Auguste Comete, the founding father of sociology, defines sociology as the science of social phenomena "subject to natural and invariable laws, the discovery of which is the object of investigation". • Kingsley Davis says that "Sociology is a general science of society". • Harry M. Johnson opines that "sociology is the science that deals with social groups". • Emile Durkheim: "Science of social institutions". • Park regards sociology as "the science of collective behavior". • Small defines sociology as "the science of social relationships". • Marshal Jones defines sociology as "the study of man-in-relationship-to-men". • Ogburn and Nimkoff : "Sociology is the scientific study of social life". • Franklin Henry Giddings defines sociology as "the science of social phenomena". • Henry Fairchild: "Sociology is the study of man and his human environment in their relations to each other". • Max Weber defines sociology as " the science which attempts the interpretative understanding of social action in order thereby to arrive at a casual explanation of its course and effects". • Alex Inkeles says, "Sociology is the study of systems of social action and of their inter-relations". Kimball Young and Raymond W. Mack say, "Sociology is the scientific study of social aspects of human life". • Morris Ginsberg: of the various definitions of sociology the one given by Morris Ginsberg seems to be more satisfactory and comprehensive. He defines sociology in the following way: "In the broadest sense, sociology is the study of human interactions and inter-relations, their conditions and consequences".

since it includes the Command Area Development Programme. Drought Prone Area Programme and Small Farmers' Development Agency. As a target group programme, its focus is on the poorest of the poor, and the unit of assistance is the 'family', and not a person. It proposes to cover about 3,000 families in each block over a period of five years. Under IRDP there are special programmes for employment, like Training Rural Youth for Self-employment (TRYSEM). Besides there are other programmes such as the National Rural Employment Programme (NREP). Evaluation reports of these programme, however, indicate the failure of the programme in reaching the real beneficiaries and in raising their economic status. The blame is laid on the executive personnel, and the rural elite who consume a large share of the resources, meant for these programmes. In other fields also India has made a good deal of progress. We have big hospital and primary healthcare centres. Life expectancy has increased and many diseases such as malaria, Polio and small pox have been controlled, and infant mortality reduced. Now we have a large network of transport and communication. . But the results of development have reached largely the urban population. Rural people still do not have good schools, proper electrification, clean water and hospitals. There are no good teachers, or proper infrastructure in schools, such as furniture, including blackboards in many schools, and no doctors, nurse or medicines in many primary healthcare centres. Besides this we find increased unemployment, a state of lawlessness, an increase in social and communal tension, and a lack of social and national concern. This shows that the country has achieved more of a quantitative than qualitative development. However, in terms of social political and economic awareness India and its villages are doing fairly well. Being one of the largest Democratic nations of the world, with an extremely vibrant political and economic structure, some amount of social unrest is inevitable. The policies of the Government are geared towards removing extreme inequalities and bringing about social justice. 1.8

the important past events and incidents. It records men past life and life of societies in a systematic and chronological order. It also tries to find out the causes of past events. It also studies the past political, social and economic events of the world. It not only studies the past but also establishes relations with present and future. That is why it is said that "History is the microscope of the past, the horoscope of the present and telescope of the future. However, both the sciences are closely inter-related and inter-dependent on each other. Both study the same human society. Their mutual dependence led G.H. Howard to remark that, "History is past Sociology and Sociology is present history." Both takes help from each other. At the same time one depends on the other for its own comprehension. History helps and enriches Sociology. History is the store house of knowledge from which Sociology gained a lot. History provides materials sociologists use. History is a record of past social matters, social customs and information about different stages of life. Sociology uses this information. Books written by historians like A. Toynbee are of great use for Sociologists. To know the impact of a particular past event sociology depends on history. Similarly Sociology also provides help to history and enriches it. A historian greatly benefited from the research conducted by Sociologists. Historians now study caste, class and family by using sociological data. Sociology provides the background for the study of history. Now history is being studied from Sociological angle. Every historical event has a social cause or social background. To understand that historical event history need the help from Sociology and Sociology helps history in this respect. Sociology provides facts on which historians rely on. Thus history and Sociology are mutually dependent on each other. History is now being studied from Sociological angle and Sociology also now studied from historical point of view. Historical sociology now became a new branch of Sociology which depends on history. Similarly Sociological history is another specialized subject which based on both the Sciences. But in spite of the above close relationship and inter-dependence both the sciences differ from each other from different angles which are described below. 2.3.1 Differences : (1) Sociology is a science of society and is concerned with the present society. But history deals with the past events and studies the past society. NSOU ? PGSW-V 36 (2) Sociology is a modern or new subject whereas history is an older social science. (3) Sociology is abstract whereas history is concrete in nature. (4) The scope of Sociology is very wide whereas the scope of history is limited. Sociology includes history within its scope. (5) Sociology is an analytical science whereas history is a descriptive science. (6) Attitude of sociology and history differ from each other. Sociology studies a particular event as a social phenomenon whereas history studies a particular event in it's entirety. (7) Sociology is a general science whereas history is a special science. 2.4 Sociology and Economics Sociology is mother of all social sciences. Hence it has close relationship with all social sciences and so also with Economics. The relationship of sociology with economics is very close, intimate and personal. There exists close relationship between these two because economic relationships bear a close relation to social activities and relationships. Likewise social relationships are also affected by economic relationships. Economic activities to a great extent are social activities. Hence both are mutually related. Sociology is a science of society. It is concerned with

the important past events and incidents. It records men past life and life of societies in a systematic and chronological order. It also tries to find out the causes of past events. It also studies the past political, social and economic events of the world. It not only studies the past but also establishes relations with present and future. That is why it is said that "History is the microscope of the past, the horoscope of the present and telescope of the future. ADVERTISEMENTS: However, both the sciences are closely inter-related and interdependent on each other. Both study the same human society. Their mutual dependence led G.H. Sociology studies a particular event as a social phenomenon whereas history studies a particular event in it's entirety. (7) Sociology is a general science whereas history is a special science. Sociology and Economics: Sociology is mother of all social sciences. Hence it has close relationship with all social sciences and so also with Economics. The relationship of sociology with economics is very close, intimate and personal. There exists close relationship between these two because economic relationships bear a close relation to social activities and relationships. Likewise social relationships are also affected by economic relationships. Economic activities to a great extent are social activities. Hence both are mutually related. ADVERTISEMENTS: Sociology is a science of society. It

the association of human beings. Sociology is the study of human inter-actions and inter-relations their conditions and consequences. But Economics deals with economic activities of man. It is a science of wealth and choice. According to Prof. Robbins Economics is a social "science which studies human behavior in relation to his unlimited ends and scarce means which have alternative uses." It is concerned with the activities of man such as production, consumption, distribution and exchange. It also studies the structure and functions of different economic organizations like banks, markets etc. It is concerned with the material needs of man as well as his material welfare. However, there exists a great deal of inter-relationship between these two sciences. Both are interdependent and inter-related with each other. Because of this inter-relationship Thomas opines that, "Economics is, in fact, but one branch of Sociology." Similarly Silverman opines Economics is regarded as offshoot of sociology which studies the general principles of all social relations. Their inter-relationships are as follows : NSOU ? PGSW-V 37 Economics takes the help of Sociology. For its own comprehension economics takes the help of sociology and depends on it. Economics is a part of Sociology hence without the help from sociology economics can't understand itself completely. Economics is concerned with material welfare of man which is common welfare. Economic welfare is a part of social welfare. For the solution of different economic problems such as inflation, poverty, unemployment etc. economists takes the help of sociology and takes into account the social events of that particular time. At the same time society controls the economic activities of man. Economics is greatly benefited by the research conducted by Sociologists like Max-weber, Pareto etc. Some economists also consider economic change as an aspect of social change. Economic draws its generalization basing on the data provided by Sociology. Thus economics cannot go far or develop without the help of Sociology. Similarly Sociology also takes the help from economics. Economics greatly enriches sociological knowledge. An economic factor greatly influences each and every aspects of social life. Economics is a part of sociology hence without the help of economics we can't understand sociology properly. Knowledge and research in the field of economics greatly contributes to sociology. Each and every social problem has an economic cause. For the solution of social problems like dowry, suicide etc. Sociologists take the help from economics. Marx opines economic relations constitute the foundation of Society. Economic factors play a very important role in every aspect of our social life that is why Sociologists concerned with economic institutions. For this reason Sociologists like Spencer, Weber, Durkheim and others have taken the help from economics in their analysis of social relationships. Thus both sociology and economics are very closely related with each other. There are some problems which are being studied by both sociologists and economists. Economic changes results in social changes and vice versa. However, inspite of the above closeness, inter-relationship and inter-dependence both the sciences have certain differences which are described below : 2.4.1 Differences : (1) Sociology is a science of society and social relationships whereas economics is a science of wealth and choice. NSOU ? PGSW-V 38 (2) Sociology is a much younger science which has very recent origin whereas economics is comparatively an older science. (3) Sociology is an abstract science whereas economics is concrete in nature. (4) Sociology is a general social science whereas economics is a special social science. (5) The scope of

is concerned with the association of human beings. Sociology is the study of human interactions and inter-relations their conditions and consequences. But Economics deals with economic activities of man. It is a science of wealth and choice. According to Prof. Robbins Economics is a social "science which studies human behavior in relation to his unlimited ends and scarce means which have alternative uses." sociology is very wide whereas the scope of economics is very limited. (6) Sociology is concerned with the social activities of man whereas economics is concerned with the economic activities of man. (7) Society is studied as a unit of study in Sociology whereas man is taken as a unit of study in economics. (8) Both Sociology and economics differ from each other in respect of the methods and techniques they use for their study. 2.5 Sociology and Psychology Sociology is a science of society. Hence it is closely related to other social sciences and so also with psychology. Sociology and Psychology are very closely interlinked interrelated and interdependent. Relationship between the two is so close and intimate that Psychologist like Karl Pearson refuses to accept both as special science. Both depend on each other for their own comprehension. Their relationship will be clear if we analyze their inter-relationship and mutual dependency. Sociology is a science of social phenomena and social relationship. It is a science of social group and social institutions. It is a science of collective behavior. It studies human behavior in groups. But psychology is a science of mind or mental processes. It is a science of human behavior. It analyses attitudes, emotions, perception, process of learning and values of individuals and process of personality formation in society. In the words of Thouless 'Psychology is the positive science of human experience and behavior.' But both the sciences are closely related to each other which can be known from the following. Sociology receives help from Psychology. Psychology is a part of sociology hence without the help from Psychology Sociology can't understand itself fully and properly. There are many psychologists like Freud, MacDougal and others who have enrich

whereas economics is a special social science. (5) The scope of sociology is very wide whereas the scope of economics is very limited. (6) Sociology is concerned with the social activities of man whereas economics is concerned with the economic activities of man. (7) Society is studied as a unit of study in Sociology whereas man is taken as a unit of study in economics. (8) Both Sociology and economics differ from each other in respect of the methods and techniques they use for their study. Sociology and Psychology: Sociology is a science of society. Hence it is closely related to other social sciences and so also with psychology. Sociology and Psychology are very closely interlinked interrelated and interdependent. Sociology in many respects. They opines that the whole social life could be reduced finally to psychological forces. Each and every social problems and social phenomenon must have a psychological basis for the solution of which sociology requires the help from psychology. A new branch of knowledge has developed with the combination of sociology and psychology which is known as social psychology. Similarly, psychology depends on Sociology to comprehend itself fully. Psychology also requires help from sociology in many cases. As human mind and personality is being influenced by social environment, culture, customs and traditions hence psychology take the help from Sociology to understand this. To understand human nature and behaviour properly psychology depends on sociology. There are many Psychological problems which must have a Social Cause. Psychology requires the help from Sociology to understand these social problems. A research in Sociology richly contributes to psychology. Contributions and theories of many Sociologists also are of great help to Psychologists. Thus Sociology and Psychology are mutually dependent on each other. One can't comprehend itself without the help from others. Besides there are some common area of study such as social disorganization, public opinion etc. which are being studied by both Sociologists and Psychologists. Social Psychology a branch of Psychology is developed with the combination of the two. In the words of Kretch and Crutchfield Social Psychology is the science of behaviour of the individuals in society.

Sociology in many respects. They opines that the whole social life could be reduced finally to psychological forces. Each and every social problems and social phenomenon must have a psychological basis for the solution of which sociology requires the help from psychology. A new branch of knowledge has developed with the combination of sociology and psychology which is known as social psychology. Similarly, psychology depends on Sociology to comprehend itself fully. Psychology also requires help from sociology in many cases. As human mind and personality is being influenced by social environment, culture, customs and traditions hence psychology take the help from Sociology to understand this. To understand human nature and behaviour properly psychology depends on sociology. There are many Psychological problems which must have a Social Cause. Psychology requires the help from Sociology to understand these social problems. A research in Sociology richly contributes to psychology. Contributions and theories of many Sociologists also are of great help to Psychologists. Thus Sociology and Psychology are mutually dependent on each other. One can't comprehend itself without the help from others. Besides there are some common area of study such as social disorganization, public opinion etc. which are being studied by both Sociologists and Psychologists. Social Psychology a branch of Psychology is developed with the combination of the two. In the words of Kretch and Crutchfield Social Psychology is the science of behaviour of the individuals in society.

Social psychology is the study of social and cultural influences on the individual. It focuses on the behaviour of a single person and hence, differs from sociology, which is more concerned with relations among groups. However, there are areas of common interest such as socialisation, norms and values. Moreover, the influences of the group on the individual and of the individual on the group are also of interest to both social psychology and sociology. 2.5.1

Differences : However, inspite of the mutual relationship and dependence both the sciences differ from each other in the following ways. (1) Sociology is a science of society but Psychology is a science of mind. (2) Scope of Sociology is wide whereas scope of Psychology is limited. (3) Society is the unit of study in sociology but individual is the unit of study in case of Psychology. NSOU ? PGSW-V 40 (4) Sociology studies social processes whereas Psychology studies mental processes. (5) Sociology studies and analyses human behavior from Sociological angle whereas psychology studies and analyses human behavior from Psychological angles. 2.6 Sociology and Anthropology Sociology is the mother of all social sciences. Hence it has close and intimate relationship with Anthropology. The relationship is so close that Anthropologists like A.L. Kroeber consider Sociology and Anthropology as twin sisters. They often appear as two names for the same subject. R. Reddfield recognizes the closeness between these two social sciences. Sociology is a science of society. It studies behavior of man in groups. The term Sociology has been derived from the Latin word 'Socius' means society, companion or association and the Greek word 'logos' means study or science. Hence Sociology is concerned with the association of human beings. It is a science that deals with social groups. Similarly the term Anthropology is derived from two Greek words 'anthropos' meaning man and 'logos' meaning study or science. Accordingly anthropology means study of man. As a science of man it deals with man, his works and behavior. Anthropology studies the biological and cultural development of man. Anthropology has a wide field of study which can be broadly divided into three main divisions such as physical anthropology. Archeology cultural anthropology and social anthropology. Physical anthropology studies bodily characteristics of early man and thereby try to understand both primitive and modern cultures. Archeology studies cultures of pre-historic period. This study facilitates sociologists to make a comparative study of present social structure. It is concerned with the early periods of human existence. It reconstructs the origin, spread and evolution of culture by examining the remains of the past societies. Social anthropology deals with the behaviour of man in social institutions. Social anthropology and sociology are one and the same. Evan Pritchard considers social anthropology as a branch of Sociology. 2.6.1 Mutual Help : However there exists a very close and intimate relationship between Sociology and Anthropology. Both contribute to the growth of others. Both are mutually related to each

other. Of course Sociology studies society whereas anthropology studies man. But as man and society are mutually interrelated hence it is very difficult to distinguish two. However their close relationship can be known from the following. Anthropology contributes to the growth of Sociology. Without the help of anthropology the study of Sociology can't be complete. It is a part of Sociology. Anthropology provides knowledge about ancient societies. To have a comprehensive understanding of present society Sociology takes the help of anthropology. Contributions of many Anthropologists like R. Brown, Linton, Mead and Pritchard enriches sociological knowledge's. The origin of family, marriage, religion etc. can be better understood through anthropological knowledge. The concepts like cultural area, cultural traits, and cultural lag etc. sociology accept from anthropology. Sociology accepts the anthropological conclusion that 'racial superiority is not responsible for mental development.' Thus Sociology is greatly benefited by anthropological studies. Similarly, Sociology contributes richly towards the growth of anthropology. Anthropology accepts many concepts of Sociology. Research and contributions of many Sociologists like Emile Durkheim, Herbert Spencer is of great help to anthropology. Anthropologists greatly benefited by the Sociological researches. Ideas and conclusions of Sociology contributes to the research in anthropology. 2.7

W <http://www.yourarticlelibrary.com/sociology/the-relationship-of-sociology-with-other-social-sciences> ...

Hence it is obvious that other social sciences are closely related to sociology. Sociology is considered as the mother of social sciences. Besides sociology synthesizes other social sciences. Hence there exists a very close and intimate relationship between Sociology and other social sciences. For our precise understanding of the relationship between sociology and other social sciences we have to discuss them individually, which are discussed below :

2.2 Sociology and Political Science As a mother of social sciences Sociology has close and intimate relationship with all other social science. Hence it has close relationship with political science as well. Their relationship is so close and intimate that led G.E.C. Catlin to remark "Political Science and Sociology are two faces or aspects of the same figure." Similarly other scholars could not find any difference between the two disciplines. NSOU ? PGSW-V 33 Sociology is a Science of society. It is a science of social groups and social institutions. It is a general science of society. It studies human interaction and inter-relations their conditions and consequences. Political Science is a science of state and Government. It studies power, political processes, political systems, types of government and international relations. It deals with social groups organised under the sovereign of the state. In the words of Paul Junet, "Political Science is that part of social science which treats the foundation of the state and principles of government." It studies the political activities of man. It only studies the organised society. However their inter-relationship and inter-dependence can be known from interdependence and mutual relationship. Sociology depends on political science. In the words of Morris Ginsberg, "Historically Sociology has its main roots in politics and philosophy of history." Sociology greatly benefited by the books written by political scientists like Plato, Aristotle and Kautilya such as The Republic, The Politics and Arthashastra respectively. Each and every social problem has a political cause. Political Science is a part of sociology. Hence sociology depends on political science to comprehend itself. To understand different political events sociology takes the help from political science. Sociology to draw it's conclusions depends on political science. Any change in the political system or nature of power structure brings changes in society. Hence Sociology takes the help of political science to understand the changes in society. Hence both are inter-dependent. Similarly political science also depends on Sociology. Political Science is a part of sociology. To understand the part it is necessary to understand the whole. Almost all political problems has a social cause and for the solution of these political problems political science takes the help of sociology. State frames its rules, regulations and laws on the basis of social customs, tradition and values. Without Sociological background the study of political science will be incomplete. Political Scientists largely benefited by the researches and research methods of the Sociologist. Some consider political science as a branch of Sociology. State is considered as a social group hence is a subject of Sociology. Besides, there are some common topics which are being studied by both the subjects. These topics are War, Propaganda, authority, communal riots and law. With the help of both political science and sociology a new subject comes into existence which is known as political sociology. Some political events like war are also significant social events.

Hence it is obvious that other social sciences are closely related to sociology. Sociology is considered as the mother of social sciences. Besides sociology synthesizes other social sciences. Hence there exists a very close and intimate relationship between Sociology and other social sciences. For our precise understanding of the relationship between sociology and other social sciences we have to discuss them individually, which are discussed below: Sociology and Political Science: As a mother of social sciences Sociology has close and intimate relationship with all other social science. Sociology and Geography It has been realised from ancient times that Geography has a great impact on human society, the influences of geographical conditions on human society are predominant and that there is a close relationship between physical conditions and social phenomena. Geographical environment as defined by Maclver consists of those conditions that nature provides for man. It includes the earth surface with all its physical features and natural resources, the distribution of land and water, mountain and plains, minerals, plants and animals, the climate and all the cosmic forces, gravitational, electric, radiational that play upon the earth and affect the life of man. There is no denying the fact that there is a correspondence between physical conditions and modes of living e.g., inhabitants of tropical regions exhibit characteristic differences from those of temperate or of Arctic regions: the sea-farer is typically distinct

Sociology and Geography: It has been realised from ancient times that Geography has a great impact on human society, the influences of geographical conditions on human society are predominant and that there is a close relationship between physical conditions and social phenomena. Geographical environment as defined by Maclver consists of those conditions that nature provides for man. It includes the earth surface with all its physical features and natural resources, the distribution of land and water, mountain and plains, minerals, plants and animals, the climate and all the cosmic forces, gravitational, electric, radiational that play upon the earth and affect the life of man. There is no denying the fact that there is a correspondence between physical conditions and modes of living e.g., inhabitants of tropical regions exhibit characteristic differences from those of temperate or of Arctic regions: the sea-farer is typically distinct

from the inlanders. One can also observe the differences between the modes and exigencies of human life in mountains, in the plains and by the seaboard, in the desert and in the forest. Some of the thinkers have attributed a dominant role to Geography, regarding it as the primary determinant of wealth and health, the size or energy of populations, of their customs and social organisations, of their creeds and philosophies. The relationship between man's physical environment and his social life has led to a geographical school of Sociology. One of the pioneers of modern social geography was a Frenchman Le Play who in his important study of European workers had developed the thesis that locality determines work and thus has a great influence on the economic organisation of the family and this social institutions of the people. The emphasis of Le Play and his successors upon the relationship between the characteristics of the physical environment and social development has influenced the sociologists at other places also. The Regional School of American Sociology under the leadership of Howard W. Odum and his colleagues has been seeking the interaction between man's physical environment and man's social life. The writers of this school have thus added tremendously to our knowledge of the role of geography in man's development. They have made us aware of the inter-play between climate and topography and the various aspects of the physical environment on the one side and the political and economic, technological and cultural phenomena on the other. But we should not lay too much stress on geographical factors determining the social life in a particular region. It is not necessary that similar environments should produce similar cultures. We have even in primitive societies different occupations being followed by different people in the same regional setting. The geographical environments alone never explain the rise of a civilization. The growth of civilization changes and minimises the direct influence of local geographical conditions. Many of the occupations of the modern man have no relation to the geographical environments. As the social heritage grows the immediate geographical factors would assume a less determinant role in the interpretation of society. Man has assumed great control over natural factors so that the overall influence of geographical forces is no longer overpowering. The fact, however, remains that geography is a contributing, if not a determining, factor of human progress and, therefore, the relation between Sociology and Geography is intimate.

W <http://www.sociologydiscussion.com/sociology/relation-of-sociology-with-other-social-sciences/2188>

Sociology and Ethics Ethics is the science of morality. It is concerned with the moral rightness and wrongness of human action. Ethics and Sociology are intimately related to each other. Man is a social being. He acquires moral standards notions of right and wrong as a member of a social group. In other words, it is the society which influences the mental and moral development of the individual and it is the individual who in return seeks to conform his actions to the moral standards of his social group. Thus the real significance of moral life lies amidst a social group or in society. Sociology is primarily concerned with the study of the social groups and it investigates into all aspects of human life—economic, political, religious, moral and cultural. Ethics throws light on the moral life of the primitive individuals and institutions. This provides a background of human conduct and may thus serve a good purpose for contrasting and comparing the moral conduct of the modern life with that of the primitive man. Further, the personal good of the individual must at the same time be in harmony with the general good of the society as a whole. It is here that both Sociology and Ethics come close to each other. This close relationship between the two has induced some ethical thinkers to regard Ethics as a branch of Sociology. Charles A. Ellwood rightly remarks, "It is the business of sociology to furnish a foundation for scientific ethics and on the other hand, it is the business of ethics to take the ethical implications which a scientific knowledge of human society affords, develop them, criticise and harmonize them. An ethics worked out upon the basis of the knowledge furnished by the sciences will make a larger use, therefore, of sociological knowledge than of any other form of scientific knowledge." But the two sciences also differ in some essential aspects. Firstly, Sociology is a positive science, while Ethics is a normative science. Sociology studies institutions, customs and manners as they are or have been while Ethics looks upon them as they ought to be. Secondly, Sociology studies men and their social relations collectively while Ethics studies men individually as moral agents of the society. Thirdly, Sociology is merely speculative and has no practical bearing on any field of social life. Ethics, on the other hand, has some practical bearing on our conduct.

Sociology and Ethics: Ethics is the science of morality. It is concerned with the moral rightness and wrongness of human action. Ethics and Sociology are intimately related to each other. Man is a social being. He acquires moral standards notions of right and wrong as a member of a social group. In other words, it is the society which influences the mental and moral development of the individual and it is the individual who in return seeks to conform his actions to the moral standards of his social group. Thus the real significance of moral life lies amidst a social group or in society. Sociology is primarily concerned with the study of the social groups and it investigates into all aspects of human life – economic, political, religious, moral and cultural. Ethics throws light on the moral life of the primitive individuals and institutions. This provides a background of human conduct and may thus serve a good purpose for contrasting and comparing the moral conduct of the modern life with that of the primitive man. Further, the personal good of the individual must at the same time be in harmony with the general good of the society as a whole. It is here that both Sociology and Ethics come close to each other. This close relationship between the two has induced some ethical thinkers to regard Ethics as a branch of Sociology. Charles A. Ellwood rightly remarks, "It is the business of sociology to furnish a foundation for scientific ethics and on the other hand, it is the business of ethics to take the ethical implications which a scientific knowledge of human society affords, develop them, criticise and harmonize them. An ethics worked out upon the basis of the knowledge furnished by the sciences will make a larger use, therefore, of sociological knowledge than of any other form of scientific knowledge." But the two sciences also differ in some essential aspects. Firstly, Sociology is a positive science, while Ethics is a normative science. Sociology studies institutions, customs and manners as they are or have been while Ethics looks upon them as they ought to be. Secondly, Sociology studies men and their social relations collectively while Ethics studies men individually as moral agents of the society. Thirdly, Sociology is merely speculative and has no practical bearing on any field of social life. Ethics, on the other hand, has some practical bearing on our conduct.

from the point of view of morality. 2.9 Sociology and Jurisprudence Jurisprudence is the science of law. It is concerned with the study of the entire body of legal principles. Jurisprudence and Sociology are intimately related to each other. Sociology is the study of man in society. Law controls and regulates actions of human beings in society and it is, therefore, a subject of great importance for the sociologists. There is, however, difference of approach of a sociologist and of a lawyer to the subject of law. A lawyer is concerned with the rules that men ought to obey; he is not interested in knowing how and to what extent these rules govern the behaviour of ordinary citizens. A sociologist, on the other hand, is interested in law as a social phenomenon. His chief concern is not with the rules themselves but with whether they are observed or not and in what way. A sociologist's study of law from this angle has been given title of Sociology of Law or Sociological Jurisprudence. Criminology and Penology are its important branches. Criminology is concerned with the systematic study of crime and criminal behaviour from the social point of view. Penology studies the effects of various penal systems of punishment and the efficacy of reform and rehabilitation schemes in changing criminal behaviour. 2.10

from the viewpoint of psychological factors involved. VIII. Sociology and Jurisprudence: Jurisprudence is the science of law. It is concerned with the study of the entire body of legal principles. Sociology and Biology Biology is the science of man's biological development, his sexual, anatomical and personal peculiarities. It tells us how man's body and mind evolved, how his system reacts to the outside world and what part his physical constitution plays in the overall build up of his whole being. NSOU ? PGSW-V 45 Sociology is the study of human interaction and inter-relation. According to N. G. Muller, "Our ideas of what sort of progress is possible or desirable for man must depend in part at least upon our views of his nature, his manner of origination, the method by which changes have occurred and can occur in him and the relation which he bears with the rest of nature." It is not possible to determine the modes and limits of man's social progress without being acquainted with his physical capacities and limitations. According to Mischa Titiev, "It is impossible to gain a full understanding of man's culture without knowing something of his biology." Darwinian Theory of evolution has been very useful in sociology. Spencer, a leading sociologist, explained his theory of the evolution of society on the principle of natural evolution. Human ecology is based upon biological ecology. Genetics, which is of major importance in Sociology, is an important branch of biology. In knowing the effects of heredity upon man's behaviour much help is sought from biology. Knowledge of biology is also essential for understanding the problems concerned with marriage and family. Sociology on its part inspires biology to search knowledge in new directions, for example, the need to limit the population has led to search for the means of birth control. However, biological principles should not be indiscriminately applied to sociology. In this regard Ginsberg writes, "Biological factors are clearly of importance to the students of society, since the unit of society is a living organism. Great confusion has, however, resulted from the too facile application of biological categories to social facts, and in particular, a tendency to overemphasize the purely racial factors in social evolution or change."

These branches of Legal Sociology have rendered great service to the law makers and law executors by adding to their knowledge how the laws actually work and how the crime can be effectively dealt with. Sociology has thus shed considerable light and understanding on the various problems that the society has to solve, particularly, from the point of view of Criminal Jurisprudence. Consequently Jurisprudence has assumed a new meaning that laws are to be made for men and the law makers and its executors are to take into consideration the human and the social aspect while making or executing it. 2.12

A group should have a given number of individuals : One or two members cannot be called a group. Similarly a very large number of individuals cannot be called a group. It would be more appropriate to call it a community, crowd, mob or a society. You will learn about these concepts later. The group members should have regular interaction between themselves : Interaction between the members should be purposeful and considered as such by the members. Thus individuals waiting for a bus and having casual conversations cannot be called a group by these standards. Awareness about each other : The members are conscious about other members' behaviour, emotions, needs and their own behaviour is influenced by this consciousness. Members are aware of themselves being a unit : Group members see themselves as distinct from others. They acknowledge that their membership in the group makes them different from others. Common goals : A group, if it has to sustain itself has to have goals. Goals can be same for all members or in some cases goals can be different. It is also possible that the stated goals of the group may be different from the actual goals. A group may declare that its aim is to help the poor but members may join it primarily to meet and socialize with each other.

Common ideals and values : When the above conditions are met it is likely that as far as the group purpose is concerned, the members will have shared values. In matters not concerned with group, the members can have different views. For example, members of group dedicated to promoting wildlife photography will agree with each other on the importance of promoting such a cause. But, they may belong to different political parties and adhere to different ideologies. Established group patterns : Regular purposeful interactions give rise to group patterns. These interactions can be formal or informal depending on the nature of the groups. In case of formal interactions, rules, regulations and procedures are followed while in case of informal relations, there is spontaneity. 3.3.1 Primary Groups Primary groups are those groups whose members have face to face contacts, intimate, personal and non-formal relationship with each other. They have the following characteristics : Primary groups are of small size : The size of the group is important as in larger groups it is difficult for the member to have intimate contacts with everyone. Small groups allow qualitatively and quantitatively better interactions. Therefore, members have personal relationship with each other. Primary group members share common goals : Members of a primary group may have different characteristics. For example, a family may have an adult male and adult female and their children. Though they are different in many ways they share common goals, which they all think are important and contribute towards their happiness. Primary group offers its

W <http://egyankosh.ac.in/bitstream/123456789/17113/1/Unit-1.pdf>

a total experience : Total experience means that it affects the members in a number of ways. Individuals are accepted as total personalities. For example, the family is a primary group, which has face to face and intimate relationship. It is also a total relationship in the sense that members benefit in a number of ways. Children are given love and affections, provided with education and taken care of when there are sick etc. The husband and wife help each other in more than one way. Hence a very important part of the lives of the members is spent in the family. Peer groups are another example of primary groups. Primary group has relationship as an end in itself : Primary group members see the relationship as an end in itself. In other words, the relationship is valued for what it is NSOU ? PGSW-V 52 i.e. more than any specific benefit the members may get because of their membership. For example, if a man marries only because he wants somebody to cook for him then it cannot be called a 'genuine marriage'. Basic Social Concepts Primary groups generally have long life : Families and peer groups exist as long as the members of the group live. If any member dies or leaves the group the group itself ends. For example, if the father of the family dies, the group in its original form also come to an end. The surviving members may continue to act as group but roles and interaction patterns undergo a major change. It is, therefore, correct to call it a new group. Primary groups play an important role in determining the individual's personality : The family and the peer group are important agencies of socialisation. Both of them are primary groups and apart from the services they provide they also give the members emotional support and education. While other agencies of socialisation do play an important role, it is the unique experiences that the individual experience in the primary groups which becomes basis of his or her personality. Primary groups sometimes compete for individual loyalty : Primary groups seek high degree of loyalty from its members and in certain cases may advocate different values. In such a situation, the individual may be in a dilemma as to which group value to adopt. For example, a teenager's family may want the individual to dress conservatively while his peer group may want him to dress according to the latest fashion and style. This can lead to personality conflicts. Some sociologists have held that primary groups must have members living in close proximity with each other and having face-to-face relationships. But it need not be so as even when there is physical distance between the members, if they can still be emotionally close to each other and thus satisfy the criteria of the primary group. 3.3.2 Secondary Groups Secondary groups are generally larger than primary groups. Members in secondary groups have formal, impersonal, and need based relationship with each other. A secondary group has the following characteristics : Secondary groups have relatively large number of members : Secondary groups consist of many members who share common interests. Some secondary groups may have

a total experience: Total experience means that it affects the members in a number of ways. Individuals are accepted as total personalities. For example, the family is a primary group, which has face- to-face and intimate relationship. It is also a total relationship in the sense that members benefit in a number of ways. A secondary group has the following characteristics: Secondary groups have relatively large number of members: Secondary groups consist of many members who share common interests. Some secondary groups may have

W <http://egyankosh.ac.in/bitstream/123456789/17113/1/Unit-1.pdf>

lesser number than a large joint family. But the manner in which they relate with each other is different, as we will see now. The members can also be spread over large distances. Now a days, there are secondary groups whose members are all around the globe. They interact through the web and conduct effective global campaigns without meeting each other face to face. Secondary groups have specific interests : While primary groups have relationship as an end in itself, in secondary groups, relations are maintained so that some other ends can be achieved. Members are also aware of this condition and as such, their emotional involvement is much less as compared to secondary groups. Secondary group has clear objectives : The aim of forming a secondary group is to attain some objectives which the members feel are important. In most cases, the objective is such that an individual cannot attain it alone. He/she needs the cooperation from others. A secondary group is conceptually closer to the concept of association. Secondary group members relate to each other formally : Since secondary members have specific objectives in mind there is no need for them to know each other intimately. There is no need of meeting each other face-to-face either. A common newsletter or a website as is the case now a days, is all that is needed to share information and pool resources. Once the objective is attained, the secondary group may end its existence. Secondary groups play an important role in furthering members' interest : In democratic societies like ours, there is a need for mobilizing people on the basis of common interests. People can influence decision making at different levels only if they organize themselves and make their voices heard. Secondary associations are used to articulate the demands of various groups. 3.3.3 Relationship between Primary and Secondary Groups Primary and secondary groups are related in more ways than one. Firstly, primary groups like family provide the secondary groups with members. They also prepare them to cooperate and interact with others. Some behavioural problems among individuals occur when families do not prepare their children to deal with the demands of secondary groups. Secondly, primary groups like sub-groups and cliques which are part of secondary groups play a vital role in their decision making process. Their influence on the performance

'Relationship Between Primary and Secondary Groups Primary and secondary groups are related in more ways than one. Firstly, primary groups like family provide the secondary groups with members. They also prepare them to cooperate and interact with others. Some behavioural problems among individuals occur when families do not prepare their children to deal with the demdds of secondary groups. Secondly, primary groups like sub-groups and cliques which are part of secondary groups play a vital role in their decision making process. Their influence on the performance

W <http://egyankosh.ac.in/bitstream/123456789/17113/1/Unit-1.pdf>

of the secondary groups may be positive or negative depending on their intentions, their power and the power of those who may oppose them. Thirdly, primary groups within the secondary group give emotional support to the members. Most secondary groups cannot give its members a real sense of identity and nor can they give them individual attention. This can be seen in a college or even in the army and in such places, the primary groups of peers give support to the member. 3.3.4 Differences and Similarities in Concepts You have been introduced to the basic sociological concepts. You would have noticed that these concepts have some similarities and some differences. Any social group is seen as being more than sum total of its members and in that way comes to have a distinct life of its own. You should keep in mind that a sociologist's major interest is in the way human collectivities function as a whole and exercise their influence on the behaviour of the individuals. The difference between the various collectivities are due to the following factors: size of the group, that is, the number of members; geographical area over which the members are located; type of relationship between the members; relationship of the members to the collectivities; the nature of goals of the collectivities the duration of their life and finally collectivities, influence on The individual members. We shall differentiate the various concepts based on these factors as it will help in better understanding of the same. Size : The society is the largest collection of individuals. It consists of a number of communities, associations, institutions, primary groups and secondary groups. A community is always a part of the larger society. Associations and secondary groups are often smaller than a community. The primary group is the smallest social unit. Geographical location : The society is spread over the largest area, followed by the community and primary group. Associations and secondary groups may have members from a wide area but all people living in the area need not be members of the association. For example, everybody living in India is an Indian and every body living in a village is part of the village community. But a political party while having members from all over India cannot claim that all Indians are its members. Voluntary nature of membership : The above stated difference is due to the type of membership of the various collectivities. An individual becomes a member of a society

of the secondary groups may be positive or negative depending on their intentions, their power and the power of those who may oppose them. Thirdly, primary groups within the secondary group give emotional support to the members. Most secondary groups cannot give its members a real sense of identity and nor can they give them individual attention. W <http://egyankosh.ac.in/bitstream/123456789/17113/1/Unit-1.pdf>

and a community naturally, that is, by being physically present in the area and sharing essential characteristics. On the other hand an individual has to formally apply to be a member of an association or a secondary group. Nature of interaction : The interaction between the members is most frequent and intense in a primary group. Community, associations and secondary groups have less frequent and less intense interaction. Individuals are considered in their wholeness in a primary group while in a secondary group and association only a few aspects of the personality are taken into consideration. A political party is not concerned whether a member is healthy or educated as long as he or she performs useful work for the party. The primary group, however is concerned about many aspects of the personality and does not just keep in view the usefulness of the member. Goals of the collective : The goals of secondary groups and associations are specifics while the goals of the society and community are general and broad in nature. Primary groups have many goals and perform many functions for their members. The existence of primary groups is crucial for the continuance of other collectivities of social life. Relationship between the members and the larger whole : The loyalty and sense of identity the members feel in primary groups is greater than the feelings of identification among members in a community or a secondary group. In a society, these feelings are weaker still and more imagined than real. Duration of the collective : The duration of groups and collectivities varies. The family as primary group exists as long as the members are alive or do not leave. On the other hand, secondary groups, associations, community and society exist for long durations even as members die or leave. The persistence of these collectivities is irrespective of the presence and absence of any member or group of members. 3.4

Society Before we understand these concepts, it is important that we clarify what a concept means. A concept is expressed in one or more words. Also concepts are abstractions, which mean that these are derived from experience and are mentally created. Once the scientific community accepts a concept, all those who use it accept the meaning assigned to it. For example, in everyday language a road means a way. NSOU ? PGSW-V 56 Sometimes there is need for further clarification of the concept. For example, a road can be a street, a pukka road or kachn one or even a highway. In scientific language also, we qualify concepts, when we want to say something more specific. For example, communities can be further classified into rural community, urban community and tribal community. In some cases, social scientist; do not agree with the meaning attached to a specific concept and after a debate among them, meanings attached to the concept undergo a change. According to Horton and Hunt, concepts are used for the following reasons. One, it enables scientific discussion to take place. Concepts help social scientists find common ground for initiating discussions on theories. Secondly. New knowledge is also created when concepts and theories are debated and its limitations are identified. Thirdly, concepts allow easy communication by 'reducing need for elaborate description. Otherwise, the communicator would have to explain the social phenomena every time he/ she has to use it. According to Horton and Hunt society is an organization of people whose associations are with one another. Maclver describes society as a web of relationships. There are a number of definitions of society. Most of them point to the following characteristics of society. Society involves mutual awareness : The first condition for calling a set of individuals a society is the awareness among them about each other. It is only when individuals are aware about the presence of others that they can form a social relationship. Society consists of social relationships : Any two individuals or

conflict in society. Similarly we find that in many ways the members of society are alike and in many other ways they are different. There are groups and subgroups with these groups that have their respective dynamics. All these different social processes make up the society. Society has division of labour : One individual cannot perform all functions required to maintain a society. The work has to be divided among the members. The criteria by which the functions are divided among the members and its social consequences are important part of study for the sociologist. Division of labour can be based on sex, education, profession, ethnicity, caste or class. Division of labour depends on the level of complexity of the society. Society is more than the sum total of its members : The society influences individuals in many ways. It is the environment along with hereditary factors that determine the personality of the individual. Thus the society comes to have a force of its own by which it influences the members. This force is applied through social institutions like laws, religion and family. 3.5 Classification of Societies Sociologists have classified societies according to different criteria. Societies classified ort their geographical location : Examples of this classification are Western society, Indian society, Chinese society and so on. This kind of classification is used broadly like in western societies. It is felt for example that all societies in the west share certain common and significant characteristics. It can also be used narrowly when we

want to refer to a regional group, for example we talk of Manipuri society or Rajasthani society. Societies classified on the basis of the language : Examples of this classification are Tamil society and Telugu society. Language is a medium which unites people and one of the modes by which the culture of the people is expressed. So language is sometimes used to distinguish societies from each other. Societies classified based on core values : Sometimes opinions regarding the nature of the society are based on essential core-values which the members adhere to. For example, Western society is considered modern, rational, individualistic and consumerist while Indian society is considered to be traditional, religious, group-oriented and spiritual. In most cases such classification is the result of stereotyping and labeling. It is based on insufficient and inaccurate information on the societies other than one's own. Social workers should be able to see how such images, often negative, about other societies, influence the behavior of members. Societies based on level of complexity of social life : Simple societies are those societies that have the following characteristics: small-sized with fewer members; relatively isolated from other societies-spatially, culturally and economically, means for obtaining food is hunting and gathering; low level of technology used in production of articles; division of labour is limited and based on age and sex; barter and gift taking and giving are the major ways for exchange of goods between the members; political system is based on heredity principle and traditional authority; group consciousness dominates individual consciousness and unity in the group is maintained by the likeness among the members. On the other hand, complex societies are based on the following characteristics: large numbers of members and, therefore; close relationship with other societies mainly due to advanced technology used in communication and transport; high level of technology used in producing all goods including foodstuffs; division of labour is highly diversified; market is the main form of exchange of goods while other forms of exchange like barter play a marginal role; political system is highly advanced with different competing interests; a large bureaucracy based on rational-legal values: individual consciousness and individual freedom is promoted; diversity in life-styles is encouraged and unity is based on interdependence of members. Societies based on its economic system : Sociologists influenced by Marxism maintain that economic factors have predominant influence on how the society is structured and how society functions. Based on these criteria societies are classified as capitalistic societies and socialistic societies. Both these societies are complex in nature, but in NSOU ? PGSW-V 59 capitalistic society, the forces of production (land, factories) are privately owned. Workers working in these factories are paid wages in exchange of the labour they contribute. Markets determine the costs of the goods and services that are produced. Private property-ownership and profit-making are encouraged. The state has no or minimal role in the economy of the country. In a socialistic society, all or significant part of the forces of production are owned by the state in different forms. The state uses its ownership of industries to influence the economy. Equally important is the role of planning in a socialistic economy The market is only allowed to have limited influence on the economy. The supply of goods and services are determined by the plan which the

Private property-ownership and profit-making are encouraged. The state has no or minimal role in the economy of the country. In a socialistic society, all or significant part of the forces of production are owned by the state in different forms. The state uses its ownership of industries to influence the economy. Equally important is the role of planning in a socialistic economy The market is only allowed to have limited influence on the economy. The supply of goods and services are determined by the plan which the

government prepares after assessing the needs and demands' of different sections of the society. The government through its policies tries to ensure that the differences in income between various sections of the society are not very large. After the collapse of the Socialist, bloc planning has lost much of its appeal for governments around the globe. Most countries have started giving significant role to market and private entrepreneurs in their economies. Nevertheless, it is also true that classical capitalist society no longer exists as all governments in the modern times play a significant role in the economy of the country. Societies based on the political system : Societies can be classified also on the basis of the nature of political system into democratic or authoritarian.. A democratic society has a state whose leaders are elected by popular vote. Regular elections are held to elect the leaders. Though free and fair elections are important, other conditions needed for democratic society are: freedom of association, freedom of speech, tolerance of different opinions, protection of minority rights, equality before law and respect for human rights. Authoritarian society neither allows dissent nor freedom of association. No other organization is allowed to challenge the authority of the state. Societies classified based on historical periods : Ancient societies, medieval societies and modern societies are some of the societies based on historical periods in which they existed. 3.6

is a grouping of people : Community consists of a number of people living together and sharing a common life. They interact with each other frequently and purposefully. A fixed geographical area : This is an important characteristic of the community. A community has well-defined boundaries that are recognized by the members of the community as well as outsiders. To become a member of the community, one needs to have some relationship with the specific geographical area. In some cases, membership of the community can be had if one's parents belong to the specific community. Division of labour : In every group, many functions have to be performed, so that the group survives. No individual or group can do all these functions by themselves. There are also differences in the skill and aptitude of the individuals. These factors lead to division of labour and occupational specialization. Members are conscious of their unity and of belongingness to the community : Members are aware of their membership in a particular community. It affects their behaviour in many ways. They take pride in the achievements of their fellow-members and are concerned when undesirable things happen to them. Members act collectively in an organized manner to achieve common goals : Members live in a particular area and share common interests. Therefore, they can be easily organized to achieve common objectives. This, condition enables the practice of social work method-community organization. Also, many programmes are implemented because it is felt that the community as a whole will participate and benefit from the programme, for example, the community development programme. Common culture : Culture of any group develops as a result of group living. A common way of thinking about the different aspects of life develops and this is transmitted from one generation to other. Cultural influences from outside the group are accepted or rejected collectively by the group. As a result of common experiences, a common culture develops and regulates the group behaviour. Use of the Concept 'Community' The concept also helps in describing and differentiating existing communities. The most commonly used classification is to distinguish between urban community and rural community. Rural communities are characterized by the following attributes: strong community sentiment;

importance of neighbourhood; relatively high incidence of extended families; predominance of primary relationships; majority of community members' occupations are related to the primary sectors like fishing, agriculture, hunting, etc; high degree of informal social control; greater degree of homogeneity. On the other hand urban community is defined as characterised by the following: weak community sentiments and lesser importance of neighbourhood; predominance of lower degree of informal social control; major occupations of the members are related to industry and services sector and heterogeneity. Further when the community is taken as a unit for action, it simplifies the formulation and implementation of programmes. Without delineating the boundaries of the community and understanding its structure it would be difficult to analyze the needs of the community. Limitations in the Use of the Concept 'Community' Though the concept is quite clear on paper, in real life its application is confusing due to these reasons. Firstly, no community seems to fulfill all the characteristics required to be termed as a community. Also, the distinctions between different types of communities are not clear. We find that characteristics that are attributed to the rural characteristics are also found in the urban areas and vice versa. Secondly, in some Indian villages, there is less or even no 'We feeling' among the members because the community is divided on the basis of caste. Thirdly, it is observed that when people say 'community' they seem to have in their minds only the male members of the community. In many village communities, women do not have a public voice and sometimes are not even seen. 3.7

so that they can promote the group's interests. Attaining group interests will eventually mean that the individual member's interests are also promoted. Associations have objectives : These interests are specific and all the members are aware of these interests. In most cases, the objectives of the association will reveal those interests of the members, which it wants to pursue. Objectives are framed after taking into consideration the reality of the situation. The success and failure of the association depends on whether it attains its objectives or not. Association has formal rules and regulations : A small association may not have any formal rules as members may be functioning based on the personal relationship they have with each other. But if the association grows larger and its functioning becomes complex, then normal rules and regulations are formulated. Formal rules and regulations of the association determine how the members will act in specific situations. In many associations, these rules and procedures are written down. In your fieldwork agency you can request the officials to allow you to show the 'Memorandum of Association'. This document will show you the objectives of the agency, its mode of functioning and other relevant information. Membership is voluntary : Associations are product of modern societies. Membership is voluntary, that is, members join the association out of their own desire. The association can set standards for allowing members to join. Once the aspirant meets these standards he or she is allowed to join the association. Associations survive as long as it has members : Unlike families, associations survive even if the original members leave or expire. The only condition is that new members should join the association and replace those who're leaving. Associations and their relevance in modern society : Modern societies freely allow and even encourage the formation of the associations. Therefore, we find that there are associations that have serious objectives like influencing government policy and there are associations that want to promote bird watching. Tocqueville, a prominent social thinker, who studied the American society in the eighteen century, was the first to point out that associations promote democracy. Modern thinkers have agreed with these observations. Associations allow citizens to organize themselves, articulate their demands, thereby restricting the authority of the government. This prevents the government from accumulating all authority in itself at the cost of individual freedom. Two, associations allow for plurality

so that they can promote the group's interests. In cases of conflict between the partners, there are police and courts to deal with them. The totality of these processes can be called the institution of marriage in India. All institutions have roles and status: Every institution gives a particular role and status to the individuals involved in it. Role is a set of behaviour expected of an individual in particular social context. Status is the position of the individual in society. In an educational institution, for example, there are individuals who come to learn and are given the status of students, and the individuals who teach are given status of teachers. In</p>

Hunting and gathering tribes, industrialized Japan, Americans each is a society terms, society refers to a group of people who live in a definable community and share the same culture. On a broader scale, society consists of the people and institutions around us, our shared beliefs, and our cultural ideas. Typically, more-advanced societies also share a political authority. Sociologist Gerhard Lenski (1924–) defined societies in terms of their technological sophistication. As a society advances, so does its use of technology. Societies with rudimentary technology depend on the fluctuations of their environments, while industrialized NSOU ? PGSW-V 72 societies have more control over the impact of their surroundings and thus develop different cultural features. This distinction is so important that sociologists generally classify societies along a spectrum of their level of industrialization—from preindustrial to industrial to post industrial.

4.3.1 Preindustrial Societies Before the Industrial Revolution

and the widespread use of machines, societies were small, rural, and dependent largely on local resources. Economic production was limited to the amount of labor a human being could provide, and there were few specialized occupations. The very first occupation was that of hunter-gatherer. Hunter-Gatherer Hunter-gatherer societies demonstrate the strongest dependence on the environment of the various types of preindustrial societies. As the basic structure of human society until about 10,000–12,000 years ago, these groups were based around kinship or tribes. Hunter-gatherers relied on their surroundings for survival—they hunted wild animals and foraged for uncultivated plants for food. When resources became scarce, the group moved to a new area to find sustenance, meaning they were nomadic. These societies were common until several hundred years ago, but today only a few hundred remain in existence, such as indigenous Australian tribes sometimes referred to as “aborigines,” or the Bambuti, a group of pygmy hunter-gatherers residing in the Democratic Republic of Congo. Hunter-gatherer groups are quickly disappearing as the world’s population explodes. Pastoral Changing conditions and adaptations led some societies to rely on the domestication of animals where circumstances permitted. Roughly 7,500 years ago, human societies began to recognize their ability to tame and breed animals and to grow and cultivate their own plants. Pastoral societies, such as the Maasai villagers, rely on the domestication of animals as a resource for survival. Unlike earlier hunter-gatherers who depended entirely on existing resources to stay alive, pastoral groups were able to breed livestock for food, clothing, and transportation, and they created a surplus of goods. Herding, or pastoral, societies remained nomadic because they were forced to follow their animals to fresh feeding grounds. Around the time that pastoral societies emerged, specialized occupations began to develop, and societies commenced trading with local groups.

Hunting and gathering tribes, industrialized Japan, Americans—each is a society. But what does this mean? Exactly what is society? In sociological terms, society refers to a group of people who live in a definable community and share the same culture. On a broader scale, society consists of the people and institutions around us, our shared beliefs, and our cultural ideas. Typically, more-advanced societies also share a political authority. Sociologist Gerhard Lenski (1924–) defined societies in terms of their technological sophistication. As a society advances, so does its use of technology. These individual pieces of land, known as fiefdoms, were cultivated by the lower class. In return for maintaining the land, peasants were guaranteed a place to live and protection from outside enemies. Power was handed down through family lines, with peasant families serving lords for generations and generations. Ultimately, the social and economic system of feudalism failed and was replaced by capitalism and the technological advances of the industrial era.

4.3.2 Industrial Society

In the eighteenth century, Europe experienced a dramatic rise in technological invention, ushering in an era known as the Industrial Revolution. What made this period remarkable was the number of new inventions that influenced people's daily lives. Within a generation, tasks that had until this point required months of labor became achievable in a matter of days. Before the Industrial Revolution, work was largely person- or animal- based, and relied on human workers or horses to power mills and drive pumps. In 1782, James Watt and Matthew Boulton created a steam engine that could do the work of twelve horses by itself. Steam power began appearing everywhere. Instead of paying artisans to painstakingly spin wool and weave it into cloth, people turned to textile mills that produced fabric quickly at a better price and often with better quality. Rather than planting and harvesting fields by hand, farmers were able to purchase mechanical seeders and threshing machines that caused agricultural productivity to soar. Products such as paper and glass became available to the average person, and the quality and accessibility of education and health care soared. Gas lights allowed increased visibility in the dark, and towns and cities developed a nightlife. One of the results of increased productivity and technology was the rise of urban centers. Workers flocked to factories for jobs, and the populations of cities became increasingly diverse. The new generation became less preoccupied with maintaining family land and traditions and more focused on acquiring wealth and achieving upward mobility for themselves and their families. People wanted their children and their children's children to continue to rise to the top, and as capitalism increased, so did social mobility. It was during the eighteenth and nineteenth centuries of the Industrial Revolution that sociology was born. Life was changing quickly and the long-established traditions of the agricultural eras did not apply to life in the larger cities. Masses of people were moving to

Horticultural Around the same time that pastoral societies were on the rise, another type of society developed, based on the newly developed capacity for people to grow and cultivate plants. Previously, the depletion of a region's crops or water supply forced pastoral societies to relocate in search of food sources for their livestock. Horticultural societies formed in areas where rainfall and other conditions allowed them to grow stable crops. They were similar to hunter-gatherers in that they largely depended on the environment for survival, but since they didn't have to abandon their location to follow resources, they were able to start permanent settlements. This created more stability and more material goods and became the basis for the first revolution in human survival. Agricultural While pastoral and horticultural societies used small, temporary tools such as digging sticks or hoes, agricultural societies relied on permanent tools for survival. Around 3000 B.C.E., an explosion of new technology known as the Agricultural Revolution made farming possible—and profitable. Farmers learned to rotate the types of crops grown on their fields and to reuse waste products such as fertilizer, which led to better harvests and bigger surpluses of food. New tools for digging and harvesting were made of metal, and this made them more effective and longer lasting. Human settlements grew into towns and cities, and particularly bountiful regions became centers of trade and commerce. This is also the age in which people had the time and comfort to engage in more contemplative and thoughtful activities, such as music, poetry, and philosophy. This period became referred to as the "dawn of civilization" by some because of the development of leisure and humanities. Craftspeople were able to support themselves through the production of creative, decorative, or thought-provoking aesthetic objects and writings. As resources became more plentiful, social classes became more divisive. Those who had more resources could afford better living and developed into a class of nobility. Difference in social standing between men and women increased. As cities expanded, ownership and preservation of resources became a pressing concern. Feudal The ninth century gave rise to feudal societies. These societies contained a strict hierarchical system of power based around land ownership and protection. The nobility, known as lords, placed vassals in charge of pieces of land. In return for the resources that the land provided, vassals promised to fight for their lords.

Social Work with Rural Communities Features of the Rural Community ? In majority of the villages, the economy is based on agriculture. The life-cycle of a village community would centre on the specific nature of agriculture. Indian Agriculture is dependent on monsoons for most parts of the country, leading to a great degree of uncertainty. The labourers do not have work throughout the year, while the farmers are unsure of a good crop. This uncertainty would be reflected in the life of the people – long term planning to spend and save becomes difficult, affecting children's education, health and other long-term expenditures. ? The main occupations are cultivation and labour work. With the onset of monsoons, for tilling and ploughing the land, and during the harvesting season, the demand for labour goes up pushing up the wages. During the off- season, not only would the wages come down, but the families may also have to migrate in search of jobs. The cultivator, who is dependent on market prices, gains if the prices are high and vice-versa; with falling prices, he tends to loose. ? Compared to an urban community, the population of a village would be much smaller. Occupationally, and in terms of residence, people would be less mobile. In a rural community, occupations tend to be inherited – a cultivator's son would turn to farming, while children from a landless household would turn to labour work. Occupational changes are easier when a person migrates to an urban centre. Members of a rural community share similar cultural patterns, such as, the same language, religion, food habits, etc. Overall, a village has a great degree of homogeneity.

The social structure of the village is based on the caste system and the traditional family structure. The primary ties would be important with a strong sense of belonging. A person's role and perceptions would emerge as an outcome of his position in the local society. There would be a fundamental acceptance of the normative and perceptual values of the group. Members of the same caste tend to stay close to each other in the village.

Institutional Structures in a Rural Community Institutional structures refer to organisations with policies, programmes, finances and administrative hierarchy; and in the last fifty years, a number of them emerged undertaking different functions. Powerful castes and economic categories control them. They affect the life of the local community in various ways and it is necessary to understand how they work. They can be of three types: a) Governmental Organisations A number of departments of the state Government affect the life of the local community, such as the Revenue, Forest, Irrigation, Health, General Administration, Public Works Department, etc. The Government exercises direct control and takes all decision related to recruitment, working conditions, payment of salary, work allotment, supervision, etc. Then, there are autonomous organisations like the State Electricity Boards and the Police Department. b) Non-Governmental Organisations Local communities have a number of formal and informal organisations. They could be of different types—social, political, religious, etc., undertaking different functions in the community. Most villages may have one or two Mahila Mandals and a committee managing the affairs of the local shrine. Members of political parties tend to be more active than members of other organisations and could be mobilised for some of the social work issues. A major characteristic of NGOs is that the Government does not exercise direct control over them. c) Statutory and Public Institutions In the last half a century of development, a number of statutory organisations have emerged, such as, Panchayati Raj Institutions and co-operative organisations in the area of credit, agriculture processing and marketing, supply of agriculture inputs,

be provisions for social security measures in the form of old age pensions, savings schemes and provisions for taking loans. ? Low-Income households would be tied to the urban informal economy where economic insecurity is higher and the scope of rules and regulation is lower. The provision for social security measures is very poor in the urban informal economy. Generally, low-income households stay in slums, which are of two types. Those slums recognised by the municipal ? Authorities not only get civic facilities, but the residents become owner of their plot of land/house and become taxpayers. But non-recognised slums suffer from a double disability. Since they are not recognised by the municipal authorities, they are not eligible for civic amenities and could, at any time, be removed from their houses/sites. In addition, they cannot create an asset by improving the house-site. ? A portion of the urban community would be migrants. In smaller towns, the migration would be from the nearby villages, while in bigger towns and industrial cities, the migrants could be from far off places. The migrants would be coming with their own culture and, possibly, could be from a different linguistic group, caste group or religion. ? The population of urban communities would be large in size and also exhibit a great deal of heterogeneity. ? The social structure would see greater influence of secondary ties and the nuclear family. Geographic and occupational mobility in an urban community would be greater than in a rural community. ? Owing to influences from a variety of sources, a member of an urban community need not share the normative and perceptual values of his/her group of origin in its totality, and also, his sense of belonging to the group need not be very strong. Institutional Structures in an Urban Community Urban communities will see a wide variety of organisations as compared to rural communities. Part of the variety will be due to the heterogeneous nature of urban communities and partly because urban areas tend to be centres of industries and local administration. They impinge on the life of the local community in various ways and it is necessary to understand how they work. They can be of three types: a) Governmental Structures NSOU ? PGSW-V 82 A number of governmental departments undertake their functions, which are important in an urban community. The Department of Revenue, the General Administration Department, the Town Planning authorities, the Rationing Department, Department of Industries, etc., are some of the examples of government departments. b) Non-Governmental Structures Urban communities have a number of Non- Governmental organisations. Educational bodies, starting from the primary level till the highest level, would be seen in urban areas. The Chambers of Commerce, Merchant's Associations, religious bodies, social organisations, student organisations, women's group, etc. are some of the other common organisations. Commercial Institutions, such as industries and banks play an important role in urban setting. Political parties and social work organisations are other notable organisations in the urban communities. c) Statutory and Public Structures The most prominent public structure would be the municipality. In the field of cooperatives, many organisations are to be found – the most common would be co-operative housing societies and credit co-operative bodies. In many states, town planning is entrusted to statutory bodies. Problems in an Urban Community a) Problems at the Level of Individuals Family conflicts of various types will come under this category.

be provisions for social security measures in the form of old age pensions, savings schemes and provisions for taking loans. Low-Income households would be tied to the urban informal economy where economic insecurity is higher and the scope of rules and regulation is lower. The provision for social security measures is very poor in the urban informal economy. Generally, low-income households stay in slums, which are of two types. Those slums recognised by the municipal Social Work Among Communities 109 authorities not only get civic facilities, but the residents become owner of their plot of land/house and become taxpayers. But non-recognised slums suffer from a double disability. Since they are not recognised by the municipal authorities, they are not eligible for civic amenities and could, at any time, be removed from their houses/sites. In addition, they cannot create an asset by improving the house-site. A portion of the urban community would be migrants. In smaller towns, the migration would be from the nearby villages, while in bigger towns and industrial cities, the migrants could be from far off places. The migrants would be coming with their own culture and, possibly, could be from a different linguistic group, caste group or religion. The population of urban communities would be large in size and also exhibit a great deal of heterogeneity. The social structure would see greater influence of secondary ties and the nuclear family. Geographic and occupational mobility in an urban community would be greater than in a rural community. Owing to influences from a variety of sources, a member of an urban community need not share the normative and perceptual values of his/her group of origin in its totality, and also, his sense of belonging to the group need not be very strong. Institutional Structures in an Urban Community Urban communities will see a wide variety of organisations as compared to rural communities. Part of the variety will be due to the heterogeneous nature of urban communities and partly because urban areas tend to be centres of industries and local administration. 110 Social Work Intervention with Individuals and Groups They impinge on the life of the local community in various ways and it is necessary to understand how they work. They can be of three types: a) Governmental Structures A number of governmental departments undertake their functions, which are important in an urban community. The Department of Revenue, the General Administration Department, the Town Planning authorities, the Rationing Department, Department of Industries, etc., are some of the examples of government departments. b) Non-Governmental Structures Urban communities have a number of Non- Governmental organisations. Educational bodies, starting from the primary level till the highest level, would be seen in urban areas. The Chambers of Commerce, Merchant's Associations, religious bodies, social organisations, student organisations, women's group, etc. are some of the other common organisations. Commercial Institutions, such as industries and banks play an important role in urban setting. Political parties and social work organisations are other notable organisations in the urban communities. c) Statutory and Public Structures The most prominent public structure would be the municipality. In the field of cooperatives, many organisations are to be found – the most common would be co-operative housing societies and credit co-operative bodies. In many states, town planning is entrusted to statutory bodies. Problems in an Urban Community a) Problems at the Level of Individuals

The most common would be conflicts between the spouses or conflicts between two generations of the family members. These conflicts are more in the nature of value-conflicts and the focus is on one or two individuals, in which the human personality plays a role. Problems of children could become a separate area of work. Inter-generational conflicts are likely to be more common in urban families. b) Problems at the Level of Groups The problems at the group level could be more in the nature of socio-economic conditions. This could be the problems of the aged, single parents, unemployed, beggars, school drop-outs, destitute, orphans, victims of crime, juvenile delinquents, AIDS affected group, mentally ill patients, differently-able, etc. c) Problems at the Level of Communities The defining element here would be a section of population larger than a group being affected. This could be a large segment of the community or the whole NSOU ? PGSW-V 83 community. In terms of issues, it could be that of alcoholism, sanitation, health, violence, environmental degradation, drinking water, problem of wages, infrastructural problems, problem of exploitation and oppression, etc. The other issues could be of poverty and employment; getting the names of poor people included in the BPL list. The identified problems have to be developed in the format of an 'Issue'. To fulfill this process, the following steps should be undertaken : 1. Identify the problem to be worked upon; 2. Decide on the target group – the quantitative dimension; 3. Operationalise the objectives, which could have both quantitative and qualitative objectives; 4. Identify local Institutional structures for collaborative work; 5. Decide on a line of action; 6. List out a few qualitative and quantitative indicators to evaluate the work done. Once these steps are undertaken, then the broad outline of the intervention measure is ready. Now specific steps have to be decided upon, for which the following details of the proposed line of action would be helpful. 1. What specific steps have to be taken? 2. What resources are required for the proposed steps? 3. From where are the resources to be obtained? 4. Discussion with the personnel of the institutional structures on the nature of collaboration to be undertaken. 4.7 Social Work with Tribal Communities Features of a Tribal Community ? The problem of defining a tribe has long defied administrators, anthropologists and sociologists, all of whom have given different definitions. The International Labour Organisation (ILO) in its report of 1953 stated that, "there can be no standard, which can apply to all indigenous or aboriginal groups throughout the world" (Deogaonkar, 1994). NSOU ? PGSW-V 84 However, any group displaying the following characteristics can be treated as a tribe : a) A definite habitat and area. b) A unified social organisation based primarily on blood relationship (Consanguinity).

Family conflicts of various types will come under this category. The most common would be conflicts between Social Work Among Communities 111 the spouses or conflicts between two generations of the family members. These conflicts are more in the nature of value-conflicts and the focus is on one or two individuals, in which the human personality plays a role. Problems of children could become a separate area of work. Inter-generational conflicts are likely to be more common in urban families. b) Problems at the Level of Groups The problems at the group level could be more in the nature of socio-economic conditions. This could be the problems of the aged, single parents, unemployed, beggars, school drop-outs, destitute, orphans, victims of crime, juvenile delinquents, AIDS affected group, mentally ill patients, differently-abled, etc. c) Problems at the Level of Communities The defining element here would be a section of population larger than a group being affected. This could be a large segment of the community or the whole community. In terms of issues, it could be that of alcoholism, sanitation, health, violence, environmental degradation, drinking water, problem of wages, infrastructural problems, problem of exploitation and oppression, etc. The other issues could be of poverty and employment; getting the names of poor people included in the BPL list. Conceptualising the Social Work Intervention Measures The identified problems have to be developed in the format of an 'Issue'. To fulfill this process, the following steps should be undertaken : Identify the problem to be worked upon; Decide on the target group – the quantitative dimension; 112 Social Work Intervention with Individuals and Groups Operationalise the objectives, which could have both quantitative and qualitative objectives; Identify local Institutional structures for collaborative work; Decide on a line of action; List out a few qualitative and quantitative indicators to evaluate the work done. Once these steps are undertaken, then the broad outline of the intervention measure is ready. were governed by notions of collective ownership of property including land and meeting many of their needs from the forest. Even today, tribals are less integrated with the market structures as compared to members of other communities. ? The status of women in tribal communities is better and they enjoy more decision-making powers. This is indicated from the fact that in olden times, a 'bride-price' had to be paid rather than 'dowry', as the case is with mainstream society. In the pre-British period, the tribals had an autonomous culture and were a nature loving community. Starting with the British period onwards, the tribal community is getting assimilated into the mainstream Indian society, but at the lower end of the society. This process is called acculturation, which "is the process by which a whole way of life is in a process of change under the influence of another culture. This cultural change may be slow or rapid, and in due course, it may lead to partial or even total assimilation with other cultures. Each tribal group may be at a different level" (Deogaonkar, 1994). Institutional Structures in a Tribal Community Traditional Institutions like the Ghotul, which helped in the socialisation of youth, is weakening, while modern structures are emerging. The Panchayati Raj System, Co-operative bodies, educational institutions and market structures are now slowly being formed in tribal areas. Many government departments, some of which have specialised in tribal affairs, are functioning among tribal communities. In many tribal areas, social work organisations, mostly NGOs, have made important contributions in the field of education and health.

Problems in a Tribal Community Land Alienation A large section of tribals own land, which is cultivable. Starting from the British period, tradesmen, moneylenders and hardy farmers have entered tribal areas and unscrupulously grabbed the tribal lands. Thus, the tribals, who were traditional farmers became farm servants and in many cases bonded labour in their own land. Later on, legislation was passed to prohibit any land transaction between a tribal, and a non-tribal monetary or otherwise, which, to an extent, has checked the process. Forest and Tribals Since time immemorial, tribals have cohabited with nature and depended upon the forests for fuel, fodder and other necessities of life. By collecting minor forest produce, they could sell it to itinerant tradesmen or in nearby markets to buy necessary things from the market. Right from the British regime, these traditional rights, known as nistar rights, were accepted and given official recognition by the Government. The tribal use of the forest was purely for home-based consumption and the forest cover was preserved. The British period saw the beginning of commercial exploitation of forest, which continued in the post- Independence period as well. This process led not only to the abridgment of tribal rights over forest, but unscrupulous contractors, in nexus with bureaucrats, cut vast stretches of forest. The tribal access to forest was reduced and a right for limited use was granted, requiring permission from local forest officials necessitating bribes and harassment. Currently, there has been some change in the forest policy and moves have been taken to entrust the management of forest to local communities under the Joint-Forestry Management Schemes. Displacement A major problem which the tribal community is facing

monetary compensation. She/He has problems in investing the compensation in a secure way or in buying an equivalent piece of land. When entire tribal communities are uprooted, then the loss is of a way of life for which no monetary compensation can suffice. Poverty and Unemployment The tribal way of life was based on 'use' and on a subsistence mode. Ownership of property, increasing production, saving and dealing with market forces was relatively unknown. The onset of modernization can be traced back to the British period. The growth of urbanization and industrialization, the emergence of modern education and new skills left the tribal community at a disadvantage. While the Old World was disintegrating, they were ill-equipped to deal with the demands of a modern age. Poverty and unemployment is rampant among the tribal community. In the last two decades, a small section of tribals has emerged, who are educated and have got good jobs. The socio-economic policies of the last few decades have led to the setting up of schools, hostels, scholarships being awarded, developmental projects, and a small stratum of tribals have taken the benefits of these programmes – they are educated and have got stable jobs in the public sector. But these changes have not taken place among a large number of tribals. A majority of poor tribals are either landless or are subsistence farmers. Owing to the poor spread of irrigation, farming in India is dependent on monsoons. Growing a single crop leaves the tribal farmer no surplus to build up some savings, while for half of the year, there are no jobs for the landless tribals. Language and Identity A majority of tribals are spread throughout the country, and in most places, do not enjoy a numerical majority. Perforce, they have to learn the language of the state to which they belong in addition to Hindi and English and in the process, the tribal language and scripts are dying. Along with the loss of their language is the loss of their way of life and the question of identity crisis. In some places, tribal movements have taken place to protest against their exploitation by outside forces and also to assert their tribal identity. One outcome of these processes has been the creation of the state of Jharkhand carved out of Bihar. Apart from the North- Eastern states, Jharkhand is the only state where the tribals form a numerical majority.

etc. Milk co-operatives have been set in many rural areas. They are public bodies reflecting local interests with political overtones. Since the leadership emerges after fighting elections, these bodies have strong local roots. The most widespread of such organisation is the Panchayati Raj Institution, which works at the District (Zilla Parishad), Block (Panchayat Samiti) and the Village (Gram Panchayat and Gram Sabha) level. Each state has passed its own legislation for the implementation of Panchayati Raj. In the area of rural banking, the National Bank for Agriculture and Rural Development has been set up under the NABARD Act, 1981, which is a Central legislation. Problems in a Rural Community The problems in a rural community can be understood in the following manner : a) Problems at the level of Individuals Family conflicts of various types will come under this category. The most common would be conflicts between the spouses or conflicts between two generations of the family members. These conflicts are more in the nature of value-conflicts, centered on one or two individuals in which the role of the human personality is important. b) Problems at the level of Groups The problems at the group level could be more in the nature of socio-economic conditions. These could be the problems of the aged, single parents, marginal farmers, landless households, illiterates, school drop-outs, teenagers, etc. c) Problems at the level of Communities The defining element here would be a section of population larger than a group being affected. This could be a large segment of the community or the whole community. At this level, there are implications on policies affecting the village community and the working of the local institutional structures. In terms of issues, it could be that of alcoholism, sanitation, health, violence, environmental degradation, drinking water, matters related to land and forest, problem of wages, infrastructural problems, problem of exploitation and oppression, below poverty line families etc. An important area of work could be the functioning of the Gram Panchayat and Gram Sabha. The Gram Sabha is supposed to be the base of the Panchayat Raj System and, in principle, exercises the maximum powers at the village level. All adult villagers constitute the Gram NSOU ? PGSW-V 80 Sabha and are supposed to meet four times a year to review the work done by the Gram Panchayat and make new plans to be implemented by the Gram Panchayat. In practice, this never happens and a small group controls and monopolises both the Gram Panchayat and the Gram Sabha. The identified problems have to be developed in the format of an 'Issue'. To implement this process, the following steps should be undertaken : 1. Identify the problem to be worked upon; 2. Decide on the target group – the quantitative dimension; 3. Operationalise the objectives, which could have both quantitative and qualitative dimensions; 4. Identify local institutional structures for collaborative work; 5. Decide on a line of action; 6. List out a few qualitative and quantitative indicators to evaluate the work done. Once these steps are undertaken, then the broad outline of the intervention measure is ready. Now, specific steps have to be decided upon, for which the following details of the proposed line of action would be helpful : ? What specific steps have to be taken? ? What resources are required for the proposed steps? ? From where the resources are to be obtained? ? Discussion with the personnel of the institutional structures on the nature of collaboration to be undertaken. 4.6 Social Work with Urban Communities Features of an Urban Community ? The

<p>The endogeneity of the capital–output ratio led us to a classical theory: the Solow model. In Solow’s twist on the Harrod–Domar story, the capital–output ratio adjusts with the relative availability of capital and labor. This adjustment occurs because of diminishing returns to each of these inputs, and we can use production functions to capture such effects. To continue, if capital grows faster than the labor force, then each unit of capital has less labor to man it, so that output divided by capital falls. Thus savings fall relative to the capital stock, and this slows down the rate of growth of capital. Exactly the opposite happens if capital is growing too slowly relative to labor. This mechanism ensures that in the long run, capital and working population grow exactly at the same rate, and per capita growth ultimately vanishes. Capital and labor maintain a constant long-run balance that is known as the steady-state capital stock (per capita).</p>

<p>Growth dies out in the simple Solow model because there is no technical progress. If you think of technical progress as a steady growth in knowledge that continually increases the productivity of labor, it becomes important to distinguish between the working population and effective labor, which is the working population multiplied by (the changing level of) individual productivity. Thus effective labor grows as the sum of population growth and technical progress. With this amendment, the Solow arguments apply exactly as before, with all per capita magnitudes reexpressed per units of effective labor. This means, for NSOU ? PGSW-V 128 instance, that while the long-run capital stock, relative to effective labor, settles down to a steady-state ratio, the capital stock per person keeps growing and it does so at the rate of technical progress. Likewise, per capita income keeps increasing in the long run precisely at the rate of technical progress. 6.6</p>

Additionally, Marx saw conflict in society as the primary means of change. Economically, he saw conflict existing between the owners of the means of production—the bourgeoisie— and the laborers, called the proletariat. Marx maintained that these conflicts appeared consistently throughout history during times of social revolution. These revolutions or “class antagonisms” as he called them, were a result of one class dominating another. Most recently, with the end of feudalism, a new revolutionary class he called the bourgeoisie dominated the proletariat laborers. The bourgeoisie were revolutionary in the sense that they represented a radical change in the structure of society. In Marx’s words, “Society as a whole is more and more splitting up into two great hostile camps, into two great classes directly facing each other—Bourgeoisie and Proletariat” (Marx and Engels 1848). In the mid-nineteenth century, as industrialization was booming, industrial employers, the “owners of the means of production” in Marx’s terms, became more and more exploitative toward the working class. The large manufacturers of steel were particularly ruthless, and their facilities became popularly dubbed “satanic mills” based on a poem by William Blake. Marx’s colleague and friend, Frederick Engels, wrote *The Condition of the Working-Class in England* in 1844, which described in detail the horrid conditions.

Another idea that Marx developed is the concept of false consciousness. False consciousness is a condition in which the beliefs, ideals, or ideology of a person are not in the person’s own best interest. In fact, it is the ideology of the dominant class (here, the bourgeoisie capitalists) that is imposed upon the proletariat. Ideas such as the emphasis of competition over cooperation, or of hard work being its own reward, clearly benefit the owners of industry. Therefore, workers are less likely to question their place in society and assume individual responsibility for existing conditions.

W <https://courses.lumenlearning.com/sociology/chapter/theoretical-perspectives-on-society/>

In order for society to overcome false consciousness, Marx proposed that it be replaced with class consciousness, the awareness of one's rank in society. Instead of existing as a "class in itself," the proletariat must become a "class for itself" in order to produce social change (Marx and Engels 1848), meaning that instead of just being an inert strata of society, the class could become an advocate for social improvements. Only once society entered this state of political consciousness would it be ready for a social revolution. NSOU ? PGSW-V 172 While Karl Marx may be one of the best-known thinkers of the nineteenth century, Max Weber is certainly one of the greatest influences in the field of sociology. Like the other social thinkers discussed here, he was concerned with the important changes taking place in Western society with the advent of industrialization. And, like Marx and Durkheim, he feared that industrialization would have negative effects on individuals. Weber's primary focus on the structure of society lay in the elements of class, status, and power. Similar to Marx, Weber saw class as economically determined. Society, he believed, was split between owners and laborers. Status, on the other hand, was based on noneconomic factors such as education, kinship, and religion. Both status and class determined an individual's power, or influence over ideas. Unlike Marx, Weber believed that these ideas formed the base of society. Weber's analysis of modern society centered on the concept of rationalization. A rational society is one built around logic and efficiency rather than morality or tradition. To Weber, capitalism is entirely rational. Although this leads to efficiency and merit-based success, it can have negative effects when taken to the extreme. In some modern societies, this is seen when rigid routines and strict design lead to a mechanized work environment and a focus on producing identical products in every location. Another example of the extreme conditions of rationality can be found in Charlie Chaplin's classic film *Modern Times* (1936). Chaplin's character performs a routine task to the point where he cannot stop his motions even while away from the job. Indeed, today we even have a recognized medical condition that results from such tasks, known as "repetitive stress syndrome." Weber was also unlike his predecessors in that he was more interested in how individuals experienced societal divisions than in the divisions themselves. The symbolic interactionism theory, the third of the three most recognized theories of sociology, is based on Weber's early ideas that emphasize the viewpoint of the individual and how that individual relates to society. For Weber, the culmination of industrialization, rationalization, and the like results in what he referred to as the iron cage, in which the individual is trapped by institutions and bureaucracy. This leads to a sense of "disenchantment of the world," a phrase Weber used to describe the final condition of humanity. Indeed a dark prediction, but one that has, at least to some degree, been borne out (Gerth and Mills 1918). In a rationalized, modern society, we have supermarkets instead of family-owned NSOU ? PGSW-V 173 stores. We have chain restaurants instead of local eateries. Superstores that offer a multitude of merchandise have replaced independent businesses that focused on one product line, such as hardware, groceries, automotive repair, or clothing. Shopping malls offer retail stores, restaurants, fitness centers, even condominiums. This change may be rational, but is it universally desirable? 9.3

Deviance If we want to reduce violent crime and other serious deviance, we must first understand why it occurs. Many sociological theories of deviance exist, and together they offer a more complete understanding of deviance than any one theory offers by itself. Together they help answer the questions posed earlier: why rates of deviance differ within social categories and across locations, why some behaviors are more likely than others to be considered deviant, and why some kinds of people are more likely than others to be considered deviant and to be punished for deviant behavior. As a whole, sociological explanations highlight the importance of the social environment and of social interaction for deviance and the commission of crime.

Travis Hirschi's (b. 1935) control theory. According to Hirschi, social control is directly affected by the strength of social bonds (1969). Many people would be willing to break laws or act in deviant ways to reap the rewards of pleasure, excitement, and profit, etc. if they had the opportunity. Those who do have the opportunity are those who are only weakly controlled by social restrictions. Similar to Durkheim's theory of anomie, deviance is seen to result where feelings of disconnection from society predominate. Individuals who believe they are a part of society are less likely to commit crimes against it. Hirschi identified four types of social bonds that connect people to society (1969) :

1. Attachment measures our connections to others. When we are closely attached to people, we worry about their opinions of us. People conform to society's norms in order to gain approval (and prevent disapproval) from family, friends, and romantic partners.
2. Commitment refers to the investments we make in conforming to conventional behaviour. A well-respected local businesswoman who volunteers at her synagogue and is a member of the neighbourhood block organization has more to lose from committing a crime than a woman who does not have a career or ties to the community. There is a cost/benefit calculation in the decision to commit a crime in which the costs of being caught are much higher for some than others.
3. Similarly, levels of involvement, or participation in socially legitimate activities, lessen a person's likelihood of deviance. Children who are members of Little League baseball teams have fewer family crises.
4. The final bond, belief, is an agreement on common values in society. If a person views social values as beliefs, he or she will conform to them. An environmentalist is more likely to pick up trash in a park because a clean environment is a social value to that person.

United States is that they resent the “Westernization” of their societies from the influence of the United States and other wealthy Western nations. When they see Coca-Cola and Pepsi logos and the McDonald’s golden arches in their nations, they fear Western influence and the loss of their own beliefs and traditions. These caveats notwithstanding, societies have become much more modern over time, to put it mildly. We thus cannot fully understand society and social life without appreciating how societies have changed as they have become more modern. Not surprisingly, sociologists have recognized the importance of modernization ever since the discipline of sociology began in the 19th century, and much of the work of sociology’s founders—Émile Durkheim, Max Weber, Karl Marx, and others—focused on how and why societies have changed as they became more modern. We can draw on their efforts and related work by later sociologists and by anthropologists to develop an idea of the differences modernization has made for societies and individuals. Several dimensions and effects of modernization seem apparent (Nolan & Lenski, 2009). First, as societies evolve, they become much larger and more heterogeneous. This means that people are more different from each other than when societies were much smaller, and it also means that they ordinarily cannot know each other nearly as well. Larger, more modern societies thus typically have weaker social bonds and a weaker sense of community than small societies and place more of an emphasis on the needs of the individual.

W <https://open.lib.umn.edu/sociology/chapter/20-1-understanding-social-change/>

We can begin to appreciate the differences between smaller and larger societies when we contrast a small college of 1,200 students with a large university of 40,000 students. Perhaps you had this contrast in mind when you were applying to college and had a preference for either a small or a large institution. In a small college, classes might average no more than 20 students; these students get to know each other well and often have a lot of interaction with the professor. In a large university, classes might hold 600 students or more, and everything is more impersonal. Large universities do have many advantages, but they probably do not have as strong a sense of community as is found at small colleges. A second aspect of modernization is a loss of traditional ways of thinking. This allows a society to be more creative and to abandon old ways that may no longer be appropriate. However, it also means a weakening or even ending of the traditions that helped define the society and gave it a sense of identity. NSOU ? PGSW-V 187 A third aspect of modernization is the growth of individual freedom and autonomy. As societies grow, become more impersonal, and lose their traditions and sense of community, their norms become weaker, and individuals thus become freer to think for themselves and to behave in new ways. Although most of us would applaud this growth in individual freedom, it also means, as Émile Durkheim (1895/1962) recognized long ago, that people feel freer to deviate from society's norms and thus to commit deviance. If we want a society that values individual freedom, Durkheim said, we automatically must have a society with deviance. Is modernization good or bad? This is a simplistic question about a very complex concept, but a quick answer is that it is both good and bad. We see evidence for both responses in the views of sociologists Ferdinand Tönnies, Weber, and Durkheim. Tönnies said that modernization meant a shift from *Gemeinschaft* (small societies with strong social bonds) to *Gesellschaft* (large societies with weaker social bonds and more impersonal social relations). Tönnies lamented the loss of close social bonds and of a strong sense of community resulting from modernization, and he feared that a sense of rootlessness begins to replace the feeling of stability and steadiness characteristic of small, older societies. Weber was also concerned about modernization. The hallmarks of modernization, he thought, are rationalization, a loss of tradition, and the rise of impersonal bureaucracy. He despaired over the impersonal quality of rational thinking and bureaucratization, as he thought it was a dehumanizing influence. Durkheim took a less negative view of modernization. He certainly appreciated the social bonds and community feeling, which he called mechanical solidarity, characteristic of small, traditional societies. However, he also thought that these societies stifled individual freedom and that social solidarity still exists in modern societies. This solidarity, which he termed organic solidarity, stems from the division of labor, in which everyone has to depend on everyone else to perform their jobs. This interdependence of roles, Durkheim said, creates a solidarity that retains much of the bonding and sense of community found in premodern societies. We have already commented on important benefits of modernization that are generally recognized: modernization promotes creativity and individual freedom and autonomy. These developments in turn usually mean that a society becomes

We can begin to appreciate the differences between smaller and larger societies when we contrast a small college of 1,200 students with a large university of 40,000 students. Perhaps you had this contrast in mind when you were applying to college and had a preference for either a small or a large institution. In a small college, classes might average no more than 20 students; these students get to know each other well and often have a lot of interaction with the professor. In a large university, classes might hold 600 students or more, and everything is more impersonal. Large universities do have many advantages, but they probably do not have as strong a sense of community as is found at small colleges. A second aspect of modernization is a loss of traditional ways of thinking. This allows a society to be more creative and to abandon old ways that may no longer be appropriate. However, it also means a weakening or even ending of the traditions that helped define the society and gave it a sense of identity. A third aspect of modernization is the growth of individual freedom and autonomy. As societies grow, become more impersonal, and lose their traditions and sense of community, their norms become weaker, and individuals thus become freer to think for themselves and to behave in new ways. Although most of us would applaud this growth in individual freedom, it also means, as Émile Durkheim (1895/1962) recognized long ago, that people feel freer to deviate from society's norms and thus to commit deviance. If we want a society that values individual freedom, Durkheim said, we automatically must have a society with deviance. Is modernization good or bad? This is a simplistic question about a very complex concept, but a quick answer is that it is both good and bad. We see evidence for both responses in the views of sociologists Ferdinand Tönnies, Weber, and Durkheim. As Chapter 5 "Social Structure and Social Interaction" discussed, Tönnies (1887/1963) said that modernization meant a shift from *Gemeinschaft* (small societies with strong social bonds) to *Gesellschaft* (large societies with weaker social bonds and more impersonal social relations). Tönnies lamented the loss of close social bonds and of a strong sense of community resulting from modernization, and he feared that a sense of rootlessness begins to replace the feeling of stability and steadiness characteristic of small, older societies. Weber (1921/1978) was also concerned about modernization. The hallmarks of modernization, he thought, are rationalization, a loss of tradition, and the rise of impersonal bureaucracy. He despaired over the impersonal quality of rational thinking and bureaucratization, as he thought it was a dehumanizing influence. Durkheim (1893/1933) took a less negative view of modernization. He certainly appreciated the social bonds and community feeling, which he called mechanical solidarity, characteristic of small, traditional societies. However, he also thought that these societies stifled individual freedom and that social solidarity still exists in modern societies. This solidarity, which he termed organic solidarity, stems from the division of labor, in which everyone has to depend on everyone else to perform their jobs. This interdependence of roles, Durkheim said, creates a solidarity that retains much of the bonding and sense of community found in premodern societies. We have already commented on important benefits of modernization that are generally recognized: modernization promotes creativity and individual freedom and autonomy. These developments in turn usually mean that a society becomes

societies, then, generally feature more tolerance than older societies. Many people, undoubtedly including most sociologists, regard greater tolerance as a good thing, but others regard it as a bad thing because they favor traditional beliefs and behaviors. Beyond these abstract concepts of social bonding, sense of community, and tolerance, modern societies are certainly a force for both good and bad in other ways. They have produced scientific discoveries that have saved lives, extended life spans, and made human existence much easier than imaginable in the distant past and even in the recent past. But they have also polluted the environment, engaged in wars that have killed tens of millions, and built up nuclear arsenals that, even with the end of the Cold War, still threaten the planet. Modernization, then, is a double-edged sword. It has given us benefits too numerous to count, but it also has made human existence very precarious.

<p>W https://open.lib.umn.edu/socialproblems/chapter/16-3-terrorism/</p>				

Vigilante terrorism is committed by private citizens against other private citizens. Sometimes the motivation is racial, ethnic, religious, or other hatred, and sometimes the motivation is to resist social change. The violence of racist groups like the Ku Klux Klan was vigilante terrorism, as was the violence used by white Europeans against Native Americans from the 1600s through the 1800s. What we now call "hate crime" is a contemporary example of vigilante terrorism. Insurgent terrorism is committed by private citizens against their own government or against businesses and institutions seen as representing the "establishment." Insurgent terrorism is committed by both left-wing groups and right-wing groups and thus has no political connotation. US history is filled with insurgent terrorism, starting with some of the actions the colonists waged against British forces before and during the American Revolution, when "the meanest and most squalid sort of violence was put to the service of revolutionary ideals and objectives" (Brown, 1989, p. 25). An example here is tarring and feathering: hot tar and then feathers were smeared over the unclothed bodies of Tories. Some of the labor violence committed after the Civil War also falls under the category of insurgent terrorism, as does some of the violence committed by left-wing groups during the 1960s and 1970s. A relatively recent example of right-wing insurgent terrorism is the infamous 1995 bombing of the federal building in Oklahoma City by Timothy McVeigh and Terry Nichols that killed 168 people. Transnational terrorism is committed by the citizens of one nation against targets in another nation. This is the type that has most concerned Americans at least since 9/11, yet 9/11 was not the first time Americans had been killed by international terrorism. A decade earlier, a truck bombing at the World Trade Center killed six people and injured more than 1,000 others. In 1988, 189 Americans were among the 259 passengers and crew who died when a plane bound for New York exploded over Lockerbie, Scotland; agents from Libya were widely thought to have planted the bomb. Despite all these American deaths, transnational terrorism has actually been much more common in several other nations: London, Madrid, and various cities in the Middle East have often been the targets of international terrorists. State terrorism involves violence by a government that is meant to frighten its own citizens and thereby stifle their dissent. State terrorism may involve mass murder, assassinations, and torture. Whatever its form, state terrorism has killed and injured more people than all the other kinds of terrorism combined (Gareau, 2010). Genocide, of course

W <https://open.lib.umn.edu/socialproblems/chapter/16-3-terrorism/>

Gender inequality is found in varying degrees in most societies around the world, and the United States is no exception. Just as racial/ethnic stereotyping and prejudice underlie racial/ethnic inequality so do stereotypes and false beliefs underlie gender inequality. Although these stereotypes and beliefs have weakened considerably since the 1970s thanks in large part to the contemporary women's movement, they obviously persist and hamper efforts to achieve full gender equality. A sociological perspective reminds us that gender inequality stems from a complex mixture of cultural and structural factors that must be addressed if gender inequality is to be reduced further than it already has been since the 1970s. Despite changes during this period, children are still socialized from birth into traditional notions of femininity and masculinity, and gender-based stereotyping incorporating these notions still continues. Although people should certainly be free to pursue whatever family and career responsibilities NSOU ? PGSW-V 214 they desire, socialization and stereotyping still combine to limit the ability of girls and boys and women and men alike to imagine less traditional possibilities. Meanwhile, structural obstacles in the workplace and elsewhere continue to keep women in a subordinate social and economic status relative to men. To reduce gender inequality, then, a sociological perspective suggests various policies and measures to address the cultural and structural factors that help produce gender inequality. These steps might include, but are not limited to, the following :

1. Reduce socialization by parents and other adults of girls and boys into traditional gender roles.
2. Confront gender stereotyping by the popular and news media.
3. Increase public consciousness of the reasons for, extent of, and consequences of rape and sexual assault, sexual harassment, and pornography.
4. Increase enforcement of existing laws against gender-based employment discrimination and against sexual harassment.
5. Increase funding of rape-crisis centers and other services for girls and women who have been raped and/or sexually assaulted.
6. Increase government funding of high-quality day-care options to enable parents, and especially mothers, to work outside the home if they so desire, and to do so without fear that their finances or their children's well-being will be compromised.
7. Increase mentorship and other efforts to boost the number of women in traditionally male occupations and in positions of political leadership.
- 8.

Gender inequality is found in varying degrees in most societies around the world, and the United States is no exception. Just as racial/ethnic stereotyping and prejudice underlie racial/ethnic inequality (see Chapter 3 "Racial and Ethnic Inequality"), so do stereotypes and false beliefs underlie gender inequality. Although these stereotypes and beliefs have weakened considerably since the 1970s thanks in large part to the contemporary women's movement, they obviously persist and hamper efforts to achieve full gender equality. A sociological perspective reminds us that gender inequality stems from a complex mixture of cultural and structural factors that must be addressed if gender inequality is to be reduced further than it already has been since the 1970s. Despite changes during this period, children are still socialized from birth into traditional notions of femininity and masculinity, and gender-based stereotyping incorporating these notions still continues. Although people should certainly be free to pursue whatever family and career responsibilities they desire, socialization and stereotyping still combine to limit the ability of girls and boys and women and men alike to imagine less traditional possibilities. Meanwhile, structural obstacles in the workplace and elsewhere continue to keep women in a subordinate social and economic status relative to men. To reduce gender inequality, then, a sociological perspective suggests various policies and measures to address the cultural and structural factors that help produce gender inequality. 8 _____ NSOU • PGSW - VI humans undergo are a result of chance incidents and personal choices, the vast majority of life changes and stages of human passes through are due to certain common biological and psychological factors partly inherited and partly environmental and are all shared by all people. Life span development deals with important common developmental stages that human being pass through: birth, infancy, adolescence, adulthood, old age and finally death. As the humans grow up from stage to stage they learn to make use of their body parts, learn how to express themselves and communicate with others, how to form relationship with others, how to love and how to work. Here an attempt will be made to present the meaning and concept of human development, characteristics and principles of development. 1.3. Concept of Development When we think of development, invariably we think of physical changes, as these are commonly observed at home with younger siblings, with parents and grandparents, in school with peers or others around us. From conception until the moment of death, we not only change physically, but we also change in the way we think, use language, and develop social relationships. Remember that, changes are not confined to any one area of a person's life; they occur in the person in an integrated manner. Development is the pattern of progressive, orderly, and predictable changes that begin at conception and continue throughout life. Development mostly involves changes — both growth and decline, as observed during old age. Development is influenced by interplay of biological, cognitive, and socio-emotional processes. Development due to genes inherited from parents, such as in height and weight, brain, heart, and lungs development, etc. all point towards the role of biological processes. The role of cognitive processes in development relate to mental activities associated with the processes of knowing, and experiencing, such as thought, perception, attention, problem solving, etc. Socio-emotional processes that influence development refer to

changes in an individual's interactions with other people, changes in emotions, and in

personality. A child's hug to her/his mother, a young girl's affectionate gesture to her/his sibling, or an adolescent's sorrow at losing a match are all reflections of socio-emotional processes deeply involved in human development. Development refers to the qualitative changes in the organism as whole. Development is a continuous process through which physical, emotional and NSOU • PGSW - VI _____ 9 intellectual changes occur. It is a wider and comprehensive term than growth. It is also possible without growth. In Webster's dictionary development is defined as "the series of changes which an organism undergoes in passing from an embryonic stage to maturity." In Encyclopedia Britannica is the term development defined as "the progressive change in size, shape and function during the life of an organism by which its genetic potential are translated into functioning adult system." So, development includes all those psychological changes that take in the functions and activities of different organs of an organism. Development is continuous and gradual process (Skinner). According to Crow

(D133211487)

and Crow (1965) development is concerned with growth as well as those changes in behavior which results from environmental

situation." Thus, development is a process of change in growth and capability over time due to function of both maturation and interaction with the environment. 1.4 Relation between Growth and Development Growth refers to an

(D133211487)

increase in the size of body parts or of the organism as a whole. It can be measured or quantified, for example, growth in height, weight, etc.

