard for two reasons. First, and as we saw earlier, women in poor nations have higher fertility rates for several reasons. Second, poorer nations have very high proportions of young people, and these high rates mean that many births occur because of the large number of women in their childbearing years. This trend poses both opportunities and challenges for poorer nations. The opportunities are many. Jobs are more plentiful in cities than in rural areas and incomes are higher, and services such as health care and schooling are easier to deliver because people are living more closely together. In another advantage, women in poorer nations generally fare better in cities than in rural areas in terms of education and employment possibilities (United Nations Population Fund, 2007). But there are also many challenges. In the major cities of poor nations, homeless children live in the streets as beggars, and many people lack necessities and conveniences that urban dwellers in industrial nations take for granted. As the United Nations Population Fund (2007) warns, "One billion people live in urban slums, which are typically overcrowded, polluted and dangerous, and lack basic services such as clean water and sanitation." The rapid urbanization of poor nations will compound the many problems these nations already have, just as the rapid urbanization in the industrial world more than a century ago led to the disease and other problems discussed earlier. As cities grow rapidly in poor nations, moreover, these nations' poverty makes them ill equipped to meet the challenges of urbanization. Helping these nations meet the needs of their cities remains a major challenge for the world community in the years ahead. In this regard, the United Nations Population Fund (United Nations Population Fund, 2007) Addressing the housing needs of the poor will be critical. A roof and an address in a habitable area are the first step to a better life. Improving access to basic social and health services, including reproductive health care, for poor people in urban slums is also critical to breaking the cycle of poverty in urban areas. 10.2.6 Globalization Globalization is defined by defined by different people in different ways. It is a Complex phenomenon. This process refers to mutual interdependence of the countries of

NSOU ? PGSW-V 194 the world, particularly their economic interdependence and freedom to integrate with one another through trade, investments, and capital flows, Globalization has economic, social, political, cultural and several other dimensions and has made tremendous impact across cultures. The process of continuing integration of the countries in the world is strongly underway in all parts of the globe. Supported by accelerating pace of the technological change, by price and trade liberalization, and growing importance of supernational rules, globalisation has exposed national economics to much more intense competition than ever before. Globalisation mainly aims at integrating the domestic economy with the world economy. Cerny defines- "Globalisation is defined here as a set of economic and political structures and processes deriving from the changing character of goods and assets that comprise the base of the international political economy - in particular, the increasing structural differentiation of those goods and assets." Jan Aart Scholte :states "Globalisation stands out for quite a large public spread across the world as one of the defining terms of late twentieth century social consciousness." To conclude we can say is that globalisation would mean being able to manufacture in the most cost effective way anywhere 'in the world. It means the ability to procure raw materials, labour and resources from the cheapest source anywhere in the world b increasing economic integration between countries in the world. Need of Globalisation In a fast changing human society and development of technologies and wide awareness through quantum of knowledge, it is not say easy to leave very simple and happy life. There are certain factor which have made us to think globally in today's competitive society. Following are the factors which need our alternation with regard to global perspective in our thinking.- 1. Development in modes of transportation and communication and easy interaction within and without. 2. Development of science and technology and building new physical infrastructures for better production. 3. With the explosion of population, new resources need to be explored to meet the requires of such a large population. Hence hunting for new sources and modes of development affect the nature of developmental activities.

NSOU ? PGSW-V 195 4. Unemployment especially in third world countries in responsible for brain drain. Professionally qualified people go to other countries for their suitable placement and progress. 5. International trade and marketing in the field of industry, agriculture, technology, textile, minerals, defense, etc. is getting new boom which creates global perspectives. 6. Political alignments and aliveness among the countries make strides to new relationships and adjustments. 7. Security and integrity of a country is an important factor responsible for globalisation and international understanding. 8. Environmental related issues and problems compel nations to get together and to take decisions at international level. 9. Role of mass media and information technology have brought people, n ion and countries together and a sense of togetherness has emerged. Globalization and Social Change in India Globalization has given nations greater access to global markets, technology, financial resources and quality services and skilled human resources. 2. Improvement in and greater access to quality goods and services and an exponential increase in the volume of trade. 3. Access to global capital resources via the stock market and international debt depending on the economic potential of nations and their markets. 4. Access to technologies depending on the nations responsiveness to respect to protection of IPR and the responsible usage of technologies. 5. Access to the world markets to the skilled human resources from nations with inherent intellectual and technical capabilities (the outsourcing of IT, Pharma, BPO and KPO work). 6. Increase in exports of goods and services in which nations have their respective competencies. 7. Increased access to better and qualitative education. 8. Increased the purchasing capability of the nation through the creation of a sizeable middle class which is hungry for quality goods and services while there coexists a large poor class whose time is yet to come. One would expect that the fruits

NSOU ? PGSW-V 196 of liberalization and globalization would have a trickle down effect through the collection of taxes and revenues by Government due to increased trade and commerce 10.3 Nature of Social change in India 10.3.1 Indian Culture The culture of any country does not only portray the region and language of the region, but it starts with the mindset and mentality of the residing citizens. Indian culture is quite rich with respect to its heritage and resources, and more importantly due to the welcoming approach of its citizens. India is bouquet of flowers varying religion, dialect, edibles, tradition, custom, music, art and architecture etc, bundled into a single unit of patriotism and unity. The common factor within all these diversities is the Indian mindset of welcoming, greeting, celebrating in a united way with immense affection and togetherness. This is the rich essence of the Indian culture that has attracted many foreigners to stay back in India and mingle into its eternal fragrance. When we analyse this rich culture with the globalization point of view, we can find many punch holes of westernization and mixing of other traits and cultures into our beautifully woven blanket. Let us closely analyse the impacts of globalization on Indian culture. 10.3.2 Family Structure Indian used to have a joint culture. However in today's life, joint families have become a strange surprise to the Indians especially to those residing in the metropolitan cities in the small flat culture with the nuclear families blooming up like mushrooms in the rain. We have lost the patience to get adjusted into the joint family, imbibing the values of the elders and getting the young ones brought up under the shadow of their grandparents. Children have started treating grandparents like guests or visitors, and such an upbringing is one of the main reasons of increasing old age homes, as those children consider their own parents as burden in their state of adulthood. 10.3.3 Marrital Values Gradually in Indian societies, marriages are also losing their values. It is very much evident from the increasing number of divorce cases and the extra-marital affairs reported

NSOU ? PGSW-V 197 every now and then. Marriage used to be considered as bonding of the souls which will be linked even after the death; but today marriage is like a professional bond or a so-called commitment to share life without compromising their self-interests. The ego factor into the Indian youth is again a product of globalization. 10.3.4 Adultery With the emergence of globalization and western culture, people are freely intermingling with each other. The friendly approach and the socializing feature is worth appreciable. But the total breakout of restrictions have adulterated the Indian mindset, playing up with the physical relationship even outside the wedlock. This has given birth to new relationships in India like live-in relationships. Also the increased cases of rape and sexual abuse cases are a result of the perverted mind which again the imported values very much alien to our mother culture. 10.3.5 Social Values We have the incorporated values of treating the guests as God, warm-hearted welcoming, greeting elders with due respect and a celebrating every small festival with great colour of enjoyment and togetherness. Such a wide gathering with full hue and light can hardly be seen today. People have highly restricted themselves in social interaction. The interaction in present generation is highly diplomatic considering the financial status and wealth. We have lost our social values and cheerful blessing of togetherness. The present generation are more happy celebrating Christmas, Valentine's day along with Holi, Id and Diwali. 10.3.6 Food, Clothing and Dialect Indian food, clothing and languages are varied with respect to different states. The food varies in its taste, but every food has its own nutrient value and every region is specified and rich in its medicinal preparations with the home remedies. Now-days people are more interested to have continental, Chinese and Italian food. Even the clothing varies in different states which is very much particular in maintaining the dignity of woman. The varies cuisines from all over the world though have different flavours to add, still the food ingredients that have inflicted with much popularity are the junk food items which has increased the health disorders in the country. Again the dressing like the suitings for the males are an inappropriate match for the Indian type of climate. The female dresses are

NSOU ? PGSW-V 198 again a way of distraction to the perverted minds. Even the Indians are not very much in favour of promoting their mother tongue or our national language. Instead the youth today consider it to be a shameful condition to speak in their national language Hindi. The way the foreign languages are getting prevalent in India like the French, German and Spanish, right from the school level, is the example of how much we provide importance to Indian languages in comparison to the foreign ones. 10.3.7 Employment and the Agricultural Sector India was predominantly an agricultural based country. With the advanced globalization and cropping up of MNCs, the farming has lost its prime value in India. Agricultural science has the least focus amongst the youngsters who consider farming as a shameful profession and look down upon the same. Employment through MNCs has lucrative deals attracting the bulk of manpower who are working for the other countries as their customer care representatives. We are losing our health and our status and slowly getting to the age of economic slavery due to these MNCs. This is what the globalization has provided Indians through their emergence. 10.4 Conclusion Social change, is inevitable, as society is not static it is dynamic. It changes according to time & situation. In this unit we learnt about those factors which lead to social change with special emphasis on Indian society. 1.5 Exercise 1. Explain the term social change. As a student of social work why is it important for us to know about social change. 2. What do you mean by the term Modernization. Explain, Gemeinschaft & Gessellschaft. 3. What are the basic problems of city life. 4. Discuss the nature of social change in India. 5. Explain briefly the factors responsible for social change.

NSOU ? PGSW-V 199 10.6 Reference <https://www.journalijcar.org/issues/globalization-and-social-change-india> <https://courses.lumenlearning.com/sociology/chapter/social-change/> <https://open.lib.umn.edu/sociology/chapter/20-1-understanding-social-change/>

NSOU ? PGSW-V 200 Unit 11 ? Existing major social issues: Illiteracy, Migration, Drug Abuse, HIV/AIDS, Terrorism, Gender Justice Structure 11.0 Objective 11.1 Introduction 11.2 Illiteracy 11.3 Migration 11.4 Drug Abuse 11.5 HIV/AIDS 11.6 Terrorism 11.6.1 Types of Terrorism 11.7 Gender Justice 11.8 Conclusion 11.9 Exercise 11.10 Reference 11.0 Objective In this unit we will get a glimpse about the various social problems existing in our society. 11.1 Introduction Our world in facing several problem there days. There are many challenging situations which needs to be addressed with great professionalism. An social worker we must be well equipped to face there problems and find the root cause and combat such problems with competency. Let us now discuss some of these problem and know the possible remedies. 11.2 Illiteracy

NSOU ? PGSW-V 201 The ability to read and write, or the ability to use language to read, write, listen, and speak is marked as a sign of literacy. UNESCO, says, "

100%

MATCHING BLOCK 158/185

W

Literacy is the ability to identify, understand, interpret, create, communicate and compute using printed and written materials associated with varying contexts. Literacy involves a continuum of learning in enabling individuals to achieve their goals to develop their knowledge and potential and to participate fully in their community and wider society".

According to UNESCO 37% of the world's illiterate people, are Indian. The literacy rate of India is 74%. Though India's literacy rate has increased since independence ie from 12% to 74% in recent times but still we could not achieve the desirable goal and according to a report by Oxfam, our country has the world's largest population of illiterate people In the last census, of 2011 the literacy rates was 82.14 percent for men while 65.46 percent of women were found to be literate. The low literacy for female also depicts the high level of

100%

MATCHING BLOCK 159/185

W

dependency of women on men for activities which requires them to read and write.

There are many differences between rural and urban areas. Kerala has the highest literacy rate of 93.91 %, while Bihar has the least literacy rate of 63.82%. Though Indian Government has allocated

85%

MATCHING BLOCK 167/185

W

around 10.5% of its total expenditure on education however it's not evenly spread out.

90%

MATCHING BLOCK 160/185

W

The Supreme Court in 1993 announced that children had a fundamental right to free education and thus in the year 2003 the "Right to Education was incorporated in the Constitution under the Constitution (83rd Amendment), 2000.

The Government of India have been launching several schemes to ensure the right to education for all irrespective of gender, caste and religion.

100%

MATCHING BLOCK 161/185

W

The National Policy of Education in the year 1986 declared that the whole nation must

be a part to fight against

for children in areas with no formal school within a one' kilometer radius.

NSOU ? PGSW-V 202 Dear learners note some of the important schemes for promoting education by Indian Government— National Education Policy, 2020: It aims at making "India a universal knowledge superpower" by introducing the numerous changes in the school level to college level. • Samagra Shiksha: It is an integrated scheme for school education extending from pre-school to class XII to ensure inclusive and equitable quality education at all levels of school education. • Mid-Day Meal Scheme: With this scheme that every child within the age group of six to fourteen years studying in classes I to VIII who enrolls and attends the school shall be provided hot cooked nutritional meals, free of cost every day except on school holidays. • Eklavya Model School and Rajiv Gandhi National Fellowship Scheme (RGNF): This scheme aims to encourage the students belonging to Scheduled Tribes (ST) community to pursue higher education. For Digital Literacy: • Digital India Programme: It pulls together many existing schemes by restructuring and re-focusing them and then implementing them in a synchronized manner. • Pradhan Mantri Gramin Digital Saksharta Abhiyan: It is one of the largest initiatives of the country with the target of making citizens digitally literate. • National Digital Literacy Mission: It aims to empower at least one person per household with crucial digital literacy skills. • Bharat Net Programme: It aims to have an optical fibre network in all Gram panchayats. Let us have a look at the possible reasons for literacy in India- • Poverty • Lack of School Facilities • Child Marriage • Child Labour • Unemployment of Educated youths • Lack of infrastructures-Poor transportation, bad roads, no toilet facility etc. • Lack of facilities in school or no recruitment of teachers

NSOU ? PGSW-V 203 CONSEQUENCES OF ILLITERACY • Due to inaccessibility to knowledge there are chances of frustration and quarrel within the family members at homes as the demands for education of children may not be fulfilled thus leading to a state of Personal disorganization. • Low level of awareness may create ignorance and increase belief in superstition amongst people. Education removes ignorance and increases cooperation and mutual understanding in society. But, on account of lack of education in a community, people can be easily have conflicting situations on communal and religious lines. This may cause Social disorganization • Family disorganization may occur due to quarrels and misguidance • There may be an increase in poverty and educational unemployment • Lack of education may lead to Increase in all anti-social activities ranging from theft, robbery to abduction and rape. • Finally illiteracy may also create chances for-social and economic exclusion in society. Possible suggestions for promoting literacy in our country Provide free education: The provision of free education in schools, colleges, and universities by the government can play the main role in reducing the level of illiteracy. Since some people fail to attend school or basic education due to the lack of money to pay for the fees, and in such cases offering free education can increase the number of people attending school and subsequently reduce illiteracy levels within society and country. • Knowledge: To create the awareness about the importance of education can motivate people to send their ward to school. Various non-governmental organi- zations, government agencies, and other concerned institutions should put their deliberate efforts to create awareness in the society and play the important role to reduce the problem of illiteracy. • Provision of Grants and financial sources: Well reputed educational institu- tions, colleges and training centres are located in urban areas, due to this migration of many rural people from rural areas to urban areas for admitting in higher education institutions. Many families, social groups and communities are not able to bear the burden of fees of their children's and other related expenditure. In those cases offering grants, subsidies, and scholarships can reduce the financial burden

NSOU ? PGSW-V 204 of the parents. It would be helpful for those students to learn without interrupting their education due to the lack of school fees. • Digitalization: Nowadays we live in the age of information and communication technology. Having digital platforms for reading and learning can help reduce illiteracy in society. It can also take care of the challenge in the scarcity of educational facilities. With the help of Digital libraries a good platform available for those who live far away from urban centres to develop their knowledge. • Development of Curriculum and Instructional Methods -To promote the literacy, it is essential to arrange the curriculum and teachings methods in a systematic and logical manner. In various educational institutions and training centres when the curriculum and teachings methods are formulated in an appropriate manner then it should rouse interest among the students towards learning. • Experience and Attitude of the Teachers -To develop education and literacy skills amongst the individuals, it is essential that the teachers and educators should possess the updated knowledge and skills. The right knowledge and skills would effectively contribute in enhancing knowledge and skills amongst the learners. To prevent illiteracy, tea hers have a vital role to play they motivated the students towards learning and those who possess learning disabilities and problems should be helped and encouraged by the teachers so that they are able to perform well in education. Effective communication and friendly nature, politeness, courtesy and kindness are the necessary behavioural traits on the part of the teachers, if they are to efficiently contribute in the prevention of illiteracy. • Development of Extra-Curricular Activities-Learning only academic subjects and concepts may make learning boring. If students go to school and they only get engaged into reading and writing then they may not feel motivated towards learning. To stimulate the individuals towards learning, it is vital to formulate measures to make learning interesting for them. The development of creative and extra-curricular activities is considered essential to arouse keenness and curiosity amongst the learners. The range of extra-curricular activities include yoga, medi- tation, sports, taekwondo, physical activities, artworks, handicrafts, playing of musical instruments, singing, dancing and so forth. These activities encourage the individuals to become dedicated towards their learning, hence resulting in enhance- ment of the literacy skills.

NSOU ? PGSW-V 205 • Development of Infrastructure and Other Facilities - There have been a number of cases mainly in rural areas that who belong to deprived and marginalized sections of the society they do not develop much interest in education because of the inadequate infrastructural facilities. Schools are placed at a distance and roads are in deprived conditions and some other individuals have transportation problems. To prevent the problem of illiteracy, it is very important that transportation, roads, equipment, telecommunications, water supplies, power supplies, public services, communications should be adequately developed. 11.3 Migration

The migrating man suffers harrowing experiences, he works hard, struggling to save something to send home to his family, but is caught in the vicious cycle of staying in the city to find a job and doing a job in order to continue staying in the city. Rural India is still floating towards Cities. Migration from one state to another within India is mainly from Bihar, Orissa, Chhattisgarh and Madhya Pradesh. Migration, is both seasonal and non-seasonal within India. The seasonal migration is mostly by weavers, brick makers and rice-go down workers (unloading rice from Lorries to depots and vice-versa). The non-seasonal migration is mainly by washermen, shoe-makers, hawkers (going from house to house), kerosene sellers, rickshaw drivers, fruit & vegetable wallas, railway-station porters, and employees of the Food Corporation of India, of other important wholesale food stockers, and of the Assam Electricity Board (e.g. helping repair electricity-line poles). These migrants live mostly without family in male groups and lead a very simple life, keeping in view their motive to earn money and send it to their family members living in Bihar, where some of that money is used, for instance, to build family houses. On many occasions, particularly for religious festivals or for the engagement or marriage of a family member, the migrant workers come back home. The human world has always been on the move. The scale and speed of migration has grown tremendously since the late nineteenth century, as transport and communication networks have brought ever larger masses of people together, with interruptions caused by policies of governments, keen to protect their territoriality in the short-term interest of a few privileged groups and with only a dim vision of a common future for humanity. In the case of citizens of one state, migration is a common affair, with migrants becoming seasonal travelers for work, festivals and pilgrimages. Migrants move between town and cities; they choose different places for spending their working lifetime in and for retiring to; they continually experience and absorb the culture or educational and health facilities of host communities, transmitting in turn their own culture and their own expertise to the host

NSOU ? PGSW-V 206 communities. This same pattern should apply to the globalised world of today. Migration forms part of .being a global citizencitizens who feel at home anywhere, without losing a sense of where they come from and who are always ready to reinvent themselves as they absorb the wonders of new cultures, new technologies and new ways of being human. 'Push' and 'Pull' factors are most important parts of rural migration of unskilled and unemployed workers of India in general and Bihar in particular. Employment opportunity is shrinking everywhere due to increase in population, decline in handicraft, stagnant agricultural economy and absence of industrial growth which resulted into large scale seasonal migration from Bihar. Furthermore, the influence of kinship acted as most powerful factor to motivate their near and dear friends and relatives to come to places where such labourers are working and earning through their enterprising efforts. Difference in socio- economic pattern is basically responsible for migration in India. Most of the migrants in Bihar to other places belong to lower and depressed section of the society who are the worst victims of exploitation of landlords and big farmers. The demographic pressure coupled with famine, flood and starvation occurring due to failure of monsoon is the potent cause of migration. This forced the weaker section of society to move along with other known persons already engaged in job. Being motivated by the desire to seek freedom from life of incessant toil and shameful exploitation, a big chunk of schedule caste and backward class community migrated to urban cities. However, one of the significant features about migration is that Migrants usually keep their alliance with the place of origin. Migrants usually carry the knowledge which they impart to the native population by way of discussion & participation in various activities, their sense of importance of education which they develop in their surroundings, their liberal attitude regarding the traditional social system, all these things directly contribute to the development of rural areas. Almost all the migrants contribute to the development of the rural areas either economically or socially or both. The economic condition of the migrants families is by & large better than those families in the village where from no migration has taken place. Migration has been significantly reshaping the traditional social and economic structures of rural communities of this country. The livelihood activities of rural families are no longer confined to farming and are increasingly being diversified through rural-to-urban and international migration. With the development of trade and industry and the awareness

NSOU ? PGSW-V 207 produced by the mass media, rural poor are shifting towards the urban area in order to improve their living standards and to search for better livelihood opportunities. The lack of employment opportunities in the rural areas and better employment prospects and infrastructure facilities in the urban areas motivate people to migrate to urban areas. In the rural areas, sluggish agricultural growth and limited development of the rural non-farm sector raises the incidence of rural poverty, unemployment and under employment. Given the fact that most of the high productivity activities are located in the urban areas - people from rural areas move towards town or cities with a hope to grab diversified livelihood opportunities as the rural poor still consider migration as one of the significant as well as reliable livelihood coping strategy. Migration primarily occurs due to disparities in regional development. The causes of migration are usually explained by using two broad categories, namely, push and pull factors. Studies conducted in the sphere of migration in India - found that poverty, job searching and family influence have been the main push factors for out- migration, while availability of better employment opportunity, prior migrants and availability of better educational facilities have been identified as the key pull factors behind migration. To be more specific, for rural India, poverty is still considered to be the main push factor for illiterates and moderately educated migrants. The National Sample Survey Office in its 64th round survey which was carried out during July 2007 to June 2008, covering a random sample of 5,72,254 persons covering 79,091 rural and 46,487 urban households spread over 7921 villages and 4688 urban blocks of the country, explored some significant trends of rural migration in India. As per the economists and development experts - migration is essential for development and it is a desirable phenomenon; but what is not desirable is the distressed migration found across the nation resulting in over-crowding of cities and mushrooming of slums. Some states which have higher investment and resources for development experience high in-migration; at the same time, the backward states like U.P, Bihar, M.P, etc are experiencing heavy out-migration. The rural poor from the down-trodden and backward communities and backward regions such as Bihar, Orissa, Uttar Pradesh travel to far distances seeking employment at the lowest rungs in construction of roads, irrigation projects, commercial and residential complexes etc. Hence, there is a need for balanced regional development. More focus for development and migration of labourers from rural to urban areas is a reflection of our misplaced development policies; investment in economic growth has been biased toward the capital-intensive urban centers,