Growth refers to physical increase in some quantity over time. It includes changes in terms of height, weight, body proportions and general physical appearance. In Encyclopedia Britannica, growth is defined as "an increase in size or the amount of an entity". It means growth involves all those structural and physiological changes that take place within individual during the process of maturation. For example, growth of a child means the increase in weight, height and different organs of the child's body. Hurlock has defined Growth as "change in size, in proportion, disappearance of old features and acquisition of new ones". Growth refers to structural and physiological changes (Crow and Crow, 1962). Thus, growth refers to an increase in physical size of whole or any of its part and can be measured.

Development is a process by which an individual grows and changes throughout the life cycle. The

term development applies to the changes that have a direction and hold definite relationship with what precedes it, and in turn, will determine what will come after. A temporary change caused by a brief illness, for example, is not considered a part of development. All changes which occur as a result of development are not of the same kind. Thus, changes in size (physical growth), changes in proportion (child to adult), changes in features (disappearance of baby teeth), and acquiring new features are varied in their pace and scope level.

10 _____ NSOU • PGSW - VI 1.4.1 Comparison of Growth and Development • Growth refers to physiological changes and Development refers to overall changes in the individual. It involves changes in an orderly and coherent type towards the goal of maturity • Changes in the quantitative respect is termed as growth but Development changes in the quality along with quantitative aspect • Growth does not continue throughout life but development continues throughout life • Growth stops after maturation but development is progressive • Growth occurs due to multiplication of cells but development occurs due to both maturation and its interaction with the environment • Growth is cellular but development is organizational • Growth is one of the part of the developmental process but development is wider and comprehensive term • Growth may be referred to describe the changes in particular aspects of the body and behaviour of the organism, whereas, development describes the changes in the organisms as a whole • Growth may or may not bring development but development is possible without growth 1.5 Life-span Development Lifespan development explores how we change and grow from conception to death. This field of psychology is studied by developmental psychologists. They view development as a lifelong process that can be studied scientifically across three developmental domains: physical, cognitive development, and psychosocial. Lifespan Development refers to the full process of human development from conception to death. It is a holistic approach to understanding all of the physiological, cognitive, emotional, and social changes that people go through. Boyd and Bee (2009) explain that psychologists who study human development have recently adopted the lifespan perspective which "maintains that important changes occur during every period of development and that these changes must be interpreted in terms of the culture and context in which they occur".

Development The study of development according to the Life-Span Perspective (LSP) includes the following assumptions: 1. Development is life long, i.e. it takes place across all age groups starting from conception to old age. It includes both gains and losses, which interact in dynamic (change in one aspect goes with changes in others) ways throughout the life-span. 2. The various processes of human development, i.e. biological, cognitive, and socio-emotional are interwoven in the development of a person throughout the life-span. 3. Development is multi-directional. Some dimensions or components of a given dimension of development may increase, while others show decrement. For example, the experiences of adults may make them wiser and guide their decisions. However, with an increase in age, one's performance is likely to decrease on tasks requiring speed, such as running. 4. Development is highly plastic, i.e. within person, modifiability is found in psychological development, though plasticity varies among individuals. This means skills and abilities can be improved or developed throughout the life- span. 5. Development is influenced by historical conditions. For example, the experiences of 20-year olds who lived through the freedom struggle in India would be very different from the experiences of 20 year olds of today. The career orientation of school students today is very different from those students who were in schools 50 years ago. 6. Development is the concern of a number of disciplines. Different disciplines like psychology, anthropology, sociology, and neuro-sciences study human development, each trying to provide answers to development throughout the life-span. 7. An individual responds and acts on contexts, which include what was inherited, the physical environment, social, historical, and cultural contexts. For example, the life events in everyone's life are not the same, such as, death of a parent, accident, earthquake, etc., affect the course of one's life as also the positive influences such as winning an award or getting a good job. People keep on changing with changing contexts.

12 NSOU • PGSW - VI 1.6 Principles of Development

Developmental psychologists realize that an accurate picture of developmental pattern is fundamental to an understanding of children. They also recognize that knowledge of what causes variations in development is essential to an understanding of each individual child. Knowing what the developmental pattern is like as scientific as well as practical value. These values are: First, knowledge of the pattern of the human development helps developmental psychologists to know what to expect of children, at approximately what ages to expect different patterns of behaviour to appear, and when these patterns will normally be replaced by more mature patterns. Second, knowing what to expect enables developmental psychologists to set up guidelines in the form of height-weight scales, age-weight scales, and social- emotional developmental scales. Third, since successful development requires guidance, knowing the developmental pattern enables parents and teachers to guide the child's learning at approximate times. Fourth, knowing what the developmental pattern makes it possible for parents and teachers to prepare children ahead of time for the changes that will take place in their bodies, their interests, or their behaviour. 1.6.1 Development involves change The human being is undergoes changes

100%

MATCHING BLOCK 6/127

Final - TNOU - MSW - Psychology for Social Wor ...
(D133211487)

from the moment of conception to the time of death.

There are different types of change occur such as, changes in size, proportions, disappearance of old features and acquisition of new features etc. The goal of these developmental changes is self-realization, which Abraham Maslow has labeled as self-actualization- the striving to be the best person possible, both physically and mentally. It is the urge to do what one is fitted to do (Maslow, 1954). By utilizing the innate or inborn abilities one tries to realize and strive for self actualization during the total life period. The human being is never static. At every age, some of the changes that occur during the developmental processes are just beginning, some are at their peak, and some are in the process of decline and some changes are antagonistic in nature also. Each individual is equipped with certain abilities and potentialities at birth. Children's attitude towards change is generally determined by many factors. First, children's awareness of attitude change. Second,

Third, social attitude toward the change affect children as they do adults. Fourth, social attitudes are influenced, to some extent at least, by how the change affects the child's appearance. Fifth, cultural attitudes, affect the way people treat children as a result of changes in their appearance and behaviour. 1.6.2 Early development is more critical than later development Erikson views "childhood is the scene of man's beginning as man." He explains that if parents gratify the needs of the child for food, attention and love etc. His perception towards people and situation remains positive throughout his life. He develops positive attitudes, feels secure, emotionally stable and adjusts well with the environment. If negative experiences occur during early life of the child, maladjustments may take place. Guidance is most needed in the early stages of learning when the foundations are being laid. Without proper guidance children will be less likely to get on the wrong track. As early foundations quickly develop into habitual patterns, it will have a long influence on the child's personal and social adjustments. Developmental Psychologist also suggests that sometimes it is desirable to make changes in what has been learned, the sooner the changes are made, and the easier it is for children and consequently, the more cooperative they are in making the changes. Glueck concludes that delinquents can be identified as early as 2-3 years of age. 1.6.3 Development is the product of Maturation and learning Intrinsic maturing-maturation-is the unfolding of characteristics potentially present in the individual that come from individual genetic endowment. On the other hand, learning is the development that comes from exercise and effort. Through learning, children can acquire competence in using their hereditary resources. They must, however, have opportunities to learn. Development during the prenatal period mainly comes from maturation and it is very little dependent upon the activity. Postnatal maturation and learning are closely interrelated. One influences the other. There is a high correlation between gross physical development and the ability to manipulate the parts of the body that have grown. Development depends on the interaction of this hereditary endowment and social and cultural forces of the environment (Buhler, 1972). 1.6.4 Development is Continuous Development continues throughout the life of an individual. This process takes

14 _____ NSOU • PGSW - VI place in interaction with the social and cultural environment in which a person lives. One stage of development is the basic framework for the next stage of development. A child has limited knowledge and experiences about his environment. But as he develops, he acquires more information through explorations and incorporates the skills already acquired and the new skills become the basis for further achievement and mastery of skills. For example, the child is able to write; he/she must have developed a hand control to hold a pencil, eraser and pen. Thus, a person has vast experiences and knowledge as he grows up. 1.6.5 Development id Predictable Human development is predictable during the life span. In prenatal development, there is a genetic sequence, with certain traits appearing in fixed intervals. The same orderly pattern is evident in postnatal development, though the individual rate of development may vary more in the postnatal period than in the prenatal period. An orderly predictable pattern in physical development in both prenatal and postnatal life, have come two laws of direction sequence of development: the cephalocaudal law and the proximodistal law. According to the first law, development spreads over the body from head to foot. According to the proximodistal law, development proceeds from the near to far-outward from the central axis of the body toward the extremities. Specific areas of development, such as: different aspects of motor development, emotional behavior, speech, social behavior, concept development, goals, intellectual development etc. follow predictable patterns. For example, the growth of the child in height and weight etc. continue up to a certain age. One has to keep in mind, that though development is continuous, it is never uniform for the entire organism. if the body is to attain its adult proportions, inequalities in rate must occur. The feet, hands, and nose, for example, reach maximum development early in adolescence, while the lower part of the face and shoulders develop more slowly. 1.6.6 Individual Differences in Development Process Every child develops as per his abilities and perception of his environment. Children differ from each other both genetically and environmentally. Even if, the pattern of development is similar for all children but the rate of development varies among children. Dobzhansky (1973) has said "Every person is indeed biologically and genetically different from every other". In addition, no two people have identical environmental influences, even identical twins. This means that individual differences are caused by both internal and external conditions. As a result, the pattern of development will be different for every child, even though it is similar in its major aspects to the pattern followed by other children. Another important aspect is that,

NSOU • PGSW - VI _____ 15 even though the rate of development varies among children, all children display certain consistency of development. Studies reveal that children who are tall at one age are tall at other ages, while those who are short remain short (Vincent and Martin, 1961).

1.6.7 Periods in Developmental Patterns The five major developmental periods in childhood begin with the moment of conception and end when the child becomes sexually mature. These periods are as follows: Prenatal Period (Conception to birth): Before birth, development is extremely rapid. It is mainly physiological and consists of growth of all the bodily structures. Infancy (Birth to 10-14 days): During this time, the infant must adjust to a totally new environment outside the mother's body. Growth is temporarily at a stand. Babyhood (2 weeks to 2 years): At first, babies are completely helpless. Gradually, they learn to control their muscles so that they can become increasingly self-reliant. Childhood (2 years to Adolescence): This period is divided into two subdivisions: Early Childhood (2 to 6 years) and Late Childhood (6 to approximately 13 years). The former division is also called 'pregang age' and later one is called 'gang-age'. Puberty (11 to 16 years): The child's body is now transformed into adult body. Developmental Psychologists also included three stages in the developmental periods, these are: Adulthood (18 to 35 years), Middle age (36 to 55 years), old age (Older than 55 years).

1.6.8 Each Developmental Period characterizes with Social Expectations In every society there are certain rules, standards and traditions which everyone is expected to follow. Development is determined by social norms and expectations of behaviors form the individuals. Children learn customs, traditions and values of the society and also what behaviors are expected from them. They realize from the approval or disapproval of their behavior. Social expectations are otherwise known as "developmental tasks". Havinghurst (1972) defines developmental task as a "task which arises at or about a certain period in the life of an individual, successful achievement of which leads to his or her happiness and success with later tasks, while failure leads to unhappiness in the individual, disapproval by society, and difficulty with later tasks". Developmental tasks arise mainly (a) as a result of physical maturation; (b) form the cultural pressures of society, (c) out of the personal values and aspirations of the individual. The developmental tasks remain the same from one generation after another in a specific culture. As societies are evolving, changing traditions and cultural patterns of a society are

16 _____ NSOU • PGSW - VI learned automatically by children during their development process. These developmental tasks help in motivating children to learn as well as help parents to guide their children.

1.6.9 Each Developmental Area has Potential Hazards Development may be hampered by various hazards. Hazards may be of physical, environmental or psychological type. These hazards may be originated from the environment in which the child grows or due to hereditary factors. They have negative impact on physical as well as socio-psychological development of the child. Erikson (1964) has explained, "The struggles that inevitably characterize all growth can generate utterly reliable talents as well as intractable problems". The growth of the child may be retarded, he may be an aggressive person or he may encounter adjustment problems. For example, if a child is slurring or stammering and parents neglect the child, the child may continue with this problem.

1.6.10. Happiness varies in different Periods of Development Happiness varies at different periods in the development process. Childhood is the happiest period of life and puberty is the unhappy. The patterns of happiness vary from child to child and it is influenced by the rearing process of the child.

1.7 Role of Heredity and Environment The life of the individual begins at the moments of conception, when a sperm cell from the father penetrates the wall of ovum from the mother. At this moment the sperm and ovum release 23 chromosomes separately. This chromosome consists of small particles called genes which are carriers of child's heredity. A human being or any individual is the product of heredity and environment. Heredity is the constant factor established at the moment of conception, though its potentialities are realized at the different stages of growth. Environment on the other hand is continuously expanding. It starts from the prenatal period to the end of the life. Environment thus works at two stages- internal and external. So, overall the development of human being is depending upon the interaction of heredity and environment.

1.7.1 Role of Heredity Heredity means that an offspring inherits most of the personality traits of his parents and forefather which make him resemble them. Douglas and Holland defined heredity in 1947 as "One's heredity consists of all structures, physical characteristics,

NSOU • PGSW - VI _____ 17 functions or capacities derived from parents, other ancestors and species". Life begins with the conception, when a sperm fertilizes the ovum, approximately nine month before birth. Human life starts from a single cell which gradually develops into a complicated composition millions of body cells, containing same genetic material that was inherited at the time of conception. The fertilized ovum or zygote consists of a semi-fluid mass called cytoplasm and within the cytoplasm there is a nucleus which contains chromosomes always exist in pairs. In human, zygote, there are 23 pairs of chromosomes (46 individual chromosomes), that are made of very small units called genes. Genes are made up with DNA and RNA. Thus, what we get from ancestral stock through our parents at the time of fertilization is the form of chromosomes, genes and their respective classical constitutes. Like chromosomes, genes also occur in pairs. Some genes are dominant and others are recessive. An offspring may be found to derive a gene pair in one of the following forms 1. A dominant gene from one parent and a recessive gene from the other 2. Dominant genes from both parents 3. Recessive genes from both parents In simple meaning, a dominant gene must exhibit its dominance over recessive ones. However, the fact that a particular trait is recessive in one generation in no way rule out the possibility of its occurrence in the future. Hereditary factors begin their influence right from the time of conception. First of all, it determines the sex of the child. The zygote or the fertilized ovum contains 23 pairs of chromosomes of which first 22 pairs are called autosomes. Autosomes are responsible for deciding and determining the growth and development of most of the characteristics and structural composition of the body. The remaining 23 rd pair is the sex chromosome. There are two different types of sex-chromosome, contributed by mother and the other is y chromosome, contributed by the father. In a female child, both these are sex chromosomes, one from each parent. Heredity contributes significantly towards physical constitution. Most of the attributes related to outer body make-up, its constitution and functioning are well- decided and guided by heredity. Hereditary factors are also said to be the cause for 18 _____ NSOU • PGSW - VI some disease like tuberculosis, cancer, schizophrenia and their abnormalities. These diseases are the result of defective genes and chromosomes and are passes to subsequent generations. Along with other necessary aspects, the physiological set-up of our mind is also well inherited by the child. Normally, at the time of fertilization, a single ovum is fertilized by a sperm, which results in the birth of a single offspring at one time. But sometimes this normal function is distributed when two or more ova get fertilized resulting in the birth of two or more offspring at a time. There are two distinctly different twins' namely-identical twins (one ovum and one sperm) and fraternal twins (two ovum and two sperm). Thus, heredity does appear to have some influence on the development but it depends on the environment in which he is nurtured. 1.7.2 Role of Environment The forms into which the hereditary potentials will develop depend largely on the significant people in the individual's environment. Thus environmental factors actually shape and modify the hereditary potentials. This environment starts to act from the moment of conception throughout life. Thus environment may be two types : (a) Prenatal Environment and (b) Post-natal environment 1.7.2.1 Prenatal Environment Mother's way of living during pregnancy is very significant for child's later development. Emotionality of the mother influences the child's emotional pattern. Child of an emotionally deprived mother tends to be withdrawn because of lack of stimulation. The child of alcoholic or drug addict mother born with many syndromes even inborn addiction to drug or alcohol. Besides this, mother's nutrition, physique, temperament, emotionality etc are also important factors that can affect the development of the child. 1.7.2.2 Postnatal Environment 1.7.2.2.1 Family Relationship Of all developmental determinants the family is the most important because (a) it is the first social group the child with which identified (b) child spends more time with it (c) family members are more significant in the child's life during the years when the foundation of personality are being made. NSOU • PGSW - VI _____ 19 1.7.2.2 Parenting Style Parenting style also influences the development of the child. Some parent can be described as authoritarian- They want their demands obeyed. They are motivated to exert their power and control over their child's behaviour. The parenting style is high in control and low in warmth. The children of these parents have been observed to be withdrawn. Permissive parents: They do not make any demands on their child. They nurture the child but remain rather passive in setting and communicating standards for their child to achieve. Uninvolved Parents: They are uninterested in their child's development. They set new standards for their child's behaviour and provide minimal nurturance and support. Authoritative Parents: These parents raise their children within a context of high nurturance and realistic maturity demands. They prefer to use reward rather than punishment. They are both high in control and warmth. 1.7.2.2.3 Attachment Attachment refers to an enduring emotional tie between a baby and his caregiver. The infant's first manifestation of attachment to the caregiver occurs between 4 and 12 months of age (Bowlby, 1973). Bowlby observed that not all children are attached to the caregiver in the same way. He found two types of attachment. One is attachment secure and other one is anxious attachment (Bowlby, 1991). Securely attached infant separate easily from mothers to explore the playroom when stranger enters the room they are overtly worry and may seek to engage in interaction and consistently show positive emotional responses. Anxiously attached infants are unable to use their mothers as a secure base for exploration of their play room. 1.7.2.2.4 Identification Identification by child with his or her parents is another ingredient of development. Psychoanalytic theory proposes that children use to identify with their parents. According to Freud personality develops through five psychosexual stages- the first stage is the oral stage (0-1 year), where the primary focus of pleasurable sensation is mouth. How parent's deals with their infant needs determine whether infant will experience personality difficulties or not. At about the ages of 1 to 3 years anal stage starts. Children derive the pleasure by retaining or explaining the feces. Fixation by this stage results in either anal retentive character or anal expulsive character. In phallic stage oedipal complex seems to take place. Here due to identification

20 _____ NSOU • PGSW - VI with mother in case of girl and with father in case of boy they try to reduce their conflict. Attending the model behaviour they try to identify themselves with their parents and through this identification gender identity develops. Freud proposes two motives as the basis child's identification with his parents: Anaclitic identification- based on the child's dependence on his/her care giver. It allows the child to maintain in fantasy a continuous positive relationship with the parents and therefore protects the child from danger. Defensive Identification: It occurs of fear of the parents; children imitate to protect themselves from harm. 1.7.2.3 Physical Environment People of the earth live under diverse conditions of climate, terrain and natural resources. Some live in dense jungles and others on barren deserts, some live on high mountains and others on flat prairie lands. Some live where it is extremely cold and others where it is oppressively hot, some live where it rains most of the time and others where there is chronic drought. In some places food and other resources are plentiful, in others they are so scarce most of the individual's life must be spent in eking out a bare subsistence. Some areas are infested with disease and other hazards to physical safety; others are relatively free to disease and danger. 1.7.2.3.1 Climate and Terrain People inhabiting areas where conditions of climate or terrain are unfavourable tend to undergo adaptive physiological changes. For example, the circulatory system of the Eskimo tends to lie deep within a protective fatty layer which conserves his body heat. 1.7.2.3.2 Scarcity, Disease and Other Unfavourable Conditions Even today millions of people live in areas where disease is rife and food supplies are inadequate. Such conditions take a tremendous toll in reduced physical vigor, bodily damage and loss of life. Because adverse physical conditions influence the way a group lives, we may assume that they also exert some effect, at least indirectly, on the development of individual members. However, the precise effect is difficult to assess, for again we typically find cultural factors complicating the total situation. It becomes very difficult to evaluate the effect of physical environment on individual and group differences in development. Except in cases where unfavourable conditions lead to actual bodily damage, as in malnutrition and disease, the role of the physical environment seems a less important than that of the socio-cultural environment.

NSOU • PGSW - VI _____ 21 1.8 Socio-cultural Environment In much the same sense that man receives a genetic heritage which is the end product of countless million years of evolutionary history, so he receives a socio- cultural heritage which is the end product of many thousands of years of social evolution. This heritage varies dramatically from one social group to another, but the various cultures of the world have enough in common to enable us to speak meaningfully of "human culture". Every group, for example, has its language, family and social structure, customs, values, music and art. These "institutions" are characteristically human and tend to be transmitted by similar means in every society. Sometimes the instruction is deliberate, but just as often it is not. Following are the chief means by which the socio-cultural environment exerts its influence on individual development. 1.8.1 Group Membership and Instruction Both deliberately and unconsciously, each society teaches its concepts, values and accepted behaviors to its child. This instruction is largely accomplished by the social institutions such as home, school and temple or their equivalents. Thus systematic instruction, together with the examples set by adults or other "models" tend to make for some degree of uniformity and to establish what may be called the basic type of the particular society. The individual's basic developmental structure is affected not only by the larger social group but also by the various subgroups to which one belongs-group based upon his family membership, religion, occupation, social class, age and sex. Each subgroup tends to foster certain values, beliefs and approved behaviour patterns which may in turn be subject to the restrictions imposed by society as a whole. The fact that each individual belongs to somewhat different type of subgroup tends to produce individual differences, just as common membership in the larger cultural group makes everyone somewhat alike. The groups with which an individual identifies, or with which he would like to be identified, are called 'reference groups'-for it is in reference to the norms and values of that group that he sets his goals, models his behaviour and evaluates his worth. Sometimes reference groups from which the individual is excluded have greater influence on the person. 1.8.2 Status and Role In every social structure there are a variety of distinguishable positions - doctor,

22 _____ NSOU • PGSW - VI teacher, carpenter, parent, student, child and so forth - each of which contributes in some way to the total group functioning and is accorded a certain 'social status'. Status brings with it both privileges and responsibilities. For example, the medical doctor has the privilege of practicing medicine and also is held in high regard by other members of society. In return, he is expected to follow the ethical code of profession. If he fails to do so, he may have his medical license revoked and be relegated to an inferior social standing. To clarify what is expected of a person with a given position and status, society establishes various roles for its members to play, each associated with a certain pattern of expected behaviour. Thus the role of an army officer calls for loyalty, decisiveness, courage and resourcefulness. Each person of the society, youth or old, tends to develop the skills, behaviour and values that his role seems to demand. If he deviates too far from what is expected from, he is likely to run into difficulties in his social relationships. 1.8.3 Interpersonal Relationships Man is a social animal and much of his development reflects his experiences with other people. In many societies a certain pattern of interpersonal relationships may predominate over others - for example, the norm may be for competition or cooperation, hostility or friendliness. In general, however, interpersonal relationships contribute to individuality rather than similarity of development, for no two of us have exactly the same acquaintances nor do we have an identical relationship with the people we do know in common. Even parents relate to each of their children in somewhat different ways. The experiences of love and hate, of friendship and distrust, of shared experience and misunderstanding that characterize our associations with other people are in each case unique. Although we have many kinds of interpersonal relationships in the course of our lives, those that have the greatest influence in shaping our development are those with our parents and with members of our peer groups. Apart from that many other types of interpersonal relationships - with brothers and sisters, grandparents, teachers, neighbors - may play a significant part in shaping personality. Even a chance meeting with someone may change the direction of our lives. 1.8.4 Process of Socialization and its Role in Development Meaning of Socialization Human society is not an external phenomenon but exists solely in the minds of its members. The human infant comes into the world as a biological organism with NSOU • PGSW - VI _____ 23 animal needs. He is gradually moulded into a social being and he learns social ways of acting and feeling. Without this process of moulding the society could not continue itself, nor could culture exist, nor could the individual become a person. This process of moulding is called 'socialization'. It is

76%

MATCHING BLOCK 7/127

SA

Final - TNOU - MSW - Psychology for Social Wor ...
(D133211487)

through the process of socialization that an individual becomes a social person and attains personality.

Socialization involves inducting the individual into the social and cultural world, of making him a particular member in society and its various groups and inducting him to accept the norms and values of that society. Socialization is a matter of learning that enables the learner to perform social roles. Agencies of Socialization Socialization turns a child into a useful member of society and gives him social maturity. Therefore, it is of paramount importance to know as to who socializes with the child. There are two sources of child's socialization. The first includes those who have authority over her; the second are those who are similar to the child. The first category may include parents, teachers, elderly persons and the state. The second one includes peer groups, friends and fellows in the club. Briefly the main agencies of socialization are the following. 1.8.4.1 Primary Agencies The Family The parents or family constitute the first agency for the socialization of the child. They are not only closely related to the child but physically also they are nearer to him than others. From the parents children learn language. They are taught societal morality. They start respecting persons in authority. In the family a child learns a number of civic virtues. The family therefore, is rightly called "the cradle of social virtues". A child gets her first lesson in cooperation, tolerance, self sacrifice, love and affection in the family. The environment of a family influences almost all aspects of growth of a child. In understanding the role of family, the role of family obstruction also needs to be known. Loss of parents: Boys who reared up in absence of their father encounter difficulties in social, emotional and cognitive development. The children often involved in delinquent activities. Girls develop in absence of father show dependency on mother; emotional problems like school maladjustment, anxiety are common in them.

24 _____ NSOU • PGSW - VI Children of Divorce: They may feel pain, confusion and self doubt. They may feel become depressed, hostile, irritate and lonely. Parental Cohesiveness and lower socio-economic status: Children of lower socio-economic status may involve in antisocial activities and delinquent behaviour. Parental Maladjustment: Children's behavioural problem is more closely related to parental maladjustment. Institutionalization: Children institutionalized for a long time may decline in intellectual functioning and develop major psychological problem. Relationship with Sibling: The child's relationships with sibling exert some influence on the development of his personality. If there is a positive interaction the children show loyalty, helpfulness and cooperative attitude. Sex of Sibling: Children with brother have more masculine traits than with sister. The girls with brother more ambitious aggressive and better on intellectual ability, where as boys with older sister were less aggressive than boys with brother. Ordinal Position: Only born children according to Adler are more self-centered than those who have brothers and sisters because never have to share their parent's attention. First born children have stronger conscience than second born. They tended to more intellectually curious, adult oriented, serious and less aggressive. Where later born are peer oriented, easy going, cheerful, less anxious and less serious. Neighbourhood The neighborhood is the second important agency of socialization. Good neighborhood can make a child to grow as a positive person and responsible citizen. Peer Group or the Play Mates The peer group and friends also constitute an important agency of socialization. The relationship between the child and her playmates is one of equality. As stated above, the child acquires co-operative morality and some of the informal aspects of culture like fashion, fads, crazes, modes of gratification and forbidden knowledge. The knowledge of these things is necessary from the social point of view. The School The school is also a very important agency of socialization. In the school the child gets education which moulds the ideas and attitudes. Proper or adequate education can make the child a good citizen, while a bad education can turn him into

NSOU • PGSW - VI _____ 25 a criminal. Education is of great importance for the process of socialization. A well planned system of education can produce competent people. Secondary Agencies of Socialization All the above mentioned agencies are known as primary agencies of socialization. There are few other agencies of socialization which are known as secondary agencies of socialization. They include Religion Religion has been an important factor in society. In the early history of societies religion provided a bond of unity. Though in modern society the importance of religion has diminished, yet it continues to mould our beliefs and ways of life. The child sees his parents going to the temple and performing religious ceremonies, and listens to religious sermons which may determine the course of life and shaped his ideas. The State The state is an authoritarian agency of socialization. It makes law for the people and lays down the modes of conduct expected of them. The people have compulsorily to obey these laws. If they fail to adjust their behaviour in accordance with the law of the state, they may be punished for such failures. Thus the state also moulds a person's behaviour and personality. 1.8.5 Other Social and Cultural Factors Minority Groups Children of all ethnic groups and socio-economic levels may encounter many kinds of difficulties. Children from minority group suffer more in a society than majority group. Occupational Status The perception of occupational status is an important factor in shaping the personality. Person's occupation can satisfy a person's desire and gives him appropriate self-esteem. Marital Status Marital relationship influences both husbands and wife's personality. If they are satisfied in their relation, their personalities influence one another. Through identification they attribute some characteristics of other partner into themselves.

26 _____ NSOU • PGSW - VI Effect of Television According to social learning theory children watch a great deal of television they see and become stereotype themselves. Typically men on television are more aggressive and competent than women who are submissive and inactive. Socio-Economic Status (SES) Socioeconomic Status plays a pivotal role in human development. The index of socioeconomic status is determined by parental education, occupation and income. The children of low socioeconomic status may develop as mal-nourished, suffer from lack of knowledge in many aspects and their normal development may get hampered. The parenting in high socioeconomic status families would be different from low socio-economic status families. Children of the high socioeconomic groups of the society get better social opportunities, are nurtured with better nutrition, good medical treatment and are exposed to more intellectual stimulation than low socioeconomic group. Normative influences Normative influences occur in a similar way for majority of people in a particular group. These influences may be biological or environmental. For example, biological events like sexual maturity or deterioration in old age. Environmental events, like entering the school at about 6 yrs of age, parenthood etc. has the same influences on individuals. Most of the people of the same age, at same place and time and generation have common biological and environmental influences such as floods, famines and other natural disasters. Non-normative influences include the unusual life events in an individual's life. For example, death of a parent when a child is young or birth defects etc. Education and Training Each child is equipped with certain abilities which need to be nurtured through proper education and training. If proper identification of the ability is not possible and adequate facilities are not available to the child, then his innate ability may not be developed. Thus, adequate education and training have influence on human development. Now, in conclusion it can be said that, the nature versus nurture debate has been a classic controversy among experts for centuries. Presently, there is no clear

NSOU • PGSW - VI _____ 27 conclusion to the dispute; yet, there are many hypotheses. Both sides of this controversy have been explored thoroughly among researchers. There are some reasons for an individual to be conceived that genetics play a large part in a person's development. When considering the biology of heredity, it is obvious that genes provide humans with their own physical equipment, which is in essence, their basis. Genes and chromosomes are passed on from each generation to the next. Therefore, without heredity, human would have nothing to hand down biologically to their descendants. On the other hand, a person's environment also plays an important role on his development from early on. Much research shows that people flourish from early stimulation. In an experiment done by H. M. Skeels using orphans, he proved this conception. Skeels studied mentally retarded orphans. Once these children were placed with families to live, were treated well, and were encouragingly nurtured, their IQs increased remarkably (Harmer and Copeland, 1998). Both heredity and environment affect one considerably; although, research favors environment as having more influence on an individual. On the other hand, the mental abilities of the humans are determined by an individual's genetics. There is also substantial proof that an individual's environment affects his mental aptitude. So, individual's development dependent on both heredity and environment. 1.9 Conclusion In this unit our learner got a vivid idea about human development. The concept of ... development was discussed, along with the various principles of development. We also got an idea about the influence of heredity & environment in our life. 1.10 Exercise Essay Type Questions 1. Define the concept of development. Write in detail the principles of development. 2. Write in the detail the role of hereditary and environmental factors on development. 3. Discuss with suitable examples the role of socio-cultural environment on development.

Growth and Development 2.6 Conclusion 2.7 Exercise 2.8 References 2.1 Objectives • Concept of Life Span Development • Developmental Tasks during the Life Span • Different aspects of Development during different Developmental Stages • Health and Nutrition required for Growth and Development at each level 2.2 Introduction Developmental Psychology is the branch of psychology that studies individual changes and inter-individual changes within these intra-individual changes. As La Bouvie (1975) has pointed out, is "not only description but also explication of age- related changes in behaviour in terms of antecedent consequent relationships." Some developmental psychologists study developmental change covering the life span from conception to death. By so doing, they attempt to give a complete picture of growth and decline. Other covers only a segment of the life span-childhood, adulthood, or old age. Today, developmental psychologists have six major objectives: which include (1) to find out what are the common characteristic age changes in appearance, in behaviour and interests, and goals from one developmental period to another; (2) to find out whether these changes occur; (3) to find out what causes them; (4) to find

NSOU • PGSW - VI _____ 31 out how they influence behaviour;(5) to find out whether they can or cannot be predicted; and (6) to find out whether they are individual or universal. Developmental Psychologists have divided the total lifespan of human development in the following stages Periods Key Features Characteristics Pre-birth Potential The child who has not yet been born could become anything—a Michelangelo, a Shakespeare, a Martin Luther King – and thus holds for all of humanity the principle of what we all may yet become in our lives. Birth Hope When a child is born, it instills in its parents and other caregivers a sense of optimism; a sense that this new life may bring something new and special into the world. Hence, the newborn represents the sense of hope that we all nourish inside of ourselves to make the world a better place. Infancy Vitality The infant is a vibrant and seemingly unlimited source of energy. Babies thus represent the inner dynamo of humanity, ever fueling the fires of the human life cycle with new channels of psychic power. Early Childhood Playfulness When young children play, they recreate the world anew. They take what is and combine it with what is possible to fashion events that have never been seen before in the history of the world. As such, they embody the principle of innovation and transformation that underlies every single creative act that has occurred in the course of civilization. (Ages 0-3) (Ages 3-6) 32 _____ NSOU • PGSW - VI Periods Key Features Characteristics

Middle Childhood Imagination In middle childhood, the sense of an inner subjective self develops for the first time, and this self is alive with images taken in from the outer world, and brought up from the depths of the unconscious. This imagination serves as a source of creative inspiration in later life for artists, writers, scientists, and anyone else who finds their days and nights enriched for having nurtured a deep inner life. Late Childhood Ingenuity Older children have acquired a wide range of social and technical skills that enable them to come up with marvelous strategies and inventive solutions for dealing with the increasing pressures that society places on them. This principle of ingenuity lives on in that part of ourselves that ever seeks new ways to solve practical problems and cope with everyday responsibilities. Adolescence Passion The biological event of puberty unleashes a powerful set of changes in the adolescent body that reflect themselves in a teenager’s sexual, emotional, cultural, and/or spiritual passion. Adolescence passion thus represents a significant touchstone for anyone who is seeking to reconnect with their deepest inner zeal for life. Early Adulthood Enterprise It takes enterprise for young adults to accomplish their many responsibilities, including finding a home and mate, establishing a family or circle of friends, and/ or getting a good job. This principle of enterprise thus serves us at any stage of life when we need to go out into the world and make our mark. (Ages 9-11) (Ages 12-20) (Ages 20-35) (Ages 6-8)

NSOU • PGSW - VI _____ 33 Periods Key Features Characteristics Midlife Contemplation After many years in young adulthood of following society’s scripts for creating a life, people in midlife often take a break from worldly responsibilities to reflect upon the deeper meaning of their lives, the better to forge ahead with new understanding. This element of contemplation represents an important resource that we can all draw upon to deepen and enrich our lives at any age. Mature Adulthood Benevolence Those in mature adulthood have raised families, established them in their work life, and become contributors to the betterment of society through volunteerism, mentorships, and other forms of philanthropy. All of humanity benefits from their benevolence. Moreover, we all can learn from their example to give more of ourselves to others. Late Adulthood Wisdom Those with long lives have acquired a rich repository of experiences that they can use to help guide others. Elders thus represent the source of wisdom that exists in each of us, helping us to avoid the mistakes of the past while reaping the benefits of life’s lessons. Death & Dying Life Those in our lives who are dying, or who have died, teach us about the value of living. They remind us not to take our lives for granted, but to live each moment of life to its fullest, and to remember that our own small lives form of a part of a greater whole. (Ages 35-50) (Ages 50-80) (Age 80+)

34 _____ NSOU • PGSW - VI 2.3 Developmental Tasks during the Life Span Development is commonly described in terms of periods or stages. Human life proceeds through different stages. For example, suppose someone is at present in the stage of adolescence and after a few years he/she will enter the stage of adulthood. Developmental stages are assumed to be temporary and are often characterized by a dominant feature or a leading characteristic, which gives each period its uniqueness. During a particular stage, individual progresses towards an assumed goal - a state or ability that s/he must achieve in the same order as other persons before progressing to the next stage in the sequence. Of course, individuals do vary with respect to the time or rate of development from one stage to another. It may be noted that certain patterns of behaviour and certain skills are learned more easily and successfully during certain stages. These accomplishments of a person become the social expectations of that stage of development. They are known as developmental tasks. Havighrurst’s Developmental Tasks during the Life Span Babyhood and Early Childhood •

Typically, it lasts for about 40 weeks.

95% **MATCHING BLOCK 14/127** SA Final - TNOU - MSW - Psychology for Social Wor ... (D133211487)

The prenatal period is also considered an important part of the developmental process. Prenatal development is a time of remarkable change that helps set the stage for future psychological development. The brain develops over the course of the prenatal period, but it will continue to go through more changes during the early years of childhood. The first two weeks after conception are known as the germinal stage, the third through the eighth week is known as the embryonic period, and the time from the ninth week until birth is known as the fetal period. 2.4.1.1 Germinal Stage The germinal stage begins at conception when the sperm and egg cell unite in one of the two fallopian tubes. The fertilized egg,

known as a zygote, then moves toward the uterus, a journey that can take up to a week to complete. Cell division begins approximately 24 to 36 hours after conception. Within

100% **MATCHING BLOCK 15/127** SA Final - TNOU - MSW - Psychology for Social Wor ... (D133211487)

just a few hours after conception, the single-celled zygote begins making a journey down the fallopian tube to the uterus

where it will begin the process of cell division and growth. Through the process of mitosis, the zygote first divides into two cells, then into four, eight, sixteen, and so on. A significant number of zygotes never progress past this early part of cell division, with as many as half of all zygotes surviving less than two weeks. Once the eight-cell point has been reached, the cells begin to differentiate and take on certain characteristics that will determine the type of cells they will eventually become. As the cells multiply, they will also separate into two distinctive masses: the outer cells will eventually become the placenta while the inner cells will form the embryo. Cell division continues at a rapid rate and the cells then develop into what is known as a blastocyst. The blastocyst is made up of three layers: 1. The ectoderm (which will become the skin and nervous system) 2. The endoderm (which will become the digestive and respiratory systems) 3. The mesoderm (which will become the muscle and skeletal systems). Finally, the blastocyst arrives at the uterus and attached to the uterine wall, a process known as implantation. Implantation occurs when the cells nestle into the uterine lining and rupture tiny blood vessels. The connective web of blood vessels and membranes that form between them will provide nourishment for the developing being for the next nine months. Implantation is not always an automatic and sure-fire process. 2.4.1.2

100%	MATCHING BLOCK 16/127	SA	Final - TNOU - MSW - Psychology for Social Wor ... (D133211487)
<p>Embryonic Stage At this point, the mass of cells is now known as an embryo. The beginning of the third week after conception marks the start of the embryonic period, a time when the mass of cells becomes distinct as a human. The embryonic stage plays an important role in the development of the brain.</p>			

The embryo begins to divide into three layers each of which will become an important body system. Approximately 22 days after conception, the neural tube forms. This tube will later develop into the central nervous system including the spinal cord and brain. The neural tube begins to form along an area known as the neural plate. The earliest signs of development of the neural tube are the emergence of two ridges that form along each side of the neural plate. Over the next few days, more ridges form and fold inward until a hollow tube is formed. Once this tube is fully formed, the cells begin to form near the center. The tube begins to close and brain vesicles form. These vesicles will eventually develop into parts of the brain including the structures of the forebrain, midbrain, and hindbrain. Around the fourth week, the head begins to form quickly followed by the eyes, nose, ears, and mouth. The cardiovascular system is where the earliest activity begins as the blood vessel that will become the heart start to pulse. During the fifth week, buds that will form the arms and legs appear. By the time the eighth week of development has been reached, the embryo has all of the basic organs and parts except those of the sex organs. It even has knees and elbows! At this point, the embryo weighs just one gram and is about one inch in length. By the end of the embryonic period, the basic structures of the brain and central nervous system have been established. At this point in development, the basic structure of the central and peripheral nervous system are also defined. 2.4.1.3

100%	MATCHING BLOCK 17/127	SA	Final - TNOU - MSW - Psychology for Social Wor ... (D133211487)
<p>Fetal Stage Once cell differentiation is mostly complete, the embryo enters the next stage and becomes known as a fetus. The fetal period of prenatal develop marks more important changes in the brain. This period of development begins during the ninth week and lasts until birth.</p>			

The early body systems and structures established in the embryonic stage continue to develop. It is at this point in prenatal development that

38 _____ NSOU • PGSW - VI the neural tube develops into the brain and spinal cord and neurons continue to form. Once these neurons have formed, they begin to migrate to their correct locations. Synapses, or the connections between neurons, also begin to develop. It is during the period between the 9th and 12th week at the earliest reflexes begin to emerge and the fetus begins to make reflexive motions with his arms and legs. This stage of prenatal development lasts the longest and is marked by amazing change and growth. During the third month of gestation, the sex organs begin to differentiate and by the end of the month, all parts of the body will be formed. At this point, the fetus weight around three ounces. The fetus continues to grow in both weight and length, although the majority of the physical growth occurs in the later stages of pregnancy. The end of the third month also marks the end of the first trimester of pregnancy. During the second trimester or months four through six, the heartbeat grows stronger and other body systems become further developed. Fingernails, hair, eyelashes, and toenails form. Perhaps most noticeably, the fetus increases quite dramatically in size, increasing about six times in size. Both genetic and environmental factors affect our development during different periods of prenatal stage. Prenatal development is also affected by maternal characteristics, which include mother's age, nutrition, and emotional state. Disease or infection carried by the mother can adversely affect prenatal development. For example, rubella (German measles), genital herpes, and Human Immunodeficiency Virus (HIV) are believed to cause genetic problems in the newborn. Another source of threat to prenatal development is teratogens - environmental agents that cause deviations in normal development that can lead to serious abnormalities or death. Common teratogens include drugs, infections, radiations, and pollution. Intake of drugs (marijuana, heroin, cocaine, etc.), alcohol, tobacco, etc. by women during pregnancy may have harmful effects on the foetus and increase the frequency of congenital abnormalities. Radiations (such as X-rays), and certain chemicals near industrial areas can cause permanent change in the genes. Environmental pollutants and toxic wastes like carbon monoxide, mercury and lead are also sources of danger to the unborn child. Some of the factors are discussed below

1. Maternal Nutrition : In order to grow, the fetus needs nutrients which in turn come from the mother. Mother's dietary intake must be balanced. Care must be given to include vitamins and minerals (such as calcium, phosphate, iron) water, proteins, fats and not carbohydrates alone. Vegetables, green leaves, seasonal fruits, pulses and cereals in addition to milk, eggs and meat or fish provide a diet adequate for the baby and the mother.

NSOU • PGSW - VI _____ 39

2. Maternal age : The ages between 21 to 29 years is the ideal age of the mother to have children. Below this bracket the mother is too immature physiologically and psychologically with a high risk of infant death. Beyond 30, risk of incidence of mental retardation and other genetic abnormalities is very high.
3. Rest and exercise of the mother : These are essential especially during pregnancy. When the mother is tired and over worked the fetal activity increases and beyond limits it can cause still birth or irritability of the child. At the same time mother must have adequate exercise.
4. Rh blood group : Majority of us are Rh+ while some have Rh- blood group. If the mother is Rh- and the fetus is Rh+ then it is an incompatible condition. The mother must be aware of it and at the time of delivery, if precautions are not adequate then complication such as jaundice can occur in child and may result in infant death.
5. Addictions : If the mother is addicted to alcohol, cigarettes or drugs the waste material is passed onto the fetus. Risk of irritability, low birth weight or prematurity, even still birth or child being born with addictions are very high.
6. Maternal diseases: The diseases of the mother can significantly affect the fetus. Especially during the initial critical times during pregnancy German measles or Rubella can cause deafness, mental retardation or even heart trouble. AIDS, Syphilis or other sexually transmitted diseases can cause miscarriage.
7. Maternal stress : When the mother has emotional problems, tensions and anxieties, blood supply to the fetus is not adequate, but is diverted. Therefore growth is hindered. This also can result in prematurity, still birth or the child being irritable.

2.4.2 Infancy Infancy or the period of newborn is according to standard dictionaries, the beginning or the early period of existence as an individual rather than as a parasite in the mother's body. Dictionaries also define an infant as a child in the first period of life. Many psychologists use the word infant in much the same way as members of the medical profession do and, like them, fail to set an age limit on infancy. They give this period an ambiguous pattern of life span. The word infant suggests extreme

40 _____ NSOU • PGSW - VI helplessness. During this period, the newborn's complete helplessness gradually gives way to increasing independence. Following are the most important characteristics of this period 1. Infancy is the shortest of all developmental periods 2. Infancy is a time of radical adjustments 3. It is a plateau in development 4. It is the preview of later development 5. It is a hazardous period The brain develops at an amazing rate before and after birth. Just before birth the newborns have most but not all brain cells. The neural connections among these cells develop at a rapid rate. The newborn is not as helpless as you might think. The activities needed to sustain life functions are present in the newborn — it breathes, sucks, swallows, and discharges the bodily wastes. The newborns in their first week of life are able to indicate what direction a sound is coming from, can distinguish their mother's voice from the voices of other women, and can imitate simple gestures like tongue protrusion and mouth opening. 2.4.2.1 Motor Development The newborn's movements are governed by reflexes—which are automatic, built-in responses to stimuli. They are genetically-carried survival mechanisms, and are the building blocks for subsequent motor development. Before the newborns have had the opportunity to learn, reflexes act as adaptive mechanisms. Some reflexes present in the newborn — coughing, blinking, and yawning persist throughout their lives. Others disappear as the brain functions mature and voluntary control over behaviour starts developing. As the brain is developing, physical development also progresses. As the infant grows, the muscles and nervous system mature which lead to the development of finer skills. Basic physical (motor) skills include grasping and reaching for objects, sitting, crawling, walking and running. The sequence of physical (motor) development is universal, with minor exceptions. 2.4.2.2 Sensory Abilities During infancy, the infant can be able to recognize their mother's voice just a few hours after birth and have other sensory capabilities. Newborns prefer to look at some stimuli rather than others such as faces, although these preferences change over the first few months of life. The newborn's vision is estimated to be lower than the NSOU • PGSW - VI _____ 41 adult vision. By 6 months it improves and by about the first year, vision is almost the same as that of an adult (20/20). Can a newborn see colour? The current consensus is that they might be able to distinguish between red and white colours but in general they are colour deficient and full colour vision develops by 3 months of age. Infants can hear immediately after birth. As the infant develops, proficiency at localizing sound improves. Newborns respond to touch and they can even feel pain. Both smell and taste capacities are also present in the newborn. 2.4.2.3

W

Cognitive Development Jean Piaget stressed that children actively construct their understanding of the world.

Information does not simply enter their minds from the environment. As children grow, additional information is acquired and they adapt their thinking to include new ideas, as this improves their understanding of the world. Piaget believed that a child's mind passes through a series of stages of thought from infancy to adolescence. The child during infancy, i.e. the first two years of life, experiences the

42 _____ NSOU • PGSW - VI world through senses and interactions with objects—through looking, hearing, touching, mouthing, and grasping. The newborn lives in the present. What is out of sight is out of mind. For example, if you hide the toy in front of the child with which the child has been playing, the young infant would react as if nothing has happened, i.e. s/he will not search for the toy. The child assumes the toy does not exist. According to Piaget, children at this stage do not go beyond their immediate sensory experience, i.e. lack object permanence — the awareness that the objects continue to exist when not perceived. Gradually by 8 months of age the child starts pursuing the object partially covered in her/his presence. The basis of verbal communication seems to be present in infants. Vocalization begins with the infant's babbling, sometime between 3 to 6 months of age. 2.4.2.4 Socio-emotional Development Babies from birth are social creatures. An infant starts preferring familiar faces and responds to parent's presence by cooing and gurgling. They become more mobile by 6 to 8 months of age and start showing a preference for their mother's company. When frightened by a new face or when separated from their mother, they cry or show distress. On being reunited with the parent or caregiver they reciprocate with smiles or hugs. The close emotional bond of affection that develops between infants and their parents (caregivers) is called attachment. In a classic study by Harlow and Harlow (1962), baby monkeys were separated from their mothers approximately 8 hours after birth. The baby monkeys were placed in experimental chambers and reared for 6 months by surrogate (substitute) "mothers", one made of wire and the other of cloth. Half the baby monkeys were fed by the wire mother, half by the cloth mother. Regardless of whether they were fed by the wire or the cloth mother the baby monkeys showed a preference for the cloth mother and spent a lot more time with her. This study clearly demonstrates that providing nourishment or feeding was not crucial for attachment and contact-comfort is important. It is also seen young children having a strong attachment to a favourite toy or blanket. There is nothing unusual in this, as the children know that the blanket or toy is not their mother. Yet it provides them comfort. As children grow and become surer of them, they abandon these objects. Human babies also form an attachment with their parents or caregivers who consistently and appropriately reciprocate to their signals of love and affection.

NSOU • PGSW - VI _____ 43 According to Erik Erikson (1968), the first year of life is the key time for the development of attachment. It represents the stage of developing trust or mistrust. A sense of trust is built on a feeling of physical comfort which builds an expectation of the world as a secure and good place. An infant's sense of trust is developed by responsive and sensitive parenting. If the parents are sensitive, affectionate, and accepting, it provides the infant a strong base to explore the environment. Such infants are likely to develop a secure attachment. On the other hand, if parents are insensitive and show dissatisfaction and find fault with the child, it can lead to creating feelings of self-doubt in the child. Securely attached infants respond positively when picked up, move freely, and play whereas insecurely attached infants feel anxious when separated and cry due to fear and get upset. A close interactive relationship with warm and affectionate adults is a child's first step towards healthy development. 2.4.2.5 Personality Development This period extends from birth to 18 months of age. This is called the age of trust v/s mistrust. The infant who comes to the new environment, from mother's womb needs only nourishment. If the child's caretaker, the mother anticipates and fulfills these needs consistently, the infant learns to trust others, develops confidence. Inevitably the child will experience moments of anxiety and rejection. If the infant fails to get needed support and care, it develops mistrust which affects the personality in later stages of life. 2.4.2.6 Hazards during Infancy Period The physical hazards can affect the entire life span of the child. Complications at the time of birth have a high possibility of causing physical harm to the child. A caesarean birth is likely to cause more harm than a normal delivery since it results in anoxia which means a temporary loss of oxygen to the brain. If this temporary loss of oxygen to brain is for a longer duration then it's likely that the brain damage would be severe. Therefore, it can be said that more complicated the birth and the more damage to the brain due to anoxia, greater will be the effect on the infant's postnatal life. Another situation that causes severe effects due to anoxia is a pre- mature delivery which can even cause death of the infant. Anoxia is a major problem

44 _____ NSOU • PGSW - VI because a pre-mature infant's respiratory mechanism is not fully developed. It's effect maybe long lasting. Psychological hazards of infancy include the traditional beliefs associated with birth. For example—Some people believe that the children born with birth complications lead a difficult life. Also, the attitude of parents towards the infant due to gender preferences, complications at the time of birth, unexpected arrival of twins or triplets etc affects his growth. 2.4.3 Babyhood Babyhood is the stage that follows infancy and extends between two weeks to two years. During babyhood months, there is a gradual but pronounced decrease in helplessness. This does not mean that helplessness quickly disappears and is replaced by independence. The term "baby" suggests to many people a helpless individual; it is becoming increasingly common to apply the label of toddler to the individual during the second year of babyhood. A toddler is a baby who has achieved enough body control to be relatively independent. The characteristics of babyhood are as follows. 1. Development during babyhood is the foundation for the development during the entire life span. 2. During babyhood rapid physical and intellectual development takes place as evidenced by increase in height, weight and body proportions. 3. Increased independence and individuality mark babyhood. 4. Socialization begins during babyhood as the baby shows increasing desire to be a part of the social group of the family and extend the basic relationship with the mother or mother substitute to others as well. 5. Sex-role typing begins during babyhood. Boys and girls are dressed sex appropriately and are treated in subtly different ways. Culturally relevant sex- appropriate clothes, games, behaviour or even interactions are gradually brought in. 6. There are hazards faced by a baby which may be physical or psychological. Physical hazards such as in illness, accidents and psychological hazards can interfere with positive development of the baby.

NSOU • PGSW - VI _____ 45 During babyhood, the baby is expected to learn to walk by two years, to take solid foods, to gain partial control over elimination, learn the foundation of receptive and expressive speech and to emotionally relate to parents and others. 2.4.3.1 Physical Development Rapid growth takes place during babyhood. Height and weight increase. The birth weight is doubled by four months and tripled by one year. On an average the height of the baby at four months is 23 to 24 inches and at one year 28 to 30 inches and by two years 32 to 34 inches. Social smile which is a response to recognizing a face is the first clear milestone which happens around 2 months. Also, the baby can roll over from side to back at 2 months and from back to side at 4 months. At 6 months, it can roll over completely. The baby begins to pull the body to a sitting positions and sits' up without support around 8 months. Hands and palm scoop up an object which is called palmer's scoop, around 5 months, Around 9 months it can use the fingers in a pincer-grip to pick up even fine objects. The baby hitches or moves in a sitting position around six months, crawls and creeps around 8 months. Walks on all fours, pulls up and stands by 10 months. He/she learns to stand with support by 11 months and without support, for longer time around a year. Also he/ she learns to walk with support initially and without support around 14 months. These milestones, which indicate movement, are also called as motor development. The motor skills of babyhood are not integrated initially but when they are integrated later, they are of importance to the baby and its developing personality. At first, the baby's body is more or less constant motion similar to the mass activity of the newborn infant. This is true even during sleep. Gradually, this random, meaningless movement becomes more coordinated, thus making control over the muscle possible. Maturation and learning work together in the development of muscle control. As a result of maturation of the muscles, bones and nerve structures, and because of the change that take place in the body proportions, babies are able to use their bodies in a coordinated manner. They must, however, be given an opportunity to learn how to do so. Until this state of readiness is present, teaching will be of little or no value.

46 _____ NSOU • PGSW - VI Some common motor control patterns are given below
Head Region Eye Control Optic nystagmus, or the response of the eyes to a succession of moving objects, begins about twelve hours after birth; ocular pursuit movements, between the third and fourth weeks; horizontal eye movements, between the second and third months; circular eye movements, several months later. Smiling Reflex smiling, or smiling in response to a tactual stimulus, appears during the first week of life; social smiling, or smiling in response to the smile of another person, begins between third and fourth months. Head holding In a prone position, babies can hold their heads erect at one month; when lying on their backs, at five months; and when held in sitting position, between four and six months. Trunk Region Rolling Babies can roll from side to back two months and from back to side at four months; at six months, they can roll over completely. Sitting The baby can pull to a sitting position at four months, sit with support at five months, sit without support momentarily at seven months, and sit up without support for ten or more minutes at nine months. Arm and Hands Thumb Opposition-the working of the thumb opposi- Hand Region tion to the fingers-appears in grasping between three and four months and in picking up objects between eight and ten months. Arms The baby can reach for objects by six or seven months and can pick up a small object without random movements by one year. Leg Region Shifting of the body by kicking occurs by the end of the second week

NSOU • PGSW - VI _____ 47 2.4.3.2 Speech Development As the baby develops, the important bridge into the world of other is also developed in the form of speech which aids communication. It has two aspects: receptive speech to understand what others are communicating and expressive speech to make oneself understood. The baby begins to babble or produces several sounds. Then she moves on to the stage of monosyllables (eg: Ma, Ma, Da, Da, Na, Na etc.) which gives way to two-syllable stage. Before two years, the baby speaks with words made of two syllables formed in a sentence which typically has no grammar. Four pre-speech forms normally appear in the development pattern of learning to talk: crying, babbling, gesturing, and the use of emotional expressions. Crying is the most frequently used from during the early months of life, though from the long-range point of view, babbling is the most important because real speech eventually develops from it. According to Ostwald and Pelzman (1974) "Crying is one of the first social acts of the infant. It marks a shift on the infant's part from being silently dependent on the mother to being able to communicate with world at large". Crying during the early months of life also serves another useful purpose; it tells whether baby is normal and healthy or whether there is something wrong. For example, a high -pitched cry of low intensity and long duration often means the baby is suffering from malnutrition or from brain damage (Lester, 1976). As vocal mechanism develops, babies become capable of producing a large number of explosive sounds. Some of these sounds are retained and eventually develop into babbling or lallation. The number of sounds produced in babbling gradually increases. Babies use gestures as a substitute for speech, as do older children, adolescents and adults. Many babies continue to use gestures, combining them with words to make their sentences. Another most important pre-speech form of communication is emotional expression. This is because nothing is more expressive than facial gestures, which babies use to communicate their emotional states to others. 2.4.3.3. Emotional and Social Development Babyhood emotions such as joy, affection, curiosity, fear and anger are often expressed explosively and are out of proportion to the stimuli. They are also short

48 _____ NSOU • PGSW - VI lived. These emotions get conditioned or established much more in later years. Beginning with a social smile babies learn to respond to the social environment and are the foundations of the social skills valued greatly in later years. Some common emotional patterns in babyhood are as follows
1. Fear : Certain fears are characteristically found at certain age and may, therefore, be called the "typical fears" for those age levels. The most common fear-provoking stimuli in babyhood are loud noises, animals, dark rooms, high places, sudden displacement, being alone pain and strange persons, places, and objects. Among older children fears are concentrated on fanciful supernatural, or remote dangers; on the dark and on imaginary creatures associated with the dark; on death or injury; on the elements; especially thunder and lightning; and; and on characters recalled from stories, movies, comics, and television.
2. Anger : Anger is a more frequently expressed emotion in childhood than fear in its different forms. The reason for this is that anger-provoking stimuli are more numerous and children discover at an early age that anger is an effective way of getting attention or what they want. Each year, the number of anger-arousing situations increases and children tend to display more anger.
3. Jealousy : Jealousy is a normal response to actual, supposed, or threatened loss of affection. It is outgrowth of anger, giving rise to an attitude of resentment directed toward people. Often some fear is combined with anger in the jealousy pattern. The jealous person feels insecure in relationship with a loved one and is afraid of losing status in that person's affection. The situation that calls forth jealousy is always a social one. There are three major situational sources of jealousy. First, most childhood jealousies are homegrown; that is they originate in conditions that exist in the home environment. Because the new baby takes much of the time and attention older children have become accustomed to receiving, they feel neglected.
4. Curiosity : Maw and Maw have described the curious child in the following

NSOU • PGSW - VI _____ 49 way. The child (a) reacts positively to new, strange, incongruous, or mysterious elements in his environment by moving toward them, exploring them or manipulating them; (b) exhibits a need or a desire to know more about himself and/or his environment; (c) scans his surroundings seeking new experiences; and/ or d) persists in examining and/or exploring stimuli in order to know more about them. 5. Joy, Pleasure, and Delight : Joy is a pleasant emotion. In its milder forms, it is known as pleasure, or happiness. Among babies, the pleasant emotions of joy, happiness, and delight come from physical well-being. In older children, the stimuli that aroused pleasant emotions at the younger ages continue to bring pleasure. 6. Affection : Affection is an emotional reaction directed toward a person, an animal, or a thing. It indicates warm regard, friendliness, sympathy, or helpfulness, and it may take a physical or verbal form. Learning plays an important role in determining the particular persons or objects to which affection is directed. 2.4.3.4 Play Development Play activities may be classified on the basis of the content of play, what the child does. In terms of content, the play activity may be sense pleasure play, skill play, dramatic play, ritual and competitive games. The second classification of play is in terms of the social character of play that is, who is the child playing with and the nature of their relationship: Under this play with adult, solitary play, parallel play, associative play and cooperative play are the different types. 2.4.3.5 Personality Development Babyhood is often referred to as a "critical period" in the development of personality because this time the foundations are laid upon which the adult personality structure will be built. The baby's environment is limited almost exclusively to the home and because the mother is most constant companion, the kind of person she is and the kind of relationship they share will have a profound effect on the baby's personality. Sex differences in personality begin to appear as early as the first year of life. There is little evidence that these differences are due to heredity and much

50 _____ NSOU • PGSW - VI evidence that they are result of environmental pressures, which are different for boys and for girls. These environmental pressures are likely to increase with time, and thus the foundations laid in babyhood will persist. Studies also revealed that the pattern established early in life remain almost unchanged as the child grow older. Certain personality traits do change, even in babyhood years. These changes may be either quantitative, in that there is strengthening or weakening a trait already presents, or qualitative, in that a socially undesirable trait is replaced by one that is socially more desirable. For the most part, personality changes tend to be quantitative in nature. Young children who have been shy in babyhood will seek the kind of environment that will encourage the development of this trait. At the same time, they avoid situations that would make them feel self-conscious. As a result their shyness tends to become stronger than weaker with age, but the core personality pattern-the self- concept-remains fundamentally the same. 2.4.3.6 Hazards in Babyhood Physical hazards range from mortality as in cot or crib death, due to various illnesses, accidents or malnutrition. Psychological hazards include delay in motor or speech development and their subsequent disadvantages. Delay in developmental milestones hinders social relation and in turn becomes a threat to emotional development. Social hazards include lack of opportunities and experiences to learn to become social. Hazards in personality development occur because self concept is largely a mirror image of what babies believe significant people in their lives think of them. Unfavourable attitudes reflected in resentment, negativism or withdrawal behaviour from parents and others, therefore, can cause damages to the developing personality. 2.4.4 Early Childhood Childhood extends from 2 to 12 years and is generally divided as early and late childhood. Early childhood can be taken to range from the completion of 2 years to 6 years. Early childhood is also called as preschool stage. The young child is eager to gain control over knowledge about the environment. He/she tries to explore the environment; so this stage is called the exploratory stage. They tend to imitate others usually the adults around them. Thus this age is called the 'imitative age'. Their play

NSOU • PGSW - VI _____ 51 activity includes a great deal of creativity and imagination, so this stage also earns the additional name 'creative age'. Some characteristics of early childhood are as follows: 1. Names used by parents: Most parents consider early childhood a problem age or troublesome age. With the dawn of childhood, behaviour problems become more frequent and more troublesome than the physical- care problems of babyhood. Parents often refer to early childhood as the toy age because young children spend much of their waking time playing with toys. 2. Names used by Educators: Educators refer to the early childhood years as preschool age to distinguish it from the time when children are considered old enough, both physically and mentally, to cope with the work they will be expected to do when they begin their formal schooling. 3. Names used by Psychologists: Psychologists use a number of different names to describe the outstanding characteristics of the psychological development of children during the early years of childhood. One of the commonly applied names is "pregang age", the time when children are learning the foundations of social behaviour as a preparation for the most highly organized social life they will be required to adjust to when they enter the first grade. 2.4.1.1 Physical Development Early development follows two principles : 1. development proceeds cephalocaudally, i.e. from the cephalic or head region to the caudal or tail region. Children gain control over the upper part of the body before the lower part. This is why one would notice that the infant's head is proportionately larger than her/his body during early infancy or if you see an infant crawling, s/he will use the arms first and then shift to using the legs.

52 _____ NSOU • PGSW - VI 2. growth proceeds from the centre of body and moves towards the extremities or more distal regions—the proximodistal trend, i.e. children gain control over their torso before their extremities. Initially infants reach for objects by turning their entire body; gradually they extend their arms to reach for things. These changes are the result of a maturing nervous system and not because of any limitation since even visually impaired children show the same sequence. As children grow older, they look slimmer as the trunk part of their bodies lengthens and body fat decreases. The brain and the head grow more rapidly than any other part of the body. The growth and development of the brain are important as they help in the maturation of children’s abilities, such as eye hand coordination, holding a pencil, and attempts made at writing. Common patterns of physical development in Early Childhood Height The average annual increase in height is three inches. By the age of six, the average child measures 46.6 inches Weight The average annual increase in weight is 3 to 5 pounds. At age six, children should weigh approximately seven times as much as did at birth Body Body proportions changed markedly, and the “baby look” disappears. Facial Proportions features remains small but the chin becomes more pronounced and the neck elongates. There is a gradual decrease in the stockiness in the trunk, and the body tends to become cone-shaped, with a flattened abdomen, a broader and flatter chest, and shoulders that are broader and squarer. Body Build Differences in body build become apparent for the first time in early childhood. Some children have an endomorphic or flabby, fat body build, some have a mesomorphic or sturdy, muscular body build, and some have an ectomorphic or relatively thin body build. Bones and The bones ossify at different rates in different parts of the body, Muscles following the laws of developmental direction. The muscles become larger, stronger and heavier, with the result that children look thinner as early childhood progresses, even though they weigh more.

NSOU • PGSW - VI _____ 53 Fat Children who tend toward endomorphy have more adipose than muscular tissue; those who tend toward mesomorphy have more muscular than adipose tissue; and those with an ectomorphic build have more small muscle and little adipose tissue Teeth During the first four to six months of early childhood, the last four baby teeth- the back molars-erupt. During the last half year of the early childhood, the baby teeth begin to be replaced by permanent teeth. 2.4.1.2 Motor Development Gross motor skills during the early childhood years involve the use of arms and legs, and moving around with confidence and more purposefully in the environment. Fine motor skills—finger dexterity and eye-hand coordination—improve substantially during early childhood. During these years the child’s preference for left or right hand also develops. Age in Years Gross Motor Skills Fine Motor Skills 3 years Hopping, jumping and running Build blocks, pick objects with forefinger and thumb 4 years Climb up and downstairs with Fit jigsaw puzzle precisely one foot on each step 5 years Run hard, enjoy races Hand, arm, and body all coordinate with eye movement Skills of Early Childhood The young children learn and master a variety of skills because of their immense curiosity gets them to manipulate and learn; they feel no inhibition or fear of ridicule as older children would; in addition, their bodies are pliable and fingers dexterous and they are ‘teachable’- an essential quality for learning skills. Depending on the environmental opportunities and the family background children learn a variety of skills. The hand skills of self feeding and dressing become perfect during childhood. Bathing, dressing, combing hair or even finer motor skills required for tying shoe laces are all learnt. Catching and throwing a ball, use of scissors, painting, colouring, use of crayons, drawing all become a part of early childhood years. With the foundational skill of walking firmly established, young children move onto additional skills. Hopping, skipping, jumping, running, climbing up and ‘down

54 _____ NSOU • PGSW - VI the stairs show the progress made by the child. Cycling, swimming, skating, and walking on walls are all activities enjoyed greatly by children at this stage. Handedness is established and the child now shows a clear left or right hand preference by the end of early childhood. 2.4.4.3 Cognitive Development The child’s ability to acquire the concept of object permanence enables her/him to use mental symbols to represent objects. However, the child at this stage lacks the ability that allows her/him to do mentally what was done physically before. Cognitive development in early childhood focuses on Piaget’s stage of preoperational thought. The child gains the ability to mentally represent an object that is not physically present. You may have observed children draw designs/ figures to represent people, trees, dog, house, etc. This ability of the child to engage in symbolic thought helps to expand her/his mental world. The progress in symbolic thought continues. A salient feature of preoperational thought is egocentrism (self-focus), i.e. children see the world only in terms of their own selves and are not able to appreciate others’ point of view. Children because of egocentrism, engage in animism - thinking that all things are living, like one. They attribute life-like qualities to inanimate objects. For example, if a child while running slips on the road, s/he might show animism by saying “road hurt me”. As children grow and are approximately between 4 and 7 years of age they want answers to all their questions like : Why is the sky blue? How do trees grow and so on? Such questions help the child to know why things are as they are. Piaget called this the stage of intuitive thought. Another feature of thought during preoperational stage is characterized by children having a tendency for centration, i.e. focusing on a single characteristic or feature for understanding an event. For example, a child may insist on drinking a “big glass” of juice, preferring a tall narrow glass to a short broad one, even though both might be holding the same amount of juice. 2.4.4.4 Speech Improvement Both receptive and expressive communication improves as babbling of babyhood and crying are largely reduced. Normal speech development gains significant strides where they learn proper pronunciation, making of sentences (even though with poor grammar) and building of vocabulary. Also the content of speech takes a turn. From talking about self, self interests and self needs the child moves on to socialized speech around six years wherein others and their concerns are spoken of. 2.4.1.4 Emotions during Early Childhood Emotions during early childhood are intense with frequent emotional outbursts. These are associated with temper tantrums, intense fears or jealousies and can be traced to the cause of long and tiring play and too little food intake.

Anger The most common causes of anger in young children are conflicts over playthings, the thwarting of wishes, and vigorous attacks from another child. Their expressions are characterized by crying, screaming, kicking, jumping up and down, or striking.

Fear Conditioning, imitation, and memories of unpleasant experiences play important roles in arousing fears, as do stories, pictures, radio and television programs, and movies with frightening elements.

Jealousy Young children become jealous when they think parental interest and attention are shifting toward someone else in the family, usually a new sibling. They may openly express their jealousy by reverting to infantile behaviour, such as bed-wetting, pretending to be ill, or being generally naughty.

Curiosity Children are curious about anything new that they see and also about their own bodies and bodies of others.

Envy They are often envious of the abilities and material possessions of another child.

Joy Young children derive joy from such things as a sense of physical well-being, sudden or unexpected noises etc. They express their joy by smiling and laughing or hugging the person or object that has made them happy.

Grief Young children are saddened by the loss of anything they love or that is important to them, whether it be person, object or inanimate object, such as toy.

Affection Young children learn to love things-people, pets, or objects-that give them pleasure. They express their affection verbally as they grow older.

2.4.4.6 Social Development Relationship with Significant Others • Parental relationship : Children experience it with their father and mother or parent substitute. Poor relationships lead to devastating effects since young children depend on parents to a great extent. Therefore, poor relationship with parents, or their absence or death can severely traumatize the young child and affect the developing personality.

56 _____ NSOU • PGSW - VI • Sibling relationship : The child progressively moves on to independence and is no longer the 'baby'. Siblings often start frictions when a young child wants his/her way. This is called sibling rivalry. However, siblings may also enjoy a good relationship. Especially when the older children serve as role models for the young children to learn socially approved and sex appropriate behaviour through imitation.

Social and Unsocial Behaviour Patterns Social Patterns Unsocial Patterns

Negativism : Negativism or resistance to adult authority reaches its peak between three and four years of age and then declines. Physical resistance gradually gives the way to verbal resistance.

Aggressiveness : It increases between the ages of two and four and then declines. Physical attacks begin to be replaced by verbal attacks in the form of name-calling or blaming others.

Ascendant Behaviour: Ascendant behaviour or "bossiness", begins around the age of three and increases as opportunities for social contact increase, girls tend to be bossier than boys.

Selfishness : While young children's social horizons are limited mainly to the home, they are often selfish and ego-centric.

Imitation : To identify themselves with the group, children imitate the attitudes and behaviour of a person whom they specially admire and want to be like.

Rivalry : The desire to excel or outdo others is apparent as early as the fourth year.

Cooperation : By the end of third year, cooperative and group play activities begin to develop and increase in both frequency and duration.

Sympathy : Because sympathy requires an understanding of the feelings and emotions of others, it appears only occasionally before the third year.

NSOU • PGSW - VI _____ 57 Social Patterns Unsocial Patterns

Empathy : Empathy requires an understanding of feelings and emotions of others but, in addition, it requires the ability to imagine oneself in the place of other person.

Social Approval : As early childhood draws to a close, peer approval becomes more important than adult approval.

Sharing : Young children discover, from experiences with others, but the one way to win approval is to share what they have=especially toys-with others.

Attachment Behaviour: Young children, who, as babies, discovered the satisfaction that comes from warm, close, personal associations with others, gradually attach their affection to people outside the home or to some inanimate object. These then become known as attachment objects.

Ego-centricism : Ego-centricism is gradually replaced by an interest in concern for others. It depends on the number of contacts young children have people with people outside the home and how anxious they are to win their acceptance.

Destructiveness : A common accompaniment of temper outbursts in young children is destroying anything within their reach, whether their own or someone else's possessions.

Sex Antagonism: Until they are four years old, boys and girls play together harmoniously. After that, boys come under social pressures that lead them to shun play activities that might be regarded as "sissyish".

Prejudice: Most preschool children show a preference for playmates of their own race, but they seldom refuse to play children of another race.

2.4.4.7 Play activities The beginning of early childhood finds children playing extensively with toys but slowly they grow out of it towards the completion of this stage. The number of toys or play equipment, the opportunities for manipulation, well developed motor skills, creativity, higher IQ-all these factors or their lack influence the pattern of playing. Play includes a great deal of imitation and dramatizing. For example, young children behave like mothers, teachers and others. The imaginative play often merges reality and fantasy and is enjoyed by young children.

58 _____ NSOU • PGSW - VI 2.4.4.8 Personality Development This stage ranges from 18 months to 3 years. By second year of life, the muscular and nervous systems have developed markedly, and the child is eager to acquire new skills, is no longer content to sit and watch. The child moves around and examines its environment, but judgement develops more slowly. The child needs guidance. In the crisis of autonomy v/s doubt faced during this period, the critical issue is the child's feeling of independence. In an extremely permissive environment, the child encounters difficulties that it cannot handle, and the child develops doubt about its abilities. Similarly if the control is severe, the child feels worthless and shameful of being capable of so little. The appropriate middle position, respecting the child's needs and environmental factors, requires the caretaker's careful and constant attention. The personality pattern, the foundations of which were laid in babyhood, begins to take form in early childhood. Because parents, Siblings and other relatives constitute the social world of young children, how they feel about them and how they treat them are important factors in shaping self-concept-the core of personality pattern. As the age progresses, young children have more and more contacts with peers either in neighbourhood or in a pre-school or child-care center. The attitudes of their peers and the way their peers treat them then begin to have an effect on their self-concepts, an effect which may reinforce the effect of family members or may contradict and counteract some of the family influences. Conditions shaping the self-concept in Early Childhood • The child-training method used in home is important in shaping the young child's developing self-concept. • The ordinal position of children in a family has an effect on their developing personalities. • Environmental insecurity, whether due to death, divorce, separation, or mobility, affects young children's self-concepts unfavorably because they feel insecure and different from peers. Increase in Individuality : Individuality, which is apparent at birth and becomes increasingly more so in babyhood, is one of the outstanding characteristics of young children. By the time early childhood is over and children are ready to enter school, the patterns of their personality can be readily distinguished, like some are leader and some are followers. Individuality is greatly influenced by early social experiences outside the home. When these experiences are unfavourable, children are likely to become unsocial in their relationships with people and to compensate in unsocial ways, such as spending their playtime, watching television and imagining themselves as martyrs who are picked on by others.

NSOU • PGSW - VI _____ 59 2.4.4.9 Moral Development Moral development on early childhood is on a low level. Early childhood has been characterized by what Piaget has called "morality by constraint". In this stage of moral development, children obey rules automatically, without using reason or judgement, and they regard adults in authority as omnipotent. They also judge all acts as right or wrong in terms of their consequences rather than in terms if motivations behind them. According to the way young children view a matter, a "wrong" act results in punishment, which is dealt with either by other human beings or by natural or supernatural factors (Piaget, 1971). Kohlberg has elaborated on and extended Piaget's stages of moral development during the early childhood years to include two stages of this first level which he has labeled "preconventional morality". In the first stage, children are obedience-and punishment oriented in the sense that they judge act as right and wrong in terms of physical consequences of these acts. In the second stage, children conform to social expectations in the hope of gaining rewards (Kohlberg, 1969). 2.4.4.10 Hazards in Early Childhood Unlike earlier stages, physical hazards such as illness, accidents or awkwardness have physical as well as psychological repercussions. Mortality rate reduces steeply as compared to earlier phases. Young children are highly susceptible to infections and illnesses. With improved health care facilities 'generally illnesses are taken care of. Accidents of everyday such as cuts, bruises, falls or burns are common and are more common among boys than girls. Serious or prolonged illness restricts the child and deprives his/her of opportunities and hence affects him/ her psychologically by affecting adjustments made by the child. A pre-schooler, who frequently experiences negative or unpleasant emotions such as anger with few pleasant emotions, faces major emotional hazards of developing a negative disposition. Early in childhood children must learn to establish an emotional linkage between themselves and significant others in their environment called as 'empathic complex'. Failure to establish 'empathic complex' becomes yet another emotional hazard. Children need to establish a warm and stable relationship with the mother, which is then extended to other relationships. 2.4.5 Late Childhood The period of late childhood ranges from 6 years to the attainment of sexual maturity, around 12- 13 years. During this stage children develop marked negativism and because of their desire for independence seldom obey the parents. The child begins going to school and learns the rudiments of knowledge essential for successful

60 _____ NSOU • PGSW - VI adult life. The peer group assumes great significance and children of this age 'crowd together or 'gang LIP', thus earning the name gang age'. This age is marked by conditions that profoundly affect a child's personal and social adjustments. Characteristics of Late Childhood Parents, educators and psychologists apply various names to late childhood and these names reflect the important characteristics of the period. 1. Names used by parents: To many parents, late childhood is the troublesome age the time when children are no longer willing to do what they are told to do and when they are more influenced by their peers than by their parents and other family members. 2. Name by Educators: Educators call late childhood elementary school age. It is the time when the child is expected to acquire the rudiments of knowledge that are considered essential for successful adjustment to adult life. It is also the time when the child is expected to learn essential skills, both curricular and extracurricular. 3. Names used by Psychologists: To the Psychologist, late childhood is the gang-age-the time when children's major concern is acceptance by their age- mates and membership in the gang, especially a gang with prestige in the eyes of their age-mates. This led the psychologists to label late childhood as the age of conformity. 2.4.5.1 Physical Development There is relatively uniform but slow physical development. The weight gain is almost even throughout late childhood and the child gains 2-3 inches every year. Body proportions are more elongated with long arms and legs giving an awkward appearance. Face also becomes angular with the loss of fat. Teeth that begin to fall during the sixth year are all replaced with permanent teeth except for the wisdom teeth. Pattern of Physical Development in Late Childhood Height The annual increase in height is 2 to 3 inches. The average 11 year old girl is 58 inches tall, and the average boy of the same age is 57.5 inches tall. Weight Weight increases are more variable than height increases, ranging from 3 to 5 more pounds annually. Body Although the head is still proportionally too large for the rest of the body, some of the facial disproportions disappear as the mouth and jaw

NSOU • PGSW - VI _____ 61 become larger, the forehead broadens and flattens, the lips fill out, the nose become larger and acquires more shape. The trunk elongates and becomes slimmer, the neck becomes longer, the chest broadens, the abdomen flattens, the arms and legs lengthen and hands and feet grow larger, but slow rate. Homeliness The body disproportions, so pronounced during late childhood, are primarily responsible for the increase in homeliness at this time. Muscle-fat In this time fat tissue develops more rapidly than muscle tissue which has a marked growth spurt beginning at puberty. Teeth By the onset of puberty, a child normally has twenty-eight of thirty two permanent teeth. The last four, wisdom teeth, erupt during adolescence Skills of Late Childhood Children develop a numbers of skills during this stage. These-skills also differ from boys to girls. • Self help skills of eating, dressing, bathing grooming become almost as adept as that of an adult, with very little concentration required. • Social skills include helping others. Cleaning and helping in daily activities at home and helping teacher at school, sharing responsibilities with age mates at play are important achievements of the child. • School skills of writing, reading, drawing, painting, clay modeling, crayoning become more proficient. • Play skills such as throwing and catching the ball, bicycling, skating and swimming re developed. Fine motor skills of painting and needlework are well developed among girls while boys achieve gross motor skills of throwing a ball, kicking football or jumping. 2.4.5.2 Speech Improvement Older children are increasingly aware of speech as a tool for being accepted by their peer group members. Therefore speech is consciously improved from immature, unacceptable ways of communication such as crying and gesturing which are avoided. Proper pronunciation and grammar are learnt. Children take interest in telling jokes or narrating events or riddles. Parents and teachers also contribute to speech improvement by encouraging them. Radio and television serve as models for speech. There is marked improvement in vocabulary names of colours, numbers, money concepts, time concepts are included. Secret codes used by the gang often become part of older child's communication pattern.

Older children learn to control emotional outbursts as these are looked down upon by peer members, as immature and inappropriate behaviour. Happy and pleasant expressions on the other hand are expressed freely as seen in laughing, giggling or jumping. While the child tends to curtail expressions of negative emotions, he/she may show moodiness or resort to sulking. In expressing emotions, sex appropriateness can be noticed. Boys tend to show anger or curiosity while girls experience fears, worries and feelings of affection. There are times during late childhood when children experience frequent and intense emotions. Because, these emotions tend to be more unpleasant than pleasant, periods of heightened emotionality becomes period of disequilibrium-times when children are out of focus and difficult to live with. It may come from physical and environmental causes or from both. Another important characteristic of emotional development of late childhood is emotional catharsis. As children learn to curb the external expressions of their emotions, they discover that they are doing so; they become nervous, tense and ready to fly of the handle in a temper outburst at the slightest provocation. They are said to be in a "baby mood" or in a "bad humor". Clearing the system of pent up emotional energy-emotional catharsis-once discovered, becomes a new way of older children to handle their emotional expressions to conform social expectations. Through strenuous play, hearty laugh or even by crying they can clear their systems.

2.4.5.4 Social Development The older child shows strong desire to be an accepted member of the peer group. Staying at home or playing with siblings is disliked by them. The gangs are not delinquent groups but play groups. Their main activity is to play games, sports or simply chatting. The gangs are also strictly segregated, that is, members of a gang often come from the same sex. Those who are accepted by the gang members gain social status and feel self confident while the opposite is true of those who are rejected. Belonging to gang helps children to become socialize. This comes primarily from conforming to patterns of behaviour, the values and the attitudes of gang members (Denzin, 1975). Group belonging is not without some unfavourable effects on children. It often results in friction with parents and a rejection of parental standards. It also invites sex antagonism among the children.

2.4.5.5 Cognitive Development As the child grows and is approximately between 7 and 11 years of age (the period of middle and late childhood) intuitive thought is replaced by logical thought. This is the stage of concrete operational thought, which is made up of operations— mental actions that allow the child to do mentally what were done physically before.

NSOU • PGSW - VI _____ 63 Concrete operations are also mental actions that are reversible. In a well known test, the child is presented with two identical balls of clay. One ball is rolled by the experimenter into a long thin strip and the other ball remains in its original shape. On being asked which has more clay, the child of 7 or 8 years, would answer that, both have the same amount of clay. This is because the child imagines the ball rolled into thin strip and then into a ball, that means he/she is able to imagine reversible mental action on concrete/real objects. He/she is likely to focus on only one aspect- length or height. Concrete operations allow the child to focus on different characteristics and not to focus on one aspect of the object. This helps the child to appreciate that there are different ways of looking at things, which also results in the decline of her/ his egocentrism. Thinking becomes more flexible, and children can think about alternatives when solving problems, or mentally retrace their steps if required. Even though the preoperational child develops the ability to see relationships between different properties of an object, he/she cannot do abstract thinking, i.e. s/he still cannot manipulate ideas in the absence of objects. For example, steps required to complete algebraic equations, or imagining line of longitude or latitude of the earth.

2.4.5.6 Play activities Play for the older child is not a mere amusement, it is the chief instrument of socializing which provides opportunities for social skills. Various games, sports or activities such as collecting items (shells, stamps and pictures) are enjoyed. While these activities may be used, acceptance and popularity are the social goals of play.

2.4.5.7 Personality Development This period ranges from 6-12 years. During this period the child develops greater attention span, needs less sleep, and gains rapidly in strength; therefore, the child can expend much more effort in acquiring skills, and needs accomplishment, regardless of ability. The crisis faced during this period is industry v/s inferiority. The child aims to develop a feeling of competence, rather than inability. The success in this endeavor leads to further industrious behaviour, failure results in development of feelings of inferiority. Hence, the caretakers should guide the child to take up appropriate tasks. As the child's social horizons broaden when they enter school, new factors begin to influence the development of their personalities. As a result, they must frequently revise their self-concepts. Since, until now they have seen themselves almost exclusively through the eyes of their parents, it is not surprising if their self-concepts are biased. Now they see themselves as their teachers, their classmates and their neighbors see them.

Late-Childhood 1. Physical Condition : Poor health or physical defects that cut children off from play with their peers make them feel inferior. 2. Body Build : Children who are overweight or very small for their ages may be unable to keep their peers and, as a result, they develop feelings of inferiority. 3. Socioeconomic Status : If children feel that they have better homes, better clothes and better play equipments than their age-mates, they will feel superior. On the other hand, they sense that their socio-economic status is inferior to that of their age-mates it is likely to lead feelings of inferiority. 4. School Environment : Competent, understanding teachers do much to bring about good adjustment in their pupils, while teachers who use this discipline that children consider unfair or that otherwise antagonize them have the opposite influence. 5. Social Acceptance : Acceptance or lack of it on the part of peers influences the child's personality through its effect on the self-concept. Very popular children and isolates are especially affected, and other less so. 6. Success and Failure : Success in the tasks the child sets out to achieve leads to a feeling of confidence and self-acceptance, while failure makes for a feeling of inadequacy. 7. Sex : Girl recognize that the sex roles they are expected to play are inferior to male roles, and this realization results in a corresponding decrease in self-evaluation. They incorporate society's evaluations of their roles as inferior and so value themselves less. 8. Intelligence: Children's personalities are adversely affected if their intelligence deviates markedly from the norm. Children who are duller than average sense their inferiority and the rejectant attitude of their group. As a result, they may become shy, introverted and apathetic-or they may become aggressive to those who reject them. Children with very high I.Q are likely to have poor self-concepts. 9. Development of Ideal Self-Concepts: As childhood draws to a close, children begin to hero-worship characters in history or in fiction, on the stage or on the screen, or in the world of sports or national affairs. They then form concepts of the ideal self, the kind of person they would likely to be. At first, ideal self-concept is patterned along the lines set by parents, teachers, and

NSOU • PGSW - VI _____ 65 others from their immediate environments. Later, as their horizons broaden, people they do not know but have heard of or read from about from the nucleus for this ideal self. 10. Search for Identity : The search for identity begins in the latter part of a childhood and reaches a crisis stage in adolescence. To achieve a sense of identity, children must have an inner assurance that they are able to function independently. Until, they get this feeling of assurance they are insecure. To cope with this problem, older children try to associate themselves emotionally with peers and try to cut parental apron strings. 2.4.5.8 Improvement of Understanding The older child is now in a stage where concepts become specific and concrete. They reflect a stage of cognitive development termed as 'concrete operations'. The school plays an important role in building, improving and clarifying concepts. The child begins to understand social dimensions in concepts – types of groups, differences, similarities etc are perceived by the child. 2.4.5.9 Moral Development Between the ages of five and twelve, children's concepts of justice change, as explained by Piaget. Their rigid and inflexible notions of right and wrong, learned from parents, become modified and they begin to take into account the specific circumstances surrounding a moral violation. This, according to Piaget, moral relativism replaces moral inflexibility. For example, to a five-year-old lying is always bad, while older child realizes that in some situations lie is justified, and therefore, not necessarily bad (Piaget, 1970). Kohlberg has elaborated on Piaget's theory and has labeled late childhood the second level of moral development, the level of conventional morality, or morality of conventional rules and conformity. In the first stage of this level, which Kohlberg has called "good boy morality", children conform to rules to win the approval to others and to maintain good relationships. In the second stage, Kohlberg contends that if the social group accepts rules as appropriate for all group members, they should conform to them to avoid social disapproval and censure (Kohlberg, 1969). 2.4.5.10 Hazards in Late Childhood The child is susceptible to many physical and psychological hazards. They include illness and accidents which are the physical hazards encountered by older children. Improved medicare takes care of several illnesses but accidents are a major cause of death among older children. Children who experience lack of peer acceptance are dissatisfied leading to personality maladjustments in later life.

66 _____ NSOU • PGSW - VI 2.4.6 Adolescence Adolescence literally means 'to grow to maturity'. It is an intermediary stage between childhood and adulthood characteristically possessing qualities of both stages, although not fully in either of them. The age range is from 12-19 years. It is the threshold to adulthood. There are rapid physical changes taking place including sexual maturity which is attained during adolescence. Consequently there are also psychological and social changes. Adolescence is a crucial stage for the person. In addition, it usually encounters problems of different kinds. Adolescents are very sensitive. The term adolescence derives from the Latin word *adolescere*, meaning "to grow into maturity". It is the transitional period in a person's life between childhood and adulthood. Adolescence is commonly defined as the stage of life that begins at the onset of puberty, when sexual maturity or the ability to reproduce is attained. It has been regarded as a period of rapid change, both biologically and psychologically. Though the physical changes that take place during this stage are universal, the social and psychological dimensions of the adolescent's experiences depend on the cultural context. For example, in cultures where the adolescent years are viewed as problematic or confusing, the adolescent will have very different experiences from someone who is in a culture, where adolescent years are viewed as beginning of adult behaviour and, therefore, undertaking responsible tasks. Although most societies have at least a brief period of adolescence, it is not universal across cultures. Characteristics of Adolescence 1. Adolescence is an important period 2. Adolescence is a period of change 3. Adolescence is a problem age 4. It is a time of search for identity 5. It is a dreaded age 6. It is a time of unrealism 7. Adolescence is the threshold of Adulthood 2.4.6.1 Physical Development Puberty or sexual maturity marks the end of childhood and signifies the beginning of adolescence, which is characterized by dramatic physical changes in both, growth rate, and sexual characteristics. However, puberty is not a sudden event, but is part of a gradual process. The hormones released during puberty result in the development of primary and secondary sexual characteristics. The primary sex

NSOU • PGSW - VI _____ 67 characteristics include those directly related to reproduction and the secondary sex characteristics include features or signs of achieving sexual maturity. Pubertal changes in boys are marked by acceleration in growth, facial hair, and changes in voice. In girls, rapid growth in height usually begins about two years before menarche, the onset of menstruation. The growth spurt generally begins at the age of 12 or 13 for boys and at the age of 10 or 11 for girls. It is normal to have variations in the pubertal sequence. For example, among two boys (or two girls) of same chronological age, one may complete pubertal sequence before the other has begun it. Both genetics and environment play a part in this. For example, identical twins reach menarche closer in time than do fraternal twins; on an average, girls from affluent families go through menarche earlier than girls from poor families; and historical trends show that the age of menarche is declining in industrialized nations reflecting better nutrition and advances in medical care. Physical development during adolescence is also accompanied by a number of psychological changes. Around puberty adolescents show an increase in interest in members of the opposite sex and in sexual matters and a new awareness of sexual feelings develops. This increased attention to sexuality is caused by factors such as individual's awareness of the biological changes taking place and the emphasis placed on sexuality by peers, parents, and society. Even then, many adolescents lack adequate knowledge or have misconceptions about sex and sexuality. The development of a sexual identity defines the sexual orientation and guides sexual behaviour. As such it becomes an important developmental task for adolescents. Adolescents are preoccupied with what they are like and develop individual images of what they look like. Another important developmental task during adolescence is accepting one's physical self maturity. Adolescents need to develop a realistic image of their physical appearance, which is acceptable to them. It is important to keep in mind that puberty also involves cognitive and social changes along with physical changes. Body changes during Adolescence External Changes Height The average girl reaches her mature height between the ages of seventeen and eighteen and the average boy, a year so later. Weight Weight changes follow a timetable similar to that for height changes, with weight now distributed over areas of the body where previously there was little or no fat.

68 _____ NSOU • PGSW - VI Body The various parts of the body gradually come Proportions into proportion. For example, the trunk broadens and lengthens, and thus the limbs no longer seem too long. Sex Organs Both male and female sex organs reach their mature size in late adolescence, but are not mature to function until several years later. Secondary The major secondary sex characteristics are at a Sex mature level of development by late adolescence. Characteristics Internal Changes Digestive The stomach becomes longer and less tubular, System the intestines grow in length and circumference, the muscles in the stomach and intestinal wall become thicker and stronger, the liver increases in weight, and the esophagus becomes longer. Circulatory The heart grows rapidly during adolescence; by System the age of seventeen or eighteen, it is twelve times as heavy as it was at birth. The length and thickness of the walls of the blood vessels increase and reach a mature level when the heart does. Respiratory The lung capacity of girl is almost at a mature System level at age seventeen; boys reach this level several years later. Endocrine The increased activity of gonads at puberty results System in a temporary imbalance of whole endocrine system in early adolescence. The sex glands develop rapidly and become functional, though they do not reach their mature size until late adolescence or early adulthood. Body The skeleton stops growing at average age of Tissues eighteen. Tissues, other than bones have reached their mature size. 2.4.6.2 Cognitive

Developmental Changes Adolescents' thought becomes more abstract, logical, and idealistic; they become NSOU • PGSW - VI _____ 69 more capable of examining their own thoughts, others' thoughts, and what others are thinking about them. Adolescents' developing ability to reason gives them a new level of cognitive and social awareness. Piaget believed that formal operational thought appears between the age of 11 and 15. During this stage adolescent thinking expands beyond actual concrete experiences and they begin to think more in abstract terms and reason about them. In addition to being abstract, adolescent thought is also idealistic. Adolescents begin to think about ideal characteristics for themselves and others and compare themselves and others with these ideal standards. For example, they may think what an ideal parent is like and compare their parents with these ideal standards. This may at times make adolescents wonder which of the new-found ideal standards they should adopt. In contrast to trial and error approach used by children in earlier stages of development, adolescent thinking becomes more systematic in solving problems—they think of possible courses of action, why something is happening the way it is, and systematically seek solutions. Piaget called this type of logical thinking—hypothetical deductive reasoning. Logical thought also influences the development of moral reasoning. Social rules are not considered as absolute standards and moral thinking shows some flexibility. The adolescent recognizes alternative moral courses, explores options, and then decides on a personal moral code. For example, individuals at this age might participate in a protest march for a cause rather than adhere/ conform to college norm. Adolescents also develop a special kind of egocentrism. According to David Elkind, imaginary audience and personal fable are two components of adolescents' egocentrism. Imaginary audience is adolescent's belief that others are as preoccupied with them as they are about themselves. They imagine that people are always noticing them and are observing their each and every behaviour. Imagine a boy who thinks that all will notice the ink spot on his shirt, or a girl with a pimple feels, all people would think how bad her skin is. It is this imaginary audience, which makes them extremely self-conscious. The personal fable is part of the adolescents' egocentrism that involves their sense of uniqueness. Adolescents' sense of uniqueness makes them think that no one understands them or their feelings. For example, an adolescent girl thinks that none can sense the hurt that she feels because of being betrayed by a friend. It is quite common to hear the adolescent say to the parents; 'you don't understand me'. To retain their sense of personal uniqueness they may weave stories filled with fantasy around them to create a world that is away from reality. Personal fables are often part of adolescent diaries.