NSOU ? PGSW-V 208 despite the fact that majority of India resides in the rural areas. Even the little that is spent in villages is wasted in microeconomic interventions to help individual villagers and not the macro-economy of the village as a whole. For instance, the government has no employment generation schemes for cities; yet, there are plenty of jobs and high-paying ones too. 11.4 Drug Abuse Drug addiction is one of the major problems in developing countries. Since these countries have young populations, they are at greater risks of addiction. The young population expose to a higher risk as a major and the most vulnerable groups. Problems of puberty, adolescents, youth identity crisis and mental conditions can be considered as important factors for tendency of this age group towards addiction. The use of drugs in adolescents is primarily for pleasure; curiosity and escape of psycho-social problems are the major causes of early drug use for the first time. Use of synthetic substances capable of having an altered effect on human health and behaviour is of recent origin. Alcohol, opium and cannabis were the traditional substances of abuse in India marked by moderate consumption generally ritualized in social gatherings. The problem of drug abuse acquired new and alarming dimensions with the introduction of heroin and other new forms of drugs in late seventies and early eighties. WHO (2002) estimated that there are about 2 billion people worldwide who consume alcoholic beverages. The commonly used substances in the world are nicotine and alcohol (most commonly), opium, codeine, cocaine, caffeine, barbiturates (amobarbital, pentobarbital), benzodiazepines (valium, ativan, Xanax), hallucinogens: LSD, mescaline, cannabis, marijuana and hashish. More than 13 million Americans use illegal drugs, more than 2 million are known to abuse prescription drugs, 60 million are hooked on cigarettes, 33 million binge on alcohol, and 12 million are heavy drinkers. The result of a study, conducted in Iran reveals, that the use of drug amongst the male population ranged from high to low were failure in life, escape from problems, staying awake, friends' and peers' insistence, pain relief, a positive attitude towards drugs, increase of the self-confidence, getting more energy, relaxation, recreation, learning from the family members, and gaining a new experience (curious). In the female population this ranking of causes included: failure in life, relaxation, recreation, increase of self-confidence, getting more energy, escape from

NSOU ? PGSW-V 209 problems, gaining a new experience (curious), pain relief, staying awake, friends' and peers' insistence, learning from family members, and a positive attitude towards drugs. India is located between the golden triangle which include Myanmar (Burma), Laos, Vietnam, and Thailand and the golden crescent which include Afghanistan, Iran, and Pakistan; two prominent drug-producing hubs in the World. India as a natural transit zone, faces a major problem of drug trafficking. Drug addiction in India has of late emerged as a matter of great concern both due to the social and economic burden caused by substance abuse. National Survey (2002), on extent, pattern and trend of drug abuse conducted at the behest of ministry of social justice and empowerment, government of India (MSJE) and United Nations indicates that about 15 million persons addicted to alcohol and various kinds of other drugs need urgent attention for their treatment, rehabilitation and reintegration into social mainstream. Drug rehabilitation is a multi-phased, multi-faceted, long term process. Drug rehabilitation centres play an important role to make drug addict free of addiction. The treatment-cum-rehabilitation centres provide services to the community as awareness generation, identification of addicts, motivational counselling, detoxification/de-addiction, vocational rehabilitation, after care and re-integration into the social mainstream and preventive education. There are different guidelines for treatment-cum-rehabilitation centres according to their bed capacity (15-bedded, 30-bedded, 50-bedded, 60-bedded). The guidelines are laid down by Ministry of Social Justice and empowerment, Government of India. The ministry runs a programme named as "Scheme for prevention of alcohol and substance (drugs) abuse" launched in 1985. The government of India would provide financial support to the organizations for institutionalized activities, stress would be on mobilization of community resources and greater community participation. At present 123 such centres have been established across the country. The ministry of social justice and Empowerment under its scheme is assisting 373 NGO's for maintaining 401 De-addiction-cum-rehabilitation centres and 68 counselling and awareness centres all over the country. 11.5 HIV/AIDS According to WHO,

95%

MATCHING BLOCK 168/185

W

the human immunodeficiency virus (HIV) is a retrovirus that infects cells of the immune system, destroying or impairing their function. As the infection NSOU ? PGSW-V 210 progresses, the immune system becomes weaker, and the person becomes more susceptible to infections. The most advanced stage of HIV infection is acquired immunodeficiency syndrome (AIDS). It can take 10-15 years for an HIV-infected person to develop AIDS; antiretroviral drugs can slow down the process even further. An estimated 36.9 million people have HIV. More than 34 million people have died from the virus, making it one of the most destructive pandemics in history.

In India, and most other countries, heterosexual transmission accounts for most HIV infections. Transmission from female sex workers to male clients, and then to these clients' regular partners, is the most common chain of infection. The HIV epidemic has been largely concentrated in high-risk populations, but the large migrant population in Bihar poses significant risks to containing the spread of HIV. The HIV Estimation 2017 Report indicates that AIDS-related mortality has been steadily rising in Bihar; Bihar is also 1 of 10 states that account for 71% of total annual new HIV infections. In such a vulnerable context, it is important to understand the perceptions of HIV and access to care from both end user and provider perspectives in order to mitigate any barriers and work towards a more patient-centred system of care and management.

Terrorism There is an old saying that "one person's freedom fighter is another person's terrorist." This saying indicates some of the problems in defining terrorism precisely. Some years ago, the Irish Republican Army (IRA) waged a campaign of terrorism against the British

NSOU ? PGSW-V 211

100%

MATCHING BLOCK 178/185

W

government and its people as part of its effort to drive the British out of Northern Ireland. Many people in Northern Ireland and elsewhere hailed IRA members as freedom fighters, while many other people condemned them as cowardly terrorists.

The terrorist attack of Mumbai which took place in 26/11 , some individuals applauded for the terrorists,

100%

MATCHING BLOCK 172/185

W

as acts of heroism. These examples indicate that there is only a thin line, if any, between terrorism on the one hand and freedom fighting and heroism on the other hand. Just as beauty is in the eyes of the beholder, so is terrorism. The same type of action is either terrorism or freedom fighting, depending on who is characterizing the action. Although dozens of definitions of terrorism exist, most take into account what are widely regarded as the three defining features of terrorism : (a) the use of violence; (b) the goal of making people afraid; and (c) the desire for political, social, economic, and/or cultural change. A popular definition by political scientist Ted Robert Gurr (1989, p. 201) captures these features: "The use of unexpected violence to intimidate or coerce people in the pursuit of political or social objectives."

100%**MATCHING BLOCK 173/185****W**

Why does terrorism occur? It is easy to assume that terrorists must have psychological problems that lead them to have sadistic personalities, and that they are simply acting irrationally and impulsively. However, most researchers agree that terrorists are psychologically normal despite their murderous violence and, in fact, are little different from other types of individuals who use violence for political ends.

100%**MATCHING BLOCK 174/185****W**

Contemporary terrorists tend to come from well-to-do families and to be well-educated themselves; ironically, their social backgrounds are much more advantaged in these respects than are those of common street criminals, despite the violence they commit. 11.6.1

99%**MATCHING BLOCK 175/185****W**

Types of Terrorism When we think about this definition, 9/11 certainly comes to mind, but there are, in fact, several kinds of terrorism —based on the identity of the actors and targets of terrorism—to which this definition applies. A typology of terrorism, again by Gurr (1989), is popular : (a) Vigilante terrorism (b) Insurgent terrorism (c) Transnational (or international) terrorism (d) State terrorism

NSOU ? PGSW-V 212

100%**MATCHING BLOCK 176/185****W**

Vigilante terrorism is committed by private citizens against other private citizens. Sometimes the motivation is racial, ethnic, religious, or other hatred, and sometimes the motivation is to resist social change. The violence of racist groups like the Ku Klux Klan was vigilante terrorism, as was the violence used by white Europeans against Native Americans from the 1600s through the 1800s. What we now call "hate crime" is a contemporary example of vigilante terrorism. Insurgent terrorism is committed by private citizens against their own government or against businesses and institutions seen as representing the "establishment." Insurgent terrorism is committed by both left-wing groups and right-wing groups and thus has no political connotation. US history is filled with insurgent terrorism, starting with some of the actions the colonists waged against British forces before and during the American Revolution, when "the meanest and most squalid sort of violence was put to the service of revolutionary ideals and objectives" (Brown, 1989, p. 25). An example here is tarring and feathering: hot tar and then feathers were smeared over the unclothed bodies of Tories. Some of the labor violence committed after the Civil War also falls under the category of insurgent terrorism, as does some of the violence committed by left-wing groups during the 1960s and 1970s. A relatively recent example of right-wing insurgent terrorism is the infamous 1995 bombing of the federal building in Oklahoma City by Timothy McVeigh and Terry Nichols that killed 168 people. Transnational terrorism is committed by the citizens of one nation against targets in another nation. This is the type that has most concerned Americans at least since 9/11, yet 9/11 was not the first time Americans had been killed by international terrorism. A decade earlier, a truck bombing at the World Trade Center killed six people and injured more than 1,000 others. In 1988, 189 Americans were among the 259 passengers and crew who died when a plane bound for New York exploded over Lockerbie, Scotland; agents from Libya were widely thought to have planted the bomb. Despite all these American deaths, transnational terrorism has actually been much more common in several other nations: London, Madrid, and various cities in the Middle East have often been the targets of international terrorists. State terrorism involves violence by a government that is meant to frighten its own citizens and thereby stifle their dissent. State terrorism may involve mass murder, assassinations, and torture. Whatever its form, state terrorism has killed and injured more people than all the other kinds of terrorism combined (Gareau, 2010). Genocide, of course

NSOU ? PGSW-V 213

99%**MATCHING BLOCK 177/185****W**

is the most deadly type of state terrorism, but state terrorism also occurs on a smaller scale. As just one example, the violent response of Southern white law enforcement officers to the civil rights protests of the 1960s amounted to state terrorism, as officers murdered or beat hundreds of activists during this period. Although state terrorism is usually linked to authoritarian regimes, many observers say the US government also engaged in state terror during the nineteenth century, when US troops killed thousands of Native Americans (D. A. Brown, 2009). Terrorism

provokes deep fear and insecurity—more than other forms of violence. Terrorists strike innocent civilians, often randomly, and without warning. We think we can protect ourselves against other forms of violence, but we feel defenseless against terrorists. Terrorists know this, and they seek to use intimidation to impose their political or other agendas. Killing is only a means to that end. By creating fear and panic, terrorists try to extort concessions or to weaken and discredit governments by showing they are unable to protect their citizens. Terrorism is also used as low—cost strategic warfare, sometimes by rogue states using surrogates, and sometimes by groups motivated by ideology, religion, or ethnicity to overthrow governments and change the course of history. Terrorists also use violence in a less focused way to express protest and rage, to advance messianic and fanatic religious agendas, and for even more obscure pathological reasons. 11.7 Gender Justice

98%

MATCHING BLOCK 179/185

W

Gender inequality is found in varying degrees in most societies around the world, and the United States is no exception. Just as racial/ethnic stereotyping and prejudice underlie racial/ethnic inequality so do stereotypes and false beliefs underlie gender inequality. Although these stereotypes and beliefs have weakened considerably since the 1970s thanks in large part to the contemporary women's movement, they obviously persist and hamper efforts to achieve full gender equality. A sociological perspective reminds us that gender inequality stems from a complex mixture of cultural and structural factors that must be addressed if gender inequality is to be reduced further than it already has been since the 1970s. Despite changes during this period, children are still socialized from birth into traditional notions of femininity and masculinity, and gender-based stereotyping incorporating these notions still continues. Although people should certainly be free to pursue whatever family and career responsibilities NSOU ? PGSW-V 214 they desire, socialization and stereotyping still combine to limit the ability of girls and boys and women and men alike to imagine less traditional possibilities. Meanwhile, structural obstacles in the workplace and elsewhere continue to keep women in a subordinate social and economic status relative to men. To reduce gender inequality, then, a sociological perspective suggests various policies and measures to address the cultural and structural factors that help produce gender inequality. These steps might include, but are not limited to, the following : 1. Reduce socialization by parents and other adults of girls and boys into traditional gender roles. 2. Confront gender stereotyping by the popular and news media. 3. Increase public consciousness of the reasons for, extent of, and consequences of rape and sexual assault, sexual harassment, and pornography. 4. Increase enforcement of existing laws against gender-based employment discrimination and against sexual harassment. 5. Increase funding of rape-crisis centers and other services for girls and women who have been raped and/or sexually assaulted. 6. Increase government funding of high-quality day-care options to enable parents, and especially mothers, to work outside the home if they so desire, and to do so without fear that their finances or their children's well-being will be compromised. 7. Increase mentorship and other efforts to boost the number of women in traditionally male occupations and in positions of political leadership. 8.

Facilities for education for girls must be made easily available. 9. Legal machineries must be strengthened to ensure justice for the womenfolk of our country. 10. Policymakers and the law makers must conduct extensive field study to get a clear picture of the socio-economic status of women.

94%

MATCHING BLOCK 180/185

W

As we consider how best to reduce gender inequality, the impact of the contemporary women's movement must be neither forgotten nor underestimated. Since it began in the late 1960s, the women's movement has generated important advances for women in almost every sphere of life. Brave women (and some men) challenged the status quo by calling attention to gender inequality in the workplace, education, and elsewhere, and they brought NSOU ? PGSW-V 215 rape and sexual assault, sexual harassment, and domestic violence into the national consciousness.

Government of India has launched several schemes and programmes for ensuring Gender justice in our country. We have constitutional provisions which are particularly meant for safeguarding the interest of the women. The Ministry of Women and Child is dedicated to intervene in case of any injustice done to women. We need a multidisciplinary approach to promote gender justice in our society. 11.8 Conclusion One of the important job of a social worker in to look for solution & for crisis intervention. The social worker are suppose to know the root cause of a problem & identify the resources to combat these issues. Proper Advocacy, net working and other activities are required to handle such social problems effectively. 11.9 Exercise 1. What do you mean by social problems how can we combat social problems. 2. Discuss about the problem of illiteracy in India. 3. What is HIV. Explains AIDS. What are the causes of transmission of HIV. 4. Explain Terrorism. Write & Explain the various types of Terrorism. 5. What do you mean by Gender Justice. 11.10 Reference Singh, G., Mitra, Y., Sidhu, B., & Kaur, P. (2019). NSOU ? PGSW-V 217 Unit 12 ? India's Socio-Economic Problems Structure 12.0 Objective 12.1 Introduction 12.2 Concept of Poverty 12.2.1 Causes Of Poverty In India 12.2.2 Impact of Poverty 12.3 Unemployment 12.4 Population growth 12.4.1 Effects of the increasing population in India on its economic growth 12.5 Conclusion 12.6 Exercise 12.7 Reference 12.0 Objective Our learner would understand about the major Socio-Economic Problems with special reference to, Poverty, Unemployment and Population Growth. 12.1 Introduction Poverty in India is one of the biggest issue we are facing today. Almost every third poor in the world is Indian. In 2019, the Indian government declared on 2019 that 6.7% of its population is below its official poverty limit. Amartya Sen, rightly pointed out that lacking in capabilities like adequate income, education, proper health, security, self- confidence, freedom of speech, are the basic cause of poverty particularly in Indian context. He further commented, "it is not sufficient to know how many poor people are there, but to know how exactly poor they are". In general terms, poverty means unable to attain basic necessities of life like food, clothing, shelter, health and education. Deprived from fulfillment of basic needs gives birth to poverty. It is also referred as the state of deprivation with

NSOU ? PGSW-V 218 respect to social inferiority, vulnerability, seclusion, physical weakness, subjection, and humiliation (Ogwumike and Odusola, 2001). 12.2 Concept of Poverty Poverty examines the relative position of an individual on some absolute standards and distribution of individuals in terms of their departure from these standards in the society (Shrinivasan, 2013). India adopted the five year plan model as a tool for planned economic development since 1951 and continued until 2017. As a developing country, poverty eradication was one of the important objectives of this planned development model. The adoption of poverty alleviation strategies in the five year development model have resulted in continuous reduction in the ratio of poverty across India. Various employment and income generation schemes were implemented and different methodologies to estimate poor population were adopted. The economic philosophy behind this initiative was to provide preferential treatment to uplift poor people to enable them to participate and contribute in economic development (Raj Krishna, 1984) The poverty rate and head count ratio are the most common standards of measuring poverty. In 1979, a task force defined poverty line based on food expenditure worth 2,400 calories in rural area and 2100 calories in urban areas. In 2011, the Suresh Tendulkar Committee quantified the poverty line based on an individual expenditure worth Rs. 27.2 and Rs. 33.3 in a day on basic substances of living in rural and urban areas, respectively. This had been criticized for setting the low poverty line (Choudhury, 2015). The Rangarajan committee defined a new poverty line as one's spending on less than Rs 32 and Rs. 47 in a day in rural and urban areas, respectively, resulting 29.5% poverty headcount ratio, which is 35% increase on 21.9%, according to the estimation of the Tendulkar committee. Regardless of its causes, poverty has devastating consequences for the people who live in it. Much research conducted and/or analyzed by scholars, government agencies, and nonprofit organizations has documented the effects of poverty (and near poverty) on the lives of the poor (Lindsey, 2009; Moore, et. al., 2009; Ratcliffe & McKernan, 2010; Sanders, 2011). Many of these studies focus on childhood poverty, and these studies make it very clear that childhood poverty has lifelong consequences. In general, poor children are more likely to be poor as adults, more likely to drop out of high school, more likely to become a teenaged parent, and more likely to have employment problems. Although only

NSOU ? PGSW-V 219 Poor children are more likely to have inadequate nutrition and to experience health, behavioral, and cognitive problems. Kelly Short – Poverty : "Damaged Child," Oklahoma City, OK, USA, 1936. (Colorized). – CC BY-SA 2.0. 1 percent of children who are never poor end up being poor as young adults, 32 percent of poor children become poor as young adults (Ratcliffe & McKernan, 2010). Poverty is measured by– (1) absolute poverty (2) relative poverty. Absolute poverty–It is a kind of poverty in which an individual is not able to get basic necessities of like food, clothing, shelter, health and education. Abstain from getting the basic necessities of life is termed as absolute poverty. Relative poverty – It is in relative terms, when an individual is deprived from getting the facilities which an average individual of the economy gets. If an individual gets less than what an average individual of an economy gets, that individual is considered as relatively poor than others. It can be calculated according to the calories consumed or income of an individual in

NSOU ? PGSW-V 220 urban and rural areas separately. A concept of poverty line has been introduced, according to which when an individual is below that poverty line then he is considered to be poor. The popular indicators of poverty like–per-capita income, monthly consumption expenditure, calorie intake, level of literacy, size of family, unemployment, pattern of income distribution etc. It may be noted that the incidence of poverty is more in rural areas and less in urban areas, because most of the people in rural area are deprived of basic necessities and belongs to weaker section of society, various schemes of poverty alleviation also fails to reach rural areas. There exist regional disparity among various states, as it is interesting to note that poverty is highest in Orissa, Jharkhand, Bihar, while it is lowest in states like Chandigarh, Jammu & Kashmir, Punjab and Gujrat. Human Poverty Index : - HPI (Human Poverty Index) is constructed by the Human Development Report, 1997. It focuses on three main areas: 1. Longevity – life expectancy at the time of birth 2. Knowledge – it is related to literacy 3. Standard of living – accessibility to basic necessities of life, food water, safety, adequate health care, proper nourishment etc. In India there were two methods used for calculating poverty : (1) Uniform Recall Period (URP) (2) Mixed Recall Period (MRP). In Uniform recall period, data for consumption expenditure is collected in reference of 30 days' recall period, while in mixed recall period, data for consumption expenditure is collected for five non-food items namely, clothing, footwear, durable goods, education and institutional medical expenses are collected in reference of 365 days' recall period and for remaining items 30 days' reference period is taken. According to NSSO's 69th round of survey on consumer expenditure, an average rural Indian household spends 61.3% of its total consumption expenditure on food and an average urban Indian household spends 39.7% of its total consumption expenditure on food. 12.2.1 Causes of Poverty In India 1. Unemployment 2. Inflation

NSOU ? PGSW-V 221 3. High population growth 4. Less agricultural growth 5. Economic inequalities 6. Regional imbalance 7. Low economic growth 8. Less initiatives taken by the government 9. Benefits of poverty alleviation accrue more in urban areas. 10. Low level of literacy 12.2.2 Impact of Poverty Family Problems The poor are at greater risk for family problems, including divorce and domestic violence. Even in families that are not poor, running a household can cause stress, children can cause stress, and paying the bills can cause stress. Families that are poor have more stress because of their poverty, and the ordinary stresses of family life become even more intense in poor families. The various kinds of family problems thus happen more commonly in poor families than in wealthier families. Compounding this situation, when these problems occur, poor families have fewer resources than wealthier families to deal with these problems. Education Poor children typically go to rundown schools with inadequate facilities where they receive inadequate schooling. They are much less likely than wealthier children to graduate from high school or to go to college. Their lack of education in turn restricts them and their own children to poverty, once again helping to ensure a vicious cycle of continuing poverty across generations. Many scholars have debated whether the poor school performance of poor children stems more from the inadequacy of their schools and schooling versus their own poverty. Regardless of exactly why poor children are more likely to do poorly in school and to have low educational attainment, these educational problems are another major consequence of poverty.