Traditionally, adolescence has been thought of as a period of "storm and stress"- a time of heightened emotional tension resulting from the physical and glandular changes that are taking place. Most of the adolescents, experiences emotional instability from time to time, which is a logical consequence of the necessity of making adjustments to new pattern of behaviour and to new social expectations. Instead of having temper tantrums, however, adolescents express their anger by sulking, refusing to speak, or loudly criticizing those who angered them. They are also found to be envious of those with more material possessions. By the end of adolescence, boys and girls are said to be more emotionally mature. They do not "blow up" emotionally when others are present, but wait for a convenient time and place to let off emotional steam in a socially acceptable manner. Finally, emotionally mature adolescents are stable in their emotional responses and they do not swing from one emotion or mood to another.

2.4.6.4 Social Development The peer group influence increases. The adolescent begins to notice and take interest in the opposite sex. Making friends and adjusting to new social situations in school, search for career are learnt during this time. Great deal of interest is shown in personal grooming, looks and clothes. Adolescents also ponder over several philosophical issues and try to find an answer to questions such as "Who am I? What is the purpose of life?" The search for identity when it takes a meaningful turn enables the adolescent to adjust well and in contrast in identity, crisis leads to confusion and diffidence in future. Of all the changes that take place in social attitudes and behaviour, the most pronounced is in the area of heterosexual relationships. In a short period of time adolescents make the radical shift from disliking members of their opposite sex to preferring their companionship to that of members of their own sex. Not only that, they no longer select their friends on the basis of ready availability at school or in the neighbourhood, as they did during childhood, and the enjoyment of the same activities is not such an important factor for friendship selection. They want to selects those as friends whose values and interests are similar to their standards and who understand them and make them feel secure. They also expect that the leaders of their gangs with whom they wants to belong must possess certain qualities like good physique, well groomed, be attractive, belongs to higher socio-economic status etc.

adolescence, boys and girls have reached what Piaget has called the stage of formal operations in cognitive ability. They are now capable of considering all possible ways of solving a particular problem and can reason on the basis of hypotheses or propositions. They can look their problems from several pints of view and can take many factors into account when solving them (Piaget, 1969). According to Kohlberg, the third level of moral development, post-conventional morality should during adolescence. This level of self-accepted principles and it consists of two stages. In the first stage, the individual believes that there should be flexibility in moral beliefs to make it possible to modify and change moral standards if this will be advantageous to group members as a whole. In the second stage, individual conform to both social standards and to internalized ideals to avoid self- condemnation rather than to avoid social censure. In this stage, morality is based on respect for others rather than on personal desires (Kohlberg, 1969).

2.4.6.6 Personality Development This is a period of transition from childhood to adulthood which extends from 12-20 years. During this period the individual attains puberty leading to many changes. These changes have enormous implications for the individual's sexual, social, emotional and vocational life; that is why Stanley Hall has rightly described this period as a "period of storm and stress". These changes make the individual to find an identity, which means developing an understanding of self, the goals one wishes to achieve and the work/occupation role. The individual craves for encouragement and support of caretakers and peer groups. If he is successful he will develop a sense of self or identity, otherwise he will suffer from role confusion/ identity confusion. By early adolescence, both boys and girls are well aware of their good and bad traits, and they appraise these in terms of similar traits in their friends. They are also well aware of the role of personality plays in social relationships and thus are strongly motivated to improve their personalities-by reading books or articles on the subject, for example-in the hope of increasing their social acceptance. Many adolescents use group standards as the basis for their concept of an "ideal" personality against which they assess their own personalities. This is difficult, often impossible task. First, the personality pattern established during childhood, has begun to stabilize and take the form it will maintain with few modifications during the remaining years of life. Second, many of the conditions that are responsible for molding the personality pattern are not within the adolescent's control since they are a product of the environment in which the

72 _____ NSOU • PGSW - VI adolescent lives and thus will continue to affect the self-concept-the core of personality pattern-as long as environment remain stable. Conditions influencing Adolescent's Self-Concept 1. Age of Maturin : Early Matures, who are treated as near-adults, develop favorable self-concepts and thus make good adjustments. Late matures, who are treated like children, feel misunderstood and thus are predisposed to maladjusted behaviour. 2. Appearance : Being different in appearance makes the adolescence feel inferior, even if difference adds to physical attractiveness 3. Sex : Appropriateness: Sex appropriate appearance, interests, and behaviour help adolescents achieve favorable self-concepts. Sex appropriateness makes them self-conscious and this influences their behaviour unfavorably. 4. Family Relationships : An adolescent who has a very close relationship with family member will identify with this person and want to develop a similar personality pattern. 5. Peers: Peers influences the adolescent's personality pattern in two ways. First, the self-concept of adolescent's are reflections of what they believe their peers' concepts of them are and, second, they cone under peer pressures to develop personality traits approved by the group. 6. Creativity: Adolescents who have been encouraged to be creative in their play and academic work as children develop a feeling of individuality and identity that has a favorable effect on their self-concepts. On the other hand, who have been forced to conform to an approved pattern since earliest childhood suffers from lack of feeling of identity and of individuality. 7. Level of Aspiration: If adolescents have unrealistically high levels of aspiration, they will experience failure. This will lead to feelings of inadequacy and to defensive reactions in which they blame others for their failures. Adolescents who are realistic about their abilities will experience more success than failures. Consequences of attempts to improve Personality How successful adolescents will be in their attempts to improve their personalities depend on many factors. First, they must set ideals that are realistic and attainable

NSOU • PGSW - VI _____ 73 for them. Second, they must make realistic assessment of their strength and weaknesses. Third, they must have stable self-concept. Fourth, they must be reasonably more satisfied with their achievements and eager to make improvements in any area in which they feel deficient. 2.4.6.7 Hazards in Adolescence While illness rates may be low, accidents and conflicts leading to suicide are high. Psychological hazards arise out of inability to make the transition into maturity. Social disapproval is still a major source of hazard especially with the opposite sex. 2.4.7 Adulthood An adult is generally defined as someone who is responsible, mature, self- supporting, and well integrated into society. There is a variation in developing these attributes, which suggests that there is a shift in timing when an individual becomes an adult or assumes adult roles. Some people take up jobs along with their college studies or may get married and not pursue their studies. Others may continue to live with their parents even after getting married and being financially independent. The assumption of adult roles is directed by an individual's social context. The best time for some of the most important life events (i.e. marriage, job, having children) might be quite different in different cultures but within a culture there is similarity in the course of adult development. In early adulthood, two major tasks are, exploring the possibilities for adult living and developing a stable life structure. Gradually, a transition from dependence to independence should occur. This could be marked by an image of the kind of life the young person wants, especially in terms of marriage and a career. 2.4.7.1 Career and Work Earning a living, choosing an occupation, and developing a career are important themes for people in their twenties and thirties. Entering work life is a challenging event in anyone's life. There are apprehensions regarding different adjustments, proving one's competence, performance, dealing with competition, and coping with expectations both of the employers and one. It is also the beginning of new roles and responsibilities. Developing and evaluating a career becomes an important task of adulthood.

74 _____ NSOU • PGSW - VI 2.4.7.2 Marriage, Parenthood, and Family The adjustments that young adults have to make when entering a marriage relate to knowing the other person if not known earlier, coping with each other's likes, dislikes, tastes, and choices. If both the partners are working, adjustments are required regarding sharing and performing roles and responsibilities at home. In addition to getting married, becoming a parent can be a difficult and stressful transition in young adults, even though it is usually accompanied by the feeling of love for the baby. As the family grows and children are added, one must realize that it involves great responsibility. Adjustment to parenthood depends on several factors including the desire for children, number of children, time when they are born, sex of children, spacing between children, ability to support them, child rearing practices used by parents, acceptance of children. Children can contribute greatly to the emotional well being of parents if brought LIP with loving care provided with overall acceptance. The parental role must be played with commitment and creativity. Adjustment to parenthood may become elusive if children are rebellious, sick or uncaring. Those who are childless by choice, although enjoy greater freedom, forfeit the joys of child's affection and companionship. 2.4.7.3 Personality Development This stage extends from 20-30 years. As an adult, the individual takes a firmer place in society, usually holding a job, contributing to community and maintaining a family and care of offspring. These new responsibilities can create tensions and frustrations, and one solution involves is, an intimate relationship with family. This situation leads to a crisis called intimacy v/s isolation. If these problems are solved effectively by the love, affection and support of family the individual leads a normal life, otherwise he will develop a feeling of alienation and isolation which in turn affects his personality negatively. 2.4.8 Middle Age Middle age is an intermediary stage between adulthood and old age. Beginning around 45 years it ends when old age begins. It is a period of transition from adulthood to old age. It is characterized by achievements professional and otherwise. It is a time when life is evaluated by introspection. It is called empty- nest period as children leave home. Many observers view it as a time of stress, often termed as 'Middle age' crises. The developmental tasks of the middle aged adult are centered on success in

NSOU • PGSW - VI _____ 75 career adjusting well in marriage and finding satisfaction in children. At work the person attains great achievements and experiences a climax. Depending on the foundations the marriage may be shaken up or strengthened. The relationship with children assumes a new dimension as they too start early adult life. 2.4.8.1 Physical Changes With active reproductive stage behind them, men and women undergo the experience of a physical decline. Women go through menopause, the end of menstrual cycle. As a result, she cannot have children any more. With the decline in hormones leading to a menopause in women several other features appear. Weight gain around the abdomen, joint pains, changes in appearance with grey hairs and sagging muscles, problems with teeth and vision, slow down the pace of life. Men too experience reduced sexual drive and motivation; hence they may question their own virility. As the youthfulness begins to fade away refocusing the relationship between husband and wife become essential. 2.4.8.2 Emotional Changes The drastic physical changes brought in by reduced hormones, lead to emotional ups and downs. Periods of moodiness, loneliness or blues affect the middle age adult. The feelings of reduced function, unattractiveness and the like cause negative feelings and stress which if left uncared for, can escalate to full blown crisis situation. Emotional stability can be achieved in meaningful work, interests and relationships. Frequently people turn to religion and God for peace, strength and meaning. 2.4.8.3 Social Changes During middle age social activities and responsibilities assume increased significance. Children and their families are a source of satisfaction. Friends and peer-group members are very important in helping one realize he/she is not alone. Happiness comes from accepting the journey of life with its many twists and turns. Developing and experiencing career goals and achieving them, renewed family intimacy and social contributions provide added value to the person. 2.4.8.4 Personality Development This period ranges from 30-65 years. It is otherwise called middle age. During this stage of life, the crisis encountered is generativity v/s stagnation. This requires

76 _____ NSOU • PGSW - VI expanding one's interests beyond oneself to include the next generation. The positive solution to the crisis lies not only in giving birth to children, but also in working, teaching and caring for the young, in the products and ideas of the culture, and in a more general belief in the species. This response reflects a desire for wellbeing of the humanity rather than selfishness. If this goal is not achieved the individual will be disappointed and experience a feeling of stagnation. 2.4.8.5 Old Age Just when "old age" begins, is not easy to determine. Traditionally, the age of retirement was linked to old age. Now that people are living longer, age of retiring from work is changing, and the cut-off point for the definition of "old age" is moving upward. Some of the challenges, which the aged have to cope with, include retirement, widowhood, illness, or death in the family. The image of old age is changing in certain ways. Now there are people who have crossed seventy years of age or so and are quite active, energetic, and creative. They are competent and are therefore, valued by society in many walks of life. Of course, the experience of old age also depends on the socio-economic conditions, availability of health care, attitude of people, expectations of society and the available support system. The age of 60 or 65, roughly equivalent to retirement ages in most developed countries is said to be the beginning of old age. 2.4.8.5.1 Physical Marks of Old Age Bone and joint : Old bones are marked by "thinning and shrinkage." This results in a loss of height (about two inches by age 80), a stooping posture in many people, and a greater susceptibility to bone and joint diseases such as osteoarthritis and osteoporosis. Chronic diseases : Older persons have at least one chronic condition and many have multiple conditions. In 2007-2009, the most frequently occurring conditions among older persons in the United States were uncontrolled hypertension (34%), diagnosed arthritis (50%), and heart disease (32%). Dental problems : Less saliva and less ability for oral hygiene in old age increase the chance of tooth decay and infection. Digestive system : About 40% of the time, old age is marked by digestive disorders such as difficulty in swallowing, inability to eat enough and to absorb nutrition, constipation and bleeding. NSOU • PGSW - VI _____ 77 Eyesight : Diminished eyesight makes it more difficult to read in low lighting and in smaller print. Speed with which an individual reads and the ability to locate objects may also be impaired. Falls : Old age spells risk for injury from falls that might not cause injury to a younger person. Every year, about one third of 65 years olds and over half of 80 years old fall. Falls are the leading cause of injury and death for old people. Hair : usually becomes thinner and grayer. Hearing : By age 75 and older, 48% of men and 37% of women encounter impairments in hearing. Hearts are less efficient in old age with a resulting loss of stamina. Less efficient immune function (Immune system) is a mark of old age. Lungs expand less well; thus, they provide less oxygen. Pain afflicts old people at least 25% of the time, increasing with age up to 80% for those in nursing homes. Most pains are rheumatological or malignant. Sexual activity decreases significantly with age, especially after age 60, for both women and men. Sexual drive in both men and women decreases as they age. Skin loses elasticity, becomes drier, and more lined and wrinkled. Sleep trouble holds a chronic prevalence of over 50% in old age and results in daytime sleepiness. Taste buds diminish so that by age 80 taste buds are down to 50% of normal. Food becomes less appealing and nutrition can suffer. Urinary incontinence is often found in old age. Voice : In old age, vocal chords weaken and vibrate more slowly. 2.4.8.5.2 Mental marks of old age Adaptable describes most people in their old age. In spite the stressfulness of old age; they are described as "agreeable" and "accepting." However, old age dependence induces feelings of incompetence and worthlessness in a minority. Depressed mood : According to Cox, Abramson, Devine, and Hollon (2012), old age is a risk factor for depression caused by prejudice (i.e., "deprejudice"). When people are prejudiced against the elderly and then become old themselves, their anti- elderly prejudice turns inward, causing depression. "People with more negative age stereotypes will likely have higher rates of depression as they get older." Old age depression results in the over-65 population having the highest suicide rate.

78 _____ NSOU • PGSW - VI Fear of crime in old age, especially among the frail, sometimes weighs more heavily than concerns about finances or health and restricts what they do. The fear persists in spite of the fact that old people are victims of crime less often than younger people. Reduced mental and cognitive ability afflicts old age. Memory loss is common in old age due to the decrease in speed of information being encoded, stored, and received. It takes more time to learn new information. Dementia is a general term for memory loss and other intellectual abilities serious enough to interfere with daily life. Its prevalence increases in old age from about 10% at age 65 to about 50% over age 85. Alzheimer's disease accounts for 50 to 80 percent of dementia cases. Demented behavior can include wandering, physical aggression, verbal outbursts, depression, and psychosis. 2.4.8.5.3 Social, emotional and Vocational changes Retirement from active vocational life is quite significant. Some people perceive retirement as a negative change. They consider it as a separation from an important source of satisfaction and self-esteem. Others view it as a shift in life with more time to pursue their own interests. It is seen that older adults who show openness to new experiences, more striving and achievement oriented behaviour prefer to keep busy and are better adjusted. Older adults also need to adjust to changes in the family structure and new roles (grand parenting) that have to be learnt. Children usually are busy in their careers and families and may set up independent homes. Older adults may depend on their children for financial support and to overcome their loneliness (after children have moved out). This might trigger-off feelings of hopelessness and depression in some people. In old age feeling of energy, and dwindling of health and financial assets, lead to insecurity and dependency. The elderly tend to look towards others to lean on and to care for them. In fact, parents in most oriental cultures rear their children with the fond hope that they will care for them during old age. It is important to give the elderly a sense of security and belonging, a feeling that people care for them (especially in the time of crisis), and to remember that we all have to grow old one day. Although death is more likely to occur in late adulthood, death can come at any point in development. The deaths, especially of children and younger adults, are often perceived to be more tragic than those of others. In children and younger adults, death is more likely to occur because of accidents but in older adults it is more likely to occur because of chronic disease. The death of a spouse is usually seen as the most difficult loss. Those left behind after the death of their

NSOU • PGSW - VI _____ 79 partner suffer deep grief, cope with loneliness, depression, financial loss and are also at risk of many health related problems. Widows by far outnumber widowers, because studies show that women live longer than men and tend to marry men older than themselves. During such times, support from children, grandchildren, and friends can help the individual cope with the loss of spouse. People in different cultures view death differently. It is brief sketch of different spheres of human development, though there are variations but most of the individuals have to follow the above mentioned pathways during their life time. 2.5

Health and Nutrition needed to Support and Enhance Growth and Development at each level

Time Period Nutrition required at each stage of Growth and Development Infants and Pre-school Many studies have proven that maintaining a balanced diet children in the infancy life stage is paramount for long-term health and well-being. For the first six months of a baby's life, the Department of Health recommends that mother's breastfeed their babies as breast milk is full of nutrients and antibodies that infants need. Breastfeeding might not be for everyone, so bottle feeding formula milk offers a great alternative. Typically, cow's- milk-based formulas are recommended. Nutritional requirements The nutritional requirements for children aged one to for Children five progresses from their first 12 months. By then, they need all of the essential nutrients to aid a growing body. In these early years they needed help managing their meals- cutting food and helping with feeding - and by the age of five, preferably earlier, they should be able to manage mealtimes independently. Key food groups to incorporate in a pre-school child's diet include carbohydrates, fruit and vegetables, milk and dairy foods, protein and good quality fats. Ensuring the child has

80 _____ NSOU • PGSW - VI a balanced diet containing the essential food groups and nutrients - vitamin A, C, calcium, iron and zinc-can be difficult if your child is a fussy eater. Early Childhood Starting school can be very daunting - not only for children, but for parents too. This is the time where, for at least one meal, a child may be in charge of what they eat. This also starts the life stage where they might stay round a friend's house for dinner, or ask for pocket money with the aim of spending it on fizzy drinks and sweets. For parents who do not opt for their child to have school dinners, choosing what they have in their packed lunch can be a tough task. Take a look at our healthy eating for kids and lunch box ideas pages to get some inspiration on how to supply balanced meals that kids will enjoy. Nutritional tips for children belonging to the age group of early childhood : Advise against snacking on crisps, biscuits and chocolate. Offer healthy snacks such as fruit, popcorn or home-made biscuits instead. Encourage three set meal times - breakfast, lunch and dinner - with healthy snacks between meals. Late Childhood When a child enters their teenage years, they tend to start making their own choices about their own social life, nutrition and education. Although this can be seen as a positive step, physiological changes and peer pressure can affect the way a teen acts. Teenagers may refuse certain types of food. They may skip breakfast and start eating a diet of fast food that won't give them essential fiber, vitamins and minerals a growing body needs. In this instance, parents can only set a good example at home. Stock the fridge with healthy snacks and serve balanced meals when they decide to stay in. Due to the accelerated growth period a teenager goes through, they need a balanced diet packed full of nutrients

NSOU • PGSW - VI _____ 81 including calcium, iron and protein. You may want to consider a vitamin and mineral supplement designed specifically for teenagers. This will ensure they are getting these essential nutrients. It's common for teenagers, particularly girls, to have a distorted view of their body image that might lead them to think they need to lose weight. Unfortunately the most common avenues that they might explore to achieve this include unhealthy fasting, skipping meals and avoiding all sugary foods and snacks. Adulthood The majority of our body's growth and development will be over when they enter adulthood. Now we can shift our focus on nutrition and maintaining a physically active and healthy lifestyle. This will help reduce the risk of weight, age and lifestyle related diseases. Old age It is important to focus on good nutrition for the elderly as our bodies' change and face a number of limitations when one is growing older. With reduced mobility to get to the shops to buy ingredients for balanced meals, and other social aspects like a lower food budget, single elderly people may lose the motivation to cook balanced meals or even lack the cooking skills to complete such tasks. Freezing food, snacking and purchasing long life foods all can be great ways to introduce and maintain the dietary requirements and nutritional needs of an older adult or elderly person. 2.6 Conclusion This unit explained us about the concept of life span development along with the various infront aspects of development or well or the different kinds of requirements. Which are needed for proper growth & development. 2.7 Exercise Essay Type Questions : 1. Write in detail about the moral development of a child from birth to adolescence.

82 _____ NSOU • PGSW - VI 2. Discuss the stages of prenatal development. 3. Adolescence is a period of "storm and stress"- discuss. 4. Write in detail about the physiological and psychological marks of old age. Short Notes: 1. Teratogens 2. Physical development in Infancy 3. Moral Development in late childhood 4. Health and Nutrition needed in different stages of growth and development. 5. Developmental tasks in different stages of development. Objective Types: 1. Define 'Object permanence'. 2. Define "empty-nest". 3. Write the names of different stages of development. 4. Define old age. 5. Whom do we call "adolescent"? 2.8 References • Berk, L. E. Child development. Learning Theories: Skinner and Bandura Structure 3.1 Objective 3.2 Introduction 3.3 Bandura social learning theory 3.4 Skinner's Experiment on Classical Conditioning 3.5 Conclusion 3.6 Exercise 3.7 Reference 3.1 Objective This unit will give you an idea about Behavioural & Social learning theories, especially developed by Skinner & Bandura. 3.2 Introduction Remember your first love? You needed a whole week before you decided to ask your girl friend if she would have a cup of coffee and a bite of sandwich with you at the nearest joint. You - reputed to be the smartest guy around, got tongue tied. And when finally you asked her out, and she replied 'Why not?', the sky seemed to be filled with music and you felt yourself the luckiest man that ever stepped on the earth. Your confidence soared; your bathroom mirror seemed to reflect back a more handsome face. How would you dress for the occasion? You stood in front of your wardrobe. You touched your costliest T shirt and the new pair of denims; no - she might think you are showing off. The trousers you wear everyday and an ordinary shirt? She would think you do not really care. Finally you decided but let's not bother about what you decided. Let's analyse from a psychological perspective your behaviour before your decision. Why were you hesitant to ask her out? Skinner would say it is because of the association between your earlier approach behaviours to ladies and their negative consequences. Dollard and Miller would say that you were socialised into being hesitant before you approach a lady, as there might be an approach - avoidance conflict between your secondary drives of love and the avoidance of pain that may 84

NSOU • PGSW - VI _____ 85 result from the effort. What about your thoughts in front of the open wardrobe? Skinner would say that your inner thoughts are of no relevance, and we must look into what you actually did. Dollard and Miller would go on about the power of words as secondary drive, as you imagine what she might say. Yet, do you feel that there is something missing in all these explanations? Actually, 'you' is missing - you - the person, who fears, who loves, who decides. In the latter half of the nineteenth century, a number of psychologists, including Albert Bandura brought in the 'person' into psychology - the cognitive turn. The social-cognitive approach to personality recognises the role of the person as an agent with the ability to choose the course of action within a given social environment. It is true that the pattern of choices and tendencies may have come through earlier feedback from the environment. However, once the person learns it, he/she is in a position to utilise it in his/her own fashion. He/she responds not merely by mechanically repeating habitual reactions to specific stimuli. He/she interacts with the environment in a constructive manner. During an action, a person is undoubtedly influenced by the environment, but also actively constructs and influences the environment. In this unit, you will be learning about Bandura's approach to personality. This approach is known as the social-cognitive approach as it involves an interaction of the social environment with the person's conscious cognition. In fact, Bandura initially named his approach the 'Social learning' theory. Later on it was renamed as social cognitive approach to emphasise the cognitive component involved in it. The Person as an Agent From the social-cognitive approach, a person is the conscious agent of one's own existence. You are empowered to select what you would do within the specific environment. Bandura (2001) in this context talked of the functional consciousness. It refers to an individual's purposive selection and processing of information. The person consciously selects, constructs, regulates, and evaluates the possible courses of action and decides the final behaviour. For this purpose the person can access concrete events as well as symbolic representations of activities, goals and future occurrences. Bandura coined the term 'Reciprocal determinism' to represent this person-environment dependence. Bandura (2001) analysed the core features of personal agency. These are: (i) Intentionality, (ii) Forethought,

86 _____ NSOU • PGSW - VI (iii) Self reactivity and (iv) Self reflectiveness. 1. Intentionality What do you mean by intention? Your intention is a representation of the future course of action which you would probably perform. If you are going to read through this unit this evening, this is your intention. You usually intend to do something because you mentally represent the positive consequences it would bring about. You must remember however, that intentionality and actual consequences may not match. You may read this unit with the intention to know about social-cognitive approach to personality, and probably your consequences would match your intention. But if you read it to score high marks in the examination, it may so happen that there is no question from this unit at all in the question paper! 2. Forethought Intention always involves some planning. Forethought refers to the planning dimension of agency. This is a temporal extension of the personal agency in future. In simpler terms, it means you project yourself in future, and see your position through imagination. When you are engaged in forethought, you are setting goals, anticipating the likely consequences of available courses of actions, and evaluating their feasibility. When you were trying to decide about the best dress to attend a social event, you were engaged in forethoughts. As you were judging the different consequences of your choice of dress, you were physically at the present moment, but were engaged in projections of future events. Bandura calls these projections 'anticipatory consequences'. Your forethoughts served as motivators for your action or in this particular case, not to act. You may note that you constructed the future reality yourself on the basis of your expectancies. You never knew for sure whether you have chosen a right colour on this occasion. But you expected the crowd to disapprove. Thus you acted on your anticipated consequences. 3. Self reactivity Once you have a fore thought you also have goals. However, simply having some goals does not lead to directed actions. You must have heard about the absent minded professor who wanted to lie down on the bed. However, being absent minded, he laid down his walking stick on the bed and stood by the door all night. He forgot to actualise his goal. Agentic implies the ability to actualise the goal, to give shape to appropriate courses of action and to regulate their execution. This self regulation is the sine qua non of agentic behaviour. When of all possible options, you choose to behave in a certain way, you regulate your own behaviour. You select the behaviour

NSOU • PGSW - VI _____ 87 or the course of action in terms of your personal standard. You also utilise the feed back you get from your action and prepare yourself for the next move. In this context, Bandura highlights the fact that neither do we always need to engage in trial and error behaviour, nor do we need to depend on external reinforcement. Human beings more often use self reinforcement. Self reinforcement refers to self produced consequences of an action. A person possesses an internal standard – a feedback for one's own performance. Take for example your decision to take this Psychology course. Probably nobody forced you to go for it. You wanted to have a degree in Psychology because in your own standard you consider it valuable. Thus, you were able to exercise self-regulation – an extremely important concept in Bandura's theory of personal agency. Experimental Evidence of Self Reinforcement: In 1967 Bandura and Perloff conducted an experiment with children. They wanted to compare the relative effectiveness of self monitored versus externally reinforced work. The participating children had to engage in a manual task of cranking a wheel. They earned scores depending on the number of crankings they could produce within a given time. Eight crankings earned them a score of 5, sixteen earned them 10, and so on. Production of higher number of cranking required investment of greater physical energy. The children were assigned randomly to any of the four groups as follows: I A no reinforcement group where no reward was given I An advance reward group

88 _____ NSOU • PGSW - VI where a pre fixed reward was given in advance I A self reinforced group that set their own standards for themselves I An externally reinforced group where the same reward selected by Group 3 was given by external decision. Results revealed that the self rewarded group selected quite stringent performance criteria. This group and the externally rewarded group produced almost double in comparison to the other two groups. The children in self reward group were also observed to raise their standard during the work. From this study Bandura concluded that self reward is essential for getting people motivated to work. Moral conduct as a self reinforcing issue: In Bandura's view, internal reinforcements and self regulation are far more important for human beings, and this is the specific area where animal experiments cannot be directly generalised to humans. You may think of a number of examples from moral reasoning. We do not steal because we have learnt that stealing is bad. If we steal, we would consider ourselves immoral. We also reason that if everybody steals every other person's belongings, then society will collapse. The first line of thinking is moral judgment in terms of right or wrong. The second one is moral reasoning. Bandura states that while explaining our conduct, we often emphasise moral reasoning. But the ultimate moral conduct, for example, refraining from stealing, is dependent on how well we can translate moral reasoning into action through moral judgment of wrong and right. Bandura states that moral conduct can be inhibitory or proactive. The example of not stealing is inhibitory. Altruism or helping others is proactive. Both can be explained by the self regulatory mechanism. Bandura further states that moral standards are not fixed. They vary depending on our evaluation of situations. In this respect legality and morality may not conform. Would you steal under emergency to save a few lives? Would you help an evil person who had killed innocent people? Answers may vary, but so far as the process of decision making is concerned, they all revolve around the point of self regulation. 4. Self reflectiveness Human beings are capable of meta-cognition. This means that they are able to observe their own cognitive processes. Bandura states that this ability of meta- cognition enables us to observe and critically evaluate our own behaviour. Thus, we can compare our past, present and future actions, and consider our position in relation to the situational demand. This ability brings us to one of the most pronounced concepts in Bandura's theorization – that of Self efficacy. Self efficacy: Bandura does not endorse a fixed structure called 'self', but considers the process of self description in terms of efficacy as crucial in detemrining behaviour (Bandura, 1995). You may describe your self efficacy in terms of your perceived ability to cope with a given situation. Bandura believes that every person

NSOU • PGSW - VI _____ 89 has a selfjudgment whereby she imaginably compares her ability to the demands of the situation. She is likely to choose her tasks accordingly, and her persistence as well as emotional reactions to the task would also be determined by it. Thus symbolisation and abstraction are often involved in self efficacy beliefs. Bandura assigns a pivotal role to self efficacy. The self regulation in terms of setting the standard, choosing the challenge, expecting the outcome is dependent on self efficacy. However, you may have higher self efficacy in one area under a particular situation, and lower self efficacy in another. You may set a very high standard for yourself and expect highly rewarding outcome in a tennis court, but may have a low self efficacy if you are asked to sing a song. Thus, Bandura does not talk of a total development of personality, but of situational developments. You may rightly guess that self efficacy beliefs may go completely wrong. If you have seen Satyajit Ray's famous children's film entitled 'Goopi Gyne Bagha Byne', you may recall how Gupi, a simple youth with a horrible off-tune voice, believed that he was the best musician under the sun. He retained the belief till the villagers drove him out of the village. course later on he was able to sing wonderfully, thanks to the king of the ghosts who happened to appreciate his song. His erroneous self efficacy came to be made true magically. While most of us would not encounter the king of ghosts, we too can make our now erroneous self efficacy come true by training. In the next section you would learn how self efficacy develops through observational learning. Bandura stated that while simple reinforcements are important, the role of observational learning and vicarious conditioning are crucial to learning social behaviour. Particular emphasis has been given by Bandura on observational learning, more popularly known as modelling.

2. Observational Learning

Observational learning refers to the process of change in the behaviour of one person simply by being exposed to another person's behaviour. This second person is known as the model. Modelling, according to Bandura, refers to the behaviour of the observed person and not to the behaviour of the person who follows. The child observes parents behaviour and parents are role models. The child imitates the parents' behaviour. In Bandura's version, the parents model a specific behaviour and the child imitates.

2.1 Stages and Factors of Observational Learning

The stages of observational learning includes exposure to the model, acquiring the model's behaviour (learning) and accepting it as one's own. People tell you that your way of talking 'Hello' over the phone is just like your mother's? Your mother never taught you to say 'Hello' in this way. But you had been exposed to her special way of greeting. The mannerism remained somewhere inside you, and at some point it became your own style.

90 _____ NSOU • PGSW - VI Four factors seem to influence observational learning. These are: (i) attention (ii) retention (iii) motor reproduction and (iv) motivation (Bandura, 1977). Simple exposure would not suffice to enable observational learning, unless the observer attends to the specific behaviour to be learnt. One implication of this is that if you want to make another person learn through observing your modelling behaviour, your own behaviour must be made attractive to draw her attention. You imitated your mother's 'Hello', because you naturally loved her. The objective and subjective determinants of attention would be relevant in this context. To accept the observed behaviour as one's own, the target behaviour must be processed. It involves coding in long term memory and the ability to retrieve it. All the laws of memory would be important here For example, you can facilitate observational learning of your child by repeating it, by providing cues for it, by associating it with other information and so on. Motor reproduction refers to the fact that the observer must be endowed with the physical and psychological capabilities and situational facilities to enact what has been observed. Unless it is given the scope of expression, it may become extinct. The final factor is motivation and reinforcement. Enactment of observed behaviour would require an expectancy of positive results. This may be learnt by observing that the model had been rewarded for the same behaviour. This factor of motivation as the external reward and internal self reinforcement has been emphasised repeatedly by Bandura. In sub section 4.3.2 we have discussed Bandura's experiment and et.al.

Bandura's Experiment on Performance Versus Acquisition Bandura, Ross and Ross (1963) conducted an experiment to demonstrate the conditions under which observational learning may take place and also the conditions of its expression in performance. Three groups of children observed a model performing an aggressive act toward a Bobo doll. The consequences of aggression varied for the three groups. For one group, the children found that there was no consequence of aggressive behaviour. For the second group, aggression was punished. For the third group the models performing aggressive act were rewarded. Subsequently the children were left alone in a room with many attractive toys including the Bobo doll. They were watched through a one way screen from outside. These children were subjected to two conditions. In Condition 1 (Incentive condition) they were told that if they imitated the model, they would be rewarded. In Condition 2 (No Incentive condition), no instruction had been given. Results revealed that under 'No Incentive' condition the children who observed their aggressive models rewarded engaged in maximum aggressive act, followed by the no consequence condition group. Those who saw their models punished demonstrated the least aggression. It is notable however that they did engage in some aggressive act despite seeing their models punished. These differences, however, were levelled out in Incentive condition. When the children learnt that they would be rewarded for imitating the model, they engaged in aggressive acting out with the Bobo doll irrespective of the consequences of their models. Interpretation of the experiment: The findings may be interpreted to demonstrate that observational learning occurs whenever the children watch an aggressive model. Learning occurs irrespective of condition. But whether the children would execute the learnt behaviour in real life would depend on the observed consequences of the model. However if immediate situation reinforces aggressive acting out, it would facilitate performance of learnt aggression irrespective of consequences. In other words, you learn to aggress when you see models aggressing. But you may or may not show this aggressive behaviour outwardly. Whether you would perform the aggressive act would depend on the motivation. Vicarious Conditioning How come the children were influenced by the observed consequences of the models? Bandura noted that human subjects who observed a model expressing a conditioned fear to a naturally neutral object learns to fear the same. It was observed even in monkeys. The baby monkeys learnt to be afraid of a toy snake because their mothers were taught to be afraid of. This kind of learning of emotional reactions

92

NSOU • PGSW - VI through imitating other's emotions is

called 'Vicarious conditioning'. Bandura noted that a large number of emotions that we feel toward persons and objects are not born out of direct experience, but through this kind of vicarious conditioning.. We imitate not only the overt behaviour, but also the emotional reactions of the model. Applications of Social-Cognitive Approach for Changing Behaviour Modelling may be used to change one's behaviour in a desired direction. It is used extensively, knowingly or unknowingly in rearing up children at home and school. You may remember the teachers whom you adored and who left a lasting influence in your life. If you look closely to yourself, you may still find remnants of their personality in your behaviour and attitude. Modelling has been used deliberately in changing attitudes. Indeed, the 'model' of the advertisement is supposed to be copied by the general people with regard to a specific behaviour. You know that when famous actors or players are offered modelling roles for a product, they are forbidden to use any other competing product in public. You may recall that when Sachin Tendulkar agreed to be a model for a specific Cold Drink, he denied taking any other Cold Drink offered during a flight. The gesture may be explained by the principles of modelling. It is expected that with the attention value drawn by Tendulkar, mere exposure to his drinking a particular brand would motivate people to do the same by imitation. The clear cut message may get confused if he is seen drinking a competing brand. You may be reminded of some of the popular television programmes on animal life. When we look at a person comfortably handling a snake or a crocodile, we tend to think these animals less dangerous than we assumed earlier. Thus modelling helps in awareness development. Bandura's initial experimental works were conducted with modelling of violence. Therefore, a major implication of his theory pertains to televised violence. The issue revolves around whether children become more aggressive by viewing aggressive scenes on television. From a review of the available studies by Bandura and others, it may be concluded that prolonged exposure to televised violence may have four effects on children's aggression: • the children imitates the aggressive style of conduct • the inhibition against aggression is reduced • desensitized the children to violence and makes it more acceptable • it alters one's image of reality, thus thinking violence as a positive coping mode to deal with situations.

NSOU • PGSW - VI _____ 93 Modelling is also used, knowingly or unknowingly in training gender role behaviour. Some traditional modelling themes are the mother being praised for good housework and the father for meeting the financial needs of the family. When a tradition is broken, for example, women go for jobs, or fathers change the baby's nappy, the modelling patterns change and so does the attitude of the observers. This is of course not done without resistance. The earlier modelling may be difficult to break. But social change is ultimately brought through changes through individual observational learning. Helping behaviour and other moral conducts are also usually taught similarly. Among the different uses of modelling in socialisation of children, one application is in training delay of gratification. Delay of gratification refers to the ability to stall one's immediate impulse to satisfy the drive. Immediate gratification often needs to be delayed in the hope of a greater gratification later in time. For example, you are feeling sleepy and would like nothing better than to close the book and drop down onto the bed. But you are carrying on with your study, as you expect to get good marks in the examination. How did you learn to do it? Presumably you learnt it by following models who have sacrificed small physical pleasures to attain a higher goal. However, you were tremendously self rewarded by this act, as it gave you the satisfaction of completing your study. Bandura noted that delay of gratification is related closely to the standard of excellence we put for ourselves. Since delay of gratification is always self motivated, you need judgment and self regulation to employ it. During exercising delay of gratification we make a mental comparison of the immediate and the distant gratifications. If we judge the latter to be worthier, we renounce the immediate one in favour of the latter. At this juncture, you may wonder how far modelling is effective? Studies have revealed that modelling can be quite efficient even in a brief period of time, provided the attention and motivation are high. Modelling is a highly preferred mode of personality change in desired direction, because, it can be used symbolically as well. We do not necessarily need the real model every time, but a film or video would suffice. You know that modelling changes personal agency by altering the self efficacy. But Bandura (1997) goes beyond personal agency and suggests collective agency as well. Bandura believes that we have one kind of efficacy as an individual; but when we operate as a group, we have a collective agency which is more than the sum of the separate self efficacies of the members. Suppose you have a moderate level of self efficacy so far you can be successful as a cricket player. But if you are a member of your college team, the interaction and the transactional dynamics of the group change your level of expectation.

94 _____ NSOU • PGSW - VI Skinner : Concept of Operant Behaviour and Operant Conditioning B. F. Skinner's (1904 - 1990) was an American. His experiments on operant conditioning won him world wide fame. Skinner defined operant conditioning as the process of learning that elicits operant behaviour. So, what is operant behaviour? According to Skinner, there are two types of behaviours, namely respondent behaviour and operant behaviour. You blink your eye in response to a flash of light. This reflexive behaviour is elicited directly by the environment. So this is respondent behaviour - spontaneous response to stimuli. But most of our behaviours are not so simply generated by the environment. You are not forced by the environment to look at this book, to talk, to sing, and to eat. These behaviours are emitted by you, the individual. Through such behaviours, you operate upon the environment. These are called operant behaviours. You might argue that we eat because we are hungry, and so it cannot be operant behaviour. But eating as a process is not a direct response to hunger, as is gastric secretion. To eat, you have to locate the bread on the plate on your table, stretch your hand, grab it and bring the hand back to your mouth, put the bread in your mouth and chew and swallow. How did you know that you have to go through this complicated chain of behavioural units to reduce the uncomfortable sensation in your stomach? You have seen from your experiences, that if you put certain kinds of things in your mouth and chew and swallow it, your hunger pang reduces. This had been a rewarding experience for you. You have also seen that the food does not automatically jump into your mouth. You have to pick it up and put it in your mouth. Thus, a series of rewards have taught you this process of finding, picking and eating. Again, you would not grab the food by hand if it were burning hot. You had learnt that the pain of touching something hot is unpleasant. The punishment had taught you to pick it with a fork. Skinner claims that we learn most of our operant behaviours through this kind of consequences. If the consequence is favourable, we tend to repeat the behaviour. If the consequence is unpleasant we tend to refrain from doing it. 3.4 Skinner's Experiment on Classical Conditioning Skinner as a young research scholar at Harvard University conducted a series of experiments on animals to formalise his idea of operant conditioning. Some of you

NSOU • PGSW - VI _____ 95 may have heard of the 'Skinner Box', which is a sort of mini laboratory for acquiring operant behaviour. In this section you would learn how Skinner conducted his experiments with the help of this box and what its implications are for behaviour modification. The Experiment The Skinner box is a simple box used to condition operant behaviour in animals. This box usually contains a lever, or some other device which must be manipulated to get some reward. In his classic experiment Skinner placed a semi-starved rat in the box. There was a lever which, after being pressed, released a mechanism to deliver a pellet of food to the rat. Initially, the rat is engaged in a number of random behaviours like walking, sniffing and scratching. None of these helped to get the food. At some point of time, the rat accidentally hit the lever and the food was delivered. Of course, for the semi-starved rat, this was a big reward. Skinner observed that after a few accidental manipulations of the lever, the rat started spending more time near the lever, and then deliberately pressed the lever whenever it was hungry. So now pressing the lever became a new operant for the rat. Skinner further noted that if the pressing of the lever did not deliver food any longer, the operant behaviour by the rat decreased and gradually stopped altogether. This is known as experimental extinction of operant conditioning. Interpretations of the Results of the Experiment You have now learnt about Skinner's experiment, but what does it imply? In Skinnerian terms, every random behaviour that the rat demonstrated within the box was also some kind of operant behaviour. But these have been conditioned in the rat

96 _____ NSOU • PGSW - VI prior to your working upon it. The rat had been rewarded earlier for each of these behaviours. For example, earlier, it had scratched a paper packet and food had spilled from it. But now, within the Skinner box, none of them succeeded to reduce its hunger. Then accidentally another behaviour (pressing of lever), which was completely new for the rat, brought about the reward. The food served as the reinforcer to strengthen this new operant. As in successive trials, the newly acquired behaviour continued to be rewarded, the probability of its occurrence also increased. Skinner developed his thesis of environmental determination of behaviour. The first pressing of the lever by the rat was accidental. But this accidental behaviour could be 'shaped' into a relatively long lasting modification in behavioural repertoire by manipulating its consequences in a specified direction. One significant point in Skinner's view is that learning is determined by the consequences of the behaviour and not by the antecedents. Antecedents provide the context, but consequents really decide whether the behaviour would be conditioned or not. You may readily understand that this is a rather provocative statement and opens up a large number of possibilities for manipulation of human behaviour. Measuring Operant Behaviour Quantification of operant behaviour was crucial to Skinner's work. He needed to demonstrate that through appropriate use of reward and punishment you can actually increase the probability of occurrence of a conditioned operant behaviour. Therefore Skinner introduced the rate of occurrence of the target behaviour as the measure of operant conditioning. He simply counted how many times the learnt behaviour has taken place within a given time. In fact, he used the cumulative frequency of the operant behaviour as the final indicator. If you put it in a graphical form you will readily see whether the probability of the occurrence of that behaviour has actually increased over time. Take for example, the lever pressing behaviour of the rat which it learnt in three hours. Let us say we divide the total time in three equal units, one hour each. In the first hour the rat was more engaged in random behaviour. At the end of the first hour it accidentally pressed the lever and food was delivered. During this second hour, it also pressed the lever three times more. Then it started staying close to the lever, and in the third and final hour pressed the lever deliberately ten times. When the rat pressed the lever 10 times it clearly indicated that the rat has learnt that behaviour which Skinner wanted it to learn – that is, pressing the lever when hungry in order to satiate the hunger. Functional Analysis of Behaviour Skinner stated that Psychology is as yet unprepared for theory building as we do

NSOU • PGSW - VI _____ 97 not have enough data to justify our theory. Therefore he suggested that instead of proposing a readymade theory of personality we should go for Functional Analysis of Behaviour. To conduct functional analysis of behaviour you must intensively observe the behaviour of the organism and conduct repeated experiments to establish the relationship of a behaviour with its antecedents and consequents. If during this observation, you hypothesize any inner state like 'thinking' or 'feeling', Skinner would disapprove them as redundant. You are supposed to observe only what you can measure in terms of rate of occurrence. Thus, according to Skinner, the functional analysis of behaviour must be done in terms of two observable things – the operant defined as specific observable behaviour and the consequence that lies outside the organism in the environment. Skinner's main interest in functional analysis of behaviour lies in its potential to divide complex chunks of behaviours in manageable smaller units. For example, your act of reading this paragraph. You can divide it in reading of letters, words and sentences. The discrete straight and curve lines make the letters. You had learnt it through earlier reward punishment process. As you read letters, you may form words. Similarly each word joins to make a meaningful sentence. All these have been conditioned into you in your childhood through manipulating consequences. So if you report your difficulty in reading this paragraph, based on functional analysis of behaviour you would analyse which part is problematic for you, letters, words, sentences and with appropriate reinforcement condition you can correct the problem and shape it your desired way. In fact, this is exactly what you would need to do with a child with learning disorder. Shaping Have you ever seen a potter making an earthen doll? Have you seen how he takes fistfuls of wet earth, makes a clumsy elongated mass around a bamboo or wooden frame, and then with the skill and quick pressure of his fingers gradually brings out the intended shape? You may not recognise at first what he is working about, but soon you recognise the head and body, the hands and legs separately. You may observe him working on the doll's face. You would see the specific parts emerging from the mass - the nose, the forehead, the cheek, the chin, the lips, even the parting of the hair. You recognize the eyes too. Soon it is a face - waiting to be coloured. The potter, through his skill, slowly but surely approximates the final shape by changing small aspects of the original shapeless lump. According to Skinner, animals and human beings behaviour are also shaped by the environment. Shaping is an extremely important concept in operant conditioning as it refers to

98 _____ NSOU • PGSW - VI the application of its principles of behaviour modification. Shaping means modification of the organism's behaviour to the experimenter's desired end. Shaping does not occur all in one go, Skinner says. It takes place only through 'successive approximations'. Suppose you are trying to modify a child's behaviour by selectively rewarding the response desired by you. Before the ultimate desired behaviour is enacted, the child's usually engaged in numerous other behaviours which may be considered as steps to the final behaviour. They are close to the target, but not the target per se. If these approximate target behaviours are rewarded, shaping is facilitated. Skinner discovered this principle of successive approximation rather accidentally. He was conditioning a pigeon to swipe a ball with its beak movement which in turn would release a food magazine. The pigeon was not lucky enough. After waiting for the accidental success to happen for a long time Skinner was bored. So, just casually, he decided to reward any behaviour that might lead toward the target behaviour, even if it is as simple as glancing at the ball. As these approximate behaviours were successively rewarded, to Skinner's surprise, the total process was quickened. Very soon 'the ball was caroming off the walls of the box as if the pigeon had been a champion squash player' (Skinner, 1938, p. 38). Rewarding of the simpler step has automatically led to the next higher step and so on. (This is successive approximation) How would you know which behaviours are approximating the target? Skinner proposed that you need to do the functional analysis of behaviour for understanding and controlling shaping. This analysis will help you to identify the elements of the final behaviour as well as the possible successive steps to it. For each small step you must identify the antecedents and consequents. The antecedent will lead to the next step and the consequent will reinforce it. This kind of breaking down of behaviour into antecedent - behaviour - consequent chain is famously known as ABC technique. As each step is rewarded (or punished), the learner automatically proceeds to the next step. Thus through successive approximation to the target she finally reaches the desired behaviour. This is, according to Skinner, the fundamental principle of shaping. Furthermore, for shaping, you need to deliver reinforcements and punishments in an intelligently pre-determined manner. In the following subsections you would learn about different types of reinforcements and punishments. In classical conditioning, reinforcement is identical with unconditioned stimulus. For Pavlov's dog, food was the UCS as well as positive reinforcer, and electric shock was the UCS and the negative reinforcer. But in operant conditioning, the concept of CS and UCS are not applicable, as we are concerned with shaping of target behaviour. So here reinforcement comes separately as a consequence of desirable behaviour. It simply serves to strengthen the response. The food pellet emerges only NSOU • PGSW - VI _____ 99 if the lever is pressed, and not otherwise. So it is contingent upon operant behaviour and strengthens the same. Positive and negative reinforcement: As in classical conditioning, reinforcements can be positive and negative in operant conditioning also. Positive reinforcers are those pleasurable consequences of behaviour that make the behaviour more probable. Example is praise from the teacher after being able to tell the square root of 169. Negative reinforcers are those unpleasurable consequences of not producing the target behaviour that makes the behaviour more probable. For example, the teacher asks you the square root of 169 and looks with fiery eyes at you. He will continue to do it till you give the correct answer. By producing the desired response, you terminate the look - the negative reinforcer. Primary and secondary reinforcement: Reinforcements may be primary - that is concerned with our basic needs. Or it can be secondary or conditioned, acquiring its reinforcement value only through association with the primary reinforcer. Food is a primary reinforcer. But if you make me work for money or for sweet words, you are using the secondary or conditioned reinforcer. We can neither eat nor drink nor sleep money; yet we are all reinforced by money because of its symbolic value through association. The famous tale of King Midas actually highlights the significance of primary reinforcer (food and water) over the secondary one (gold). Schedules of reinforcement:

100 _____ NSOU • PGSW - VI You may wonder whether in operant conditioning we always reinforce the 'correct' behaviour? Does it work properly? What would happen if we decide to stop it? Indeed, you might think of your son whom you reinforce with a toffee for 'being a good boy', and after a few days, he just loses interest in the candy. He would neither be a good boy, nor would he care for your bribe. Can't the same happen with rats and pigeons? The Skinnerians also attended to this problem and suggested that proper conditioning depends on intelligent scheduling of reinforcement. You can schedule reinforcement for your operant conditioning experiment in various ways. Basically, it can be Continuous or Intermittent. In continuous reinforcement, the target behaviour is reinforced every time it occurs. Just as you always gave a candy to your son if he behaved. Intermittent or partial reinforcement means you reinforce the target behaviour at times, and not always. What will be the basis of intermittent reinforcement? It may be based on interval of time or ratio of responses. Each of these again may be subdivided in fixed or variable scheduling. Let us now consider the nature and example of each subtype of schedule of intermittent reinforcement. Interval schedule: Interval scheduling means that reinforcement would be given after a certain time interval following the target behaviour. In fixed interval schedule of reinforcement, for example, you may decide to reinforce the rat's first lever pressing response after every fifteen minutes. It is possible that within the fifteen minutes the rat had pressed the lever twice. But you wait for the fifteen minutes to pass and give the food pellet only after the first response after fifteen minutes. Again you wait for fifteen minutes irrespective of the rat's behaviour. But you reward again the first desired response that occurs after the fifteen minutes had elapsed. In variable interval schedule of reinforcement, the deliverance of the food pellet is varied randomly around an average time interval. For example, you may decide to reinforce the target behaviour of your subject around an average of 12 minutes interval. You can reinforce at a random schedule of 5, 12, 7, 20 and 16 minutes, the average of these being 12. So you reward the first target response, then wait for 5 minutes and reinforce the immediate next target response. Then you wait for 12 minutes and again reinforce the next immediate target response that takes place and so on. You can go for a completely different set of random variations if you wish. Ratio Schedule: Ratio schedule refers to reinforcing the target behaviour after a specified number of behaviours. In fixed ratio schedule, you reinforce the target response after, say every five correct response, irrespective of the time elapsed. In variable ratio schedule, as in variable interval schedule, you reinforce the target behaviour after an unpredictable number of responses, but around an average number of responses.

NSOU • PGSW - VI _____ 101 Rate of learning in different schedules: The rate of learning differs in these different schedules. In fixed interval schedules, greater target behaviour is observed near the end of the schedule, but the rate falls down immediately after the delivery of the reward. The variable interval schedule produces a slow steady rate of response. In general, ratio scheduling produces better response than interval scheduling. Fixed ratio schedule results in a steady and high rate of response. The variable ratio scheduling has been found to be the best as it maintains a high level of expectation and thus produces a very high and steady rate of response. Examples of different schedules of reinforcement from real life: Let us consider some examples from our school days to understand the application of various schedules of reinforcements in human life. Everyday and every time you greet a teacher by saying 'Good morning, teacher', you get a reply 'Good morning'. This is continuous reinforcement. You know this pleasant interaction is always there for you if you behave. Now let us try a few examples of intermittent or partial reinforcement. Remember the happiness you felt during the last ten minutes of the class? The bell for the end of class would sound after every one hour, and you would be released for a break. This is an example of fixed interval reinforcement. Suppose you love Madam B's classes, but she takes your class only when some regular teacher is absent. However, every week, usually two regular teachers are absent, and you get about 2 to 3 weekly classes of Madam B on an average. This is variable interval reinforcement. Now for ratio scheduling. Consider your examination time. You have some questions which do not allow part marking. You have to answer all three components of the question and you get either 1 or 0 depending on whether you have done them all correct or not. So every three correct responses you earn a reward of one mark. This is a fixed ratio reinforcement. For variable ratio reinforcement, consider the most knowledgeable but moody teacher you had. On some occasions, he/she would simply grunt if you give the correct answer. But sometimes, when you happen to satisfy he/ her by a brilliant stroke of idea, he/she would beam all over and heap praises on you. Getting a word of appreciation from her makes you feel special that day. Since he/her praise means a lot to you and you never know which answer would satisfy her most, you always try to give your best to her. Outside the school premise and in the adult world, gambling is one example of variable ratio reinforcement. So are adventures in unpredictable conditions. Have you seen Charlie Chaplin in 'Gold rush' or Omar Sharif in 'Mackenna's Gold'? Did you ever wonder why people went at all for such indefinite prospects? An answer lies in the effectiveness of variable ratio scheduling of reinforcements. You know that out of thousands, some excavations would be rewarded with heaps of gold. And since there is no fixed rule, who knows, you might be the chosen one.

All of us have been punished sometime or other in school for being inattentive or disobedient. How far those punishments have been successful in controlling the unruly behaviour? In the parlance of operant conditioning, punishment is that event or condition which, if consistently delivered following a response, will reduce the likelihood of the occurrence of that response. Each time you talk with your friend during the class you would be required to remain standing for five minutes. The teacher expects that this will reduce the probability of your chatting with your friend while the class is going on. So punishment is an aversive consequent of undesired behaviour. Like reinforcement, punishment can be positive or negative. Positive punishment is the situation when an unpleasant thing, presented as a consequence of a behaviour, decreases the probability of that behaviour. If you scold your child for her misbehaviour it is positive punishment. Negative punishment occurs when the withdrawal or removal of a pleasant thing as a consequence of a specific behaviour decreases the probability of that behaviour. If you do not greet your child your usual smiling way because of her misbehaviour, it is negative punishment. You have already learnt about negative reinforcement which also uses aversive stimuli. Are negative reinforcement and punishment synonymous? Negative reinforcement is used to elicit a desired behaviour. Pavlov wanted the dog to learn withdrawal of paw. The shock as an unpleasant stimulus was given and the dog learnt to withdraw the paw. So in this case the shock was a negative reinforcer as it increased the probability of paw withdrawal. Punishment, on the other hand, is used to stop undesirable behaviour. If we suppose that walking of the dog in the laboratory is an undesirable behaviour and deliver the shock every time the dog starts walking, expectedly the dog's probability of walking would be reduced. In this instance, shock will be punishment. In other words, when negative reinforcer is given, you act in a desired way to stop the unpleasant condition. When punishment is given you associate it with whatever undesirable thing you did before, and refrain from repeating it. Controversy remains as to how effective punishment is. Traditional child rearing practices are often punishment based. 'Spare the rod and spoil the child', they say. But don't we often see that the abused child becomes seasoned to beatings and continues with the disruptive behaviour? Skinner himself was not too much in favour of punishment. He considered positive reinforcement as the best technique for training, and considered punishment to have too much side effects. Some recent researchers however have reported that punishment delivered without hostility and to a measured amount in a consistent manner may bring about desired result without much harm.

Operant Conditioning As in case of classical conditioning, you can have your subject's behaviour generalised to situations similar to the conditioned one. You learnt to wash your hands before taking food at home, and you generalised it at school. In fact, if it were not so, we had to condition each and every operant conditioning separately for every context. Discrimination is the opposite of generalisation. Through manipulation of consequences, we learn to respond to one stimulus which is rewarded / punished and not to a similar stimulus which is not rewarded / not punished. For example, you talk and laugh when Mr. M. is taking classes, but you think twice before moving your neck when Mr. N. is in charge Operant Conditioning and Human Behaviour In the above following sections you would learn about application of principles of operant conditioning in real life. Skinner's View of Human Nature Skinner considers the world as a large version of the Skinner box within which 'technology of behaviour' plays its role. You learn everything here through reinforcements and punishments. Skinner, in his book 'Beyond freedom and dignity' (1971) presents his view of human existence as a series of learning processes. You may wonder what 'personality' is from Skinner's point of view? Skinner does not use the word 'personality'. But he speaks on human nature in general. According to Skinner, human being is completely determined by his conditioning history. There is nothing called free will. One does what one is reinforced to do. There is also no point in debating whether man is rational or irrational. Both are inner states, and hence outside the domain of scientific analysis of behaviour. Skinner opines that human behaviour is changeable, and this change constitutes what we think as 'personality growth'. It does not occur from within, but from manipulation of reinforcements from outside. There is no mystery in human existence. It is completely objective and knowable through scientific investigation. We know a person so far we know his/her environmental contingencies. Skinner also comments in his book that usually we think that those who manipulate human behaviour are evil persons. Those who manipulate for evil purpose may be condemned. But manipulation of human behaviour is something which cannot be avoided. Indeed, we have no other alternative than to be controlled and manipulated. Psychopathology from Operant Conditioning Perspective From Skinnerian perspective, psychopathology is the resultant of faulty conditioning with improper reinforcement. No individual is sick; only he/she

104 _____ NSOU • PGSW - VI has not learnt to elicit the right behaviour at the right moment. Take the case of compulsion. Suppose the client needs to wash his/her hands with soap thirty times a day, otherwise he/she does not feel clean. Skinner would assume that cleaning is a correct response in some situations. But for this particular client, cleaning has been conditioned erroneously to situations where it is actually not required and has been overgeneralised. Depression from Skinner's perspective is absence of reinforcement from the environment. The quick fatigueability of depression has been explained by Skinner as low rate of response as there had been too much withdrawal of positive reinforcers. Some of you may have seen children and adolescents with conduct disorder. Imagine a boy who demands a costly video game. When his/her parents object to the unreasonable demand, he/she threatens to destroy his/her school books. After some efforts to pacify him/her, the parents buy the game. Similar extortions continue. At one point she/he demands a costly mobile with many features. Unless she/he gets it, she/he would burn the wardrobe, she/he threatens. The distraught parents yield again. Now, she/he is a big boy, and she/he wants a car for his/her own use. If she/ he is not given a car he/she would create problems for her/his mother. From she/he a Skinnerian perspective such cases may be explained by reinforcement of the wrong behaviour. Every time, from his/her childhood days, aggressive outburst and threat of violence had won him his desired object. Her antisocial trend has been positively reinforced. Operant Conditioning of Social Attitudes Do you wear a particular ring whenever you go to face an interview? "My little luck" – you say indulgently. It may sober you up to learn that Skinner observed development of 'superstition' in pigeons. He found that if reinforcements are completely unpredictable and any random behaviour is accidentally reinforced, the pigeon may develop an association between the behaviour and the reward. Suppose a pigeon was flapping its wings when the food pellet was given. If it accidentally occurs a few times, the pigeon would start flapping its wings whenever it is hungry. Do you believe in the ideals of a specific political party? You think you have enough justification? Skinner would say that it is not your much advocated rational self, but a mere series of conditioning that made you declare your affiliation to those 'ideals'. If you are repeatedly rewarded for chanting a particular slogan, you will soon start 'believing' in that slogan and chant it frequently. Applications of Skinnerian Principles to Psychotherapy You have already learnt how psychopathology has been conceptualised by Skinner as faulty learning. From this premise, you may readily conclude that psychotherapy would consist of unlearning of the faulty conditioning and relearning off correct operants through appropriate reinforcement. In fact, the major bulk of

NSOU • PGSW - VI _____ 105 behaviour therapy depends on Skinnerian principles. You may observe the applications of Skinner's principles in behaviour therapy at two stages. One is in setting and defining the targets of modification, and the second is in executing the change process itself. The basic requisite of behaviour therapy is to identify the short term and long term targets by analysing the maladaptive behaviour. Essentially, you need to conduct the functional analysis of behaviour for this purpose. If a child is brought to you for aggressive outbursts, you need to make a thorough record of her behaviour from herself and from his/her informants. You need to identify the contexts of his/her un socialised aggressive behaviour – and identify the feedback he/she gets from her social environment. Once these are identified you break down the total behaviour in successive stages from easy to difficult. You approach the small and easy targets first, reinforce the adaptive responses and through the principles of shaping reach the final goal of changing her behaviour. What kind of reinforcements should be given? While the reinforcements can be of different kinds – verbal and non-verbal, one particular mode of reinforcement has been closely linked with Skinnerian principle. This is known as 'token economy'. This is most applicable for children and in-patients under strict hospital supervision, in other words for those whose reinforcements can be maintained within a structured environment. In this method, plastic or paper tokens are given to the person for desirable behaviour. Tokens are charged from the person for undesirable behaviour. For example, during lunch time you get 2 tokens for standing in line, 1 token for taking the plate and napkin in the correct order, 3 tokens for eating cleanly and so on. If you grab food out of turn 3 tokens are taken back. With the tokens you can buy candy, pictures, an hour out with a friend and other things you enjoy. An extensive application of token economy was conducted by Atthowe and Krasner (1968) in a hospital set up and considerable behaviour gains were reported. Token economy is still found useful in training hyperactive children, children with mental retardation and developmental disorders. Critical Analysis of Skinner's Approach to Personality Even within behavioural paradigm, Skinner's approach has been criticized for excessive emphasis on consequence and less on the stimulus. However, Skinner has been critiqued mainly from the cognitive perspective. Noam Chomsky (1959) severely criticized Skinner's thesis by saying that his experiments were inapplicable to human beings, and the approach was 'scientistic', but not scientific. Chomsky also accused Skinner of supporting a totalitarian political face. That cognitive learning does exist was also proved through Edward Tolman's (1932) famous experiment on latent learning that demonstrates that learning is possible even without any reinforcer.

106 _____ NSOU • PGSW - VI The biological critics have observed that certain species are predisposed to learn certain types of things. Everything cannot be taught to every species. These criticisms limit the generalisability of Skinner's approach, but do not downgrade its impact in applied psychology. Indeed, if we use the Skinnerian principles judiciously, behavioural gains may be obtained in many areas of educational and clinical psychology. 3. 5 Conclusion In this unit we have learnt about the concept of operant behaviour and its conditioning. We now know about the basic experiment of Skinner where rats were conditioned to press a lever to obtain food, and this was done by manipulation of reinforcement. We have also learnt Skinnerian principles of functional analysis of behaviour and shaping through successive approximation. The nature of reinforcements and their schedules have been discussed in detail. We have learnt about punishment and the distinction between punishment and negative reinforcement. We have discussed Skinner's view of human nature as completely determined by reinforcements from the environment. We have also discussed the nature of psychopathology and social attitude formation from Skinner's point of view. We have learnt how Skinnerian principles can be used in Behaviour therapy, particularly in the context of token economy and time out procedures. Finally we engaged in a critical evaluation of Skinner's point of view. 3.6 Exercise 1) What was Social cognitive theory called earlier? 2) What are the characteristic features of personal agency? 3. Describe with the help of Skinner's classic experiment the nature and principles of operant conditioning. 4. Discuss the role of Functional Analysis of Behaviour in operant conditioning. 5. Define shaping. Illustrate in this context the principle of successive approximation. 6. Discuss with suitable examples the different schedules of reinforcement. 7. Distinguish between negative reinforcement and punishment with examples from everyday life. 8. Discuss the Skinnerian view of human nature. 9. Discuss from Skinnerian perspective the genesis of psychopathology and its treatment.

Introduction Group dynamics is the scientific approach to the understanding of the dynamics of group. It implies an interactive psychological relationship in which members of a group develop a common perception based on feelings and emotions. Group dynamics refer to the changes that take place within the group. It also refers to forces operating within the groups. Group dynamics is related to the field theory of Lewin which assumes man's behaviour to be a function of the field existing at the time of the occurrence of behaviour. We can further say that it is the study of group processes, their objective analysis and measurement and the effect of group membership on individual members. Our behaviour is not static. It means that the change of behaviour is through interaction in the group. According to Segal, group dynamics is a process by which one considers other individuals and a problem in a group at the same time. It not only tends to increase understanding of the problem, but also creates a solution which the individual practices in bringing about emotional balance. We can also say that group dynamics is influenced by sympathy, suggestion and imitation. Sympathy enables the members of a group to perceive the psychological state of the other members. Suggestion plays a big role in influencing group behaviour. The suggestions put forward by leader of a group are implemented by the members of the group. 4.3

Group Dynamics : Definition A group includes only persons who share some norms and values about something. We can say that group contains people with interrelated social roles. An aggregate of people may form themselves into a group as a result of interaction. Thus, we can say that groups are the products of interaction. Group interaction is a two way process whereby each individual or group stimulates the other and also in varying degrees that modify the behaviour of the participants. The behaviour and personality characteristics of individual members of a group affect the behaviour of others and make a significant impact over the functioning of a group as a whole. In this context we can consider two types of groups, viz., formal and informal groups. Formal groups are formed on the basis of specific norms, values etc. School is an example of formal group. 110 _____

On the other hand, play group, peer group and social clubs are examples of formal groups. In informal groups, rules are usually flexible. An individual may belong to many groups. The behaviour of an individual is different from the group behaviour. In the group a person has to act according to the norms of the group and generally, a few individuals may guide the behaviour of the group. In this context, we can say that group interaction is a two-way process whereby each individual or group stimulates the behaviour of the participants. We can further say that the behaviour and personality characteristics of individual members of a group affect the behaviour of others and ultimately it makes a significant impact over the functioning of a group as a whole. As for example, we can say that the school is a social institution set up by the society to serve its ends. School is primarily a social institution. Group activities should be encouraged to provide opportunities to the students to participate in the affairs of the group. One of the important functions of the school is social interaction. Not only are the teachers and pupils continually interacting in the class-room system, but the pupils are also interacting among themselves through special pre determined code or signs or looks, and there are many common stereotypes and values that they share with each other. Like any other social system, the class-room group shows a variety of interactions continuously. Formal structure is not only factor in group functioning. Within this formal structure, there is informal relationship. Communication within the group may flow more through informal channels than through formal ones. The informal sub-groups are typically more homogenous than the classroom group. Not only this, peer group pressures exert a powerful impact in many cases. NSOU • PGSW - VI

111 4.4 Meaning, Concept and Importance of Group

Dynamics In 1944, Kurt Lewin, set up the Research Centre for Group Dynamics to meet the need of a scientific approach to the understanding of the dynamics of group. Group dynamics can be defined as a field of enquiry dedicated to the advancing knowledge about the nature of groups, the laws of their development and their interrelations with individuals, other groups and larger institutions. Actually, it implies that the interactive psychological relationship in which members of a group develop a common perception based on feelings and emotions. It is not easy to define the important area of group dynamics. We can say that it represents a field of enquiry, a series of inter-related problems, a set of techniques and interaction process. Group dynamics consists of two words – (i) group and (ii) dynamics. A group is a unit of two or more individuals who share a set of beliefs and values. The members of the group share a common purpose, task or goals. The relations among the members are interdependent. Not only this, there is a feeling of belongingness or we feeling among the members of the group. The members of the group generally prescribe a set of norms of behaviour for themselves. The members want to attain the goal effectively. The structure is hierarchical where the functions and powers are distributed. On the other hand, the word dynamics means force. Group dynamics refers to forces operating with in the groups. Group dynamics is related to field theory of Lewin, which assumes man's behaviour to be a function of the field existing at the time of the occurrence of behaviour. We can also say that the group dynamics is the study of group processes, their objective analysis and measurement and the effect of group membership on individual members. When a group of people is formed with a common goal, a kind of social force is created. Our behaviour is not static. Thus, group dynamics means the change of behaviour through interaction in the group. Concept of Group Dynamics The social psychologists seek to explain group behaviour on the basis of social interaction and cultural transmission through social interaction. The interactive psychological relationship is termed as "group dynamics". The important two variables we can say in this context are "group cohesiveness" and "group locomotion". Cohesiveness plays a vital role in determining the influence of the group on the members. On the other hand, locomotion indicates the movement towards the desired 112

NSOU • PGSW - VI goal. Personality

of the individual and character of the social situation both takes an important role for group dynamics. All the psychological effects take place within the individual members who compose the group. According to Cartwright and Zander (1968), the basic assumptions are: i) the groups are inevitable (even the hermits / Sanyasis and the Hippies), ii) that groups mobilise powerful forces that produce effects of utmost importance to individuals, iii) that groups can produce constructive as well as destructive consequences and iv) that it is the correct understanding of group dynamics based on empirical studies that helps in enhancing the constructive aspects of group life and group achievements. It can also be said that group cohesiveness indicates the degree to which the members stick together so that there is unity in the group. Actually the basis of attraction to the group may lie in the interaction itself because of the mutual satisfaction of needs. The group may be teen-age group or a political group or Group Dynamics a religious group. Three important things one can consider for group cohesiveness, i.e., task direction, personal attraction and group prestige. The strength of the cohesiveness may vary on the basis of the situation. Thus, when we study the group as a whole we are aware of studying changes which occur in the behaviour of the individuals and how these changes are transmitted to all the individuals to the total field, so that the behaviour of the group is altered. On the other hand, when the group itself shows a readiness to change by active participation then actual social change becomes possible. The change will occur when the group actually takes the decision to change. Thus the concept of group dynamics is helpful in understanding social changes which involve not only the introduction of an innovation, but also in overcoming of resistance. Group dynamics is also influenced by sympathy, suggestion and imitation. Sympathy enables the members of a group to perceive the psychological state of the other members. Actually the members begin to feel as others feel. On the other hand, suggestion plays a big role in influencing the group behaviour. The suggestions put forward by the leader of the group are readily accepted. The behaviour of the leader of the group is initiated by the members of the group. Besides this, some specific group techniques which could be utilised for improvement of the group process, viz., buzz sessions, role

playing, brain storming and recreational experiences. In buzz sessions, in which five or six members participate and is organised for purposes of stimulating discussion. In role playing, problems are handling in such a manner so

of group dynamics are given below: i) It is essential for effective practice with any type of task. ii) It promotes out the unproductive meetings. iii) Individual members or group as a whole benefit in a number of ways. iv) Underlying group dynamic is the multicultural diversification of the society. v) The future functioning of the group is influence by group dynamic. vi) Facilitates the participation of the members. vii) Helps to achieve the goals of the group in connection with the participation and satisfaction of the group. viii) It increases the interpersonal attraction. ix) It increases the communication processes and interaction patterns. x) It increases the power and control of the group. xi) It creates impact on racial, ethnic and cultural background. 4.5 Role of Communication in Group Dynamics Communication involves the transmission of a message from a sender to a receiver. According to Toseland and Rivas (2001) communication includes: i) encoding of perception, thoughts and feelings into language and other symbols by a sender; ii) transmission of language and symbols verbally, non-verbally or virtually; and iii) decoding of the message by the receiver. Face-to-face group members experience both verbal and non-verbal communication, whereas members of telephone groups experience only verbal communication and members of computer groups experience only virtual communication. Interaction patterns are also fundamental to group dynamics. According to David (1980) some of the significant points in this regard include: i) Leader is the central figure, and communication occurs from member to leader and leader to member 114

_____NSOU • PGSW - VI ii) Group members take turns talking. iii) Indication of extension between leader and the member. iv) All members freely communicate. v) Interaction pattern focuses on the degree of centralisation of communication. vi) Group-centred interaction pattern is more valued than leader-centered interaction pattern. vii) Indication of full participation among the members. viii) The status and power relationship within the group affect the interaction pattern. Group Dynamics ix) Interpersonal attraction and the emotional bonds that form between members influence the interaction pattern. x) Size of the group affects the interaction pattern. In general, there is more chance to communicate if the group size is small. xi) Selective attention, clues and reinforcement may take important role to change the interaction patterns. xii) If members do not interact with equal valence, there seems to be indication of sub-group formation. xiii) Interpersonal attraction, emotional bonds and interest may create impact on the group members. xiv) Physical arrangement in some situation may affect interaction patterns. Thus, we can say the communication processes and interaction patterns are important factors for group dynamics. 4.6 Interpersonal Attraction and Cohesion in Group Dynamics We can say that sub-group formation depends on interpersonal attraction among the group members and the level of cohesion depends on this. There are some important features that can be mentioned here: i) Proximity increases interaction among people and ultimately it increases attraction. ii) Similarity tend to make people attract toward each other. iii) The important contributing factors are acceptance and approval. iv) Members are attracted to those who engage in group interactions that meet their expectations. NSOU • PGSW - VI _____ 115 v) Interpersonal attraction is just one of the building blocks of group cohesion. vi) Compatibility tends to promote interpersonal attraction. vii) Group cohesion is the sum of all the forces that are exerted on members to remain in a group. viii) Cohesion means satisfaction of group members' need for affiliation, recognition and security. ix) Participation of the group members increases the prestige and resources. x) Cohesion reveals the positive relationship among the group members. xi) Cohesion can lead to a level of conformity that detracts from the work of the group According to Toseland and Rivas (2001) high levels of cohesion have been associated with beneficial group member behaviours. These include the following: i) greater perseverance towards group goals; ii) willingness to take responsibilities for group functioning; iii) willingness to express feelings; iv) willingness to listen; and v) ability to use feedback and evaluations. High levels of group cohesion are generally associated with positive outcomes such as. • Great satisfaction with the group experience, • Higher levels of goal attainment by group members and group members and group as a whole, • Great commitment by group members, • Increased feelings of self-confidence, self-esteem and personal adjustment, amongst members of the group. Sometimes it happens that high levels of cohesion may lead to dependence on the group. Some members remain silent. In this context we can say that there is a relationship between group dynamics and interpersonal attraction as well as cohesion. 4.7

Group Dynamics and Social Integration Social integration means how group members fit together and are accepted in the group. In each and every group there are norms, roles and status. These are the group dynamics that promote social integration by influencing how members behave. The norm, status and roles help the groups to avoid conflict and unpredictability which 116 _____ NSOU • PGSW - VI may create chaos. It is true that group can not function effectively without a fairly high level of social integration among group members. Social integration helps to build unanimity about the purposes and goals of the group. Deutsch and Gerard (1955) postulated two forms of social influence: normative influence and informational influence. Normative influence is the desire to meet other people's expectations and to be accepted by others. Informational influence is accepting and being persuaded by information provided by others. It is undoubtedly true that certain amount of predictability, conformity and compliance is necessary for the group members to work together to achieve the goals of the group. Actually norms develop slowly in the group, as members experience what is valued and what is preferred behaviour through group interaction. On the other hand, roles are shared expectations about the functioning of individual members of the group. Members may take different roles. Besides this, status refers to the ranking of importance of members of the group relative to each other. Status is determined by the prestige, power, position and expertise. Because a group member's status is measured in relationship to other members, it may change when other members join or leave the group. Status is also determined by the situation. Status hierarchies have a good deal of influence on social integration within groups. Thus, norms, roles and status are important components of the social influence that groups have on members. 4.8 Culture and Group Culture as is well known is a combination of values, beliefs and traditions of the society. Every individual born in that culture and it influence his overall personality. Values, beliefs, customs, traditions etc. are important factors for culture and these are shared by group members. When group members meet, they explore their value system and interpersonal styles, searching for a common ground on which to relate to each other. The culture of a group is determined by the communality and also the larger society. The system depends on the nature and extent of their interaction with the group. Multicultural differences are salient interpersonal factors that have significance for the group culture. Group processes have reflected the European and American values of individualism, independence, competitiveness and achievement. Besides this, cultural experiences of group survival, social hierarchy, inclusiveness and also ethnic identification influence the way members interact with one another in the group. Member's expectations and goals in a multicultural group vary widely. They significantly influence the dynamics of the group (Hopps and Pinderhughes, NSOU • PGSW - VI _____ 117 1991; Matsukawa, 2001). According to Davis et al (1995), the group leader should be sensitive to racial /ethnic and socioeconomic differences, should understand the effect of these differences on group dynamics and should translate this knowledge into culturally sensitive modes of program development and service delivery. Many factors affect group development. Structural characteristic is one of the important impacts on development. 4.9 Measurement of Group Dynamics Measurement of group dynamics is essential to understand the behaviour of a group as a whole as well an individuals who make up the group. There are many scales to measure group dynamics, viz., Group Climate Questionnaire (Mackenzie, 1983), Group Cohesiveness Scale (Budman, 1993), Group Work Engagement Measure (Macgowan, 2000) and Group Member Interpersonal Process Scale (Soldz, 1993). Task groups, such as committees, teams, board of directors are not merely collections of individuals. The synergy that is created when people come together to work in these groups transcends the collection of individual efforts. We have to pay attention to group dynamics because group dynamics facilitate member participation and satisfaction to achieve the group goal. 4.10 Group Development As groups develop over time, group dynamic processes evolve. In this context, we can mention a well-known model by Tuckman (1963), which is known as stage model (as mentioned in unit 1). The stages are: i) Forming, ii) Storming, iii) Norming iv) Performing and v) Adjourning There is also the widely used model by Garland, Jones and Kolody (1976) Here the five significant stages are: i) Pre-affiliation: Should be affected to the group. ii) Power and control: Should be able to have some influences over the other members. iii) Intimacy: There must be certain closeness and intimacy. 118 _____

NSOU • PGSW - VI

iv) Differentiation: The group members should be able to differentiate their personal goals from group goals

v)

Separation: This refers to each influence having a separate identity despite being part of the group. Beginning stages of group development are characterised by the formation of group dynamics. Members interact tentatively, establishing norms, roles and status hierarchies and ultimately a group culture slowly emerges through interaction. At first, interaction is tentative and cautious and there exists little conflict. After that members become more comfortable resistance can develop. After that members want to become a part of the group but at the same time group members maintain their own identity and independence. Many factors affect group development. Structural characteristics have an important impact on group development.

Social Identity, Crowding and Crowd Behaviour Individuals are not self-contained units of psychological analysis. Social identity theory states that people think, feel and act as members of groups, institutions and cultures. The social identity approach reinforces the idea of the individuals' social cognitions which are socially constructed depending on their group or collective frames of reference. Social identity is mainly composed of four elements, viz., categorisation, identification, comparison and psychological distinctiveness. Actually social identity refers to the membership or associations of an individual with a NSOU • PGSW - VI _____ 119 primary group ranging from nuclear to extended based on factors as the individual's capacities, experiences, mobility and location. Ethnicity is a powerful social identity with many components, viz., common biological origins, customs, habits, norms etc. Personal identification with a specific group and the development of an in group mentality is involved in social identity theory. 4.11 Social identity theory We, the human being spend a lot of time thinking about ourselves. We can also say that self is the centre of each person's social universe. Our self-concept is mainly acquired through the interaction with the immediate family and also with the other people with whom we meet throughout our life. Actually self-concept is one's self- identity which consists of an organised collection of beliefs and feelings about oneself. We can further say that we develop our social identity which includes how we conceptualise ourselves, including how we evaluate ourselves. Self- concept also includes all of the information and feelings relevant to our past, present and future selves. We use the term self-concept which influences how we process information about the social world around us along with information about ourselves – such as our motives, emotional status, abilities, self-evaluation etc. All these important things influence how we process social and personal information that is relevant to our own identities. People want to know about others' beliefs, affiliations and intentions in order to interpret their words and actions and to predict their future behaviour. Social identity theory explains how people develop a sense of membership and belonging in particular group. There are many interconnected mechanisms in this theory. People generally seek out group membership as an affirmation of self-esteem, but that membership as an affirmation of self-esteem, but that membership in a group alone is not enough to build an affirm self-esteem. To feel more self-esteem, people have to believe that they are in the right group, which creates the need for a positive distinction from other groups. People want to know about others' beliefs, affiliations and intentions in order to interpret their future behaviour. These qualities we are unable to observe directly. We do not build up our impression of another trait by trait. Interpretation of identity is subjective. Social identity Theory was developed by Tajfel and Turner in 1979. In this theory, it was highlighted that a person has not one "personal Self" but rather several selves that corresponds to widening circles of group membership. An individual has multiple

120 _____ NSOU • PGSW - VI "social identities". It is the individual's self-concept derived from perceived membership of social groups (Hogg and Vaughan, 2002). Tajfel and Turner (1979) identified three variables which has contribution to the in-group favouritism is particularly important. • the extent to which individuals identify with an in-group to internalise that group membership as an aspect of their self-concept; • the extent to which the prevailing context provides ground for comparison between groups; • the perceived relevance of the comparison group, which itself will be shaped by the relative and absolute status of the in-group. Social identity theory has a considerable impact on social psychology. It is tested in a wide range of fields and settings and includes prejudice, stereotyping, negotiation and language use. The social identity theory has implication on the way people deal with social and organisational change. Besides this, we can also say that social identity is mainly composed of i) categorisation, ii) identification, iii) comparison, and iv) psychological distinctiveness. Generally social identities are associated with normative rights, obligations and sanctions which within specific collectivities form roles. Social identity refers to the membership or association of an individual with "primary" and other human beings. The significant factors which we can mention here are mainly individual's capacity, experiences mobility and location. 4.12 Definition of crowd Crowd is a physically compact organisation of human beings brought into direct, temporary and unorganised contact with one another. If some people stand together for a short time at any place, then it may be called crowd. The crowd is the most transitory and unstable of all the social groups. Actually crowd exhibits no patterns, no characteristic expressions. The collection of human beings in the market or in the open space is also designated as crowd. Maclver defines crowd as "A physically compact aggregation of human beings brought into direct, temporary and unorganised

NSOU • PGSW - VI _____ 121 contact with one another". According to Kimball Young, "A crowd is a gathering of a considerable number of persons around a centre or point of common attraction". According to Majumder, "A crowd is an aggregation of individuals drawn together by an interest without premeditation on the part of any of them and without even tentative provision of what to expect". Crowd behaviour involves three aspects: i) psychological continuity ii) polarisation of interest and attention and iii) transition and temporary character. A crowd collects because of some curiosity, interest and other temporary causes and dissolves as many as its cause vanishes. If two people start fighting on the road, a crowd will collect and when they stop their struggle, it will break up. Active Crowd Crowd can be divided into two classes: (a) Active and (b) Inactive. Active crowd can be further classified into four classes: a) Aggressive crowd: It is a crowd of people in an aggressive and destructive frame of mind, capable of any and every act of destruction and irrationality, brutality and inhumanity. This kind of crowd exhibits a tremendous excitement. b) Panicky crowd: Panicky crowd is the panicky or fear-stricken crowd whose constituent members are almost crazed with fear to a point where they can no longer think and find reason. They are almost frightened out of their units, so that thinking is for the time being a task beyond their power. They are concerned with the prime quest of saving their lives. c) Acquisitive crowd: The aim and objective of each of its members is to obtain or acquire something. Acquisitive crowd is composed almost entirely of individuals whose objectives is to gain or obtain something, be it a cinema ticket, kerosene oil etc. d) Expressive crowd: In this kind of crowd some people gathered to give expression or to manifest their demands or sentiments. Desire of violence is relatively less pronounced and dominant in the members of an expressive crowd.

122 _____ NSOU • PGSW - VI Inactive Crowd No crowd is completely inactive. The difference between an active and inactive crowd is only relative. The inactive crowd even resembles an audience. You may join in a crowd, where you can find some special characteristics: • Crowd has no predetermined aim • There is no definite time and place for crowd. • It is a congregate group of individuals who have temporarily identified themselves with common interest. It seems that members are motivated by emotions and soon become uncontrollable. • The behaviour of crowd is not certain. • People within the crowd stimulate each other. • Members of the crowd are generally uncontrolled, unorganised and disordered. Members are motivated by emotions and soon become uncontrollable. • The curiosity, values and emotions are temporarily identical and which arises because of common interest. • Immersed in the crowd, the individual loses self-control and may engage in different types of activities. Crowd behaviour arises as a result of the three mechanisms of anonymity, contagion and suggestibility (Le Bon, 1895). • Dollard (1939) used the frustration-aggression hypothesis to explain the violent behaviour of crowds. • Turner (1964) explained crowd behaviour in terms of "emergent norms". The contagion, the spread of the feelings and actions is facilitated by the process of mixing, the close proximity, the jostling like the sheep in the herd. • Generally in crowd people of varying interests and abilities converge because they share some common quality like hostility, aggressiveness etc. 4.13 Crowd psychology Crowd psychology mainly refers to the studies and theories regarding the behaviour of the crowd and also the psychological causes and effects of crowd participation. In a study entitled, "The Crowd: A Study of the Popular Mind (1895)", Le Bon suggested that when people become part of a crowd they lose almost all of their individuality, autonomy and personal judgment and morality. According to Carl

NSOU • PGSW - VI _____ 123 Jung, it is called "collective unconscious". Convergence theory emerged during the twentieth century, thinking that acts of the crowd is in unified way, not because of the collective 'mind' of the crowd but because they tend to be composed of like-minded people who are attracted into the crowd situation because of a shared interest or objective. 4.14 Crowd behaviour Neither the socio-psychological processes that take place within the crowd nor the techniques employed by the crowd, lead to understanding of crowd behaviour. However the leader provides an adequate understanding of the peculiarities of crowd behaviour. Some of them are as given below • In the crowd, with the loss of individuality, a form of group consciousness develops a fusion of mind with mind, a sympathetic participation on emotional level which is common to all the participants. Appeals, slogans are the common features. • Crowd behaviour is the release of repressed drives. The suggestibility, the exaltation, the lack of self-consciousness, the egoistic expansion and spontaneity, exhibited by the members of the crowd are phenomena susceptible to this kind of explanation. • We may think of the crowd as a temporary collective within which thwarted impulses are afforded an outlet. The close connection between the underlying characteristics of the cultural conditions and the types of crowd those are apt to mark the community life. • The manifestations of crowd feeling deserve study not only because they reveal the significance of this transitory form of aggregation, but also because they throw light on other social phenomena. 4.15 Theories of crowd behaviour Classical Theory The minds of the group would merge to form a way of thinking. Le Bon's idea is that crowd fosters anonymity and sometimes generate emotion. Different individuals in a group do not think individually but they think experience and act through the group mind. When individuals collect in a crowd, their individual mind becomes a part of the collective mind. The collective mind thinks in its own way and formulates

individual minds do not formulate in their individual capacities. Emphasis was given on unconscious motives. According to him, in a crowd these unconscious motives get more active. The individual is influenced by these unconscious motives and his own conscious motivation sinks into the background. The person become uninhibited and shows even the lowliest behaviour in the crowd. Convergence Theory Crowd behaviour is not a product of the crowd itself, but is carried into the crowd by particular individuals. According to the convergence theory people who wish to act in a certain way come together to form crowds. There is no homogenous activity within a repetitive practice. This theory states that crowd itself does not generate racial hatred or violence. Actually, crowd arises from convergence of people who oppose the presence of particular group of neighbours. Generally people in crowd express existing beliefs and values so that mob reaction is the rational product of widespread popular feeling. Group Mind Theory The Group mind theory has been advocated by Lebon, Espinas, Trotter, Durkheim, Mc. Dougall and Allport. According to this theory, the individual in the crowd loses his individuality and becomes a part of the crowd which comes to develop its own crowd consciousness. The mentality of the individual member becomes de- individualised and the person begins to act on an emotional level which is common to all the participants. Its working is based on emotions, slogans, appeals and suggestions. Its actions are less rational and more emotional. It becomes easily excited and acts in a hypnotic way. Lebon was the first writer to put forward the theory of group mind in 1892. According to him, the sentiments and ideas of all the persons in the gathering take one and the same direction and their conscious personality vanishes. Different individuals in a group do not think individually but think, experience and act through the group mind. When individuals collect in a crowd, their individual minds become a part of the collective mind. Lebon has laid great emphasis on the unconscious motives. The individual is influenced by the unconscious motives and his own conscious motivation sinks into the background. Espinas calls group mind as social consciousness. According to him, there is a sort of self-consciousness in every group. Collective consciousness is formed out of the collection of many individuals consciousness taken together. According to Trotter, everyman is possessed of the instinct of

NSOU • PGSW - VI

125 gregariousness. Man's gregariousness

activates his mental system as a result of which he accepts the command of the group without any argument and acts according to the command given. Durkheim has sought to explain group behaviour in terms of collective consciousness. According to him, when people collect in a group, a collective consciousness is created by the mutual exchange of ideas and notions. Actually mind is another name for the flow of consciousness. Social consciousness is a compound of several individual consciousness but its qualities are different from the qualities of the consciousness of the individual. According to Mc.Dougall, every group has a mind of its own. The group mind is not a mere collection of the minds of all the individual members of group. The group-mind has the power of influencing the mind of the individuals. It is because of this power of the group mind that the thinking of the individual changes when he becomes a member of the group. According to Allport, the behaviour of the individual in the crowd is influenced by two processes of social facilitation and inter-stimulation. Members of the group motivate each other. Social facilitation and inter-stimulation curb the reasoning capacity of the individuals and increase their suggestibility. Sometimes crowd behaviour may be the expression of impulses repressed or thwarted by the conditions and social controls of everyday life, but it may not be true of all the crowds. In a crowd all the differences of high and low, rich and poor are submerged and all act as one man. We can say that crowd behaviour is learned. In a crowd the individual responsibility is blotted out. De-individualisation of the individuals in the group leads to reduction of inner restraint and to move expressive behaviour. Public and Crowd: The public and the crowd while have some factors common, they differ a great deal. While both crowd and public are collectivities of people and are generally organised, one of the important differences is that there is physical contact among the members of a crowd, where as public is scattered at several places. Secondly, public is much bigger group than the crowd and thirdly, the stimulus in the crowd is simultaneous whereas stimulus in the public is diffused. The crowd is more suggestible than the public. Thus, we can say that the crowd and public differ in many ways. 4.16 Collective behaviour All social interactions fall under the category of collective behaviour. When two or more persons behave in the same way, it may be termed as 'collective behaviour'. Any religious congregation may be called collective behaviour. Collective behaviour

126 _____ NSOU • PGSW - VI brings people into contact with others in situations where conventional guidelines and formal authority fail to afford direction and supply channels for action. Social unrest may be both the cause and effect of collective behaviour. It may sometimes lead to the emergence of new norms and generally accepted policies. The agitated crowds can develop into disciplined association. Collective behaviour may act as an agent of flexibility and as a forerunner of social change. Some special features of collective behaviour are the following • It takes place in occasional episodes rather than regularly or routinely. • It is not regulated by any particular set of rules or procedures. • It is generally guided by unreasoning beliefs, hopes, fears or hatreds. • It is unpredictable. Generally we can say that social life is a system of well-structured and stable relationships. It is characterised by change rather than stability, uncertainty rather than predictability, disorganisation rather than equilibrium. Collective behaviour entails a crisis or a break in regular routines. Collective behaviour may be an agent of flexibility and social movements and revolutions fall under the category of collective behaviour. A crowd may be said to be more stable than a mob. Under conditions of stress or danger, a crowd may quickly turn into a mob. Crowd may include mob behaviour as well as audience behaviour. Casual crowd is short in time, loosely organised collectivity that may be motivated by the attraction of the movement. A group of people may collect together when there is an accident on the road. On the other hand, there is conventional crowd which are directed by conventional rules like collection of people in religious festivals. Mass Society Mass society is characterised by rationality, impersonal relations, extreme specialisation of roles and loneliness for the individual in spite of concentration of sheer numbers and loss of sense of intimacy and security. In such society's suggestion, persuasion, propoganda and other aspects of crowd behaviour are common (Young, 1948). The modern cities are changing rapidly. It consists of millions of human beings. Personal contacts among the people are reducing day by day. The loss of personal relationship creates a sense of insecurity, loneliness and incompleteness. To overcome these problems, they engage in voluntary organisation, associations and clubs etc. and also affiliate themselves with one or the other of the ashrams. Another significant feature of mass society, with its desire for crowd contacts, is irrationality,

NSOU • PGSW - VI _____ 127 susceptibility to propoganda and advertisement. Technological progress and impersonality are based on rational grounds. The sense of insecurity and sense of loneliness makes the individual irrational. In the mass society there is a mixture of rational and irrational thing. Audience Audience is a polarised crowd which assembles in one place. It is an index of mental unity. There may be two types of audience i) casual audience and ii) scheduled audience- A number of people may congregate and become polarised by seeing a street quarrel and it is called casual audience. On the other hand, the crowd which assembles in a lecture hall or cinema hall may be called scheduled audience. In the audience situation several psychological processes are involved in the interaction of people. This interaction may be of two types, viz., i) between audience and speaker or actor and ii) among the member of the audience themselves. The aim of audience is of many types. One is to get facts and interpretations. We can also observe some emotional appeals among audience. Sometimes it may be conversational. As for example we can say that the dramatic troupe or the musician will have to build up rapport with the audience so that the audience appreciates and enjoys the music or the program. If it is unfavourable, then it becomes aggressive one. Group singing breaks down the individual isolation, removes differences in social status and helps to build up common emotions and feelings. MOB Generally, the members of a mob tend to show a similarity in feelings, thoughts and actions irrespective of the variation in education, occupation and intelligence. The members of the mob are attending to and reacting to some common object in a common way. Sometimes heightened emotionality is a characteristic feature of mob behaviour. The significant features are anger, fear, joy etc. Sometimes they become unreasonable, intolerant and fickle-minded. Most common characteristic of mob behaviour is the diminished sense of responsibility. They are generally irresponsible.

128 _____ NSOU • PGSW - VI An aggressive mob may indulge in some unfortunate behaviour like destroying music, puperty attacking the. Not only their sense of autonomy may also be reduced and may become part of mob behaviour. Suggestion, imitation and sympathy – are the three mechanisms of interaction which we can observe in the mob behaviour. It can further be said that mob behaviour is due to the operation of a number of factors, some of which depend upon the predisposition of the individuals and some upon the characteristics of the situation in which the collectivity finds itself. Mob behaviour is conditioned by so many factors – past as well as present, social as well as individual. Fashion Fashion is an important example of collective action and it is common with crowd behaviour. Fashion is a variation that is permissible within limits of custom. Fashion as well as fads and crases are based on the desire for change, the desire for something new. There is a psychological reaction and it is outgrowth of emotional and irrational tendencies. It can further be said that fashion sometimes furnishes the desire of conformity, security and social solidarity. Social movements are collective efforts to change the society. Some movements are local, some are national and others are international. The term 'collective behaviour' is now used as 'audience behaviour', 'mob behaviour', 'social movement' etc. Self Assessment Questions 1) All _____ called under the category of collected behaviour. 2) Write features of collective behaviour.

(ii)..... 4) Mob behaviour is conditioned by three factors i).....
ii)..... iii).....

NSOU • PGSW - VI _____ 129 4.17 Conclusion Generally people want to know about others' beliefs, affiliations and intentions in order to interpret their words and actions and to predict their future behaviour. The premise of the social identity concept is that individuals partially derive their self- concepts from membership in social groups. Social identity concept provides a robust framework for psychologists to understand issues of labeling, self-esteem, discrimination, conformity and in-group or out-group perspectives. Individuals are not self-contained units of psychological analysis. Social identity theory states that people think, feel and act as members of collective groups, institutions and cultures. This approach reinforces the idea that individual's social cognitions are socially construed depending on their group or collective frames of reference. This theory incorporates three main points: i) people are motivated to maintain a positive self-concept; ii) the self-concept derives largely from group identification ;and iii) people establish positive social identities by favorably comparing their in- group against an out- group. It is true that group often exerts powerful effects upon their members. In this context three important aspects are role, status and norms. Different persons perform different tasks and they expected to accomplish different things for the group. They fulfill different roles. Generally roles are assigned in a formal manner. Groups may choose a person as leader and others as follower. Roles are acquired and people internalise them. They link their roles to key aspects to their self-concept and self- perception. A role may exert profound effects on a person's behaviour. Besides role, another important factor in functioning of group is status. It is social standing or rank within a group. Different roles or position in a group is linked with wide range of desirable outcomes. Groups often confer or withhold status, as a means of influencing the behaviour of their members. Another powerful factor which has significant impact on group is the 'norm'. The rules may be implicit or explicit, established by groups to regulate the behaviour of their members. In many situations, norms tell group members how to behave or how not to behave. Generally group insists upon adherence to their norms as a basic requirement for membership. Groups influence their members through roles, i.e., members' assigned functions in the group; status, i.e., their relative standing in the group and norms, i.e., rules concerning appropriate behaviour for

130 _____ NSOU • PGSW - VI members, and lastly, cohesiveness, i.e., all the factors that cause members to remain in the group. In this context another important term we can use, i.e., "crowd". A crowd is a gathering of a considerable number of persons around a centre or point of common attraction. Crowd is a temporary, direct and unorganised group of individuals whose curiosity, values and emotions are temporarily identical and which arise because of common interest or common stimuli. According to the "group-mind theory", the individual in the crowd loses his individuality and becomes a part of the crowd which comes to develop its own crowd consciousness. Like-minded people, who are attracted into the crowd situation, have a shared interest or object, which is based on convergence theory. The other type of groups we can mention here are mob, audience, mass society etc 4.18 Exercise 1) Write five importance's of group dynamics. 2) Write two features of group dynamics. 3) Self- concept also includes all of the andrelevant to our past, present and future. 4) What does social identity explain? 5) Social identity composed of four elements i.e i)..... ii)..... iii)..... iv)..... 6) Define what is crowd? 7) What are the two classes of crowd? 8) Explain crowd behaviour 9) What is classical theory? 10) Explain convergence theory? 11) All..... called under the category of collected behaviour 12) Write features of collective behaviour? 13) Two types of audience are (i) (ii) (iii) 14) Mob behaviour is conditioned by three factors i) ii) iii)

Introduction Psychodynamic Theory is one in which patients treated are viewed within a model of illness that attempts to identify something that is not obvious but is present, but may be at the unconscious level. Such a material once brought out of the unconscious would be able to help the patient be relieved of the symptoms and get the person on the road to recovery. Thus each individual is perceived to have had certain experiences and events that have been pushed into the unconscious as these materials are very painful and shameful to the individual. These materials remain in the unconscious and keep trying to enter the conscious only to be repressed back. These are basically materials that are wishes and desires and needs which are represented by the Id, and which are catered to by the ego so as to fulfill the needs of the Id. At the same time the do's and don'ts, the moral values, the rights and wrongs that are imparted by the parents are represented by the superego which tries to curb the id impulses from arising so that the person may not do anything wrong which may cause the society harm. Thus the dynamic interaction amongst the Id, Ego and the superego as well as the society or the outer environment make the individual behave in a certain way. All these dynamics start quite at an early age of the individual and remain so and continue even in adulthood. In the process of catering to the Id and the superego the ego uses many defenses which help in maintaining a balance in the personality. However if balance is not restored the individual may

132 NSOU I PGSW- VI _____ 133 develop certain abnormalities called as mental disorders which need to be treated and one method of treatment is the psychoanalysis. Freud developed a technique that he called psychoanalysis and used it to treat mental disorders. The conscious contains all the information that a person is paying attention to at any given time. The preconscious contains all the information outside of a person's attention but readily available if needed. The unconscious contains thoughts, feelings, desires, and memories of which people have no awareness but which keep influencing every aspect of individual's day to day life. Freud believed that personality gets clearly established during childhood, largely before the age of five years. He proposed five stages of psychosexual development, viz., the oral stage, the anal stage, the phallic stage, the latency stage, and the genital stage. Thus personality development for Freud took place before five years of age and continued on into the adulthood with very little change. Freud had many followers and some of them parted company with him on many of the issues related to personality development, as for instance the issue of psychosexual development etc. Erikson was one such person who was a follower of Freud but separated away to propound his own theory. Erikson's theory of ego psychology holds certain tenets that differentiate his theory from Freud's. Erikson's stages provide a framework in which one can bring in the culture concept and compare the present day to that of the earlier days. It also offers insights regarding the eight stages being divided into two parts, with one ending with childhood and the other adult development. In this unit we will be dealing with the theories of personality development as put forward by Freud and Erikson. 5.3

W

Psychodynamic Theories of Personality Psychodynamic Theory is one in which patients treated for mental disorders are viewed within a model of illness that attempts to identify something that may be not in the realm of awareness of the individual concerned. Each individual is perceived to be made up from a dynamic that begins in early childhood and continually progresses throughout life. This way of thinking, however, is generally considered a watered down version of the more conservative and rigid psychoanalytic school of thought. Psychoanalysis emphasises the belief that all adult problems are directly related to events in one's childhood. Therapists who practice this theory have a tendency to look at individuals as the composite of their parental upbringing. Their focus is on the means for settling conflicts between themselves and their parents as well as within themselves. Psychodynamic therapists tend to believe in the theoretical constructs of the ego (which acts as a force 134 _____)

NSOU I PGSW-VI

MATCHING BLOCK 35/127

W

similar to a referee) and the superego (known as the conscience) as well as an id that exists inside all of us that tends to act as the devil's advocate working against the thought process of the conscience. All of these constructs work together to make up the personality and the role of the unconscious is emphasised meaning that contrary to what else one may think, what one does not know can indeed hurt the person and more often than not, it does just that. The development of an adult's personality is viewed in terms of whether an individual has been able to successfully maneuver through the psychosexual stages of childhood development. Because of this belief, adults are unlikely to know how they are screwed up and as a result may not even recognise the signs of mental distress or mental disorder. 5.4 Psychoanalytic Theory by Sigmund Freud In the late 1800s and early 1900s, Freud developed a technique that he called psychoanalysis and used it to treat mental disorders. He formed his theory of psychoanalysis by observing his patients. According to psychoanalytic theory, personality development takes place as a result of the attempts to resolve conflicts between unconscious sexual and aggressive impulses and societal demands to restrain these impulses. Freud's theory of development has two primary ideas: 1) Everything you become is determined by your first few years – indeed, the adult is exclusively determined by the child's experiences, because whatever actions occur in adulthood are based on a blueprint laid down in the earliest years of life (childhood solutions to problems are perpetuated) 2) The story of development is the story of how to handle anti-social impulses in socially acceptable ways. The Conscious, The Preconscious, and The Unconscious Freud believed that most mental processes are unconscious. He proposed that people have three levels of awareness: The Preconscious, the conscious and the unconscious The conscious contains all the information that a person is paying attention to at any given time. Example: The words Dan is reading, the objects in his field of vision, the sounds he can hear, and any thirst, hunger, or pain he is experiencing at the moment are all in his conscious. The preconscious contains all

NSOU I PGSW-VI_____ 135

MATCHING BLOCK 32/127

W

the information outside of a person's attention but readily available if needed. Example: A close friend's telephone number, the make of one's car, and many of the past experiences are in the preconscious. The unconscious contains thoughts, feelings, desires, and memories of which people have no awareness but that which influence every aspect of the individual's day to-day lives.

Image: The three levels of awareness given by Freud.

people make between ideas. The Freudian Slip Manju calls up her mother on Mother’s Day and says, “You’re the beast, Mom,” when she consciously intended to say, “You’re the best, Mom.” According to psychoanalytic theory, this slip of the tongue, known as a Freudian slip, reveals her unconscious anger toward her mother. 136

----- NSOU I PGSW-VI The ID, The EGO, and The Superego Freud proposed that personality has three components: the id, the ego, and the superego. Id: Id is conceived as a reservoir of instinctual energy that contains biological urges such as impulses toward survival, sex, and aggression. The id is unconscious and operates according to the pleasure principle, the drive to achieve pleasure and avoid pain. The id is characterised by primary process thinking, which is illogical, irrational, and motivated by a desire for the immediate gratification of impulses. Ego: Ego is considered as the component that manages the conflict between the id and the constraints of the real world. Some parts of the ego are unconscious, while others are preconscious or conscious. The ego operates according to the reality principle, the awareness that gratification of impulses has to be delayed in order to accommodate the demands of the real world. The ego is characterised by secondary process thinking, which is logical and rational. The ego’s role is to prevent the id from gratifying its impulses in socially inappropriate ways. Superego: This is considered to be the moral component of personality. It contains all the moral standards learned from parents and society. The superego forces the ego to conform not only to reality but also to its ideals of morality. Hence, the superego causes people to feel guilty when they go against society’s rules. Like the ego, the superego operates at all three levels of awareness. Conflict: Freud believed that the id, the ego, and the superego are in constant conflict. He focused mainly on conflicts concerning sexual and aggressive urges because these urges are most likely to violate societal rules. Anxiety: Internal conflicts can make a person feel anxious. In Freud’s view, anxiety arises when the ego cannot adequately balance the demands of the id and the superego. The id demands gratification of its impulses, and the superego demands maintenance of its moral standards.

Stages of Psychosexual Development Sigmund Freud (1856-1939) is probably the most well known theorist when it comes to the development of personality. Freud’s Stages of Psychosexual Development are, like other stage theories, completed in a predetermined sequence and can result in either successful completion or a healthy personality or can result in failure, leading to an unhealthy personality. This theory is probably the best known as well as the most controversial; as Freud believed that we develop through stages based upon a particular erogenous zone.

NSOU I PGSW-VI----- 137 Image: Stages of Psychosexual Development During each stage, an unsuccessful completion means that a child becomes fixated on that particular erogenous zone and either over- or under-indulges once he or she becomes an adult. a) Oral Stage (Birth to 18 months): During the oral stage, the child is focused on oral pleasures (sucking). Too much or too little gratification can result in an Oral Fixation or Oral Personality which is evidenced by a preoccupation with oral activities. This type of personality may have a stronger tendency to smoke, drink alcohol, over eat, or bite his or her nails. Personality wise, these individuals may become overly dependent upon others, gullible, and perpetual followers. On the other hand, they may also fight these urges and develop pessimism and aggression toward others. b) Anal Stage (18 months to three years): The child’s focus of pleasure in this stage is on eliminating and retaining faeces. Through society’s pressure, mainly via parents, the child has to learn to control anal stimulation. In terms 138 ----- NSOU I PGSW-VI of personality, after effects of an anal fixation during this stage can result in an obsession with cleanliness, perfection, and control (anal retentive). On the opposite end of the spectrum, they may become messy and disorganised (anal expulsive). c) Phallic Stage (ages three to six): The pleasure zone switches to the genitals. Freud believed that during this stage boys develop unconscious sexual desires for their mother. Because of this, he becomes rivals with his father and sees him as competition for the mother’s affection. During this time, boys also develop a fear that their father will punish them for these feelings, such as by castrating them. This group of feelings is known as Oedipus complex (after the Greek Mythology figure, who accidentally killed his father and married his mother). d) Later it was added that girls go through a similar situation, developing unconscious sexual attraction to their father. Although Freud Strongly disagreed with this, it has been termed the Electra complex by more recent psychoanalysts. e) According to Freud, out of fear of castration and due to the strong competition of their father, boys eventually decide to identify with him rather than fight him. By identifying with his father,

52%

MATCHING BLOCK 44/127

W

the boy develops masculine characteristics and identifies himself as a male, and represses his sexual feelings toward his mother.

A fixation at this stage could result in sexual deviancies (both overindulging and avoidance) and weak or confused sexual identity according to psychoanalysts. f) Latency Stage (age six to puberty) : It's during this stage that sexual urges remain repressed and children interact and play mostly with same sex peers. g) Genital Stage (puberty on): The final stage of psychosexual development begins at the start of puberty when sexual urges are once again awakened. Through the lessons learned during the previous stages, adolescents direct their sexual urges onto opposite sex peers; with the primary focus of pleasure are the genitals.

95%

MATCHING BLOCK 36/127

W

Defense Mechanisms To manage these internal conflicts, people use defense mechanisms. Defense mechanisms are behaviours that protect people from anxiety. There are different defense mechanisms, many of which are automatic and unconscious. Some of these defense mechanisms commonly used by individuals are presented below. It may be mentioned here that the individual is generally not aware that he or she is using defense mechanisms at the conscious level. a. Repression: keeping unpleasant thoughts, memories, and feelings shut up in the unconscious. Example: Ram witnessed his mother being beaten by agoonda on a motor cycle who was trying to snatch away her gold chain.

NSOU I PGSW-VI_____ 139

100%

MATCHING BLOCK 37/127

to accept such feelings within him. He therefore unconsciously projects these feelings on to his wife saying that she is unfaithful and that she goes with other men and gets attracted to other men etc.

d.

98%

MATCHING BLOCK 40/127

W

Rationalization: using incorrect but self serving explanations to justify unacceptable behaviour, thoughts, or feelings. Example: Ronak jumps a red light while driving. He justifies this by telling to himself that he was already in the intersection when the light changed to red. e. Displacement: transferring feelings about a person or event onto someone or something else. Example: Seth is angry at his professor for giving him a bad grade. He leaves class and shouts angrily at a passerby who accidentally bumps into him.

f.

100%

MATCHING BLOCK 41/127

W

Denial: refusing to acknowledge something that is obvious to others. Example: Rashmi has started drinking alcohol which has started to affect her academic performance, her job, and her relationships. However, she insists that she drinks only to relieve stress and that she does not have an alcohol problem.

g.

Regression: reverting to a more immature state of psychological development. Example: When six-year-old Jameel gets less attention from his parents because of a new baby brother, he suddenly starts to wet his bed at night. h. Sublimation: channeling unacceptable thoughts and feelings into socially acceptable behaviour. Example: Priya deals with her angry feelings toward her family by writing science fiction stories about battles between civilizations which contains a lot of aggression. 140

NSOU I PGSW-VI Limitation : Some of the limitations typically raised in response to Freudian theory are: Freud's hypotheses are neither verifiable nor falsifiable. It is not clear what would count as evidence sufficient to confirm or refute theoretical claims. The theory is based on an inadequate conceptualization of the experience of women. The theory overemphasizes the role of sexuality in human psychological development and experience.

5.5 Adler's Individual Psychology Alfred Adler, a medical graduate is best known as the founder of Individual Psychology. In addition he is credited, along with Carl Jung and Sigmund Freud, as one of the greatest founding influences of modern psychology. Adler developed the school of individual psychology which consisted of the concepts of human drives, feelings, emotions, and memory in the context of the individual's overall life plan. Among Adler's chief contributions, the following may be mentioned: i) the importance of birth order in the formation of personality, ii) the impact of neglect or pampering on child development, iii) the notion of a "self perfecting" drive within human beings, and iv) the idea that one must study and treat the patient as a "whole person." Adler with the creation of individual psychology, developed a new direction in psychotherapy, and created the first significant schism in the psychoanalytic movement. Adler considered psychic development to be the formation of an unconscious life plan, or even a lifestyle. The concepts used by Adler are the following: i) Individual Psychology ii) Striving for perfection iii) Aggressive drive iv) Compensation v) Masculine protest

NSOU I PGSW-VI _____ 141 i) Individual psychology deals as much as possible with what can be observed and as little as possible with what must be taken on faith. Alfred Adler postulates a single "drive" or motivating force behind all our behaviour and experience and he called this motivating force as striving for perfection. This actually refers to the desire that all humans have to fulfill their potentials, to come closer and closer to their ideal self actualization. ii) Striving for perfection refers to the single motivating force underlying personality. Adler's earliest phrase in regard to this was the aggression drive, referring to the reaction one has when other drives, such as our need to eat, to be sexually satisfied, to get things done, or be loved, etc., are all frustrated. It might better be called as the assertiveness drive, as aggression term has a negative connotation. iii) Compensation: Another word Adler used to refer to basic motivation was compensation, or striving to overcome. Since people have problems, shortcomings, inferiorities of one sort or another, Adler felt, earlier in his writing, that individual personalities could be accounted for by the ways in which they compensate or overcome those problems. iv) Masculine Protest: One of Adler's earliest phrases was masculine protest. He noted something pretty obvious in his culture that boys were held in higher esteem than girls, and boys wanted, often desperately, to be thought of as strong, aggressive, in control that is, "masculine" and not weak, passive, or dependent that is, "feminine." Goal-striving Adler saw man imbued with a unitary dynamic force, a striving from below to above. Since this striving is an "intrinsic necessity of life itself, like physical growth," there is no need to infer a further source of energy for it. Adler described it as directed toward superiority, overcoming, perfection, success, significance – always as these are variously envisioned by each individual. Self-determination Adler found that an individual might respond to a perceived inferiority with greater or lesser inferiority feelings and with discouragement, compensation, or overcompensation. Thus the individual is not completely determined by objective factors. Adler called this degree of self-determination man's creative power. It includes not only the ability to choose between several ways of regarding or reacting but also, more importantly, man's potential for spontaneity. Through it the individual arrives at his style of life. Life Style Life style refers to how a person lives his/her life, how he/she handle problems and interpersonal relations. Social Ties Adler specified three main tasks of life: occupation, association with others, and love and marriage. He also referred to them as social ties, for they all require

NSOU I PGSW-VI cooperation for their solution. Man's very uniqueness is influenced by his relations to others: "The style of the child's life cannot be understood without reference to the persons who look after him." Social Interest Adler also assumed an innate potentiality for coping with society, termed social interest. Unlike an instinct, it must be evoked and developed. Its subjective development is based in man's native empathy; the objective "development of the innate potentiality for cooperation occurs first in the relationship of the child and the mother." Social interest represents a transcendence of the self, an absence of self centeredness. It is a trait, like intelligence, and as such influences the direction of the striving, but it is the most important trait in the life style. Psychological types Adler mentioned three distinguished types based on the different levels of energy involved: 1) Ruling type: They are, from childhood on, characterized by a tendency to be rather aggressive and dominant over others. Their energy — the strength of their striving after personal power — is so great that they tend to push over anything or anybody who gets in their way. The most energetic of them are bullies and sadists; somewhat less energetic ones hurt others by hurting themselves, and include alcoholics, drug addicts, and suicides. 2) Leaning type: They are sensitive people who have developed a shell around themselves which protects them, but they must rely on others to carry them through life's difficulties. They have low energy levels and so become dependent. When overwhelmed, they develop what we typically think of as neurotic symptoms: phobias, obsessions and compulsions, general anxiety, hysteria, amnesias, and so on, depending on individual details of their lifestyle. 3) Avoiding type: These have the lowest levels of energy and only survive by essentially avoiding life — especially other people. When pushed to the limits, they tend to become psychotic, retreating finally into their own personal worlds. 4) Socially useful type: This is the healthy person, one who has both social interest and energy. Note that without energy, you can't really have social interest, since you wouldn't be able to actually do anything for anyone! Adler noted that his four types looked very much like the four types proposed by the ancient Greeks. They, too, noticed that some people are always sad, others always angry, and so on. But they attributed these temperaments (from the same root as temperature) to the relative presence of four bodily fluids called humors. Choleric (hot and dry) and angry all the time. The choleric is, roughly, the ruling type. Phlegmatic (cold and wet) and

NSOU I PGSW-VI 143 be sluggish. This is roughly the leaning type. Melancholic (cold and dry) and tend to be sad constantly. This is roughly the avoiding type. Sanguine (warm and moist). This naturally cheerful and friendly person represents the socially useful type. Adler believed very strongly that each person is a unique individual with his or her own unique lifestyle. The idea of types is, for him, only a heuristic device, meaning a useful fiction, not an absolute reality. Childhood Adler, like Freud, saw personality or lifestyle as something established quite early in life. In fact, the prototype of the individual's lifestyle tends to be fixed by about five years old. Adler felt that there were three basic childhood situations that most contribute to a faulty lifestyle. 1. First, organ inferiority as well as early childhood diseases: They are what he called "overburdened," He felt that someone has to draw their attention to others, in order that they give up focusing on their own self and look at others. 2. The second is pampering. Many children are taught, by the actions of others that they can take without giving. Their wishes are everyone else's commands. 3. The third is neglect. A child who is neglected or abused learns what the pampered child learns, but learns it in a far more direct manner. They learn inferiority because they are told and shown every day that they are of no value. They learn selfishness because they are taught to trust no one. If you have not known love, you do not develop a capacity for it later. Birth Order Adler must be credited as the first theorist to include not only a child's mother and father and other adults as early influence on the child, but the child's brothers and sisters as well. His consideration of the effects of siblings and the order in which they were born is probably what Adler is best-known for. The only child is more likely than others to be pampered, with all the ill results one has discussed. After all, the parents of the only child have put all their eggs in one basket, so to speak, and are more likely to take special care, sometimes anxiety filled care of their pride and joy. If the parents are abusive, on the other hand, the only child will have to bear that abuse alone. The first child begins life as an only child, with all the attention to him or herself. Sadly, just as things are getting comfortable, the second child arrives and "dethrones" the first. At first, the child may battle for his or her lost position. He or she might try acting like the baby. After all, it seems to work for the baby! But the elder child gets only rebuffed and told to grow up. Some become disobedient and rebellious, others sullen and withdrawn. Adler believed that the first born children

144 _____ NSOU I PGSW-VI are often precocious. They tend to be relatively solitary and more conservative than the other children in the family. The second child is in a very different situation: He or she has the first child as a sort of "pace-setter," and tends to become quite competitive, constantly trying to surpass the older child. They often succeed, but many feel as if the race is never over, and they tend to dream of constant running without getting anywhere. Other "middle" children will tend to be similar to the second child, although each may focus on a different "competitor." The youngest child is likely to be the most pampered in a family with more than one child. After all, he or she is the only one who is never dethroned! And so the youngest children are the second most likely source of problem children, just behind the first borns. On the other hand, the youngest may also feel incredible inferiority, with everyone older and "therefore" superior. But, with all those "pace-setters" ahead, the youngest can also be driven to exceed all of them. Who is a first, second, or youngest child is not as obvious as it might seem. If there is a long stretch between children, they may not see themselves and each other in the same way as if they were closer together. And if some of the children are boys and some girls, it makes a difference as well. A second child who is a girl might not take her older brother as someone to compete with. A boy in a family of girls may feel more like the only child and so on. As with everything in Adler's system, birth order is to be understood in the context of the individual's own special circumstances. Therapist and Patient The therapist's function, according to Adler, is not to treat "mental disease" but to divine the error in the patient's way of life and lead him to greater maturity. Adler wished the patient to appreciate his (patient's) own power of self-determination and have the courage to exercise it. To encourage the patient, the therapist must express a disinterested concern that evokes and fosters feelings of trust and fellowship, which in turn fulfils a function at which the mother had failed.

NSOU I PGSW-VI _____ 145 5. 6 Conclusion In this Unit our learner got an in-depth idea about the theories on psychodynamics, Psychoanalytical Theory and Adler's Individual Psychology. Dear learners, now you would be able to understand the social behaviour of the client in a much meaningful manner. 5. 7 Exercise 1)

Humanistic and Self Theories of (Malsow and Rogers) Personality The Humanistic Approach began in response to concerns by therapists against perceived limitations of Psychodynamic theories, especially psychoanalysis. Psychologists and psychoanalysts such as Carl Rogers and Abraham Maslow felt that the existing (psychodynamic) theories failed to adequately address issues such as the meaning of behaviour, and the nature of healthy growth. However, the result was not simply new variations on psychodynamic theory, but rather a fundamentally new approach. There are several factors which distinguish the Humanistic Approach from other approaches, that is, the difference can be seen in the emphasis on subjective meaning, a rejection of determinism, and a concern for positive growth rather than pathology. While one might argue that some psychodynamic theories provide a vision of healthy growth (including Jung's concept of individuation), the other characteristics distinguish the Humanistic Approach from every other approach within psychology (and sometimes lead theorists from other approaches to say the Humanistic Approach is not a science at all). Most psychologists believe that

NSOU I PGSW-VI _____ 147

MATCHING BLOCK 46/127

W

behaviour can only be understood objectively (by an impartial observer), but the humanists argue that this results in concluding that an individual is incapable of understanding their own behaviour—a view which they see as both paradoxical and dangerous to well-being. Instead, humanists like Rogers argue that the meaning of behaviour is essentially personal and subjective; they further argue that accepting this idea is not unscientific, because ultimately all individuals are subjective: what makes science reliable is not that scientists are purely objective, but that the nature of observed events can be agreed upon by different observers (a process Rogers calls

inter subjective

MATCHING BLOCK 61/127

W

verification). The main aim of humanistic approach is to provide concepts and methods for stimulating learning, growth and development both in individual persons as well as in society, thus enhancing well-being and the overall quality of life. Maslow coined the term “the Third Force” to describe the Humanistic Approach, to emphasise how it differed from the Psychodynamic and Behaviourist Approaches, which dominated psychology in the 1950’s. This “third force”, in contrast with clinical psychology, influenced by Freudian psycho-analysis, which studies mental illness, i.e. the negative side of human behaviour, and traditional academic, experimental psychology, influenced by behaviourism, which tends to reduce human behaviour to statistical correlations between different kinds of stimuli, responses and personality traits. Instead of merely modeling normal behaviour or of curing clear dysfunctions, a humanistic psychologist tries to help people to develop in a better way, thus making them more competent, more aware, happier, in the hope of reaching some state of “optimal” mental health. The central theme in humanistic theories is the drive towards self-actualisation, to realise one’s full potential. Other themes include personal growth, openness to experience, living in the present, personal responsibility, and inherent goodness of people. For the humanists, the unit of analysis is the perceived reality. Probably the best known proponent of this approach is Abraham Maslow. What distinguishes his work from that of other “humanists”, such as Carl Rogers or Erich Fromm is that he proposes a model of how a happy, healthy, well-functioning person behaves, which is based on concrete observations of real people, rather than on formulating ideal requirements. Also Maslow proposes a simple and intuitively appealing theory of motivation, which explains where such a “self-actualising” personality comes from. In parallel with systems theory, Maslow reacts against too much reductionism in psychological modeling, and proposes an alternative holistic approach of personality research. In recent years, a number of initiatives have appeared which, while influenced significantly by humanistic ideas and theories, have new directions. Perhaps the most significant is positive psychology, a term coined by Dr. Martin Seligman when he was President of the American Psychological Association in 2000. Positive psychology, like the humanistic approach, focuses on enhancing human potential, but embraces research 148 _____

NSOU | PGSW-VI

methods (e.g., surveys, group data) which humanists have traditionally avoided. Another area influenced by the humanistic approach has been coaching psychology. While the term originated in "personal coaching" in sports, it more generally refers to a focus on enhancing individual potential, and the field has gradually become a specific area within many psychology associations. Abraham Maslow : Humanistic Approach to Personality Abraham Maslow, widely regarded as one of the founders of the Humanistic Approach, was born on April 1, 1908 in Brooklyn, New York. He received his BA in 1930, his MA in 1931, and his PhD in 1934, all in psychology, all from the University of Wisconsin. A year after graduation, he returned to New York to work with E. L. Thorndike at Columbia, where Maslow became interested in research on human sexuality. He began teaching full time at Brooklyn College. During this period of his life, he came into contact with the many European intellectuals who were migrating to the US, and Brooklyn in particular, at that time. Persons like Adler, Fromm, Horney, as well as several Gestalt and Freudian psychologists also migrated to Brooklyn initially. Maslow served as the chair of the psychology department at Brandeis from 1951 to 1969. While working here he met Kurt Goldstein, who had put forward the idea of self- actualisation in his famous book, *The Organism* (1934). It was also here that he began his crusade for a humanistic psychology, something ultimately much more important to him than his own theorising. He spent his final years in semi retirement in California, until, on June 8 1970, he died of a heart attack after years of ill health. Maslow developed a theory of personality that has influenced a number of different fields. This wide influence is due in part to the high level of practicality of Maslow's theory. His theory accurately describes many realities of personal experiences. Humanists do not believe that human beings are pushed and pulled by mechanical forces, either of stimuli and reinforcements (behaviourism) or of unconscious instinctual impulses (psychoanalysis). Humanists focus upon potentials. They believe that humans strive for an upper level of capabilities. Humans seek the frontiers of creativity, the highest reaches of consciousness and wisdom. This has been labeled "fully functioning person", "healthy personality", or as Maslow calls this level, "self-actualising person." Maslow's theory of personality can be explained

NSOU I PGSW-VI_____ 149 under

the following headings: 1) Hierarchy of needs, 2) Deficit needs, 3) Growth needs, 4) Self-actualisers Hierarchy of Needs Maslow proposed a theory of human motivation based on hierarchy of needs. The lower a need in the hierarchy the more dominating that need is. In other words, when several needs are active, the lowest need will be most compelling. The higher order needs emerge only when the lower level needs are satisfied. The first four levels are considered deficiency or deprivation needs ("D-needs") in that their lack of satisfaction causes a deficiency that motivates people to meet these needs. For instance the Physiological needs which are at the lowest level on the hierarchy, include necessities such as air, food, and water. These tend to be satisfied for most people, but they become predominant when unmet. During emergencies, safety needs such as health and security rise to the forefront. Once these two levels are met, belongingness needs, such as obtaining love and intimate relationships or close friendships, become important. The next level, esteem needs, include the need for recognition from others, confidence, achievement, and self-esteem. The highest level is self-actualisation, or the self-fulfilment. Behaviour in this case is not driven or motivated by deficiencies but rather one's desire for personal growth and the need to become all the things that a person is capable of becoming (Maslow, 1970). Now we will discuss each level of needs one by one : The lowest level in the Maslow's hierarchy is the physiological needs. These include the most basic needs that are vital to survival, such as the need for water, air, food and sleep. Maslow believed that these needs are the most basic and instinctive needs in the hierarchy because all needs become secondary until these physiological needs are met. These needs are such that if they are not satisfied the organism dies. If the threat of dying because of perturbation of the physiological equilibrium has vanished, the organism can direct its attention to more indirect threats, such as the danger of being caught by a predator, and try to avoid them. The next needs in the hierarchy are safety needs. These include needs for safety and security. Security needs are important for survival, but they are not as demanding 150 _____ NSOU I PGSW-VI as the physiological needs. Examples of security needs include a desire for steady employment, health insurance, safe neighbourhoods and shelter from the environment. At the third level of the hierarchy are belongingness needs. These include needs for belonging, love and affection. Maslow considered these needs to be less basic than physiological and security needs. Relationships such as friendships, romantic attachments and families help fulfill this need for companionship and acceptance, as does involvement in social, community or religious groups. At the fourth level of hierarchy are self-esteem needs After the first three needs have been satisfied, esteem needs becomes increasingly important. Maslow noted two versions of esteem needs, a lower one and a higher one. The lower one is the need for the respect of others, the need for status, recognition, fame, prestige, and attention. The higher one is the need for self-respect, the need for strength, competence, mastery, self-confidence, independence and freedom. These needs rank higher because it rests more on inner competence won through experience. Deprivation of these needs can lead to an inferiority complex, weakness and helplessness. Satisfaction of the self-esteem need leads to feelings of self-confidence, worth, strength, capability and adequacy of being useful and necessary in the world. These feelings in turn give rise to either basic discouragement or else compensatory or neurotic trends. An appreciation of the necessity of basic self-confidence and an understanding of how helpless people are without it, can be easily gained from a study of severe traumatic neurosis The highest level need is self-actualisation. "What a man can be, he must be". This forms the basis of the perceived need for self-actualisation. This level of need pertains to what a person's full potential is and realising that potential. Maslow describes this desire as the desire to become more and more what one is, to become everything that one is capable of becoming. This is a broad definition of the need for self-actualisation, but when applied to individuals the need is specific. For example one individual may have the strong desire to become an ideal parent, while for another it may be expressed athletically, and in the third it may be expressed in painting, pictures, or inventions. As mentioned earlier, in order to reach a clear understanding of this level of need one must first not only achieve the previous needs, physiological, safety, love, and esteem, but master these needs. Below are Maslow's descriptions of the consequences that what will happen if these needs are not satisfied.

NSOU I PGSW-VI _____ 151 Image : Maslow's Hierarchy of Needs

Deficiency Needs It has been stated in the earlier discussion that the first four levels of needs are called deficit needs, or D-needs. If you don't have enough of something, then it is said that you have a deficit that is you feel the need. But if you get all you need, you feel nothing at all! In other words, they cease to be motivating. He also talks about these levels in terms of homeostasis. Homeostasis is the principle by which the bodily system (thermostat) operates. In other words, when it gets too cold, the thermostat switches the heat on and when it gets too hot, it switches the heat off. In the same way, human body, when it lacks a certain substance, develops a hunger for it; when it gets enough of it, then the hunger stops. Maslow simply extends this homeostatic principle to needs, such as safety, belongingness, and esteem about which we do not ordinarily think of in these terms. In terms of overall development, we move through these levels a bit like stages. As newborns, our focus (if not our entire set of needs) is on the satisfaction of the physiological needs. Soon, we begin to recognise that we need to be safe. Soon after that, we crave attention and affection. A bit later, we look for self-esteem. Mind you, this is in the first couple of years! Under stressful conditions, or when survival is 152 _____

98%

MATCHING BLOCK 50/127

W

threatened, we can “regress” to a lower need level. When you find that your great career falls flat, you might seek out a little attention. When your family decides to leave you, it seems that love is again all you ever wanted. If you have significant problems along your development, that is a period of extreme insecurity such as hunger as a child, or the loss of a family member through death or divorce, or significant neglect or abuse, it is possible that one may “fixate” on that set of needs for the rest of one’s life. Growth Needs Maslow has used a variety of terms to refer to the last level of needs. He has called it growth motivation (in contrast to deficit motivation). They are called the being needs (or B-needs, in contrast to D-needs), and self-actualisation. These are needs that do not involve balance or homeostasis. They involve the continuous desire to fulfill potentials, to “be all that you can be”. If you want to be truly self-actualising, you need to have your lower needs taken care of, at least to a considerable extent. This makes sense, which is if you are hungry, you are scrambling to get food; if you are unsafe, you have to be continuously on guard; if you are isolated and unloved, you have to satisfy that need; if you have a low sense of self-esteem, you have to be defensive or compensate. When lower needs are unmet, you cannot fully devote yourself to fulfilling your potentials. The question becomes, of course, what exactly Maslow means by self-actualisation. To answer that, we need to look at the kind of people he called self-actualised persons. Fortunately, he did this for us, using a qualitative method called biographical analysis. He began by picking out a group of people, some historical figures, some people he knew, whom he felt clearly met the standard of self-actualisation. Included in this august group were Abraham Lincoln, Thomas Jefferson, Albert Einstein, Eleanor Roosevelt, Jane Adams, William James, Albert Schweitzer, Benedict Spinoza, and Aldous Huxley, plus 12 unnamed people who were alive at the time Maslow did his research. He then looked at their biographies, writings, the acts and words of those he knew personally, and so on. From these sources, he developed a list of qualities that seemed characteristic of these people, as opposed to the great mass of us. Characteristics of Self-Actualisers According to Maslow, people who are self-actualised, were: 1) Reality-centred, which means they could differentiate what is fake and dishonest from what is real and genuine?

NSOU | PGSW-VI _____ 153 2)

99%

MATCHING BLOCK 51/127

W

Problem-centred, meaning they treated life’s difficulties as problems demanding solutions, not as personal troubles to be railed at or surrendered to. 3) Had a different perception of means and ends. They felt that the ends do not necessarily justify the means, that the means could be ends themselves, and that the means, that is the journey was often more important than the ends. 4) Had different ways of relating to others. First, they enjoyed solitude, and were comfortable being alone. And they enjoyed deeper personal relations with a few close friends and family members, rather than more shallow relationships with many people. 5) Enjoyed autonomy, a relative independence from physical and social needs. 6) Resisted enculturation, that is, they were not susceptible to social pressure to be “well adjusted” or to “fit in”. They were, in fact, nonconformists in the best sense. 7) Had an unhostile sense of humor. They preferred to joke at their own expense, or at the human condition, and never directing their humor at others. 8) Had a quality of acceptance of self and others, by which he meant that these people would be more likely to take you as you are than try to change you into what they thought you should be. This same acceptance applied to their attitudes towards themselves: If some quality of theirs wasn’t harmful, they let it be, even enjoying it as a personal quirk. 9) They were often strongly motivated to change negative qualities in themselves that could be changed. 10) They possessed qualities such as spontaneity and simplicity. 11) They preferred being themselves rather than being pretentious or artificial. 12) They had a sense of humility and respect towards others — something Maslow also called democratic value. 13) They had a quality Maslow called human kinship, that is social interest, compassion, and humanity. 14) were strong in their ethical behaviours. 15) They were spiritual but never conventionally religious in nature. 16) They had a certain freshness of appreciation, an ability to see things, even ordinary things, with wonder. 17) They had the ability to be creative, inventive, and original. 18) They tended to have more peak experiences than the average person. A peak 154

MATCHING BLOCK 52/127

W

experience is one that takes you out of yourself, that makes you feel very tiny, or very large, to some extent one with life or nature or God. It gives you a feeling of being a part of the infinite and the eternal. These experiences tend to leave their mark on a person, change them for the better, and many people actively seek them out. They are also called mystical experiences, and are an important part of many religious and philosophical traditions. Maslow did not however think that self actualised persons were perfect. There were several flaws or imperfections he discovered along the way as well. These were as given below: 1) They often suffered considerable anxiety and guilt. These anxiety and guilt were realistic ones rather than misplaced or neurotic versions. 2) Some of them were absent minded and overly kind. 3) Also some of them had unexpected moments of ruthlessness, surgical coldness, and loss of humor. 4) Maslow also stated that when a self actualised person does not get their needs fulfilled, they respond with metapathologies. That is they respond with a list of problems. 5) When forced to live without these values, the self-actualiser develops depression, despair, disgust, alienation, and a degree of cynicism. Evaluation Maslow has been a very inspirational figure in personality theories. In the 1960's in particular, people were tired of the reductionist, mechanistic messages of the behaviourists and physiological psychologists. They were looking for meaning and purpose in their lives, even a higher, more mystical meaning. Maslow was one of the pioneers in that movement to bring the human being back into psychology and the person back into personality. Moreover, Maslow's unique contribution lies in his preoccupation with healthy people rather than sick ones and his feeling that studies of two groups generate different types of theory. Maslow chose the more direct course of studying healthy people whose wholeness and unity of personality are readily apparent. But in spite of this unique contribution Maslow's theory has been criticized on many grounds. The most common criticism concerns his methodology: Picking a small number of people that he himself declared self-actualising, then reading about them or talking with them, and coming to conclusions about what self-actualisation is in the first place does not sound like good science to many people. Another criticism is that Maslow placed certain constraints on self-actualisation.

NSOU | PGSW-VI _____ 155 First,

Kurt Goldstein and Carl Rogers used the phrase to refer to what every a living creature does, that is to try to grow, and to fulfill its biological destiny. Maslow limits self actualisation to be achieved only by about two percent of the human species, while most do not achieve this. While Rogers felt that babies were the best examples of human self-actualisation, Maslow saw it as something achieved only rarely by the young. Another criticism is that we take much take care of our lower needs before self actualisation comes to the forefront. And yet we can find many examples of people who exhibit least aspects of self-actualisation and were far from having their lower needs taken care of. Many of our best artists and authors, for example, suffered from poverty, bad upbringing, neuroses,

98%

MATCHING BLOCK 53/127

W

and depression. 6.3 Carl Rogers's Theory of Personality Carl Rogers was born on January 8, 1902, in Oak Park, Illinois. Raised on a farm from the age of twelve, Rogers entered the Agricultural College of the University of Wisconsin in 1919, where he graduated with a degree in history. While in college he felt a religious calling and eventually began training to become a Protestant minister, and after graduating in 1924 he enrolled at the Union Theological Seminary in New York City. From there he transferred to Teachers College at Columbia University in order to pursue counseling rather than the strictly religious aspect of his ministerial profession. He subsequently focused on clinical and educational psychology, writing his doctoral dissertation on personality adjustment in children. Throughout the 1930s, Rogers worked in the field of child psychology, and in 1940 he accepted a position as a professor of psychology at Ohio State University. It was at this time that he began to develop the theories and methodology for which he would later become renowned. The incipient concepts of Rogers's therapeutic approach appeared in his 1942 book Counseling and Psychotherapy, and within the next few years he developed his concept of the self as the organising element in human personality and the principles of the "nondirective," or client-centered, style of therapy. In 1945 he took a position as professor of psychology and head of the counseling center at the University of Chicago, where, over the next twelve years, he further refined and articulated his 156

W

ideas, publishing Client-Centered Therapy (1951) during this time. A charismatic figure, Rogers's influence over students, colleagues, and various collaborators, as well as his publication of best-selling books such as *On Becoming a Person* (1961) and *Person to Person* (1967) made him the central figure in American humanistic psychology throughout his lifetime. Carl Rogers was not only one of the founders of the Humanistic Approach, but also arguably the most influential therapist in the 20th century. Rogers's theory is basically phenomenological, in that it placed a strong emphasis on the experience of the person, their feelings, their values, and all that is summed up by the expression "inner life". His theory is also known as self-theory. The other name of his theory is person-centered theory. His theory grew out of his own experience in working with individual in the therapeutic relationship. In terms of his theory, there are two fundamental ideas which are particularly worth noting. First, Rogers talked about healthy development in terms of how individuals perceived their own being. Healthy individuals will tend to see congruence between their sense of who they are (self) and who they feel they should be (ideal self). While no one tends to experience perfect congruence at all times, the relative degree of congruence is an indicator of health. The second fundamental idea is Rogers's concept of the conditions for healthy growth, and the role of a therapist in fostering healthy growth. Through a process Rogers called person-centered therapy; the therapist seeks to provide empathy, openness, and unconditional positive regard. Rogers called his technique nondirective therapy, based on the concept that the therapist is simply a "mirror" who reflects the individual's thoughts and feelings. Rogers's theory can be explained under the following three headings: 1) Enduring aspects of personality 2) Self-actualisation 3) Development of self

6.4 Maslow Theory of Personality

Enduring Aspects of Personality Rogers' theory of personality evolved out of his work as a clinical psychologist and developed as an offshoot of his theory of client-centered (later called person-centered) therapy. Since the main aim of his theory is to explain the growth and development within the individual, so his theory does not appear to lay much emphasis on personality development, rather prefer to devote his attention to such constructs that are of fundamental importance to his theory. These are: (i) the organism and (ii) the self.

W

The Organism Rogers approach to the study of persons is phenomenological and idiographic. His view of human behaviour is that it is "exquisitely rational". Furthermore, in his opinion: "the core of man's nature is essentially positive" and he is a "trustworthy organism". According to Rogers the organism is the locus of all experience, including everything potentially available to awareness, at any given moment. The totality of experience constitutes the phenomenal field. The phenomenal field is the individual's frame of reference that can only be known to the person. It can never be known to another, except through empathetic experience and at that level too, can never be known perfectly. Rogers emphasised that the individual's way of behaving depends upon the phenomenal field (subjective reality) and not upon the stimulating conditions (external reality). The phenomenal field at any given moment is made up of conscious and unconscious experiences. The person tends to check his or her experiences against the reality. This testing of reality provides with dependable knowledge of the world so that one is able to behave realistically. In most of the cases the person accepts his or her experiences as true representation of reality, while in reality they may not be the true representation. As a result the person may develop misconceptions about himself/herself and about the external world.

The Self (Real and Ideal) Rogers developed one of the most systematic models of self, in relation to the personality-functioning. The self or self-concept, is one of the central concepts in his theory, and the theory is often referred to as the self-theory of personality. Rogers defined self as the organised, consistent, conceptual gestalt composed of perceptions of the characteristics of the "I" or "me", and the perception of the relationship "I" or "me" to various aspects of life, together the values attached to those perceptions. In short, it is one's picture of him or hers. Rogers further distinguishes two aspects or subsystems of self: The real self and the ideal self. The real self is the "you" that, if all goes well, you will become, while the ideal self is what the person would like to be. By ideal, Rogers is suggesting something not real, something that is always out of our reach, the standard we can not meet. Thus, Rogers's personality theory distinguishes between two personalities. The real self, which is created and developed through the actualising tendency, it is the self that one can become. The demands of society, however, do not always support the actualising tendency and we are forced to live under conditions that are out of step with our tendencies. The ideal self is the

NSOU | PGSW-VI

ideal created through the demands of society. Rogers does not see it as something to strive for (that is the real self) but an ideal imposed on us we can never fully reach. Rogers' view of 'hidden' personality relates to the person one could be given the right circumstances within society and for an individual to be truly happy (and for self-actualisation to be realised) their public and private selves must be as similar as possible. For an individual to be truly happy and for self-actualisation to be realised, the public and hidden selves must be as similar as possible. Rogers believed that when all aspects of a person's life, surroundings and thoughts are in harmony then the ideal state of congruence is reached (Pervin & Oliver 1997). Congruity and Incongruity

The importance of the concept of organism and self, in Rogers theory becomes clear when we examine the idea of congruence and incongruence between this self as perceived, and the self as actually experienced by the organism. When the symbolised experiences that constitute the self, faithfully mirror the experiences of the organism, the self and organism are said to be congruent, that is the individual is believed to be adjusted, mature and fully functioning. Otherwise, there would be incongruence. According to Rogers, most of the ways of behaving that are adopted by the organism are those that are consistent with the concept of self. In some instances, behaviour may be brought about by organic experiences and needs which have not been symbolised. Such behaviour may be inconsistent with the structure of the self but in such instances the behaviour is not "owned" by the individual. Rogers suggests that the incongruent individual who is always on the defensive and cannot be open to all experiences is not functioning ideally and may even be malfunctioning. They work hard at maintaining/protecting their self concept. Because their lives are not authentic this is a difficult task and they are under constant threat. They deploy defense mechanisms to achieve this. He describes two mechanisms: distortion and denial. Distortion occurs when the individual perceives a threat to their self concept. They distort the perception until it fits their self concept. This defensive behaviour reduces the consciousness of the threat but not the threat itself. And so, as the threats mount, the work of protecting the self concept becomes more difficult and the individual becomes more defensive and rigid in their self structure. If the incongruence is immoderate this process may lead the individual to a state that would typically be described as neurotic. Their functioning becomes precarious and psychologically vulnerable. If the situation worsens it is possible that the defenses cease to function altogether and the individual becomes aware of the incongruence of their situation. Their personality becomes disorganised and bizarre; irrational behaviour, associated with earlier denied aspects of self, may erupt uncontrollably. Thus, it may be concluded that psychological adjustment exists when the concept of the self is such that all the sensory and visceral experiences of the organism are,

NSOU | PGSW-VI _____ 159

or may be, assimilated on a symbolic level into a consistent relationship with the concept of self. Psychological maladjustment exists when the organism denies awareness of significant sensory and visceral experiences, which consequently are not symbolised and organised into the gestalt of the self structure. When this situation exists, there is a basic or potential psychological tension. Any experience which is inconsistent with the organisation of the structure of the self may be perceived as a threat, and the more of these perceptions there are, the more rigidly the self structure is organised to maintain itself. Self-Actualisation According to Rogers, only the single motive is there that impels human beings to action, and that motive can be described as the actualising tendency. Rogers (1959) maintains that the human "organism" has an underlying "actualising tendency", which aims to develop all capacities in ways that maintain or enhance the organism and move it toward autonomy. This tendency is directional, constructive and present in all living things. The actualising tendency can be suppressed but can never be destroyed without the destruction of the organism (Rogers, 1977). The concept of the actualising tendency is the only motive force in the theory. It encompasses all motivations; tension, need, or drive reductions; and creative as well as pleasure-seeking tendencies (Rogers, 1959). Only the organism as a whole has this tendency, parts of it (such as the self) do not. Maddi (1996) describes it as a "biological pressure to fulfill the genetic blueprint". Each person thus has a fundamental mandate to fulfill one's potential. This tendency is selective, and pays attention only to those aspects of the environment which promises to move the person constructively, in the direction of fulfillment and wholeness. Therefore, as already stated, the single motivating force is 'the self-actualisation drive' and single goal of life is 'to become selfactualised'. The Development of Self Rogers, unlike Freud, Sullivan, and Erikson, did not try to propose a stage theory of personality development. In other words, Rogers did not explain the personality development in steps or stages; rather he emphasised the importance of congruence between the self of the person and his experiences in the development of personality. Adjustment and psychological health have also been explained in terms of realistic self-concept that is congruent with self. Rogers maintained that unless we are taught inappropriately by those whose love we need, our self-concept is based on our own perceptions, and fits well with our experiences. If we are taught 160 _____

NSOU | PGSW-VI

to have a self-concept that does not match what we actually experience, we are going to have difficulty. For example, you might learn that nice people never get angry and then find yourself in a situation in which you are insulted; your self-concept does not allow you to perceive your feeling of anger accurately. The greater the discrepancy between our self and our experiences, the greater the maladjustment and anxiety, and the harder we must reconcile what we believe ourselves and what we encounter in the world around us. Rogers also suggests that if there is a large self-experience discrepancy, and if there is no way to avoid all of the relevant experiences, the defensive system may be unable to handle anxiety; it may breakdown and result in a disorganisation of personality. Early in our lives, we each have direct experience with pleasure and pain; for example, we obviously learn that it is good to eat and bad to be hungry, good to be in mother's arm and bad to touch a hot stove and so on. Beyond these simple physical reactions, there is a need for positive regard. That is, we want to be loved and respected as individuals. Our parents tend to be the primary source of love and affection, and it is desperately important to maintain their good will. We want them to praise us, say that we are good, and express positive feelings toward us. When we do something they dislike and they let us know it, the experience is painful one. We strive to alter our behaviour to get back in their good graces. The crucial problem occurs when the beliefs, values, and perceptions of parents do not fit the child's experiences and feelings. Let us look at an example of the process. A three year old boy is upset when his mother gives birth to a second baby. He must share love and attention with the new addition, be quiet when the baby is sleeping and so on. From the brother's perspective, the situation involves rejection and loss of status: most likely he feels not only depressed but hostile. The obvious target of his hostility is the new sister. One day his mother finds him deliberately pinching the sister's arm to make her cry. What does the mother do? Her decision at this point is described by Rogers as a critical one in the development of the boy's self-concept. The usual response of the mother will be to punish the child and reject him because of his hostility and force him to love his sister. The conflict for the boy is clear. Since the need for mother's love is vitally important, so he may alter his self-concept to conform to what the mother wanted. In this case, the mother's reaction might serve to help give this child a self-concept, inconsistent with his experiences. Rogers recognised the three crucial points for the parents to keep in mind. 1) First, the child's feeling must be recognised and accepted. 2) Second, the mother should avoid threatening the child with the most threatening punishment of all – loss of love. 3) Third, the hostile behaviour must be clearly and unmistakably rejected and prevented.

NSOU I PGSW-VI_____ 161

Evaluation The person-centered approach, being the unique approach to understanding personality and human relationships, found wide application in various domains such as psychotherapy and counseling, organisations, and other group settings. Rogers's greatest contribution may lie in his encouraging a humane and ethical treatment of persons, approaching psychology as a human science rather than a natural science. Rogers's person-centered approach has been criticised on many grounds. The most important being the charge that many psychologists tend to impose their views based upon naïve phenomenology. For instance, Rogers accepted client's statement to be always true and reliable, when self-reports normally lack credibility. Rogers has also been criticised for ignoring unconscious determinants of behaviour, attested by psycho-analytic investigators over a long period. It is also criticised on the ground that the theory deals only with surface issues and does not explore deeper areas. 6.5

The central theme in humanistic and self theories is the drive towards self actualisation, to realise one's full potential. Other themes include personal growth, openness to experience, living in the present, personal responsibility, and inherent goodness of people. For the humanists, the unit of analysis is "perceived reality". Probably the best known proponent of this approach is Abraham Maslow. Maslow proposes a model of how a happy, healthy, well-functioning person behaves, which is based on concrete observations of real people, rather than on formulating ideal requirements. Moreover Maslow proposes a simple and intuitively appealing theory of motivation, which explains where such a "self-actualising" personality comes from. Maslow's theory can be explained in terms of Hierarchy of needs, deficiency needs, growth needs and characteristics of self-actualising persons. Maslow proposed a theory of human motivation based on hierarchy of needs. The lower a need in the hierarchy the more prepotent or dominating that need is. In other words, when several needs are active, the lowest need will be most compelling. The higher order need emerge only when the lower level needs are satisfied. The first four levels are considered deficiency or deprivation needs ("D-needs") in that their lack of satisfaction causes a deficiency that motivates people to meet these needs. Physiological needs, the lowest level on the hierarchy, include necessities such as air, food, and water. These tend to be satisfied for most people, but they become 162 _____ NSOU I PGSW-VI predominant when unmet. During emergencies, safety needs such as health and security rise to the forefront. Once these two levels are met, belongingness needs, such as obtaining love and intimate relationships or close friendships, become important. The next level, esteem needs, include the need for recognition from others, confidence, achievement, and self-esteem. The highest level is self-actualisation, or the self-fulfillment. Behaviour in this case is not driven or motivated by deficiencies but rather one's desire for personal growth and the need to become all the things that a person is capable of becoming. In order to study the characteristics self-actualisers of Maslow studied a group of people, whom he felt clearly met the standard of self- actualisation. Using a qualitative method called biographical analysis; he developed a list of qualities that seemed characteristic of the self-actualisers, as opposed to the great mass of us. Rogers's theory, also known as self-theory, is basically phenomenological, in that it placed a strong emphasis on the experience of the person, their feelings, their values, and all that is summed up by the expression "inner life". His theory grew out of his own experience in working with individual in the therapeutic relationship

Along with this the learners will know about the aspects of nutrition and indigenous system of medicine (ISM). 7.2 Introduction Mahatma Gandhi in one of his famous speech which he delivered on 1948 said: "It is health that is real wealth and not pieces of gold and silver". By this statement Gandhi ji probably wanted to convey that health is much more important than any valuable or monetary wealth, and a society can never progress until its members are healthy. The word "health" is derived from an old English word, "hale", which means "wholeness, being whole or sound." There are several etymological meanings, which have evolved gradually over the time. Some of the definitions focuses on biomedical aspects: were health is seen as the ability of the body to carry out its biological functions and any disruption in these functions is viewed as a disease.

India is one of the fastest growing economies of the world. The very essential components of primary health care— promotion of food supply, proper nutrition, safe water and basic sanitation and provision for quality health information concerning the prevailing health problems – is largely ignored. Access to healthcare services, provision of essential medicines and scarcity of doctors are other bottlenecks in the primary health care scenario Thus in

this unit we will try to know in detail about health and hygienic practices. 7.3 Concept of Health The concept of health envisages everything related to treatment, healing or coping up with disease. World Health Organization (WHO) in 1948, stated: "Health is a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity". This definition promoted for the first time that, in addition to physical and mental health, social welfare is an integral component of the overall health, because health is closely linked to the social environment and living and working conditions. Thus this definition emphasizes the importance of both mental and social wellbeing. However, although comprehensive, the WHO definition of health did invite some criticism, due to the inclusion of the term "Complete", which made it difficult to measure. Questions were raised over whether it is even possible for a person to be without any physical, mental or social challenges. Smith argues that this prerequisite for completeness would mean many would be unhealthy most of the time. In 1982, Stokes, Noren and Shindell defined health as: "A state characterized by anatomic, physiologic, and psychological integrity; an ability to perform personally valued family, work, and community roles; an ability to deal with physical, biologic, psychological, and social stress." Thus, for one to be healthy, one needs to be in perfect physical, psychological and social state. Interestingly, this definition introduces the concept of resilience, whereby health is not an absolute state of well-being as previously described, but also a means of coping with stressors experienced by an individual. It therefore follows, that health is determined by a person's physical, psychological, social, religious and economic environment.

NSOU ? PGSW-VI _____ 167 Public Health The art and science of preventing disease, prolonging life, and promoting physical and mental health, sanitation, personal hygiene, control of infectious diseases, and organization of health services can be termed as Public Health. The various activities within the community which are important in the promotion of health and the prevention and treatment of disease, may be included in the domain of public health. Everything which includes right from ensuring clean and safe drinking water, nutritious food to eat, pollution free air to breathe, and easy access to a wide range of services to promote human health, from immunization and other crucial health care service to the public is what is known as Public Health. The sociology of health encompasses social epidemiology, disease, mental health, disability, and medicalization. The principle insight of sociology is that health and illness cannot be simply regarded as biological or medical phenomena. They are perceived, organized, and acted on in a political, economic, cultural, and institutional context. Moreover, the way that we relate to them is in constant evolution. As we learn to control existing diseases, new diseases develop. As our society evolves to be more global, the way that diseases spread evolves with it. Sociologists may also understand these issues more fully by considering them through one of the main theoretical perspectives of the discipline. The functionalist perspective is a macroanalytical perspective that looks at the big picture, focusing on the way that all aspects of society are integral to the continued health and viability of the whole. For those working within the functionalist perspective, the focus is on how healthy individuals have the most to contribute to the stability of society. Functionalists might study the most efficient way to restore "sick" individuals to a healthy state. Sociologists may also understand these issues more fully by considering them through one of the main theoretical perspectives of the discipline. The functionalist perspective is a macroanalytical perspective that looks at the big picture, focusing on the way that all aspects of society are integral to the continued health and viability of the whole. For those working within the functionalist perspective, the focus is on how healthy individuals have the most to contribute to the stability of society. Functionalists might study the most efficient way to restore "sick" individuals to a healthy state. If sociology is the systematic study of human behaviour in society, medical sociology is the systematic study of how humans manage issues of health and illness, disease and disorders, and health care for both the sick and the healthy. Medical sociologists study the physical, mental, and social components of health and illness. Major topics for medical sociologists include the doctor-patient

168 _____ NSOU ? PGSW-VI relationship, the structure and socioeconomics of health care, and how culture impacts attitudes toward disease and wellness. The social construction of health is a major research topic within medical sociology. At first glance, the concept of a social construction of health does not seem to make sense. After all, if disease is a measurable, physiological problem, then there can be no question of socially constructing disease, right? Well, it's not that simple. The idea of the social construction of health emphasizes the socio-cultural aspects of the discipline's approach to physical, objectively definable phenomena. Sociologists Conrad and Barker (2010) offer a comprehensive framework for understanding the major findings of the last 50 years of development in this concept. Their summary categorizes the findings in the field under three subheadings: the cultural meaning of illness, the social construction of the illness experience, and the social construction of medical knowledge.

7.4 Hygiene: personal and environmental According to Jennie Naidoo and Jane Wills (1994) physical health concerns the body whereas mental health concerns the ability to think and make judgements and spiritual health is the recognition and ability to put into practice moral or religious principles or beliefs. Good physical health means a state of well-being without any disease or illness To achieve better physical health and maintain it once it is achieved, human beings must feed their body with nutritious foods and drinks, attend regular exercise sessions, avoid harmful behaviors and substances like taking drugs or consuming tobacco, and protect him or her from accidents. Mental health refers to emotional , intellectual and mental states which refer ability to think and learn from experience of life, being flexible and open to new ideas, and the ability of one to question and evaluate information and thoughts and feelings Good mental health- helps in getting awareness of and in accepting a wide range of feelings in him/her and others, expressing emotions, functioning independently and coping with the challenges of daily stressors, An individual with good mental health generally be able to make right decisions, set realistic and challenging goals in life, and be able to handle a problem wisely. The essential component of spiritual health is a belief that a higher power in the universe gives greater significance to individual life. People with good spiritual health identify their own basic purpose in life : learn how to experience love, joy, peace and fulfilment: and help themselves and others achieve their full potential.

NSOU ? PGSW-VI _____ 169 They concern themselves with, "giving, forgiving and attending to others' needs before one's own needs." Roger Smith, Michigan State University ([http://www.msjc.edu/hs/www/health overview, html](http://www.msjc.edu/hs/www/health%20overview.html) 7.4.1 Concept of Hygiene Hygiene is a science of the establishment and maintenance of health and conditions of practices (as of cleanliness) conducive to health (Merri am-Webster Online Dictionary). Hygiene is the science of preventive medicine and the preservation of health. The word hygiene came from the name of Hygeia, the daughter of Asklepios, the Greek god of medicine (whose staff with entwined snake is the symbol of medicine). Asklepios (known to the Romans as Aesculapius) had a number of children including not only Hygeia but also Panaceaia, the patroness of clinical medicine. Hygeia also followed her farther into medicine. As the patroness of health, hygeia was charged with providing a healthy environment to prevent illness In Greek, "hygieia" means health (<http://www.medtenns.com/script/main/art.asp?articlekey=7324>). Wikipedia gave following points about hygiene- ? Hygiene is the maintenance of healthy practices. In modern terminology, this is usually regarded as a particular reference to cleanliness. ? Outward signs of good hygiene include the absence of visible dirt (including dust and stains on clothing) or of bad smells. Since the development of the germ theory of disease, hygiene has come to mean any practice leading to the absence of harmful levels of bacteria. ? Good hygiene is an aid to health, beauty, comfort, and social interactions It directly aids in disease prevention and/or disease isolation. (That is, good hygiene will help keep you healthy and thus avoid illness. If you are sick, good hygiene can reduce your contagiousness to others) 7.4.2 Personal Hygiene It is a fact that good health has direct link with the personal hygiene, environmental cleanliness, life style and health practices. Guy Howard et al (2002) stated that personal hygiene is essential for improving health. For example, if injuries and minor cuts are not kept clean, they may become infected and lead to further health problems. And even though water supplies and sanitation facilities may be constructed in a community, unless people use these facilities properly and wash

170 _____ NSOU ? PGSW-VI their hands after defecation, store water safely, bathe, and clean clothes and utensils properly, diseases caused by poor water and sanitation still exist. Regular hand-washing is necessary to prevent the spread of infectious diseases. There are five ways diseases are transmitted by contaminated hands. ? Hand to food ? Infected hands to other hands ? Food to hands to ready-to-eat food ? Nose, mouth, or eyes to hands ? Food to hands to person Hence human beings should trimmed their nails regularly and washed their hands with soap and water after defecating, after cleaning a child who has defecated and before eating or handling food. Regular bathing and laundering is necessary to prevent hygiene -related diseases like scabies, ringworm, trachoma (an illness that can cause blindness and other eyesight problems), conjunctivitis, etc. Due to poor hygiene of teeth and mouth cavity in the tooth occurs. Foul breath is sometimes the end result of the same. Brushing the teeth twice daily is needed to keep the teeth clean and gums healthy. 7.4.3 Environmental Hygiene Environmental hygiene includes water source protection, proper disposal of solid waste and excreta, wastewater drainage, controlling animal rearing and market hygiene. Every individual in a given community can play an important role in environmental hygiene and have a responsibility to keep the environment clean. UNDP and WHO (1994) prepared golden rules for safe water, Some of them are as follow- ? No one should defecate or urinate near or in a source of drinking or bathing water; ? Keep animals away from water collection areas; ? Water for drinking must always be boiled or chlorinated, covered against flies and dust. Germs causing diarrhoea will be killed or inactivated when water begins boiling rapidly, or when it is chlorinated If the water is very cloudy it should be filtered before chlorination. ? Keep drinking water in as clean container Be sure hands do not touch the

NSOU ? PGSW-VI _____ 171 water inside. Cover the container to keep water free from insects and dust. Clean the container and change the water regularly. Storage of household garbage, dirt materials, dusts etc. in and around the household may be the breeding ground of flies and mosquitoes. Open drains, puddles of water in the streets, collection of cow dung, and kitchen waste are also regarded as dangerous for environmental hygiene. 7.4.4 Sexual Hygiene Sexual hygiene is a presentation of the laws of sexual right-living. It is a branch of hygiene concerned with sexual behavior as they relate to individual and community well-being (Random House Unabridged Dictionary). Good sexual hygiene includes : ? Always wiping from front to back after a defecating or urinating. ? Keep the skin around and between the rectum and vagina clean by washing with soap and water at least once daily. However, too much soap may irritate the sensitive skin, ? Women who wash both before and after sexual intercourse may lower their risk, of developing a urinary tract infection. ? Change the undergarments regularly. ? Keep the pubic hair short. ? After urinating one should cleaned the fore skin by pulling it. ? In the time of menstruation only a clean, washed and sun-dried cloth should be used if disposable sanitary napkins are not available, 7.4.5 Home Sanitation According to Brian Appleton and Dr. Cliristine van Wijk health benefits form home sanitation facilities are as follows. ? 36% reduction in incidence of diarrhoea from improved excreta disposal; ? 30% reduction in incidence of diarrhoea in children (3-36 months) in households with flush toilets ; ? 15% in incidence of diarrhoea in children (3-36 months) in households with pit latrines, ? 40% reduction of children with stunted growth in households with flush toilets.

172 _____ NSOU ? PGSW-VI ? 26% reduction of children with stunted growth in households with pit latrines; ? Among illiterate mothers, a 7-fold larger reduction in child mortality than with a better water supply. Jan Davis et al. remarked that where there is no improved from the sanitation, many people practice what has been called; open-field defecation. Custom may dictate location and the areas which men and women use. Children may defecate in or near the household yard. Some of these traditional sanitation practices are uncontrolled and can pose serious health risks. Improved sanitation aims to contain and safely dispose of human excreta. Defecating in open places spreads harmful germs which intern causes diseases. Open defecation is the major cause of hookworm and round worms in the children. as the larvae of these worms get mingle with the soil and enter through the sole of the foot wliile walking bare-footed. Hence every household should have a sanitary latrine. Government of India is porviding support to the households in need to build sanitary units in their respective households with low cost through Total Sanitation Campaign. Local Panchayat Samity and Sanitary Mart should be contacted for construction of latrine. Privacy is another important reason to promote home sanitation. Generally women in the villages are waiting for the darkness to defecate in order not to be seen by others causes health problems. In the time of pregnancy and menstruation they also face difficulty to go out in the fields to defecate. Having a home sanitary facility is convenient to all the family members in general and women children and older persons in particular. 7.4.6 First Aid First aid is the immediate and temporary aid provided to a sick or injurned person until medical treatment can be provided. It generally consists of series of simple, life saving medical techniques that a non-doctor or lay person can be trained to perform with minimal equipment (Wikipedia). The following details will help the students to provide basic first aid in the time of emergency (on the basis of <http://www.wholesale-direct-fir5t-aid.conV Scripts/ page-asp/ idpage=20>).

NSOU ? PGSW-VI _____ 173 (A) Bleeding ? Keep victim lying down. ? Apply direct pressure using a clean cloth or sterile dressing directly on the wound ? Once bleeding is controlled, keep victim warm by covering with a blanket, continuing to monitor for shock, ? Wash your hands and cleanse the injured area with clean soap and water, then blot dry ? Apply antibiotic ointment to minor wound and cover with a sterile gauze dressing or bandage that is slightly larger than the acutal wound. (B) Eye Injuries ? Cover both eyes with sterile dressings or eye cups to immobilize. ? Covering both eyes will minimize the movement of the injured eye ? DO NOT rub or apply pressure, ice, or raw meat to the injured eye. ? If the injury is a black eye, you may apply ice to check and area around eye, but not on the eyeball itself. (C) Burns First Degree Burn : Skin will appear red and may be swollen or painful. Generally does not require medical attention. Second Degree Burn : Skin will appear red, blistered and swollen. May require medical attention. Third Degree Burn : Skin will be visibly charred and may be white. Usually very painful. Requires Medical Attention. Submerge burn area immediately in cool water until pain stops If affected area is large, cover with cool wet cloths. Do not break blisters if they are present. If pain persists but no medical assistance is needed, apply medicated first aid cream or gel and cover with sterile dressing If medical attention is needed, do not apply any cream Just cover with a dry, sterile dressing and seek medical help immediately. (D) Drowning ? Just squeeze the chest and abdomen of the person who are lying face down, in a periodic manner.

174 _____ NSOU ? PGSW-VI ? Perform mouth to mouth breathing keeping an eye on the chest movement of the person. ? Use the right hand on the top of the left (for left handed person just opposite) to massage the heart-it is slightly to the left of the mid-line Give heart message 40-60 times in a minute but not more than that. What do we mean by health? Give definition of health. 2. What do we mean by hygiene? Discuss about personal, environmental and sexual hygiene. 3. What are the importances of home sanitation in a village life? 4. Write a brief note on first aid services could be provided in the time of emergency.

NSOU ? PGSW-VI _____ 175 7.5 Concept of Nutrition Food is needed for human survival. Good nutrition promotes and maintains a nutritional status capacitates the people to grow well and enjoy good health. Health is the state of wellbeing of body and mind. The secret to good health is balanced nutrition Nutrition is obtained from food and helps in formation, maintenance and protection of health. The body organs receive nutrition from food and water and maintain their normal functioning and develop immunity against diseases. Optimal balance of nutrition enables optimal performance of the body. Earlier nutrition was considered as one of the element of health aspect recently, nutrition status of human being has been interpreted from the sociological point of view. Nutritional status determines the preventive health, mother and child health, family health, but socioeconomic factors like poverty, illiteracy, lack of awareness, unhealthy physical environment, and sanitation system have great impact on health Nutrition is required : 1. In maintenance of adequate energy level 2. In formation of body structure and in maintenance of normal functioning of muscles, bones and other organs and in building immunity and 3. In repair, protection and development of the system of organisms. 7.5.1 Elements of Nutrition There are six basic categories of nutrients: they are as follows ? Carbohydrates ? Protein ? Vitamin ? Fat ? Minerals and ? Water 7.5.2 Carbohydrates The body receives sufficient energy from the food enriched with carbohydrates. Carbohydrates provide energy for all the cells of human body. A 1 gram carbohydrate gives 4 calories. It is also helping the body for effective utilization of fats. In deficiency of carbohydrates, the body receives necessary energy from protein and fat. There are two types of carbohydrates found in foods. Simple carbohydrates, which

176 _____ NSOU ? PGSW-VI include the sugars that are found in milk, fruit and sweets, like cookies, rasogollas, candy, provide quick energy. Human body digests simple carbohydrates quickly and easily. Complex carbohydrates include fiber and starchy foods. This type of carbohydrate takes time to digest and gives slowly and gradually. A good source of complex carbohydrates is found in vegetables, potatoes, rice, flour, cereals and bread. 7.5.3 Fat Fat nutrients influence body function in various ways- ? In production and storage of energy and in balancing body temperature ? In absorbing shock and in protecting organs from decay ? In maintaining normal functioning of glands ? In transporting lipoprotein (a combination of fat, protein and other fat related substances) vitamin in natural occurrences of cholesterol in tissues. ? In maintenance of normal functioning of heart, intestine etc. 1 gram fat gives human body 9 calories. Human body receives fat from ghee, butter, milk, cheese, egg, meat, fish, groundnut, mustard, coconut, vegetable oils, etc. 7.5.4 Proteins Proteins are the important component of human diet. Proteins are made up of 20 different amino acids. These acids can combine in many different ways to produce different proteins. Essential amino acids are obtained from foods and non-essential amino acids are naturally produced in organisms. The utilities of proteins are the following- ? Protein nutrients help in formation, growth and repair of tissues and build up new tissues. Protein transport blood in cells through enzymes, hormones and hemoglobin ? In protection and maintenance of tissues, proteins are used ? Protein is used in generating energy in organism during deficiency of calories, ? Proteins are also necessary for synthesis of some substances like antibodies, hemoglobin, enzymes and hormones. ? Protein strengthens the immunity power of human body. Protein constitutes about 20% of the human body weight. Proteins are available from milk, egg, meat, fish, pulses, beans, peas, soya-beans, nuts, oilseeds and cereals.

NSOU ? PGSW-VI _____ 177 7.5.5 Vitamins Vitamin nutrients help in normal functioning of eye, heart and urinary tract, it is used to maintain normal functioning of glands, It is used in formation of bone structure and in development of immunity against diseases. Two types of vitamin nutrients are available from food- 1. Vitamin-A, D, E and K (fat soluble-they can be stored in th human body) 2. Vitamin-C, Bs, (water soluble-have to consume everyday as they cannot be stored in the human body) Vitamin A Bs C D E K What it Does promotes healthy teeth, bones & skin ; helps you see well helps body form energy, helps form red blood cells; promotes healthy nerves, skin & blood helps heal wounds and resist infection; promotes healthy bones and teeth, promotes healthy bones and teeth by helping the body to absorb and use calcium and phosphorous. helps form and protect body tissues helps blood clot Source fortified milk, eggs, carrots spinach, cantaloupe eggs, milk, whole grain breads & cereals, broccoli, beans strawberries, oranges, tomatoes, potatoes, fortified milk, eggs, tuna & salmon. vegetable oils, lettuce spinach broccoli, spinach Source: <http://Avwww.veggJe-mon.org/sUidents^VMnutritior^nutritionA^itamins.htm> 7.5.6 Mineral Mineral nutrients is the inorganic substances needed in formation of teeth, bones and in coagulation of blood, muscles contraction and maintenance of normal and haemoglobin. However, minerals are not in a position to control bodily functions as they are in small quantity in the human body But more than 50 mineral are found in the human body.

178 _____ NSOU ? PGSW-VI Source: <http://www.veggfle-mon.org/students/VMniitrition/nutrition/minerals.htm> 7.5.7 Water Water is one of the most important parts of human diet. Water is a useful ingredient required by human body for maintenance of normal functioning. All the metabolic reactions, working of cell take place in water substances in the organisms. Water helps in keeping the body temperature constant. Water is transporting things like nutrients, carbon dioxide, oxygen and hormones and keep human alive. Water aids in digestion and even keeps your eyes from drying out. Water is obtained through drinking water and food Here one must remember that drinking water is the source of germs like typhoid, cholera, worm, jaundice, diarrhoea, etc 7.5.8 Balance Diet A balanced diet means a diet with the following components- ? Energy yielding foods (carbohydrates, fats) ? Body-building foods (protein, minerals) and ? Protective foods (vitamins) in correct proportions. Balanced diet is an assurance to the individual that he or she is obtaining the minimum requirements of all the nutrients. The components of a balanced diet will differ according to age, sex, physical activity, economic status, occupation and the physiological state like pregnancy, lactation etc. Mineral Calcium Iron Magnesium Phosphorous Zinc What it Does promotes strong bones & teeth; helps muscles work helps blood carry oxygen helps muscles contract, aids nervous system promotes strong teeth & bones; takes part in cell activities (energy metabolism) helps wounds heal; needed for growth Source milk, yogurt, leafy green vegetables red meat, whole grain breads, beans, raisins, & spinach milk, vegetable, yogurt nuts red meat, milk, eggs, nuts, oysters, meat, whole grains, nuts & seeds

NSOU ? PGSW-VI _____ 179 Healthy Diet for a Day Food Group No of Serving Size/Serving Cereals 10-11 1 roti (25 g wheat flour) 1 bread 1 katori rice, 25 g raw dalia/cornflakes/suji Pulses 2 12g raw dal Milk 2 250 ml milk Fruit and 5 vegetables 5 100 gm fruit 100-125 gms raw vegetables Fat and oil 3-4 1 tea spoon Source: Ministry of Health and Family Welfare, Government of India. 7.5.9 Nutrition Requirements among Infants Small amount of ? Well boiled vegetables ? Fruit juice ? Rice ? Pulses ? Fish ? Meat and ? Milk products should be given to the infants along with breast milk as a supplementary diet. Fried and spicy food should be avoided. WHO (2005) recently published a guideline for feeding non-breastfed children 6-24 months of age suggested the following; ? Meat, poultry, fish or eggs should be eaten daily, or as often as possible, because they are rich sources of many key nutrients such as iron and zinc. Milk products are rich sources of calcium and several other nutrients. Diets that do not contain animal-source foods (meat, poultry, fish or eggs, plus milk products) cannot meet all nutrient needs at this age unless fortified products or nutrient supplements are used.

180 _____ NSOU ? PGSW-VI ? If adequate amounts of other animal-source foods are consumed regularly, the amount of milk needed is -200-400 mL/d ; otherwise, the amount of milk needed is - 300-50 mL/d. Acceptable milk sources include full-cream animal milk (cow, goat, buffalo, sheep, camel), Ultra High Temperature (UHT) milk, reconstituted evaporated (but not condensed) milk, fermented milk or yogurt, and expressed breast milk (heat-treated if the mother is HIV-positive) ? If milk and other animal-source foods are not eaten in adequate amounts, both grains and legumes should be consumed daily, if possible within the same meal, to ensure adequate protein quality. ? Dairy products are the richest sources of calcium. If dairy products are not consumed in adequate amounts, other foods that contain relatively large amounts of calcium, such as small fish that include the bones (dried or fresh, with the bones crushed or otherwise processed so that they are safe to eat) and lime-treated maize tortillas, can fill the gap. Other foods such as soybeans, cabbage, carrots, squash, papaya, dark green leafy vegetables, guava and pumpkin are useful additional sources of calcium. ? The daily diet should include Vitamin A-rich foods (e.g dark coloured fruits and vegetables , red palm oil, vitamin A-fortified oil or foods) ; vitamin C-rich foods (e.g., many fruits, vegetables and potatoes) consumed with meals to enhance iron absorption ; and foods rich in the B vitamins including riboflavin (e.g. liver, egg, dairy products, green leafy vegetables, soybeans) vitamin B6 (e.g. meal, poultry, fish, banana, green leafy vegetables, potato and other tubers, peanuts) and folate (e.g.. legumes green leafy vegetables, orange juice), ? Provide diets with adequate fat content. If animal source foods are not consumed regularly, 10-20 g of added fats or oils are needed unless a fat-rich food is given (such as foods or pastes made from groundnuts, other nuts and seeds) If animal source foods are consumed, up to 5 g of additional fats of oils may be needed. ? Avoid giving drinks with low nutrient value, such as tea, coffee and sugary soft drinks. Limit the amount of juice offered, to avoid displacing more nutrient-rich foods. 7.5.10 Nutrition Requirements among Pre-school Children During this period, appropriate food and nutrition is to be given to the child for proper physical growth and development. The child get acquainted to various kinds

NSOU ? PGSW-VI _____ 181 of food. Proper care should be given to ensure weight increase of the child, and to see the child maintains his /her normal activities and restlessness. In this period, the child should be encouraged to eat fruits, vegetables, fish, meat, egg, nuts, dry fruit, cereals and various milk products which are good for building bones, teeth, muscles, etc, the child should be given a balanced meal of protein, fat, carbohydrate, calcium and iron. Parents should help child adjust to the family food habits and to take food properly. 7.5.11 Nutrition Requirements among Nursing Mothers Ministry of Health and Family Welfare, Government of India and WHO proposed following in relation to the nutritional requirements among nursing mothers. ? Nursing women should eat more quantity than the normal food intake. She needs one extra helping family food. ? Since she has to breastfeed the child and therefore needs to consume lots of fluids ? She needs to eat vitamin rich food, like milk with cream, butter, ghee, all the dark yellow and orange fruits and vegetables, which are rich in carotene. ? She needs to eat green leafy vegetables. 7.5.12 References 1. Health Promotion : Foundation for Practice-by Jennie Naidoo and Jane Wills. 2. 182 _____ NSOU ? PGSW-VI 7.6 Indigenous system of medicine (ISM)
An indigenous system is a natural form of medicine outside the stream of Western or allopathic medicine practised by majority of doctors all over the world today. Indigenous systems have existed since time immemorial, but few of them have been developed into fully-fledged working systems. Thus, indigenous systems are a diverse lot, but they all have one basic feature in common. They all attempt in some way or the other, to stimulate the self-healing capacity of the body.

100%

MATCHING BLOCK 68/127

W

The Indian Systems of Medicine (ISM) is one of the famous medical systems in the world which include Ayurveda, Siddha, Unani, Homeopathy and other indigenous practices. Ayurveda is the oldest known medical system in India has alone documented 2000 medicinal plants followed by Siddha and Unani.

Ayurveda is believed to be the predecessor of the Atharvaveda, which is more than 3000 years old. It is the oldest indigenous system of medicine in India existing since 1000 BC and the vast knowledge of this medicine is documented in different types of manuscripts viz. birch, palm leaf, handmade paper, cloth etc.

100%

MATCHING BLOCK 69/127

W

The ISM is based mainly on medicinal herbs found in the wild and forest sources which contribute 90% of raw materials for the production of herbal medicines.

On 13 April 2021, the new Ministry of AYUSH (Ayurveda, Yoga & Naturopathy, Unani, Siddha and Homoeopathy), headed by Sarbananda Sonowal, came up with the objective to promote all seven traditional systems of healthcare. 7.7 Conclusion We must always be careful about health & surrounding and promote good health practice. Effort must be also be made to popularise Indigenous system of medicine so that we may cater to a larger population. 7.8 Exercise 1. What do you mean by Health. Explain it in your own words. 2. Discuss about Hygiene, with special emphasis on Personal and environmental hygiene. 3. Explain "Balance diet". Give details of the nutritional requirements during infancy and early childhood. 4. What do you understand by Indigenous system of medicine.

184 _____ NSOU ? PGSW-VI Unit-8 ????? Mental health – concept, dimensions and determinants Structure 8.1 Objectives 8.2 Introduction 8.3 Concept of Mental Health 8.4 Dimensions 8.5 Determinants 8.6 Causes, Symptoms and Treatment of Mental Disorder 8.7 Conclusion 8.8 Exercise 8.9 Reference 8.1 Objectives Through this chapter the learners would get to know the concept about Mental Health, particularly the changes that has been taking place in this field. We will also try to understand the various dimensions a determinants of Mental Health. 8.2 Introduction Mental health can be defined as the absence of mental disease or it can be defined as a state of being that also includes the biological, psychological or social factors which contribute to an individual's mental state and ability to function within the environment. WHO includes realising one's potential, the ability to cope with normal life stresses and community contributions as core components of mental health. Other definitions may include intellectual, emotional and spiritual development, positive self-perception, feelings of self-worth and physical health, and intrapersonal harmony. Prevention strategies may aim to decrease the rates of mental illness but promotion strategies aim at improving mental health. The possible scope of promotion initiatives depends on the definition of mental health. There are three general theories of the etiology of mental illness: Supernatural Somatogenic, Psychogenic. 184

NSOU ? PGSW-VI _____ 185 Supernatural theories explains mental illness as possession by evil or demonic spirits, displeasure of gods, eclipses, planetary gravitation, curses, and sin. While somatogenic theories identify disturbances in physical functioning resulting from either illness, genetic inheritance, or brain damage or imbalance. Psychogenic theories focus on traumatic or stressful experiences, maladaptive learned associations and cognitions, or distorted perceptions. 8.3 Concept of Mental Health Since ages there has been so many changes within the mental health concepts. Lets go through them- ? Examination of prehistoric skulls and cave art from as early as 6500 BC has identified surgical drilling of holes in skulls to treat head injuries and epilepsy as well as to allow evil spirits trapped within the skull to be released (Restak, 2000). ? Mesopotamian and Egyptian papyri from 1900 BC describe women suffering from mental illness resulting from a wandering uterus, the uterus could become dislodged and attached to parts of the body like the liver or chest cavity, preventing their proper functioning or producing varied and sometimes painful symptoms ? Hebrews saw madness as punishment from God, so treatment consisted of confessing sins and repenting. ? Greek physicians rejected supernatural explanations of mental disorders. It was around 400 BC that Hippocrates (460–370 BC) attempted to separate superstition and religion from medicine by systematizing the belief that a deficiency in or especially an excess of one of the four essential bodily fluids (i.e., humors)—blood, yellow bile, black bile, and phlegm—was responsible for physical and mental illness. ? While Greek physician Galen (AD 130–201) for the first time he opened the door for psychogenic explanations for mental illness, however, by allowing for the experience of psychological stress as a potential cause of abnormality. ? Between the 11th and 15th centuries, supernatural theories of mental disorders again dominated Europe, fueled by natural disasters like plagues and famines that lay people interpreted as brought about by the devil. Superstition, astrology, and alchemy took hold, and common treatments included prayer rites, relic touching, confessions, and atonement.

186 _____ NSOU ? PGSW-VI ? Beginning in the 13th century the mentally ill, especially women, began to be persecuted as witches who were possessed. ? Johann Weyer and Reginald Scot tried to convince people in the mid- to late- 16th century that accused witches were actually women with mental illnesses and that mental illness was not due to demonic possession but to faulty metabolism and disease. ? Modern treatments of mental illness are most associated with the establishment of hospitals and asylums beginning in the 16th century. Such institutions' mission was to house and confine the mentally ill, the poor, the homeless, the unemployed, and the criminal. ? By the 18th century, protests rose over the conditions under which the mentally ill lived, and the 18th and 19th centuries saw the growth of a more humanitarian view of mental illness. In 1785 Italian physician Vincenzo Chiarughi (1759–1820) removed the chains of patients at his St. Boniface hospital in Florence, Italy, and encouraged good hygiene and recreational and occupational training. ? In England, humanitarian reforms rose from religious concerns. William Tuke (1732–1822) urged the Yorkshire Society of (Quaker) Friends to establish the York Retreat in 1796, where patients were guests, not prisoners, and where the standard of care depended on dignity and courtesy as well as the therapeutic and moral value of physical work . ? In the second half of the 19th century, a retired school teacher proposed for establishment of state hospital for mental health treatment. ? By the late 19th century, moral treatment had given way to the mental hygiene movement, founded by former patient Clifford Beers with the publication of his 1908 memoir A Mind That Found Itself. ? European psychiatry in the late 18th century and throughout the 19th century, however, struggled between somatogenic and psychogenic explanations of mental illness, particularly hysteria, which caused physical symptoms such as blindness or paralysis with no apparent physiological explanation. ? Josef Breuer (1842–1925) and Sigmund Freud (1856–1939) resolved this dispute in favor of a psychogenic explanation for mental illness by treating hysteria through hypnosis, which eventually led to the cathartic method that became the precursor for psychoanalysis during the first half of the 20th century.

NSOU ? PGSW-VI _____ 187 ? Psychoanalysis was the dominant psychogenic treatment for mental illness during the first half of the 20th century, providing the launching pad for the more than 400 different schools of psychotherapy found today (Magnavita, 2006). Most of these schools cluster around broader behavioral, cognitive, cognitive-behavioral, psychodynamic, and client-centered approaches to psychotherapy applied in individual, marital, family, or group formats. Mental illness entails the occurrence of disorders of cognition, affect, and behavior, typically International Classification of Diseases. These include highly prevalent conditions such as depression, anxiety, dementia, and substance use disorders, as well as less common but often severe illnesses such as schizophrenia, autism, and bipolar disorder. Psychological well-being comprises multiple affective and cognitive components, including happiness—both hedonic (enjoyment and pleasure) and eudaimonic (purpose, meaning, and fulfillment)—self-actualization (accomplishments, optimism, and wisdom), resilience (capacity to cope, adaptive emotion regulation, and lack of maladaptive problem-solving), and healthy relationships. For the purpose of this framework, we also include aspects of cognitive functioning (e.g., attention and working memory) and a lack of mental distress (e.g., stress and loneliness). While we try to know the key to Mental wellbeing , we must try to understand the concept of "Quality of life".This concept is closely related to our lived experience, subjective experience, psychosocial issues, health needs, and strategies for living.

Dimensions Dimensions of Mental Health Understanding about the Eight Dimensions of Wellness can help us to make our decision and choose our way of life and plan how to make mental wellness a part of our everyday life. Mental wellness strategies are practical ways to start developing healthy habits that can have a positive impact on our physical and mental health. While individuals may be born with a genetic predisposition for a certain psychological

190 _____ NSOU ? PGSW-VI disorder, certain psychological stressors need to be present for them to develop the disorder. Sociocultural factors such as sociopolitical or economic unrest, poor living conditions, or problematic interpersonal relationships are also viewed as contributing factors. Thus considering these factors eight dimensions may be developed for determining mental wellness- 1. Emotional—Coping effectively with life and expressing emotions in an appropriate manner.

100%

MATCHING BLOCK 89/127

W

An emotionally well person successfully expresses and manages an entire range of feelings, including anger, doubt, hope, joy, desire, fear, and many others. People who are emotionally well maintain a high level of self-esteem. They have a positive body-image and the ability to regulate their feelings. They know where to seek support and help regarding their mental health, including but not limited to, seeking professional counseling services. 2.

Environmental—Occupying pleasant, healthy, and safe environments that support well-being; positively impacting the quality of our surroundings (including protecting and preserving nature),

100%

MATCHING BLOCK 90/127

W

An environmentally well person appreciates the external cues and stimuli that an environment can provide. People who have achieved environmental wellness recognize the limits to controlling an environment and seek to understand the role an individual plays in the environment. 3.

Financial—Achieving satisfaction with current and future financial situations; handling finances wisely.

100%

MATCHING BLOCK 111/127

W

Those who are financially well are fully aware of their current financial state. They set long- and short-term goals regarding finances that will allow them to reach their personal goals and achieve self- defined financial success. 4.

Intellectual—Recognizing creative abilities and finding ways to expand knowledge and skills; being open-minded.

100%

MATCHING BLOCK 91/127

W

Those who enjoy intellectual wellness engage in lifelong learning. They seek knowledge and activities that further develop their critical thinking and heighten global awareness. They engage in activities associated with the arts, philosophy, and reasoning. 5.

Occupational—Personal fulfillment and enrichment from one's work and/or responsibilities.

100%

MATCHING BLOCK 92/127

W

An occupationally well person enjoys the pursuit of a career which is fulfilling on a variety of levels. This person finds satisfaction and enrichment in work, while always in pursuit of opportunities to reach the next level of professional success 6.

Physical—Recognizing the need for physical activity, healthy foods, and
NSOU ? PGSW-VI _____ 191 adequate sleep; avoiding unhealthy habits.

98%

MATCHING BLOCK 93/127

W

People who are physically well actively make healthy decisions on a daily basis. They eat a nutritionally balanced diet; they try to get an adequate amount of sleep, and they visit the doctor routinely. They make a habit of exercising three to five times per week; they have the ability to identify their personal needs and are aware of their body's limitations. They maintain positive interpersonal relationships and make healthy sexual decisions that are consistent with their personal values and beliefs. 7.
Cultural Wellness-

100%

MATCHING BLOCK 94/127

W

Culturally well people are aware of their own cultural background, as well as the diversity and richness present in other cultural backgrounds. Cultural wellness implies understanding, awareness and intrinsic respect for aspects of diversity. A culturally well person acknowledges and accepts the impact of these aspects of diversity on sexual orientation, religion, gender, racial and ethnic backgrounds, age groups, and disabilities 8

Social wellness—Developing a sense of connection, belonging, and sustained support system; having positive relationships.

96%

MATCHING BLOCK 95/127

W

A socially well person builds healthy relationships based on interdependence, trust, and respect. Those who are socially well have a keen awareness of the feelings of others. They develop a network of friends and co-workers who share a common purpose, and who provide support and validation. 9 Spiritual wellness—

Having a sense of purpose and meaning in life; establishing peace, harmony, and balance in our lives.

100%

MATCHING BLOCK 96/127

W

People who can be described as spiritually well have identified a core set of beliefs that guide their decision making, and other faith-based endeavors. While firm in their spiritual beliefs, they understand others may have a distinctly different set of guiding principles. They recognize the relationship between spirituality and identity in all individuals.

Thus all the elements of wellness are interlinked and is required for our mental wellbeing. Absence of anyone of these elements may lead to situations which may cause mental disturbances. 8.5 Determinants

79%

MATCHING BLOCK 97/127

W

Determinants of mental health and well being A commonly used definition of mental health we know is a state of whelming in which the individual realises his or her own abilities

and can cope up with the

192 _____ NSOU ? PGSW-VI

93%

MATCHING BLOCK 98/127

W

normal stresses of life can work productively and fruitfully and is able to make a contribution to his or her own community

taking this into consideration we can propose three important determinants of mental health Individual attributes and behaviour This is related

83%

MATCHING BLOCK 99/127

W

to a person's innate as well as learning ability to deal with thoughts and feelings and to manage him or herself in the daily life, as well as the capacity to deal with the social world around by partaking in social activities taking responsibilities or respecting the views of others. An individual's mental health state can also be influenced by genetic and biological factors that is determinants that

the person are born or indoor with including chromosome abnormalities for example Down syndrome an

W

exposure to predominating cultural beliefs attitudes or practises as well as by social and economic policies formed at the national level for example the ongoing global financial crisis

in our communities is expected to have a great effect on the mental health consequences in fact the coded pandemic also can be an example for this factor. These factors may lead to increased rate of suicide and harmful alcoholic uses. 8.6 Causes, Symptoms and Treatment of Mental Disorder ? Statistical Infrequency: One aspect of abnormality is that it is infrequent. An assertion that majority of individuals tends to display behavioral or emotional characteristics that is normal. However, though, having certain rare characteristics may be easily detectable, but possessing those may not always deem an individual as abnormal e.g. great athletic ability. ? Deviation: Each society establishes explicit and implicit rules for proper conduct, Behaviour, thoughts and emotions are deemed abnormal when they violate a society's ideas about proper functioning. A society's norms grow out of its culture, its history etc, So judgements of abnormality, based on socio-cultural norms are relative and may vary from society to society. A society's values may also change over time causing its views of what is psychologically deviating to change as well. Also, just the violation of societal norm does not necessarily qualify the individual as psychologically abnormal. Criminals and prostitutes violate social norms. But they are rarely studied within the domain of abnormal psychology. ? Distress: According to many clinical theorists, any behaviour, thought or emotion has to cause significant personal distress., before it can be labeled abnormal. However, there is an exception to this theory. Some people, by virtue of their abnormal psychological functioning experience an inappropriate sense of subjective well-being. ? Dysfunction: Abnormal behaviour tends to interfere with daily functioning; people cannot take care of themselves, participate in ordinary social interactions or work productively. Once again, there are exceptions to this theory. Revolutionaries and social leaders like Jatin Das, Bhagat Singh, and Gandhi etc. had deprived themselves of things they need and temporarily acted in a dysfunctional manner to protest against social injustice. But instead of labelling them as abnormal people have always admired them.