NSOU ? PGSW-V 222 Housing and Homelessness The poor are, not surprisingly, more likely to be homeless than the nonpoor but also more likely to live in dilapidated housing and unable to buy their own homes. Many poor families spend more than half their income on rent, and they tend to live in poor neighborhoods that lack job opportunities, good schools, and other features of modern life that wealthier people take for granted. The lack of adequate housing for the poor remains a major national problem. Even worse is outright homelessness. An estimated 1.6 million people, including more than 300,000 children, are homeless at least part of the year (Lee, et. al., 2010). Crime and Victimization A study reflects, poor (and near poor) people account for the bulk of our street crime (homicide, robbery, burglary, etc.), and they also account for the bulk of victims of street crime. That chapter will outline several reasons for this dual connection between poverty and street crime, but they include the deep frustration and stress of living in poverty and the fact that many poor people live in high-crime neighbourhoods. In such neighbourhoods, children are more likely to grow up under the influence of older peers who are already in gangs or otherwise committing crime and people of any age are more likely to become crime victims. Moreover, because poor and near-poor people are more likely to commit street crime, they also comprise most of the people arrested for street crimes, convicted of street crime, and imprisoned for street crime. Most of the inmates of the correctional homes come from poor or near-poor backgrounds. Criminal behaviour and criminal victimization, then, are other major consequences of poverty. Poverty and Women Women,

92%

MATCHING BLOCK 181/185

W

still have an overall survival deficit in childhood and during their reproductive years and are severely disadvantaged in the labour market.

The educational attainment of girls lags behind that of boys. But as in other areas, in gender inequality too, India is highly heterogeneous. Outcomes for instance, tend to be much poorer among Adivasi (Scheduled Tribe), Dalit (Scheduled Caste), and Muslim women than among others. There are also large regional variations. The World Bank's report on Poverty and Social Exclusion in India captures some key areas of female exclusion. India Poverty and Social Exclusion Report reflects that poverty has strong association with women's access to maternal health and the health of their children and it has also been a major reason for spousal violence against women in India.

NSOU ? PGSW-V 223 The truth that most of us would guess that the richest countries are often those with the least people. Compare the United States, which possesses a relatively small slice of the population pie and owns by far the largest slice of the wealth pie, with India. These disparities have the expected consequence. The poorest people in the world are women and those in peripheral and semi-peripheral nations. For women, the rate of poverty is particularly worsened by the pressure on their time. In general, time is one of the few luxuries the very poor have, but study after study has shown that women in poverty, who are responsible for all family comforts as well as any earnings they can make, have less of it. The result is that while men and women may have the same rate of economic poverty, women are suffering more in terms of overall wellbeing (Buvinic 1997). It is harder for females to get credit to expand businesses, to take the time to learn a new skill, or to spend extra hours improving their craft so as to be able to earn at a higher rate. Global Feminization of Poverty- In some ways, the phrase "global feminization of poverty" says it all: around the world, women are bearing a disproportionate percentage of the burden of poverty. This means more women live in poor conditions, receive inadequate healthcare, bear the brunt of malnutrition and inadequate drinking water, and so on. Throughout the 1990s, data indicated that while overall poverty rates were rising, especially in peripheral nations, the rates of impoverishment increased for women nearly 20 percent more than for men (Mogadham 2005). Why is this happening? While myriad variables affect women's poverty, research specializing in this issue identifies three causes (Mogadham 2005) : 1. The expansion in the number of female-headed households 2. The persistence and consequences of intra-household inequalities and biases against women 3. The implementation of neoliberal economic policies around the world While women are living longer and healthier lives today compared to ten years ago, around the world many women are denied basic rights, particularly in the workplace. In peripheral nations, they accumulate fewer assets, farm less land, make less money, and face restricted civil rights and liberties. Women can stimulate the economic growth of peripheral nations, but they are often undereducated and lack access to credit needed to start small businesses.

NSOU ? PGSW-V 224 In 2013, the United Nations assessed its progress toward achieving its Millennium Development Goals. Goal 3 was to promote gender equality and empower women, and there were encouraging advances in this area. While women's employment outside the agricultural sector remains under 20 percent in Western Asia, Northern Africa, and Southern Asia, worldwide it increased from 35–40 percent over the twenty-year period ending in 2010 (United Nations 2013). In a very interesting study conducted in 2013 by World Bank, reveals the following– ? First, poverty has declined between 1993-94 and 2009-10 along every dimension. Indeed, poverty has fallen for every social and religious group in every state in rural and urban areas separately as well as taken jointly. ? Second, acceleration in growth rates between 2004-05 and 2009-10 has been accompanied by acceleration in poverty reduction. Poverty rates have fallen rapidly for all major social and religious groups at the national level. This phenomenon also holds true for most states across various social and religious groups. ? Third, for the first time, poverty reduction between 2004-05 and 2009-10 has been larger for the Scheduled Castes and Scheduled Tribes than the upper caste groups. Thus, the gap in poverty rates between the socially disadvantaged and upper caste groups has narrowed over time. This pattern provides clear evidence to refute the claim that reforms and growth have failed to help the socially disadvantaged or that they are leaving these groups behind. A continuation of this trend, helped along by further reforms and higher growth rates, would help eliminate the difference in poverty rates between the historically disadvantaged and the privileged. ? Fourth, inter-state comparisons reveal that the states with large Scheduled Caste and Scheduled Tribe populations face a more uphill task with regards to combating poverty. The point is most forcefully brought out by a comparison of Punjab and Kerala. When we compare poverty rates in 2009-10 by social groups, the two states have very similar poverty rates. But because the poverty rates for the Scheduled Castes are higher than those for non-scheduled castes in both states and the Scheduled Castes account for a much larger proportion

NSOU ? PGSW-V 225 of its population, the aggregate poverty rate in Punjab turns out to be significantly higher. ? Finally, we find that in the Indian case, there is no robust relationship between inequality and poverty. Indeed, to the extent that such a relationship exists, it suggests that more unequal states enjoy lower levels of poverty. Kerala offers the most dramatic example in this respect. It has had one of the highest Gini coefficients in rural as well as urban areas and also one of the lowest poverty ratios in both regions. In 2009-10, its Gini coefficients were by far the highest among the large states in both rural and urban areas and poverty ratios the smallest. In our discussion on redpoint is most forcefully brought out by a comparison of Punjab and Kerala. When we compare poverty rates in 2009-10 by social groups, the two states have very similar poverty rates. But because the poverty rates for the Scheduled Castes are higher than those for non-scheduled castes in both states and the Scheduled Castes account for a much larger proportion of its population, the aggregate poverty rate in Punjab turns out to be significantly higher. Finally, we find that in the Indian case, there is no robust relationship between inequality and poverty. Indeed, to the extent that such a relationship exists, it suggests that more unequal states enjoy lower levels of poverty. Kerala offers the most dramatic example in this respect. 12.3 Unemployment Unemployment has been a major problem for India from a long time. The problem of unemployment is a global phenomenon, with international bodies like ILO predicting the rise in unemployment in India in coming years. Unemployment is a situation where in the person willing to work fails to find a job that earns him/her a living. Unemployment has been considered as one of the biggest problems of India. A UN Labour report released in January reports that, Unemployment in India is projected to increase from 17.7 million to 17.8 million in 2017 and 18 million in 2018. We can not think of a better India with such a huge number of unemployed youth in the country. The reasons for this Unemployment scenario are: high population, defective education system, excessive burden on agriculture, low productivity in agriculture sector combined with lack of alternative opportunities for

NSOU ? PGSW-V 226 agricultural worker, unskilled workforce etc. Though education level in the recent years has improved, skill development is still a crucial issue. India has the largest population of youth in the world. Around 65 per cent population of India is under the age of 35, so the impact of declining financial market and the lack of job opportunities has the worst effect in India. Apart from the usual solutions of controlling the rising population or increasing the quality of our education to include skill based learning. Government should also encourage and develop Industrialisation and agriculture based industries especially in rural areas so that the rural candidates don't migrate to the urban areas. It is not only a serious economic problem but is may even lead to health problems as well , as a study reveals, there is a strong

94%

MATCHING BLOCK 183/185

W

relationship between unemployment and poor health .The unemployed tend to have higher levels of impaired mental health including depression, anxiety, and stress, as well as higher levels of mental health hospital admissions, chronic disease (cardiovascular disease, hypertension, and musculoskeletal disorders), and even premature mortality Some longitudinal studies have shown that higher levels of depression and unemployment are not just correlated, but that higher levels of depression are a result of unemployment. Other prospective studies have found that poor mental health also contributes to unemployment.

There has been a pressure on successive governments and policymakers to create enough jobs in India so that the workforce of India can be used better and the population can be self-sustainable by becoming economically strong. The creation of jobs, in addition to ensuring that the working population becomes economically productive, is also a vital avenue for fighting poverty and lack of proper use of intellectual, manual and skill-based potentials of the individuals. Job growth is a critical component of the equation that seeks to balance strong economic performance and keeping a check on the unemployment levels. The growth in the number of quality jobs that provide assured wages is a key mechanism in modern-day economies to share back the benefits of their growth. It becomes a problem when any country's government is not able to create enough jobs. Policy makers have been long uncomfortable with the concept of 'jobless growth' and have sought to develop new ways to bridge this gap. This involves taking steps like

NSOU ? PGSW-V 227 fiscal support to stagnating sectors, attract private investments, providing skill-training opportunities and promoting the option of self-employment. Many such policies directly aimed at creating shifts in the labor market. The present government has tried to create the self-employment opportunities for the unemployed people of the country. 12.4 Population growth The fastest rise in the population of India was during the period of 1951 to 1981, in which the population was from 36 crores in 1951 was reached around 70 crores in 1981. During this period of 30 years, the population increased by around 34 crores, which is the fastest rise in the history of population statistics. Death rate has become controlled due to modern health and medical facilities and it has reduced to become 15 persons per thousand whereas; the birth rate has not got any significant reduction. That is why; this period from 1951 to 1981 is known in India as the period of Population Explosion. Ordinarily, with an increase in population, production also increases, and the number of those people also increases, among whom the total increase in production is distributed. Thus, the ultimate effect of an increase in population on the level of production per head would be indifferent or negative. This would depend on the form of an increase in population and its directions. If the increase is in the number of dependents, then in place of production, consumers would increase, and ultimately the effect on per head production would be adverse. On the contrary, in case of a favorable age constitution of the population, its effect on the economic development would be better 12.4.1 Effects of the increasing population in india on its economic growth The explosive increase in population in India has adversely affected the economic development and economy, which is clear from the following facts 1. Lower Growth Rate Due to the increasing population, the rate of development has been slow. Whereas; the growth rate of Japan during the previous 10 years has been 15%, while the average growth rate of India has been 4% only.