194 _____ NSOU ? PGSW-VI ? Unexpectedness: Perhaps an important point in conceptualization of abnormality is unexpected responses to stressors /stimuli. Distress or disability are thus considered as normal or abnormal depending upon whether the individual's response is an expected or unexpected response pattern to the stressor/ stimulus that provoked it. For example anxiety disorders are diagnosed when anxiety is unexpected and out of proportion to the situation. Thus, a person who has been exposed to harsh and traumatic experiences, the "expected" response will be of "distress" and "dysfunction" and it will be technically incorrect and unethical to label the person as "abnormal" Thus, a perfect conceptualization should synthesize all these aspects to arrive at a true picture of deviating human psychological functioning. Classification of Functional Psychiatric Illnesses ANXIETY DISORDERS GENERALIZED ANXIETY DISORDER PHOBIA OBSESSIVE COMPULSIVE DISORDER PANIC DISORDER AXIS I AXIS II PERSONALITY DISORDERS CLUSTER A ? SCHIZOID ? SCHIZOTYPAL ? PARANOID CLUSTER B ? ANTISOCIAL ? BORDERLINE ? HISTRIONIC ? NARCISSISTIC CLAUTER C ? DEPENDENT ? AVOIDANT ? OBSESSIVE COMPULSIVE MOOD DISORDERS MENTAL RETARDATION SCHIZOPHRENIA SUBSTANCE DEPENDENCE DISORDERS DEPRESSION MANIA BIPOLAR AFFECTIVE DISORDER MILD MODERATE SEVERE PROFOUND

NSOU ? PGSW-VI _____ 195 DSM-IV has distinguished between Axis I and Axis II disorders. Axis I disorders are those which often begin as a noticeable change in a person's usual behaviour and are in most cases, of limited duration. The axis II disorders begin well before adulthood and may continue into adulthood and these pattern are not marked by changes in intensity or periods of clear improvements. DSM-IV and ICD-10 are internationally accepted and accredited classificatory systems for diagnosing and conducting research on mental illnesses. The American Psychiatric Association publishes the DSM-IV and the World Health Organization published the ICD-10 Anxiety Disorders. In anxiety disorders the most striking features are mental and physical features of anxiety occurring in the absence of any organic brain disease. Generalized Anxiety Disorder • Symptoms 1. Chronic uncontrollable, diffuse anxiety called "free floating anxiety" 2. At least for 6 months 3. Somatic complaints like sweating, pounding heart, dry mouth, frequent urination, shortness of breath i.e., hyperactivity of autonomic nervous system (A.N.S.) 4. Irritability, insomnia, distractibility, anger outbursts • Aetiology 1. Biological Perspective: The low activity of the inhibitory neurotransmitter gamma amino butyric acid (GABA) has been linked to generalized anxiety disorder. Neurotransmitters are chemicals that carry messages from one neuron to another in the brain. GABA carries inhibitory messages i.e. when GABA is received at a receptor ; it causes the neuron to stop firing. In normal fear reactions, key neurons throughout the brain fire more rapidly, causing a general state of excitability in the brain and body. If this state of arousability continues for a period of time, a feedback system is called into action, which inhibits the excitation. In case of anxiety, GABA plays this role, 2. Psychoanalytic Perspective: The psychoanalytic perspective regards the source of generalized anxiety disorder as an unconscious conflict between ego and id impulses, which are sexual and aggressive in nature. The ego does not want to allow the expression of the id impulses for the fear of punishment. Since the source of anxiety is unconscious, the person experiences fear and apprehension without knowing it.

196 _____ NSOU ? PGSW-VI 3. Cognitive-Behavioural Perspective: According to the cognitive-behavioural perspective, anxiety is either classically conditioned to a vast range of external stimuli or else, there is a perception of not being in control. Phobia ??? Symptoms 1. Persistent, unrealistic, fear that is out of proportion to the danger posed by a particular object or situation and is recognized by the sufferer as groundless. 2. There is intense distress and socio-occupational impairment because of the anxiety ? Specific Phobia - Unwarranted fears are caused by the presence or anticipation of a specific object. ? Social Phobia - Unwarranted fears are generally linked to the presence of other people or apprehension on negative evaluation by other people. • Aetiology 1. Biological Perspective: The biological perspective in the genesis of phobia holds that the autonomic nervous system, which is involved in the processing of fear, is more easily arousable in people with phobia. Lacey, (1967) identified a dimension of autonomic activity called stability -liability and proposed that phobic behaviour is characterized by autonomic liability. 2. Psychoanalytic Perspective: According to the psychoanalytic view, phobias represent defence against repressed id impulses, This anxiety is displaced from the feared id impulse and moved to an object or situation that has a symbolic connection to it. By avoiding them, the person is able to avoid dealing with repressed conflicts. 3. Behavioural Perspective-Behavioural theories hold that all phobias are learned reactions They are acquired either through- i. Classical conditioning -the pairing of an innocuous object or situation with an innately painful event ii Operant Conditioning-Whereby a person is rewarded for avoidance iii Modelling-imitating the fear and avoidance of others 4. Cognitive Perspective -By making catastrophic misinterpretations of events that could be construed in a less negative fashion. Obsessive Compulsive Disorder ????? Symptoms

NSOU ? PGSW-VI _____ 197 1. Obsessions are recurrent intrusive thoughts, which are resisted by the individual and recognized by the individual as his own e.g. obsessional doubts, ruminations, fears, images, and impulse. 2. The content of obsessions can be grouped under the following theme: dirt and contaminations, aggression, orderliness, illness, sex, religion. 3. Compulsions are voluntary and repetitive overt or covert actions that an individual resorts to in order to neutralize the anxiety or distress provoked by the obsessions. 4. Compulsions may take various forms \ko~cleining compulsions, checking compulsions, compulsions for order & symmetry, counting, compulsions, compulsive rituals etc. ? Aetiology 1. Biological Perspective: Research on neurochemical factors has related OCD to low activity of the neurotransmitter serotonin OCD has also been associated with malfunctioning of the orbito-frontal cortex , reflecting an over concern of the individual with his own thoughts ; and a set of subcortical structures like caudate nucleus and the basal ganglia; the result of the over activity of this circuit could manifest itself clinically as intrusive persistent thoughts, a visceral feeling of dread and sensations that "something is wrong" ; this send an intensely bothersome "false alarm" to the patient. 2. Psychoanalytic Perspective: In psychoanalytic theory, obsessions and compulsions are viewed to have similar roots i.e in instinctual forces, which are sexual or aggressive in nature. These instinctual or id impulses are not under control because of overly harsh toilet training. The person is thus fixated at the anal stage of psychosexual development. The symptoms represent the defense mechanisms employed by the individual as he / she struggles to control the id impulses, In case of OCD, the individual more commonly uses the defense of "Reaction Formation". 3. Behavioural Perspective : A prominent behavioural model of the acquisition and maintenance of obsessive-compulsive symptoms derives from the two- stage learning theory of Mowrer (1939). In Stage I-, anxiety is classically conditioned to a specific environmental event The person then engages in compulsive rituals (escape/avoidance responses). If the person is successful in reducing the anxiety, the compulsive behaviour is more likely to occur in future (Stage II-Operant Conditioning), Higher Order Conditioning occurs when other neutral stimulus such as words, images or thoughts are associated with the initial stimulus and the anxiety becomes diffused.

NSOU ? PGSW-VI 4. Cognitive Perspective : Trie cognitive factors mediating obsessions maintain that the difference lies in the interpretation of the meaning of the presence of intrusive thoughts i.e. there is a pivotal role of responsibility appraisal in OCD, leading to a conclusion that catastrophic events are impending. Panic Disorder ? Symptoms 1. A sudden and often inexplicable attack of a host of jarring symptoms- laboured breathing, heart palpitations, nausea, chest pain, feelings of choking, dizziness, sweating, trembling, an intense apprehension, feeling of impending doom. 2. Panic attacks can occur in seemingly benign states, such as relaxation, in sleep, and in unexpected situations. 3. Panic attacks can occur in the presence or absence of "agoraphobia" : is a cluster of fears centering on public places and from where escape is difficult or seemingly impossible. 4. Agoraphobia is linked with a fear of having a panic attack, which further incapacitates the individual. • Aetiology 1. Biological Perspective: The biological theory suggests that panic is caused by the over activity in the noradrenergic system (neurons that use norepinephrine as a neurotransmitter), particularly in a nucleus in the pons called the locus ceruleus. 2. Cognitive Perspective: The principal cognitive perspective of panic disorder is that patients misinterpret physiological sensations in a catastrophic way. In this over concern, they may amplify slight physical sensations into signs of impending disaster. The psychological explanation of agoraphobia suggests the "fear of fear" hypothesis i.e. a fear of having a panic attack in public produces the agoraphobia Mood Disorders The mood disorders are so called because one of their main features is abnormality of mood. Depression • Symptoms 1. Low Mood 2. Decreased interest in pleasurable 3. Increased fatigability 4. Low self esteem 5. Pessimistic views about future 6. Feelings of guilt

NSOU ? PGSW-VI

199 7. Difficulty in attention and concentration 8. Difficulty in taking decisions 9. Disturbances in sleep, appetite & libido 10. The first 3 symptoms must be present along with two or more of the other symptoms for a period of at least 2 weeks, for a diagnosis of depression. ????? Psychotic Symptoms: May be present or absent in the form of delusions or hallucinations. ????? Aetiology 1. Biological Perspective : Low activity of the neurotransmitter serotonin and norepinephrine has been associated with depression. Over activity of the hypothalamic-pituitary-adrenal axis is also found among depressed patients, indicating that the endocrine system may also influence mood disorders. 2. Psychoanalytical Perspectives: Psychoanalytic formulations stress fixation in the oral stage (leading to a high level of dependency) and unconscious identification with a lost loved one whose desertion of the individual has led to anger turned inwards (introjection). 3. Cognitive Perspective: According to Beck (1967), people with depression have certain characteristic ways of cognition. Beck proposed the "cognitive triad of depression" that consists of-negative views of self, negative views of world and negative views of future. These negative cognitive cognitions are sustained by illogical ways of thinking called "cognitive distortions". 4. Behavioural Perspective: Helplessness-Hopelessness Theory-According to helplessness-hopelessness theory, early experiences in inescapable, hurtful situation instill a sense of hopelessness that can evolve into depression individuals are likely to attribute failures to their own general and persistent inadequacies and faults 5. Interpersonal Perspective: According to this viewpoint, depressed individuals tend to have sparse social networks and to regard them as providing less social support. Reduced social support may lessen an individual's ability to handle negative life events and make him or her vulnerable to depression. Behaviour of depressed people tends to elicit rejection from others. Mania ? Symptoms 1. Elevated mood 2. Inappropriate sense of subjective well-being 3. Increased psychomotor activity 4. Disturbances in sleep, appetite & libido 5. Disturbances in cognitive function

200

NSOU ? PGSW-VI 6. Inflated self esteem 7. The first 3 symptoms must be present along with one or more of the other symptoms, at least for a period of 7days/week ? Aetiology 1. Biological Perspective: The biological perspective to mania has associated the disorder to high levels of the neurotransmitter norepinephrine and increased activities of G-proteins, which carry information across neurons and amplify neural signal. 2. Psychological Perspective: The psychological perspective of mania considers it as a defence against a debilitating psychological state, such as low self-esteem Bipolar Affective Disorder ? Symptoms 1. Is defined as including episodes alternating between mania and depression or consecutive episodes of mania 2. Shows typical symptoms of retarded depression There are some other phenomenological between unipolar and bipolar affective disorders i. The age onset is earlier compared to unipolar depression ii. First degree relatives of people with bipolar affective disorder are at higher risk for developing either of unipolar depression. iii. First degree relative of people with unipolar depression are at higher risk of developing unipolar depression ? Psychotic Symptoms-May be present or absent in the form of delusion or hallucinations. Schizophrenia The concept of schizophrenia was initially formulated by two European psychiatrists Emil Kraepelin and Eugen Bleuler. Kraepelin provided some of the earliest and detailed descriptions of the "preocious" mental decline. He first presented his idea of Dementia Praecox, the early term for schizophrenia, in 1898. The term reflected his belief that the core symptoms of his disorder are-an early onset (praecox) and progressive intellectual deterioration (dementia). Eugen Bleuler (1950), the second major pioneer of schizophrenia broke away from Kraepelin on the grounds that the term "dementia" was inaccurate and felt that schizophrenia did not represent a true intellectual deterioration or dementia. Instead, the illness involved a subordination of the intellect to the "fundamental" symptoms and to their devastating effect on mental life, The "fundamental" symptoms described by Bleuler were-

NSOU ? PGSW-VI _____ 201 i) Disturbances of association ii) Disturbance of affect iii) Detachment from reality or autism iv) Ambivalence Despite shifts in emphasis within and between legacies of Bleuler and Kraepelin the same kinds of behaviour are included in contemporary accounts and analyses of schizophrenic symptoms. The only changes have been attempts to subcategorize and differentiate some aspects of the illness from others. Thus, "positive" symptoms have been distinguished from "negative" symptoms. Positive symptoms seem to be abnormal additions to mental life e.g. delusions, hallucinations, disorganized speech, Negative symptoms are deficits or losses like reduced motivation, impoverished speech or emotional withdrawal. ? Symptoms of schizophrenia The symptoms of schizophrenia involves disturbances in several major areas-thought, perception, affect or emotion, attention, motor behaviour, and life functioning i. Hallucination: sensory experiences in the absence of any stimulation from the environment. They occur most often in the auditory modality and less often in the visual modality. Some auditory hallucinations are regarded as pathognomic of schizophrenia such as "hearing own thoughts spoken aloud by another voice" and 'hearing voices arguing, comment- ing of commanding upon the action". ii. Delusion: are firmly held implausible beliefs in spite of evidences to the contrary. Delusions may comprise delusions of influence (patient may believe that thought that are not his own have been placed in his mind by an external source) passivity (patient is the unwilling recipient of bodily sensations imposed by an external agency, and control (pa- tient may believe that his feelings and behaviour are being controlled by an external agency) persecution, reference, infidelity etc. iii. Formal thought Disorder: refers to the problems in the organization of ideas and in speaking so that a listener can understand. iv. Catatonic symptoms: characterized by several motor abnormalities Catatonic Immobility / stupor is characterized by patients adopting unusual postures and maintaining them for long periods of time. There may be accompanying muscular rigidity,. Waxy flexibility is a condition in which another person can move the patients's limbs into whatsoever positions, without his resistance which he will maintain for long peri-

202 _____ NSOU ? PGSW-VI ods of time. Some patients may manifest an unusual increase a their overall level of activity, including excitement, flailing of limbs and great expenditure of energy. v. Avolition: or apathy refers to a lack or absence of energy and seeming of absence of interest in what are usually routine activities (personal hygiene,, work, household chores). vi. Alogia: is a negative thought disorder that can take several forms. In poverty of speech, the amount of speech is greatly reduced. In poverty of content of speech, the amount of discourse is adequate but it conveys little information and it tends to be vague and repetitive. vii. Anhedonia: refers to an inability to experience pleasure and is mani- fested as a lack of interest in recreational activities, failure to develop close relationships etc. viii. Asociaity: impairments in social relations manifested as little interest in being with other people and poor social skills. ix. Flat or blunted affect/inappropriate affect: in patients with flat effect virtually no stimulus can elicit an emotional response. In case of blunted affect, emotional responseis attenuated, that is the emotional response is less intense. In case of inappropriate affect, the emotional responses are out of context e.g. a patient may laugh on hearing that his mother just died. That is thought processes become disconnected from feelings, making it liaphazard, inconsistent and unpredictable. ? Aetiology 1. Biological Perspective: The biological holds that schizoplrenia results form excessive activity of the neurotransmitter dopamine. Brain imagine techniques have detected abnormal brain structures like enlarged brain ventricles, excess tlickended corpus callosum and abnormal cerebral blood flow and glucose metabolism in the frontal lobes. 2. Psychological Perspectives: i. Schizophrenogenic Mother-A concept proposed by Fromm- Reichmmann (1948) and now mostly refuted, suggested that mothers who are cold, domineering and rejecting make their children vulnerable to develop schizopernia. ii. Schismatic Family/Skewed Family-A child in dysfunctional family is mor vulnerable to develop schizophrenia as he/she is confused and caught between the conflicts of the parent where an atmtpt to please one parent is viewed by the other as rejection and the parents are con-

NSOU ? PGSW-VI _____ 203 tinuously trying to competing with each other for winning the loyalty of the child.This concept was proposed by Lidz(1963) bitf has also been invalidated as an explanation for schizophrenia. ? Subtypes of Schizophrenia- 1. Simple -It is an uncommon form of schizophrenia. It has an insidious or gradual onset. The individual shows inability to meet the demands of the society and oddities of conduct. It shows usually the "negative symptoms" characteristics of residual schizophrenia But, these symptoms" characteristics of residual schizophrenia. But, these symptoms develop without being preceded by any overt or obvious positive psychotic symptoms. 2. Paranoid-It is the most common type of schizophrenia. A type of schizophrenia in which a person has an organized and relatively stable system of delusions and hallucinations. Disturbances of affect, speech, volition and catatonic symptoms are not usually present. 3. Catatonic-An uncommon type if schizophrenia characterized by prominent psychomotor disturbances and may alternate between extremes such as hyperkinesis and stupor. 4. Residual- A chronic stage in the development of a schizophrenic disorder in wliich there has been a clear progression from an earlier stage comprising of one or more episodes, to a later stage, with negative symptoms. 5. Undifferentiated-A type of schizophrenia in which no single set of psychotic symptoms dominates. 6. Disorganized-A type of scliizophrenia characterized by confusion, incoherent speech and flat or inappropriate affect. Management of Psychiatric Illnesses ? Pharmacological Researchers have discovered since 1950's several effective psychotropic medications; medicines that can modify emotions and thought processes Anxiety Disorders- 1. Antianxiety-For example, Lorazepam, Diazepam, Alprazolam etc. Mood Discorders 1. Antidepressant- i. Moioamine Oxidase Inhibitors. ii. Selective Serotonin Re uptake Inhibitors iii. Tricycle 2. Mood Stabilizers -Lithium, Carbamezapine, Sodium Valproate.

204 _____ NSOU ? PGSW-VI Schizophrenia 1. Antipsychotic- i. Typical-These antipsychotics e.g. haloperidol, chlorpromazine, thioridazine etc produce more extra-pyramidal side effects (E. P. S.). These stem from the dysfunction of the nerve tracts that descend from brain to spinal motor neurons. E.P.S. resembles symptoms of neurologi- cal diseases. Some E. P.S. are-4ystonia (a state of muscular rigidity), akathisia (an inability to remain still) ii. Atypical-These antipsychotics produce less E.P.S. e.g. clozapine. olanzapine etc. ? Psychosocial Management The psychosocial management of the psychiatric illness may be based on various schools of thought, but all approaches essentially focus on the following aspects- 1. Correcting distorted cognitions 2. Developing an insight to the illness and self awareness 3. Developing autonomy 4. Trying to integrate social networks 5. Trying to develop health promoting life styles 6. Enlightening on the necessity of compliance to treatment 7. Developing the functional efficacy of the individual, Promotion of

206 _____ NSOU ? PGSW-VI Unit-9 ????? Health Care Models of India
Structure 9.1 Objectives 9.2 Introduction 9.3 Levels of Health Prevention 9.4 Integrative model and development model 9.5 Holistic approach to health 9.6 Alternative system of health - yoga naturopathy 9.7 Conclusion 9.8 Exercise 9.9 References 9.10 Objectives Through this chapter the learners would understand the various of prevention of diseases and the health care models . A deeper understanding on these issues will help the learners to plan strategies in health care management while working in the fields. 9.2 Introduction One of the notable role of Health Care system is the focus on prevention of diseases and promotion of wellness. This occurs through addressing individual-level competencies within a community and also through working to change systems and contexts. The core belief is that taking early action can prevent more serious problems from developing in the future. The concept of prevention comes from the field of public health. This is very different from the medical model, which refers to the framework of treating social problems in the same manner that we treat illness. Two key aspects of a public health approach to problems include measuring the incidence and prevalence of disease. Public health approach focuses on measuring the incidence or prevalence of a social issue. For example, Incidence refers to the number of new cases during a specified period of time (e.g., the annual rate of new 206

NSOU ? PGSW-VI _____ 207 cases of depression among women, the annual rate of new individuals who experience homelessness). Prevalence is the total number of cases in a population (e.g., the total number of women in the population with depression, the total number of people in the population who are homeless in a particular country). 9.3 Levels of Health Prevention Three broad categories of determinants of human behavior will be discussed in this study session and you will have an opportunity to learn about the influence of these factors in determining human behavior. Prevention, as it relates to health, is really about avoiding disease before it starts. It has been defined as the plans for, and the measures taken, to prevent the onset of a disease or other health problem before the occurrence of the undesirable health event. There are three distinct levels of prevention. Primary prevention—those preventive measures that prevent the onset of illness or injury before the disease process begins. ? Examples include immunization and taking regular exercise. Secondary prevention—those preventive measures that lead to early diagnosis and prompt treatment of a disease, illness or injury to prevent more severe problems developing. Here health educators such as Health Extension Practitioners can help individuals acquire the skills of detecting diseases in their early stages. ?Examples include screening for high blood pressure and breast self-examination. Tertiary prevention—those preventive measures aimed at rehabilitation following significant illness. At this level health services workers can work to retrain, re- educate and rehabilitate people who have already developed an impairment or disability. Read the list of the three levels of prevention again. Think about your experience of health education, whether as an educator or recipient of health education. ? How do you think health education can help with the prevention of disease? ? Do you think it will operate at all these levels? ? Note an example of possible health education interventions at each level where you think health education can be applied. Health Education can be applied at all three levels of disease prevention and can be of great help in maximizing the gains from preventive behavior.

208 _____ NSOU ? PGSW-VI ? For example at the primary prevention level — you could educate people to practice some of the preventive behaviors, such as having a balanced diet so that they can protect themselves from developing diseases in the future. ? At the secondary level, you could educate people to visit their local health center when they experience symptoms of illness, such as fever, so they can get early treatment for their health problems. ?At the tertiary level, you could educate people to take their medication appropriately and find ways of working towards rehabilitation from significant illness or disability. HEALTH MODELS The Institute of Medicine developed a model for problem assessment, intervention, and dissemination strategies. For example, this research cycle includes assessing the prevalence of risk and protective factors of a problem area, developing prevention innovations, researching the effectiveness of those innovations, and disseminating innovations into the community. Figure below outlines each aspect of the preventive intervention research cycle "The Preventive Intervention Research Cycle" by Valerie Anderson, Samanta Boddapati, and Symone Pate

NSOU ? PGSW-VI _____ 209 There are a number of challenges to conducting prevention research and using these models since they identify what needs to be done but provide very little detail on how these things will happen. Most models, such as the Institute of Medicine framework, focus on the functions that are part of the innovation, implementation, and dissemination process, but not on the systems that support these functions. To address this gap, Wandersman and colleagues (2008) proposed a framework that describes relevant systems to help bridge the gap. The Interactive Systems Framework works to connect step four (conducting trials of the program) and step five (implementing the program in the community) of the Institute of Medicine model. Halgunseth and colleagues (2012) used the Interactive Systems Framework to understand the relationship between program capacity and implementation in after- school settings. They examined eight after-school sites . Aligned with the Prevention Support System element of the Interactive Systems Framework, the after-school staff was trained and received weekly on-site support in implementing the intervention. It was found that after-school settings that were more organized and maintained strong links to individuals or community-based organizations scored higher in program fidelity and quality. Funders can utilize the Interactive Systems Framework to identify what kinds of support they should provide for the Prevention Synthesis and Translation System element; similarly, practitioners can gather information from that same component for what they need as well as from the Prevention Support System element. Additionally, practitioners can see what they need to do to build capacity from the perspective of the Prevention Delivery System component.

Although there might be national differences in defining Integrated Healthcare (IHC), one can simply describe it as efforts needed to provide all healthcare services that make humans healthy . Consequently, such provision necessitates valid and functional delivery systems at all times. The World Health Organization (WHO) defines an integrated delivery system as, “the organization and management of health services so that people get the care they need, when they need it, in ways that are user-friendly, achieve the desired results, and provide value for money” . These definitions work well in peacetime and with intact resources and capabilities. However, the last decades’ economic strain on healthcare systems and an increasing number of public health emergencies highlight the insufficiency of delivering integrated healthcare, particularly to vulnerable groups of a society . IHC is one of the important concepts related to the management and organization of healthcare systems. At present, efforts to integrate the process of providing healthcare, in addition to the integration of other areas of socio-economic life with the healthcare system, are a major concern for many international entities like WHO . Attention to this concern is seen through a variety of projects that either directly or indirectly orient towards coordinating the provision of healthcare. By implementing these projects, healthcare systems aim to obtain the interrelated goals of improving the effectiveness of treatment, attribution of costs, and leveling inequalities in the access to and utilization of medical care. In

practice, efforts to improve efficiency aim to maximize the outcomes of service activities at specific input levels or by obtaining desired outcomes with minimal expenditure . Social efficiency is associated with progress towards the implementation of social tasks, which benefit the healthcare system as seen in improving the combined health of societal groups or improving the quality and availability of healthcare at differing levels for a certain population 9.5

Holistic approach to health Several holistic and interdisciplinary approaches that work with the human– animal–environment interface exist in order to safeguard health. Three of the most influential concepts at this moment, are One Health, Eco Health, and Planetary

NSOU ? PGSW-VI _____ 211 Health. Of these three concepts, Planetary Health is a more recent and therefore possibly less developed concept, and it may hence appear somewhat arbitrary to choose this concept and compare it to the two more well-established ones. However, based on the fact that Planetary Health has rapidly become an approach mentioned in very well-renowned and high-ranked global publications and furthermore seems to attract attention among politically influential groups we still find it highly relevant to include this concept in the discussion on an equal basis. One Health is the collaborative effort of multiple health science professions, together with their related disciplines, and institutions—working locally, nationally, and globally—to attain optimal health for people, domestic animals, wildlife, plants, and our environment. EcoHealth has been described as involving the health of humans, animals, and ecosystems, including also environmental sustainability and socioeconomic stability in the framework. In some cases, the EcoHealth approach seems to have more of a biodiversity focus, with an emphasis on all living creatures, implying that parasites, unicellular organisms, and possibly also viruses have a value and should be protected. Waltner-Toews suggests that EcoHealth aims for “sustainable human and animal health and well-being, through healthier ecosystems” Planetary Health has in recent years been put forward as an alternative to One Health and EcoHealth. The concept has been developed by The Rockefeller Foundation-Lancet Commission on planetary health. However, the concept seems to be less interdisciplinary than One Health and EcoHealth and primarily focus on human health, although the environment is acknowledged. Planetary Health is focused on mitigating and responding to threats to human health and well-being, and on the sustainability of the entire human civilization. Planetary health is the achievement of the highest attainable standard of health, well-being, and equity worldwide through judicious attention to the human systems—political, economic, and social—that shape the future of humanity and the Earth’s natural systems that define the safe environmental limits within which humanity can flourish. 9.6 Alternative system of health - Yoga Naturopathy ”

and population health”.T he integration can therefore contribute to current issues in public health and healthcare such as developing strategies of healthy ageing, promoting self-management, and controlling healthcare expenditures [6, 7]. Positive examples demonstrating and supporting the WHO strategy of integrating the best of both of worlds from T&CM and conventional medicine are the integration of the AYUSH (Ayurveda, Yoga, Naturopathy, Unani, Siddha, and Homeopathy (AYUSH)) system in the conventional system in India [8], the increasing use of mindfulness techniques in the treatment of depressive disorders [9], and the use of traditional medicinal systems in reducing the prescription of antibiotics in Thailand as one of the strategies to fight the global antimicrobial resistance problem.

Naturopathy is a form of healthcare that combines modern treatment with traditional methods. It includes alternative, natural therapies to modern medicine. Naturopathy focuses on- ? The body's capacity to heal itself ? Preventing health problems ? A personal responsibility to optimize health Naturopathic treatment plans focus on education and prevention. They often emphasize diet, exercise, and stress management. Naturopathy uses a series of principles and beliefs to create individual treatment plans. The principles and beliefs of Naturopathy are: ? Self-healing: Identifying and removing obstacles to recovery, allows for natural healing. ? Underlying symptoms: Rather than stopping symptoms, a naturopathic doctor can resolve underlying physical or mental issues by treating the body, mind, and spirit.

NSOU ? PGSW-VI _____ 213 ? Harmless treatment: Treatment plans should not have harmful side effects or control symptoms negatively. ? Holistic treatment: A naturopathic doctor must recognize individuality to treat all aspects of a person's health effectively. ? Education in treatment: Naturopathic doctors teach self-care to help empower people against ill health. ? Prevention: It is good to remove toxic substances from a lifestyle to prevent problems from arising. 9.7 Conclusion The learner understood various Health Models available for Intervention into any challenging issue. These models makes over planning eassier & very effective. 9.8 Exercise 1. What do you mean by Health Care System? Analyse the levels of health prevention : 2. Write about the alternative system of health. 3. What is the Logistic approach to health? Describe it? 9.9 Reference <https://www.mdpi.com/2071-1050/13/8/4517/htm> <https://www.hindawi.com/journals/ecam/2017/4904930/#copyright> Contemporary Health Issues. 214 _____ NSOU ? PGSW-VI Unit-10 ????? Preventive Medicine Structure 10.1 Objectives 10.2 Introduction 10.3 Understanding the concepts of-Social medicine, community medicine, preventive medicines 10.4 Primary Health Care: organization and functions. 10.5 Education, Provisions for medical education in India 10.6 Common diseases in India – Communicable, non-communicable and lifestyle •HIV/AIDS epidemics in India 10.7 Programmes for controlling diseases in India. 10.8 Social Work Intervention in health 10.9 Conclusion 10.10 Eercise 10.11 Reference 10.1 Objectives The objective of the present unit is to give an idea to the learners about the concept of preventive medicine, common diseases in India, primary health care, disease control programmes and social work intervention in health. 10.2 Introduction Health systems and polices have a critical role in determining the manner in which health services are delivered, utilized and affect health outcomes. The Bhore Committee Report, 1946, put forward a three-tiered health-care system to provide preventive and curative health care in rural and urban areas and made the Government responsible in order to ensure that there is an easy access to primary care which would be independent of individual socioeconomic conditions. Due to the India's federalized system of government, the areas of governance and operations of health system in India have been divided between the union and the state governments. The Union Ministry of Health & Family Welfare is responsible for implementation of 214

NSOU ? PGSW-VI _____ 215 various programs on a national scale (National AIDS Control Program, Revised National Tuberculosis Program, to name a few) in the areas of health and family welfare, prevention and control of major communicable diseases, and promotion of traditional and indigenous systems of medicines and setting standards and guidelines, which state governments can adapt. In addition, the Ministry assists states in preventing and controlling the spread of seasonal disease outbreaks and epidemics through technical assistance. 5 On the other hand, the areas of public health, hospitals, sanitation and so on come under the purview of the state, making health a state subject. However, areas having wider ramification at the national level, such as family welfare and population control, medical education, prevention of food adulteration, quality control in manufacture of drugs, are governed jointly by the union and the state government Public health-care infrastructure in India The public health-care infrastructure in rural areas has been developed as a three- tier system based on the population norms and described below- Sub-centers A sub-center (SC) is established in a plain area with a population of 5000 people and in hilly/difficult to reach/tribal areas with a population of 3000, and it is the most peripheral and first contact point between the primary health-care system and the community. Each SC is required to be staffed by at least one auxiliary nurse midwife (ANM)/female health worker and one male health worker (for details see recommended staffing structure under the Indian Public Health Standards (IPHS)). Under National Rural Health Mission (NRHM), there is a provision for one additional ANM on a contract basis. SCs are assigned tasks relating to interpersonal communication in order to bring about behavioral change and provide services in relation to maternal and child health, family welfare, nutrition, immunization, diarrhea control and control of communicable diseases programs. The Ministry of Health & Family Welfare is providing 100% central assistance to all the SCs in the country since April 2002 in the form of salaries, rent and contingencies in addition to drugs and equipment. Primary health centers A primary health center (PHC) is established in a plain area with a population of 30 000 people and in hilly/difficult to reach/tribal areas with a population of

216 _____ NSOU ? PGSW-VI 20000, and is the first contact point between the village community and the medical officer. PHCs were envisaged to provide integrated curative and preventive health care to the rural population with emphasis on the preventive and promotive aspects of health care. The PHCs are established and maintained by the State Governments under the Minimum Needs Program (MNP)/Basic Minimum Services (BMS) Program. As per minimum requirement, a PHC is to be staffed by a medical officer supported by 14 paramedical and other staff. Under NRHM, there is a provision for two additional staff nurses at PHCs on a contract basis. It acts as a referral unit for 5-6 SCs and has 4-6 beds for in-patients. The activities of PHCs involve health-care promotion and curative services. Community health centers Community health centers (CHCs) which are maintained by the State Government under the MNP/BMS program in an area with a population of 120000 people and in hilly/difficult to reach/tribal areas with a population of 80000. As per minimum norms, a CHC is required to be staffed by four medical specialists, that is, surgeon, physician, gynecologist/obstetrician and pediatrician supported by paramedical and other staff. It has 30 beds with an operating theater, X-ray, labor room and laboratory facilities. It serves as a referral center for PHCs within the block and also provides facilities for obstetric care and specialist consultations. First referral units An existing facility (district hospital, sub-divisional hospital, CHC) can be declared a fully operational first referral unit (FRU) only if it is equipped to provide round-the-clock services for emergency obstetric and newborn care, in addition to all emergencies that any hospital is required to provide. It should be noted that there are three critical determinants of a facility being declared as a FRU: (i) emergency obstetric care including surgical interventions such as caesarean sections; (ii) care for small and sick newborns; and (iii) blood storage facility on a 24-hour basis. National Rural Health Mission, launched in 2005, was a watershed for the health sector in India. With its core focus to reduce maternal and child mortality, it aimed at increased public expenditure on health care, decreased inequity, decentralization and community participation in operationalization of health-care facilities based on IPHS norms. It was also an articulation of the commitment of the government to raise public spending on health from 0.9% to 2-3% of GDP. 8

NSOU ? PGSW-VI _____ 217 Seeking to improve access of rural people, especially poor women and children, to equitable, affordable, accountable and effective primary health care, NRHM (2005-2012) aimed to provide effective health care to the rural population throughout the country with special focus on 18 states having weak public health indicators and/ or weak infrastructure. Within the mission there are high-focused and low-focused states and districts based on the status of infant and maternal mortality rates, and these states are provided additional support, both financially and technically. Gradually it has emerged as a major financing and health sector reform strategy to strengthen the state health systems. Major initiatives have been undertaken under NRHM for architectural correction of the rural health system—in terms of availability of human resources, program management, physical infrastructure, community participation, financing health care and use of information technology. Global rhetoric on health has recently showed a renewed interest in the values and practices of comprehensive Primary Health Care (PHC). The adoption of the Sustainable Development Goal of 'healthy lives' and 'well-being for all' marks a change towards more holistic considerations of health; in line with the sociopolitical ideas of PHC heralded 40 years ago at the Alma-Ata conference. Some of these ideas have been reaffirmed recently in global forums. However, there is an urgent need for these ideas on PHC to take roots within country contexts—for past experience has shown that implementation of PHC is not straightforward. At a macro level, a whole range of factors in a country's health system context—competing ideologies to the PHC approach (global and country-specific), fiscal priorities and development aid mechanisms that favour vertical programs—along with broader sociopolitical and epidemiological factors—influence the uptake of PHC interventions. Further, these macro issues interact with the 'everyday politics' of the health system—more specifically, front-line actors' values, past experiences and expectations. All this together influences what happens to PHC on the ground. We elucidate some challenges posed by contexts to the implementation of PHC using the example of primary health centres in India, a rural peripheral health unit within the public health system. These centres were originally visualised in the 1940s as a 'social model' of health service delivery—frontline services close to the homes of people, that consider people's needs, integrate preventive and curative care and link to specialty care as needed. The Alma-Ata declaration gave impetus to the expansion of these centres within the country However, today's primary health centres are a far cry from what was envisaged originally. These centres are fraught with several infrastructural weaknesses, no longer serve as 'first access institutes' for the community—who rely mainly on local private practitioners and deliver barely 15% of primary-level services.

The services are usually provided at three levels.- 1. House hold &Community Level: services like empowering families to provide services like breast feeding, nutrition, homebased newborn care, diarrhea management (ORS Depot, Drug distribution centers, Fever treatment depots) Physical exercise etc. The service providers like ASHA & AWWs and Community Based Organizations and Non- Governmental Organization volunteers empower the mothers and family and community members through awareness creation and skill building support. 2. Outreach Services: These are services that are delivered at community level on periodical basis. These include monthly Routine immunization, Antenatal care, contraceptive distribution, prophylaxis against nutritional anemia with daily/weekly supplementation of Iron and folic acid tablets to all pregnant mothers and all school going age children and half yearly supplementation of Vit. A and Anti-helminthic in endemic communities. 3. Individual Care: This is the most critical of the three modes of services, delivered at the above two levels by paramedical workers and at the facilities starting from PHC to the tertiary level care institutes. Though many studies suggest that the private sector meets two thirds (78%) of OPD care and nearly half (60%) of inpatient care but It is a fact that if one desegregates the

The Principles of Enhancement of Health 1. Transforming some of the present Health sub-Centers and Primary Health Centers to Health into Health and Wellness Centers to ensure universal access to Comprehensive Primary Health Care. 2. Adopt a people-centric, holistic, equity-based response to people’s health needs through a process of family’s empanelment, regularly interacting at homes and community to promote community system strengthening and people’s participation. 3. Build capacity to deliver high-quality care covering health risks and disease conditions through expansion in availability of medicines & diagnostics, use of standard treatment and referral protocols and advanced technologies including IT systems to maintain health records 4. A team-based approach to deliver quality health care including preventive, promotive, curative, rehabilitative and palliative care will be promoted. 5. A two-way referral system and follow up support will be ensured for continuity of care 6. Emphasize health promotion (including through school education & individual centric awareness and public health action) through active engagement & capacity building of individual volunteers and community-based organizations (CBOs) 7. Implement mechanisms of flexible financing, like performance-based incentives and responsive resource allocations. 8. Deliver Yoga and AYUSH services through existing health facilities to meet peoples needs 9. Use appropriate technology for improving access to health care advice, treatment initiation, reporting and recording, progressing to electronic records for individuals and families. 10. Social accountability through participation of civil society will be Institutionalized. 220

Govt. will partner with not for profit agencies & private sector for gap filling of PHC functions. 12. Govt. will systematically share information for feedback, improvements & innovations scale up. 13. To build up accountability for improved performance on measures that matter to people Govt. will develop strong measurement systems and information sharing with all stakeholders 10.6

Common diseases in India – Communicable, non-communicable and lifestyle • HIV/AIDS epidemics in India Include 9.1 to 9.8 of unit 9 of existing paper 5 A communicable disease is one that is spread from one person to another through a variety of ways that include: contact with blood and bodily fluids; breathing in an airborne virus; or by being bitten by an insect. Eg-Covid 19, Flu, Hepatitis, Measles A noncommunicable disease is a non-infectious health condition that cannot be spread from person to person. It also lasts for a long period of time. This is also known as a chronic disease. A combination of genetic, physiological, lifestyle, and environmental factors can cause these diseases. In the Indian as well as global context, the major cause for mortality is, Non-communicable diseases. Some of the NCDs are Cancer, Diabetes, esCardiovascular disease (CVD), Chronic and developmental challenges. The rising burden of NCDs has generated an overall concern globally to formulate and implement effective strategies for their prevention and control. 10.7 Programmes for controlling diseases in India In India, a national programme on cancer control was taken up for more than 30 years. Later this programme was integrated with the NCD control programme and the National Programme for Prevention and Control of Cancer, Diabetes, Cardiovascular diseases and Stroke (NPCDCS) was thus launched in October 2010. The objectives of this programme included prevention and control of NCDs through behaviour and lifestyle changes through providing early diagnosis and management of common NCDs Efforts were taken to build capacity at various levels of health care; training human resources adequately and establishing palliative and rehabilitative care and to develop sufficient community resources for effective prevention, detection, referral and treatment through linkage services along with the ongoing interventions of the National Health Mission (NHM) including programmes such as the National NSOU ? PGSW-VI _____ 221 Tobacco Control Programme (NTCP), National Mental Health Programme (NMHP), National Programme for Health Care of the Elderly (NPHCE) for NCDs, programmes that deal with communicable diseases like TB, as well as programmes like the RCH/ Adolescent/School Health etc. The Ministry of Health and Family Welfare has two departments: (i) the Department of Health and Family Welfare, and (ii) the Department of Health Research. The Department of Health and Family Welfare is responsible for functions including: (i) implementing health schemes, and (ii) regulating medical education and training. The Department of Health Research is broadly responsible for conducting medical research. This note analyses the financial allocation trends and key issues concerning the health sector. Overview of finances Overall, India's public health expenditure (sum of central and state spending) has remained between 1.2% to 1.6% of GDP between 2008-09 and 2019-20. [1], [2], [3] This expenditure is relatively low as compared to other countries such as China (3.2%), USA (8.5%), and Germany (9.4%). In 2020-21, the Ministry received an allocation of Rs 67,112 crore. This is an increase of 3.9% over the revised estimates of 2019-20 (Rs 64,609 crore). [4] Under the Ministry, the Department of Health and Family Welfare accounts for 97% of the Ministry's allocation, at Rs 65,012 crore. Whereas, the Department of Health Research is allocated Rs 2,100 crore (3% of the allocation). Following table shows the number of health professionals in India. Number of public health professionals in India (2014-18)

Profession	2014	2018	% increase
Allopathic Doctors	7,47,109	9,23,749	24%
AYUSH Doctors**	7,36,538	7,99,879	9%
Nurses and Pharmacists	32,86,157	40,91,597	25%

Notes: **includes Ayurveda Unani Siddha Naturopathy Homeopathy. Source: Economic Survey 2019-20; PRS. Pradhan Mantri Jan Arogya Yojana (PMJAY) Launched in September 2018 under the Ayushman Bharat programme, PMJAY aims to provide a cover of Rs five lakh per family per year to 10.7 crore families (no 222 _____ NSOU ? PGSW-VI cap on family size and age) belonging to poor and vulnerable population. [13] The scheme subsumed two centrally sponsored schemes, namely, Rashtriya Swasthya Bima Yojana (RSBY) and the Senior Citizen Health Insurance Scheme. Benefits: The scheme provides insurance coverage for secondary and tertiary healthcare. At present, 1,393 procedures across different specialties such as general medicine, oncology, cardiology, and orthopaedics are covered. In addition, the scheme provides for pre and post hospitalisation expenses. Pradhan Mantri Swasthya Suraksha Yojana Pradhan Mantri Swasthya Suraksha Yojana (PMSSY) has been implemented since 2003

Reproductive, Maternal, Newborn, Child and Adolescent Health (RMNCH+A) programme essentially looks to address the major causes of mortality among women and children as well as the delays in accessing and utilizing health care and services. It also introduces new initiatives like the use of Score Card to track health performance, National Iron + Initiative to address the issue of anemia across all age groups and the Comprehensive Screening and Early interventions for defects at birth, diseases, and deficiencies among children and adolescents. Rashtriya Bal Swasthya Karyakram (RBSK) is an important initiative aiming at early identification and early intervention for children from birth to 18 years to NSOU ? PGSW-VI

_____ 223 cover 4 'D's viz. Defects at birth, Deficiencies, Diseases, Development delays including disability. Early detection and management diseases including deficiencies bring added value in preventing these conditions to progress to its more severe and debilitating form The Rashtriya Kishor Swasthya Karyakram The key principle of this programme is adolescent participation and leadership, Equity and inclusion, Gender Equity and strategic partnerships with other sectors and stakeholders. The programme enables all adolescents in India to realize their full potential by making informed and responsible decisions related to their health and well-being and by accessing the services and support they need to do so. The government of India has launched Janani Shishu Suraksha Karyakaram to motivate those who still choose to deliver at their homes to opt for institutional deliveries. It is an initiative with a hope that states would come forward and ensure that benefits under JSSK would reach every needy pregnant woman coming to government institutional facility. ? Since the rate of deaths in the country because of communicable and non- communicable diseases is increasing at an alarming rate, the government has introduced various programmes to aid people against these diseases. In India, approximately about 5.8 million people die because of Diabetes, heart attack, cancer etc each year. In other words, out of every 4 Indians, 1 has a risk of dying because of a Non- Communicable disease before the age of 70. According to the World Health Organisation, 1.7 million Indian deaths are caused by heart diseases. National AIDS Control Organisation was set up so that every person living with HIV has access to quality care and is treated with dignity. By fostering close collaboration with NGOs, women's self-help groups, faith-based organizations, positive people's networks, and communities, NACO hopes to improve access and accountability of the services. It stands committed to building an enabling environment wherein those infected and affected by HIV play a central role in all responses to the epidemic – at state, district and grassroots level. Revised National TB Control Programme is a state-run tuberculosis control initiative of Government of India with a vision of achieving a TB free India. The program provides, various free of cost, quality tuberculosis diagnosis and treatment services across the country through the government health system. 224 _____ NSOU ? PGSW-VI ? National Leprosy Eradication Programme was initiated by the government for Early detection through active surveillance by the trained health workers and to provide Appropriate medical rehabilitation and leprosy ulcer care services. The Government of India has launched Mission Indradhanush with the aim of improving coverage of immunization in the country. It aims to achieve at least 90 percent immunization coverage by December 2018 which will cover unvaccinated and partially vaccinated children in rural and urban areas of India. 9. In order to address the huge burden of mental disorders and the shortage of qualified professionals in the field of mental health, Government of India has implemented National Mental Health Program to ensure the availability and accessibility of minimum mental healthcare for all in the foreseeable future. Pulse Polio is an immunization campaign established by the government of India to eliminate polio in India by vaccinating all children under the age of five years against the polio virus. The Pradhan Mantri Swasthya Suraksha Yojana (PMSSY) was announced with objectives of correcting regional imbalances in the availability of affordable/ reliable tertiary healthcare services and also to augment facilities for quality medical education in the country by setting up of various institutions like AIIMS and upgrading government medical college institutions. ?

98%**MATCHING BLOCK 122/127****W**

The most important programme launched by the government is Rashtriya Arogya Nidhi which provides financial assistance to the patients that are below poverty line and are suffering from life-threatening diseases, to receive medical treatment at any government run super specialty hospital/ institution. ? National Tobacco Control Programme was launched with the objective to bring about greater awareness about the harmful effects of tobacco use and about the Tobacco Control Laws and to facilitate the effective implementation of the Tobacco Control Laws. 14. Integrated Child Development Service was launched to improve the nutrition and health status of children in the age group of 0-6 years, lay the foundation for proper psychological, physical and social development of the child, effective coordination and implementation of policy among the various departments and to enhance the capability of the mother to look after the normal health and nutrition needs through proper nutrition and health education. NSOU ? PGSW-VI _____ 225 Rashtriya Swasthya Bima Yojana is a government-run health insurance programme for the Indian poor. It aims to provide health insurance coverage to the unrecognized sector workers belonging to the below poverty line and their family members shall be beneficiaries under this scheme. 10.8

Role of Social Workers in School Health Services Changes in contemporary society, the provision of health care, education, and the structure of the family have increased the necessity and demand for school health services. To address the diverse and complex health problems of students of today new kind of school health services are need of the hour In addition to health issues, schools are trying hard to cope with problems caused by socio -economic, family and marriage related problems, poverty, substance abuse, and violence. A social worker has a central management role in the implementation of the school health services for all children and youth studying in the school. Generally, the social worker collaborates with primary care providers, specialists/consultant physicians, and local health authorities, Local Government and NGOs to ensure a effective and quality health services to the children, adolescents and youths According to American Academy of Pediatrics (AAP) goals of the school health programmes are- ? Ensure access to primary health care ? Provide a system for dealing with crisis medical situations; ? Provide mandated screening and immunization monitoring; and ? Provide a process for identification and resolution of students' health care needs that affect educational achievement These goals are focusing on the prevention and early intervention to help the students to live a happy and prosperous life in future. The social workers could play a critical role to implement and manage the school health promotion activity, Apart from that social workers can provide health education and health counselling and advocate for students with disabilities Social workers will also be instrumental in making partnerships with local doctors, community organization, youth clubs and NGOs, Municipalities and Panchayats and Insurance Agencies (for group insurance of children) to make the school health services a participatory, holistic and successful one. From the successful school health programmes it can be stated there are 3 major roles to be played by the social workers in school health services-

226 _____ NSOU ? PGSW-VI 1. Providing health education to the students. Focus will be on how to improve health and prevent illness. 2. Providing limited health care services to treat common illness early, before they become serious, First Aid and referral services in case of severe ailments. 3. Helping the student community to change their knowledge, values, beliefs attitudes and practices and to rectify myths and misconceptions so that they can lead a healthier lives. 10.8.1 Role of Social Workers in Promotion of Personal Hygiene in School Social workers will encourage the students- ? To keep injuries and minor cuts clean ? To make regular bath with soap ? To wash their hands after defecation ? To wear clean clothes ? To trim their nails regularly ? To brush the teeth twice daily ? To wash private parts from front to back after defecating or urinating ? To change the undergarments regularly ? To keep the pubic hair short ? To use sanitary napkin or a clean, washed and sun-dried cloth during the time of menstruation. 10.8.2 Role of Social Workers in Providing Classroom facilities Social workers should use direct observation method to analyze the classroom facilities in a school He/She may also organize discussion with the students, teachers, and members of the governing body, Panchayats and any other concerned person to ascertain the number of children vis-a-vis number of classrooms, seating arrangements, blackboards available furniture, books, learning materials, audio-visual facilities, games materials etc. Social workers will try to convince the local authorities, Panchayats, Municipalities, Local MLAs and MPs and NGOs, Donors and common people of the area to provide required classroom facilities to the students. 10.8.3 Role of Social Workers in Promotion of healthy physical school environment The physical school environment encompasses the school building and all its

NSOU ? PGSW-VI _____ 227 contents including physical structures., infrastructure, furniture, and the use and presence of chemicals and biological agents, the site on which a school is located; and the surrounding environment including the air, water, and material with which children may come into contact, as well as nearby land uses, roadways and other hazards (WHO information Series on School Health). To promote healthy physical environment in schools social workers must promote the following components as proposed by WHO- ? Provision of basic necessities.. ? Shelter ? Warmth ? Water ? Food ? Light ? Ventilation ? Sanitary facilities ? Emergency medical care ? Protection from biological threats ? Molds ? Unsafe of insufficient water ? Unsafe food ? Vector-borne diseases ied cloth during the time of menstruation. ? Venomous animals ? Rodents and hazardous insects ? Other animal (e.g. dogs) ? Protection from physical threats. ? Traffic and transport ? Violence and crime ? Injuries ? Extreme heat and cold ? Radiation

228 _____ NSOU ? PGSW-VI ? Protection from chemical threats ? Air pollution ? Water pollution ? Pesticides ? Hazardous waste ? Hazardous materials and finishes ? Asbestos, pa'mt ? Clening agents

10.8.4 Role of Social Worker in Promotion of School Sanitation According to UNESCO access to clean water and adequate sanitation facilities is a fundamental right that safeguards health and human dignity. Schools offer a unique setting for the development and implementation of programmes to help need that right. UNESCO justified the statement by stating the following reasons- ? Children spend long hours in schools, so the school environment has a significant impact on their health and well being. An unsanitary or unsafe school environment can be the cause of sickness, injury or emotional distress. ? It is generally recognized that childhood is the best time for children to learn hygiene behaviours. Compared to adults, children tend to be more receptive to new ideas and new ways of doing things. They can more easily change their behaviour or adopt new behaviours as the result of increased knowledge and opportunities to practict new skills. ? Children and youth have important roles in the household, taking care ofyoung brothers and sisters and helping with daily chores, They are eager to learn and t help If they feel that health and environmental issues are improtant, and that the have a role to play, they can contribute in significant ways to efforts to protect the own and other health. Depending on the culture, they may become agents of chani within the family and the community by questioning harmful practices and mode of change within the family and the community by questioning harmful practices and modelling new behaviours. ? Children are future parents an what they learn is likely to be applied during the rest of their lives. Being tomorrow's parents, they have the potential to ensure the sustainability of a programme's impact.

NSOU ? PGSW-VI _____ 229 ? Schools are not only important places of learning for children; they are part of the fabric of community life. Through their links to other community institutions, and through their students, especially, they are usually in touch with a large proportion of the households in a community. If appropriate water and sanitation facilities are available in schools, they can serve as a model for such facilities in homes and other places in the community. Schools can also influence their communities, and especially families, through outreach activities. ? Teachers, as professionals and influential individuals are important role models for their students and for other adults. By demonstrating positive attitudes and the appropriate use of facilities, they can help to ensure that investments in sanitation "hardware" are supported by changes in individuals' hygiene behaviour. ? While the problems associated with poor sanitation and hygiene are disastrous for infants and young children, they also affect the health and school attendance of older children and adolescents. Keeping young people in school for a sufficient number of years is essential to the goals of universal basic education. These statements of UNESCO will be helpful for the social workers to advocate school sanitation in a more appropriate way UNICEF and IRC after recognizing the importance of the school sanitation admitted that three factors have to be addressed if lasting changes in hygiene behaviour are to occur. These are: -Predisposing factors-knowledge, attitude and belief; -Enabling factors-availability of resources like latrine facilities and safe water supply, enabling students to transform newly acquired knowledge, attitudes and beliefs into desirable behaviours; -Reinforcing factors-factors affecting the students' ability to sustain certain behaviour, like support and cooperation received from parents, guardians and peer groups. Keeping these in mind social workers must take initiatives to promote sanitation at schools. For installation of separate sanitary units for boys and girls they can contact with the local Panchayats and Sanitary Marts, Social workers should also have a dialogue with the parents, guardians and out of school peers to aware them

230 _____ NSOU ? PGSW-VI about the benefits of the sanitation and encourage them to install sanitary units in their dwelling if they have none. Lastly social workers should teach the pupils to use the sanitary facilities and wash their hands after defecation. 10.8.5 Role of Social Workers in Promotion of Child to Child Practice The child to child approach to health education was first introduced in 1978 by a team of health and education professional at the University of London to help school-aged children to learn about the disseminate basic health information to their peers and brothers and sisters The basic premise of this approach is that if given the required opportunity, our children can make valuable contributions to the improvement of health and well-being of themselves and others living in the same house or neighbourhoods. According to Sara Gibbs, Gillian Mann and Nicola Mathers (2002) some of the intended result of the child to child approach are : ? Children feel more able to tackle community problems ? Children feel better about themselves. ? Children work better in groups, ? Children know more about their chosen issue ? Children and adults communicate more openly with one another ? Children being more likely to speak out about issues of concern of them ? Children know more about resources and services that exist in their community ? The community being more open to listening and involving children ? Family and community respecting children's ideas and capabilities Again from the writhing of them we are here giving details of the roles of the social workers as facilitators in promotion of child to child approach. ? Listen carefully to children ? Take children's opinions and experiences seriously ? Be flexible ? Be open and approachable ? Give time to the process ? Guide and encourage ? Consider children's needs ? Keep a sense of humour

NSOU ? PGSW-VI _____ 231 ? Be patient ? Be creative ? Be democratic ? Listen to criticism ? Provide concrete opportunities ? Give regular feedback ? Share power ? Learn from mistakes Child-to-Child Trust proposed following six steps to promote health through child to child approach-Identifying a local health issue and understanding it well- Children and/or their teacher/ facilitator identify a priority health issue. The issue chosen may relate to a stated objective of the school curriculum or syllabus, or to a health campaign taking place in the community. Once an issue is identified, the children carry out activities designed to increase their understanding of it Finding out more the health issue- This step involves children in further information gathering activities. Some of these activities may take place inside the school, while others might take place in the community or at home. Ideally, these activities help children to learn how to gather and document information and develop important communication skills. Discussing what's been found out and planning action- Here the children organize their findings and use them as a basis for planning action in relation to specific health problems they have identified during step 2. The teacher/facilitator can take part in the planning process, and help children to distinguish between correct and incorrect information they might have gathered. Taking action -The children undertake the activities planned at step 3. These might take place in school, community or home, depending on the nature of the health issue chosen The type of activities undertaken may also depend on local customs and the nature of the relationships in the community, including between the school and community Evaluation : discussing results-The children and their teacher/facilitator evaluate the effectiveness or otherwise of their activities. If unexpected problems have been encountered, it is important for these to be discussed. Discussing how we can be more effective next time and sustain action Step 6 invites children to improve upon the activities they implemented at step 4 and, if appropriate, to repeat or continue their action.

<p>Introduction Group dynamics is the scientific approach to the understanding of the dynamics of group. It implies an interactive psychological relationship in which members of a group develop a common perception based on feelings and emotions. Group dynamics refer to the changes that take place within the group. It also refers to forces operating within the groups. Group dynamics is related to the field theory of Lewin which assumes man's behaviour to be a function of the field existing at the time of the occurrence of behaviour. We can further say that it is the study of group processes, their objective analysis and measurement and the effect of group membership on individual members. Our behaviour is not static. It means that the change of behaviour is through interaction in the group. According to Segal, group dynamics is a process by which one considers other individuals and a problem in a group at the same time. It not only tends to increase understanding of the problem, but also creates a solution which the individual practices in bringing about emotional balance. We can also say that group dynamics is influenced by sympathy, suggestion and imitation. Sympathy enables the members of a group to perceive the psychological state of the other members. Suggestion plays a big role in influencing group behaviour. The suggestions put forward by leader of a group are implemented by the members of the group. 4.3</p>		<p>INTRODUCTION Group dynamics is the scientific approach to the understanding of the dynamics of group. On the other hand, play group, peer group and social clubs are examples of formal groups. In informal groups, rules are usually flexible. An individual may belong to many groups. The behaviour of an individual is different from the group behaviour. In the group a person has to act according to the norms of the group and generally, a few individuals may guide the behaviour of the group. In this context, we can say that group interaction is a two-way process whereby each individual or group stimulates the behaviour of the participants. We can further say that the behaviour and personality characteristics of individual members of a group affect the behaviour of others and ultimately it makes a significant impact over the functioning of a group as a whole. As for example, we can say that the school is a social institution set up by the society to serve its ends. School is primarily a social institution. Group activities should be encouraged to provide opportunities to the students to participate in the affairs of the group. One of the important functions of the school is social interaction. Not only are the teachers and pupils continually interacting in the class-room system, but the pupils are also interacting among themselves through special pre determined code or signs or looks, and there are many common stereotypes and values that they share with each other. Like any other social system, the class-room group shows a variety of interactions continuously. Formal structure is not only factor in group functioning. Within this formal structure, there is informal relationship. Communication within the group may flow more through informal channels than through formal ones. The informal sub-groups are typically more homogenous than the classroom group. Not only this, peer group pressures exert a powerful impact in many cases. NSOU • PGSW - VI

--- 111 4.4 Meaning, Concept and Importance of Group Dynamics In 1944, Kurt Lewin, set up the Research Centre for Group Dynamics to meet the need of a scientific approach to the understanding of the dynamics of group. Group dynamics can be defined as a field of enquiry dedicated to the advancing knowledge about the nature of groups, the laws of their development and their interrelations with individuals, other groups and larger institutions. Actually, it implies that the interactive psychological relationship in which members of a group develop a common perception based on feelings and emotions. It is not easy to define the important area of group dynamics. We can say that it represents a field of enquiry, a series of inter-related problems, a set of techniques and interaction process. Group dynamics consists of two words – (i) group and (ii) dynamics. A group is a unit of two or more individuals who share a set of beliefs and values. The members of the group share a common purpose, task or goals. The relations among the members are interdependent. Not only this, there is a feeling of belongingness or we feeling among the members of the group. The members of the group generally prescribe a set of norms of behaviour for themselves. The members want to attain the goal effectively. The structure is hierarchical where the functions and powers are distributed. On the other hand, the word dynamics means

On the other hand, play group, peer group and social clubs are examples of formal groups. In informal groups, rules are usually flexible. An individual may belong to many groups. Like any other social system, the class-room group shows a variety of interactions continuously. Formal structure is not only factor in group functioning. Within this formal structure, there is informal relationship. Communication within the group may flow more through informal channels than through formal ones. The informal sub-groups are typically more homogenous than the classroom group. Not only this, peer group pressures exert a powerful impact in many cases. 2.2.1 Meaning, Concept and Importance of Group Dynamics In 1944, Kurt Lewin, set up the Research Centre for Group Dynamics to meet the need of a scientific approach to the understanding of the dynamics of group. 24 Group Dynamics Group dynamics can be defined as a field of enquiry dedicated to the advancing knowledge about the nature of groups, the laws of their development and their interrelations with individuals, other groups and larger institutions. Actually, it implies that the interactive psychological relationship in which members of a group develop a common perception based on feelings and emotions. It is not easy to define the important area of group dynamics. We can say that it represents a field of enquiry, a series of inter-related problems, a set of techniques and interaction process. Group dynamics consists of two words – (i) group and (ii) dynamics. A group is a unit of two or more individuals who share a set of beliefs and values. The members of the group share a common purpose, task or goals. The relations among the members are interdependent. Not only this, there is a feeling of belongingness or we feeling among the members of the group. The members of the group generally prescribe a set of norms of behaviour for themselves. The members want to attain the goal effectively. The structure is hierarchical where the functions and powers are distributed. On the other hand, the word dynamics means force. Group dynamics refers to forces operating with in the

force. Group dynamics refers to forces operating within the groups. Group dynamics is related to field theory of Lewin, which assumes man's behaviour to be a function of the field existing at the time of the occurrence of behaviour. We can also say that the group dynamics is the study of group processes, their objective analysis and measurement and the effect of group membership on individual members. When a group of people is formed with a common goal, a kind of social force is created. Our behaviour is not static. Thus, group dynamics means the change of behaviour through interaction in the group. Concept of Group Dynamics The social psychologists seek to explain group behaviour on the basis of social interaction and cultural transmission through social interaction. The interactive psychological relationship is termed as "group dynamics". The important two variables we can say in this context are "group cohesiveness" and "group locomotion". Cohesiveness plays a vital role in determining the influence of the group on the members. On the other hand, locomotion indicates the movement towards the desired 112

___NSOU • PGSW - VI goal. Personality of the individual and character of the social situation both takes an important role for group dynamics. All the psychological effects take place within the individual members who compose the group. According to Cartwright and Zander (1968), the basic assumptions are: i) the groups are inevitable (even the hermits / Sanyasis and the Hippies), ii) that groups mobilise powerful forces that produce effects of utmost importance to individuals, iii) that groups can produce constructive as well as destructive consequences and iv) that it is the correct understanding of group dynamics based on empirical studies that helps in enhancing the constructive aspects of group life and group achievements. It can also be said that group cohesiveness indicates the degree to which the members stick together so that there is unity in the group. Actually the basis of attraction to the group may lie in the interaction itself because of the mutual satisfaction of needs. The group may be teen-age group or a political group or Group Dynamics a religious group. Three important things one can consider for group cohesiveness, i.e., task direction, personal attraction and group prestige. The strength of the cohesiveness may vary on the basis of the situation. Thus, when we study the group as a whole we are aware of studying changes which occur in the behaviour of the individuals and how these changes are transmitted to all the individuals to the total field, so that the behaviour of the group is altered. On the other hand, when the group itself shows a readiness to change by active participation then actual social change becomes possible. The change will occur when the group actually takes the decision to change. Thus the concept of group dynamics is helpful in understanding social changes which involve not only the introduction of an innovation, but also in overcoming of resistance. Group dynamics is also influenced by sympathy, suggestion and imitation. Sympathy enables the members of a group to perceive the psychological state of the other members. Actually the members begin to feel as others feel. On the other hand, suggestion plays a big role in influencing the group behaviour. The suggestions put forward by the leader of the group are readily accepted. The

groups. Group dynamics is related to field theory of Lewin, which assumes man's behaviour to be a function of the field existing at the time of the occurrence of behaviour. We can also say that the group dynamics is the study of group processes, their objective analysis and measurement and the effect of group membership on individual members. When a group of people is formed with a common goal, a kind of social force is created. Our behaviour is not static. Thus, group dynamics means the change of behaviour through interaction in the group. Concept of group dynamics The social psychologists seek to explain group behaviour on the basis of social interaction and cultural transmission through social interaction. The interactive psychological relationship is termed as "group dynamics". The important two variables we can say in this context are "group cohesiveness" and "group locomotion". of group dynamics are given below: i) It is essential for effective practice with any type of task. ii) It promotes out the unproductive meetings. iii) Individual members or group as a whole benefit in a number of ways. iv) Underlying group dynamic is the multicultural diversification of the society. v) The future functioning of the group is influence by group dynamic. vi) Facilitates the participation of the members. vii) Helps to achieve the goals of the group in connection with the participation and satisfaction of the group. viii) It increases the interpersonal attraction. ix) It increases the communication processes and interaction patterns. x) It increases the power and control of the group. xi) It creates impact on racial, ethnic and cultural background. 4.5 Role of Communication in Group Dynamics Communication involves the transmission of a message from a sender to a receiver. According to Toseland and Rivas (2001) communication includes: i) encoding of perception, thoughts and feelings into language and other symbols by a sender; ii) transmission of language and symbols verbally, non-verbally or virtually; and iii) decoding of the message by the receiver. Face-to-face group members experience both verbal and non-verbal communication, whereas members of telephone groups experience only verbal communication and members of computer groups experience only virtual communication. Interaction patterns are also fundamental to group dynamics. According to David (1980) some of the significant points in this regard include: i) Leader is the central figure, and communication occurs from member to leader and leader to member 114

 ___NSOU • PGSW - VI ii) Group members take turns talking. iii) Indication of extension between leader and the member. iv) All members freely communicate. v) Interaction pattern focuses on the degree of centralisation of communication. vi) Group-centred interaction pattern is more valued than leader-centered interaction pattern. vii) Indication of full participation among the members. viii) The status and power relationship within the group affect the interaction pattern. Group Dynamics ix) Interpersonal attraction and the emotional bonds that form between members influence the interaction pattern. x) Size of the group affects the interaction pattern. In general, there is more chance to communicate if the group size is small. xi) Selective attention, clues and reinforcement may take important role to change the interaction patterns. xii) If members do not interact with equal valence, there seems to be indication of sub-group formation. xiii) Interpersonal attraction, emotional bonds and interest may create impact on the group members. xiv) Physical arrangement in some situation may affect interaction patterns. Thus, we can say the communication processes and interaction patterns are important factors for group dynamics. 4.6 Interpersonal Attraction and Cohesion in Group Dynamics We can say that sub-group formation depends on interpersonal attraction among the group members and the level of cohesion depends on this. There are some important features that can be mentioned here: i) Proximity increases interaction among people and ultimately

Group Dynamics and Social Integration Social integration means how group members fit together and are accepted in the group. In each and every group there are norms, roles and status. These are the group dynamics that promote social integration by influencing how members behave. The norm, status and roles help the groups to avoid conflict and unpredictability which 116

____NSOU • PGSW - VI may create chaos. It is true that group can not function effectively without a fairly high level of social integration among group members. Social integration helps to build unanimity about the purposes and goals of the group. Deutsch and Gerard (1955) postulated two forms of social influence: normative influence and informational influence. Normative influence is the desire to meet other people's expectations and to be accepted by others. Informational influence is accepting and being persuaded by information provided by others. It is undoubtedly true that certain amount of predictability, conformity and compliance is necessary for the group members to work together to achieve the goals of the group. Actually norms develop slowly in the group, as members experience what is valued and what is preferred behaviour through group interaction. On the other hand, roles are shared expectations about the functioning of individual members of the group. Members may take different roles. Besides this, status refers to the ranking of importance of members of the group relative to each other. Status is determined by the prestige, power, position and expertise. Because a group member's status is measured in relationship to other members, it may change when other members join or leave the group. Status is also determined by the situation. Status hierarchies have a good deal of influence on social integration within groups. Thus, norms, roles and status are important components of the social influence that groups have on members. 4.8 Culture and Group Culture as is well known is a combination of values, beliefs and traditions of the society. Every individual born in that culture and it influence his overall personality. Values, beliefs, customs, traditions etc. are important factors for culture and these are shared by group members. When group members meet, they explore their value system and interpersonal styles, searching for a common ground on which to relate to each other. The culture of a group is determined by the communality and also the larger society. The system depends on the nature and extent of their interaction with the group. Multicultural differences are salient interpersonal factors that have significance for the group culture. Group processes have reflected the European and American values of individualism, independence, competitiveness and achievement. Besides this, cultural experiences of group survival, social hierarchy, inclusiveness and also ethnic identification influence the way members interact with one another in the group. Member's expectations and goals in a multicultural group vary widely. They significantly influence the dynamics of the group (Hopps and Pinderhughes, NSOU • PGSW - VI

Group processes have reflected the European and American values of individualism, independence, competitiveness and achievement. Besides this, cultural experiences of group survival, social hierarchy, inclusiveness and also ethnic identification influence the way members interact with one another in the group. Member's expectations and goals in a multicultural group vary widely. They significantly influence the dynamics of the group (Hopps and Pinderhughes, 1991; Matsukawa, 2001). According to Davis et al (1995), the group leader should be sensitive to racial /ethnic and socio- economic differences, should understand the effect of these differences on group

___ 117 1991; Matsukawa, 2001). According to Davis et al (1995), the group leader should be sensitive to racial /ethnic and socioeconomic differences, should understand the effect of these differences on group dynamics and should translate this knowledge into culturally sensitive modes of program development and service delivery. Many factors affect group development. Structural characteristic is one of the important impacts on development. 4.9 Measurement of Group Dynamics Measurement of group dynamics is essential to understand the behaviour of a group as a whole as well an individuals who make up the group. There are many scales to measure group dynamics, viz., Group Climate Questionnaire (Mackenzie, 1983), Group Cohesiveness Scale (Budman, 1993), Group Work Engagement Measure (Macgowan, 2000) and Group Member Interpersonal Process Scale (Soldz, 1993). Task groups, such as committees, teams, board of directors are not merely collections of individuals. The synergy that is created when people come together to work in these groups transcends the collection of individual efforts. We have to pay attention to group dynamics because group dynamics facilitate member participation and satisfaction to achieve the group goal. 4.10 Group Development As groups develop over time, group dynamic processes evolve. In this context, we can mention a well-known model by Tuckman (1963), which is known as stage model (as mentioned in unit 1). The stages are: i) Forming, ii) Storming, iii) Norming iv) Performing and v) Adjourning There is also the widely used model by Garland, Jones and Kolody (1976) Here the five significant stages are: i) Pre-affiliation: Should be affected to the group. ii) Power and control: Should be able to have some influences over the other members. iii) Intimacy: There must be certain closeness and intimacy. 118

dynamics and should translate this knowledge into culturally sensitive modes of program development and service delivery. Many factors affect group development. Structural characteristic is one of the important impacts on development. 2.4 MEASUREMENT OF GROUP DYNAMICS Measurement of group dynamics is essential to understand the behaviour of a group as a whole as well an individuals who make up the group. There are many scales to measure group dynamics, viz., Group Climate Questionnaire (Mackenzie, 1983), Group Cohesiveness Scale (Budman, 1993), Group Work Engagement 30 Group Dynamics Measure (Macgowan, 2000) and Group Member Interpersonal Process Scale (Soldz, 1993). Task groups, such as committees, teams, board of directors are not merely collections of individuals. The synergy that is created when people come together to work in these groups transcends the collection of individual efforts. Group Dynamics : Definition A group includes only persons who share some norms and values about something. We can say that group contains people with interrelated social roles. An aggregate of people may form themselves into a group as a result of interaction. Thus, we can say that groups are the products of interaction. Group interaction is a two way process whereby each individual or group stimulates the other and also in varying degrees that modify the behaviour of the participants. The behaviour and personality characteristics of individual members of a group affect the behaviour of others and make a significant impact over the functioning of a group as a whole. In this context we can consider two types of groups, viz., formal and informal groups. Formal groups are formed on the basis of specific norms, values etc. School is an example of formal group. 110

Introduction Psychodynamic Theory is one in which patients treated are viewed within a model of illness that attempts to identify something that is not obvious but is present, but may be at the unconscious level. Such a material once brought out of the unconscious would be able to help the patient be relieved of the symptoms and get the person on the road to recovery. Thus each individual is perceived to have had certain experiences and events that have been pushed into the unconscious as these materials are very painful and shameful to the individual. These materials remain in the unconscious and keep trying to enter the conscious only to be repressed back. These are basically materials that are wishes and desires and needs which are represented by the Id, and which are catered to by the ego so as to fulfill the needs of the Id. At the same time the do's and don'ts, the moral values, the rights and wrongs that are imparted by the parents are represented by the superego which tries to curb the id impulses from arising so that the person may not do anything wrong which may cause the society harm. Thus the dynamic interaction amongst the Id, Ego and the superego as well as the society or the outer environment make the individual behave in a certain way. All these dynamics start quite at an early age of the individual and remain so and continue even in adulthood. In the process of catering to the Id and the superego the ego uses many defenses which help in maintaining a balance in the personality. However if balance is not restored the individual may develop certain abnormalities called as mental disorders which need to be treated and one method of treatment is the psychoanalysis. Freud developed a technique that he called psychoanalysis and used it to treat mental disorders. The conscious contains all the information that a person is paying attention to at any given time. The preconscious contains all the information outside of a person's attention but readily available if needed. The unconscious contains thoughts, feelings, desires, and memories of which people have no awareness but which keep influencing every aspect of individual's day to day life. Freud believed that personality gets clearly established during childhood, largely before the age of five years. He proposed five stages of psychosexual development, viz., the oral stage, the anal stage, the phallic stage, the latency stage, and the genital stage. Thus personality development for Freud took place before five years of age and continued on into the adulthood with very little change. Freud had many followers and some of them parted company with him on many of the issues related to personality development, as for instance the issue of psychosexual development etc. Erikson was one such person who was a follower of Freud but separated away to propound his own theory. Erikson's theory of ego psychology holds certain tenets that differentiate his theory from Freud's. Erikson's stages provide a framework in which one can bring in the culture concept and compare the present day to that of the earlier days. It also offers insights regarding the eight stages being divided into two parts, with one ending with childhood and the other adult development.

Freud had many followers and some of them parted company with him on many of the issues related to personality development, as for instance the issue of psychosexual development etc. Erikson was one such person who was a follower of Freud but separated away to propound his own theory. Erikson's theory of ego psychology holds certain tenets that differentiate his theory from Freud's. Erikson's stages provide a framework in which one can bring in the culture concept and compare the present day to that of the earlier days. It also offers insights regarding the eight stages being divided into two parts, with one ending with childhood and the other adult development.

In this unit we will be dealing with the theories of personality development as put forward by Freud and Erikson. 5.3

In this unit we will be dealing with the theories of personality development as put forward by Freud and Erikson. 2.1

Psychodynamic Theories of Personality Psychodynamic Theory is one in which patients treated for mental disorders are viewed within a model of illness that attempts to identify something that may be not in the realm of awareness of the individual concerned. Each individual is perceived to be made up from a dynamic that begins in early childhood and continually progresses throughout life. This way of thinking, however, is generally considered a watered down version of the more conservative and rigid psychoanalytic school of thought. Psychoanalysis emphasises the belief that all adult problems are directly related to events in one's childhood. Therapists who practice this theory have a tendency to look at individuals as the composite of their parental upbringing. Their focus is on the means for settling conflicts between themselves and their parents as well as within themselves. Psychodynamic therapists tend to believe in the theoretical constructs of the ego (which acts as a force

people make between ideas. The Freudian Slip Manju calls up her mother on Mother's Day and says, "You're the beast, Mom," when she consciously intended to say, "You're the best, Mom." According to psychoanalytic theory, this slip of the tongue, known as a Freudian slip, reveals her unconscious anger toward her mother. 136

___ NSOU I PGSW-VI The ID, The EGO, and The Superego
 Freud proposed that personality has three components: the id, the ego, and the superego. Id: Id is conceived as a reservoir of instinctual energy that contains biological urges such as impulses toward survival, sex, and aggression. The id is unconscious and operates according to the pleasure principle, the drive to achieve pleasure and avoid pain. The id is characterised by primary process thinking, which is illogical, irrational, and motivated by a desire for the immediate gratification of impulses. Ego: Ego is considered as the component that manages the conflict between the id and the constraints of the real world. Some parts of the ego are unconscious, while others are preconscious or conscious. The ego operates according to the reality principle, the awareness that gratification of impulses has to be delayed in order to accommodate the demands of the real world. The ego is characterised by secondary process thinking, which is logical and rational. The ego's role is to prevent the id from gratifying its impulses in socially inappropriate ways. Superego: This is considered to be the moral component of personality. It contains all the moral standards learned from parents and society. The superego forces the ego to conform not only to reality but also to its ideals of morality. Hence, the superego causes people to feel guilty when they go against society's rules. Like the ego, the superego operates at all three levels of awareness. Conflict: Freud believed that the id, the ego, and the superego are in constant conflict. He focused mainly on conflicts concerning sexual and aggressive urges because these urges are most likely to violate societal rules. Anxiety: Internal conflicts can make a person feel anxious. In Freud's view, anxiety arises when the ego cannot adequately balance the demands of the id and the superego. The id demands gratification of its impulses, and the superego demands maintenance of its moral standards.

The ego is characterised by secondary process thinking, which is logical and rational. The ego's role is to prevent the id from gratifying its impulses in socially inappropriate ways. Superego: This is considered to be the moral component of personality. It contains all the moral standards learned from parents and society. The superego forces the ego to conform not only to reality but also to its ideals of morality. Hence, the superego causes people to feel guilty when they go against society's rules. Like the ego, the superego operates at all three levels of awareness. Conflict: Freud believed that the id, the ego, and the superego are in constant conflict. He focused mainly on conflicts concerning sexual and aggressive urges because these urges are most likely to violate societal rules. Anxiety: Internal conflicts can make a person feel anxious. In Freud's view, anxiety arises when the ego cannot adequately balance the demands of the id and the superego. The id demands gratification of its impulses, and the superego demands maintenance of its moral standards. 2.3.3

similar to a referee) and the superego (known as the conscience) as well as an id that exists inside all of us that tends to act as the devil's advocate working against the thought process of the conscience. All of these constructs work together to make up the personality and the role of the unconscious is emphasised meaning that contrary to what else one may think, what one does not know can indeed hurt the person and more often than not, it does just that. The development of an adult's personality is viewed in terms of whether an individual has been able to successfully maneuver through the psychosexual stages of childhood development. Because of this belief, adults are unlikely to know how they are screwed up and as a result may not even recognise the signs of mental distress or mental disorder.

5.4 Psychoanalytic Theory by Sigmund Freud

In the late 1800s and early 1900s, Freud developed a technique that he called psychoanalysis and used it to treat mental disorders. He formed his theory of psychoanalysis by observing his patients. According to psychoanalytic theory, personality development takes place as a result of the attempts to resolve conflicts between unconscious sexual and aggressive impulses and societal demands to restrain these impulses. Freud's theory of development has two primary ideas: 1) Everything you become is determined by your first few years – indeed, the adult is exclusively determined by the child's experiences, because whatever actions occur in adulthood are based on a blueprint laid down in the earliest years of life (childhood solutions to problems are perpetuated) 2) The story of development is the story of how to handle anti-social impulses in socially acceptable ways. The Conscious, The Preconscious, and The Unconscious

Freud believed that most mental processes are unconscious. He proposed that people have three levels of awareness: The Preconscious, the conscious and the unconscious. The conscious contains all the information that a person is paying attention to at any given time. Example: The words Dan is reading, the objects in his field of vision, the sounds he can hear, and any thirst, hunger, or pain he is experiencing at the moment are all in his conscious. The preconscious contains all

Humanistic and Self Theories of (Malsow and Rogers) Personality The Humanistic Approach began in response to concerns by therapists against perceived limitations of Psychodynamic theories, especially psychoanalysis. Psychologists and psychoanalysts such as Carl Rogers and Abraham Maslow felt that the existing (psychodynamic) theories failed to adequately address issues such as the meaning of behaviour, and the nature of healthy growth. However, the result was not simply new variations on psychodynamic theory, but rather a fundamentally new approach. There are several factors which distinguish the Humanistic Approach from other approaches, that is, the difference can be seen in the emphasis on subjective meaning, a rejection of determinism, and a concern for positive growth rather than pathology. While one might argue that some psychodynamic theories provide a vision of healthy growth (including Jung's concept of individuation), the other characteristics distinguish the Humanistic Approach from every other approach within psychology (and sometimes lead theorists from other approaches to say the Humanistic Approach is not a science at all). Most psychologists believe that

methods (e.g., surveys, group data) which humanists have traditionally avoided. Another area influenced by the humanistic approach has been coaching psychology. While the term originated in "personal coaching" in sports, it more generally refers to a focus on enhancing individual potential, and the field has gradually become a specific area within many psychology associations. Abraham Maslow :

Humanistic Approach to Personality Abraham Maslow, widely regarded as one of the founders of the Humanistic Approach, was born on April 1, 1908 in Brooklyn, New York. He received his BA in 1930, his MA in 1931, and his PhD in 1934, all in psychology, all from the University of Wisconsin. A year after graduation, he returned to New York to work with E. L. Thorndike at Columbia, where Maslow became interested in research on human sexuality. He began teaching full time at Brooklyn College. During this period of his life, he came into contact with the many European intellectuals who were migrating to the US, and Brooklyn in particular, at that time. Persons like Adler, Fromm, Horney, as well as several Gestalt and Freudian psychologists also migrated to Brooklyn initially. Maslow served as the chair of the psychology department at Brandeis from 1951 to 1969. While working here he met Kurt Goldstein, who had put forward the idea of self- actualisation in his famous book, *The Organism* (1934). It was also here that he began his crusade for a humanistic psychology, something ultimately much more important to him than his own theorising. He spent his final years in semi retirement in California, until, on June 8 1970, he died of a heart attack after years of ill health. Maslow developed a theory of personality that has influenced a number of different fields. This wide influence is due in part to the high level of practicality of Maslow's theory. His theory accurately describes many realities of personal experiences. Humanists do not believe that human beings are pushed and pulled by mechanical forces, either of stimuli and reinforcements (behaviourism) or of unconscious instinctual impulses (psychoanalysis). Humanists focus upon potentials. They believe that humans strive for an upper level of capabilities. Humans seek the frontiers of creativity, the highest reaches of consciousness and wisdom. This has been labeled "fully functioning person", "healthy personality", or as Maslow calls this level, "self-actualising person." Maslow's theory of personality can be explained

the following headings: 1) Hierarchy of needs, 2) Deficit needs, 3) Growth needs, 4) Self-actualisers Hierarchy of Needs Maslow proposed a theory of human motivation based on hierarchy of needs. The lower a need in the hierarchy the more dominating that need is. In other words, when several needs are active, the lowest need will be most compelling. The higher order needs emerge only when the lower level needs are satisfied. The first four levels are considered deficiency or deprivation needs ("D-needs") in that their lack of satisfaction causes a deficiency that motivates people to meet these needs. For instance the Physiological needs which are at the lowest level on the hierarchy, include necessities such as air, food, and water. These tend to be satisfied for most people, but they become predominant when unmet. During emergencies, safety needs such as health and security rise to the forefront. Once these two levels are met, belongingness needs, such as obtaining love and intimate relationships or close friendships, become important. The next level, esteem needs, include the need for recognition from others, confidence, achievement, and self-esteem. The highest level is self-actualisation, or the self-fulfillment. Behaviour in this case is not driven or motivated by deficiencies but rather one's desire for personal growth and the need to become all the things that a person is capable of becoming (Maslow, 1970). Now we will discuss each level of needs one by one : The lowest level in the Maslow's hierarchy is the physiological needs. These include the most basic needs that are vital to survival, such as the need for water, air, food and sleep. Maslow believed that these needs are the most basic and instinctive needs in the hierarchy because all needs become secondary until these physiological needs are met. These needs are such that if they are not satisfied the organism dies. If the threat of dying because of perturbation of the physiological equilibrium has vanished, the organism can direct its attention to more indirect threats, such as the danger of being caught by a predator, and try to avoid them. The next needs in the hierarchy are safety needs. These include needs for safety and security. Security needs are important for survival, but they are not as demanding 150

____ NSOU I PGSW-VI as the physiological needs. Examples of security needs include a desire for steady employment, health insurance, safe neighbourhoods and shelter from the environment. At the third level of the hierarchy are belongingness needs. These include needs for belonging, love and affection. Maslow considered these needs to be less basic than physiological and security needs. Relationships such as friendships, romantic attachments and families help fulfill this need for companionship and acceptance, as does involvement in social, community or religious groups. At the fourth level of hierarchy are self-esteem needs After the first three needs have been satisfied, esteem needs becomes increasingly important. Maslow noted two versions of esteem needs, a lower one and a higher one. The lower one is the need for the respect of others, the need for status, recognition, fame, prestige, and attention. The higher one is the need for self-respect, the need for strength, competence,

the following headings: 1) Hierarchy of needs, 2) Deficit needs, 3) Growth needs, 4) Self-actualisers 4.3.1 Hierarchy of Needs Maslow proposed a theory of human motivation based on hierarchy of needs. The lower a need in the hierarchy the more prepotent or dominating that need is. In other words, when several needs are active, the lowest need will be most compelling. The higher order needs emerge only when the lower level needs are satisfied. The first four levels are considered deficiency or deprivation needs ("D-needs") in that their lack of satisfaction causes a deficiency that motivates people to meet these needs. For instance the Physiological needs which are at the lowest level on the hierarchy, include necessities such as air, food, and water. These tend to be satisfied for most people, but they become predominant when unmet. During emergencies, safety needs such as health and security rise to the forefront. Once these two levels are met, belongingness needs, such as obtaining love and intimate relationships or close friendships, become important. The next level, esteem needs, include the need for recognition from others, confidence, achievement, and self-esteem. The highest level is self-actualisation, or the self-fulfillment. Behaviour in this case is not driven or motivated by deficiencies but rather one's desire for personal growth and the need to become all the things that a person is capable of becoming (Maslow, 1970). Now we will discuss each level of needs one by one: The lowest level in the Maslow's hierarchy is the physiological needs. These include the most basic needs that are vital to survival, such as the need for water, air, food and sleep. Maslow believed that these needs are the most basic and instinctive needs in the hierarchy because all needs become secondary until these physiological needs are met. These needs are such that if they are not satisfied the organism dies. If the threat of dying because of perturbation of the physiological equilibrium has vanished, the organism can direct its attention to more indirect threats, such as the danger of being caught by a predator, and try to avoid them 62 Theories of Personality-I The next needs in the hierarchy are safety needs. These include needs for safety and security. Security needs are important for survival, but they are not as demanding as the physiological needs. Examples of security needs include a desire for steady employment, health insurance, safe neighbourhoods and shelter from the environment. At the third level of the hierarchy are belongingness needs. These include needs for belonging, love and affection. Maslow considered these needs to be less basic than physiological and security needs. Relationships such as friendships, romantic attachments and families help fulfill this need for companionship and acceptance, as does involvement in social, community or religious groups. At the fourth level of hierarchy are self-esteem needs After the first three needs have been satisfied, esteem needs becomes increasingly important. Maslow noted two versions of esteem needs, a lower one and a higher one. The lower one is the need for the respect of others, the need for status, recognition, fame, prestige, and attention. The higher one is the need for self-respect, the need for strength, competence, mastery, self-

mastery, self-confidence, independence and freedom. These needs rank higher because it rests more on inner competence won through experience. Deprivation of these needs can lead to an inferiority complex, weakness and helplessness. Satisfaction of the self-esteem need leads to feelings of self-confidence, worth, strength, capability and adequacy of being useful and necessary in the world. These feelings in turn give rise to either basic discouragement or else compensatory or neurotic trends. An appreciation of the necessity of basic self-confidence and an understanding of how helpless people are without it, can be easily gained from a study of severe traumatic neurosis. The highest level need is self-actualisation. "What a man can be, he must be". This forms the basis of the perceived need for self-actualisation. This level of need pertains to what a person's full potential is and realising that potential. Maslow describes this desire as the desire to become more and more what one is, to become everything that one is capable of becoming. This is a broad definition of the need for self-actualisation, but when applied to individuals the need is specific. For example one individual may have the strong desire to become an ideal parent, while for another it may be expressed athletically, and in the third it may be expressed in painting, pictures, or inventions. As mentioned earlier, in order to reach a clear understanding of this level of need one must first not only achieve the previous needs, physiological, safety, love, and esteem, but master these needs. Below are Maslow's descriptions of the consequences that what will happen if these needs are not satisfied.

confidence, independence and freedom. These needs rank higher because it rests more on inner competence won through experience. Deprivation of these needs can lead to an inferiority complex, weakness and helplessness. Deficiency Needs It has been stated in the earlier discussion that the first four levels of needs are called deficit needs, or D-needs. If you don't have enough of something, then it is said that you have a deficit that is you feel the need. But if you get all you need, you feel nothing at all! In other words, they cease to be motivating. He also talks about these levels in terms of homeostasis. Homeostasis is the principle by which the bodily system (thermostat) operates. In other words, when it gets too cold, the thermostat switches the heat on and when it gets too hot, it switches the heat off. In the same way, human body, when it lacks a certain substance, develops a hunger for it; when it gets enough of it, then the hunger stops. Maslow simply extends this homeostatic principle to needs, such as safety, belongingness, and esteem about which we do not ordinarily think of in these terms. In terms of overall development, we move through these levels a bit like stages. As newborns, our focus (if not our entire set of needs) is on the satisfaction of the physiological needs. Soon, we begin to recognise that we need to be safe. Soon after that, we crave attention and affection. A bit later, we look for self-esteem. Mind you, this is in the first couple of years! Under stressful conditions, or when survival is

threatened, we can "regress" to a lower need level. When you find that your great career falls flat, you might seek out a little attention. When your family decides to leave you, it seems that love is again all you ever wanted. If you have significant problems along your development, that is a period of extreme insecurity such as hunger as a child, or the loss of a family member through death or divorce, or significant neglect or abuse, it is possible that one may "fixate" on that set of needs for the rest of one's life. Growth Needs Maslow has used a variety of terms to refer to the last level of needs. He has called it growth motivation (in contrast to deficit motivation). They are called the being needs (or B-needs, in contrast to D-needs), and self-actualisation. These are needs that do not involve balance or homeostasis. They involve the continuous desire to fulfill potentials, to "be all that you can be". If you want to be truly self-actualising, you need to have your lower needs taken care of, at least to a considerable extent. This makes sense, which is if you are hungry, you are scrambling to get food; if you are unsafe, you have to be continuously on guard; if you are isolated and unloved, you have to satisfy that need; if you have a low sense of self-esteem, you have to be defensive or compensate. When lower needs are unmet, you cannot fully devote yourself to fulfilling your potentials. The question becomes, of course, what exactly Maslow means by self-actualisation. To answer that, we need to look at the kind of people he called self-actualised persons. Fortunately, he did this for us, using a qualitative method called biographical analysis. He began by picking out a group of people, some historical figures, some people he knew, whom he felt clearly met the standard of self-actualisation. Included in this august group were Abraham Lincoln, Thomas Jefferson, Albert Einstein, Eleanor Roosevelt, Jane Adams, William James, Albert Schweitzer, Benedict Spinoza, and Alduous Huxley, plus 12 unnamed people who were alive at the time Maslow did his research. He then looked at their biographies, writings, the acts and words of those he knew personally, and so on. From these sources, he developed a list of qualities that seemed characteristic of these people, as opposed to the great mass of us. Characteristics of Self-Actualisers According to Maslow, people who are self-actualised, were: 1) Reality-centred, which means they could differentiate what is fake and dishonest from what is real and genuine?

Problem-centred, meaning they treated life's difficulties as problems demanding solutions, not as personal troubles to be railed at or surrendered to. 3) Had a different perception of means and ends. They felt that the ends do not necessarily justify the means, that the means could be ends themselves, and that the means, that is the journey was often more important than the ends. 4) Had different ways of relating to others. First, they enjoyed solitude, and were comfortable being alone. And they enjoyed deeper personal relations with a few close friends and family members, rather than more shallow relationships with many people. 5) Enjoyed autonomy, a relative independence from physical and social needs. 6) Resisted enculturation, that is, they were not susceptible to social pressure to be "well adjusted" or to "fit in" . They were, in fact, nonconformists in the best sense. 7) Had an unhostile sense of humor. They preferred to joke at their own expense, or at the human condition, and never directing their humor at others. 8) Had a quality of acceptance of self and others, by which he meant that these people would be more likely to take you as you are than try to change you into what they thought you should be. This same acceptance applied to their attitudes towards themselves: If some quality of theirs wasn't harmful, they let it be, even enjoying it as a personal quirk. 9) They were often strongly motivated to change negative qualities in themselves that could be changed. 10) They possessed qualities such as spontaneity and simplicity. 11) They preferred being themselves rather than being pretentious or artificial. 12) They had a sense of humility and respect towards others — something Maslow also called democratic value. 13) They had a quality Maslow called human kinship, that is social interest, compassion, and humanity. 14) were strong in their ethical behaviours. 15) They were spiritual but never conventionally religious in nature. 16) They had a certain freshness of appreciation, an ability to see things, even ordinary things, with wonder. 17) They had the ability to be creative, inventive, and original. 18) They tended to have more peak experiences than the average person. A peak 154

experience is one that takes you out of yourself, that makes you feel very tiny, or very large, to some extent one with life or nature or God. It gives you a feeling of being a part of the infinite and the eternal. These experiences tend to leave their mark on a person, change them for the better, and many people actively seek them out. They are also called mystical experiences, and are an important part of many religious and philosophical traditions. Maslow did not however think that self actualised persons were perfect. There were several flaws or imperfections he discovered along the way as well. These were as given below: 1) They often suffered considerable anxiety and guilt. These anxiety and guilt were realistic ones rather than misplaced or neurotic versions. 2) Some of them were absent minded and overly kind. 3) Also some of them had unexpected moments of ruthlessness, surgical coldness, and loss of humor. 4) Maslow also stated that when a self actualised person does not get their needs fulfilled, they respond with metapathologies. That is they respond with a list of problems. 5) When forced to live without these values, the self-actualiser develops depression, despair, disgust, alienation, and a degree of cynicism. Evaluation Maslow has been a very inspirational figure in personality theories. In the 1960's in particular, people were tired of the reductionist, mechanistic messages of the behaviourists and physiological psychologists. They were looking for meaning and purpose in their lives, even a higher, more mystical meaning. Maslow was one of the pioneers in that movement to bring the human being back into psychology and the person back into personality. Moreover, Maslow's unique contribution lies in his preoccupation with healthy people rather than sick ones and his feeling that studies of two groups generate different types of theory. Maslow chose the more direct course of studying healthy people whose wholeness and unity of personality are readily apparent. But in spite of this unique contribution Maslow's theory has been criticized on many grounds. The most common criticism concerns his methodology: Picking a small number of people that he himself declared self-actualising, then reading about them or talking with them, and coming to conclusions about what self-actualisation is in the first place does not sound like good science to many people. Another criticism is that Maslow placed certain constraints on self-actualisation.

experience is one that takes you out of yourself, that makes you feel 65 Humanistic and Self Theory (Malsow and Rogers) very tiny, or very large, to some extent one with life or nature or God. and depression. 6.3 Carl Rogers's Theory of Personality Carl Rogers was born on January 8, 1902, in Oak Park, Illinois. Raised on a farm from the age of twelve, Rogers entered the Agricultural College of the University of Wisconsin in 1919, where he graduated with a degree in history. While in college he felt a religious calling and eventually began training to become a Protestant minister, and after graduating in 1924 he enrolled at the Union Theological Seminary in New York City. From there he transferred to Teachers College at Columbia University in order to pursue counseling rather than the strictly religious aspect of his ministerial profession. He subsequently focused on clinical and educational psychology, writing his doctoral dissertation on personality adjustment in children. Throughout the 1930s, Rogers worked in the field of child psychology, and in 1940 he accepted a position as a professor of psychology at Ohio State University. It was at this time that he began to develop the theories and methodology for which he would later become renowned. The incipient concepts of Rogers's therapeutic approach appeared in his 1942 book *Counseling and Psychotherapy*, and within the next few years he developed his concept of the self as the organising element in human personality and the principles of the "nondirective," or client-centered, style of therapy. In 1945 he took a position as professor of psychology and head of the counseling center at the University of Chicago, where, over the next twelve years, he further refined and articulated his

and Rogers) 4.4 CARL ROGER'S THEORY OF PERSONALITY Carl Rogers was born on January 8, 1902, in Oak Park, Illinois. ideas, publishing Client-Centered Therapy (1951) during this time. A charismatic figure, Rogers's influence over students, colleagues, and various collaborators, as well as his publication of best-selling books such as *On Becoming a Person* (1961) and *Person to Person* (1967) made him the central figure in American humanistic psychology throughout his lifetime. Carl Rogers was not only one of the founders of the Humanistic Approach, but also arguably the most influential therapist in the 20th century. Rogers's theory is basically phenomenological, in that it placed a strong emphasis on the experience of the person, their feelings, their values, and all that is summed up by the expression "inner life". His theory is also known as self-theory. The other name of his theory is person-centered theory. His theory grew out of his own experience in working with individual in the therapeutic relationship. In terms of his theory, there are two fundamental ideas which are particularly worth noting. First, Rogers talked about healthy development in terms of how individuals perceived their own being. Healthy individuals will tend to see congruence between their sense of who they are (self) and who they feel they should be (ideal self). While no one tends to experience perfect congruence at all times, the relative degree of congruence is an indicator of health. The second fundamental idea is Rogers's concept of the conditions for healthy growth, and the role of a therapist in fostering healthy growth. Through a process Rogers called person-centered therapy; the therapist seeks to provide empathy, openness, and unconditional positive regard. Rogers called his technique nondirective therapy, based on the concept that the therapist is simply a "mirror" who reflects the individual's thoughts and feelings. Rogers's theory can be explained under the following three headings: 1) Enduring aspects of personality 2) Self-actualisation 3) Development of self 6.4 Maslow Theory of Personality Enduring Aspects of Personality Rogers' theory of personality evolved out of his work as a clinical psychologist and developed as an offshoot of his theory of client-centered (later called person-centered) therapy. Since the main aim of his theory is to explain the growth and development within the individual, so his theory does not appear to lay much emphasis on personality development, rather prefer to devote his attention to such constructs that are of fundamental importance to his theory. These are: (i) the organism and (ii) the self.

ideas, publishing Client-Centered Therapy (1951) during this time. A charismatic figure, Rogers's influence over students, colleagues, and various collaborators, as well as his publication of best-selling books such as *On Becoming a Person* (1961) and *Person to Person* (1967) made him the central figure in American humanistic psychology throughout his lifetime. Carl Rogers was not only one of the founders of the Humanistic Approach, but also arguably the most influential therapist in the 20th century. Rogers's theory is basically phenomenological, in that it placed a strong emphasis on the experience of the person, their feelings, their values, and all that is summed up by the expression "inner life". His theory is also known as self-theory. The other name of his theory is person-centered theory. His theory grew out of his own experience in working with individual in the therapeutic relationship. In terms of his theory, there are two fundamental ideas which are particularly worth noting. First, Rogers talked about healthy development in terms of how individuals perceived their own being. Healthy individuals will tend to see congruence between their sense of who they are (self) and who they feel they should be (ideal self). While no one tends to experience perfect congruence at all times, the relative degree of congruence is an indicator of health. The second fundamental idea is Rogers's concept of the conditions for healthy growth, and the role of a therapist in fostering healthy growth. Through a process Rogers called person-centered therapy; the therapist seeks to provide empathy, openness, and unconditional positive regard. Rogers called his technique non- directive therapy, based on the concept that the therapist is simply a "mirror" who reflects the individual's thoughts and feelings. 68 Theories of Personality-I Rogers's theory can be explained under the following three headings: 1) Enduring aspects of personality 2) Self-actualisation 3) Development of self 4.4.1 Enduring Aspects of Personality Rogers' theory of personality evolved out of his work as a clinical psychologist and developed as an offshoot of his theory of client-centered (later called person-centered) therapy. Since the main aim of his theory is to explain the growth and development within the individual, so his theory does not appear to lay much emphasis on personality development, rather prefer to devote his attention to such constructs that are of fundamental importance to his theory. These are: (i) the organism and (ii) the self. 4.4.1.1

W <http://egyankosh.ac.in/bitstream/123456789/20821/1/Unit-4.pdf>

The Organism Rogers approach to the study of persons is phenomenological and idiographic. His view of human behaviour is that it is "exquisitely rational". Furthermore, in his opinion: "the core of man's nature is essentially positive" and he is a "trustworthy organism". According to Rogers the organism is the locus of all experience, including everything potentially available to awareness, at any given moment. The totality of experience constitutes the phenomenal field. The phenomenal field is the individual's frame of reference that can only be known to the person. It can never be known to another, except through empathetic experience and at that level too, can never be known perfectly. Rogers emphasised that the individual's way of behaving depends upon the phenomenal field (subjective reality) and not upon the stimulating conditions (external reality). The phenomenal field at any given moment is made up of conscious and unconscious experiences. The person tends to check his or her experiences against the reality. This testing of reality provides with dependable knowledge of the world so that one is able to behave realistically. In most of the cases the person accepts his or her experiences as true representation of reality, while in reality they may not be the true representation. As a result the person may develop misconceptions about himself/herself and about the external world. The Self (Real and Ideal) Rogers developed one of the most systematic models of self, in relation to the personality-functioning. The self or self-concept, is one of the central concepts in his theory, and the theory is often referred to as the self-theory of personality. Rogers defined self as the organised, consistent, conceptual gestalt composed of perceptions of the characteristics of the "I" or "me", and the perception of the relationship "I" or "me" to various aspects of life, together the values attached to those perceptions. In short, it is one's picture of him or hers. Rogers further distinguishes two aspects or subsystems of self: The real self and the ideal self. The real self is the "you" that, if all goes well, you will become, while the ideal self is what the person would like to be. By ideal, Rogers is suggesting something not real, something that is always out of our reach, the standard we can not meet. Thus, Rogers's personality theory distinguishes between two personalities. The real self, which is created and developed through the actualising tendency, it is the self that one can become. The demands of society, however, do not always support the actualising tendency and we are forced to live under conditions that are out of step with our tendencies. The ideal self is the 158

The Organism Rogers approach to the study of persons is phenomenological and idiographic. His view of human behaviour is that it is "exquisitely rational". Furthermore, in his opinion: "the core of man's nature is essentially positive" and he is a "trustworthy organism". As a result the person may develop misconceptions about himself/herself and about the external world. 4.4.1.2 The Self (Real and Ideal) Rogers developed one of the most systematic models of self, in relation to the personality-functioning. The self or self-concept, is one of the central concepts in his theory, and the theory is often referred to as the self-theory of personality. Rogers defined self as the organised, consistent, conceptual gestalt composed of perceptions of the characteristics of the "I" or "me", and the perception of the relationship "I" or "me" to various aspects of life, together the values attached to those perceptions. In short, it is one's picture of him or hers. Rogers further distinguishes two aspects or subsystems of self: The real self and the ideal self. The real self is the "you" that, if all goes well, you will become, while the ideal self is what the person would like to be. 69 Humanistic and Self Theory (Malsow and Rogers) By ideal, Rogers is suggesting something not real, something that is always out of our reach, the standard we can not meet. Thus, Rogers's personality theory distinguishes between two personalities. The real self, which is created and developed through the actualising tendency, it is the self that one can become. The demands of society, however, do not always support the actualising tendency and we are forced to live under conditions that are out of step with our tendencies. The ideal self is the

W <http://egyankosh.ac.in/bitstream/123456789/20821/1/Unit-4.pdf>

ideal created through the demands of society. Rogers does not see it as something to strive for (that is the real self) but an ideal imposed on us we can never fully reach. Rogers' view of 'hidden' personality relates to the person one could be given the right circumstances within society and for an individual to be truly happy (and for self-actualisation to be realised) their public and private selves must be as similar as possible. For an individual to be truly happy and for self-actualisation to be realised, the public and hidden selves must be as similar as possible. Rogers believed that when all aspects of a person's life, surroundings and thoughts are in harmony then the ideal state of congruence is reached (Pervin & Oliver 1997). Congruity and Incongruity The importance of the concept of organism and self, in Rogers theory becomes clear when we examine the idea of congruence and incongruence between this self as perceived, and the self as actually experienced by the organism. When the symbolised experiences that constitute the self, faithfully mirror the experiences of the organism, the self and organism are said to be congruent, that is the individual is believed to be adjusted, mature and fully functioning. Otherwise, there would be incongruence. According to Rogers, most of the ways of behaving that are adopted by the organism are those that are consistent with the concept of self. In some instances, behaviour may be brought about by organic experiences and needs which have not been symbolised. Such behaviour may be inconsistent with the structure of the self but in such instances the behaviour is not "owned" by the individual. Rogers suggests that the incongruent individual who is always on the defensive and cannot be open to all experiences is not functioning ideally and may even be malfunctioning. They work hard at maintaining/protecting their self concept. Because their lives are not authentic this is a difficult task and they are under constant threat. They deploy defense mechanisms to achieve this. He describes two mechanisms: distortion and denial. Distortion occurs when the individual perceives a threat to their self concept. They distort the perception until it fits their self concept. This defensive behaviour reduces the consciousness of the threat but not the threat itself. And so, as the threats mount, the work of protecting the self concept becomes more difficult and the individual becomes more defensive and rigid in their self structure. If the incongruence is immoderate this process may lead the individual to a state that would typically be described as neurotic. Their functioning becomes precarious and psychologically vulnerable. If the situation worsens it is possible that the defenses cease to function altogether and the individual becomes aware of the incongruence of their situation. Their personality becomes disorganised and bizarre; irrational behaviour, associated with earlier denied aspects of self, may erupt uncontrollably. Thus, it may be concluded that psychological adjustment exists when the concept of the self is such that all the sensory and visceral experiences of the organism are,

ideal created through the demands of society. Rogers does not see it as something to strive for (that is the real self) but an ideal imposed on us we can never fully reach. or may be, assimilated on a symbolic level into a consistent relationship with the concept of self. Psychological maladjustment exists when the organism denies awareness of significant sensory and visceral experiences, which consequently are not symbolised and organised into the gestalt of the self structure. When this situation exists, there is a basic or potential psychological tension. Any experience which is inconsistent with the organisation of the structure of the self may be perceived as a threat, and the more of these perceptions there are, the more rigidly the self structure is organised to maintain itself. Self-Actualisation According to Rogers, only the single motive is there that impels human beings to action, and that motive can be described as the actualising tendency. Rogers (1959) maintains that the human "organism" has an underlying "actualising tendency", which aims to develop all capacities in ways that maintain or enhance the organism and move it toward autonomy. This tendency is directional, constructive and present in all living things. The actualising tendency can be suppressed but can never be destroyed without the destruction of the organism (Rogers, 1977). The concept of the actualising tendency is the only motive force in the theory. It encompasses all motivations; tension, need, or drive reductions; and creative as well as pleasure-seeking tendencies (Rogers, 1959). Only the organism as a whole has this tendency, parts of it (such as the self) do not. Maddi (1996) describes it as a "biological pressure to fulfill the genetic blueprint". Each person thus has a fundamental mandate to fulfill one's potential. This tendency is selective, and pays attention only to those aspects of the environment which promises to move the person constructively, in the direction of fulfillment and wholeness. Therefore, as already stated, the single motivating force is 'the self-actualisation drive' and single goal of life is 'to become selfactualised'. The Development of Self Rogers, unlike Freud, Sullivan, and Erikson, did not try to propose a stage theory of personality development. In other words, Rogers did not explain the personality development in steps or stages; rather he emphasised the importance of congruence between the self of the person and his experiences in the development of personality. Adjustment and psychological health have also been explained in terms of realistic self-concept that is congruent with self. Rogers maintained that unless we are taught inappropriately by those whose love we need, our self-concept in based on our own perceptions, and fits well with our experiences. If we are taught

Each person thus has a fundamental mandate to fulfill one's potential. This tendency is selective, and pays attention only to those aspects of the environment which promises to move the person constructively, in the direction of fulfillment and wholeness. Therefore, as already stated, the single motivating force is 'the self-actualisation drive' and single goal of life is 'to become self- actualised' 4.4.3 The Development of Self Rogers, unlike Freud, Sullivan, and Erikson, did not try to propose a stage theory of personality development. In other words, Rogers did not explain the personality development in steps or stages; rather he emphasised the importance of congruence between the self of the person and his experiences in the development of personality. Adjustment and psychological health have also been explained in terms of realistic self-concept that is congruent with self. Rogers maintained that unless we are taught inappropriately by those whose love we need, our self-concept in based on our own perceptions, and fits well with our experiences. If we are taught

to have a self-concept that does not match what we actually experience, we are going to have difficulty. For example, you might learn that nice people never get angry and then find yourself in a situation in which you are insulted; your self-concept does not allow you to perceive your feeling of anger accurately. The greater the discrepancy between our self and our experiences, the greater the maladjustment and anxiety, and the harder we must reconcile what we believe ourselves and what we encounter in the world around us. Rogers also suggests that if there is a large self-experience discrepancy, and if there is no way to avoid all of the relevant experiences, the defensive system may be unable to handle anxiety; it may breakdown and result in a disorganisation of personality. Early in our lives, we each have direct experience with pleasure and pain; for example, we obviously learn that it is good to eat and bad to be hungry, good to be in mother's arm and bad to touch a hot stove and so on. Beyond these simple physical reactions, there is a need for positive regard. That is, we want to be loved and respected as individuals. Our parents tend to be the primary source of love and affection, and it is desperately important to maintain their good will. We want them to praise us, say that we are good, and express positive feelings toward us. When we do something they dislike and they let us know it, the experience is painful one. We strive to alter our behaviour to get back in their good graces. The crucial problem occurs when the beliefs, values, and perceptions of parents do not fit the child's experiences and feelings. Let us look at an example of the process. A three year old boy is upset when his mother gives birth to a second baby. He must share love and attention with the new addition, be quiet when the baby is sleeping and so on. From the brother's perspective, the situation involves rejection and loss of status: most likely he feels not only depressed but hostile. The obvious target of his hostility is the new sister. One day his mother finds him deliberately pinching the sister's arm to make her cry. What does the mother do? Her decision at this point is described by Rogers as a critical one in the development of the boy's self-concept. The usual response of the mother will be to punish the child and reject him because of his hostility and force him to love his sister. The conflict for the boy is clear. Since the need for mother's love is vitally important, so he may alter his self-concept to conform to what the mother wanted. In this case, the mother's reaction might serve to help give this child a self-concept, inconsistent with his experiences. Rogers recognised the three crucial points for the parents to keep in mind. 1) First, the child's feeling must be recognised and accepted. 2) Second, the mother should avoid threatening the child with the most threatening punishment of all – loss of love. 3) Third, the hostile behaviour must be clearly and unmistakably rejected and prevented.

Evaluation The person-centered approach, being the unique approach to understanding personality and human relationships, found wide application in various domains such as psychotherapy and counseling, organisations, and other group settings. Rogers's greatest contribution may lie in his encouraging a humane and ethical treatment of persons, approaching psychology as a human science rather than a natural science. Rogers's person-centered approach has been criticised on many grounds. The most important being the charge that many psychologists tend to impose their views based upon naïve phenomenology. For instance, Rogers accepted client's statement to be always true and reliable, when self-reports normally lack credibility. Rogers has also been criticised for ignoring unconscious determinants of behaviour, attested by psycho-analytic investigators over a long period. It is also criticised on the ground that the theory deals only with surface issues and does not explore deeper areas. 6.5

The central theme in humanistic and self theories is the drive towards self actualisation, to realise one's full potential. Other themes include personal growth, openness to experience, living in the present, personal responsibility, and inherent goodness of people. For the humanists, the unit of analysis is "perceived reality". Probably the best known proponent of this approach is Abraham Maslow. Maslow proposes a model of how a happy, healthy, well-functioning person behaves, which is based on concrete observations of real people, rather than on formulating ideal requirements. Moreover Maslow proposes a simple and intuitively appealing theory of motivation, which explains where such a "self-actualising" personality comes from. Maslow's theory can be explained in terms of Hierarchy of needs, deficiency needs, growth needs and characteristics of self-actualising persons. Maslow proposed a theory of human motivation based on hierarchy of needs. The lower a need in the hierarchy the more prepotent or dominating that need is. In other words, when several needs are active, the lowest need will be most compelling. The higher order need emerge only when the lower level needs are satisfied. The first four levels are considered deficiency or deprivation needs ("D-needs") in that their lack of satisfaction causes a deficiency that motivates people to meet these needs. Physiological needs, the lowest level on the hierarchy, include necessities such as air, food, and water. These tend to be satisfied for most people, but they become 162

___ NSOU I PGSW-VI predominant when unmet. During emergencies, safety needs such as health and security rise to the forefront. Once these two levels are met, belongingness needs, such as obtaining love and intimate relationships or close friendships, become important. The next level, esteem needs, include the need for recognition from others, confidence, achievement, and self-esteem. The highest level is self-actualisation, or the self-fulfillment. Behaviour in this case is not driven or motivated by deficiencies but rather one's desire for personal growth and the need to become all the things that a person is capable of becoming. In order to study the characteristics self-actualisers of Maslow studied a group of people, whom he felt clearly met the standard of self- actualisation. Using a qualitative method called biographical analysis; he developed a list of qualities that seemed characteristic of the self-actualisers, as opposed to the great mass of us. Rogers's theory, also known as self-theory, is basically phenomenological, in that it placed a strong emphasis on the experience of the person, their feelings, their values, and all that is summed up by the expression "inner life". His theory grew out of his own experience in working with individual in the therapeutic relationship

verification). The main aim of humanistic approach is to provide concepts and methods for stimulating learning, growth and development both in individual persons as well as in society, thus enhancing well-being and the overall quality of life. Maslow coined the term "the Third Force" to describe the Humanistic Approach, to emphasise how it differed from the Psychodynamic and Behaviourist Approaches, which dominated psychology in the 1950's. This "third force", in contrast with clinical psychology, influenced by Freudian psycho-analysis, which studies mental illness, i.e. the negative side of human behaviour, and traditional academic, experimental psychology, influenced by behaviourism, which tends to reduce human behaviour to statistical correlations between different kinds of stimuli, responses and personality traits. Instead of merely modeling normal behaviour or of curing clear dysfunctions, a humanistic psychologist tries to help people to develop in a better way, thus making them more competent, more aware, happier, in the hope of reaching some state of "optimal" mental health. The central theme in humanistic theories is the drive towards self-actualisation, to realise one's full potential. Other themes include personal growth, openness to experience, living in the present, personal responsibility, and inherent goodness of people. For the humanists, the unit of analysis is the perceived reality. Probably the best known proponent of this approach is Abraham Maslow. What distinguishes his work from that of other "humanists", such as Carl Rogers or Erich Fromm is that he proposes a model of how a happy, healthy, well-functioning person behaves, which is based on concrete observations of real people, rather than on formulating ideal requirements. Also Maslow proposes a simple and intuitively appealing theory of motivation, which explains where such a "self-actualising" personality comes from. In parallel with systems theory, Maslow reacts against too much reductionism in psychological modeling, and proposes an alternative holistic approach of personality research. In recent years, a number of initiatives have appeared which, while influenced significantly by humanistic ideas and theories, have new directions. Perhaps the most significant is positive psychology, a term coined by Dr. Martin Seligman when he was President of the American Psychological Association in 2000. Positive psychology, like the humanistic approach, focuses on enhancing human potential, but embraces research 148

<p>Although there might be national differences in defining Integrated Healthcare (IHC), one can simply describe it as efforts needed to provide all healthcare services that make humans healthy . Consequently, such provision necessitates valid and functional delivery systems at all times. The World Health Organization (WHO) defines an integrated delivery system as, "the organization and management of health services so that people get the care they need, when they need it, in ways that are user-friendly, achieve the desired results, and provide value for money" . These definitions work well in peacetime and with intact resources and capabilities. However, the last decades' economic strain on healthcare systems and an increasing number of public health emergencies highlight the insufficiency of delivering integrated healthcare, particularly to vulnerable groups of a society . IHC is one of the important concepts related to the management and organization of healthcare systems. At present, efforts to integrate the process of providing healthcare, in addition to the integration of other areas of socio-economic life with the healthcare system, are a major concern for many international entities like WHO . Attention to this concern is seen through a variety of projects that either directly or indirectly orient towards coordinating the provision of healthcare. By implementing these projects, healthcare systems aim to obtain the interrelated goals of improving the effectiveness of treatment, attribution of costs, and leveling inequalities in the access to and utilization of medical care. In</p>		<p>Although there might be national differences in defining Integrated Healthcare (IHC), one can simply describe it as efforts needed to provide all healthcare services that make humans healthy [1]. Consequently, such provision necessitates valid and functional delivery systems at all times. The World Health Organization (WHO) defines an integrated delivery system as, "the organization and management of health services so that people get the care they need, when they need it, in ways that are user-friendly, achieve the desired results, and provide value for money" [2]. Reproductive, Maternal, Newborn, Child and Adolescent Health (RMNCH+A) programme essentially looks to address the major causes of mortality among women and children as well as the delays in accessing and utilizing health care and services. It also introduces new initiatives like the use of Score Card to track health performance, National Iron + Initiative to address the issue of anemia across all age groups and the Comprehensive Screening and Early interventions for defects at birth, diseases, and deficiencies among children and adolescents. Rashtriya Bal Swasthya Karyakram (RBSK) is an important initiative aiming at early identification and early intervention for children from birth to 18 years to NSOU ? PGSW-VI

___ 223 cover 4 'D's viz. Defects at birth, Deficiencies, Diseases, Development delays including disability. Early detection and management diseases including deficiencies bring added value in preventing these conditions to progress to its more severe and debilitating form The Rashtriya Kishor Swasthya Karyakram The key principle of this programme is adolescent participation and leadership, Equity and inclusion, Gender Equity and strategic partnerships with other sectors and stakeholders. The programme enables all adolescents in India to realize their full potential by making informed and responsible decisions related to their health and well-being and by accessing the services and support they need to do so. The government of India has launched Janani Shishu Suraksha Karyakaram to motivate those who still choose to deliver at their homes to opt for institutional deliveries. It is an initiative with a hope that states would come forward and ensure that benefits under JSSK would reach every needy pregnant woman coming to government institutional facility. ? Since the rate of deaths in the country because of communicable and non- communicable diseases is increasing at an alarming rate, the government has introduced various programmes to aid people against these diseases. In India, approximately about 5.8 million people die because of Diabetes, heart attack, cancer etc each year. In other words, out of every 4 Indians, 1 has a risk of dying because of a Non- Communicable disease before the age of 70. According to the World Health Organisation, 1.7 million Indian deaths are caused by heart diseases. National AIDS Control Organisation was set up so that every person living with HIV has access to quality care and is treated with dignity. By fostering close collaboration with NGOs, women's self-help groups, faith-based organizations, positive people's networks, and communities, NACO hopes to improve access and accountability of the services. It stands committed to building an enabling environment wherein those infected and affected by HIV play a central role in all responses to the epidemic – at state, district and grassroots level. Revised National TB Control Programme is a state-run tuberculosis control initiative of Government of India with a vision of achieving a TB free India. The program provides, various free of cost, quality tuberculosis diagnosis and treatment services across the country through the government health system. 224

The Principles of Enhancement of Health 1. Transforming some of the present Health sub-Centers and Primary Health Centers to Health into Health and Wellness Centers to ensure universal access to Comprehensive Primary Health Care. 2. Adopt a people-centric, holistic, equity-based response to people's health needs through a process of family's empanelment, regularly interacting at homes and community to promote community system strengthening and people's participation. 3. Build capacity to deliver high-quality care covering health risks and disease conditions through expansion in availability of medicines & diagnostics, use of standard treatment and referral protocols and advanced technologies including IT systems to maintain health records 4. A team-based approach to deliver quality health care including preventive, promotive, curative, rehabilitative and palliative care will be promoted. 5. A two-way referral system and follow up support will be ensured for continuity of care 6. Emphasize health promotion (including through school education & individual centric awareness and public health action) through active engagement & capacity building of individual volunteers and community-based organizations (CBOs) 7. Implement mechanisms of flexible financing, like performance-based incentives and responsive resource allocations. 8. Deliver Yoga and AYUSH services through existing health facilities to meet peoples needs 9. Use appropriate technology for improving access to health care advice, treatment initiation, reporting and recording, progressing to electronic records for individuals and families. 10. Social accountability through participation of civil society will be Institutionalized. 220

PREFACE In the curricular structure introduced by this University for students of Post-Graduate degree programme, the opportunity to pursue Post-Graduate course in a subject is introduced by this University is equally available to all learners. Instead of being guided by any presumption about ability level, it would perhaps stand to reason if receptivity of a learner is judged in the course of the learning process. That would be entirely in keeping with the objectives of open education which does not believe in artificial differentiation. I am happy to note that university has been recently accredited by National Assessment and Accreditation Council of India (NAAC) with grade 'A'. Keeping this in view, study materials of the Post-Graduate level in different subjects are being prepared on the basis of a well laid-out syllabus. The course structure combines the best elements in the approved syllabi of Central and State Universities in respective subjects. It has been so designed as to be upgradable with the addition of new information as well as results of fresh thinking and analysis. The accepted methodology of distance education has been followed in the preparation of these study materials. Co-operation in every form of experienced scholars is indispensable for a work of this kind. We, therefore, owe an enormous debt of gratitude to everyone whose tireless efforts went into the writing, editing, and devising of a proper lay-out of the materials. Practically speaking, their role amounts to an involvement in 'invisible teaching'. For, whoever makes use of these study materials would virtually derive the benefit of learning under their collective care without each being seen by the other. The more a learner would seriously pursue these study materials the easier it will be for him or her to reach out to larger horizons of a subject. Care has also been taken to make the language lucid and presentation attractive so that they may be rated as quality self-learning materials. If anything remains still obscure or difficult to follow, arrangements are there to come to terms with them through the counselling sessions regularly available at the network of study centres set up the University. Needless to add, a great deal of these efforts are still experiment—in fact, pioneering in certain areas. Naturally, there is every possibility of some lapse or deficiency here and there. However, these do admit of rectification and further improvement in due course. On the whole, therefore, these study materials are expected to evoke wider appreciation the more they receive serious attention of all concerned. Professor (Dr.) Ranjan Chakrabarti Vice-Chancellor

Science and Scientific Research What is research? Depending on who you ask, you will likely get very different answers to this seemingly innocuous question. Some people will say that they routinely research different online websites to find the best place to buy goods or services they want. Television news channels supposedly conduct research in the form of viewer polls on topics of public interest such as forthcoming elections or government-funded projects. Under-graduate students research the Internet to find the information they need to complete assigned projects or term papers. Graduate students working on research projects for a professor may see research as collecting or analyzing data related to their project. Businesses and consultants research different potential solutions to remedy organizational problems such as a supply chain bottleneck or to identify customer purchase patterns. However, none of the above can be considered "scientific research" unless: (1) it contributes to a body of science, and (2) it follows the scientific method. This chapter will examine what these terms mean. 1.3

Elements of Social Work Research

History of Scientific Thought It may be interesting to go back in history and see how science has evolved over time and identify the key scientific minds in this evolution. Although instances of scientific progress have been documented over many centuries, the terms "science," "scientists," and the "scientific method" were coined only in the 19th century. Prior to this time, science was viewed as a part of philosophy, and coexisted with other branches of philosophy such as logic, metaphysics, ethics, and aesthetics, although the boundaries between some of these branches were blurred. In the earliest days of human inquiry, knowledge was usually recognized in terms of theological precepts based on faith. This was challenged by Greek philosophers such as Plato, Aristotle, and Socrates during the 3rd century BC, who suggested that the fundamental nature of being and the world can be understood more accurately through a

99%**MATCHING BLOCK 7/88****W**

process of systematic logical reasoning called rationalism. In particular, Aristotle's classic work *Metaphysics* (literally meaning "beyond physical [existence]") separated theology (the study of Gods) from ontology (the study of being and existence) and universal science (the study of first principles, upon which logic is based). Rationalism (not to be confused with "rationality") views reason as the source of knowledge or justification, and suggests that the criterion of truth is not sensory but rather intellectual and deductive, often derived from a set of first principles or axioms (such as Aristotle's "law of non-contradiction"). The next major shift in scientific thought occurred during the 16th century, when British philosopher Francis Bacon (1561-1626) suggested that knowledge can only be derived from observations in the real world. Based on this premise, Bacon emphasized knowledge acquisition as an empirical activity (rather than as a reasoning activity), and developed empiricism as an influential branch of philosophy. Bacon's works led to the popularization of inductive methods of scientific inquiry, the development of the "scientific method" (originally called the "Baconian method"), consisting of systematic observation, measurement, and experimentation, and may have even sowed the seeds of atheism or the rejection of theological precepts as "unobservable." Empiricism continued to clash with rationalism throughout the Middle Ages, as philosophers sought the most effective way of gaining valid knowledge. French philosopher Rene Descartes sided with the rationalists, while British philosophers John Locke and David Hume sided with the empiricists. Other scientists, such as Galileo Galilei and Sir Issac Newton, attempted to fuse the two ideas into natural philosophy (the philosophy of nature), to focus specifically on understanding nature and the physical universe, which is considered to be the precursor of the natural sciences. Galileo (1564-1642) was perhaps the first to state that the laws of nature are mathematical, and contributed to the field of astronomy through an innovative combination of experimentation and mathematics. In the 18th century, German philosopher Immanuel Kant sought to resolve the dispute between empiricism and rationalism in his book *Critique of Pure Reason*, by arguing that experience is purely subjective and processing them using pure reason without first delving into the subjective nature of experiences will lead to theoretical illusions. Kant's ideas led to the development of German idealism, which inspired later development of interpretive techniques such as phenomenology, hermeneutics, and critical social theory. At about the same time, French philosopher Auguste Comte (1798-1857), founder of the discipline of sociology, attempted to blend rationalism and empiricism in a new doctrine

97%**MATCHING BLOCK 8/88****W**

called positivism. He suggested that theory and observations have circular dependence on each other. While theories may be created via reasoning, they are only authentic if they can be verified through observations. The emphasis on verification started the separation of modern science from philosophy and metaphysics and further development of the "scientific method" as the primary means of validating scientific claims. Comte's ideas were expanded by Emile Durkheim in his development of sociological positivism (positivism as a foundation for social research) and Ludwig Wittgenstein in logical positivism. In the early 20th century, strong accounts of positivism were rejected by interpretive sociologists (antipositivists) belonging to the German idealism school of thought. Positivism was typically equated with quantitative research methods such as experiments and surveys and without any explicit philosophical commitments, while antipositivism employed qualitative methods such as unstructured interviews and participant observation. Even

practitioners

100%**MATCHING BLOCK 9/88****W**

of positivism, such as American sociologist Paul Lazarsfeld who pioneered large-scale survey research and statistical techniques for analyzing survey data, acknowledged potential problems of observer bias and structural limitations in positivist inquiry. In response, antipositivists emphasized that social actions must be studied through interpretive means based upon an understanding of the meaning and purpose that individuals attach to their personal actions, which inspired Georg Simmel's work on symbolic interactionism, Max Weber's work on ideal types, and Edmund Husserl's work on phenomenology. In the mid-to-late 20th century, both positivist and antipositivist schools of thought were subjected to criticisms and modifications. British philosopher Sir Karl Popper suggested that human knowledge is based not on unchallengeable, rock-solid foundations, but rather on a set of tentative conjectures that can never be proven conclusively, but only disproven. Empirical evidence is the basis for disproving these conjectures or "theories." This metatheoretical stance, called postpositivism (or postempiricism), amends positivism by suggesting that it is impossible to verify the truth although it is possible to reject false beliefs, though it retains the positivist notion of an objective truth and its emphasis on the scientific method. Likewise, antipositivists have also been criticized for trying only to understand society but not critiquing and changing society for the better. The roots of this thought lie in *Das Kapital*, written by German philosophers Karl Marx and Friedrich Engels, which critiqued capitalistic societies as being socially inequitable and inefficient, and recommended resolving this inequity through class conflict and proletarian revolutions. Marxism inspired social

revolutions in countries such as Germany, Italy, Russia, and China, but generally failed to accomplish the social equality that it aspired. Critical research (also called critical theory) propounded by Max Horkheimer and Jurgen Habermas in the 20th century, retains similar ideas of critiquing and resolving social inequality, and adds that people can and should consciously act to change their social and economic circumstances, although their ability to do so is constrained by various forms of social, cultural and political domination. Critical research attempts to uncover and critique the restrictive and alienating conditions of the status quo by analyzing the oppositions, conflicts and contradictions in contemporary society, and seeks to eliminate the causes of alienation and domination (i.e., emancipate the oppressed class).

100%**MATCHING BLOCK 11/88****W**

Science What is science? To some, science refers to difficult high school or college-level courses such as physics, chemistry, and biology meant only for the brightest students. To others, science is a craft practiced by scientists in white coats using specialized equipment in their laboratories. Etymologically, the word "science" is derived from the Latin word *scientia* meaning knowledge. Science refers to a systematic and organized body of knowledge in any area of inquiry that is acquired using "the scientific method" (the scientific method is described further below). Science can be grouped into two broad categories: natural science and social science. Natural science is the science of naturally occurring objects or phenomena, such as light, objects, matter, earth, celestial bodies, or the human body. Natural sciences can be further classified into physical sciences, earth sciences, life sciences, and others. Physical sciences consist of disciplines such as physics (the science of physical objects), chemistry (the science of matter), and astronomy (the science of celestial objects). Earth sciences consist of disciplines such as geology (the science of the earth). Life sciences include disciplines such as biology (the science of human bodies) and botany (the science of plants). In contrast, social science is the science of people or collections of people, such as groups, firms, societies, or economies, and their individual or collective behaviors. Social sciences can be classified into disciplines such as psychology (the science of human behaviors), sociology (the science of social groups), and economics (the science of firms, markets, and economies). The natural sciences are different from the social sciences in several respects. The natural sciences are very precise, accurate, deterministic, and independent of the person m

100%**MATCHING BLOCK 12/88****W**

aking the scientific observations. For instance, a scientific experiment in physics, such as measuring the speed of sound through a certain media or the refractive index of water, should always yield the exact same results, irrespective of the time or place of the experiment, or the person conducting the experiment. If two students conducting the same physics experiment obtain two different values of these physical properties, then it generally means that one or both of those students must be in error. However, the same cannot be said for the social sciences, which tend to be less accurate, deterministic, or unambiguous. For instance, if you measure a person's happiness using a hypothetical instrument, you may find that the same person is more happy or less happy (or sad) on different days and sometimes, at different times on the same day. One's happiness may vary depending on the news that person received that day or on the events that transpired earlier during that day. Furthermore, there is not a single instrument or metric that can accurately measure a person's happiness. Hence, one instrument may calibrate a person as being "more happy" while a second instrument may find that the same person is "less happy" at the same instant in time. In other words, there is a high degree of measurement error in the social sciences and there is considerable uncertainty and little agreement on social science policy decisions. For instance, you will not find many disagreements among natural scientists on the speed of light or the speed of the earth around the sun, but you will find numerous disagreements among social scientists on how to solve a social problem such as reduce global terrorism or rescue an economy from a recession. Any student studying the social sciences must be cognizant of and comfortable with handling higher levels of ambiguity, uncertainty, and error that come with such sciences, which merely reflects the high variability of social objects. Sciences can also be classified based on their purpose. Basic sciences, also called pure sciences, are those that explain the most basic objects and forces, relationships between them, and laws governing them. Examples include physics, mathematics, and biology. Applied sciences, also called practical sciences, are sciences that apply scientific knowledge from basic sciences in a physical environment. For instance, engineering is an applied science that applies the laws of physics and chemistry for practical applications such as building stronger bridges or fuel efficient combustion engines, while medicine is an applied science that applies the laws of biology for solving human ailments. Both basic and applied sciences are required for human development. However, applied sciences cannot stand on their own right, but instead relies on basic sciences for its progress. Of course, the industry and private enterprises tend to focus more on applied sciences given their practical value, while universities study both basic and applied sciences.

100%**MATCHING BLOCK 13/88****W**

Scientific Knowledge The purpose of science is to create scientific knowledge. Scientific knowledge refers to a generalized body of laws and theories to explain a phenomenon or behavior of interest that are acquired using the scientific method. Laws are observed patterns of phenomena or behaviors, while theories are systematic explanations of the underlying phenomenon or behavior. For instance, in physics, the Newtonian Laws of Motion describe what happens when an object is in a state of rest or motion (Newton's First Law), what force is needed to move a stationary object or stop a moving object (Newton's Second Law), and what happens when two objects collide (Newton's Third Law). Collectively, the three laws constitute the basis of classical mechanics – a theory of moving objects. Likewise, the theory of optics explains the properties of light and how it behaves in different media, electromagnetic theory explains the properties of electricity and how to generate it, quantum mechanics explains the properties of subatomic particles, and thermodynamics explains the properties of energy and mechanical work. An introductory college level text book in physics will likely contain separate chapters devoted to each of these theories. Similar theories are also available in social sciences. For instance, cognitive dissonance theory in psychology explains how people react when their observations of an event is different from what they expected of that event, general deterrence theory explains why some people engage in improper or criminal behaviors, such as illegally download music or commit software piracy, and the theory of planned behavior explains how people make conscious reasoned choices in their everyday lives. The goal of scientific research is to discover laws and postulate theories that can explain natural or social phenomena, or in other words, build scientific knowledge. It is important to understand that this knowledge may be imperfect or even quite far from the truth. Sometimes, there may not be a single universal truth, but rather an equilibrium of "multiple truths." We must understand that the theories, upon which scientific knowledge is based, are only explanations of a particular phenomenon, as suggested by a scientist. As such, there may be good or poor explanations, depending on the extent to which those explanations fit well with reality, and consequently, there may be good or poor theories. The progress of science is marked by our progression over time from poorer theories to better theories, through better observations using more accurate instruments and more informed logical reasoning.

NSOU ? PGSW-VII 14 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022

100%**MATCHING BLOCK 14/88****W**

We arrive at scientific laws or theories through a process of logic and evidence. Logic (theory) and evidence (observations) are the two, and only two, pillars upon which scientific knowledge is based. In science, theories and observations are interrelated and cannot exist without each other. Theories provide meaning and significance to what we observe, and observations help validate or refine existing theory or construct new theory. Any other means of knowledge acquisition, such as faith or authority cannot be considered science. Scientific Research Given that theories and observations are the two pillars of science, scientific research operates at two levels: a theoretical level and an empirical level. The theoretical level is concerned with developing abstract concepts about a natural or social phenomenon and relationships between those concepts (i.e., build "theories"), while the empirical level is concerned with testing the theoretical concepts and relationships to see how well they reflect our observations of reality, with the goal of ultimately building better theories. Over time, a theory becomes more and more refined (i.e., fits the observed reality better), and the science gains maturity. Scientific research involves continually moving back and forth between theory and observations. Both theory and observations are essential components of scientific research. For instance, relying solely on observations for making inferences and ignoring theory is not considered valid scientific research. Depending on a researcher's training and interest, scientific inquiry may take one of two possible forms: inductive or deductive. In inductive research, the goal of a researcher is to infer theoretical concepts and patterns from observed data. In deductive research, the goal of the researcher is to test concepts and patterns known from theory using new empirical data. Hence, inductive research is also called theory-building research, and deductive research is theory-testing research. Note here that the goal of theory-testing is not just to test a theory, but possibly to refine, improve, and extend it. Figure 1.1 depicts the complementary nature of inductive and deductive research. Note that inductive and deductive research are two halves of the research cycle that constantly iterates between theory and observations. You cannot do inductive or deductive research if you are not familiar with both the theory and data components of research. Naturally, a complete researcher is one who can traverse the entire research cycle and can handle both inductive and deductive research.

W

It is important to understand that theory-building (inductive research) and theory-testing (deductive research) are both critical for the advancement of science. Elegant theories are not valuable if they do not match with reality. Likewise, mountains of data are also useless until they can contribute to the construction of meaningful theories. Rather than viewing these two processes in a circular relationship, as shown in Figure 1.1, perhaps they

Figure 1.1 : The Cycle of Research THEORY OBSERVATIONS Generalization observations Test hypotheses Induction Deduction

can be better viewed as a helix, with each iteration between theory and data contributing to better explanations of the phenomenon of interest and better theories. Though both inductive and deductive research are important for the advancement of science, it appears that inductive (theory-building) research is more valuable when there are few prior theories or explanations, while deductive (theory-testing) research is more productive when there are many competing theories of the same phenomenon and researchers are interested in knowing which theory works best and under what circumstances.

100%

MATCHING BLOCK 17/88

W

Theory building and theory testing are particularly difficult in the social sciences, given the imprecise nature of the theoretical concepts, inadequate tools to measure them, and the presence of many unaccounted factors that can also influence the phenomenon of interest. It is also very difficult to refute theories that do not work. For instance, Karl Marx's theory of communism as an effective means of economic production withstood for decades, before it was finally discredited as being inferior to capitalism in promoting economic growth and social welfare. Erstwhile communist economies like the Soviet Union and China

W

eventually moved toward more capitalistic economies characterized by profit-maximizing private enterprises. However, the recent collapse of the mortgage and financial industries in the United States demonstrates that capitalism also has its flaws and is not as effective in fostering economic growth and social welfare as previously presumed. Unlike theories in the natural sciences, social science theories are rarely perfect, which provides numerous opportunities for researchers to improve those theories or build their own alternative theories. Conducting scientific research, therefore, requires two sets of skills – theoretical and methodological – needed to operate in the theoretical and empirical levels respectively. Methodological skills ("know-how") are relatively standard, invariant across disciplines, and easily acquired through doctoral programs. However, theoretical skills ("know-what") is considerably harder to master, requires years of observation and reflection, and are tacit skills that cannot be "taught" but rather learned through experience. All of the greatest scientists in the history of mankind, such as Galileo, Newton, Einstein, Neils Bohr, Adam Smith, Charles Darwin, and Herbert Simon, were master theoreticians, and they are remembered for the theories they postulated that transformed the course of science. Methodological skills are needed to be an ordinary researcher, but theoretical skills are needed to be an extraordinary researcher! Scientific Method The

In the preceding sections, we described science as knowledge acquired through a scientific method. So what exactly is the "scientific method"? Scientific method refers to a standardized set of techniques for building scientific knowledge, such as how to make valid observations, how to interpret results, and how to generalize those results. The scientific method allows researchers to independently and impartially test preexisting theories and prior findings, and subject them to open debate, modifications, or enhancements. The scientific method must satisfy four characteristics: ? Replicability: Others should be able to independently replicate or repeat a scientific study and obtain similar, if not identical, results. ? Precision: Theoretical concepts, which are often hard to measure, must be defined with such precision that others can use those definitions to measure those concepts and test that theory. ? Falsifiability: A theory must be stated in a way that it can be disproven. Theories that cannot be tested or falsified are not scientific theories and any such knowledge is not scientific knowledge. A theory that is specified in imprecise terms or whose concepts are not accurately measurable cannot be tested, and is therefore not scientific. Sigmund Freud's ideas on psychoanalysis fall into this category and is therefore not considered a "theory", even though psychoanalysis may have practical utility in treating certain types of ailments. ? Parsimony: When there are multiple explanations of a phenomenon, scientists must always accept the simplest or logically most economical explanation. This concept is called parsimony or "Occam's razor." Parsimony prevents scientists from pursuing overly complex or outlandish theories with endless number of concepts and relationships that may explain a little bit of everything but nothing in particular. Any branch of inquiry that does not allow the scientific method to test its basic laws or theories cannot be called "science." For instance, theology (the study of religion) is not science because theological ideas (such as the presence of God) cannot be tested by independent observers using a replicable, precise, falsifiable, and parsimonious method. Similarly, arts, music, literature, humanities, and law are also not considered science, even though they are creative and worthwhile endeavors in their own right.

99%**MATCHING BLOCK 20/88****W**

The scientific method, as applied to social sciences, includes a variety of research approaches, tools, and techniques, such as qualitative and quantitative data, statistical analysis, experiments, field surveys, case research, and so forth. Most of this book is devoted to learning about these different methods. However, recognize that the scientific method operates primarily at the empirical level of research, i.e., how to make observations and analyze and interpret these observations. Very little of this method is directly pertinent to the theoretical level, which is really the more challenging part of scientific research. Types of Scientific Research Depending on the purpose of research, scientific research projects can be grouped into three types: exploratory, descriptive, and explanatory. Exploratory research is often conducted in new areas of inquiry, where the goals of the research are: (1) to scope out the magnitude or extent of a particular phenomenon, problem, or behavior, (2) to generate some initial ideas (or "hunches") about that phenomenon, or (3) to test the feasibility of undertaking a more extensive study regarding that phenomenon. For instance, if the citizens of a country are generally dissatisfied with governmental policies regarding during an economic recession, exploratory research may be directed at measuring the extent of citizens' dissatisfaction, understanding how such dissatisfaction is manifested, such as the frequency of public protests, and the presumed causes of such dissatisfaction, such as ineffective government policies in dealing with inflation, interest rates, unemployment, or higher taxes. Such research may include examination of publicly reported figures, such as estimates of economic indicators, such as gross domestic product (GDP), unemployment, and consumer price index, as archived by third-party sources, obtained through interviews of experts, eminent economists, or key government officials, and/or derived from studying historical examples of dealing with similar problems. This research may not lead to a very accurate understanding of the target problem, but may be worthwhile in scoping out the nature and extent of the problem and serve as a useful precursor to more in-depth research. Descriptive research is directed at making careful observations and detailed documentation of a phenomenon of interest. These observations must be based on the scientific method (i.e., must be replicable, precise, etc.), and therefore, are more reliable than casual observations by untrained people. Examples of descriptive research are tabulation of demographic statistics by the United States Census Bureau or employment statistics by the

W

Bureau of Labor, who use the same or similar instruments for estimating employment by sector or population growth by ethnicity over multiple employment surveys or censuses. If any changes are made to the measuring instruments, estimates are provided with and without the changed instrumentation to allow the readers to make a fair before-and-after comparison regarding population or employment trends. Other descriptive research may include chronicling ethnographic reports of gang activities among adolescent youth in urban populations, the persistence or evolution of religious, cultural, or ethnic practices in select communities, and the role of technologies such as Twitter and instant messaging in the spread of democracy movements in Middle Eastern countries. Explanatory research seeks explanations of observed phenomena, problems, or behaviors. While descriptive research examines the what, where, and when of a phenomenon, explanatory research seeks answers to why and how types of questions. It attempts to "connect the dots" in research, by identifying causal factors and outcomes of the target phenomenon. Examples include understanding the reasons behind adolescent crime or gang violence, with the goal of prescribing strategies to overcome such societal ailments. Most academic or doctoral research belongs to the explanation category, though some amount of exploratory and/or descriptive research may also be needed during initial phases of academic research. Seeking explanations for observed events requires strong theoretical and interpretation skills, along with intuition, insights, and personal experience. Those who can do it well are also the most prized scientists in their disciplines.

The theories of Truth

100%

MATCHING BLOCK 22/88

rely on an ontology, or a set of assumptions about what is real. We assume that gravity is real and that the mitochondria of a cell are real. With a powerful microscope, mitochondria are easy to spot and observe, and we can theorize about their function in a cell. The gravitational force is invisible, but clearly apparent from observable facts, like watching an apple fall. The theories about gravity have changed over the years, and those improvements in theory were made when existing theories fell short in explaining observations. If we weren't able to perceive mitochondria or gravity, they would still be there, doing their thing because they exist independent of our observation of them. This is a

idea called realism, and it simply means that the concepts we talk about in science really and truly exist. Ontology in physics and biology is focused on objective truth. You may have heard the term "being objective" before: it involves observing and thinking with an open mind and pushing aside anything that might bias your perspective. Objectivity also

NSOU ? PGSW-VII 20 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022

99%**MATCHING BLOCK 24/88****W**

involves finding what is true for everyone, not just what is true for one person. Gravity is certainly true for everyone, everywhere, but let's consider a social work example. It is objectively true that children who are subjected to severely traumatic experiences will experience negative mental health effects afterwards. A diagnosis of post-traumatic stress disorder (PTSD) is considered objective because it refers to a real mental health issue that exists independent of the social worker's observations, and it presents similarly in all clients who experience the disorder. Objective, ontological perspective implies that observations are true for everyone, regardless of whether we are there to observe them or not observe them. Epistemology, or our assumptions about how we come to know what is real and true, helps us to realize these objective truths. The most relevant epistemological question in the social sciences is whether truth is better accessed using numbers or words. Generally, scientists approaching research with an objective ontology and epistemology will use quantitative methods to arrive at scientific truth. Quantitative methods examine numerical data to precisely describe and predict elements of the social world. This is due to the epistemological assumption that mathematics can represent the phenomena and relationships we observe in the social world. Mathematical relationships are uniquely useful because allow us to make comparisons across individuals as well as time and space. For example, let's look at measures of poverty. While people can have different definitions of poverty, an objective measurement such as an annual income less than Rs25,000 for a family of four is insightful because (1) it provides a precise measurement, (2) it can be compared to incomes from all other people in any society from any time period, and (3) it refers to real quantities of money that exist in the world. In this book, we will review survey and experimental methods, which are the most common designs that use quantitative methods to answer research questions. It may surprise you to learn that objective facts, like income or mental health diagnoses, are not the only facts that are present in the social sciences. Indeed, social science is not only concerned with objective truths, but it is also concerned with subjective truth. Subjective truths are unique to individuals, groups, and contexts. Unlike objective truths, subjective truths will vary based on who you are observing and the context you are observing them in. The beliefs, opinions, and preferences of people are actually truths that social scientists measure and describe. Additionally, subjective truths do not exist

independ-

NSOU ? PGSW-VII 21 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 dent

100%**MATCHING BLOCK 25/88****W**

of human observation because they are the product of the human mind. We negotiate what is true in the social world through language, arriving at a consensus and engaging in debate. Epistemologically, a scientist seeking subjective truth assumes that truth lies in what people say, in their words. A scientist uses qualitative methods to analyze words or other media to understand their meaning. Humans are social creatures, and we give meaning to our thoughts and feelings through language. Linguistic communication is unique. We share ideas with each other at a remarkable rate. In so doing, ideas come into and out of existence in a spontaneous and emergent fashion. Words are given a meaning by their creator, but anyone who receives that communication can absorb, amplify, and even change its original intent. Because social science studies human interaction, subjectivists argue that language is the best way to understand the world. This epistemology is based on some interesting ontological assumptions. What happens when someone incorrectly interprets a situation? While their interpretation may be wrong, it is certainly true to them that they are right. Furthermore, they act on the assumption that they are right. In this sense, even incorrect interpretations are truths, even though they are only true to one person. This leads us to question whether the social concepts we think about really exist. They might only exist in our heads, unlike concepts from the natural sciences which exist independent of our thoughts. For example, if everyone ceased to believe in gravity, we wouldn't all float away. It has an existence independent of human thought.

100%**MATCHING BLOCK 26/88****W**

One area that social workers commonly investigate is the impact of a person's social class background on their experiences and lot in life. You probably wouldn't be surprised to learn that a person's social class background has an impact on their educational attainment and achievement. In fact, one group of researchers in the early 1990s found that the percentage of children who did not receive any postsecondary schooling was four times greater among those in the lowest quartile (25%) income bracket than those in the upper quartile of income earners (i.e., children from high-income families were far more likely than low-income children to go on to college). Another recent study found that having more liquid wealth that can be easily converted into cash actually seems to predict children's math and reading achievement (Elliott, Jung, Kim, & Chowa, 2010).

These findings—that wealth and income shape a child’s educational experiences—are probably not that shocking to any of us. Yet, some of us may know someone who may be an exception to the rule. Sometimes the patterns that social scientists observe fit our commonly held beliefs about the way the world works. When this happens, we don’t tend to take issue with the fact that patterns don’t necessarily represent all people’s experiences. But what happens when the patterns disrupt our assumptions? For example, did you know that teachers are far more likely to encourage boys to think critically in school by asking them to expand on answers they give in class and by commenting on boys’ remarks and observations? When girls speak up in class, teachers are more likely to simply nod and move on. The pattern of teachers engaging in more complex interactions with boys means that boys and girls do not receive the same educational experience in school (Sadker & Sadker, 1994).

100%

MATCHING BLOCK 29/88

W

People who object to these findings tend to cite evidence from their own personal experience, refuting that the pattern actually exists. However, the problem with this response is that objecting to a social pattern on the grounds that it doesn’t match one’s individual experience misses the point about patterns. Patterns don’t perfectly predict what will happen to an individual person, yet they are a reasonable guide. When patterns are systematically observed, they can help guide social work thought and action. 1.4

Concepts of Construct and Variables Concepts may also have progressive levels of abstraction. Some concepts such as a person’s weight are precise and objective, while other concepts such as a person’s personality may be more abstract and difficult to visualize. A construct is an abstract concept that is specifically chosen (or “created”) to explain a given phenomenon. A construct may be a simple concept, such as a person’s weight, or a combination of a set of related concepts such as a person’s communication skill, which may consist of several underlying concepts such as the person’s vocabulary, syntax, and spelling. The former instance (weight) is a unidimensional construct, while the latter (communication skill) is a multi-dimensional construct (i.e., it consists of multiple underlying concepts). The distinction between constructs and concepts are clearer in multi-dimensional constructs, where the higher order abstraction is called a construct and the lower order abstractions are called concepts. However, this distinction tends to blur in the case of unidimensional constructs.

NSOU ? PGSW-VII 23 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 Constructs used for scientific research must have precise and clear definitions that others can use to understand exactly what it means and what it does not mean. For instance, a seemingly simple construct such as income may refer to monthly or annual income, before-tax or after-tax income, and personal or family income, and is therefore neither precise nor clear. There are two types of definitions: dictionary definitions and operational definitions. In the more familiar dictionary definition, a construct is often defined in terms of a synonym. For instance, attitude may be defined as a disposition, a feeling, or an affect, and affect in turn is defined as an attitude. Such definitions of a circular nature are not particularly useful in scientific research for elaborating the meaning and content of that construct. Scientific research requires operational definitions that define constructs in terms of how they will be empirically measured. For instance, the operational definition of a construct such as temperature must specify whether we plan to measure temperature in Celsius, Fahrenheit, or Kelvin scale. A construct such as income should be defined in terms of whether we are interested in monthly or annual income, before-tax or after-tax income, and personal or family income. One can imagine that constructs such as learning, personality, and intelligence can be quite hard to define operationally. Figure 1.2 : The theoretical and empirical planes of research A term frequently associated with, and sometimes used interchangeably with, a construct is a variable. Etymologically speaking, a variable is a quantity that can vary (e.g., from low to high, negative to positive, etc.), in contrast to constants that do not vary (i.e., Theoretical Plane Construct A Construct B Proposition Empirical Plane Independent Variable Hypothesis Dependent Variable

NSOU ? PGSW-VII 24 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 remain constant). However, in scientific research, a variable is a measurable representation of an abstract construct. As abstract entities, constructs are not directly measurable, and hence, we look for proxy measures called variables. For instance, a person's intelligence is often measured as his or her IQ (intelligence quotient) score, which is an index generated from an analytical and pattern-matching test administered to people. In this case, intelligence is a construct, and IQ score is a variable that measures the intelligence construct. Whether IQ scores truly measures one's intelligence is anyone's guess (though many believe that they do), and depending on whether how well it measures intelligence, the IQ score may be a good or a poor measure of the intelligence construct. As shown in Figure 2.1, scientific research proceeds along two planes: a theoretical plane and an empirical plane. Constructs are conceptualized at the theoretical (abstract) plane, while variables are operationalized and measured at the empirical (observational) plane. Thinking like a researcher implies the ability to move back and forth between these two planes. Depending on their intended use, variables may be classified as independent, dependent, moderating, mediating, or control variables. Variables that explain other variables are called independent variables, those that are explained by other variables are dependent variables, those that are explained by independent variables while also explaining dependent variables are mediating variables (or intermediate variables), and those that influence the relationship between independent and dependent variables are called moderating variables. As an example, if we state that higher intelligence causes improved learning among students, then intelligence is an independent variable and learning is a dependent variable. There may be other extraneous variables that are not pertinent to explaining a given dependent variable, but may have some impact on the dependent variable. These variables must be controlled for in a scientific study, and are therefore called control variables. Moderating Effort Intelligence Independent Mediating Dependent Academic Earning Figure 1.3. A nomological network of constructs

NSOU ? PGSW-VII 25 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 To understand the differences between these different variable types, consider the example shown in Figure 1.2. If we believe that intelligence influences (or explains) students' academic achievement, then a measure of intelligence such as an IQ score is an independent variable, while a measure of academic success such as grade point average is a dependent variable. If we believe that the effect of intelligence on academic achievement also depends on the effort invested by the student in the learning process (i.e., between two equally intelligent students, the student who puts in more effort achieves higher academic achievement than one who puts in less effort), then effort becomes a moderating variable. Incidentally, one may also view effort as an independent variable and intelligence as a moderating variable. If academic achievement is viewed as an intermediate step to higher earning potential, then earning potential becomes the dependent variable for the independent variable academic achievement, and academic achievement becomes the mediating variable in the relationship between intelligence and earning potential. Hence, variable are defined as an independent, dependent, moderating, or mediating variable based on their nature of association with each other. The overall network of relationships between a set of related constructs is called a nomological network (see Figure 2.2). Thinking like a researcher requires not only being able to abstract constructs from observations, but also being able to mentally visualize a nomological network linking these abstract constructs. 1.5 Social Survey a. Definition : It is very difficult to give a universally accepted definition of social survey. This is because the scope of social survey is very wide. So, generally any definition cannot suffice to express its aims. Actually, it is practically impossible to define the different applications of social survey in just few lines. This is because starting from a more or less eighty years from now, the classical poverty survey till modern-day survey of urban planning or market surveyor public opinion surveyor surveys conducted by government offices have been so varied that it is really difficult to encompass all these types under one single definition. Again, with respect to its aims, the scope of social survey has been very wide. This because it can range from implementation of administrative decision, from finding, cause-effect relation to shed light on some social theory. Moreover if we look at it as subject, then it may be inclusive of characteristic of population distribution social environment, different activities, opinion of social groups and the like.

NSOU ? PGSW-VII 26 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 Wells had delivered a definition of social survey in 1935 as primarily the expression of real cause of the poverty of labour class, their problems and social nature of it. But this is not a complete definition. In modern days, social surveys are used in wider meanings and contexts because on the one hand, it is attached to governmental surveys, market research, public opinion research and on the other, it is attached to different sides of social science research. Therefore social survey can be defined as scientific method by which the cause- effect relationship is understood, with an aim to realize the real cause of an event or to understand the source of a social problem. (b) Purpose of social survey: Some social surveys aim at exploring some data delivering those to concerned people. In other words, such surveys have a clear descriptive aim. In the same way, as social surveys have descriptive aims for social scientist does it is a means of forming ideas about social relationships and social behaviour of members of society. In reality, different data based subjects are included in its objective For example, how does different families of various status-positions expend their income, what is the relationship between education and social status, what is the opinion of general public towards social security policies, and many more such issues. But it should not be believed that descriptions are the only aim of social surveys. Many social surveys also aim at explanation. Such surveys are completely theoretical. It means that, some surveys aim at formulating hypothesis on any theory of social science and then testing it or measuring the effect of theories on different issues. Whatever may be the aim of such surveys, it mainly aims at establishing relationship between different variables. This is why, such surveys require complex analysis and explanation. From the above discussion, following can be summarized :- (1) to uphold the relation between society and the elements of social organization. (2) to search for reasons or causes of social problems. (3) to analyse the cause-effect relationship of any social event. (4) to analyse the different opinions of various social groups. (5) to measure the effect of any sociological theory of society. (6) to explore different data, analyse them and over and above create theories with the help of collected facts. (c) Subject-matter of Surveys: Though it is difficult to produce a complete list of subject-matters of social surveys but still four such subject-matters can be identified- NSOU ? PGSW-VII 27 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 (1) To construct ideas about the distribution of a population for example, their family- structure, marital status, age, fertility-rate, ratio of children to aged population etc. (2) To understand the social environment and economic condition of that population. It includes, occupation, profession, income, condition of living, social securities enjoyed etc. (3) To construct ideas on the activities of that population. It includes their activities, behaviour, leisure activities, expenditure pattern, etc. (4) To know about different perspectives and opinion of that population. For example, pre-poll survey, public opinion survey, market research etc. (d) Historical Background of Social Survey: The history of social survey is not very old. The names that are associated from the beginning are Eden, Mayhew, and Booth. But, Booth is considered to be the father of scientific social survey. In 1886, Booth started a survey on The lives of Labour and Citizens of London and this survey ended in 1902. In the earlier parts of the twentieth century, Booth and Rowntree initiated many long-term social surveys. This is why they are called the torch- bearers of modern social surveys. In the later twenty years, many scholars also initiated surveys. Among them most noteworthy is Bowley. In the later decades of 1920s and earlier parts of 1930s, a number of survey were conducted in British Isles following the methods of earlier studies. Later on, urban planning and governmental activities were associated with survey. Slowly, the significance of survey increased and survey as a method also entered non- governmental sectors. In the mid twentieth century, academic courses of surveys started to come up and was included in the syllabi of various universities. In the U. S. too, alongwith British initiatives, various surveys were conducted. Among them, Glock's work in 1967-Survey Research in the Social Sciences was published. In this book, the role of surveys in Sociology, Political Science, Psychology, Economics, Anthropology, Education, Social Work, Public Health and Medical Sciences, was vividly explained. The Classical Poverty Survey : The torchbearer of modern social survey Charles Booth started his survey in 1886 and concluded it in 1902. The results of his work was published in 17 volumes. He was a rich merchant and he felt deeply for the poverty stricken labour class and their social living, condition. The most difficult task which he faced during his survey was how to collect data on the huge population of the labour class living in London. He was the first to introduce "group interview" method. The data collected through this method was divided into eight classes of families. Out of these four were situated above the poverty line and the other

NSOU ? PGSW-VII 28 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 four below it. But this differentiation was not too logical since, his definition of 'poor' and 'very poor' was not perfect. But still this survey attracted attention because it highlighted on the terrible sides of poverty and its variation. Beatrix Webb later on had shown how much and to what extent, this survey had a political effect. In reality, Booth's survey paved the way for scientific social survey. After a decade later, Rowntree started his survey in 1902. The subject of his survey was "Poverty: A Study of Town Life". His survey was different from Booth's methods in three respects : Firstly, he collected data on occupation, income and housing conditions of each labour class family. Secondly, he directly- gathered data from each family, and Thirdly, the important issue of his survey was that he was able to present a nearly perfect conception of poverty. He was also able to differentiate between different strata of poverty stricken families. In his views if the total family income falters to provide essentials to maintain the basic physical strength of the members then it can be called primary poverty. And, if the family income can provide the least essentials to maintain physical strength of its members, but cannot always satisfy important or unimportant expenditure of the family, it is called secondary poverty. He also, initiated a price index for food and clothing of (≠) such families. In 1912, Bowley started a very important survey. He conducted the survey on the living conditions of labourers in five cities. The name of this survey was "Livelihood and poverty". The most important contribution of Bowley was the use of sampling. Later in this method was used in every survey. In the 1930s, surveys were conducted in random and its use became rampant : In 1932, Ford conducted a survey in Southampton. This was published in 1934 as work and wealth in Modern Port Ford had followed Bowley's method in this survey but conceptualized poverty in different times. This new term was potential poverty. The order surveys on labour class which were equally significant were Rowntree's survey Poverty and Progress in 1941 and Lavers' Survey in 1950 and Abel-Smith's work in 1965. Rowntree gave up the earlier index of poverty and substituted it with a new one- human necessity value. Lavers' and Rowntree both conducted a survey named Poverty and the welfare state. Abel-Smith and Townsend conducted a survey named "The Poor and the Poorest".

NSOU ? PGSW-VII 29 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 Still today, surveys are conducted on urban planning, market research, public-opinion as done earlier. But in modern times, census is the most elaborate survey conducted so far. In every country, under government patronage census conducted every ten years.

Exercises 01. What is social survey? What are its objectives. 02. What are the subject-matter of surveys. 03. Explain the historical background of surveys. 1.6 Social Research (a) Social Research: In general terms, social research is a deep concern for search to establish a new knowledge. Social research is research on Society-related any subject. Research is always conducted through scientific methods. The tools for this are experimen- tation, observation, data-analysis and decision. In natural sciences, experimentation is given more significance than is social science research. In social research on the other hand, observation, data-collection, data analysis is given more importance. In teal sense, research is a process whereby existing knowledge is tested, modified by deep observation analysis and decisions. In 1947, Western Reserve University in the us conducted a work shop, In its report, it was said that social research is conducted to ensure the progress of pure natural sciences. But the characteristics that are found in social research are as follows : 1. Social research is conducted in social and behavioural sciences. 2. Such researches are also conducted in sociology and anthropology. 3. To clearly understand human behaviour and to make progress in knowledge acquired, or to reject an old theory, or modify it, or to establish, a new theory, such researches are conducted. 4. Social research is also conducted with an aim to help in formulating policies and to see it an idea on social issues is practically useable. 5. A social researcher starts his research with an educational aim and also to fill up the gaps in social science knowledge. The ultimate aim of such researches is to acquire unknowledge about social facts and social environment.

NSOU ? PGSW-VII 30 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 (b) Importance of Research in Social Work: Social work is a practical profession. The scope of social work is mainly : Proposal, Promotion, Medical treatment of mental illness and over and above it is associated with, the positive aspects of social state. For this reason, it is important for the social workers to have a clear idea of different social problems and the reality. Because, the lack of it, the social researcher may find it difficult to construct an appropriate proposal and technique that would be a help for an individual or a group. Social research is for this reason helpful for social work. It becomes easier to find solutions to a problem and also find out the possible sources of a problem through research. In this way it helps the researcher to dwell deep into a problem and assist him/her in making a decision as to how and where to start their work. For example, let us think that cholera has shaped up like an epidemic in a village. The first step a social worker should undertake is to find out what are the potential causes of cholera; which castes or groups are most affected by it. Moreover, the history of the disease, the source of drinking water, opportunities for medical treatment etc. are also to be understood by the researcher. Only after having a complete understanding of the nature of scope of the problem, he/ she will be in a position to draw a policy to solve it. But if an immediate solution to the problem is looked for, then it is advisable to take care of the medical treatment only. But in this way there will be ample scope for the disease to take the tony of an epidemic in the future. If a permanent solution is looked for, then along with medical treatment, efforts should be made to eradicate the causes' of the problem, It means that through research, if a knowledge about the disease is formed, only then it would be possible to create a permanent solution to the problem. The importance of research his here. It is through research, that a social worker can develop a clear concept of the disease, causes of it and the socio-economic background of the patients. And this would had a permanent solution of the problem. With the development of civilization, social life has become more and more complex. There has been important changes in the Social norms and regulation of earlier times. In order to understand this complex social environment it is important to survey the components of the social setting. It is also for this reason that research has become indispensable for the understanding of social complexities. This is because, unless the social workers can fully understand the social environment and the social facts, it would be impossible to carry on work for them. Whenever there is a disruption in the normal working of the society, social work research becomes essential. It is through research that the

NSOU ? PGSW-VII 31 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 probable cause of such disruption are looked for. In reality, the aim of social work is to find out the potential causes and solutions of the problems of mankind. It also aims at finding out alternative solutions that evolve out of the understanding of complex social problems. In summary, it can be said that the aim of social work is to build up an opposition to social problems and in this way to enhance the scope of social work and find solutions to problems. Social research helps social workers to practically use theoretical knowledge and help them to find out possible solutions to the problems they face. But, in reality social research and social work research are completely different subjects altogether. (C) Features of Social Work Research: There may be some similarities between social work research and social research but there are some characteristics of social work research, which are as follows : 1. The aim of social work research is to explore any answer to question related to social work through the application of structured scientific method. Besides, social work research tries to find alternative solutions to those problems which social workers face. 2. Social work research is not always directed towards enhancing knowledge in social science. It specially aims at finding out how this knowledge can be utilized for building up self-sufficiency and independence among people who are in trouble. 3. Social research aims at progressive enhancement of the works of individuals, group and over and above, the society. 4. Social work research is a part of social research. 5. Social work research is always oriented towards the reality. It emphasizes mostly on the practicality of the problems that men face and tries to find 'out possible solutions for it. It also aims at finding out the practicality of the methods used. (D) Scope of Social Work Research: The scope of social work research underlines the parameter within which social work is practically implemented. Its scope extends from establishing different theories of social work, research on various facts, policy formulation, implementation of different programmes practical utilization of policies and evaluation of policies and its control. In all aspects of social work research is essential. Due to changes in ideas, development of science and technology and differences between nature and culture, social work research alongwith changing social problems is undergoing revision.

NSOU ? PGSW-VII 32 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 Not denying the fact is the concept that social work has different implications in differing space and time. It is for this reason that implications of a particular research is not applicable universally. For example, changes that take place in a urban area does not have same effect in rural areas. But it is true that the implications of development in urban areas have some effect on rural areas as well. It is for this reason that social work research is continuous and its importance can never be underestimated. Areas in which social work research is immensely applied is policies-for social welfare activities, formulation of social laws and strengthening of same security policies of some communities. Through this, there develops a deep bond of cooperation between the members of the society. In different areas, through social work research social justice and social security is easily established through such research the different gaps between different strata of people can be diminished. (F) Position of Social Work Research in India : Social Work as an academic discipline was first started in Tata Institute of Social Science. In the same way, social work research also started in the same institute. But still, it is suffice to say that social work research has not gained momentum in India. The social work researchers in India still accept and depend solely on research methods, theories and techniques developed in the west. Indian social work researchers lack originality in their orientation. It is not true that research methods and techniques developed in the west are in applicable in India. But it needs revision while applying those on Indian conditions. Generally, it is seen that there lies a gap between the results of research and what common people think. Besides that, common people have very little knowledge about career in social work. The NGOs, government offices, international organisations, who do a lot of social work research, do not inspire social work researchers in any pure research. The type or research conducted by such organisations are so error some, that common people find it hard to integrate with them, It is for this reason that, though demand for trained efficient researchers are growing but still, the scope of social work research remains unchanged. The participatory research which are conducted usually entrusts its results on common people. But such researches should aim at hypothesizing after understanding the needs of the mass. Many times, such researches are conducted according to the needs of the organization which sponsors the research. Only in few cases, researches aim at the needs of the masses, evaluation of resources and importance of policy building. The reasons behind such errors in social work research are as follows : (i) The administrators and policy-makers give less importance or research. (ii) Insufficient financial resources are available for the research and the aims of the financial organizations or sponsoring agents limit the scope of research.

NSOU ? PGSW-VII 33 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 (iii) Lack of a central organization that would help in promoting social work research. (iv) No real training centre for researchers. (v) Lack of initiative among professional social work researchers. But in a country like India, where a substantial number of people live below the poverty line, it can play a viable role. The importance of social work research in India can be underlined below : (1) Social work research method : Indian Social System is dynamic. Therefore, which social work research method is applicable in which social context of Indian society is very important to discern. The traditional methods of social work research used in Indian conditions are case work, group work and convey organization. There is importance in evaluating the success of each method. Because in the changing socio-cultural circum- stances in India, these methods should be evaluated so that they can be more effective. (2) Development of Policies, Integration and Evaluation: India has a number of tribes, castes and a number of people belonging to different classes. It is necessary to integrate the different social welfare works and evaluate these methods used. This is because, it is important to analyse the significance and the importance of collecting evidences for different demands. It is possible to develop varying programmes evaluate and integrate them only through research. (3) Social problem oriented research: Different social problems such as illiteracy, superstition, poverty, unemployment, prostitution etc. are so complex that it is possible to understand them only through research. Besides them, problems of the scheduled castes and scheduled tribes, the unorganized labour force are only to be understood through research. Other than these problems faced by AIDS patients the negative reactions towards them also can be understood through research. Therefore, in order to understand any complex social problem social work research has an important role to play. (4) To know the history of social work: It is impossible to understand the present without throwing the past. It is only by analysing the history of social work, we can understand the nature of its continuity of works already done. So, it is important for social workers to understand how changes in socio-cultural and political spheres has had an effect on social work. So, one of the important aspects of social work research is to enlighten on the history and its development. (5) To understand Social Work and Social Policy: Many social policies are enacted for social work. It is important for social workers to understand the effectiveness of such policies at present and the success and failures of these policies. It can be understood only through social work.

NSOU ? PGSW-VII 34 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 Besides these, the importance of social work is understood in areas like administration, establishing human rights, training of social workers and in developing those etc. (6) Limitations of Social Work Research: Research answers questions on many unknown issues. This is why social research is called a pioneer of modern civilization. But the level of reliable data that research can yield for natural sciences, is somewhat jeopardised in case of social science. This is the reason why there are certain limitations of social work research. These are : (i) Many social work research is based on systems approach. This approach is based on human body. The parts of the human body perform certain particular functions. Any disruption in this working has a negative effect on the human body. This means there is an internal cohesion and mutual dependence in the working of the parts of human body. Similarly, if this logic is applied on research then it means that the data collected would try to find out ways to solve problems in such a way that it would match the modern social structure. But problem arises when it is inherent in the structure. This is how social work research begets its limitation. (ii) The problem areas where social work research is generally conducted are not analysed deeply. As a result, in place of analysing the complex social causes, the researcher only explores some causes ignoring the others. Thus often happens because, the amount of labour and time needed for such work is not given. So, it lacks continuity. (iii) The effect of India's regional differences is high on social work. To do such work," continuous research is essential. The time and labour needed is often not adhered to. (iv) The relationship between theory and research is significant. Though it cannot be denied that the social work theory and its applicability is universal but still its applicability is truly limited by regional differences. In respect to regional difference, modification of theories is so important but this aspect is not given significance by researchers. (v) Many a times it is seen that there lies a misconception among researcher, financial institute, government office, and organisations dealing with social work. As a result of this, the policies taken up to consider needs of common man are not always accurate. As a result of misconception and biased ideas of the researcher, the results of research can also be misleading. (vi) In Indian situation, behind different social work policies, are a particular impact of politics is envisaged. This political impact poses limitations on social work research. (vii) Men hope that through research, solution to many human problems can be found. But this concept is not true in all senses. So, social work research too, cannot always bring success and help in meeting all kinds of demands, or bring about desired changes.

NSOU ? PGSW-VII 35 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 (F) Distinction between Social Research and Social Work Research. In 1937, Helen Jetter in her book "Social Work Year Book" said that the aim of social work research is to find out social work philosophy, method, process, technique etc. for the problems faced by social work researchers, in a scientific and national exploration. Differently, though social work research aim at progress in fundamental social science. The theories of social science and methods are applied on social work and in this way, there establishes a relationship between the two. In reality, the main differences between social work research and social research is that social work research is always conducted from the point of view of the social worker. The differences between the two are as follows :-

1. Definition Social research is exploration of social science development through scientific and national methods.
2. Field Social Research is conducted on behavioral sciences such as sociology, anthropology etc.
3. Aim To establish clear concepts regarding social environment, social problem, human behaviour, to reject any old theory, to reform or modify them. In short, to aim at knowledge regarding social Science research.
4. Scope The scope of social research is very wide. Any issues of social significance are included in such research.
5. Basis Social research works on the limitation of social science. Its aim is exploration of new knowledge.

Social work Research Social work research is to find solutions to the problems social workers face, through scientific and national exploration. Such research is conducted on areas where social workers face problems. To understand the causes of the problems social workers face to find solutions to these problems, to examine the utility of social policies. Social work research is apart of social research. As it is limited by its scope of working within the field of Social Welfare in comparison to social research, its scope is limited. The basis of social work research is to find" solutions to the problems of human kind.

NSOU ? PGSW-VII 36 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 F : Distinction between Survey and Research :- Though survey and research have some common areas but still they cannot be synonymous. In reality, survey is to analyse or explore on certain issues so that its true nature can be highlighted on. Generally, survey is conducted to find out if a plan is researchable or not. On the other hand, to explore on a fundamental issue on the basis of scientific and rational criterion is research. Its aim is to find out sources of knowledge and rectify' or modify old theories. If social survey is done explicitly that in-depth social surveys can be called research. Survey is mainly based on problems. To find art causes of any problem is the aim of surveys. It is on the basis of surveys that a plan is made and implemented. On the other side, it is possible to know causes of a problem through research and find out permanent solutions to them. In social surveys importance is given to a fact and its description. So, the result of surveys are temporary but the results of researches are permanent. The results of surveys and different recording to time space and persons on whom they and applicable. Therefore they are flexible and universal in the same time. In case of research, specially pure research experiments are conducted. But the scope of experiments in surveys are limited. Surveys the primarily description and sometimes analytical. On the other hand, research is primarily normative. But in practice research is used as a term instead of surveys-as market research, public opinion research etc. These actually mean market survey, opinion survey. Exercise: 1. What is the meaning of social research? Analyse its objectives and scope. 2. What is the difference between survey and research. 3. Illustrate the difference between social research and social work research. 1.7 Process of Social Work Research Idea : Research is a continuous process. The process depends upon execution of specific work. These are like steps of a stare case who are interrelated, Scientific methods are followed to execute these work. On the other hand the steps which are followed in a scientific research are not scattered rather they are interrelated and interdependent. As these steps are followed and executed in a definite way in a research work thus they are considered as research methods. The main steps of a research works are as follows :

NSOU ? PGSW-VII 37 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 1. To identify the problems of research. 2. (a) Discussion of various theories and concepts. (b) Gathering knowledge on similar kind of research. 3. Project preparation. 4. Draft sketch plan of the research. 5. Collection of data. 6. Analysis of collected data. 7. Detail explanation of information based on the data and preparation of project report. But depending upon the requirement these steps can be changed. In case of social research similar steps are followed. Since the social research are done to solve the problems faced but the social workers and emphasises on the problem itself that is why these kind of researches are very much problem specific. Thus identifying the problem is the initial phase of this kind of research, similarly report with recommended solutions to these problems are the last phase of these research. The intermediate phase of the research work is considered to correlate between the two phase. This is the most critical and major part of a research work. In this phase so many works needs to be done such as sketch plan of the research, tools for the research, to determine the source of data and information which are to be collected, collection of data & Information data analysis, project preparation, examining the project, Analysing of the information etc. (B) Identification of Research Problem : Problem of a research means to determine the solution to those problems through research. Therefore identification of research problem means the research worker will research on what to find a solution-that means to identify or ascertain the topic of research. The researchers has to discuss thoroughly the theoretical and practical side of the problem so as to understand them properly. For this they have to read specific problem related books as well as to talk who such persons who have experience and have worked on similar kind of problem. This way after identifying the problem then the research methodology is to be settled. Therefore it need various works to be done identify a problem. The good thing that are obtained by identifying a problem are; 1. To ascertain the sphere of the topic of research.

NSOU ? PGSW-VII 38 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 2. This specifies the topic of the research and makes the research work smoother. 3. The problem can be properly defined. 4. To differentiate between the relevant (Research related) and irrelevant data. Identification of Research Problem is basically to determine the topic or subject on which the research work will be carried out. This mainly depends upon the discretion of the researcher as well as the knowledge and proficiency of the researcher, on a particular subject. Thus it is the primary job of a researcher to select the subject area of his research. Otherwise it is not possible to reach to the goal of the research. For this he has to perform the following; 1. The researchers have to decide the subject on which he has sufficient knowledge or among the various problems of the society which one attracts him the most. For example a researcher may choose. 'The malice of addiction' as his subject of his research. In this case the sphere of research is quite large, because cigarette, alcohol, Opium, Ganja, various drug they fall in the range of adict substance. Therefore he have to decide among these which will be his choice of research, whether he wants to carry out the research on smokers or alcoholic or drug adict. 2. Once the topic and the subject is selected then it is advised to make it precise: In that case it becomes easier for the researcher to put light on a particular side of the problem such as if a researcher decide to carry out the research on alcoholic person then he can make it more precise as whether he wants to study the health related problem with an alcoholic person or the society related problem with an alcoholic or the role of alcoholism as a cause behind the diplorable condition of a family. 3. After this the researcher has to determine the goal and mission of his research. Because the mission of a research helps the researcher to reach his goal in a disciplined way. Due to this the researcher none other but only concentrates on his research. Apart from the above steps the researcher has to follow other rules which are as follows. 1) The researcher must exchange his views and ideas with other research fellows and interact with those persons who have experience on similar kind of work. This will make the research more specific and effective. ii) He have to read books and journals relected to the said research this will make him more knowledgable.

NSOU ? PGSW-VII 39 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 iii) The researcher must have attraction on which he is carrying out the research work and he should have fairly good conception about the research, which are already done in the same field. iv) It is always recommended to avoid such fields of research which has a wide area and easily attracts the researcher. v) Above all the problem of research, or the subject has to be viable in respect of time and money. (c) Review of Literature After selecting the topic of research the second phase of the research requires that the researcher should gather in depth knowledge about the subject unless the researcher have a clear idea about the nature, cause and depth of the problem, he cannot carry out the research in the right direction. Reading of books helps him to build ideas, learn theories etc. It gives proper direction to the research work and prevents duplication of the same. It also indicates about the problems that may be encountered while doing the research. Study of books does not only mean studying of published books, but it includes study of unpublished books, journals, magazines, articles, Govt. reports etc. The research should make a list of these materials, because at the end of the research the researcher has to declare about the references from which he got help in preparing the thesis. 1.8 Ethical issues in Research Ethics is the moral distinction between right and wrong, and what is unethical may not necessarily be illegal. If a scientist's conduct falls within the gray zone between ethics and law, she may not be culpable in the eyes of the law, but may still be ostracized in her professional community, face severe damage to professional reputation, and may even lose her job on grounds of professional misconduct. Social Work is a field of knowledge that maintains an ethical and political commitment to protecting the rights of the participants in research. Prior to the creation of the resolution, the Social Workers' Professional Code of Ethics already indicated the need for professionals to respect the rights of participants to have prior information about the study procedure, freedom of choice and access to the results of the studies. In research projects conducted by social workers, it is common for the object of the study to be users of Social Work who belong to socially stigmatized social

NSOU ? PGSW-VII 40 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 classes or groups due to factors such as income, level of education, profession or even physical and mental deficiencies. Some of the people who participate in Social Work studies can be described, according to Barroco, as "a population considered vulnerable to certain requirements presented by scientific research." In this sense, the adoption of ethical care in the realization of scientific studies is an attribute of considerable importance in the education and professional exercise of social workers. While we talk about the Ethical issues involved in Research, it would be naive to simply and only trust in the self-guidance and morality of individual researchers. We must keep a few things in our mind- First, knowledge and acceptance of ethical standards and principles may vary widely between countries and disciplines and a unitary approach is therefore desirable for all stakeholders involved. Second, the transformation of international research into something akin to a capitalistic competition of scientific reputation with rankings and impact factors deciding on the standing and status of researchers (Münch 2014), the pressure on the individual researcher in this system is too high to expect everyone to adhere simply to their conscience everywhere and all the time during every phase of research. Third, Ethical concerns envisages issues of data sharing, privacy, and security. We know these days, the misuse of online data by various actors is likely to continue, as the potential gains are huge. However, researchers should not be left alone in addressing these issues. Rather, they should receive support from institutionalized agencies trained and tasked in the handling of ethical issues. These do not need to take the form of established IRBs and should provide guidance as much as restrictions Following are the Ethical Principles in Scientific Research— ? Scientific validity- A study should be designed in a way that will get an understandable answer to the important research question ? Fair subject selection The primary basis for recruiting participants should be the scientific goals of the study — not vulnerability, privilege, or other unrelated factors. ? Favourable risk-benefit ratio Everything should be done to minimize the risks and inconvenience to research participants to maximize the potential benefits, and to determine that the potential benefits are proportionate to, or outweigh, the risks.

NSOU ? PGSW-VII 41 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 ? Independent review To minimize potential conflicts of interest and make sure a study is ethically acceptable before it starts, an independent review panel should review the proposal and ask important questions, including: Are those conducting the trial sufficiently free of bias? Is the study doing all it can to protect research participants? etc ? Informed consent Potential participants should make their own decision about whether they want to participate or continue participating in research. This is done through a process of informed consent in which individuals (1) are accurately informed of the purpose, methods, risks, benefits, and alternatives to the research, (2) understand this information and how it relates to their own clinical situation or interests, and (3) make a voluntary decision about whether to participate. ? Respect for potential and enrolled subjects Individuals should be treated with respect from the time they are approached for possible participation — even if they refuse enrollment in a study — throughout their participation and after their participation ends. This includes: ? Respecting the privacy and keeping the private information of the respondents confidential ? Respecting the right to change the mind of the respondents, if they feel that the research does not match their interests, and to withdraw without a penalty ? Informing them of new information that might emerge in the course of research, which might change their assessment of the risks and benefits of participating ? Monitoring their welfare and, if they experience adverse reactions, unexpected effects, or changes in clinical status, ensuring appropriate treatment and, when necessary, removal from the study ? Informing the respondents about what was learned from the research

NSOU ? PGSW-VII 42 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 1.9 Hypothesis A hypothesis is an assumption about how two or more variables are related; it makes a conjectural statement about the relationship between those variables. In social science the hypothesis will often predict how one form of human behaviour influences another. In research, independent variables are the cause of the change. The dependent variable is the effect, or thing that is changed. For example, in a basic study, the researcher would establish one form of human behaviour as the independent variable and observe the influence it has on a dependent variable. How does gender (the independent variable) affect rate of income (the dependent variable)? How does one's religion (the independent variable) affect family size (the dependent variable)? How is social class (the dependent variable) affected by level of education (the independent variable)? ? Hypothesis are testable explanations of a problem, phenomenon, or observation. ? Both quantitative and qualitative research may involve formulating a hypothesis to address the research problem. ? Hypotheses that suggest a causal relationship involve at least one independent variable and at least one dependent variable; in other words, one variable which is presumed to affect the other. ? An independent Variable is one whose value is manipulated by the researcher or experimenter. ? A dependent variable is a variable whose values are presumed to change as a result of changes in the independent variable A hypothesis is an assumption or suggested explanation about how two or more variables are related. It is a crucial step in the scientific method and, therefore, a vital aspect of all scientific research. There are no definitive guidelines for the production of new hypotheses. The history of science is filled with stories of scientists claiming a flash of inspiration, or a hunch, which then motivated them to look for evidence to support or refute the idea. While there is no single way to develop a hypothesis, a useful hypothesis will use deductive reasoning to make predictions that can be experimentally assessed. If results contradict the predictions, then the hypothesis under examination is incorrect or incomplete and must be revised or abandoned. If results confirm the predictions, then the hypothesis might be correct but is still subject to further testing.

NSOU ? PGSW-VII 43 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 1.10 Steps in the process of research 1 Problem Selection— The first step in the process of carrying out any kind of Research is to identify a problem. This problem may be something the researcher may identifies and which may need further investigation for building up new knowledge or information. This step involves identification of one or more research questions dealing with a specific behaviour, event, or phenomena of interest. Research questions are specific questions about a behaviour, event, or phenomena of interest that you wish to seek answers for in your research. Research questions can delve into issues of what, why, how, when, and so forth. More interesting research questions are those that appeal to a broader population. Narrowly focused research questions (often with a binary yes/no answer) tend to be less useful and less EXPLORATION RESEARCH DESIGN RESEARCH EXECUTION Research Questions Literature Review Theory Operation- alization Research Method Sampling Strategy Researchh Proposal Pilot Testing Data Collection Data Analysis Research Report

NSOU ? PGSW-VII 44 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 interesting and less suited to capturing the subtle nuances of social phenomena. Uninterest- ing research questions generally lead to uninteresting and unpublishable research findings. The next step is to conduct a literature review of the domain of interest. The purpose of a literature review is three-fold: (1) to survey the current state of knowledge in the area of inquiry, (2) to identify key authors, articles, theories, and findings in that area, and (3) to identify gaps in knowledge in that research area. Literature review is commonly done today using computerized keyword searches in online databases. Keywords can be combined using "and" and "or" operations to narrow down or expand the search results. Once a shortlist of relevant articles is generated from the keyword search, the researcher must then manually browse through each article, or at least its abstract section, to determine the suitability of that article for a detailed review. Literature reviews should be reasonably complete, and not restricted to a few journals, a few years, or a specific methodology. Reviewed articles may be summarized in the form of tables, and can be further structured using organizing frameworks such as a concept matrix. A well-conducted literature review should indicate whether the initial research questions have already been addressed in the literature (which would obviate the need to study them again), whether there are newer or more interesting research questions available, and whether the original research questions should be modified or changed in light of findings of the literature review. The review can also provide some intuitions or potential answers to the questions of interest and/or help identify theories that have previously been used to address similar questions. Since functionalist (deductive) research involves theory-testing, the third step is to identify one or more theories can help address the desired research questions. While the literature review may uncover a wide range of concepts or constructs potentially related to the phenomenon of interest, a theory will help identify which of these constructs is logically relevant to the target phenomenon and how. Forgoing theories may result in measuring a wide range of less relevant, marginally relevant, or irrelevant constructs, while also minimizing the chances of obtaining results that are meaningful and not by pure chance. In functionalist research, theories can be used as the logical basis for postulating hypotheses for empirical testing. Obviously, not all theories are well-suited for studying all social phenomena. Theories must be carefully selected based on their fit with the target problem and the extent to which their assumptions are consistent with that of the target problem. Selection and Formulation of Research Design — The next phase in the research process is research design. This process is concerned with creating a blueprint of the activities to take in order to satisfactorily answer the

NSOU ? PGSW-VII 45 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 research questions identified in the exploration phase. This includes selecting a research method, operationalizing constructs of interest, and devising an appropriate sampling strategy. Operationalization is the process of designing precise measures for abstract theoretical constructs. This is a major problem in social science research, given that many of the constructs, such as prejudice, alienation, and liberalism are hard to define, let alone measure accurately. Operationalization starts with specifying an "operational definition" (or "conceptualization") of the constructs of interest. Next, the researcher can search the literature to see if there are existing prevalidated measures matching their operational definition that can be used directly or modified to measure their constructs of interest. If such measures are not available or if existing measures are poor or reflect a different conceptualization than that intended by the researcher, new instruments may have to be designed for measuring those constructs. This means specifying exactly how exactly the desired construct will be measured (e.g., how many items, what items, and so forth). This can easily be a long and laborious process, with multiple rounds of pretests and modifications before the newly designed instrument can be accepted as "scientifically valid." Simultaneously with operationalization, the researcher must also decide what research method they wish to employ for collecting data to address their research questions of interest. Such methods may include quantitative methods such as experiments or survey research or qualitative methods such as case research or action research, or possibly a combination of both. If an experiment is desired, then what is the experimental design? If survey, do you plan a mail survey, telephone survey, web survey, or a combination? For complex, uncertain, and multi-faceted social phenomena, multi-method approaches may be more suitable, which may help leverage the unique strengths of each research method and generate insights that may not be obtained using a single method. Researchers must also carefully choose the target population from which they wish to collect data, and a sampling strategy to select a sample from that population. For instance, should they survey individuals or firms or workgroups within firms? What types of individuals or firms they wish to target? Sampling strategy is closely related to the unit of analysis in a research problem. While selecting a sample, reasonable care should be taken to avoid a biased sample (e.g., sample based on convenience) that may generate biased observations.

NSOU ? PGSW-VII 46 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 Data Collection – Data can be defined as the quantitative or qualitative values of a variable. Data is plural of datum which literally means to give or something given. Data is thought to be the lowest unit of information from which other measurements and analysis can be done. Data can be numbers, images, words, figures, facts or ideas. Data in itself cannot be understood and to get information from the data one must interpret it into meaningful information. There are various methods of interpreting data. Data sources are broadly classified into primary and secondary data. Data is one of the most important and vital aspect of any research studies. Researchers conducted in different fields of study can be different in methodology but every research is based on data which is analyzed and interpreted to get information. Data is the basic unit in statistical studies. Statistical information like census, population variables, health statistics, and road accidents records are all developed from data. There are two sources of data collection techniques. Primary and Secondary data collection techniques, Primary data collection uses surveys, experiments or direct observations. Secondary data collection may be conducted by collecting information from a diverse source of documents or electronically stored information, census and market studies are examples of a common sources of secondary data. This is also referred to as "data mining." Primary Data- Primary data means original data that has been collected specially for the purpose in mind. It means someone collected the data from the original source first hand. Data collected this way is called primary data. Survey Survey is most commonly used method in social sciences, management, marketing and psychology to some extent. Surveys can be conducted in different methods. Questionnaire Questionnaire is the most commonly used method in survey. Questionnaires are a list of questions either an open-ended or close-ended for which the respondent give answers. Questionnaire can be conducted via telephone, mail, live in a public area, or in an institute, through electronic mail or through fax and other methods. Interview Interview is a face-to-face conversation with the respondent. It is slow, expensive, and they take people away from their regular jobs, but they allow in-depth questioning and follow-up questions.