NSOU ? PGSW-V 228 2. Widespread Poverty Due to the heavy population, the benefit of economic development is almost nil in the country. Though during the last 30 years there has been an increase of 15% in the national income, still the per capita income has increased '50% only. About 50% of the population of the country is below the poverty line. Read about the Problem of Poverty in India 3. High Prices 4. Due to a higher population, we find scarcity everywhere and due to scarcity, the prices are heading towards an increase. The country has a scarcity of food-grains, scarcity of employment, scarcity of essentials, scarcity of houses, scarcity of oil, etc.. 5. Excess Burden on the Economy The 1.5 crore increase in the population each year is increasing the burden on the Indian economy. 6. Problems in Industrialization Our country has poverty and unemployment only due to the higher population. The level of savings and investments is lower and mechanization is discouraged due to excess human resources. The small and cottage industries are primary. Due to all these reasons, rapid industrialization has not become possible. The slow pace of capital formation is also a hurdle in industrialization in India. 7. Expenditure on Population Control The explosive increase in population in India has forced expenditure of crores of rupees on population control under planned development. These resources would otherwise have been used in the economic development of the country and the standard of living would have improved. 8. Problem of Unemployment 1. The means of employment do not increase at the same rate as the increase in population, as a result, the existing problem of unemployment becomes more dreadful. This is the reason for the continuous increase in unemployment in India. At the beginning of the first plan, the numbers of unemployed were 35 million which increased to 26 crores in 2010.

NSOU ? PGSW-V 229 2. Shortage of Food-gains Due to the rapid increase in population, to fulfill the requirements of the population for several years, millions of tons of food-grains has to be imported. This has adversely affected foreign trade. 3. Problem of the Increasing Number of Dependents The rapid increase in population increases the burden of the number of dependents. According to the 1961 census, 47.3% of the population was dependent which increased today to 71.1%. 4. Problem of Capital Formation The increase in income due to economic development is expended in catering to the needs of the increased population, as a result, capital formation cannot be increased and the investment rate remains lower. 5. Hinders the Growth of Agriculture and Industry The increasing population hinders the quick development of agriculture. It has two reasons ? Subdivision of land reduces the area of land per person ? The burden of population on agriculture increases. Similarly, the increasing population hinders the growth of the industry also. A rapid increase in population decreases the savings and investment rates. During a lack of capital, the pace of industrial development is slow. 6. Increase In the Burden of Public Utility Services For the rapid increase in population, the government has to incur more on housing, education, health, welfare, law and order, and security. Thus, funds for development work fall short. 12.5

Conclusion We need strong policies and a group of dedicated social workers along with other social control agencies to tackle these socio-economics problems. In this unit, we learnt about such major problems and also got an idea to combat it professionally.

NSOU ? PGSW-V 230 12.6 Exercise 1. What is Poverty? What are causes and impact of poverty in our Society? 2. How can we deal with the problems of unemployment? 3. What must be the role of the government & Social Workers to control the growing population of our nation? 4. What are the effect of poverty on Women? 12.7 Reference [Shachi Gupta. Major concerns of Sociology Sociology seeks to study the society and to analyse it in terms of the social relations that have a pattern. Sociology addresses itself to three basic questions : i) how and why societies emerge? ii) how and why societies persist? iii) how and why societies change? Sociology has been concerned with the evolution of society. It has tried to analyse the factors and forces underlying the historical transformations of society. For example, societies have evolved from primitive tribal state to rural communities. How villages have become important centres of commercial activity or of art and culture and grown into towns and cities. Sociology has also been concerned with the units of social life. The attempt has been to look at various types of groups, communities, associations and society. The effort has been to study the pattern of social relationships in these units. An important area which sociology deals with is social institutions. The institutions provide a structure for the society and perform functions, which enable the society to meet its needs. In any society, there are five basic social institutions; family, political institutions, economic institutions, religious institutions and educational institutions. However, in more complex societies, there may be many other institutions such as bureaucracy, military organisations, welfare and recreational organisations, etc. Caste is also an institution, which is more or less peculiar to India. Another area of study and analysis by sociologists is social processes. In one sense, the social institutions provide the stability and order whereas social processes are the dynamic aspects of social relations. Among the various processes that will be dealt with in the latter units are socialisation, social control, co operation, conflict, social deviation and social change. NSOU ? PGSW-V 12 1.3.1 Concept of Culture Culture is another very important concept. As mentioned earlier, we are immersed in culture from birth onwards, we take culture for granted. It is difficult to imagine what life would be like without culture. Culture provides summing up

science of society which could not only explain the past of mankind but also, predict its future course. He felt that society moves through definite and fixed stages and that, it progresses towards ever-increasing perfection. The three stages, according to him, in which the society moves, were : i) the theological or the religious ii) the metaphysical or the philosophical iii) the positive or the scientific stage. In the first stage people thought, all phenomena were caused by supernatural forces. Abstract forces of either a religious or secular type were considered to be the source of knowledge in the second stage. In the last stage, scientific laws were supposed to determine both the natural and the social worlds. He also talked about two broad areas - 'social statistics', which deals with the orderly and, stable aspects of social life and patterns of behaviour (family, occupational, polity, etc.). The second area called 'social dynamics' emphasises the study of changes in a social system. According to him, sociology was to be the queen of all sciences.

1.5.2 Emile Durkheim (1858-1917) Emile Durkheim was also interested in sociology being a scientific discipline. He wrote a (1858-1917) book in 1895 entitled : Rules of Sociological Method. To him, social solidarity was one of the main principles of human life. He distinguished between two kinds NSOU ? PGSW-V 14 of solidarity: 'mechanical solidarity' based on common assumptions, beliefs, sentiments like those found in traditional societies and 'organic solidarity' based on the division of labour and inter-related interests as found in industrial societies. When solidarity is broken, there would be social disorganisation and confusion in society. He considered sociology as having wide interests, which includes sociology of religion, sociology of knowledge, sociology of law. sociology of crime, economic sociology, and sociology of education, art and aesthetics. An important concept given by Durkheim was social facts, which, according to him, are external to the individual but they exert pressure on the individual in the behaviour pattern. Customs, traditions, folkways and mores are social facts. He felt that sociology should be involved in the reformation of society. For him society was a reality in itself, that is, it is more than its parts.

1.5.3 Max Weber (1864-1920) Max Weber used the concept of social action rather than social relations. A comprehensive Max Weber study of social action, to him, meant understanding the meanings human beings give to (1864-1920) their behavioural pattern. The social behaviour was not merely a mechanical learning of norms but how people interpreted the social values. Sociology studies all kinds of social action without making any value judgements. Weber was concerned with understanding of inter- relations between parts of society and also, with comparative studies of different societies. He studied religion in different societies. His work Protestant Ethics and the Spirit of

science of society. which could not only explain the past of mankind but also, predict its future course. He felt that society moves through definite and fixed stages and that, it progresses towards ever-increasing perfection. The three stages, according to him, in which the society moves, were: i) the theological or the religious to ii) the metaphysical or the philosophical to iii) the positive or the scientific stage. In the first stage. people thought, all phenomena were caused by supernatural forces. Abstract forces of either a religious or secular type were considered to be the source of knowledge in the second stage. In the last stage, scientific laws were supposed to determine both the natural and the social worlds. He also talked about two broad areas - 'social statistics', which deals with the orderly and, stable aspects of social life and patterns of behaviour (family, occupational, polity, etc.). The second area called 'social dynamics' emphasises the study of changes in a social system. According to him, sociology was to be the queen of all sciences.

Illustration 1.4.2 Emile Durkheim (1858-1917) Emile Durkheim Durkheim was also interested in sociology being a scientific discipline. He wrote a (1858 - 1917) book in 1895 entitled: Rules of Sociological Method. To him, social solidarity was one of the main principles of human life. He distinguished between two kinds of solidarity: 'mechanical solidarity' based on common assumptions, beliefs, sentiments like those found in traditional societies and 'organic solidarity' based on the division of labour and inter-related interests as found in industrial societies. When solidarity is broken, there would be social disorganisation and confusion in society. He considered sociology as having wide interests, which includes sociology of religion, sociology of knowledge, sociology of law. sociology of crime, economic sociology, and sociology of education, art and aesthetics. An important concept given by Durkheim was social facts, which, according to him, are external to the individual but they exert pressure on the individual in the behaviour pattern. Customs, traditions, folkways and mores are social facts. He felt that sociology should be involved in the reformation of society. For him society was a reality in itself, that is, it is more than its parts.

Nature and Scope of Sociology 1.4.3 Max Weber (1864-1920) Weber used the concept of social action rather than social relations. A comprehensive Max Weber study of social action, to him, meant understanding the meanings human beings give to (1864 - 1920) their behavioural pattern. The social behaviour was not merely a mechanical learning of norms but how people interpreted the social values. Sociology studies all kinds of social action without making any value judgements. Weber was concerned with understanding of inter-relations between parts of society and also, with comparative studies of different societies. He studied religion in different societies. His work 011 Protestant Ethics and the Spirit of

The nature and meaning of social development Development is a broad concept and, though interrelated, it differs from social change. Change is a value-neutral concept whereas development is a value-laden concept. The notion of development is, in other words, the process of desired change. All cases of change do not indicate development. Only planned and desired changes can be described as development. Thus, it is important to keep in mind the distinct character of the concept of development. Secondly, we also need to distinguish between economic and sociological notions of development. This point becomes clearer as you read this unit. While speaking of social development, we emphasise the sociological understanding of the process of development. As a broad concept, social development refers to the overall transformation of individuals and society, which may enable every person to achieve moral, social physical and material well-being. Egalitarian development is a desired goal, but it remains only an 'ideal'. In spite of development efforts, disparities in various dimensions of development continue to widen between societies, regions and groups. Variations are observed when we compare various regions or countries. Out of such comparisons have emerged the concepts of underdevelopment mainly in economic terms, such as per capita income, gross national product, level of the standard of living and degree of technological advancement. There are many criteria of 'over' and 'under' development. The simplest one of them is the ratio of industrial capacity to social utility. It means that the countries which are unable to produce, sufficient goods to meet the requirements of their population, may be considered as underdevelopment and those which produce more than what is required, as overdeveloped. In the overdeveloped category may be placed the countries such as America, and in the underdeveloped category, many Asian and African countries. It is, however, a controversial point whether underdevelopment and over development can be identified with any particular country. Further the term underdevelopment is not acceptable, to some of the economically less developed countries, such as India. These countries consider

themselves quite developed from social and cultural points of view. They prefer to be designated as 'developing' rather than as 'underdeveloped' countries. An important idea implicit in the classification of countries, into developed and developing, is that the former became a 'model' for the latter. The developing countries may like to imitate or adopt the economic and technological systems of developed countries. What is more important about this classification, with regard to the conceptual meaning of development, is the fact that the developing countries depended upon the developed ones for technology, skills and monetary aid. The latter tried to exploit the former. This is known as the dependency theory of development. Having realised the exploitative tendencies of the developed countries, the developing countries tried to be self-reliant in economic terms. Thus, substitution of economic dependence by self-reliance emerged as an important indicator of development. The greater the self-reliance, the higher the levels of development. Endeavours towards self-reliance resulted in import substitution by stopping the purchase of goods from developed countries and producing them in their own country. 1.7

The prevailing notions of social development For a discussion of the contemporary sociological concerns about development, we can begin by outlining some of the views based on historical events, on the socio-cultural dimensions of development. But before we examine these dominant concerns regarding development, it would be useful to undertake a brief description of the "three worlds of development" as it had existed prior to the break-up of the Soviet Union. This had become an important part of the social scientists parlance since the middle of the 20th century. Earlier the world was divided into two i.e. it was a bipolar world with the capitalist block of United States of America (USA), on the one side and the socialist block of the Soviet Union, on the other. After the break-up of Soviet Union, the 'Cold War ' has ended and the world has become unipolar, with USA as the most powerful nation of the world. 1.7.1 The Three Worlds of Development The First World consists of North America, Western and Southern Europe. The countries were seen to be following mainly a capitalist model of development. The Second World had consisted of Soviet Union and the East European group such as, Poland, East

Germany, Hungary etc. Many socio-political changes have occurred in these countries now and they do not remain a communist bloc any more. They were associated with the socialist model of development. The Third World was and to certain extent still is generally used to refer to the less developed or developing societies of Asia, Africa and Latin America. Most of these countries emerged out of colonial rule to attain political independence only in the middle of the 20th century. The majority of the third world countries are characterised by low per capita income, high rates of illiteracy and infant mortality. These were generally agriculture-based economies where people had short life expectancies, low degree of social mobility and strong attachment to tradition (Estes, R.J., p. 92). The countries, though subject to influence by the erstwhile First and the Second World countries, have devised their own national strategy and path of development. The First and the Second World's models of development had laid primary emphasis on economic growth.