NSOU ? PGSW-VII 47 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 Observations Observations can be done while letting the observing person know that he is being observed or without letting him know. Observations can also be made in natural settings as well as in artificially created environment. Primary data has not been published yet and is more reliable, authentic and objective. Primary data has not been changed or altered by human beings; therefore its validity is greater than secondary data. Advantages of Primary Data— ? Data interpretation is better. ? Targeted Issues are addressed. ? Efficient Spending for Information. ? Decency of Data. ? Addresses Specific Research Issues. ? Greater Control. ? Proprietary Issues Disadvantage of Primary Data ? High Cost ? Time Consuming ? Inaccurate Feed-backs ? More number of resources is required Secondary Data Secondary data is the data that has been already collected by and readily available from other sources. When we use Statistical Method with Primary Data from another purpose for our purpose we refer to it as Secondary Data. It means that one purpose's Primary Data is another purpose's Secondary Data. So that secondary data is data that is being reused. Such data are more quickly obtainable than the primary data. These secondary data may be obtained from many sources, including literature, industry surveys, compilations from computerized databases and information systems, and computerized or mathematical models of environmental processes.

NSOU ? PGSW-VII 48 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 Published Printed Sources There are varieties of published printed sources. Their credibility depends on many factors. For example, on the writer, publishing company and time and date when published. New sources are preferred and old sources should be avoided as new technology and researches bring new facts into light. Books Books are available today on any topic that you want to research. The uses of books start before even you have selected the topic. After selection of topics books provide insight on how much work has already been done on the same topic and you can prepare your literature review. Books are secondary source but most authentic one in secondary sources. Journals/periodicals Journals and periodicals are becoming more important as far as data collection is concerned. The reason is that journals provide up-to-date information which at times books cannot and secondly, journals can give information on the very specific topic on which you are researching rather talking about more general topics. Magazines/Newspapers Magazines are also effective but not very reliable. Newspaper on the other hand is more reliable and in some cases the information can only be obtained from newspapers as in the case of some political studies. Published Printed Sources There are varieties of published printed sources. Their credibility depends on many factors. For example, on the writer, publishing company and time and date when published. New sources are preferred and old sources should be avoided as new technology and researches bring new facts into light. Books Books are available today on any topic that you want to research. The uses of books start before even you have selected the topic. After selection of topics books provide insight on how much work has already been done on the same topic and you can prepare your literature review. Books are secondary source but most authentic one in secondary sources.

NSOU ? PGSW-VII 49 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022

Journals/periodicals Journals and periodicals are becoming more important as far as data collection is concerned. The reason is that journals provide up-to-date information which at times books cannot and secondly, journals can give information on the very specific topic on which you are researching rather talking about more general topics. Magazines/Newspapers Magazines are also effective but not very reliable. Newspaper on the other hand is more reliable and in some cases the information can only be obtained from newspapers as in the case of some political studies. Published Electronic Sources As internet is becoming more advance, fast and reachable to the masses; it has been seen that much information that is not available in printed form is available on internet. In the past the credibility of internet was questionable but today it is not. The reason is that in the past journals and books were seldom published on internet but today almost every journal and book is available online. Some are free and for others you have to pay the price. E-journals: e-journals are more commonly available than printed journals. Latest journals are difficult to retrieve without subscription but if your university has an e-library you can view any journal, print it and those that are not available you can make an order for them. General Websites; Generally websites do not contain very reliable information so their content should be checked for the reliability before quoting from them. Weblogs: Weblogs are also becoming common. They are actually diaries written by different people. These diaries are as reliable to use as personal written diaries. Advantage of Secondary Data They are Inexpensive They are Easily accessible Immediately available Will provide essential background and help to clarify or refine research problem – essential for literature review Secondary data sources will provide research method alternatives. Will also alert the researcher to any potential difficulties.

NSOU ? PGSW-VII 50 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 Disadvantage of Secondary Data 1 They may not be immediately available – takes time to define problem, sampling frame, method and analysis. 2 It does not give us complete Information Thus we say that Primary research entails the use of immediate data in determining the survival of the market. The popular ways to collect primary data consist of surveys, interviews and focus groups, which shows that direct relationship between potential customers and the companies. Whereas secondary research is a means to reprocess and reuse collected information as an indication for betterments of the service or product. Data Analysis: Assessment of Intervention effects/impacts Data collection, is followed by Data Analysis. The data is analyzed and interpreted for the purpose of drawing conclusions regarding the research questions of interest. Depending on the type of data collected (quantitative or qualitative), data analysis may be quantitative (e.g., employ statistical techniques such as regression or structural equation modeling) or qualitative (e.g., case studies Focus Group Discussions or Content analysis). Data Analysis for Quantitative data— Numeric data collected in a research project can be analyzed quantitatively using statistical tools in two different ways. Descriptive analysis refers to statistically describing, aggregating, and presenting the constructs of interest or associations between these constructs. Inferential analysis refers to the statistical testing of hypotheses (theory testing). We may now examine statistical techniques used for descriptive analysis, and the next chapter will examine statistical techniques for inferential analysis. Much of today's quantitative data analysis is conducted using software programs such as SPSS or SAS. Data Preparation In research projects, data may be collected from a variety of sources: mail-in surveys, interviews, pretest or post test experimental data, observational data, and so forth. This data must be converted into a machine-readable, numeric format, such as in a spreadsheet or a text file, so that they can be analyzed by computer programs like SPSS or SAS. Data preparation usually follows the following steps. Data coding. Coding is the process of converting data into numeric format. A codebook should be created to guide the coding process. A codebook is a comprehensive document containing detailed description of each variable in a research study, items or

NSOU ? PGSW-VII 51 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 measures for that variable, the format of each item (numeric, text, etc.), the response scale for each item (i.e., whether it is measured on a nominal, ordinal, interval, or ratio scale; whether such scale is a five-point, seven-point, or some other type of scale), and how to code each value into a numeric format. For instance, if we have a measurement item on a seven-point Likert scale with anchors ranging from "strongly disagree" to "strongly agree", we may code that item as 1 for strongly disagree, 4 for neutral, and 7 for strongly agree, with the intermediate anchors in between. Nominal data such as industry type can be coded in numeric form using a coding scheme such as: 1 for manufacturing, 2 for retailing, 3 for financial, 4 for healthcare, and so forth (of course, nominal data cannot be analyzed statistically). Ratio scale data such as age, income, or test scores can be coded as entered by the respondent. Sometimes, data may need to be aggregated into a different form than the format used for data collection. For instance, for measuring a construct such as "benefits of computers," if a survey provided respondents with a checklist of benefits that they could select from (i.e., they could choose as many of those benefits as they wanted), then the total number of checked items can be used as an aggregate measure of benefits. Note that many other forms of data, such as interview transcripts, cannot be converted into a numeric format for statistical analysis. Coding is especially important for large complex studies involving many variables and measurement items, where the coding process is conducted by different people, to help the coding team code data in a consistent manner, and also to help others understand and interpret the coded data. Data entry. Coded data can be entered into a spreadsheet, database, text file, or directly into a statistical program like SPSS. Most statistical programs provide a data editor for entering data. However, these programs store data in their own native format (e.g., SPSS stores data as .sav files), which makes it difficult to share that data with other statistical programs. Hence, it is often better to enter data into a spreadsheet or database, where they can be reorganized as needed, shared across programs, and subsets of data can be extracted for analysis. Smaller data sets with less than 65,000 observations and 256 items can be stored in a spreadsheet such as Microsoft Excel, while larger dataset with millions of observations will require a database. Each observation can be entered as one row in the spreadsheet and each measurement item can be represented as one column. The entered data should be frequently checked for accuracy, via occasional spot checks on a set of items or observations, during and after entry. Furthermore, while entering data, the coder should watch out for obvious evidence of bad data, such as the respondent selecting

NSOU ? PGSW-VII 52 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 the "strongly agree" response to all items irrespective of content, including reverse-coded items. If so, such data can be entered but should be excluded from subsequent analysis. Missing values. Missing data is an inevitable part of any empirical data set. Respondents may not answer certain questions if they are ambiguously worded or too sensitive. Such problems should be detected earlier during pretests and corrected before the main data collection process begins. During data entry, some statistical programs automatically treat blank entries as missing values, while others require a specific numeric value such as -1 or 999 to be entered to denote a missing value. During data analysis, the default mode of handling missing values in most software programs is to simply drop the entire observation containing even a single missing value, in a technique called list wise deletion. Such deletion can significantly shrink the sample size and make it extremely difficult to detect small effects. Hence, some software programs allow the option of replacing missing values with an estimated value via a process called imputation. For instance, if the missing value is one item in a multi-item scale, the imputed value may be the average of the respondent's responses to remaining items on that scale. If the missing value belongs to a single-item scale, many researchers use the average of other respondent's responses to that item as the imputed value. Such imputation may be biased if the missing value is of a systematic nature rather than a random nature. Two methods that can produce relatively unbiased estimates for imputation are the maximum likelihood procedures and multiple imputation methods, both of which are supported in popular software programs such as SPSS and SAS. Data transformation. Sometimes, it is necessary to transform data values before they can be meaningfully interpreted. For instance, reverse coded items, where items convey the opposite meaning of that of their underlying construct, should be reversed (e.g., in a 1-7 interval scale, 8 minus the observed value will reverse the value) before they can be compared or combined with items that are not reverse coded. Other kinds of transformations may include creating scale measures by adding individual scale items, creating a weighted index from a set of observed measures, and collapsing multiple values into fewer categories (e.g., collapsing incomes into income ranges). Data Analysis for Qualitative Study— Qualitative analysis is the analysis of qualitative data such as text data from interview transcripts. Unlike quantitative analysis, which is statistics driven and largely independent of the researcher, qualitative analysis is heavily dependent on the researcher's analytic and

NSOU ? PGSW-VII 53 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 integrative skills and personal knowledge of the social context where the data is collected. The emphasis in qualitative analysis is "sense making" or understanding a phenomenon, rather than predicting or explaining. A creative and investigative mindset is needed for qualitative analysis, based on an ethically enlightened and participant-in-context attitude, and a set of analytic strategies. Let us take two examples to explain how we carry on Qualitative analysis. Content Analysis Content analysis is the systematic analysis of the content of a text (e.g., who says what, to whom, why, and to what extent and with what effect) in a quantitative or qualitative manner. Content analysis typically conducted as follows. First, when there are many texts to analyze (e.g., newspaper stories, financial reports, blog postings, online reviews, etc.), the researcher begins by sampling a selected set of texts from the population of texts for analysis. This process is not random, but instead, texts that have more pertinent content should be chosen selectively. Second, the researcher identifies and applies rules to divide each text into segments or "chunks" that can be treated as separate units of analysis. This process is called unitizing. For example, assumptions, effects, enablers, and barriers in texts may constitute such units. Third, the researcher constructs and applies one or more concepts to each unitized text segment in a process called coding. For coding purposes, a coding scheme is used based on the themes the researcher is searching for or uncovers as she classifies the text. Finally, the coded data is analyzed, often both quantitatively and qualitatively, to determine which themes occur most frequently, in what contexts, and how they are related to each other. A simple type of content analysis is sentiment analysis – a technique used to capture people's opinion or attitude toward an object, person, or phenomenon. Reading online messages about a political candidate posted on an online forum and classifying each message as positive, negative, or neutral is an example of such an analysis. In this case, each message represents one unit of analysis. This analysis will help identify whether the sample as a whole is positively or negatively disposed or neutral towards that candidate. Examining the content of online reviews in a similar manner is another example. Though this analysis can be done manually, for very large data sets (millions of text records), natural language processing and text analytics based software programs are available to automate the coding process, and maintain a record of how people sentiments fluctuate with time.

NSOU ? PGSW-VII 54 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 A frequent criticism of content analysis is that it lacks a set of systematic procedures that would allow the analysis to be replicated by other researchers. Schilling (2006) [20] addressed this criticism by organizing different content analytic procedures into a spiral model. This model consists of five levels or phases in interpreting text: (1) convert recorded tapes into raw text data or transcripts for content analysis, (2) convert raw data into condensed protocols, (3) convert condensed protocols into a preliminary category system, (4) use the preliminary category system to generate coded protocols, and (5) analyze coded protocols to generate interpretations about the phenomenon of interest. Content analysis has several limitations. First, the coding process is restricted to the information available in text form. For instance, if a researcher is interested in studying people's views on capital punishment, but no such archive of text documents is available, then the analysis cannot be done. Second, sampling must be done carefully to avoid sampling bias. For instance, if your population is the published research literature on a given topic, then you have systematically omitted unpublished research or the most recent work that is yet to be published. Hermeneutic Analysis Hermeneutic analysis is a special type of content analysis where the researcher tries to "interpret" the subjective meaning of a given text within its socio-historic context. Unlike content analysis, which ignores the context and meaning of text documents during the coding process, hermeneutic analysis is a truly interpretive technique for analyzing qualitative data. This method assumes that written texts narrate an author's experience within a socio-historic context, and should be interpreted as such within that context. Therefore, the researcher continually iterates between singular interpretation of the text (the part) and a holistic understanding of the context (the whole) to develop a fuller understanding of the phenomenon in its situated context, which German philosopher Martin Heidegger called the hermeneutic circle. The word hermeneutic (singular) refers to one particular method or strand of interpretation. More generally, hermeneutics is the study of interpretation and the theory and practice of interpretation. Derived from religious studies and linguistics, traditional hermeneutics, such as biblical hermeneutics, refers to the interpretation of written texts, especially in the areas of literature, religion and law (such as the Bible). In the 20th century, Heidegger suggested that a more direct, non-mediated, and authentic way of understanding social reality is to experience it, rather than simply observe it, and proposed philosophical

NSOU ? PGSW-VII 55 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 hermeneutics, where the focus shifted from interpretation to existential understanding. Heidegger argued that texts are the means by which readers can not only read about an author's experience, but also relive the author's experiences. Contemporary or modern hermeneutics, developed by Heidegger's students such as Hans-Georg Gadamer, further examined the limits of written texts for communicating social experiences, and went on to propose a framework of the interpretive process, encompassing all forms of communication, including written, verbal, and non-verbal, and exploring issues that restrict the communicative ability of written texts, such as presuppositions, language structures (e.g., grammar, syntax, etc.), and semiotics (the study of written signs such as symbolism, metaphor, analogy, and sarcasm). The term hermeneutics is sometimes used interchangeably and inaccurately with exegesis, which refers to the interpretation or critical explanation of written text only and especially religious texts. Finally, standard software programs, such as ATLAS.ti.5, NVivo, and QDA Miner, can be used to automate coding processes in qualitative research methods. These programs can quickly and efficiently organize, search, sort, and process large volumes of text data using user-defined rules. To guide such automated analysis, a coding schema should be created, specifying the keywords or codes to search for in the text, based on an initial manual examination of sample text data. The schema can be organized in a hierarchical manner to organize codes into higher-order codes or constructs. The coding schema should be validated using a different sample of texts for accuracy and adequacy. However, if the coding schema is biased or incorrect, the resulting analysis of the entire population of text may be flawed and non-interpretable. However, software programs cannot decipher the meaning behind the certain words or phrases or the context within which these words or phrases are used (such as those in sarcasms or metaphors), which may lead to significant misinterpretation in large scale qualitative analysis Report Writing — The final phase of research involves preparing the final research report documenting the entire research process and its findings in the form of a research paper, dissertation, or monograph. This report should outline in detail all the choices made during the research process (e.g., theory used, constructs selected, measures used, research methods, sampling, etc.) and why, as well as the outcomes of each phase of the research process. The research process must be described in sufficient detail so as to allow other researchers to replicate your study, test the findings, or assess whether the inferences derived are scientifically acceptable. Of course, having a ready research proposal will greatly simplify and quicken the process of writing the finished report. Note that research is of no value

NSOU ? PGSW-VII 56 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 unless the research process and outcomes are documented for future generations; such documentation is essential for the incremental progress of science. 1.11 Conclusion From this unit we learnt that unless and until we design a Research systematically we will not be able to reach the goal. We must be careful enough to choose the appropriate steps to attain the final result. 1.12 Exercise 1. What do you mean by Scientific Research? 2. Differentiate between Social Research and Social Work Research 3. What do you understand by Hypothesis? 4. NSOU ? PGSW-VII 57 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 Unit 2 ? Social Work Research Structure 2.0 Objective 2.1 Introduction 2.2 Use of research in social work 2.3 Types of social work research 2.4 Conclusion 2.5 Exercise 2.6 Reference 2.0 Objective Social work research requires a focus on gaining an empathic understanding of an individual's feelings and the meaning that they give to everyday life with the goal to gaining greater understanding of the individual's behavior. For this reason is a very essential social work research. 2.1 Introduction All social workers, from micro to macro, need to understand the root causes and policy solutions to social problems that their clients are experiencing. Social work supervisors and administrators at agency-based settings will likely have to demonstrate that their agency's programs are effective at achieving their goals. Most private and public grants will require evidence of effectiveness for your agency to receive funding and to keep the programs running. Social workers at community-based organizations commonly use research methods to target their interventions to the needs of their service area. Clinical social workers must also make sure that the interventions they use in practice are effective and not harmful to clients. In addition, social workers may want to track client progress on goals, help clients gather data about their clinical issues, or use data to advocate for change. As a whole, all social workers in all practice situations must remain current on the scientific literature to ensure competent and ethical practice.

57

NSOU ? PGSW-VII 58 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 In all of these cases, a social worker needs to be able to understand and evaluate scientific information. Evidence-based practice (EBP) for social workers involves making decisions on how to help clients based on the best available evidence. A social worker must examine the current literature and understand both the theory and evidence relevant to the practice situation. According to Rubin and Babbie (2017), [4] EBP also involves understanding client characteristics, using practice wisdom and existing resources, and adapting to environmental context. It is not simply “doing what the literature says,” but rather a process by which practitioners examine the literature, client, self, and context to inform interventions with clients and systems. As we discussed in Section 1.2, the patterns discovered by scientific research are not perfectly applicable to all situations. Instead, we rely on the critical thinking of social workers to apply scientific knowledge to real-world situations. Let’s consider an example of a social work administrator at a children’s mental health agency. The agency uses a private grant to fund a program that provides low-income children with bicycles, teaches the children how to repair and care for their bicycles, and leads group bicycle outings after school. Physical activity has been shown to improve mental health outcomes in scientific studies, but is this social worker’s program improving mental health in their clients? Ethically, the social worker should make sure that the program is achieving its goals. If the program is not beneficial, the resources should be spent on more effective programs. Practically, the social worker will also need to demonstrate to the agency’s donors that bicycling truly helps children deal with their mental health concerns. The example above demonstrates the need for social workers to engage in evaluation research, or research that evaluates the outcomes of a policy or program. She will choose from many acceptable ways to investigate program effectiveness, and those choices are based on the principles of scientific inquiry you will learn in this textbook. As the example above mentions, evaluation research is embedded into the funding of nonprofit, human service agencies. Government and private grants need to make sure their money is being spent wisely. If your program does not work, then the funds will be allocated to a program that has been proven effective or a new program that may be effective. Just because a program has the right goal doesn’t mean it will actually accomplish that goal. Grant reporting is an important part of agency-based social work practice. Agencies, in a very important sense, help us discover what approaches actually help clients.

NSOU ? PGSW-VII 59 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 Thus Social Work Research aims at— (1) To solve social problems and issues that shape how our society is organized, thus you have to live with the results of research methods every day of your life. (2) To understand Research Methods that will help us to evaluate the effectiveness of social work interventions. 2.2 Use of research in social work—Intervention research and Practice based research Intervention Research Interventional studies are often prospective and are specifically tailored to evaluate direct impacts of treatment or preventive measures on some social phenomenon. Each study design has specific outcome measures that rely on the type and quality of data utilized. Additionally, each study design has potential limitations that are more severe and need to be addressed in the design phase of the study. Interventional study designs, also called experimental study designs, are those where the researcher intervenes at some point throughout the study. The most common and strongest interventional study design is a randomized controlled trial, however, there are other interventional study designs, including pre-post study design, non-randomized controlled trials, and quasi-experiments. Experimental studies are used to evaluate study questions related to either therapeutic agents or prevention. Therapeutic agents can include prophylactic agents, treatments, surgical approaches, or diagnostic tests. Prevention can include changes to protective equipment, engineering controls, management, policy or any element that should be evaluated as to a potential cause of disease or injury. Practice Based Research

95%

MATCHING BLOCK 30/88

W

Practice-based research is a conceptual framework that allows a researcher to incorporate their creative practice, creative methods and creative output into the research design and as a part of the research output. Smith and Dean note that practice-based research arises out of two related ideas. Firstly, “that creative work in itself is a form of research and generates detectable research outputs”. The product of creative work itself contributes to the outcomes of a research

NSOU ? PGSW-VII 60 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022

95%

MATCHING BLOCK 31/88

W

process and contributes to the answer of a research question. Secondly, “creative practice — the training and specialised knowledge that creative practitioners have and the processes they engage in when they are making art — can lead to specialised research insights which can then be generalised and written up as research” Smith and Dean’s point here is that the content and processes of a creative practice generate knowledge and innovations that are different to, but complementary with, other research styles and methods. Practice-based research projects are undertaken across all creative disciplines and, as a result, the approach is very flexible in its implementation able to incorporate a variety of methodologies and methods within its bounds. A helpful way to understand this is to think of practice-based research as an approach that allows us to incorporate our creative practices into the research, legitimises the knowledge they reveal and endorses the methodologies, methods and research tools that are characteristic of

Social Work discipline. 2.3 Types of social work research Broadly speaking Social Work Research may be categorized in the following ways- 1 Needs Assessment studies 2 Situational Analysis 3 Monitoring and Evaluation, 4 Impact assessment 5 Policy research. Needs Assessment studies— A needs assessment is a systematic process that provides information about social needs or issues in a place or population group and determines which issues should be prioritised for action. The term 'social issue' as used here is intended to be deliberately broad and essentially denotes an identified problem in a place or population. Social issues, or 'needs', can include health-related topics such as the increased prevalence of poor mental health in a population or high smoking rates, or issues such as low levels of literacy or child development. In this context, a social need or social issue is something that can be addressed by service providers (or community members in a community development initiative), so a needs assessment gathers information about the issue that can then inform NSOU ? PGSW-VII 61 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 service provision or policy development. A needs assessment in this context moves beyond individual assessment and explores the needs of a community. Community is frequently defined in terms of a geographical area but a needs assessment could also explore the needs of a specific population group; for example, the needs of single-parent families. A needs assessment in a geographical area may also have a focus on priority population groups; for example, Aboriginal and Torres Strait Islander people. Needs assessment is most often undertaken in order to allocate or redistribute resources and design programs, policies and services. However, needs assessment can also be considered as a form of evaluation, or as a component of program evaluation, because it involves collecting information in order to make an evaluative judgement about what needs exist in a community, what needs should be prioritised and how a particular policy, service, program or suite of activities will address those needs. A needs assessment can also provide baseline data that can be used in an evaluation. Importantly, a needs assessment is best undertaken as a systematic process (Altschuld & Kumar, 2005; Rossi, Lipsey, & Freeman, 2004): 1. Decisions are made about the scope of the needs assessment. 2. There is a plan to collect information. 3. Data are collected and analysed. 4. These data are used to determine priorities and make decisions about resource allocation, program design and service delivery. In practice, needs assessments are often done informally. For example, a number of clients might present with similar issues that are not met by current services, a gap in service delivery may be observed, or a new client group becomes known, and something is designed to address these issues. Without a systematic process of needs assessment that includes multiple forms of evidence, this ad hoc method of meeting client need can eventually result in a fragmented service system that may not be making the most effective use of scarce resources. There may also be client or community needs that are less visible and so not being met. Undertaking a systematic needs assessment is a transparent and defensible way of ensuring that resources are being used in the most effective way possible. Situational Analysis Situational analysis is an approach to research using a grounded theorizing methodology to identify and describe social worlds and arenas of action and by representing complexity through mapmaking Clarke has taken grounded theory beyond the more NSOU ? PGSW-VII 62 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 constructivist approach of Charmaz and Morse to create a new process of analysis that is situation-centred (i.e., largely centred on context) and focused on a social worlds/arenas/ negotiations framework. Situational analysis is beneficial to open up the data by providing a comprehensive framework for considering multiple connections and relationships that can influence activities – in this case, elements of the situation that influence implementation of core public health programs. Using explanatory maps, situational analysis provides unique visuals for understanding the phenomenon of interest and considerable potential for visual representation of data to aid in knowledge translation activities. Visual complexity, as a means to recognize patterns and to clarify complex systems, is part of a growing trend in social science. It allows the reader to see how complex the situation is, while demonstrating how various parts, through interaction, influence outcomes. Situational analysis provides a means to specify and map all the important human and nonhuman elements of a situation, emphasizing relationships, social worlds and discursive positions Specifically, the methodology for situational analysis involves substantive theorizing and story-telling through the use of maps with a goal of critical analysis to produce a possible 'truth,' or the underlying structure or mechanism of action Monitoring & Evaluation

96%

MATCHING BLOCK 33/88

W

In the world of monitoring and evaluation (M&E) three approaches can be identified: result-oriented, constructivist and reflexive. Every approach includes principles, methods and tools that can be used for projects that have the ambition to contribute to (system) innovation. But they differ widely in their vision on reality, the on-going processes and their results and how to support, manage or adjust these processes. Deciding which method is the best depends heavily on the nature of the project, its context, and the monitoring and evaluation objectives. In practice, it may be desirable to use a selection of methods from the different approaches in order to combine their strong points.

Social Impact Assessment (SIA) A Social Impact Assessment is a process of research, planning and the management of social change or consequences (positive and negative, intended and unintended) arising from policies, plans, developments and projects (UNEP, 2007). The core focus of an SIA is on the important impacts of projects and developments beyond the impacts on natural resources. Examples of social impacts include (Vanclay, 2003):

NSOU ? PGSW-VII 63 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 People's way of life – that is, how they live, work, play and interact with one another on a day-to-day basis. Their culture – that is, their shared beliefs, customs, values and language or dialect. Their community – its cohesion, stability, character, services and facilities. Their political systems – the extent to which people are able to participate in decisions that affect their lives, the level of democratization that is taking place, and the resources provided for this purpose. Their health and well-being – health is a state of complete physical, mental, social and spiritual well-being and not merely the absence of disease or infirmity. From the listed examples above, it is clear that the SIA must look not only at social issues but also at the environmental impacts and their interactions. For example, if the planned project impacts the availability of water and land for local food production it also leads to social impacts, such as increases in food prices, the need to travel longer distances to buy and/or grow food. In general, an SIA calls for close collaboration with community members, as well as other stakeholders and experts. This usually covers the following specific areas to identify impacts and mitigation measures (State of Queensland, 2013): ? Community and stakeholder engagement ? Workforce management ? Housing and accommodation ? Local business and industry content ? Health and community well-being. During the SIA, the proponent is usually expected to (State of Queensland, 2013): ? Identify stakeholders' groups and communities impacted by the project. ? Collect baseline data covering key social issues of the impacted communities such as community history, indigenous communities, culture and key events that have shaped economic and social development, key industries presently and in the past (if relevant); pressures or vulnerabilities experienced by these industry sectors. ? Provide an overview of government legislation and policies that complement the mitigation measures for social impacts that are directly related to the project.

NSOU ? PGSW-VII 64 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 ? Explain methods used to gather information, including a description of how the communities of interest were engaged during the development of the SIA. ? Identify potential direct social impacts and prediction of the significance of any impacts and duration and extent of each impact. ? List proposed mitigation measures ? Describe the monitoring framework that informs stakeholders on the progress of implementing mitigation measures and overall project implementations. Policy Research Organizations whether they are private or public, for-profit or not for profit are governed by a set of policies and procedures. To ensure the optimum efficiency and utilization these policies and procedures need to be reviewed periodically. The review process not only assesses the success or failure of the policy or procedure it also encapsulates the implementation of these policies. The research that undertakes this role is applied policy research, which means that the research is required to gather specific information and has the potential to create actionable outcomes (Ritchie & Spencer, 1994). Over the last three decades qualitative research methods have been recognized as a valuable tool in the social sciences and in particular management studies (Denzin & Lincoln, 2000, Locke, 2001) and this has spilled over into applied social policy research. A good Policy can be framed by strong Advocacy. Advocacy effort or campaign is a structured and sequenced plan of action with the purpose to start, direct, or prevent a specific policy change. The ultimate target of any advocacy effort is to influence those who hold decision-making power. In some cases, advocates can speak directly to these people in their advocacy efforts; in other cases, they need to put pressure on these people by addressing secondary audiences. Thus- "Policy advocacy is the process of negotiating and mediating a dialogue through which influential networks, opinion leaders, and ultimately, decision makers take ownership of your ideas, evidence, and proposals, and subsequently act upon them." Therefore Policy Research is a very important part of Social Work Research as it ultimately leads to Policy making to establish Social Justice in our society.

The Research Design would be help to plan the Research Methodology ways of Data collection. 3.1 Introduction Research design is a comprehensive plan for data collection in an empirical research project. It is a "blueprint" for empirical research aimed at answering specific research questions or testing specific hypotheses, and must specify at least three processes: (1) The data collection process, (2) The instrument development process, and (3) The sampling process. Broadly speaking, data collection methods can be broadly grouped into two categories: positivist and interpretive. Positivist methods, such as laboratory experiments and survey research, are aimed at theory (or hypotheses) testing, while interpretive methods, such as action research and ethnography, are aimed at theory building. Positivist methods employ a deductive approach to research, starting with a theory and testing theoretical 66

NSOU ? PGSW-VII 67 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 postulates using empirical data. In contrast, interpretive methods employ an inductive approach that starts with data and tries to derive a theory about the phenomenon of interest from the observed data. Often times, these methods are incorrectly equated with quantitative and qualitative research. Quantitative and qualitative methods refers to the type of data being collected (quantitative data involve numeric scores, metrics, and so on, while qualitative data includes interviews, observations, and so forth) and analyzed (i.e., using quantitative techniques such as regression or qualitative techniques such as coding). Positivist research uses predominantly quantitative data, but can also use qualitative data. Interpretive research relies heavily on qualitative data, but can sometimes benefit from including quantitative data as well. Sometimes, joint use of qualitative and quantitative data may help generate unique insight into a complex social phenomenon that are not available from either types of data alone, and hence, mixed-mode designs that combine qualitative and quantitative data are often highly desirable. Thus the research design refers to the overall strategy that you choose to integrate the different components of the study in a coherent and logical way, thereby, ensuring you will effectively address the research problem; it constitutes the blueprint for the collection, measurement, and analysis of data. We may note that research problem determines the type of design we would apply. The function of a research design is to ensure that the evidence obtained enables us to effectively address the research problem logically and as unambiguously as possible. In social sciences research, obtaining information relevant to the research problem generally entails specifying the type of evidence needed to test a theory, to evaluate a program, or to accurately describe and assess meaning related to an observable phenomenon. With this in mind, a common mistake made by researchers is that they begin their investigations far too early, before they have thought critically about what information is required to address the research problem. Without attending to these design issues beforehand, the overall research problem will not be adequately addressed and any conclusions drawn will run the risk of being weak and unconvincing. As a consequence, the overall validity of the study will be undermined.

NSOU ? PGSW-VII 68 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 3.2 Key Attributes of a Research Design The quality of research designs can be defined in terms of four key design attributes: internal validity, external validity, construct validity, and statistical conclusion validity. Internal validity, also called causality, examines whether the observed change in a dependent variable is indeed caused by a corresponding change in hypothesized independent variable, and not by variables extraneous to the research context. Causality requires three conditions: (1) covariation of cause and effect (i.e., if cause happens, then effect also happens; and if cause does not happen, effect does not happen), (2) temporal precedence: cause must precede effect in time, (3) no plausible alternative explanation (or spurious correlation). Certain research designs, such as laboratory experiments, are strong in internal validity by virtue of their ability to manipulate the independent variable (cause) via a treatment and observe the effect (dependent variable) of that treatment after a certain point in time, while controlling for the effects of extraneous variables. Other designs, such as field surveys, are poor in internal validity because of their inability to manipulate the independent variable (cause), and because cause and effect are measured at the same point in time which defeats temporal precedence making it equally likely that the expected effect might have influenced the expected cause rather than the reverse. Although higher in internal validity compared to other methods, laboratory experiments are, by no means, immune to threats of internal validity, and are susceptible to history, testing, instrumentation, regression, and other threats that are discussed later in the chapter on experimental designs. Nonetheless, different research designs vary considerably in their respective level of internal validity. External validity or generalizability refers to whether the observed associations can be generalized from the sample to the population (population validity), or to other people, organizations, contexts, or time (ecological validity). For instance, can results drawn from a sample of financial firms in the United States be generalized to the population of financial firms (population validity) or to other firms within the United States (ecological validity)? Survey research, where data is sourced from a wide variety of individuals, firms, or other units of analysis, tends to have broader generalizability than laboratory experiments where

NSOU ? PGSW-VII 69 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 artificially contrived treatments and strong control over extraneous variables render the findings less generalizable to real-life settings where treatments and extraneous variables cannot be controlled. The variation in internal and external validity for a wide range of research designs are shown in Figure 3.1. Figure 3.1 : Internal and external validity. Some researchers claim that there is a trade off between internal and external validity: higher external validity can come only at the cost of internal validity and vice-versa. But this is not always the case. Research designs such as field experiments, longitudinal field surveys, and multiple case studies have higher degrees of both internal and external validities. Personally, I prefer research designs that have reasonable degrees of both internal and external validities, i.e., those that fall within the cone of validity shown in Figure 5.1. But this should not suggest that designs outside this cone are any less useful or valuable. Researchers' choice of designs is ultimately a matter of their personal preference and competence, and the level of internal and external validity they desire. Construct validity examines how well a given measurement scale is measuring the theoretical construct that it is expected to measure. Many constructs used in social science research such as empathy, resistance to change, and organizational learning are difficult to define, much less measure. For instance, construct validity must assure that a measure of empathy is indeed measuring empathy and not compassion, which may be difficult since these constructs are somewhat similar in meaning. Construct validity is assessed in positivist research based on correlational or factor analysis of pilot test data.

NSOU ? PGSW-VII 70 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022

Statistical conclusion validity examines the extent to which conclusions derived using a statistical procedure is valid. For example, it examines whether the right statistical method was used for hypotheses testing, whether the variables used meet the assumptions of that statistical test (such as sample size or distributional requirements), and so forth. Because interpretive research designs do not employ statistical test, statistical conclusion validity is not applicable for such analysis. The different kinds of validity and where they exist at the theoretical/empirical levels are illustrated in Figure 5.2.

Figure 5.2. Different Types of Validity in Scientific Research

Improving Internal and External Validity	The best research designs are those that can assure high levels of internal and external validity. Such designs would guard against spurious correlations, inspire greater faith in the hypotheses testing, and ensure that the results drawn from a small sample are generalizable to the population at large. Controls are required to assure internal validity (causality) of research designs, and can be accomplished in four ways: (1) manipulation, (2) elimination, (3) inclusion, and (4) statistical control, and (5) randomization. In manipulation, the researcher manipulates the independent variables in one or more levels (called "treatments"), and compares the effects of the treatments against a control group where subjects do not receive the treatment. Treatments may include a new drug or different dosage of drug (for treating a medical condition), a teaching style (for students), and so forth. This type of control is achieved in experimental or quasi-experimental designs
Theoretical Plane	Construct A Proposition Construct B Construct Validity Construct Validity External Validity Independent Variable Hypothesis Dependent Variable Internal Validity Statistical Conclusion Validity Empirical Plane

NSOU ? PGSW-VII 71 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022

but not in non-experimental designs such as surveys. Note that if subjects cannot distinguish adequately between different levels of treatment manipulations, their responses across treatments may not be different, and manipulation would fail. The elimination technique relies on eliminating extraneous variables by holding them constant across treatments, such as by restricting the study to a single gender or a single socio-economic status. In the inclusion technique, the role of extraneous variables is considered by including them in the research design and separately estimating their effects on the dependent variable, such as via factorial designs where one factor is gender (male versus female). Such technique allows for greater generalizability but also requires substantially larger samples. In statistical control, extraneous variables are measured and used as covariates during the statistical testing process. Finally, the randomization technique is aimed at canceling out the effects of extraneous variables through a process of random sampling, if it can be assured that these effects are of a random (non-systematic) nature. Two types of randomization are: (1) random selection, where a sample is selected randomly from a population, and (2) random assignment, where subjects selected in a non-random manner are randomly assigned to treatment groups. Randomization also assures external validity, allowing inferences drawn from the sample to be generalized to the population from which the sample is drawn. Note that random assignment is mandatory when random selection is not possible because of resource or access constraints. However, generalizability across populations is harder to ascertain since populations may differ on multiple dimensions and you can only control for few of those dimensions.

3.3 Popular Research Designs

As noted earlier, research designs can be classified into two categories – positivist and interpretive – depending how their goal in scientific research. Positivist designs are meant for theory testing, while interpretive designs are meant for theory building. Positivist designs seek generalized patterns based on an objective view of reality, while interpretive designs seek subjective interpretations of social phenomena from the perspectives of the subjects involved. Some popular examples of positivist designs include laboratory experiments, field experiments, field surveys, secondary data analysis, and case research while examples of interpretive designs include case research, phenomenology, and ethnography. Note that case research can be used for theory building or theory testing, though not at the same time.

NSOU ? PGSW-VII 72 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 Not all techniques are suited for all kinds of scientific research. Some techniques such as focus groups are best suited for exploratory research, others such as ethnography are best for descriptive research, and still others such as laboratory experiments are ideal for explanatory research. Following are brief descriptions of some of these designs.

Experimental Research Design Experimental studies are those that are intended to test cause-effect relationships (hypotheses) in a tightly controlled setting by separating the cause from the effect in time, administering the cause to one group of subjects (the "treatment group") but not to another group ("control group"), and observing how the mean effects vary between subjects in these two groups. For instance, if we design a laboratory experiment to test the efficacy of a new drug in treating a certain ailment, we can get a random sample of people afflicted with that ailment, randomly assign them to one of two groups (treatment and control groups), administer the drug to subjects in the treatment group, but only give a placebo (e.g., a sugar pill with no medicinal value). More complex designs may include multiple treatment groups, such as low versus high dosage of the drug, multiple treatments, such as combining drug administration with dietary interventions. In a true experimental design, subjects must be randomly assigned between each group. If random assignment is not followed, then the design becomes quasi-experimental. Experiments can be conducted in an artificial or laboratory setting such as at a university (laboratory experiments) or in field settings such as in an organization where the phenomenon of interest is actually occurring (field experiments). Laboratory experiments allow the researcher to isolate the variables of interest and control for extraneous variables, which may not be possible in field experiments. Hence, inferences drawn from laboratory experiments tend to be stronger in internal validity, but those from field experiments tend to be stronger in external validity. Experimental data is analyzed using quantitative statistical techniques. The primary strength of the experimental design is its strong internal validity due to its ability to isolate, control, and intensively examine a small number of variables, while its primary weakness is limited external generalizability since real life is often more complex (i.e., involve more extraneous variables) than contrived lab settings. Furthermore, if the research does not identify ex ante relevant extraneous variables and control for such variables, such lack of controls may hurt internal validity and may lead to spurious correlations.

NSOU ? PGSW-VII 73 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 The blueprint of the procedure that enables the researcher to maintain control over all factors that may affect the result of an experiment. In doing this, the researcher attempts to determine or predict what may occur. Experimental research is often used where there is time priority in a causal relationship (cause precedes effect), there is consistency in a causal relationship (a cause will always lead to the same effect), and the magnitude of the correlation is great. The classic experimental design specifies an experimental group and a control group. The independent variable is administered to the experimental group and not to the control group, and both groups are measured on the same dependent variable. Subsequent experimental designs have used more groups and more measurements over longer periods. True experiments must have control, randomization, and manipulation.

What do Experimental Research tells us?

1. Experimental research allows the researcher to control the situation. In so doing, it allows researchers to answer the question, "What causes something to occur?"
2. Permits the researcher to identify cause and effect relationships between variables and to distinguish placebo effects from treatment effects.
3. Experimental research designs support the ability to limit alternative explanations and to infer direct causal relationships in the study.
4. Approach provides the highest level of evidence for single studies.

Exploratory Design An exploratory design is conducted about a research problem when there are few or no earlier studies to refer to or rely upon to predict an outcome. The focus is on gaining insights and familiarity for later investigation or undertaken when research problems are in a preliminary stage of investigation. Exploratory designs are often used to establish an understanding of how best to proceed in studying an issue or what methodology would effectively apply to gathering information about the issue. It seeks to find out how people get along in the setting under questions, what meanings they give to their actions, and what issues concern them; frequently involves qualitative methods, Marketing research to gather preliminary information that will help define problems and suggest hypotheses. The goals of exploratory research are intended to produce the following possible insights:

- ? Familiarity with basic details, settings, and concerns.

NSOU ? PGSW-VII 74 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 ? Well grounded picture of the situation being developed. ? Generation of new ideas and assumptions. ? Development of tentative theories or hypotheses. ? Determination about whether a study is feasible in the future. ? Issues get refined for more systematic investigation and formulation of new research questions. ? Direction for future research and techniques get developed. Descriptive Research Descriptive research designs help provide answers to the questions of who, what, when, where, and how associated with a particular research problem; a descriptive study cannot conclusively ascertain answers to why. Descriptive research is used to obtain information concerning the current status of the phenomena and to describe "what exists" with respect to variables or conditions in a situation. In a descriptive design, a researcher is solely interested in describing the situation or case under their research study. It is a theory-based design method which is created by gathering, analyzing, and presenting collected data. This allows a researcher to provide insights into the why and how of research. Descriptive design helps others better understand the need for the research. If the problem statement is not clear, we can conduct exploratory research. Descriptive research involves the gathering of facts. Measurement and sampling are central concerns; survey research is often used for descriptive purposes. Descriptive research seeks to describe the current status of an identified variable. These research projects are designed to provide systematic information about a phenom- enon. The researcher does not usually begin with an hypothesis, but is likely to develop one after collecting data. The analysis and synthesis of the data provide the test of the hypothesis. Systematic collection of information requires careful selection of the units studied and careful measurement of each variable. What do these Design tell us? 1. The subject is being observed in a completely natural and unchanged natural environment. True experiments, whilst giving analyzable data, often adversely influence the normal behavior of the subject [a.k.a., the Heisenberg effect whereby measurements of certain systems cannot be made without affecting the systems].

NSOU ? PGSW-VII 75 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 2. Descriptive research is often used as a pre-cursor to more quantitative research designs with the general overview giving some valuable pointers as to what variables are worth testing quantitatively. 3. If the limitations are understood, they can be a useful tool in developing a more focused study. 4. Descriptive studies can yield rich data that lead to important recommendations in practice. 5. Approach collects a large amount of data for detailed analysis. Case Study Case Study is an in-depth investigation of a problem in one or more real-life settings (case sites) over an extended period of time. Data may be collected using a combination of interviews, personal observations, and internal or external documents. Case studies can be positivist in nature (for hypotheses testing) or interpretive (for theory building). The strength of this research method is its ability to discover a wide variety of social, cultural, and political factors potentially related to the phenomenon of interest that may not be known in advance. Analysis tends to be qualitative in nature, but heavily contextualized and nuanced. However, interpretation of findings may depend on the observational and integrative ability of the researcher, lack of control may make it difficult to establish causality, and findings from a single case site may not be readily generalized to other case sites. Generalizability can be improved by replicating and comparing the analysis in other case sites in a multiple case design. Focus group research is a type of research that involves bringing in a small group of subjects (typically 6 to 10 people) at one location, and having them discuss a phenomenon of interest for a period of 1.5 to 2 hours. The discussion is moderated and led by a trained facilitator, who sets the agenda and poses an initial set of questions for participants, makes sure that ideas and experiences of all participants are represented, and attempts to build a holistic understanding of the problem situation based on participants' comments and experiences. Internal validity cannot be established due to lack of controls and the findings may not be generalized to other settings because of small sample size. Hence, focus groups are not generally used for explanatory or descriptive research, but are more suited for exploratory research.

NSOU ? PGSW-VII 76 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 Action Research

Action research assumes that complex social phenomena are best understood by introducing interventions or "actions" into those phenomena and observing the effects of those actions. In this method, the researcher is usually a consultant or an organizational member embedded within a social context such as an organization, who initiates an action such as new organizational procedures or new technologies, in response to a real problem such as declining profitability or operational bottlenecks. The researcher's choice of actions must be based on theory, which should explain why and how such actions may cause the desired change. The researcher then observes the results of that action, modifying it as necessary, while simultaneously learning from the action and generating theoretical insights about the target problem and interventions. The initial theory is validated by the extent to which the chosen action successfully solves the target problem. Simultaneous problem solving and insight generation is the central feature that distinguishes action research from all other research methods, and hence, action research is an excellent method for bridging research and practice. This method is also suited for studying unique social problems that cannot be replicated outside that context, but it is also subject to researcher bias and subjectivity, and the generalizability of findings is often restricted to the context where the study was conducted. The essentials of action research design follow a characteristic cycle whereby initially an exploratory stance is adopted, where an understanding of a problem is developed and plans are made for some form of interventionary strategy. Then the intervention is carried out [the "action" in action research] during which time, pertinent observations are collected in various forms. The new interventional strategies are carried out, and this cyclic process repeats, continuing until a sufficient understanding of [or a valid implementation solution for] the problem is achieved. The protocol is iterative or cyclical in nature and is intended to foster deeper understanding of a given situation, starting with conceptualizing and particularizing the problem and moving through several interventions and evaluations. What do Action Research studies tell us? 1. This is a collaborative and adaptive research design that lends itself to use in work or community situations. 2. Design focuses on pragmatic and solution-driven research outcomes rather than testing theories.

NSOU ? PGSW-VII 77 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 3. When practitioners use action research, it has the potential to increase the amount they learn consciously from their experience; the action research cycle can be regarded as a learning cycle. 4. Action research studies often have direct and obvious relevance to improving practice and advocating for change. 5. There are no hidden controls of direction by the researcher. Grounded Theory

Grounded theory is a systematic qualitative research methodology, originating in the social sciences and emphasizing the generation of theory from qualitative data in the process of conducting research. Grounded theory, in its original form, was proposed by Glaser and Strauss. Grounded theory is a systematic qualitative research methodology that emphasizes the generation of theory from data. Grounded theory operates almost in a reverse fashion to the traditional scientific method. Rather than proposing a hypothesis and gathering data to support it, data collection is pursued first without any preconceptions. Key points in the data are marked with a series of "codes," which are then grouped into similar concepts or categories. These categories become the basis of a theory. The coding process is typically performed in two steps, initial then focused coding. The categorization process is normally referred to as axial coding. Grounded theory emerged as a research methodology in the 1960s, during a time when sociological research practices were particularly reliant on quantitative methodologies. In 1967, Glaser and Strauss coined the term grounded theory in their book *The Discovery of Grounded Theory*. The term refers to the idea of a theory that is generated by—or grounded in—an iterative process of analysis and sampling of qualitative data gathered from concrete settings, such as interviews, participant observation, and archival research. Grounded theory offers educational researchers a method that complements varied forms of qualitative data collection and that will expedite their work. Adopting more grounded theory strategies will enable educational researchers to further the theoretical reach of their studies and to make tacit meanings and processes explicit. Constructivists have not only re-envisioned grounded theory, but also revised it in ways that make the method more flexible and widely adoptable than its earlier versions. In the past, grounded theory has often been viewed as separate from other methods. Now, the constructivist version makes the usefulness of combining grounded theory with other approaches more apparent, as is evident in grounded theory studies in education.

NSOU ? PGSW-VII 78 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 Grounded theory can make ethnography more analytic, interview research more in-depth, and content analysis more focused. Several computer-assisted qualitative data analysis programs are built on grounded theory, and this method can add innovation to mixed methods research. Grounded theory emphasizes focusing data collection and checking and developing analytic ideas. Hence, grounded theory offers the tools for building strong evidence within the analysis and for explicating processes. Consequently, grounded theorists in education have a bright future for making powerful arguments in areas such as curricular studies, educational leadership, and educational policy Ethnographic Research Design Sometimes referred to as participant observation, Ethnographic Research designs, revolves around field research encompass a variety of interpretative procedures [e.g., observation and interviews] rooted in qualitative approaches to studying people individually or in groups while inhabiting their natural environment as opposed to using survey instruments or other forms of impersonal methods of data gathering. Information acquired from observational research takes the form of "field notes" that involves documenting what the researcher actually sees and hears while in the field. Findings do not consist of conclusive statements derived from numbers and statistics because field research involves analysis of words and observations of behavior. Conclusions, therefore, are developed from an interpretation of findings that reveal overriding themes, concepts, and ideas. More information can be found here. What do Ethnographic Research Design tell us? 1. Field research is often necessary to fill gaps in understanding the research problem applied to local conditions or to specific groups of people that cannot be ascertained from existing data. 2. The research helps contextualize already known information about a research problem, thereby facilitating ways to assess the origins, scope, and scale of a problem and to gauge the causes, consequences, and means to resolve an issue based on deliberate interaction with people in their natural inhabited spaces. 3. Enables the researcher to corroborate or confirm data by gathering additional information that supports or refutes findings reported in prior studies of the topic. 4. Because the researcher is embedded in the field, they are better able to make observations or ask questions that reflect the specific cultural context of the setting being investigated.

NSOU ? PGSW-VII 79 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 5. Observing the local reality offers the opportunity to gain new perspectives or obtain unique data that challenges existing theoretical propositions or long-standing assumptions found in the literature. Ethnography is an interpretive research design inspired by anthropology that emphasizes that research phenomenon must be studied within the context of its culture. The researcher is deeply immersed in a certain culture over an extended period of time (8 months to 2 years), and during that period, engages, observes, and records the daily life of the studied culture, and theorizes about the evolution and behaviors in that culture. Data is collected primarily via observational techniques, formal and informal interaction with participants in that culture, and personal field notes, while data analysis involves "sense-making". The researcher must narrate her experience in great detail so that readers may experience that same culture without necessarily being there. The advantages of this approach are its sensitiveness to the context, the rich and nuanced understanding it generates, and minimal respondent bias. However, this is also an extremely time and resource-intensive approach, and findings are specific to a given culture and less generalizable to other cultures. 3.4 Mixed-Method or Eclectic Method Mixed methods research represents more of an approach to examining a research problem than a methodology. Mixed method is characterized by a focus on research problems that require, 1) an examination of real-life contextual understandings, multi-level perspectives, and cultural influences; 2) an intentional application of rigorous quantitative research assessing magnitude and frequency of constructs and rigorous qualitative research exploring the meaning and understanding of the constructs; and, 3) an objective of drawing on the strengths of quantitative and qualitative data gathering techniques to formulate a holistic interpretive framework for generating possible solutions or new understandings of the problem. Tashakkori and Creswell (2007) and other proponents of mixed methods argue that the design encompasses more than simply combining qualitative and quantitative methods but, rather, reflects a new "third way" epistemological paradigm that occupies the conceptual space between positivism and interpretivism. What do Mixed-Method tell us? 1. Narrative and non-textual information can add meaning to numeric data, while numeric data can add precision to narrative and non-textual information.

NSOU ? PGSW-VII 80 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 2. Can utilize existing data while at the same time generating and testing a grounded theory approach to describe and explain the phenomenon under study. 3. A broader, more complex research problem can be investigated because the researcher is not constrained by using only one method. 4. The strengths of one method can be used to overcome the inherent weaknesses of another method. 5. Can provide stronger, more robust evidence to support a conclusion or set of recommendations. 6. May generate new knowledge new insights or uncover hidden insights, patterns, or relationships that a single methodological approach might not reveal. 7. Produces more complete knowledge and understanding of the research problem that can be used to increase the generalizability of findings applied to theory or practice. 3.5 Selecting Research Designs Given the above multitude of research designs, which design should researchers choose for their research? Generally speaking, researchers tend to select those research designs that they are most comfortable with and feel most competent to handle, but ideally, the choice should depend on the nature of the research phenomenon being studied. In the preliminary phases of research, when the research problem is unclear and the researcher wants to scope out the nature and extent of a certain research problem, a focus group (for individual unit of analysis) or a case study (for organizational unit of analysis) is an ideal strategy for exploratory research. As one delves further into the research domain, but finds that there are no good theories to explain the phenomenon of interest and wants to build a theory to fill in the unmet gap in that area, interpretive designs such as case research or ethnography may be useful designs. If competing theories exist and the researcher wishes to test these different theories or integrate them into a larger theory, positivist designs such as experimental design, survey research, or secondary data analysis are more appropriate. Regardless of the specific research design chosen, the researcher should strive to collect quantitative and qualitative data using a combination of techniques such as questionnaires, interviews, observations, documents, or secondary data. For instance, even

NSOU ? PGSW-VII 81 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 in a highly structured survey questionnaire, intended to collect quantitative data, the researcher may leave some room for a few open-ended questions to collect qualitative data that may generate unexpected insights not otherwise available from structured quantitative data alone. Likewise, while case research employ mostly face-to-face interviews to collect most qualitative data, the potential and value of collecting quantitative data should not be ignored. As an example, in a study of organizational decision making processes, the case interviewer can record numeric quantities such as how many months it took to make certain organizational decisions, how many people were involved in that decision process, and how many decision alternatives were considered, which can provide valuable insights not otherwise available from interviewees' narrative responses. Irrespective of the specific research design employed, the goal of the researcher should be to collect as much and as diverse data as possible that can help generate the best possible insights about the phenomenon of interest. 3.6 Conclusion An impactful research design usually creates a minimum bias in data and increases trust in the accuracy of collected data. A design that produces the least margin of error in experimental research is generally considered the desired outcome. Proper research design sets your study up for success. Successful research studies provide insights that are accurate and unbiased The essential elements of the research design are: 1. Accurate purpose statement 2. Techniques to be implemented for collecting and analyzing research 3. The method applied for analyzing collected details 4. Type of research methodology 5. Probable objections for research 6. Settings for the research study 7. Timeline 8. Measurement of analysis

Idea and Importance: Sampling is very important in a research work. There are two methods which are followed to collect data. Data can be collected from all the sources or few representative sources may be identified and then the data be is collected from that source. When the number of sources are very high and the periphery is also very wide spread I then the second. method is followed. All possible sources are termed as 'population'. But 83

NSOU ? PGSW-VII 84 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 it may out be always possible to collect data from this 'population'. But it may not be always possible to collected data from this 'population', because it becomes almost impossible to meet the expense and give necessary effort to this work for a researcher. Apart from this, it also becomes quite difficult and complexed for a researcher to properly manage, analyse and explain such huge volume of data. Generally a small population that represent the actual population is selected and from here the data, is collected, This selection procedure is called sampling. Suppose a research will be done on the slum dwellers of Rajabagan area in Kolkata to ascertain their socio economic status. Suppose 10,000 family lives in that slum then the population for data collection will be 1000. Even though it is quite difficult, expensive as well as time consuming and laborious to collect data from these 1000 family. So to minimize his work load the researcher will select 1 family in every 10 family' out of this 1'000 family which sums up to a total of family from where he will collect the relevant (data). The process of selecting the 100 family out of 1000 family is called sampling. Although the researcher can not choose this 100 family as per his discretion. Specific rules are followed during selecting the family so that the selected small population can correctly represent the entire population. Otherwise the desired result can not be obtained from the research. The research becomes ineffective. Sampling is a very important, extensively used and popular aspects of a research. This helps the research work to be more easier and faster. It has its own merit and demerits. If the small sample can not correctly represent the entire population then there is each always a chance of failure of the research work. That is why selection of sample is done very carefully and continuously, some special statistical techniques are used. These are called sampling techniques. Therefore sampling may be defined as. 'It is to select a portion of the entire source of data in such manner so that the inference can be drawn based on this sample. In this process a survey is conducted on a portion of the total population and then it is decided whether to take them as sample or not In research terminology this population is called universal. But the term population is very popular and widely used. The population may be definite or indefinite depending upon the number of components. For example the number of books published .by a publisher is finite but the number of reader of that book is not finite, rather it is infinite. The infinite population can be divided into two from another view point .. 'Real' and Hypothetical or Imaginary. As example the number of employees in an organisation is finite but their inspiration factors are imaginary because nothing can be said for certain in this regard.

NSOU ? PGSW-VII 85 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 A researcher should have a clear conception about samples which are as follows. i) Sampling design: It is a specific plan regarding sampling so that the representative sample can be obtained from the population. It is also to be determined that what kind of statistical approach should be taken to draw the design. ii) Sampling distribution: In some cases where more than one sample is taken there the statistical mean, standard deviation, range, correlation etc. of each of the sample is considered. All these values of a sample is then listed and thus sampling distribution is done. The reliability" (confidence) level of a sample is assessed through sample distribution. Suppose a researcher sets the confidence level of 95% in that case it is assumed that out of 100 sample, 95 of them correctly represents the total population. Significance level tells the opposite to confidence level that is some of the sample naturally does not represent or support the entire population. Thus confidence level and significance level complements each other. The sum of two level is always 100. Hence if the confidence level is 95% then automatically the significance level becomes 5%. Therefore 5% significance level proves, that out of every 100 samples 5 of them does not represent the population. iii) Sampling errors : As the sampling is made with a portion of huge population therefore one cannot expect that the sample will always correctly express all the characteristics of a total population. There is always a chance of sampling error, it is often noted that even after making two or three samples from same population produces different results. This difference is called 'sampling errors' on the other hand errors that occurs in data collection and analysis are human error hence they are known as non sampling error. B. Rules relating to selection of samples : The rules that are followed for selection of sample are like – if the topics are set at random and are more in numbers than that of the total population then they may represent the population almost with no-error. For examples if 1000 leaves of a tree is randomly plucked and measured then it may be seen that the average length of the leaf will be almost near to the length of all the leaves of the tree. The following two points are very important in case of statistical analysis. i) The larger the size or volume of sample the more it can represent the population. The equation is Dependancy on sample \propto Number of topics included in the sample. From the above example we can say that if 500 leaves were plucked instead of 1000 leaves as sample then dependancy/reliability of sample would decrease.

NSOU ? PGSW-VII 86 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 In 1st situation the dependency on sample = $K/1000$ (K is constant) 2nd situation dependency on sample = $K/500$ Therefore in the 1st case the value of dependency is $31.62K$ where as in 2nd case the value is $22.36K$. ii) Sample selection must be done at random. As per the abovementioned rule a portion of a large population is able to express the characteristic of the entire population. But lack of time, find and effort prevents to collect the data from the entire population and due to this random data collection has been the most conventional method. This rule supports the idea that if data is collected randomly then there is a chance of inclusion of all the traits and attributes of a large population in equal population. At the time of sample selection few cautions must be followed. The selection has to be unbiased. Otherwise if there is any mistake in sample selection then it can not properly express the characteristics of the entire population. So the sample must be alike with the actual population. If more topics are included in the sample then as per the law of inertia the chances of error is reduced and the same is increased in case of small sample.

4.3 Theory of Sampling The selection of sampling (Theory) means the way to bring out the interrelation between the sample and its original population. The theory of sampling helps to have an idea about the large population at the same time it helps to correct them. Following are the joints based on which the sampling theory is evolved: i) Statistical estimation : The sampling theory with the help of statistical estimation enables to derive some unknown characteristic of a population. This estimation can be of two types - point estimate and interval estimate. In case of the first type the result is expressed by a single number and in the second case the result is expressed by an expansion which has an upper and lower limit. For example in a sample of 10 spare parts round defective, therefore it may be assumed that out of 100 such sample the number of defective parts will be 10. When more than one sample is tested in similar way then on this basis it may be expressed that the probability of defective parts may vary from 8 to 12 out of 100. ii) Testing of Hypothesis : The second objective of sampling theory is to test the hypothesis and then either to reject or accept. This theory help to determine the logic

NSOU ? PGSW-VII 87 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 behind the difference of results as whether it is just due to chance or the difference is really significant when the hypothesis is tested. iii) Statistical Inference: This theory helps to draw inference about the characteristic of total population from the sample. Apart from this it helps to draw correct inference about the population. D. Importance of sampling techniques : Sampling techniques are extensively used in case of quantitative research. It is also important in the other spheres of research. Sampling techniques are used in the field of education, Economy, Commerce and scientific research. In fact in our day to day life we follow some sampling techniques, because at the time of buying vegetables and daily commodities we take decision just by testing some sample of them, we don't test the entire quantity. For example, the pathologists tests only 1 or 2 drops of blood to draw inference about any disease. Therefore sampling technique is not only followed in case of research but it is followed in our daily life. Following are the significant reason for which shows the importance of sampling techniques. i) Economy: It is quite expensive, time consuming and laborious task to analyse all the aspects of a population. This can be reduced and controlled through sampling techniques. ii) Reliability : If the characteristic of a population is not heterogenous and the sampling is done with proper precaution then the sampling result should able to correctly reflect some special characteristics of the population therefore the sampling becomes fully reliable. iii) Detailed study: As the sample contains lesser amount of elements therefore they can be studied deeply and in details. Since the sample is tested from different angle, hence chances of error in the result is much less. iv) Scientific base: There is a scientific basis of sampling techniques. Sampling is done from the entire population in such a way (impartially) so that the sample remain unbiased. v) Suitability in most situations: The study which are carried out for a research work are mostly sample study. Conducting a study or survey on an entire population is a very rare case, because if there is a similarity in characteristic of a population then there is no deviation found in the sample too. Therefore in most situations sampling techniques are followed. It is true that though, in case of research work sampling techniques is widely followed but it is not applicable in all sphere. In the following areas sampling techniques may not be effective, following are the areas where this technique is very much effective.

NSOU ? PGSW-VII 88 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022

i) Data is vast : When the population for research is huge and required volume of data is also vast in such cases sampling techniques is very much essential. It not only saves time, money and labour but reduces the complexity of the research.

ii) Where cent percent accuracy is not required : There is no alternative of sampling techniques where cent percent error free result is not required from the research.

iii) Where census is not feasible : Generally cent percent accurate result is possible to get on studying all the elements of a population for research. Where census is not feasible in those cases sampling technique is considered as the only solution. For example if the total quantity of mineral and ores of India is to be measured then it is not possible to dig all the mines and measure the quantity. So there is no alternative way than sampling techniques.

iv) Homogeneity : If the overall characteristics of a population is same then it becomes easier to use the sampling techniques and the obtained result is accurate. This is quite true that if the sampling is faulty then the research result will also be confusing. For example if the per family expense of slums dwellers is the subject of a research and at the time of sampling the data is collected from only those family who lives in a concrete house then the obtained result will be incorrect, because while preparing the sample, the family who does not have a concrete house were not included. So it can be said that sampling techniques will be successful only when it is done with proper precaution and without any bias. If the elements are collected with direction then chances of error in the result becomes very high. Therefore it increases the chances, of failure of a research. Hence it is advisable that selection of sample should be done intentionally and carefully then only a research work may be carried out.

4.4 Methods of sampling It becomes very effective to work with a small sample which is derived from a huge population. It was mentioned earlier that sampling method should be scientific it has to have, a scientific basis and it should be able to represent the entire population. Otherwise there is a chance of deviation in the research. The sampling method is divided into two parts, they are: i) Random Sampling method. ii) Non-random Sampling method.

i) Random Sampling method: NSOU ? PGSW-VII 89 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 According to this method when sample is prepared from a large population then it includes all the elements of the population. This kind of selection is always unbiased. That is the sampling is not influenced by the persons likings and dislikings. The elements of these sample are called indiscriminately from the population. This method avoids personal preference. The merits of this method are as follows : i) Potential sampling gives an idea. The assumption are unbiased and neutral. ii) The potential sample and its effectiveness does not depend upon the details of the information, iii) In those research works where there is more number of samples are obtained by this method, there the relative potentiality of every samples can be ascertained, which is not possible in other by other methods. The demerits of this methods are : i) Selection of sample depends upon the skill and experience of the person. ii) It requires enough time to prepare the sample. Without preplan the sampling can not be done. iii) This relatively a costly method. If the sampling is done unbiasedly then the cost may proportionately reduce.

Type of probability sampling There are four kinds of probability sampling. They are: 1) Simple random sampling 2) Stratified sampling 3) Systematic sampling 4) Cluster sampling. The above four are discussed below: 1. Simple random sampling: When all the elements of an sample is selected unbiasedly then it is called simple random sampling. The significance of this sampling is that the sample contains all the elements of the population from which it was taken. Here importance is not given to the personal choice of the researcher. It can be said in another way that if a sample is prepared with 'n' number of elements and if the sample includes as many as possible combination of 'n' number elements then this method is called simple random sampling. Follow are the areas where application of this method is often seen.

NSOU ? PGSW-VII 90 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022

a) Lottery method b) Tipet's number method c) Selection from sequential list d) Grid method Let us have a preliminary idea about all the above methods. (a) Lottery method: In this method, at first all the elements of a population is segregated and written on separate piece of paper, then they are kept in a container. The pieces of paper are then mixed and well shaken there after each of the pieces are picked. All the elements written in those pieces are included in the sample. This way the number of pieces are taken out depending upon the number of elements of a sample. This is called the lottery method. (b) Tipet's number method: This has been named after the name of L.B.C. Tipet. Tipet prepared a table with 4 digit where all the number were unbiased by written. An unbiased, impartial sampling can be produced from this table. For example if some one wants to prepare 50 samples out of 500 population then from any page of Tipets table he can choose first 50 numbers. The test result showed that sampling done through this method is quite dependable. (c) Selection from sequential List: The elements of population is listed in a sequence. The sequence may be done on the first alphabet of the name, or may be done Geographically or just serially. The elements that are oriented in this method, can easily be included in the sample and the selection may be started from any point. For example, if a sample consists of 10 student of a class where the total number of student in 100 then this may be done based on the roll number like 5,15,25, 95 or 10, 20, 30, 100 likewise. (d) Grid system: This system is followed in case of area wise sample selection. In this system at first a complete map of the area is drawn. Then a rectangular screen is placed on the map and some rectangles are unbiasedly selected. The areas in the map that are indicated by the rectangles are then included in the sample.

Merits and demerits of simple random sampling. Following are the merits of this method :- i) The method is relatively simple and the researcher need not have to be very much attentive as to which element is to be included and which one to be excluded in the sample. ii) Since this is an unbiased method so chances of human error is nil.

NSOU ? PGSW-VII 91 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 iii) As the chances of inclusion of all the elements in the sample is equal therefore the sample can well represent the entire population. iv) Since this is a disciplined method therefore if there is error in the results they can be easily corrected. Following are the demerits of the method :- i) This method is not applicable when the size of the population is large. ii) In this method the selector does not have any control over the elements of a sample. As a result the range of selected elements may be quite wide and it becomes impossible to keep control over each and every element. iii) This method becomes ineffective if the population is heterogeneous. 2. Stratified sampling: At first the entire population is divided into number of classes, and each class is considered as strata. The significance of this method is that, that emphatically the population is divided into number of subgroups and for stratification some precautionary measures are taken as per the following. i) Proportionate stratified sampling : In this method the proportion of elements in a sample is same with the various strata of the total population. For example if a population evolves 5 strata then from each strata 5 joints are identified and included in the sample. So in both situation the ratio is 1.5. ii) Disproportionate stratified sampling: In this method equal number of element is selected to prepare the sample. This method is also known as controlled sampling. iii) Stratified weight sampling: This method is applied where the size and volume of the strata differs from the original population. According to this method initially equal amount of element is selected from the strata, and their weighted average is calculated. How much weight is to be put on to which strata that depends upon the proportion of total population and the size of the strata. This is known as stratified weight sampling method. Merits & demerits of stratified sampling method : Following are the merits of this method : i) The selector have more control over the selection procedure, because in a simple random sampling method there is always a chance that some important sample may not have all the elements which is almost absolutely nil in case of stratified sampling method.

NSOU ? PGSW-VII 92 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 ii) Samples can be prepared with a small number of elements in such cases where the strata are of similar nature there the sample are prepared with very little amount of elements even though there is no deviation the results. iii) Another significant advantage of this method is the inaccessible can be replaced with the accessible aspects. The demerits of the method are as follows : i) This method has been developed based on the stratification of population. Therefore if there is any fault in stratification the sampling will also be faulty. ii) Scientific method is not properly applied while stratification. It depends upon the personal decision and choice of the selector to prepare the strata. Therefore there is always a probability of biasness, which poses problem in future. iii) In case of stratified weight sampling method if there is a difference of weight assigned to various strata then there is a chance of deterioration of the quality of the sample. 3. Systematic sampling: This is another version of simple random sampling method. In this method the elements of a population is initially organised in such a manner so that all the elements are properly distributed in the table. The Voter list, the Telephone directory these are the ideal example of this method. Suppose a sample with 50 elements is to be prepared out of a population that consists of 500 elements. In this situation we can select a number between 1 to 10 let us assume that the digit is 6 then the sample will be prepared based on the matrix 6,16,26,36, , 486,496 likewise. This is known as systematic sampling method. The significance of this method is the selection of elements of a sample is done in a particular sequence. All the elements maintain equal difference. But the reliability and depend ability of the sample depends upon their position in the table. Following are the merits of this method: i) Sample preparation is easy: ii) This method is effective on every sphere of population except the extinct population. The demerits of thus methods are: i) If the difference between two element are very high then the effectiveness of the sample reduces. Therefore. it is not useful in case of preparing small sample out of a large population,

NSOU ? PGSW-VII 93 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 ii) The quantity of error increases if more than one strata is present in the population. The other demerits of this method are: i) If the elements of the population is not oriented properly in the table, if they have a tendency of becoming restless instead of being stable, then it cannot correctly reflect the characteristics of the population. ii) The possibility of error is very high in this method if the stratification has a good influence on the total population. iii) The elements are selected from the table based on their consistency. In this way if the difference between the elements are very high then the sample can not be considered as an ideal sample. 4) Cluster sampling: This method is also known as multilayer samplings, because in this method the preparation of sample is done through various layer and steps. This method is extensively used while preparing a sample from a huge population. Generally the sampling is done in three or four stages. At the first stage the initial classification of the elements are done and in the second stage they are again divided into subclass in the third stage the sample is prepared with the first, second and third graded elements. This method is comparatively complex in respect to the other methods. An example may clarify the method. Suppose a sample of 100 professors is to be prepared who teaches in the colleges the score affiliated by the University of Calcutta. Suppose there is a list of professor which has 100 number of pages and each page contains 20 names which are alphabetically sorted. Now 20 pages are chosen unbiasedly out of 100 pages then from each page 5 names are randomly chosen. Therefore to choose 20 pages out of 100 any number between 1 to 5 is to be choosed first, suppose the number is 4 then the order of the selected page will be 4,8,12,16,96 and 100. After this if 5 names are taken randomly from each page then a sample of such 100 names will be prepared. Therefore this is, a true example of combination of systematic sampling and random sampling method. But this method is not very widely used, because the method is quite expensive and it is difficult to keep control over the non sampling error. Non-probability sampling methods: We must have an idea about non probability sampling method along with side by side probability sampling methods. In fact the method which is incapable of preparing samples with all the elements of a population is known as non-probability sampling method. In this

NSOU ? PGSW-VII 94 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 method the elements are not taken randomly. In another way, this may be said that while sampling it partly depends upon the personal preference of the selector, this means that in this method the probability of inclusion of an element in a sample depends upon the convenience and consideration of the individual. This sampling method is again divided into three parts: i) Judgement or purposive sampling ii) Convenience sampling iii) Quota sampling. i) Judgement or purposive sampling: This method completely depends upon the consideration and personal preference of the researcher. Though the researcher tries up to the best of his capability to make the sample a true representative of the entire population. Even then the sample is dependent upon this judiciousness. When a small number of elements is taken from the population to prepare a sample, then this method becomes very much effective. If simple random sampling method is applied in such a situation then there is always a chance of exclusion of some important elements in the sample. Here judgement or purposive sampling becomes very effective. For example, if the effectiveness of the workers of an organisation is to be judged then a sample is prepared by randomly selecting 10 employees out of 100 employees of the organisation. This sample may not have representatives from all the departments, the total sample may consist of one / two departments. Therefore the sample result can not give a general idea about the effectiveness of all the employees of the organisation. In other way this may be said that the sample study fails to give correct idea about the objective of the research. There is no scope to judge the reliability of the result obtained from the sample, this is another demerit of this method. Even though when a research is conducted to determine some unknown characteristics and features of a population then the entire population is divided into few categories then the elements are selected by examining each and every category. This makes the sample more reliable and representative. ii) Convenience sampling : When importance is given on the convenience of the researcher then it is known as convenience sampling. This kind of sampling does not consider the 'probability- factor' as well and does not depend upon the rationality of the individual. Instead of this sample is prepared in such a way so that it can provide the maximum advantage to the research. When a sampling is done from a telephone directory, registration list of automobiles then

NSOU ? PGSW-VII 95 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 it is called convenience sampling. If the simple random sampling method is applied to prepare the sample even though it can not be considered as random sampling. The elements of the sample can not represent the entire population. Therefore this sort of sampling remains biased and never accepted satisfactorily. Even though in some exceptional cases where the complete data is not available of the total population the elements can not be clearly identified and where just the pilot study are conducted in such cases this method is applied. iii) Quota Sampling : Quota sampling is a special version of stratified sampling. In this method the population is divided into different classes based on some known characteristics of the population. After this the ratio of all the elements of each class and the elements of the total population is determined. Now the responsibility of the researchers is laid out, that is the study is to be carried out on what part of which classes etc. This way the proportionate data is collected from a total population. The advantage of this method is it helps to collect information from each strata which includes various elements of the population. Thus the collected data represents the population and reduces the expense of research. The main drawback of this method is during stratification the biasness of the sampler becomes predominant. Apart from this, since the sampling is not randomly done therefore the errors in result can not be statistically measured. 4.5 Precautions in using Sampling Methods Few points are considered as precautionary measures while selecting sampling methods. a) The sample must represent the entire population. b) If the sample is unable to express all the characteristics of the population then it cannot completely represent the population and the goal of the research remains unachieved if the research is carried out with this sample: c) Therefore the researcher has to be very much cautious to ensure that the samples are not prepared with biasness. Following are the precautions which are followed to do the above: 1. The survey, study and data collection has to be done in definite intervals where the characteristic change occurs quite often in a population. 2. It is to be ensured that the size of the sample should not be small. Because a small sample fails to properly represent the population. Therefore the size of the sample should be such so that it can express all the characteristics of the population.

NSOU ? PGSW-VII 96 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 Sampling should not be done with intension, because then it increases the chance of biasness. 3. If the stratification method is applied for sampling even then principle of perfect stratification should not be followed. 4. If sampling is done from an incomplete table then also it becomes biased. 5. If freedom is given to the data accumulator for preparing sample without any guideline then they prepare the sample as per their convenience. In such cases situation the probability of unbiasedness and representativeness reduces. 6. Improper selection method makes the sample biased. Special precaution is required in case of preparing sample from a complex, heterogeneous and huge population. 7. The researcher should always be careful to ensure that the sample is unbiased and can correctly represent the population. (G) Sampling Reliability: Two aspects are important for selection of sample for a research work. (i) It should be unbiased and random (ii) It should be reliable. The reliability of a sample depends on correctly the characteristics of the population. Following are the points based on which the reliability of a sample is judged. i) Size of the sample : Size of the sample is very important to correctly express the characteristics of the population. The bigger the size of sample, the more it is expressive. The reliability is less when the sample is small in size. The researcher has to examine and judge whether the sample is competent enough for scientific research. ii) By testing the representative character of a sample : The reliability of a sample can be judged by testing the representing feature of the sample. ii) Parallel Sampling: To test the reliability of a sample another sample is prepared from the same population. After testing the reliability of the parallel sample the primary sample is tested. A clear idea about the two samples are obtained by comparing their results. iv) Homogeneity of the sample : A sample which is prepared out of a large population must express all the characteristics of the population. Therefore by testing the homogeneity the reliability of a sample is judged.

NSOU ? PGSW-VII 97 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 v) Unbiased selection : The sampling should be done in such a way that there should be no biasness at the time of selecting the elements. The unbiased selection method is more reliable. vi) Preparing sample from the main sample : This is a process of preparing sample to sample. Many a time this is done just to test the reliability of the sample. The newly prepared sample is then well tested and the obtained result is compared with the results of the main sample. This enables to identify any error in the main sample. 4.6 Sampling and Non-sampling errors In case of statistical analysis the error which occurs at the time of data collection, analysis and processing they may be categorised in two parts, 1. non-sampling errors and 2. sampling errors. These are discussed below : 1. Sampling errors : Generally the survey is conducted on a small portion of a large population, by taking a sample of the same. Therefore it is quite natural that there is a possibility of differences with the result of actual population. Moreover if the survey is conducted on more than one sample prepared from a large population even then slight deviation is seen in the results. i) Error in sample selection : Intentional sample selection can not be unbiased. Therefore it evolves error. If the elements of samples are intentionally selected then it becomes biased. In case of sample selection the probability of error is very high when it is unorganisedly selected. ii) Incomplete Investigation : If investigation is not carried out on all the elements of a sample then the obtained information becomes biased. In such situation the question- naire method is applied. It is often seen that in such situation all the questions are not answered. iii) Error in Data Collection: If there is any error in the method of data collection then it is reflected in the entire process. The possible reason for error in data collection is as follows : a) If the data collector is not careful enough at the time of data collection then the accumulated data becomes faulty for example if the data collector does not ask questions or record the answers correctly then the information becomes faulty.

NSOU ? PGSW-VII 98 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 b) If the answerer lacks in knowledge then the answers are not correct and proper. c) If the questionnaire is weak. d) If data is collected other than any approved method. iv) Replacement : If an element or a persons on whatsoever is not present in the sample and the data collector collects the data from a replacement, due to this the sample becomes biased and result remains incorrect. iv) Faulty analysis : The inference of a research is drawn by analysing the collected data. But if the analysis is faulty then the sampling error occurs. From the above discussion it is observed that the biased attitude of the data collector, answerer and information supplier creates lot of errors. But many a times it is also seen that with no fault of the data collector or answerer just due to accident some error occurs. This types of error are known as unbiased error, most of the time these errors are set off just by complementary each other, and does not influence the result of the research. 2. Non sampling errors: If the sampling is done correctly even though it can not be said that the surveyor the research is error free. In fact in all stages of a research such as data collection, data processing, data analysis, an error may occur. Therefore even if there is not error in sampling still the following errors may occur which are known as Non- Sampling errors; i) The incorrect presentation and improper planning about the subject of research ii) If there is wrong selection of population on which the research will be carried out. iii) If data collection is done with incomplete and faulty questionnaire. iv) Wrong approach for data collection. v) If the data collector collects inconsistent and erroneous data. vi) Personal inclination or biased attitude of the presenter. vii) In correct knowledge about the variables of the research. viii) Misutilization of average value. ix) Adapting wrong methodology for research. x) If there is any fault in different measuring methods of the research. There may be more reasons apart from the above for Non-Sampling errors. But if the above reason can be removed or eradicated then the research can be made error free.

NSOU ? PGSW-VII 99 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 4.7 Methods of Data collection We will now learn about the methods of data collection. Types of Data it is essential to have knowledge about some common terms that is crucial for us to know. While collection of data is concerned, we must know that there are two types of data- 1 Primary data 2 Secondary data 1 Primary data The Data which is collected directly from the area of investigation for a specific reason are called primary data. thus characteristically primary data are unique.. such as a doctor can prepare a weight chart for his patient directly with the help of a weighing machine these types of data set are primary data set. At the time of population census data is directly collected. These are primary data set primary data set are more reliable but to collect primary data it requires more money time and labour. 2 Secondary data The data which has been previously collected by some agency and later for some specific investigation if the investigator uses the same set of data then they are called secondary data. Secondary data is not unique in character. when a data is availed from a census report for investigation then the collected data are transformed into secondary data to the investigator..It is less expensive to collect secondary data because comparatively it requires less money time and energy. The secondary data is apparently less reliable because while transcription or rounding up from the source it may carry some error. It is therefore revealed from the above discussion that a data which is primary 2. an individual the same data may be secondary to another individual, for example the data in the census report published by Government of India is primary data and the same data published in another book a report secondary data. ? most of the time the source of data are divided into two primary source and second resource. The authority, which directly collects the data from the investigation area or called primary source, while the agency that uses the data collected from primary source to somewhere else they're called the second resource.

NSOU ? PGSW-VII 100 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 ? in case of statistical investigation the primary data is most fruitful although because of limited time and money the secondary data are also used. therefore special precaution is needed to be taken to avoid errors of using secondary data. Examples of primary data are the census report, the annual report of the Chief Inspector of mines in India, the common textile bulletin published from Mumbai etc. Examples of secondary data sources are statistical abstract of the Indian union published by the central statistical organisation New Delhi, survey report published by the statistical institution etc. Methods of data collection Data collection is a primary job before going into a statistical work. in relation to this there are some common terms that we must know like questionnaires, schedules etc. Questionnaire Questionnaire means a set of well defined questions about the investigation. The questionnaire should be prepared in such a way that it should be capable of collecting all relevant data. Generally in the first phase of observation it draught questionnaire is prepared and though their experiment answers are collected from a group of people.. the draught questionnaire is prepared to identify the flaws and defects in the questions so that they do not appear in the actual questionnaire.. the flaws and errors in the draught questionnaires are then removed and revised a good question should have the following features- ? The question should be written in simple language and it must be relevant with the topic or subject of investigation ? number of questions must be limited else the answerer will lose interest to respond to every question. ? The questions should not be doubtful and difficult to understand. ? Most of the questions should have multiple choice of answering. ? It is better to avoid such questions which may hurt the ego or sentiments of the answer. Schedule In this context schedule means a list of topics or subjects on which data will be collected. Preparation of questionnaire publishing of relevant information these are not mentioned in the schedule. These activities are interested upon the investigator The different types of data collection can be discussed generally in the following ways during numeric data collection-

NSOU ? PGSW-VII 101 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 Interview method Mail questionnaire method Direct personal observation method Indirect oral investigation method 1. Interview method - Data is collected directly from the spot of investigation through this method with the help of trained and experienced investigator. The investigators are addressed as enumerator of field staff. The field staff reaches the specific locality and collect data from the local people through personal interaction an interview with a set of specific questions.. the local people who acts as data suppliers are to be intimated about the investigation topic and the answers obtained from the interview are carefully recorded. this is very popular method of data collection by appointing field staff and is considered to be very effective. 2. Questionnaire through postal - The questionnaire is the most important tool in this method the questionnaire is prepared with a bunch of questions about the subject of investigation.. the required data are collected from the answers of these questions. the questionnaire is sent to a group of selected data supplier by post requesting them to duly fill up the questions with their answers and return the same by post. the correspondence include the objectives of investigation an instruction to fill up the answers.. the confidentiality of the total method is also assured. This method is quite faster and comparatively cheaper. Some of the problem with this methods include - reliability of the collected data through this method is relatively low lot of questionnaire return without any answer. 3. Direct personal observation - In this method the investigator personally stays in the place of investigation and collects the data directly through personal observation counting and measurement. The investigator does not depends upon any other person for data collection and the collected data through this method are reliable. Up to a large extent. Although the priority of the data depends upon the honesty wholeheartedness and fine observation power of the Investigator is also included in this method. 4. In direct oral investigation - Relevant data can be obtained from some indirect sources persons with vast experience about this surroundings and problems are identified and then they are interviewed to collect the data. The investigation Commission and government committees mostly followed this method as the primary data collection method. It is needless to mention that the sanctity of the data collected through this method entirely depends upon unbiasedness of the data supplier and honesty of the investigator.

NSOU ? PGSW-VII 102 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 ? apart from these ways of data collection there can be other ways where data is collected locally by appointing agents this method is followed where supply of data is required on a regular basis. the media sector specially follow this technique. 4.8 Conclusion In this unit we learnt about the concept of sampling. This will help to carry out out research more system its celly. 4.9 Exercise 1. Explain the importance of sampling. 2. What are the methodologies followed. 3. Explain the main methodologies for sampling. 4.10 Reference I. Statist6ical Methods For The Social Sciences: Alan Agresti, Fifth Edition, 2018, Pearson. II. 100% **MATCHING BLOCK 35/88** **W**

When social scientists measure concepts, they sometimes use the language of variables and attributes (also called values). A variable refers to a phenomenon that can vary. It can be thought of as a grouping of several characteristics. For example, hair color could be a variable because it has varying characteristics. Attributes are the characteristics that make up a variable. For example, the variable hair color would contain attributes like blonde, brown, black, red, gray, etc. A variable's attributes determine its level of measurement. There are four possible levels of measurement: nominal, ordinal, interval, and ratio. The first two levels of measurement are categorical, meaning their attributes are categories rather than numbers. The latter two levels of measurement are continuous, meaning their attributes are numbers, not categories. 103

NSOU ? PGSW-VII 104 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 5.2

100% **MATCHING BLOCK 37/88** **W**

Nominal level of measurement Hair color is an example of a nominal level of measurement. Nominal measures are categorical, and those categories cannot be mathematically ranked. There is no ranking order between hair colors. They are simply different. That is what constitutes a nominal level of measurement. Gender and race are also measured at the nominal level. When using nominal level of measurement in research, it is very important to assign the attributes of potential answers very precisely. The attributes need to be exhaustive and mutually exclusive. Let's think about the attributes contained in the variable hair color. Black, brown, blonde, and red are common colors. But, if we listed only these attributes, people with gray hair wouldn't fit anywhere. That means our attributes were not exhaustive. Exhaustiveness means that all possible attributes are listed. We may have to list a lot of colors before we can meet the criteria of exhaustiveness. Clearly, there is a point at which trying to achieve exhaustiveness can get to be too much. If a person insists that their hair color is light burnt sienna, it is not your responsibility to list that as an option. Rather, that person could reasonably be described as brown-haired. Perhaps listing a category for other color would suffice to make our list of colors exhaustive. What about a person who has multiple hair colors at the same time, such as red and black? They would fall into multiple attributes. This violates the rule of mutual exclusivity, in which a person cannot fall into two different attributes. Instead of listing all of the possible combinations of colors, perhaps you might include a list of attributes like all black, all brown, all blonde, all red, multi-color, other to include people with more than one hair color, but keep everyone in only one category. The discussion of hair color elides an important point with measurement—reification. You should remember reification from our previous discussion in this chapter. For many years, the attributes for gender were male and female. Now, our understanding of gender has evolved to encompass more attributes including transgender, non-binary, or

gender queer.

MATCHING BLOCK 36/88

W

We shouldn't confuse our labeling of attributes or measuring of a variable with the objective truth "out there." Another example could be children of parents from different races were often classified as one race or another in the past, even if they identified with both cultures equally. The option for bi-racial or multi-racial on a survey not only more accurately reflects the racial diversity in the real world but validates and acknowledges people who identify in that manner.

MGEOSE-21 All.pdf (D133844839)

Characteristics of Nominal Scale 1. In nominal scale a variable is divided into two or more categories,

for example, agree/disagree, yes or no etc. It's a measurement mechanism in which answer to a particular question can fall into either category.

NSOU ? PGSW-VII 105 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 2. Nominal scale is qualitative in nature, which means numbers are used here only to categorize or identify objects. For example, football fans will be really excited, as the football world cup is around the corner! Have you noticed numbers on a jersey of a football player? These numbers have nothing to do with the ability of players, however, they can help identify the player. 3. In nominal scale, numbers don't define the characteristics related to the object, which means each number is assigned to one object. The only permissible aspect related to numbers in a nominal scale is "counting." In nominal scale, it is easy to generate responses using close ended questions, a lot of responses can be collected in short period of time, which in turn increases reliability. However, there is a downside to the scale, without a linear scale, participants are unable to express their degrees of response. 5.3

100%

MATCHING BLOCK 38/88

W

Ordinal level of measurement Unlike nominal-level measures, attributes at the ordinal level can be rank ordered. For example, someone's degree of satisfaction in their romantic relationship can be ordered by rank. That is, you could say you are not at all satisfied, a little satisfied, moderately satisfied, or highly satisfied. Note that even though these have a rank order to them (not at all satisfied is certainly worse than highly satisfied), we cannot calculate a mathematical distance between those attributes. We can simply say that one attribute of an ordinal-level variable is more or less than another attribute.

80%

MATCHING BLOCK 43/88

SA

MGEOSE-21 All.pdf (D133844839)

Ordinal scale is the 2nd level of measurement that reports the ranking and ordering of

the data without actually establishing the degree of variation between them. Ordinal level of measurement is the second of the four measurement scales. "Ordinal" indicates "order". Ordinal data is quantitative data which have naturally occurring orders and the difference between is unknown. It can be named, grouped and also ranked.

100%

MATCHING BLOCK 40/88

W

This can get a little confusing when using Likert scales. If you have ever taken a customer satisfaction survey or completed a course evaluation for school, you are familiar with Likert scales. "On a scale of 1-5, with one being the lowest and 5 being the highest, how likely are you to recommend our company to other people?" Sound familiar? Likert scales use numbers but only as a shorthand to indicate what attribute (highly likely, somewhat likely, etc.) the person feels describes them best. You wouldn't say you are "2" more likely to recommend the company. But you could say you are not very likely to recommend the company.

100%

MATCHING BLOCK 41/88

W

Ordinal-level attributes must also be exhaustive and mutually exclusive, as with nominal-level variables.

Ordinal Scale Characteristics ? Along with identifying and describing the magnitude, the ordinal scale shows the relative rank of variables. ? The properties of the interval are not known. ? Measurement of non-numeric attributes such as frequency, satisfaction, happiness etc. ? In addition to the information provided by nominal scale, ordinal scale identifies the rank of variables. ? Using this scale, survey makers can analyze the degree of agreement among respondents with respect to the identified order of the variables. Advantages of Ordinal Scale ? The primary advantage of using ordinal scale is the ease of comparison between variables. ? Extremely convenient to group the variables after ordering them. ? Effectively used in surveys, polls, and questionnaires due to the simplicity of analysis and categorization. Collected responses are easily compared to draw impactful conclusions about the target audience. ? As the values are indicated in a relative manner using a linear rating scale, the results are more informative than the nominal scale. 5.4

100%

MATCHING BLOCK 42/88

W

Interval level of measurement At the interval level, the distance between attributes is known to be equal. Interval measures are also continuous, meaning their attributes are numbers, rather than categories. IQ scores are interval level, as are temperatures. Interval-level variables are not particularly common in social science research, but their defining characteristic is that we can say how much more or less one attribute differs from another. We cannot, however, say with certainty what the ratio of one attribute is in comparison to another. For example, it would not make sense to say that 50 degrees is half as hot as 100 degrees. But we can say it is 50 degrees cooler than 100. At the interval level, attributes must also be exhaustive and mutually exclusive.

55%

MATCHING BLOCK 45/88

SA

MGEOSE-21 All.pdf (D133844839)

The interval scale is a quantitative measurement scale where there is order, the difference between the two variables is meaningful

and equal, and the presence

NSOU ? PGSW-VII 107 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 of zero is arbitrary. It measures variables that exist along a common scale at equal intervals. The measures used to calculate the distance between the variables are highly reliable. The interval scale is the third level of measurement after the nominal scale and the ordinal scale. Understanding the first two levels will help you differentiate interval measurements. A nominal scale is used when variables do not have a natural order or ranking. Questions that can be measured on the interval scale are the most commonly used question types in research studies. To receive answers in the form of interval data, you need to limit feedback options to variables that can be assigned a numerical value where the difference between the two variables is equal. 5.5

100%

MATCHING BLOCK 44/88

W

Ratio level of measurement Finally, at the ratio level, attributes can be rank ordered, the distance between attributes is equal, and attributes have a true zero point. Thus, with these variables, we can say what the ratio of one attribute is in comparison to another. Examples of ratio-level variables include age and years of education. We know, for example, that a person who is 12 years old is twice as old as someone who is 6 years old. Just like all other levels of measurement, at the ratio level, attributes must be mutually exclusive and exhaustive.

Ratio scale has most of the characteristics of the other three variable measurement scale i.e nominal, ordinal and interval. Nominal variables are used to "name," or label a series of values. Ordinal scales provide a sufficiently good amount of information about the order of choices, such as one would be able to understand from using a customer satisfaction survey. Interval scales give us the order of values and also about the ability to quantify the difference between each one. Ratio scale helps to understand the ultimate- order, interval, values, and the true zero characteristic is an essential factor in calculating ratios. A ratio scale is the most informative scale as it tends to tell about the order and number of the object between the values of the scale. The most common examples of ratio scale are height, money, age, weight etc. With respect to market research, the common examples that are observed are sales, price, number of customers, market share etc. Characteristics of Ratio Scale 1. Ratio scale, as mentioned earlier has an absolute zero characteristic. It has orders and equally distanced value between units. The zero point characteristic makes it relevant or meaningful to say, "one object has twice the length of the other" or "is twice as long."