1.7.1.1 The Capitalist Model of Development of the First World : The main characteristics of the capitalist model of development are : a) provision for private ownership of property and means of production, b) promotion of economic activities through private enterprises, and c) minimum possible state regulation and control on private enterprises. Thus the capitalist model is characterised by a free economy regulated by competition.

1.7.1.2 The Socialist Model of Development of the Second World The socialist path of development adopted by the Second World, was seen to be opposite or dichotomous to the capitalist path of development. The former, contrary to the latter, is characterised by state ownership of property and means of production, public enterprises and complete state regulation of economic activities. Thus, the socialist model refers to a regulated economy. The main allegation against the capitalist model is that, since it permits minimum state regulation, its economic system becomes exploitative in the sense that the working class people (proletariat) do not get their due share. The capitalists enjoy a major share of the nation's resources. Hence it contributes to inequalities so that a few are very rich and the majority is very poor.

W <http://egyankosh.ac.in/bitstream/123456789/18834/1/Unit-34.pdf>

The capitalist model is, therefore, alleged to be exploitative and non-egalitarian. On the contrary, the socialist model was ideally considered as non-exploitative and egalitarian. Private ownership and the lack of state regulation, were considered to be important measures of exploitation of the weaker sections and hence the causes of income inequalities. Since, the socialist state did not allow private ownership of property, there was a strong belief that there was no room for exploitation and inequality in it. However, historical events proved this belief to be incorrect as the Soviet Union could not survive for long. The period of "Glasnost" and "perestroika" led by Gorbachev, the erstwhile Russian Prime Minister during the 1980's, dismantled the communist political and economic structure. The Soviet Union broke-up into several small countries and the socialist ideology gave way to capitalist tendencies. However, China still follows a socialistic socio-political order. The two models had also differed in their conception of development. Whereas the capitalist model lays greater stress on economic growth, than on equal distribution of the fruits of economic growth. The socialist model laid equal stress on both resource generation and equal distribution of income, and tried to change the social system in such a way that greater social justice could be ensured. In reality, socialist model did not give much space to individual initiative and consumerist desires. The foregoing discussion implies another difference between these models. The capitalist model does not see any major conflict in the interests of the two classes-workers and capitalists. In its eyes both the classes are complementary to each other, they; are functionally interdependent. The rules of society, particularly about ownership of property and distribution of income, are supposed to be based on consensus. Hence according to this model, there is no need to change the economic structure. On the contrary, the socialist model saw inherent conflict in the interests of the workers Social Development and the capitalists. According to it, rules are not based on consensus but are imposed on the weaker section by the stronger one. This leads to the exploitation of the weak by the strong, which is likely to result in conflicts, and in revolution by the exploited people who want radical change in the system itself. Thus, the capitalist model is NSOU ? PGSW-V 20 sometimes designated as functionalist or consensual, and the socialist as a conflict, radical or revolutionary model. In practice, as observed by some researchers, these two models have entered a process of convergence. For instance now, there is an increased state regulation on private economic enterprises in the USA. There has been a relaxation in grants to private enterprises in Russia. One could see income inequalities, and a tendency to resist alterations in political and economic systems in both the Worlds.

The capitalist model is, therefore, alleged to be exploitative and non-egalitarian. On the contrary, the socialist model was ideally considered as non-exploitative and egalitarian. Private ownership and the lack of state regulation, were considered to be important measures of exploitation of the weaker sections and hence the causes of income inequalities. Since, the socialist state did not allow private ownership of property, there was a strong belief that there was no room for exploitation and inequality in it. In recent times there has developed a new concept of "fourth world" of development as identified first by Manuel and Postluns (1974) and Hamalian and Karl (1974). They used this concept to describe "a community of the powerless, the oppressed and the dispossed". According to them all the other "worlds of development" i.e. the First, the Second and the Third, share the people who belong to the Fourth world of development. In current usage, the countries which belong to the First world are referred to as "developed Market Economies" (DMEs); those belonging to the Second World are referred to as the "Eastern Trading Area (ETAs); and those belonging to the Third World are referred to as the "Developing Countries". The countries of the Fourth World are referred to as "least Developing Countries" (LDCs). (Quoted in Estes, Richard J.'s" World's of Development, www. google.com website). 1.7.1.3 Development of the Third World It is difficult to specify the model of development, adopted by the majority of the. Third World countries as there are variations among them, dictated mainly by their historical and socio-cultural circumstances. What they seem to share in common is that : a) They are economically and technologically underdeveloped in comparison to the countries of the so called developed world. b) Social planning is a key element in their development process. Their plans of development incorporate not only economic concerns, especially removal of poverty, but also concerns regarding nation building, national culture and social transformation. They have been seeking technological and economic aid from the developed countries. The developed countries have given them economic assistance, but they have also been NSOU ? PGSW-V 21 increasingly attempting to extend their political influence in the developing countries. It has been noted that the global military defence strategy is, the major consideration of the developed countries, in extending their economic and political influence to the developing countries. In fact, the idea of the Third World is associated with the emergence of consciousness among developing countries, of being exploited by the developed countries in the garb of monetary help and expert advice. Some nations had become conscious of exploitation much earlier, but others, understood this fact only after seeing the disastrous role of big powers in the developing countries, e.g., the role of the USA in Vietnam or the USSR in Afghanistan. The social analysts have played a very significant role both in appreciating the help, as well as analysing the "games" of the big powers in the developing countries. Against this background of information about the First, the Second and the Third Worlds we will now proceed to look at some of the prevailing conceptions about development across the world. 1.7.2

In recent times there has developed a new concept of "fourth world" of development as identified first by Manuel and Postluns (1974) and Hamalian and Karl (1974 : 13). They used this concept to describe "a community of the powerless, the oppressed and the dispossed". According to them all the other "worlds of development" i.e. the First, the Second and the Third, share the people who belong to the Fourth world of development. W <http://egyankosh.ac.in/bitstream/123456789/18834/1/Unit-34.pdf>

Socio-cultural Dimensions of Development The concept of development has encompassed many dimensions over the years. One of the popular notions that economic growth, was a sufficient and a necessary condition to stimulate development of all the sections of a society has been proved incorrect. Economic advancement of a class of people has not, and does not trickle down to the entire population. Similarly, the attainment of high levels of economic growth by some of the developed countries has not helped to solve some of their serious problems. In fact affluence has given rise to new and more social problems. It is, therefore, now realised that if the ultimate aim of development is the improvement of the quality of life of every human being in society, it cannot be achieved as a consequence of economic growth or capital accumulation. Sociologists now believe that it is necessary to lay stress on socio-cultural dimensions of development. To elaborate, social development includes :

- a) Proper satisfaction of basic needs, such as, food, shelter and clothing.
- b) Availability of essential amenities such as electricity, transportation, communication and water.
- c) Good physical and mental health, measurable in terms of increased life chances, abolition of environmental pollution, nutritious diet, medical care etc.
- d) Economic welfare i.e. opportunities for employment in economic activities and high level of living.
- e) Development of human beings i.e. enhancement of literacy, vocational education, moral education, creative personality etc.
- f) Social integration i.e. involvement and participation of people in social, political and economic processes and establishment and maintenance of effective social institutions.
- g) Minimisation of disparities in access to various resources and opportunities- economic, social and political.

Some sociologists have laid a special emphasis on the psychological, social and moral dimensions while talking about the "holistic" approach to development. They look at development as an improvement in the overall quality of life including physical, psychological, social and cultural. They emphasise that these dimensions are very closely interlinked. For instance, an improvement in the psychological quality of life entails the idea of life satisfaction including positive mental health. This requires a proper and effective balance between material and non-material life-goals of people and between instrumental and intrinsic values of society. This subjective dimension is very closely linked with the social quality of life. The improvement in social quality means an increase in the strength of family stability, interpersonal bonds and social solidarity. An improvement in the cultural quality of life signifies the upsurge of the moral dimensions. A concern for others is the essence of social morality. They have pointed out that in many developed societies there is more concern 'for self than for others', hence no true development (Sharma, 1986). Thus, the sociological approach to development looks upon the development process as alterations that affect the whole socio-cultural matrix of society. In the modern sense, development refers to the planned, stimulated movement of the entire system in the direction of the overall desirable goals of a given society. Today we have a "Sociology of Development" which is seen to be growing in two directions – towards the analysis of internal structures and of historical linkages. A look at the studies in this field provides us with an idea of the following approaches to

Socio-cultural Dimensions of Development The concept of development has encompassed many dimensions over the years. One of the popular notions that economic growth, was a sufficient and a necessary condition to stimulate development of all the sections of a society has been proved incorrect. Economic advancement of a class of people has not, and does not trickle down to the entire population. Similarly, the attainment of high levels of economic growth by some of the developed countries has not helped to solve some of their serious problems. In fact affluence has given rise to new and more social problems. It is, therefore, now realised that if the ultimate aim of development is the improvement of the quality of life of every human being in society, it cannot be achieved as a consequence of economic growth or capital accumulation. Sociologists now believe that it is necessary to lay stress on socio-cultural dimensions of development. To elaborate, social development includes:

- a) Proper satisfaction of basic needs, such as, food, shelter and clothing.
- b) Availability of essential amenities such as electricity, transportation, communication and water.
- c) Good physical and mental health, measurable in terms of increased life chances, abolition of environmental pollution, nutritious diet, medical care etc.
- d) Economic welfare i.e. opportunities for employment in economic activities and high level of living.
- e) Development of human beings i.e. enhancement of literacy, vocational education, moral education, creative personality etc.
- f) Social integration i.e. involvement and participation of people in social, political and economic processes and establishment and maintenance of effective social institutions.
- g) Minimisation of disparities in access to various resources and opportunities - economic, social and political

Some sociologists have laid a special emphasis on the psychological, social and moral dimensions while talking about the "holistic" approach to development. They look at development as an improvement in the overall quality of life including physical, psychological, social and cultural. They emphasise that these dimensions are very closely interlinked. For instance, an improvement in the psychological quality of life, entails the idea of life satisfaction including positive mental health. This requires a proper and effective balance between material and non-material life-goals of people and between instrumental and intrinsic values of society.

6.4 Social Control, Change and Development

This subjective dimension is very closely linked with the social quality of life. The improvement in social quality, means an increase in the strength of family stability, interpersonal bonds and social solidarity. An improvement in the cultural quality of life signifies the upsurge of the moral dimensions. A concern for others is the essence of social morality. They have pointed out that in many developed societies there is more concern 'for self than for others', hence no true development (Sharma 1986: 20). Thus, the sociological approach to development looks upon the development process as alterations that affect the whole socio-cultural matrix of society. In the modern sense, development refers to the planned, stimulated movement of the entire system in the direction of the overall desirable goals of a given society. Today we have a "Sociology of Development" which is seen to be growing in two directions – towards the analysis of internal structures and of historical linkages. A look at the studies in this field provides us with an idea of the following approaches to

	<p>Approaches to development may be discerned on the basis of two criteria, (i) centralisation versus decentralisation of development schemes and resources, and (ii) Unit of development, i.e., the focus of development – individual, group, village etc. The first criterion gives rise to two approaches, namely, development from the top and development from the bottom. The second criterion gives rise to the three approaches- sectoral development, areas development and target group development. Let us now review briefly the five approaches. 1) Development from the top The approach of development from the top envisages the planning and execution, of development schemes by the central or apex bodies of administration. In other words, the central organisations decide the nature and direction of plan formulate projects and impose them on the people. For instance, the ministers and high officials sitting in the capital, make the development plans for rural people without fully realising their problems. Implicit in this approach is the assumption that the people who need development are incapable of understanding their needs, of devising development schemes and of executing them on their own. Hence, the need for experts and outside agencies in fact, this assumption is baseless. The elite at the top have a vested interest in making such assumptions. Their major interest is to hold control on resources and mobilise them for their own benefits. The people accept the development schemes, because they have neither sufficient resources of their own, nor any control on the resources of the community. As a result, most of the schemes imposed from the top fail to yield the desired results. This happens in most of the cases. A large part of the funds of development schemes is eaten up in one way or the other, by the experts and executive personnel deputed or employed by the sponsors of the scheme, be it own government or any foreign agency. The major drawback of this approach is that it fails to involve the beneficiaries, in the development process. Instead, it generates a feeling of alienation among them. For these reasons this approach has been characterised by a higher degree of centralisation and bureaucratisation. NSOU ? PGSW-V 24 2) Development from bottom Social Development The exponents of second approach of development from the bottom, on the contrary, believe the fairness of intentions and abilities of the people who need development. They are given an opportunity to articulate their problems as well as the ways to solve them. They are trained and made capable, and are prepared for self-help. Utilisations of resources for development schemes</p>		<p>Approaches to development may be discerned on the basis of two criteria, (i) centralisation versus decentralisation of development schemes and resources, and (ii) unit of development, i.e., the focus of development – individual, group, village etc. The first criterion gives rise to two approaches, namely, development from the top and development from the bottom. The second criterion gives rise to the three approaches --sectoral development, areas development and target group development. Let us now review briefly the five approaches. i) Development from the top The approach of development from the top envisages the planning and execution, of development schemes by the central or apex bodies of administration. In other words, the central organisations decide the nature and direction of plan, formulate projects and impose them on the people. For instance, the ministers and high officials sitting in the capital, make the development plans for rural people without fully realising their problems. Implicit in this approach is the assumption that the people who need development are incapable of understanding their needs, of devising development schemes and of executing them on their own. Hence the need for experts and outside agencies. in fact, this assumption is baseless. The elite at the top have a vested interest in making such assumptions. Their major interest is to hold control on resources and mobilise them for their own benefits. The people accept the development schemes, because they have neither sufficient resources of their own, nor any control on the resources of the community. As a result, most of the schemes imposed from the top fail to yield the desired results. This happens in most of the cases. A large part of the funds of development schemes is eaten up in one way or the other, by the experts and executive personnel deputed or employed by the sponsors of the scheme, be it own government or any foreign agency. The major drawback of this approach is that it fails to involve the beneficiaries, in the development process. Instead, it generates a feeling of alienation among them. For these reasons this approach has been characterised by a higher degree of centralisation and bureaucratisation. 6 5 Social Development ii) Development from bottom The exponents of second approach of development from the bottom, on the contrary, believe the fairness of intentions and abilities of the people who need development. They are given an opportunity to articulate their problems as well as the ways to solve them. They are trained and made capable, and are prepared for self-help. Utilisations of resources for development schemes</p>

decided, by the concerned people themselves or by their representatives at the local level. Thus, there is a greater decentralisation of plans and higher participation of people. While the planners realise the importance of development from the bottom, and claim that they adopt this approach, in practice, they often adopt the approach of development from the top. The result is ineffectiveness of the development schemes. 3) Sectoral development On the basis of 'unit' of development, as mentioned earlier, three approaches are envisaged, viz., sectoral development, area development and target group development. Sectoral development approach refers to formulation and execution of schemes for development, of a particular sector of economy like agriculture or industry. For instance, the Indian planners thought of developing industries just after the Independence. Therefore they made plans to develop technology or borrow it from other countries. Stress was laid on technological education. Many institutes and colleges were established, independently or in collaboration with other countries, such as the United States of America, Russia and England. On the other side, funds were made available for heavy industries such as textile, steel and cement. Later on, when the country faced a food problem in the early sixties, the planners thought of developing the agricultural sector. As a result, many agricultural universities were set up, which helped in evolving high yielding varieties of crops, insecticides and pesticides, and farm implements, like threshers. Extension services were made available to educate and persuade farmers, to adopt new agricultural technology, and loans were advanced to farmers quite liberally. You have seen the results of these efforts in the form of the green revolution. The country is now almost self-reliant in food NSOU ? PGSW-V 25 4) Area development All regions are not equally developed. Some are more affluent than others. The underdevelopment of regions is due to the lack of infrastructural development- roads, railways, electrification etc. or due to the problems of floods and drought. When schemes are devised for the infrastructural development of an area or region, we call it area development approach. The Command Area Development Scheme, introduced in India in 1974 for the development of irrigation resources in certain regions, illustrates this approach. 5) Target group development Target group approach has its focus on a particular category of people, such as small farmers, women and farm labourers. Schemes, such as Small Farmers Development Agency (SFDA) and reservation of seats in schools and colleges, and in employment for scheduled castes, exemplify the target group approach. There is another approach to development, which has its focus on the overall development of the people residing in a locality – village or town. This is known as a community development approach. This approach lays stress on the development of education, health facilities, economic and social activities, and other infrastructural facilities. 1.74

Indian experience of development after independence There have been schemes and plans of development in almost all dimensions of socio economic life, such as health, education, population control, industry, transport, irrigation communication and agriculture. It is neither possible to present here a list of all the development schemes, nor are you expected to know about all of them. Therefore our main objective is to present a synoptic view of the development schemes in India, introduced after Independence with a view to illustrate some of the approaches to development, discussed in the preceding section. After Independence, India did not follow either the First or the Second World, it

hand it has almost full control, at least in principle, over all the entrepreneurial and business activities. 1.7.4.1 Socialist Path and Mixed Economy The state also acts as an entrepreneur in setting up heavy industries, such as the manufacture of steel and generation of electricity. The banks have been nationalised. The state has full control over railways and postal departments. These measures are illustrative of a socialist path of development. On the other hand, certain industries are reserved for private entrepreneurs – both small and large. In some industries, such as textile and cement, both private and state enterprises have been allowed to operate. In many other activities, too, such as education, health and transport both private and state agencies work, either independently or in collaboration. It is true that India adopted a 'mixed' path of development, but scholars differ in their opinion about the real functioning of the economy. One view is that India's path of development is a capitalist one. Entry of state in heavy industries was, in fact, meant to support private enterprise, in the sense that these industries did not yield high profits and required a long gestation period and high capital investment. Hence they did not attract private entrepreneurs, and at the same time industrial development was not possible without basic industries. Similarly, it has been argued that big enterprises still dominate over the small ones, and the industrial sector over the agricultural one. Also there is a concentration of economic power in a few big business houses. The other view is that our bias has been increasing towards a socialist model, as is evident from the facts such as nationalisation of banks. These are controversial arguments which cannot be sorted out here. The fact remains that India pursues a 'mixed' path of development. 1.7.4.2 Sectoral Development No doubt India has progressed a lot in industrial and agricultural sectors, but there has been relatively less progress in the latter. Many policies and plans were adopted, which showed results that were far below the expectations. The major policies for the development of agriculture after Independence were: abolition of landlordism (zamindari), consolidation of land holding, and land ceiling. Whereas the first two policies succeeded, the last one was made ineffective due to several factors including the vested interests of large farmers. However, due to increase in population there has a natural curtailment of farm size, and it

has been that further ceiling on farm size, will come in the way of raising the productivity. All these policies reflect a sectoral development approach. The sectoral approach got further accentuated in the 'green' and 'white' revolutions, i.e., development of cash crops, and dairy products, respectively. Such revolutions have not been widespread. They are confined to a few states, such as Punjab, Haryana, Tamil Nadu, Gujarat and Maharashtra. The important thing is that the farmers, even in these states, do not get remunerative returns from farm produce, because of an absence of check on the rise of prices of farm inputs – machines, fertilisers, insecticides, pesticides etc., which come from industrial sector, and also because of a strict control on the prices of farm outputs, with the rationale that high rise in the prices of food grains will adversely affect the masses. This indicates discrimination against the farm sector. The majority of people depend upon agriculture even today. Therefore non-remunerative farm return keeps the agricultural sections in poverty.

Auguste Comete, the founding father of sociology, defines sociology as the science of social phenomena "subject to natural and invariable laws, the discovery of which is the object of investigation". 2. Kingsley Davis says that "Sociology is a general science of society". 3. Harry M. Johnson opines that "sociology is the science that deals with social groups". 4. Emile Durkheim : "Science of social institutions". 5. Park regards sociology as "the science of collective behavior". 6. Small defines sociology as "the science of social relationships". 7. Marshal Jones defines sociology as "the study of man-in-relationship-to-men". 8. Ogburn and Nimkoff : "Sociology is the scientific study of social life". 9. Franklin Henry Giddings defines sociology as "the science of social phenomena". 10. Henry Fairchild : "Sociology is the study of man and his human environment in their relations to each other". 11. Max Weber defines sociology as " the science which attempts the interpretative understanding of social action in order thereby to arrive at a casual explanation of its course and effects". 12. Alex Inkeles says, "Sociology is the study of systems of social action and of their inter-relations". 13. Kimball Young and Raymond W. Mack say, "Sociology is the scientific study of social aspects of human life". 14. Morris Ginsberg: of the various definitions of sociology the one given by Morris Ginsberg seems to be more satisfactory and comprehensive. He defines sociology in the following way: "In the broadest sense, sociology is the study of human interactions and inter-relations, their conditions and consequences".