NSOU ? PGSW-VII 108 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 2. Ratio scale doesn't have a negative number, unlike interval scale because of the absolute zero or zero point characteristic. To measure any object on a ratio scale, researchers must first see if the object meets all the criteria for interval scale plus has an absolute zero characteristic. 3. Ratio scale provides unique possibilities for statistical analysis. In ratio scale, variables can be systematically added, subtracted, multiplied and divided (ratio). All statistical analysis including mean, mode, the median can be calculated using ratio scale. Also, chi-square can be calculated on ratio scale variable. 4. Ratio scale has ratio scale units which have several unique and useful properties. One of them is they allow unit conversion. Take an example of calculation of energy flow. Several units of energy occur like Joules, gram-calories, kilogram- calories, British thermal units. Still more units of energy per unit time (power) exist kilocalories per day, liters of oxygen per hour, ergs, and Watts. Advantages of Ratio Scale ? A ratio scale has a point zero characteristic, where the value of the variable has no value at all. Weight, height etc can be calculated on ratio scale because they have a real zero value. However, the temperature cannot be measured on this scale because zero degree celsius doesn't mean there is no cold or heat for that matter. But most of the scientific variables can be measured on a ratio scale. ? Point zero is an essential characteristic to measure a ratio between any two variables because in the absence of zero there is no ratio. So without a zero would it make any sense to say, "Tom is driving at a speed of 100 km/hour, which is double the speed at which Thelma is driving, which is 50 Km/hr?" ? This scale is used to calculate all the scientific variables. In fact, in the absence of a ratio scale, scientific variables cannot be measured. 5.6

Thurstone's scaling method Louis Thurstone. one of the earliest and most famous scaling theorists, published a method of equal-appearing intervals in 1925. This method starts with a clear conceptual definition of the construct of interest. Based on this definition, potential scale items are generated to measure this construct. These items are generated by experts who know something about the construct being measured. The initial pool of candidate items (ideally 80 to 100 items) should be worded in a similar manner, for instance, by framing them as

NSOU ? PGSW-VII 109 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022

100%

MATCHING BLOCK 49/88

W

statements to which respondents may agree or disagree (and not as questions or other things). Next, a panel of judges is recruited to select specific items from this candidate pool to represent the construct of interest. Judges may include academics trained in the process of instrument construction or a random sample of respondents of interest (i.e., people who are familiar with the phenomenon). The selection process is done by having each judge independently rate each item on a scale from 1 to 11 based on how closely, in their opinion, that item reflects the intended construct (1 represents extremely unfavorable and 11 represents extremely favorable). For each item, compute the median and inter-quartile range (the difference between the 75th and the 25th percentile – a measure of dispersion), which are plotted on a histogram, as shown in Figure 6.1. The final scale items are selected as statements that are at equal intervals across a range of medians. This can be done by grouping items with a common median, and then selecting the item with the smallest inter- quartile range within each median group. However, instead of relying entirely on statistical analysis for item selection, a better strategy may be to examine the candidate items at each level and selecting the statement that is the most clear and makes the most sense. The median value of each scale item represents the weight to be used for aggregating the items into a composite scale score representing the construct of interest. We now have a scale which looks like a ruler, with one item or statement at each of the 11 points on the ruler (and weighted as such). Because items appear equally throughout the entire 11-point range of the scale, this technique is called an equal-appearing scale. Thurstone also created two additional methods of building unidimensional scales – the method of successive intervals and the method of paired comparisons – which are both very similar to the method of equal-appearing intervals, except for how judges are asked to rate the data. For instance, the method of paired comparison requires each judge to make a judgment between each pair of statements (rather than rate each statement independently on a 1 to 11 scale). Hence, the name paired comparison method. With a lot of statements, this approach can be enormously time consuming and unwieldy compared to the method of equal-appearing intervals. 5.7

Likert scale. Designed by Rensis Likert, this is a very popular rating scale for measuring ordinal data in social science research. This scale includes Likert items that are simply-worded statements to which respondents can indicate their extent of agreement or disagreement on a five or seven-point scale ranging from 'strongly disagree' to 'strongly agree'. A typical example of a six-item Likert scale for the 'employment self-esteem' construct is shown in

NSOU ? PGSW-VII 110 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 Table 6.3. Likert scales are summated scales—that is, the overall scale score may be a summation of the attribute values of each item as selected by a respondent. Strongly Somewhat Neutral Somewhat Strongly Disagree Disagree Agree Agree I feel good about my job 1 2 3 4 5 I get along well with others at work 1 2 3 4 5 Strongly Somewhat Neutral Somewhat Strongly Disagree Disagree Agree Agree I'm proud of my relationship with my supervisor at work 1 2 3 4 5 I can tell that other people at work are glad to have me there 1 2 3 4 5 I can tell that my co-workers respect me 1 2 3 4 5 I feel like I make a useful contribution at work 1 2 3 4 5 A six-item Likert scale for measuring employment self-esteem Likert items allow for more granularity (more finely tuned response) than binary items, including whether respondents are neutral to the statement. Three or nine values (often called 'anchors') may also be used, but it is important to use an odd number of values to allow for a 'neutral' (or 'neither agree nor disagree') anchor. Some studies have used a 'forced choice approach' to force respondents to agree or disagree with the Likert statement by dropping the neutral mid-point and using an even number of values, but this is not a good strategy because some people may indeed be neutral to a given statement, and the forced choice approach does not provide them the opportunity to record their neutral stance. A key characteristic of a Likert scale is that even though the statements vary in different items or indicators, the anchors ('strongly disagree' to 'strongly agree') remain the same. Likert scales are ordinal scales because the anchors are not necessarily equidistant, even though sometimes we treat them like interval scales.

NSOU ? PGSW-VII 111 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 5.8 Guttman scale Designed by Louis Guttman, this composite scale uses a series of items arranged in increasing order of intensity of the construct of interest, from least intense to most intense. What does that mean? Essentially, we would like a set of items or statements so that a respondent who agrees with any specific question in the list will also agree with all previous questions. Put more formally, we would like to be able to predict item responses perfectly knowing only the total score for the respondent The key to Guttman scaling is in the analysis. We construct a matrix or table that shows the responses of all the respondents on all of the items. We then sort this matrix so that respondents who agree with more statements are listed at the top and those agreeing with fewer are at the bottom. For respondents with the same number of agreements, we sort the statements from left to right from those that most agreed to to those that fewest agreed to. As an example, the construct 'attitude toward immigrants' can be measured using five items shown in the Table. Each item in the above Guttman scale has a weight (not indicated above) which varies with the intensity of that item, and the weighted combination of each response is used as an aggregate measure of an observation. How will you rate your opinions on the following statements about immigrants? Do you mind immigrants being citizens of your country? Yes No Do you mind immigrants living in your own neighbourhood? Yes No Would you mind living next door to an immigrant? Yes No Would you mind having an immigrant as your close friend? Yes No Would you mind if someone in your family married an immigrant? Yes No 5.9 Reliability and Validity A measure can be reliable but not valid, if it is measuring something very consistently but is consistently measuring the wrong construct. Likewise, a measure can be valid but not reliable if it is measuring the right construct, but not doing so in a consistent manner. Using the analogy of a shooting target, as shown below, a multiple-item measure of a construct that is both reliable and valid consists of shots that clustered within a narrow range near the center of the target. A measure that is valid but not reliable will consist of shots centered on the target but not clustered within a narrow range, but rather scattered around the target. Finally, a

NSOU ? PGSW-VII 112 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 measure that is reliable but not valid will consist of shots clustered within a narrow range but off from the target. Hence, reliability and validity are both needed to assure adequate measurement of the constructs of interest. Fig. Comparison of reliability and validity Reliability Reliability is the degree to which the measure of a construct is consistent or dependable. In other words, if we use this scale to measure the same construct multiple times, do we get pretty much the same result every time, assuming the underlying phenomenon is not changing? An example of an unreliable measurement is people guessing your weight. Quite likely, people will guess differently, the different measures will be inconsistent, and therefore, the "guessing" technique of measurement is unreliable. A more reliable measurement may be to use a weight scale, where you are likely to get the same value every time you step on the scale, unless your weight has actually changed between measurements. Note that reliability implies consistency but not accuracy. In the previous example of the weight scale, if the weight scale is calibrated incorrectly (say, to shave off ten pounds from your true weight, just to make you feel better!), it will not measure your true weight and is therefore not a valid measure. Nevertheless, the miscalibrated weight scale will still give you the same weight every time (which is ten pounds less than your true weight), and hence the scale is reliable. What are the sources of unreliable observations in social science measurements? One of the primary sources is the observer's (or researcher's) subjectivity. If employee morale in a firm is measured by watching whether the employees smile at each other, whether they make jokes, and so forth, then different observers may infer different measures of morale Reliable and valid Valid but not reliable Reliable but not valid

NSOU ? PGSW-VII 113 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 if they are watching the employees on a very busy day (when they have no time to joke or chat) or a light day (when they are more jovial or chatty). Two observers may also infer different levels of morale on the same day, depending on what they view as a joke and what is not. "Observation" is a qualitative measurement technique. Sometimes, reliability may be improved by using quantitative measures, for instance, by counting the number of grievances filed over one month as a measure of (the inverse of) morale. Of course, grievances may or may not be a valid measure of morale, but it is less subject to human subjectivity, and therefore more reliable. A second source of unreliable observation is asking imprecise or ambiguous questions. For instance, if you ask people what their salary is, different respondents may interpret this question differently as monthly salary, annual salary, or per hour wage, and hence, the resulting observations will likely be highly divergent and unreliable. A third source of unreliability is asking questions about issues that respondents are not very familiar about or care about, such as asking an American college graduate whether he/she is satisfied with Canada's relationship with Slovenia, or asking a Chief Executive Officer to rate the effectiveness of his company's technology strategy – something that he has likely delegated to a technology executive. So how can you create reliable measures? If your measurement involves soliciting information from others, as is the case with much of social science research, then you can start by replacing data collection techniques that depends more on researcher subjectivity (such as observations) with those that are less dependent on subjectivity (such as questionnaire), by asking only those questions that respondents may know the answer to or issues that they care about, by avoiding ambiguous items in your measures (e.g., by clearly stating whether you are looking for annual salary), and by simplifying the wording in your indicators so that they not misinterpreted by some respondents (e.g., by avoiding difficult words whose meanings they may not know). These strategies can improve the reliability of our measures, even though they will not necessarily make the measurements completely reliable. Measurement instruments must still be tested for reliability. There are many ways of estimating reliability, which are discussed next.

Inter-rater reliability. Inter-rater reliability, also called inter-observer reliability, is a measure of consistency between two or more independent raters (observers) of the same construct. Usually, this is assessed in a pilot study, and can be done in two ways, depending on the level of measurement of the construct. If the measure is categorical, a set of all categories is defined, raters check off which category each observation falls in, and the percentage of agreement between the raters is an estimate of inter-rater reliability. For instance, if there are two raters rating 100 observations into one of three possible categories, and their ratings match for 75% of the observations, then inter-rater reliability is 0.75. If the measure is interval or ratio scaled (e.g., classroom activity is being measured once every 5 minutes by two raters on 1 to 7 response scale), then a simple correlation between measures from the two raters can also serve as an estimate of inter-rater reliability.

Test-retest reliability. Test-retest reliability is a measure of consistency between two measurements (tests) of the same construct administered to the same sample at two different points in time. If the observations have not changed substantially between the two tests, then the measure is reliable. The correlation in observations between the two tests is an estimate of test-retest reliability. Note here that the time interval between the two tests is critical. Generally, the longer is the time gap, the greater is the chance that the two observations may change during this time (due to random error), and the lower will be the test-retest reliability.

Split-half reliability. Split-half reliability is a measure of consistency between two halves of a construct measure. For instance, if you have a ten-item measure of a given construct, randomly split those ten items into two sets of five (unequal halves are allowed if the total number of items is odd), and administer the entire instrument to a sample of respondents. Then, calculate the total score for each half for each respondent, and the correlation between the total scores in each half is a measure of split-half reliability. The longer is the instrument, the more likely it is that the two halves of the measure will be similar (since random errors are minimized as more items are added), and hence, this technique tends to systematically overestimate the reliability of longer instruments.

Internal consistency reliability. Internal consistency reliability is a measure of consistency between different items of the same construct. If a multiple-item construct measure is administered to respondents, the extent to which respondents rate those items in a similar manner is a reflection of internal consistency. This reliability can be estimated in terms of average inter-item correlation, average item-to-total correlation, or more commonly, Cronbach's alpha. Validity, often called construct validity, refers to the extent to which a measure adequately represents the underlying construct that it is supposed to measure. For instance, is a measure of compassion really measuring compassion, and not measuring a different

NSOU ? PGSW-VII 115 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 construct such as empathy? Validity can be assessed using theoretical or empirical approaches, and should ideally be measured using both approaches. Theoretical assessment of validity focuses on how well the idea of a theoretical construct is translated into or represented in an operational measure. This type of validity is called translational validity (or representational validity), and consists of two subtypes: face and content validity. Translational validity is typically assessed using a panel of expert judges, who rate each item (indicator) on how well they fit the conceptual definition of that construct, and a qualitative technique called Q-sort. Empirical assessment of validity examines how well a given measure relates to one or more external criterion, based on empirical observations. This type of validity is called criterion-related validity, which includes four sub-types: convergent, discriminant, concurrent, and predictive validity. While translation validity examines whether a measure is a good reflection of its underlying construct, criterion-related validity examines whether a given measure behaves the way it should, given the theory of that construct. This assessment is based on quantitative analysis of observed data using statistical techniques such as correlational analysis, factor analysis, and so forth. The distinction between theoretical and empirical assessment of validity is illustrated in Figure 7.2. However, both approaches are needed to adequately ensure the validity of measures in social science research. Note that the different types of validity discussed here refer to the validity of the measurement procedures, which is distinct from the validity of hypotheses testing procedures, such as internal validity (causality), external validity (generalizability), or statistical conclusion validity. The latter types of validity are discussed in a later chapter. Face validity. Face validity refers to whether an indicator seems to be a reasonable measure of its underlying construct "on its face". For instance, the frequency of one's attendance at religious services seems to make sense as an indication of a person's religiosity without a lot of explanation. Hence this indicator has face validity. However, if we were to suggest how many books were checked out of an office library as a measure of employee morale, then such a measure would probably lack face validity because it does not seem to make much sense. Interestingly, some of the popular measures used in organizational research appears to lack face validity. For instance, absorptive capacity of an organization (how much new knowledge can it assimilate for improving organizational processes) has often been measured as research and development intensity (i.e., R&D expenses divided by gross revenues)! If your research includes constructs that are highly

NSOU ? PGSW-VII 116 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 abstract or constructs that are hard to conceptually separate from each other (e.g., compassion and empathy), it may be worthwhile to consider using a panel of experts to evaluate the face validity of your construct measures. Fig. : Two approaches of validity assessment Content validity. Content validity is an assessment of how well a set of scale items matches with the relevant content domain of the construct that it is trying to measure. For instance, if you want to measure the construct "satisfaction with restaurant service," and you define the content domain of restaurant service as including the quality of food, courtesy of wait staff, duration of wait, and the overall ambience of the restaurant (i.e., whether it is noisy, smoky, etc.), then for adequate content validity, this construct should be measured using indicators that examine the extent to which a restaurant patron is satisfied with the quality of food, courtesy of wait staff, the length of wait, and the restaurant's ambience. Of course, this approach requires a detailed description of the entire content domain of a construct, which may be difficult for complex constructs such as self-esteem or intelligence. Hence, it may not be always possible to adequately assess content validity. As with face validity, an expert panel of judges may be employed to examine content validity of constructs. Convergent validity refers to the closeness with which a measure relates to (or converges on) the construct that it is purported to measure, and discriminant validity refers to the degree to which a measure does not measure (or discriminates from) other constructs that it is not supposed to measure. Usually, convergent validity and discriminant Theories/ideas Conceptualize Valid Measures Statistical Analysis Observations Theoretical Realm Empirical realm

NSOU ? PGSW-VII 117 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 validity are assessed jointly for a set of related constructs. For instance, if you expect that an organization's knowledge is related to its performance, how can you assure that your measure of organizational knowledge is indeed measuring organizational knowledge (for convergent validity) and not organizational performance (for discriminant validity)? Convergent validity can be established by comparing the observed values of one indicator of one construct with that of other indicators of the same construct and demonstrating similarity (or high correlation) between values of these indicators. Discriminant validity is established by demonstrating that indicators of one construct are dissimilar from (i.e., have low correlation with) other constructs. In the above example, if we have a three-item measure of organizational knowledge and three more items for organizational performance, based on observed sample data, we can compute bivariate correlations between each pair of knowledge and performance items. If this correlation matrix shows high correlations within items of the organizational knowledge and organizational performance constructs, but low correlations between items of these constructs, then we have simultaneously demonstrated convergent and discriminant validity. Criterion-related validity can also be assessed based on whether a given measure relate well with a current or future criterion, which are respectively called concurrent and predictive validity. Predictive validity is the degree to which a measure successfully predicts a future outcome that it is theoretically expected to predict. For instance, can standardized test scores (e.g., Scholastic Aptitude Test scores) correctly predict the academic success in college (e.g., as measured by college grade point average)? Assessing such validity requires creation of a "nomological network" showing how constructs are theoretically related to each other. Concurrent validity examines how well one measure relates to other concrete criterion that is presumed to occur simultaneously. For instance, do students' scores in a calculus class correlate well with their scores in a linear algebra class? These scores should be related concurrently because they are both tests of mathematics. Unlike convergent and discriminant validity, concurrent and predictive validity is frequently ignored in empirical social science research. 5.10 Conclusion ?

Objectives By the end of this chapter, you will be able to 1. Describe

the limited but crucial role of statistics in social research. 2. Distinguish between different components of statistics and identify situations in which each is appropriate. 3. Construct and analyse frequency distributions for both quantitative and qualitative variables. 4. Construct and analyse bar and pie charts, histograms, and line graphs. 6.1 Introduction Students sometimes wonder about the value of studying statistics. What, after all, do numbers and statistics have to do with understanding people and society? The value of statistics will become clear as we move from chapter to chapter but, for now, we can 119

NSOU ? PGSW-VII 120 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 demonstrate the importance of statistics by considering research. Scientists conduct research to answer questions, examine ideas, and test theories. Research is a disciplined inquiry that can take numerous forms. Statistics are relevant for quantitative research projects, or projects that collect information in the form of numbers or data. Statistics, then, are a set of mathematical techniques used by social scientists to organize and manipulate data for the purpose of answering questions and testing theories. Research results do not speak for themselves. They must be organized and manipulated so that whatever meaning they have can be quickly and easily understood by the researcher and by his or her readers. Researchers use statistics to clarify their results and communicate effectively. In this unit, we consider some commonly used techniques for presenting research results, including percentages, rates, tables, and graphs. These univariate descriptive statistics are not mathematically complex (although they are not as simple as they might seem at first glance), but they are extremely useful for presenting research results clearly and concisely.

6.2 Definition of Statistics, its Components and its Role in Social Research:

Recent years have seen a dramatic increase in the use of statistical methods by social scientists, whether they work in academia, government, or the private sector. Social scientists study their topics of interest, such as analysing how well a program works or investigating the factors associated with beliefs and opinions of certain types, by analysing quantitative evidence provided by data. The growth of the Internet and computing power has resulted in an increase in the amount of readily available quantitative information. At the same time, the evolution of new statistical methodology and software makes new methods available that can more realistically address the questions that social scientists seek to answer. You already have a sense of what the word statistics means. You hear statistics quoted about sports events (number of points scored by each player on a basketball team), statistics about the economy (median income, unemployment rate), and statistics about opinions, beliefs, and behaviours (percentage of students who indulge in binge drinking). In this sense, a statistic is merely a number calculated from data. But statistics as a field can

NSOU ? PGSW-VII 121 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 be broadly viewed as a way of thinking about data and quantifying uncertainty, not a maze of numbers and messy formulas.

Definition.

Statistics is the art and science of designing studies and analysing the data that those studies produce. Its ultimate goal is translating data into knowledge and understanding of the world around us. In short, statistics is the art and science of learning from data. Statistical methods help us investigate questions in an objective manner. Statistical problem solving is an investigative process that involves four components: (1) formulate a statistical question, (2) collect data, (3) analyse data, and (4) interpret results. There are the three main components of statistics for answering a statistical question: ? Design: Planning how to obtain data to answer the questions of interest ? Description: Summarizing and analysing the data that are obtained ? Inference: Making decisions and predictions based on the data for answering the statistical question. Design refers to planning how to obtain data that will efficiently shed light on the problem of interest. How could you conduct an experiment to determine reliably whether regular large doses of vitamin C are beneficial? In marketing, how do you select the people to survey so you'll get data that provide good predictions about future sales? Description means exploring and summarizing patterns in the data. Files of raw data are often huge. For example, over time the General Social Survey has collected data about hundreds of characteristics on many thousands of people. Such raw data are not easy to assess—we simply get bogged down in numbers. It is more informative to use a few numbers or a graph to summarize the data, such as an average amount of TV watched or a graph displaying how number of hours of TV watched per day relates to number of hours per week exercising. Inference means making decisions or predictions based on the data. Usually, the decision or prediction refers to a larger group of people, not merely those in the study. For instance, in elections, television networks often declare the winner well before all the votes have been counted. They do this using exit polling, interviewing voters after they leave the voting booth. Using an exit poll, a network can often predict the winner after learning how several thousand people voted, out of possibly millions of voters.

NSOU ? PGSW-VII 122 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 The 2010 California gubernatorial race pitted Democratic candidate Jerry Brown against Republican candidate Meg Whitman. In the exit poll of 3889 voters sampled, 53.1% said they voted for Jerry Brown. Using these data, we can predict (infer) that a majority of the 9.5 million voters voted for him. Stating the percentages for the sample of 3889 voters is description, while predicting the outcome for all 9.5 million voters is inference. Statistical description and inference are complementary ways of analysing data. Statistical description provides useful summaries and helps you find patterns in the data, while inference helps you make predictions and decide whether observed patterns are meaningful. You can use both to investigate questions that are important to society. For instance, "Has there been global warming over the past decade?" "Is having the death penalty available for punishment associated with a reduction in violent crime?" "Does student performance in school depend on the amount of money spent per student, the size of the classes, or the teachers' salaries?" Despite its importance and usefulness, the science of statistics is looked upon with suspicion. Quite often it is discredited, by people who do not know its real purpose and limitations. We often hear statements such as: "There are three types of lies: lies, damned lies, and statistics". "Statistics can prove anything". "Statistics cannot prove anything". "Statistics are lies of the first order". These are expressions of distrust in statistics. By distrust of statistics, we mean lack of confidence in statistical data, statistical methods and the conclusions drawn. You may ask, why distrust in statistics? Some of the important reasons for distrust in statistics are as follows: ? Arguments based upon data are more convincing. But data can be manipulated according to wishes of an individual. To prove a particular point of view, sometimes arguments are supported by inaccurate data. ? Even if correct figures are used, they may be incomplete and presented in such a manner that the reader is misled. Suppose, it has been found that the number of traffic accidents is lower in foggy weather than on clear weather days. It may be concluded that it is safer to drive in fog. The conclusion drawn is wrong. To arrive at a valid conclusion, we must take into account the difference between the rush of traffic under the two weather conditions.

NSOU ? PGSW-VII 123 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 ? Statistical data does not bear on their face the label of their quality. Sometimes even unintentionally inaccurate or incomplete data is used leading to faulty conclusions. ? The statistical tools have their own limitations. The investigator must use them with precaution. But sometimes these tools or methods are handled by those who have little or no knowledge about them. As a result, by applying wrong methods to even correct and complete data, faulty conclusions may be obtained. This is not the fault of statistical methods, but of the persons who use them. 2. Displaying and Describing Categorical Data What happened on the Titanic at 11:40 on the night of April 14, 1912, is well-known. Frederick Fleet's cry of Iceberg, right ahead and the three accompanying pulls of the crow's nest bell signalled the beginning of a nightmare that has become legend. By 2:15 a.m., the Titanic, thought by many to be unsinkable, had sunk, leaving more than 1500 passengers and crew members on board to meet their icy fate. Here are some data about the passengers and crew aboard the Titanic. Each case (row) of the data table represents a person on board the ship. The variables are the person's Survival (Dead or Alive) and the person's Age (Adult or Child), Sex (Male or Female), and ticket Class (First, Second, Third, or Crew), etc. Table 1: Part of a data table showing four variables for nine people aboard the Titanic

NSOU ? PGSW-VII 124 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 The problem with a data table like this and in fact with all data tables is that you can't see what's going on. And seeing is just what we want to do. We need ways to show the data so that we can see patterns, relationships, trends, and exceptions. Frequency Tables: Making Piles To make a picture of data, the first thing we have to do is to make piles. Making piles is the beginning of understanding about data. We pile together things that seem to go together, so we can see how the cases distribute across different categories. For categorical data, piling is easy. We just count the number of cases corresponding to each category and pile them up. One way to put all 2201 people on the Titanic into piles is by ticket Class, counting up how many had each kind of ticket. We can organize these counts into a frequency table, which records the totals and the category names. Even when we have thousands of cases, a variable like ticket Class, with only a few categories, has a frequency table that's easy to read. A frequency table with dozens or hundreds of categories would be much harder to read. We use the names of the categories to label each row in the frequency table. For ticket Class, these are First, Second, Third, and Crew. Counts are useful, but sometimes we want to know the fraction or proportion of the data in each category, so we divide the counts by the total number of cases. Usually, we multiply by 100 to express these proportions as percentages. A relative frequency table displays the percentages, rather than the counts, of the values in each category. Both types of tables show how the cases are distributed across the categories. In this way, they describe the distribution of a categorical variable because they name the possible categories and tell how frequently each occurs. Class Count Class % First 325 First 14.77 Second 285 Second 12.95 Third 706 Third 32.08 Crew 885 Crew 40.21 Table2: A frequency table of for the Titanic Table 3: A relative frequency passengers The Area Principle table for the same data The best data displays observe a fundamental principle of graphing data called the area principle. The area principle says that the area occupied by a part of the graph should correspond to the magnitude of the value it represents. Violations of the area principle are a common way to lie (or, since most mistakes are unintentional, we should say err) with Statistics.

NSOU ? PGSW-VII 125 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 FIGURE: How many people were in each class on the Titanic? From this display, it looks as though the service must have been great, since most aboard were crew members. Although the length of each ship here corresponds to the correct number, the impression is all wrong. In fact, only about 40% were crew. 6.3 Bar Charts A bar chart displays the distribution of a categorical variable, showing the counts for each category next to each other for easy comparison. Bar charts should have small spaces between the bars to indicate that these are freestanding bars that could be rearranged into any order. The bars are lined up along a common base.

NSOU ? PGSW-VII 126 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 FIGURE: People on the Titanic by Ticket Class With the area principle satisfied, we can see the true distribution more clearly Here's a chart that obeys the area principle. It's not as visually entertaining as the ships, but it does give an accurate visual impression of the distribution. The height of each bar shows the count for its category. The bars are the same width, so their heights determine their areas, and the areas are proportional to the counts in each class. Now it's easy to see that the majority of people on board were not crew, as the ships picture led us to believe. We can also see that there were about 3 times as many crews as second-class passengers. And there were more than twice as many third-class passengers as either first or second-class passengers, something you may have missed in the frequency table. Bar charts make these kinds of comparisons easy and natural. If we really want to draw attention to the relative proportion of passengers falling into each of these classes, we could replace the counts with percentages and use a relative frequency bar chart. 1000 800 600 400 200 0 First Second Third Crew Class

NSOU ? PGSW-VII 127 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 FIGURE: The relative frequency bar chart looks the same as the bar chart, but shows the proportion of people in each category rather than the counts Contingency Tables To look at two categorical variables together, we often arrange the counts in a two- way table. Here is a two-way table of those aboard the Titanic, classified according to the class of ticket and whether the ticket holder survived or didn't. Because the table shows how the individuals are distributed along each variable, contingent on the value of the other variable, such a table is called a contingency table. Table: Contingency table of ticket Class and Survival. The bottom line of Totals is the same as the previous frequency table. 40% 30% 20% 10% 0 First Second Third Crew Class Class Survival

NSOU ? PGSW-VII 128 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 The margins of the table, both on the right and at the bottom, give totals. The bottom line of the table is just the frequency distribution of ticket Class. The right column of the table is the frequency distribution of the variable Survival. When presented like this, in the margins of a contingency table, the frequency distribution of one of the variables is called its marginal distribution. Each cell of the table gives the count for a combination of values of the two variables. If you look down the column for second-class passengers to the first cell, you can see that 118 second-class passengers survived. Looking at the third-class passengers, you can see that more third-class passengers (178) survived. Were second-class passengers more likely to survive? Questions like this are easier to address by using percentages. The 118 survivors in second class were 41.4% of the total 285 second-class passengers, while the 178 surviving third-class passengers were only 25.2% of that class's total. We know that 118 second-class passengers survived. We could display this number as a percentage, but as a percentage of what? The total number of passengers? (118 is 5.4% of the total, 2201.) The number of second-class passengers? (118 is 41.4% of the 285 second-class passengers.) The number of survivors? (118 is 16.6% of the 711 survivors.) All of these are possibilities, and all are potentially useful or interesting. You'll probably wind-up calculating (or letting your technology calculate) lots of percentages. Most statistics programs offer a choice of total percent, row percent, or column percent for contingency tables. Unfortunately, they often put them all together with several numbers in each cell of the table. The resulting table holds lots of information, but it can be hard to understand:

NSOU ? PGSW-VII 129 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 To simplify the table, let's first pull out the percent of table values: These percentages tell us what percent of all passengers belong to each combination of column and row category. For example, we see that although 8.1% of the people aboard the Titanic were surviving third-class ticket holders, only 5.4% were surviving second-class ticket holders. Conditional Distribution The more interesting questions are contingent. We'd like to know, for example, what percentage of second-class passengers survived and how that compares with the survival rate for third-class passengers. It's more interesting to ask whether the chance of surviving the Titanic sinking depended on ticket class. We can look at this question in two ways. First, we could ask how the distribution of ticket Class changes between survivors and non-survivors. To do that, we look at the row percentages:

NSOU ? PGSW-VII 130 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 By focusing on each row separately, we see the distribution of class under the condition of surviving or not. The sum of the percentages in each row is 100%, and we divide that up by ticket class. In effect, we temporarily restrict the Who first to survivors and make a pie chart for them. Then we refocus the Who on the non-survivors and make their pie chart. These pie charts show the distribution of ticket classes for each row of the table: survivors and non-survivors. The distributions we create this way are called conditional distributions, because they show the distribution of one variable for just those cases that satisfy a condition on another variable. But we can also turn the question around. We can look at the distribution of Survival for each category of ticket Class. To do this, we look at the column percentages. Those show us whether the chance of surviving was roughly the same for each of the four classes. Now the percentages in each column add to 100%, because we've restricted the Who, in turn, to each of the four ticket classes: Looking at how the percentages change across each row, it sure looks like ticket class mattered in whether a passenger survived. To make it more vivid, we could show the distribution of Survival for each ticket class in a display. Here's a side-by-side bar chart showing percentages of surviving and not for each category:

NSOU ? PGSW-VII 131 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 Figure: Side-by-side bar chart showing the conditional distribution of Survival for each category of ticket Class. The corresponding pie charts would have only two categories in each of four pies, so, bar charts seem the better alternative. Segmented Bar Charts: We could display the Titanic information by dividing up bars rather than circles. The resulting segmented bar chart treats each bar as the whole and divides it proportionally into segments corresponding to the percentage in each group. We can clearly see that the distributions of ticket Class are different, indicating again that survival was not independent of ticket Class.

NSOU ? PGSW-VII 132 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 FIGURE: A segmented bar chart for Class by Survival Notice that although the totals for survivors and non-survivors are quite different, the bars are the same height because we have converted the numbers to percentages. 6.4 Pie Diagram A pie chart is a circular graph which is used to represent the total value with its components. The area of a circle represents the total values and the different sectors of the circle represents the different component parts. The circle is divided into sectors by radii and the areas of the sectors are proportional to the angles at the centre. In a pie chart the data are expressed as percentage. Each component is expressed as a percentage of the total value. 100% is represented by 360° angles at the centre of the circle, and hence 1% is represented by 3.6° angle. If P be the percentage of a certain component, the angle which represents the percentage of such component is (3.6° × P) degrees. A pie chart is used to show comparison between different components, and between components and the total value. A pie chart is also known as a Circular Chart. Example: Draw a pie chart to represent the following data on the proposed outlay during the Fourth Five Year Plan:

NSOU ? PGSW-VII 134 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 NOTE: Pie charts display all the cases as a circle whose slices have areas proportional to each category's fraction of the whole. Pie charts give a quick impression of the distribution. Because we're used to cutting up pies into 2, 4, or 8 pieces, pie charts are particularly good for seeing relative frequencies near 1/2, 1/4, or 1/8. Bar charts are almost always better than pie charts for comparing the relative frequencies of categories. Pie charts are widely understood and colourful, and they often appear in but the following figures show why statisticians prefer bar charts. Figure: Pie charts may be attractive, but it can be hard to see patterns in them. Can you discern the differences in distributions depicted by these pie charts? Figure: Bar charts of the same values as shown in figure above make it much easier to compare frequencies in groups.

NSOU ? PGSW-VII 135 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 3. Displaying a Quantitative Variable The production manager of the Dalmon Carpet Company is responsible for the output of over 500 carpet looms. So that he does not have to measure the daily output (in yards) of each loom, he samples the output from 30 looms each day and draws a conclusion as to the average carpet production of the entire 500 looms. The table below shows the yards produced by each of the 30 looms in yesterday's sample. These production amounts are the raw data from which the production manager can draw conclusions about the entire population of looms yesterday. 16.2 15.4 16.0 16.6 15.9 15.8 16.0 16.8 16.9 16.8 15.7 16.4 15.2 15.8 15.9 16.1 15.6 15.9 15.6 16.0 16.4 15.8 15.7 16.2 15.6 15.9 16.3 16.3 16.0 16.3 ARRANGING DATA USING THE DATA ARRAY AND THE FREQUENCY DISTRIBUTION The data array is one of the simplest ways to present data. It arranges values in ascending or descending order. First table repeats the carpet data from our chapter- opening problem, and second table rearranges these numbers in a data array in ascending order. 16.2 15.8 15.8 15.8 16.3 15.6 15.7 16.0 16.2 16.1 16.8 16.0 16.4 15.2 15.9 15.9 15.9 16.8 15.4 15.7 15.9 16.0 16.3 16.0 16.4 16.6 15.6 15.6 16.9 16.3 TABLE: SAMPLE OF DAILY PRODUCTION IN YARDS OF 30 CARPET LOOMS 15.2 15.7 15.9 16.0 16.2 16.4 15.4 15.7 15.9 16.0 16.3 16.6 15.6 15.8 15.9 16.0 16.3 16.8 15.6 15.8 15.9 16.1 16.3 16.8 15.6 15.8 16.0 16.2 16.4 16.9 TABLE: DATA ARRAY OF DAILY PRODUCTION IN YARDS OF 30 CARPET LOOMS

NSOU ? PGSW-VII 136 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 Data arrays offer several advantages over raw data: 1. We can quickly notice the lowest and highest values in the data. In our carpet example, the range is from 15.2 to 16.9 yards. 2. We can easily divide the data into sections. In the second table, the first 15 values (the lower half of the data) are between 15.2 and 16.0 yards, and the last 15 values (the upper half) are between 16.0 and 16.9 yards. Similarly, the lowest third of the values range from 15.2 to 15.8 yards, the middle third from 15.9 to 16.2 yards, and the upper third from 16.2 to 16.9 yards. 3. We can see whether any values appear more than once in the array. Equal values appear together. The second table shows that nine levels occurred more than once when the sample of 30 looms was taken. 4. We can observe the distance between succeeding values in the data. In the second table, 16.6 and 16.8 are succeeding values. The distance between them is 0.2 yards (16.8–16.6). In spite of these advantages, sometimes a data array isn't helpful. Because it lists every observation, it is a cumbersome form for displaying large quantities of data. We need to compress the information and still be able to use it for interpretation and decision making. How can we do this? A Better Way to Arrange Data: The Frequency Distribution One way we can compress data is to use a frequency table or a frequency distribution. A frequency distribution is a table that organizes data into classes, that is, into groups of values describing one characteristic of the data. A frequency distribution shows the number of observations from the data set that fall into each of the classes. If you can determine the frequency with which values occur in each class of a data set, you can construct a frequency distribution. CONSTRUCTING A FREQUENCY DISTRIBUTION: 1. Decide on the type and number of classes for dividing the data. In this case, we have already chosen to classify the data by the quantitative measure of the number of yards produced rather than by a qualitative attribute such as colour or pattern. Next, we need to decide how many different classes to use and the range each class should cover. The range must be divided by equal classes; that is, the width of the interval from the beginning of one class to the beginning of the next class must be the same for every class. If we choose a width of 0.5 yard for each class in our distribution, the classes will be those shown in table below:

NSOU ? PGSW-VII 137 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 TABLE: DAILY PRODUCTION IN A SAMPLE OF 30 CARPET LOOMS WITH 0.5-YARDCLASS INTERVALS

Class in Yards	Frequency	Relative Frequency
15.1–15.5	2	2/30 = 0.067
15.6–16.0	16	16/30 = 0.533
16.1–16.5	8	8/30 = 0.267
16.6–17.0	4	4/30 = 0.133
Total	30	1

Note: A relative frequency distribution presents frequencies in terms of fractions or percentages. The number of classes depends on the number of data points and the range of the data collected. The more data points or the wider the range of the data, the more classes it takes to divide the data. Of course, if we have only 10 data points, it is senseless to have as many as 10 classes. As a rule, statisticians rarely use fewer than 6 or more than 15 classes. Because we need to make the class intervals of equal size, the number of classes determines the width of each class. To find the intervals, we can use this equation: Width of class intervals = (Next unit value after largest value in data – Smallest value in data)/Total number of class intervals We must use the next value of the same units because we are measuring the interval between the first value of one class and the first value of the next class. In our carpet-loom study, the last value is 16.9, so 17.0 is the next value. We shall use six classes in this example, so the width of each class will be: (Next unit value after largest value in data – Smallest value in data) ÷ Total number of class intervals. = (17.0 – 15.2)/6 = 1.8/6 = 0.3 yd ← 0. width of class intervals Step 1 is now complete. We have decided to classify the data by the quantitative measure of how many yards of carpet were produced. We have chosen 6 classes to cover the range of 15.2 to 16.9 and, as a result, will use 0.3 yard as the width of our class intervals.

NSOU ? PGSW-VII 138 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 2. Sort the data points into classes and count the number of points in each class. This we have done in table below. Every data point fits into at least one class, and no data point fits into more than one class. Therefore, our classes are all-inclusive and mutually exclusive. Notice that the lower boundary of the first class corresponds with the smallest data point in our sample, and upper boundary of the last class corresponds with the largest data point. 3. Illustrate the data in a chart. These three steps enable us to arrange the data in both tabular and graphic form. In this case, our information is displayed in table and in figure below. These two frequency distributions omit some of the detail contained in the raw data of Table mentioned above, but they make it easier for us to notice patterns in the data. One obvious characteristic, for example, is that the class 15.8–16.0 contains the most elements; class 15.2–15.4, the fewest. Class Frequency Relative Frequency 15.2–15.4 2 2/30 = 0.067 15.5–15.7 5 5/30 = 0.167 15.8–16.0 11 11/30 = 0.367 16.1–16.3 6 6/30 = 0.200 16.4–16.6 3 3/30 = 0.100 16.7–16.9 3 3/30 = 0.100 30 1.000

NSOU ? PGSW-VII 139 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 6.5 Histograms How can we make a bar chart for a quantitative variable? We can't, because quantitative variables don't have categories. Instead, we make a histogram. Histograms and bar charts both use bars, but they are fundamentally different. The bars of a bar chart display the count for each category, so they could be arranged in any order (and should be displayed with a space between them). The horizontal axis of a bar chart just names the categories. The horizontal axis of a histogram shows the values of the variable in order. A histogram slices up that axis into equal-width bins, and the bars show the counts for each bin. Now gaps are meaningful; they show regions with no observations. Figure below shows a histogram of the ages of those aboard the Titanic. In this histogram, each bin has a width of 5 years, so, for example, the height of the tallest bar shows that the most populous age group was the 20- to 24-year-olds, with over 400 people. The youngest passengers were infants, and the oldest was more than 70 years old. The fact that there are fewer and fewer people in the 5-year bins from age 25 on probably doesn't surprise you either. After all, there are increasingly fewer people of advancing age in the general population as well, and there were no very elderly people on board the Titanic. But the bins on the left are a little strange. It looks like there were more infants and toddlers (0–5 years old) than there were preteens.

NSOU ? PGSW-VII 140 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 The frequency table is easier to interpret than the raw data, but it is still hard to get an overall impression of the data from it. The histogram is an excellent tool for studying the distribution of a list of quantitative measurements. A histogram is a way of visualizing a frequency table graphically—of making a picture from a frequency table. The fraction of data in each class interval is represented by a rectangle (bin) whose base is the class interval and whose area is the fraction of data (relative frequency of data) that fall in the class interval: $\frac{\text{\#observations in the class interval}}{\text{total number of observations}}$ = fraction of data in class interval = $\frac{\text{area of bin}}{\text{width of class interval}}$ The key to a histogram is that it is the area of the bin, not the height of the bin, that represents the relative frequency of data in the bin. The area of the bin is proportional to the relative frequency of observations in the class interval. The horizontal axis of a

NSOU ? PGSW-VII 141 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 histogram needs a scale with units. The vertical axis of a histogram always has units of percent per unit of the horizontal axis, so that the areas of bins have units of (horizontal units) \times (percent per horizontal unit) = percent. The scale of the vertical axis is automatically imposed by the fact that the total area of the histogram must be 100% (100% of the data fall somewhere on the plot). The vertical scale is called a density scale. The height of a bin is the density of observations in the bin: the percentage of observations in the bin per unit of the horizontal axis. Typically, it is not the percentage of observations in the bin. A histogram is not the same as a bar chart: In a bar chart, the height of a rectangle (bar), rather than the area of the bar, indicates the relative frequency of observations. The width of the bar does not matter; it does not even need to have units. This makes bar charts especially useful for displaying categorical and qualitative data, where the horizontal axis does not have a scale—it is just a way to separate groups. Histograms are more appropriate for quantitative data. • Example: A distribution table Annual incomes of U.S. adults in 2010

Income (Thousands of dollars)	Percent
0 – 10	20
10 – 25	28
25 – 50	27
50 – 100	18
100 – 150	7

Where are the people who earned exactly \$25,000: in 10-25 or 25-50? Endpoint convention: Intervals include the left end-point but not the right. • Total percent = 100% • Did nobody make \$150,000 or more? Yes, but they are such a small percent that they have been “swept in” just below \$150,000.

NSOU ? PGSW-VII 142 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 • Something like a bar graph? • Want to draw a diagram analogous to a bar graph, to show how the incomes are distributed. • Want income on the horizontal axis, and vertical rectangular bars. Can't simply use the percents as the heights of the bars, because the widths of the bars are unequal. • Area = percent • How tall should the bars be? • 20% of the people are in the 0-to-10-thousand-dollar interval. • Main idea: area of the bar = percent in the interval • area of bar over the 0–10-thousand-dollar interval = 20% = height of bar \times width of bar = height \times 10 thousand dollars • height of bar \times 10 thousand dollars = 20% • height of bar = 20% / (10 thousand dollars) = 2% per thousand dollars Formula for height: height of bar = % in interval / width of interval = % in interval / (right endpoint – left endpoint) The distribution table, along with the heights of the bars

Income (thousands of dollars)	Height (% per thousand dollars)
0 – 10	20/10 = 2:00
10 – 25	28/15 = 1:87
25 – 50	27/25 = 1:08
50 – 100	18/50 = 0:36
100 – 150	7/50 = 0:14

NSOU ? PGSW-VII 143 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 A histogram What do the heights measure? • The 10-25 bar has more people than the 0-10 bar (28% versus 20%). Its area is greater. • But it is shorter than the 0-10 bar. So, heights do not measure “percent of people.” Areas measure that. • Heights measure “percent of people per unit on the horizontal axis”. That's density, or crowdedness in the interval. The 10-25 bar has more people than the 0-10 bar, but it is less crowded. Height and crowdedness units: percent per thousand dollars

Income (thousands of dollars)	Height (% per thousands)
0 – 10	20 = 2:00
10 – 25	28 = 1:87
25 – 50	27 = 1:08
50 – 100	18 = 0:36
100 – 150	7 = 0:14

NSOU ? PGSW-VII 144 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 Assuming that the people are uniformly distributed within the bars, ? about 2% have incomes in the range \$5,000 to \$6,000 ? about 4% have incomes in the range \$5,000 to \$7,000 ? about 1.87% have incomes in the range \$14,000 to \$15,000 Under the assumption of uniformity within bars, % In a subinterval = height of bar \times width of subinterval Histogram: summary A histogram shows how a quantitative variable is distributed over all its values. ? Allows for the variable to be “binned” into unequal intervals ? Horizontal axis must be drawn to scale ? Areas represent percents height = %/width ? Units of height: % per unit on the horizontal axis Time Plots: Displaying Data over Time For some variables, observations occur over time. Examples include the daily closing price of a stock and the population of a country measured every decade in a census. A data set collected over time is called a time series. We can display time-series data graphically using a time plot. This charts each observation, on the vertical scale, against the time it was measured, on the horizontal scale. A common pattern to look for is a trend over time, indicating a tendency of the data to either rise or fall. To see a trend more clearly, it is beneficial to connect the data points in their time sequence. Example: Is whooping cough close to being eradicated? In the first half of the 20th century, whooping cough was a frequently occurring bacterial infection that often resulted in death, especially among young children. A vaccination for whooping cough was developed in the 1940s. How effective has the vaccination been in eradicating whooping cough? One measure to consider is the incidence rate (number of infected individuals per 100,000 population) in the United States. The table shows incidence rates from 1925– 1970.

NSOU ? PGSW-VII 145 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 Incidence Rates for Whooping Cough, 1925-1970 Year Rate per 1,00,000 1925 131.2 1930 135.6 1935 141.9 1940 139.6 1945 101 1950 80.1 1955 38.2 1960 8.3 1965 3.5 1970 2.1 Sketch a time plot. What type of trend do you observe? Based on the trend from 1945–1970, was the whooping cough vaccination proving effective in reducing the incidence of whooping cough? One can see in the time plot below that after an initial slight increase, there was a sharp and steady decrease in incidence of whooping cough starting around 1940. The decrease levelled off starting around 1960. These data suggest that the whooping cough vaccination was proving effective in reducing the incidence of whooping cough.

NSOU ? PGSW-VII 146 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U 1-6 (M-2) 3RD PROOF 27-09-2022 High Performance Bicycle Products Company in Chapel Hill, North Carolina, sampled its shipping records for a certain day with these results: Time from Receipt of Order to Delivery (in Days) 4 12 8 14 11 6 7 13 13 11 11 20 5 19 10 15 24 7 19 6 Construct a frequency distribution for these data and a relative frequency distribution. Use intervals of 6 days. (a) What statement can you make about the effectiveness of order processing from the frequency distribution? (b) If the company wants to ensure that half of its deliveries are made in 10 or fewer days, can you determine from the frequency distribution whether they have reached this goal? (c) What does a relative frequency distribution permit you to do with the data that is difficult to do with only a frequency distribution? Class 1–6 7–12 13–18 19–24 25–30 Frequency 4 8 4 3 1 Relative Frequency 0.2 0.4 0.2 0.15 0.05 (a) Assuming that the shop is open 6 days a week, we see that fully 80 percent of the orders are filled in 3 weeks or less. (b) We can tell only that between 20 percent and 60 percent of the deliveries are made in 10 or fewer days, so the distribution does not generate enough information to determine whether the goal has been met. (c) A relative frequency distribution lets us present frequencies as fractions or percentages. A relative frequency distribution presents frequencies in terms of fractions or percentages. 6.6 Conclusion This our learners got an idea about the various statistical representatives.

As you could imagine, very new set of data is filled with mystery. You have no idea what it contains. Will it tell us something odd, something interesting, or will it just confirm something we already knew? So when given a new set of data, where should we get started? How can we begin to feel comfortable with our new data set? Again, let's remember our data set is a collection of values. Some might be big, some might be small and individually these values are likely too much to handle, but we're hoping together all of these values will tell us a story. So what might be a good beginning to this story? Oddly enough for many, they like to start their story in the middle. With so many data 148

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 149 points, wouldn't it be nice to know the center of the data? It makes sense. Knowing the center of the data would seem to give us some balance. The bigger question is what do we mean by the center of the data? Again, let's take a look at these two small data sets. Both may have the same average, both have the same median values. Still, it might be that the data sets are vastly different. These data sets are small so we can quickly view all of the data and see the differences. What happens when the data sets are enormous? How can we measure the differences in data sets that might have very similar medians and means? Better yet, how can we get a better idea of what kind of data makes up this data set? When we measured mean and median, we were looking for the middle. Let's now measure how far out from the means and averages the farthest data points lie. Summarizing data can help us understand them, especially when the number of data is large. This chapter presents several ways to summarize quantitative data by a typical value (a measure of location, such as the mean, median, or mode) and a measure of how well the typical value represents the list (a measure of spread, such as the range, inter- quartile range, or standard deviation). 7.2 Measures of Central Tendency : The farthest one can reduce a set of data, and still retain any information at all, is to summarize the data with a single value. Measures of location do just that: They try to capture with a single number what is typical of the data. What single number is most representative of an entire list of numbers? We cannot say without defining "representative" more precisely. We will study three common measures of location: the mean, the median, and the mode. The mean, median and mode are all "most representative," but for different, related notions of representativeness. Mean The best-known and most frequently used measure of the center of a distribution of a quantitative variable is the mean. It is found by averaging the observations. Another popular measure is the median. Half the observations are smaller than it, and half are larger.

NSOU ? PGSW-VII 150 Median The median is the middle value of the observations when the observations are ordered from the smallest to the largest (or from the largest to the smallest). Example 1 : The sodium level in 20 breakfast cereals and saw various ways to graph the data. Let's return to those data and learn how to describe their center. The observations (in mg) are : 0, 340, 70, 140, 200, 180, 210, 150, 100, 130, 140, 180, 190, 160, 290, 50, 220, 180, 200, 210 a. Find the mean. b. Find the median. Solution : a. we find the mean by adding all the observations and then dividing this sum by the number of observations, which is 20 : Mean = $(0 + 340 + 70 + \dots + 210)/20 = 3340/20 = 167$. b. To find the median, we arrange the data from the smallest to the largest observation. 0, 50, 70, 100, 130, 140, 140, 150, 160, 180, 180, 180, 190, 200, 200, 210, 210, 220, 290, 340 For the 20 observations, the smaller 10 (on the first line) range from 0 to 180, and the larger 10 (on the second line) range from 180 to 340. The median is 180, which is the average of the two middle values, the tenth and eleventh observations, $(180 + 180)/2$. Note : The mean and median take different values. Why? The median measures the center by dividing the data into two equal parts, regardless of the actual numerical values above that point or below that point. The mean takes into account the actual numerical values of all the observations. Problem 1: The Energy Information Agency reported the CO₂ emissions from fossil fuel combustion for the seven countries in 2008 with the highest emissions. These values, reported as million metric tons of carbonequivalent, are 6534 (China), 5833 (United States), 1729 (Russia), 1495 (India), 1214 (Japan), 829 (Germany), and 574 (Canada). a. Find the mean and median. PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 151 b. The totals reported here do not take into account a nation's population size. Explain why it may be more sensible to analyze per capita values. Problem 2 : A list has 10 entries. Each entry is either 1 or 2 or 3. What must the list be if the average is 1? If the average is 3? Can the average be 4? Problem 3 : Ten people in a room have an average height of 5 feet 6 inches. An 11th person, who is 6 feet 5 inches tall, enters the room. Find the average height of all 11 people. Problem 4 : Twenty-one people in a room have an average height of 5 feet 6 inches. A 22nd person, who is 6 feet 5 inches tall, enters the room. Find the average height of all 22 people. Compare with exercise 3. Problem 5 : Twenty-one people in a room have an average height of 5 feet 6 inches. A 22nd person enters the room. How tall would he have to be to raise the average height by 1 inch? ? Mathematical formulation of Average : Variables are symbolized by letters near the end of the alphabet, most commonly x and y. The sample size is denoted by n. For a sample of n observations on a variable x, the mean is denoted by \bar{x} . Using the mathematical symbol Σ for "sum," the mean has the formula : ONE STEP AT A TIME Finding the Median Step Operation 1. Array the scores in order from high score to low score. 2. Count the number of scores to determine whether N is odd or even. IF N is ODD \downarrow 3. The median will be the score of the middle case. 4. To find the middle case, add 1 to N and divide by 2. 5. The value you calculated in step 4 is the number of the middle case. the median is the score of this case. For example, if N = 13, the median will be the score of the $(13 + 1)/2$, or seventh, case. IF N is EVEN \downarrow 3. The median is halfway between the scores of the two middle cases. 4. To find the first middle case, divide N by 2. 5. To find the second middle case, increase the value you computed in step 4 by 1. 6. Add the scores of the two middle cases together and divide by 2. The result is the median. For example, if N = 14, the median is the score halfway between the scores of the seventh and eighth cases. If the middle cases have the same score, that score is defined as the median. $\bar{x} = \Sigma x / n$ NSOU ? PGSW-VII 152 For instance, the cereal data set (in example 1) has n = 20 observations. $\bar{x} = \Sigma x/n = (0 + 340 + 70 + \dots + 210)/20 = 3340/20 = 167$. Some basic properties of the mean : ? The mean is the balance point of the data: If we were to place identical weights on a line representing where the observations occur, then the line would balance by placing a fulcrum at the mean. ? For a skewed distribution, the mean is pulled in the direction of the longer tail, relative to the median. ? The mean can be highly influenced by an outlier, which is an unusually small or unusually large observation. Note : An outlier is an observation that falls well above or well below the overall bulk of the data. Outliers typically call for further investigation to see, for example, whether they resulted from an error in data entry or from some surprising or unusual occurrence. Example 2 : Consider the following three sets of observations : Set 1 : 8, 9, 10, 11, 12 Set 2 : 8, 9, 10, 11, 100 Set 3 : 8, 9, 10, 11, 1000 a. Find the median for each data set. b. Find the mean for each data set. c. What do these data sets illustrate about the resistance of the median and mean? Solution : a. The median for all three data sets is ten. The values for all three sets of observation are already arranged in numerical order, and the middle number for each is 10. b. WE know, $\bar{x} = \Sigma x/n$. The Fulcrum Shows the Mean of the Central Sodium Data 0 50 100 150 200 250 300 350 = 167 PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 153 Thus, set 1 : $= (8+9+10+11+12)/5 = 10$. set 2 : $= (8+9+10+11+100)/5 = 27.6$ set 3 : $= (8+9+10+11+1000)/5 = 207.6$ c. As the highest values become more and more of an extreme outlier, the median is unaffected, whereas the mean gets higher and higher as the data become more skewed. Problem 6 : The International Energy Agency reported the per capita CO₂ emissions by country (that is, the total CO₂ emissions for the country divided by the population size of that country) for 2007. For the eight largest countries in population size (which make up more than half the world's population), the values were, in metric tons per person : China 4.9 Brazil 1.9 India 1.4 Pakistan 0.9 United States 18.9 Russia 10.8 Indonesia 1.8 Bangladesh 0.3 a. For these eight values, the mean is 5.1. What is the median? b. Is any observation a potential outlier? Discuss its impact on how the mean compares to the median. c. Using this data set, explain the effect an outlier can have on the mean. Comparing mean and median The shape of a distribution influences whether the mean is larger or smaller than the median. For instance, an extremely large value out in the right-hand tail pulls the mean to the right. The mean then usually falls above the median. Generally, if the shape is x x x NSOU ? PGSW-VII 154 ? Perfectly symmetric, the mean equals the median. When a distribution is close to symmetric, the tails will be of similar length, and therefore the median and mean are similar. ? Skewed to the right, the mean is larger than the median. In a Positively Skewed Distribution, the mean is greater in value than the median. ? Skewed to the left, the mean is smaller than the median. In a Negatively Skewed Distribution, the mean is less than the median. Symmetric Distribution Mean = Median Right-Skewed Distribution Median Mean Left-Skewed Distribution Mean Median

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 155 Note : ? For skewed distributions, the mean lies toward the direction of skew (the longer tail) relative to the median. This is because extreme observations in a tail affect the balance point for the distribution, which is the mean. ? The more highly skewed the distribution, the more the mean and median tend to differ. ? Median is not affected by an outlier. How far an outlier falls from the middle of the distribution does not influence the median. The median is determined solely by having an equal number of observations above it and below it. ? Unlike the median, mean depends on how far observations fall from the middle. Because the mean is the balance point, an extreme value on the right side pulls the mean toward the right tail. Because the median is not affected, it is said to be resistant to the effect of extreme observations. ? Resistant-A numerical summary of the observations is called resistant if extreme observations have little, if any, influence on its value. The median is resistant. The mean is not. You might think that it would always be advisable to use median (and not mean) in order to know the centrality of a typical distribution. However, that is not the case. Mean has some very useful properties and the use of it become more apparent in the modules to follow. Moreover, there are certain advantages of having a measure that involve all the numerical values in a dataset. For instance, for discrete data that take only a few values, quite different patterns of data can give the same result for the median. It is then too resistant.

Example 3 : The table summarizes responses of 4383 subjects in a recent General Social Survey to the question, "Within the past month, how many people have you known personally that were victims of homicide?"

Number of People You Have Known Who Were Victims of Homicide	No. of Victims	Frequency
0	3944	1
1	279	2
2	97	3
3	40	4
4 or more	23	Total 4383

NSOU ? PGSW-VII 156 a. To find the mean, it is necessary to give a score to the "4 or more" category. Find it, using the score 4.5. (In practice, you might try a few different scores, such as 4, 4.5, 5, 6, to make sure the resulting mean is not highly sensitive to that choice.) b. Find the median. Note that the "4 or more" category is not problematic for it. c. If 1744 observations shift from 0 to 4 or more, how do the mean and median change? d. Why is the median the same for parts b and c, even though the data are so different? Solution : a. The mean is 0.16. $(0 \cdot 3944 + 1 \cdot 279 + 2 \cdot 97 + 3 \cdot 40 + 4.5 \cdot 23) / 4383 = 0.16$. [The mean is not necessarily a possible value for a discrete variable.] b. The median is the middle score. With 4383 scores, the median is the score in the 2192nd position. Thus the median is zero. c. The median would still be zero, because there are still 2200 people who gave zero as a response. The mean would now be 1.95. $(0 \cdot 2200 + 1 \cdot 279 + 2 \cdot 40 + 3 \cdot 40 + 4.5 \cdot 1767) / 4383 = 1.95$ d. The median is same for the both because median ignores much of the data. The data are highly discrete; hence, a high proportion of the data falls at only one or two values. The mean is better in this case because it uses the numerical values of all of the observations, not just the ordering. Note : The median ignores too much information when the data are highly discrete— that is, when the data take only a few values. An extreme case occurs for binary data, which take only two values, 0 and 1. The median equals the more common outcome but gives no information about the relative number of observations at the two levels. Illustration : For instance, consider a sample of size 5 for the variable, number of times married. The observations (1, 1, 1, 1, 1) and the observations (0, 0, 1, 1, 1) both have a median of 1. The mean is 1 for (1, 1, 1, 1, 1) and 3/5 for (0, 0, 1, 1, 1). When observations take values of only 0 or 1, the mean equals the proportion of observations that equal 1. It is much more informative than the median. When the data are highly discrete

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 157 but have more than two categories, it is more informative to report the proportions (or percentages) for the possible outcomes than to report the median or the mean. Problem 7 : One variable in a study measures how many serious motor vehicle accidents a subject has had in the past year. Explain why the mean would likely be more useful than the median for summarizing the responses of the 60 subjects. A Rough Rule of Using Mean and Median : ? If a distribution is highly skewed, the median is usually preferred over the mean because it better represents what is typical. ? If the distribution is close to symmetric or only mildly skewed, or if it is discrete with few distinct values, the mean is usually preferred because it uses the numerical values of all the observations. The Mode : In statistical language the mode in an ungrouped data is defined as the value corresponding to a peak when the observations are arranged according to their order of magnitudes and in a grouped data it is defined as the value corresponding to a maximum frequency. Thus, the mode of any distribution of scores is the value that occurs most frequently. For example, in the set of scores 58, 82, 82, 90, 98, the mode is 82 because it occurs twice and the other scores occur only once. The concept of the mode is most often used to describe the category of a categorical variable that has the highest frequency (the modal category). With quantitative variables, the mode is most useful with discrete variables taking a small number of possible values. The mode is a simple statistic, most useful when you are interested in the most common score and when you are working with nominal-level variables. In fact, the mode is the only measure of central tendency for nominal-level variables. The mode need not be near the center of the distribution. It may be the largest or the smallest value. Here are some properties of the mode : ? The mode is appropriate for all types of data. For example, we might measure the mode for religion in Australia (nominal scale), for the grade given by a teacher (ordinal scale), or for the number of years of education completed by Hispanic Americans (interval scale). ? A frequency distribution is called bimodal if two distinct mounds occur in the distribution. Bimodal distributions often occur with attitudinal variables when

NSOU ? PGSW-VII 158 populations are polarized, with responses tending to be strongly in one direction or another. For instance, figure below shows the relative frequency distribution of responses in a General Social Survey to the question "Do you personally think it is wrong or not wrong for a woman to have an abortion if the family has a very low income and cannot afford any more children?" The frequencies in the two extreme categories are much higher than those in the middle categories. ? The mean, median, and mode are identical for a unimodal, symmetric distribution, such as a bell-shaped distribution. The mean, median, and mode are complementary measures. They describe different aspects of the data. In any particular example, some or all their values maybe useful. Be on the lookout for misleading statistical analyses, such as using onestatistic when another would be more informative. People who present statisticalconclusions often choose the statistic giving the impression they wish to convey. 50 Percent 40 30 20 10 0 Not Wrong Almost Always Wrong Only Always Wrong at All Sometimes Wrong

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 159 Example 4. Obtain the mode, if it exists, for the followingdata (a) 1, 2, 2, 7; (b) 4, 5, 6; (c) -1, 0, 0, 2, 4, 5, 6, 8; (d) 2, 7, 7,8, 9, 10, 10, 10, 11, 12. Solution : (a) Since 2 is the most frequently occurring item themode is 2. (b) Since 4, 5, and 6 occur with frequency one eachthere is no mode. (c) Here 0 occurs with frequency 2 and hencethe mode is zero. (d) Here 7 occurs with frequency 2 and 10 occurswith frequency 3 and others occur with frequency one. If these arerepresented by a histogram then there will be two peak pointscorresponding to the frequencies 2 and 3. Hence there are twomodes, namely, 7 and 10. This can be called a bimodal data. You should note that the mode has several limitations. First, distributionscan have no mode at all (when all scores have the same frequency) or so many modes that the statistic becomes meaningless. Second, the modal score of ordinal or interval-ratio variables may not becentral to the distribution as a whole. That is, most common does not necessarily identify the center of the distribution.

Choosing a Measure of Central Tendency Use the mode when : 1 The variable is measured at the nominal level. 2 You want a quick and easy measure for ordinal and interval-ratio variables. 3 You want to report the most common score. Use the median when : 1 The variable is measured at the ordinal level. 2 An interval-ratio variable is badly skewed. 3 You want to report the central score. The median always lies at the exact center of the distribution. Use the mean when : 1 The variable is measured at the interval-ratio level (except when the variable is badly skewed). 2 You want to report the typical score. The mean is the "fulcrum that exactly balances all of the scores." 3 You anticipate additional statistical analysis.

NSOU ? PGSW-VII 160 7.3 Measures of Dispersions : A measure of the center is not enough to adequately describe a distribution for aquantitative variable. Besides locating the center of the data, any descriptive study of data must numerically measure the extent of variation around the center. Two data sets mayexhibit similar positions of center but may be remarkably different with respectto variability. For example, the dots in Figure 1b are more scattered than thosein Figure 1a. The Range : The difference between the largest and smallest observations is the simplest way todescribe variability. Range : The

95%	MATCHING BLOCK 51/88	SA 1. Introduction to statistics .pdf (D47853248)
range is the difference between the largest and smallest observations. The		

range gives the length of the interval spanned by the observations. Example 5 : In {4, 6, 9, 3, 7} the lowest value is 3, and the highest is 9. So, the range is 9 – 3 = 6. The range is not, however, sensitive to other characteristics of data variability.The threedistributions in the Figure below.All have the same mean (\$25,000) and range(\$50,000), but they differ in variability about the center. In terms of distances of observations from the

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 161 mean, nation A has the most variability, and nation B theleast. The incomes in nation A tend to be farthest from the mean, and the incomesin nation B tend to be closest. Distributions with the Same Mean and Range, but Different Variability about the Mean. Standard Deviation : Because the sample mean, \bar{x} , is a measure of center, the variation of the individual data points about this center is reflected in their deviation from the mean Deviation = Observation – sample mean For instance, the data set 3, 5, 7, 7, 8 has mean, $\bar{x} = (3 + 5 + 7 + 7 + 8)/5 = 30/5 = 6$, so the deviations are calculated by subtracting 6 from eachobservation. Calculation of Deviations

Observation (x)	Deviation (x-x)
3	-3
5	-1
7	1
7	1
8	2

One might feel that the average of the deviations would provide a numerical measure ofspread. However, some deviations are positive and some negative, and the total of the = $\sum (x - \bar{x})$

NSOU ? PGSW-VII 162 positive deviations exactly cancels the total of the negative ones. In the foregoing example, we see that the positive deviations add to 4and the negative ones add to -4, so the total deviation is 0. With a little reflection on the definition of the sample mean, the reader will realize that this wasnot just an accident. For any data set, the total deviation is 0. $\sum (\text{Deviation}) = \sum (x_i - \bar{x}) = 0$ To obtain a measure of spread, we must eliminate the signs of the deviations before averaging. One way of removing the interference of signs is to square the numbers. A measure of spread, called the sample variance, is constructed by adding the squared deviations and dividing the total by the number of observations minus one. Sample variance of n observations : Example 6 : Calculating Sample Variance Calculate the sample variance of the data 3, 5, 7, 7, 8.For this data set, n = 5. To find the variance, we first calculate the mean,then the deviations and the squared deviations. Calculation of Variance

Observation	Deviation	Deviation squared
3	-3	9
5	-1	1
7	1	1
7	1	1
8	2	4

Total : 30 0 16 sum of squared deviations $s^2 = \frac{\sum (x_i - \bar{x})^2}{n - 1} = \frac{16}{5 - 1} = 4$

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 163 $\sum (x - \bar{x})^2 = \sum x^2 - \frac{(\sum x)^2}{n}$ (30/5) = 6, Sample Variance (s^2) = 16/(5-1) = 4. Note : Although the sample variance is conceptualized as the average squared deviation, notice that the divisor, (n - 1) is rather than n. The divisor is called the degrees of freedom associated with s^2 . A Technical Point : You may wonder why the denominators of the variance and the standard deviation use n - 1 instead of n. We said that the variance was an average of the n squared deviations, so should we not divide by n? Basically, it is because the deviations have only n - 1 pieces of information about variability : That is, n - 1 of the deviations determine the last one, because the deviations sum to 0. For example, suppose we have n = 2 observations and the first observation has deviation (x - \bar{x}) = 5. Then the second observation must have deviation (x - \bar{x}) = -5 because the deviations must add to 0. With n = 2, there's only n - 1 = 1 nonredundant piece of information about variability. And with n = 1, the standard deviation is undefined because with only one observation, it's impossible to get a sense of how much the data vary. Because the variance involves a sum of squares, its unit is the square of the unit in which the measurements are expressed. For example, if the data pertain to measurements of weight in pounds, the variance is expressed in (pounds)². To obtain a measure of variability in the same unit as the data,

71%

MATCHING BLOCK 52/88

SA MBA-Sem-1-Data Analytics.docx (D128714679)

we take the positive square root of the variance, called the sample standard deviation. The

standard deviation rather than the variance serves as a basic measure of variability. Sample Standard Deviation $s = \sqrt{s^2}$ = $\sqrt{\frac{\sum (x_i - \bar{x})^2}{n-1}}$ Example 6 : Calculating the Sample Standard Deviation Calculate the standard deviation for the data of the previous Example. Solution : We already calculated the variance, so the standard deviation is $S = \sqrt{4} = 2$.

NSOU ? PGSW-VII 164 Example 7 : Calculate the standard deviation for the data 1, 4, 5, 9, 11. Solution : The standard deviation is calculated in the table below :

x	1	4	5	9	11	Total
$x - \bar{x}$	-2	1	2	6	8	30
$(x - \bar{x})^2$	4	1	4	36	64	109
$\sum (x - \bar{x})^2$						109
s^2						21.8
s						4.67

Compare Variation in Two Data Sets, viz, data sets in problems 6 and 7 : ? An alternative formula for the sample variance is : $s^2 = \frac{\sum x^2 - \frac{(\sum x)^2}{n}}{n-1}$ It does not require the calculation of the individual deviations. In hand calculation, the use of this alternative formula often reduces the arithmetic work, especially when it turns out to be a number with many decimal places. Dot Diagram of Data Set in Example 6 Dot Diagram of Data Set in Example 7

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 165 Problem 8 : In a psychological experiment a stimulating signal of fixed intensity was used on six experimental subjects. Their reaction times, recorded in seconds, were 4, 2, 3, 3, 6, 3. Calculate the standard deviation for the data by using the alternative formula. Problem 9 : For the data set 8, 6, 14, 4 : (a) Calculate the deviations and check to see that they add up to 0. (b) Calculate the variance and the standard deviation. Problem 10 : The monthly rents for 7 one-bedroom apartments located in one area of the city, are 625, 740, 805, 670, 705, 740, 870. (a) The sample variance. (b) The sample standard deviation. Problem 11 : (a) For each list below, work out the average, the deviations from average, and the SD. (i) 1, 3, 4, 5, 7 (ii) 6, 8, 9, 10, 12 (b) How is list (ii) related to list (i)? How does this relationship carry over to the average? the deviations from the average? the SD? Problem 12 : Can the SD ever be negative? Problem 13 : Can the SD ever be positive? Problem 14 : For a list of positive numbers, can the SD ever be larger than the average? Problem 15 : What is the reason behind the use of (n - 1), rather than n, in the denominator of standard deviation? Problem 16 : The first exam in your statistics course is graded on a scale of 0 to 100. Suppose that the mean score in your class is 80. Which value is most plausible for the standard deviation s : 0, 10, or 50? Problem 17 : For an exam given to a class, the students' scores ranged from 35 to 98, with a mean of 74. Which of the following is the most realistic value for the standard deviation : -10, 0, 3, 12, 63? Clearly explain what's unrealistic about each of the other values.

NSOU ? PGSW-VII 166 Problem 18 : A company decides to investigate the amount of sick leave taken by its employees. A sample of eight employees yields the following numbers of days of sick leave taken in the past year : 0, 0, 4, 0, 0, 0, 6, 0. a. Find and interpret the range. b. Find and interpret the standard deviation s. c. Suppose the 6 was incorrectly recorded and is supposed to be 60. Redo parts a and b with the correct data and describe the effect of this outlier. Quartiles and other percentiles : The mean and median describe the center of a distribution. The range and the standard deviation describe the variability of the distribution. We'll now learn about some other ways of describing a distribution using measures of position. One type of measure of position tells us the point where a certain percentage of the data fall above or fall below that point. The median is an example. It specifies a location such that half the data fall below it and half fall above it. The range uses two other measures of position, the maximum value and the minimum value. Another type of measure of position tells us how far an observation falls from a particular point, such as the number of standard deviations an observation falls from the mean. The median is a special case of a set of measures of position called percentiles. Percentile : The pth percentile is a value such that p percent of the observations fall below or at that value. Suppose you're informed that your score of 1200 (out of 1600) on the college entrance exam falls at the 90th percentile. Set p = 90 in this definition. Then, 90% of those who took the exam scored between the minimum score and 1200. Only 10% of the scores were higher than yours. p% pth Percentile

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 167 Substituting $p = 50$ in this definition gives the 50th percentile. For it, 50% of the observations fall below or at it and 50% above it. But this is simply the median. The 50th percentile is usually referred to as the median. Three useful percentiles are the quartiles. The first quartile has $p = 25$, so it is the 25th percentile. The lowest 25% of the data fall below it. The second quartile has $p = 50$, so it is the 50th percentile, which is the median. The third quartile has $p = 75$, so it is the 75th percentile. The highest 25% of the data fall above it. The quartiles split the distribution into four parts, each containing one quarter (25%) of the observations. The quartiles and the median split a distribution into four equal parts. The interquartile range describes the spread of the middle half of the distribution. Note : The median, the quartiles, and the maximum and minimum are five positions often used as a set to describe center and spread. Sample interquartile range = Third quartile – First quartile 90% 10% 1200 90th Percentile 25% 25% 25% Interquartile range 25% Lower quartile Median Upper quartile

NSOU ? PGSW-VII 168 Example 8 : An administrator wanted to study the utilization of long-distance telephone service by a department. One variable of interest is the length, in minutes, of long-distance calls made during one month. There were 38 calls that resulted in a connection. The lengths of calls, already ordered from smallest to largest, are presented in Table below. Also calculate the sample interquartile range for the length of long-distance phone calls data given in Table The Lengths of Long-Distance Phone Calls in Minutes 1.6 1.7 1.8 1.8 1.9 2.1 2.5 3.0 3.0 4.4 4.5 4.5 5.9 7.1 7.4 7.5 7.7 8.6 9.3 9.5 12.7 15.3 15.5 15.9 15.9 16.1 16.5 17.3 17.5 19.0 19.4 22.5 23.5 24.0 31.7 32.8 43.5 53.3 Solution : To determine the first quartile, we take $p = .25$ and calculate the product $38 * .25 = 9.5$. Because 9.5 is not an integer, we take the next largest integer, 10. In Table above, we see that the 10th ordered observation is 4.4 so the first quartile is $Q_1 = 4.4$ minutes. We confirm that this observation has 10 values at or below it and 29 values at or above so that it does satisfy the conceptual definition of the first quartile. For the median, we take $p = .5$ and calculate $38 * .5 = 19$. Because this is an integer, we average the 19th and 20th smallest observations to obtain the median, $(9.3 + 9.5) / 2 = 9.4$ minutes. Next, to determine the third quartile, we take $p = .75$ and calculate $38 * .75 = 28.5$. The next largest integer is 29, so the 29th ordered observation is the third quartile $Q_3 = 17.5$ minutes. More simply, we could mimic the calculation of the first quartile but now count down 10 observations starting with the largest value. For the 90th percentile, we determine $38 * .90 = 34.2$, which we increase to 35. The 90th percentile is 31.7 minutes. Only 10% of calls last 31.7 minutes or longer. Sample interquartile range = $Q_3 - Q_1 = 17.4 - 4.4 = 13.1$ minutes.

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 169 The following operating rule will simplify the calculation of the sample percentile. Calculating the Sample 100p-th Percentile 1. Order the data from smallest to largest 2. Determine the product (sample size) \times (proportion) = np . If np is not an integer, round it up to the next integer and find the corresponding ordered value. If np is an integer, say k , calculate the average of the k th and $(k + 1)$ st ordered values. The quartiles are simply the 25th, 50th, and 75th percentiles. Sample Quartiles Lower (first) quartile $Q_1 = 25$ th percentile Second quartile (or median) $Q_2 = 50$ th percentile Upper (third) quartile $Q_3 = 75$ th percentile As with the range and standard deviation s , the more varied the data, the larger the IQR tends to be. But unlike those measures, the IQR is not affected by any observations below the first quartile or above the third quartile. In other words, it is not affected by outliers. In contrast, the range depends solely on the minimum and the maximum values, the most extreme values, so the range changes as either extreme value changes. Detecting Potential Outliers Examining the data for unusual observations, such as outliers, is important in any statistical analysis. Is there a formula for flagging an observation as potentially being an outlier? One way uses the interquartile range. The $1.5 \times$ IQR Criterion for Identifying Potential Outliers An observation is

85%

MATCHING BLOCK 53/88

W

a potential outlier if it falls more than $1.5 \times$ IQR below the first quartile or more than $1.5 \times$ IQR above the third quartile.

Example 9 :

The sodium level in 20 breakfast cereals (in mg) are : 0 340 70 140 200 180 210 150 100 310 140 180 190 160 290 50 220 180 200 210

NSOU ? PGSW-VII 170 the breakfast cereal sodium data has $Q_1 = 135$ and $Q_3 = 205$. So, $IQR = Q_3 - Q_1 = 205 - 135 = 70$. For those data $1.5 * IQR = 1.5 * 70 = 105$. $Q_1 - 1.5 * IQR = 135 - 105 = 30$ (lower boundary, potential outliers below) and $Q_3 + 1.5 * IQR = 205 + 105 = 310$ (upper boundary, potential outliers above). By the $1.5 * IQR$ criterion, observations below 30 or above 310 are potential outliers. The only observations below 30 or above 310 are the sodium values of 0 mg and 340 mg for. These are the only potential outliers. Interpreting the magnitude of s : the empirical rule A distribution with $s = 5.1$ has greater variability than one with $s = 3.3$, but how do we interpret how large $s = 5.1$ is? We've seen that a rough answer is that s is a typical distance of an observation from the mean. To illustrate, suppose the first exam in your course, graded on a scale of 0 to 100, has a sample mean of 77. A value of $s = 0$ is unlikely, since every student must then score 77. A value such as $s = 50$ seems implausibly large for a typical distance from the mean. Values of s such as 8 or 12 seem much more realistic. Suppose that a distribution is unimodal and approximately symmetric with a bell shape. The value of s then has a more precise interpretation. Using the mean and standard deviation, we can form intervals that contain certain percentages (approximately) of the data. Empirical Rule Bell-shaped Distribution

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 171 If a distribution of data is bell shaped, then approximately 68% of the observations fall within 1 standard deviation of the mean, that is, between the values of $x - s$ and $x + s$ (denoted $x \pm s$). 95%

50%

MATCHING BLOCK 54/88

W

of the observations fall within 2 standard deviations of the mean ($\bar{x} \pm 2s$). All or nearly all observations fall within 3 standard deviations of the mean ($\bar{x} \pm 3s$).

The empirical rule has this name because many distributions of data observed in practice (empirically) are approximately bell-shaped. Example 10 : Students require different amounts of sleep. A sample of 59 students at a college reported the following hours of sleep the previous night. A graphical portrayal of the empirical rule 3σ All or nearly all observations About 95% of observations About 68% of observations 3σ 2σ \bar{x} s 2σ 3σ

NSOU ? PGSW-VII 172 Hours of Sleep for Fifty-nine Students 4.5 4.7 5.0 5.0 5.3 5.5 5.5 5.7 5.7 5.7 6.0 6.0 6.0 6.0 6.3 6.3 6.3 6.5 6.5 6.5 6.7 6.7 6.7 6.7 7.0 7.0 7.0 7.0 7.3 7.3 7.3 7.3 .75 7.5 7.5 7.5 7.7 7.7 7.7 7.7 8.0 8.0 8.0 8.0 8.3 8.3 8.3 8.5 8.5 8.5 8.5 8.7 8.7 9.0 9.0 9.0 9.3 9.3 10.0 Examine the 59 hours of sleep in the above table in the context of the empirical guideline. Solution : We can calculate the following values as follows (Try!) : $\bar{x} = 7.18$ $s = 1.28$ $2s = 2(1.28) = 2.56$ Going two standard deviations either side of \bar{x} results in the interval : $7.18 - 2.56 = 4.62$ to $7.18 + 2.56 = 9.74$ By actual count, all the observations except 4.5 and 10.0 fall in this interval. We find that $57/59 = .966$, or 96.6% of the observations lie within two standard deviations of \bar{x} . The empirical guidelines suggest 95% so they are close. Problem 19 : The following data represent the scores of 40 students on a college qualification test : 162 171 138 145 144 126 125 162 174 178 167 98 161 152 182 136 165 137 133 143 184 166 115 115 95 190 119 144 176 135 194 147 160 158 178 162 131 106 157 154 Calculations with the test scores data of the above table give $\bar{x} = 150.125$ and $s = 24.677$. a) Find the proportion of the observations in the intervals $\bar{x} + 2s$ & $\bar{x} - 2s$ and $\bar{x} + 3s$ & $\bar{x} - 3s$. b) Compare your findings in part (a) with those suggested by the empirical guidelines for bell-shaped distributions. c) Calculate the interquartile range.

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 173 The Box Plot : Graphing a Five-Number Summary of Positions The quartiles and the maximum and minimum values are five numbers often used as a set to summarize positions that help to describe center and variability of a distribution. The five-number summary is the basis of a graphical display called the boxplot. The box of a box plot contains the central 50% of the distribution, from the first quartile to the third quartile (see the margin figure). A line inside the box marks the median. The lines extending from the box are called whiskers. These extend to encompass the rest of the data, except for potential outliers, which are shown separately. SUMMARY : Constructing a Box Plot A box goes from the lower quartile Q1 to the upper quartile Q3. A line is drawn inside the box at the median. A line goes from the lower end of the box to the smallest observation that is not a potential outlier. A separate line goes from the upper end of the box to the largest observation that is not a potential outlier. These lines are called whiskers. The potential outliers (more than 1.5 IQR below the first quartile or above the third quartile) are shown separately.

Example 11 : The sodium level in 20 breakfast cereals (in mg) are : 0 340 70 140 200 180 210 150 100 130 140 180 190 160 290 50 220 180 200 210 min max Q1 Q3 Median

NSOU ? PGSW-VII 174 Figure below shows a box plot for the sodium values. Labels are also given for the five-number summary of positions. Box Plot and Five-Number Summary for 20 Breakfast Cereal Sodium Values. The central

52%

MATCHING BLOCK 55/88

W

box contains the middle 50% of the data. The line in the box marks the median. Whiskers extend from the box to the smallest and largest

observations, which are not identified as potential outliers. Potential outliers are marked separately. The five-number summary of sodium values shown on the boxplot is minimum = 0, Q1 = 135, median = 180, Q3 = 205, and maximum = 340. The middle 50% of the distribution of sodium values range from Q1 = 135 mg to Q3 = 205 mg, which are the two outer lines of the box. The median of 180 mg is indicated by the center line through the box. As we saw in part a, the $1.5 * IQR$ criterion flags the sodium values of 0 mg for and 340 mg for as outliers. These values are represented on the boxplot as asterisks. The whisker extending from Q1 is drawn down to 50, which is the smallest observation that is not below the lower boundary of 30. The whisker extending from Q3 is drawn up to 290, which is the largest observation that is not above the upper boundary of 310. Problem 20 : The scores on an exam have mean = 88, standard deviation = 10, minimum = 65, Q1 = 77, median = 85, Q3 = 91, maximum = 100. Sketch a box plot, labeling which of these values are used in the plot. Usefulness of Boxplot Diagram : ? Box plots are useful as they show the average score of a data set. The median is the average value from a set of data and is shown by the line that divides the box into two parts. Half the scores are greater than or equal to this value and half are less. Minimum value = 0 Q1 = 135 Median = 180 Q3 = 205 Maximum value = 340 0 100 200 300 340 400 Sodium (mg)

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 175 ? Box plots are useful as they show the skewness of a data set The box plot shape will show if a statistical data set is normally distributed or skewed. When the median is in the middle of the box, and the whiskers are about the same on both sides of the box, then the distribution is symmetric. When the median is closer to the bottom of the box, and if the whisker is shorter on the lower end of the box, then the distribution is positively skewed (skewed right). When the median is closer to the top of the box, and if the whisker is shorter on the upper end of the box, then the distribution is negatively skewed (skewed left). ? Box plots are useful as they show the dispersion of a data set. The smallest value and largest value are found at the end of the 'whiskers' and are useful for providing a visual indicator regarding the spread of scores (e.g. the range). Normal Distribution Positive Skew Negative Skew

NSOU ? PGSW-VII 176 The interquartile range (IQR) is the box plot showing the middle 50% of scores and can be calculated by subtracting the lower quartile from the upper quartile (e.g. $Q_3 - Q_1$). ? Box plots are useful as they show outliers within a data set. For example, outside 1.5 times the interquartile range above the upper quartile and below the lower quartile ($Q_1 - 1.5 * IQR$ or $Q_3 + 1.5 * IQR$). Box plots are useful as they show the skewness of a data set How to compare box plots : Box plots are a useful way to visualize differences among different samples or groups. They manage to provide a lot of statistical information, including— medians, ranges, and outliers. Q_1 IQR Q_3 Minimum Maximum Median Outliers "Minimum" ($Q_1 - 1.5 * IQR$) Interquartile Range (IQR) Outliers "Maximum" $Q_3 + 1.5 * IQR$ Median Q_1 (25th Percentile) Q_3 (75th Percentile) -4 -3 -2 -1 0 1 2 3 4

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 177 Step 1 : Compare the medians of box plots : Compare the respective medians of each box plot. If the median line of a box plot lies outside of the box of a comparison box plot, then there is likely to be a difference between the two groups. Step 2 : Compare the interquartile ranges and whiskers of box plots : Compare the interquartile ranges (that is, the box lengths), to examine how the data is dispersed between each sample. The longer the box the more dispersed the data. The smaller the less dispersed the data. 12 11 10 9 8 7 6 5 4 3 2 1 0 Time Slept (Hours) Mon Tues Wed Thurs Fri Sat Sun

NSOU ? PGSW-VII 178 Next, look at the overall spread as shown by the extreme values at the end of two whiskers. This shows the range of scores (another type of dispersion). Larger ranges indicate wider distribution, that is, more scattered data. Step 3 : Look for potential outliers : When reviewing a box plot, an outlier is defined as a data point that is located outside the whiskers of the box plot. Step 4 : Look for signs of skewness : If the data do not appear to be symmetric, does each sample show the same kind of asymmetry? Problem 21 : Vertical side-by-side box plots shown below compare the values reported by the UN of per capita carbon dioxide emissions for nations in the European Union and in South America. Left-Skewed Symmetric Right-Skewed Q_1 Q_2 Q_3 Q_1 Q_2 Q_3 25 20 15 10 5 0 CO2 Europe South America Boxplot of CO2

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 179 a. Give the approximate value of carbon dioxide emissions for the outlier shown. b. What shape would you predict for the distribution in South America? Why? c. Summarize how the carbon dioxide emissions compare in Europe and South America. The z-Score Also Identifies Position and Potential Outliers The empirical rule tells us that for a bell-shaped distribution, it is unusual for an observation to fall more than 3 standard deviations from the mean. An alternative criterion for identifying potential outliers uses the standard deviation. An observation in a bell-shaped distribution is regarded as a potential outlier if it falls more than 3 standard deviations from the mean. How do we know the number of standard deviations that an observation falls from the mean? When $x = 84$ and $s = 16$, a value of 100 is 1 standard deviation above the mean, since $(100 - 84) = 16$. Alternatively, $(100 - 84)/16 = 1$. Taking the difference between an observation and the mean and dividing by the standard deviation tells us the number of standard deviations that the observation falls from the mean. This number is called the z-score. Z-SCORE The z-score for an observation is the number of standard deviations that it falls from the mean. A positive z-score indicates the observation is

73%

MATCHING BLOCK 56/88

W

above the mean. A negative z-score indicates the observation is below the mean. For

sample data, the z-score is calculated as $\text{observation} - \text{mean} / \text{standard deviation}$. The z-score allows us to quickly tell how surprising or extreme an observation is. The z-score converts an observation (regardless of the observation's unit of measurement) to a common scale of measurement, which allows comparisons. Example 12 : Suppose a student scored 65 in a math course and 72 in a history course. These (raw) scores tell little about the student's performance. If the class averages and standard deviations were $x = 60$ and $s = 20$ in mathematics and $x = 78$ and $s = 10$ in history, this student's

NSOU ? PGSW-VII 180 Z-score in mathematics = $(65 - 60)/20 = .25$ Z-score in history = $(72 - 78)/10 = -.60$ Thus, the student was .25 standard deviations above the average in math and .6 standard deviations below the average in history. Problem 22 : (a) If $x = 490$ and $s = 120$, find the z scores of 350 and 620. (b) For a z score of 2.4, what is the raw score if $x = 210$ and $s = 50$? Problem 23 : Two cities provided the following information on public school teachers' salaries. Minimum Q_1 Median Q_3 Maximum City A 38,400 44,000 48,300 50,400 56,300 City B 39,600 46,500 51,200 55,700 61,800 (a) Construct a boxplot for the salaries in City A. (b) Construct a boxplot, on the same graph, for the salaries in City B. (c) Are there larger differences at the lower or the higher salary levels? Explain. 7.5 Coefficient of Variation : To compare variation in different data sets, you can use standard deviation when the data sets use the same units of measure and have means that are about the same. For data sets with different units of measure or different means, use the coefficient of variation. The coefficient of variation (CV) of a data set describes the standard deviation as a percent of the mean. Population : $CV = (\sigma/\mu) * 100\%$ Sample : $CV = (s/x) * 100\%$ Note that the coefficient of variation measures the variation of a data set relative to the mean of the data.

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 181 Example 13 : The table at the left shows the population heights (in inches) and weights (inpounds) of the members of a football team. Find the coefficient of variationfor the heights and the weights. Then compare the results. Heights Weights 72 180 74 168 68 225 76 201 74 189 69 192 72 197 79 162 70 174 69 171 77 185 73 210 Solution : The mean height is $\mu \approx 72.8$ inches with a standard deviation of $\sigma \approx 3.3$ inches. The coefficient of variation for the heights is $CV \text{ height} = (\sigma/\mu) * 100\% = (3.3/72.8)*100\% = 4.5\%$ The mean weight is $\mu \approx 187.8$ pounds with a standard deviation of $\sigma \approx 17.7$ pounds. The coefficient of variation for the weights is $CV \text{ weight} = (\sigma/\mu) * 100\% = (17.7/187.8) * 100\% = 9.4\%$ Interpretation : The weights (9.4%) are more variable than the heights (4.5%).

NSOU ? PGSW-VII 182 Problem 24 : Find the coefficient ofvariation for each of the two data sets. Then compare the results.Sample annual salaries (in thousands of dollars) forentry level accountants in Dallas and New York City are listed. 41.6 50.0 49.5 38.7 39.9 Dallas 45.8 44.7 47.8 40.5 44.3 45.6 41.5 57.6 55.1 59.3 New York City 59.0 50.6 47.2 42.3 51.0 7.6 Probability Distributions A prescription for the probability model of an experiment contains two basic ingredients: the sample space and the assignment of probability to each elementary outcome.we encountered several examples where the elementary outcomes had only qualitative descriptions rather than numerical values. For instance, with two tosses of a coin, the outcomes HH, HT, TH, and TTare pairs of letters that identify the occurrences of heads or tails. If a new vaccine is studied for the possible side effects of nausea, the response of each subject may be severe, moderate, or no feeling of nausea. These are qualitative outcomes rather than measurements on a numerical scale.Often, the outcomes of an experiment are numerical values: for example,the daily number of burglaries in a city, the hourly wages of students on summerjobs, and scores on a college placement examination. Even in the former situation where the elementary outcomes are only qualitatively described, interestfrequently centres on some related numerical aspects. Random Variables : A random variable X associates a numerical value with each outcome of an experiment. In mathematical language, we say that a random variable X is a real-valued function defined on a sample space. The word "random"serves as a reminder of the fact that, beforehand, we do not know the outcomeof an experiment or its associated value of X. Example 1 : Consider X to be the number of heads obtained in three tosses of a coin. Listthe numerical values of X and the corresponding elementary outcomes. Solution : First, X is a variable since the number of heads in three tosses of a coin canhave any of the values 0, 1, 2, or 3. Second, this variable is random in thesense that the value that would occur in a given instance cannot be predictedwith certainty. We can,

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 183 though, make a list of the elementary outcomes andthe associated values of X. Outcome Value of X HHH 3 HHT 2 HTH 2 HTT 1 THH 2 THT 1 TTH 1 TTT 0 Note that, for each elementary outcome there is only one value of X.However, several elementary outcomes may yield the same value. Scanningour list, we now identify the events (i.e., the collections of the elementaryoutcomes) that correspond to the distinct values of X. Guided by this example, we observe the following general facts. ? The events corresponding to the distinct values of X are incompatible. ? The union of these events is the entire sample space. Typically, the possible values of a random variable X can be determined directly from the description of the random variable without listing the sample space. However, to assign probabilities to these values, treated as events, it issometimes helpful to refer to the sample space. Problem 1 : Identify each of the following as a discrete orcontinuous random variable. (a) Number of empty seats on a flight fromAtlanta to London. (b) Yearly low temperature in your city. (c) Yearly maximum daily amount of ozonein Los Angeles. (d) Time it takes for a plumber to fix a bathroom faucet. (e) Number of cars ticketed for illegal parking on campus today.

NSOU ? PGSW-VII 184 Problem 2 : A child psychologist interested in how friendsare selected studies groups of three children. For one group, Ann, Barb, and Carol, each isasked which of the other two she likes best. (a) Make a list of the outcomes. (Use A, B,and C to denote the three children.) (b) Let X be the number of times Carol ischosen. List the values of X. Probability distribution of a discrete random variable : The probability distribution or, simply the distribution, of a discrete random variable X is a list of the distinct numerical values of X along with their associated probabilities. Often, a formula can be used in place of a detailed list. Example 2 : If X represents the number of heads obtained in three tosses of a fair coin, find the probability distribution of X. Solution : We know the eight elementary outcomes and theassociated values of X. The distinct values of X are 0, 1, 2, and 3. We now calculate their probabilities. The model of a fair coin entails that the eight elementary outcomes areeually likely, so each is assigned the probability The event $[X = 0]$ has thesingle outcome TTT, so its probability is Similarly, the probabilities of $[X = 1]$, $[X = 2]$, and $[X = 3]$ are found to be and respectively. Collecting these results, we obtain the probability distribution of X displayed in Table : Value of X Probability 0 1/8 1 3/8 2 3/8 3 1/8 Total 1

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 185 For general discussion, we will use the notation x_1, x_2, \dots , and so on, to designate the distinct values of a random variable X. The probability that a particularvalue occurs will be denoted by $f(x_i)$. If X can take k possible values, \dots , with the corresponding probabilities $f(x_1), \dots, f(x_k)$, the probability distribution of X can be displayed in the format of the above Table. Sincethe quantities $f(x_i)$ represent probabilities, they must all be numbers between 0 and 1. Furthermore, when summed over all possible values of X, these probabilities must add up to 1. TABLE 2 Form of a Discrete Probability Distribution Value of X Probability $f(x)$ $x_1 f(x_1)$ $x_2 f(x_2)$ \dots $x_k f(x_k)$ Total 1 The probability distribution of a discrete random variable X is described as the function $f(x_i) = P[X = x_i]$ which gives the probability for each value and satisfies : 1. $0 \leq f(x_i) \leq 1$ for each value x_i of X 2. $f(x_i) + \dots + f(x_k) = \sum_{i=1}^k 1$ A probability distribution or the probability function describes the mannerin which the total probability 1 gets apportioned to the individual values of therandom variable. Note : You should recognize an important distinction between a relativefrequency distribution and the probability distribution. The former is a sample-based entity and is

NSOU ? PGSW-VII 186 therefore susceptible to variation on different occasions of sampling. By contrast, the probability distribution is a stable entity that refers to the entire population. It is a theoretical construct that serves as a model for describing the variation in the population. The probability distribution of X can be used to calculate the probabilities of events defined in terms of X . Problem 3 : Faced with a tight deadline on two major projects, you decide to hire two of the five available persons to help complete the work. They have 1, 2, 4, 2- and 1- years' experience, respectively. Since their references are very similar, you decide to select two of these workers at random. Let X denote the sum of their years' experience. Obtain the probability distribution of X . Expectation (mean) and standard deviation of a probability distribution : The mean of X or population mean $E(X) = \mu = \sum (x_i \cdot P_i)$ Here the sum extends over all the distinct values x_i of X . The mean of a probability distribution is also called the population mean for the variable X and is denoted by the Greek letter μ . The mean of a random variable X is also called its expected value and, alternatively, denoted by $E(X)$. That is, the mean μ and expected value $E(X)$ are the same quantity and will be used interchangeably. Example 3 : Calculate the mean of the following data set. Suppose a die is tossed 20 times and the following data obtained. 4, 3, 4, 2, 5, 1, 6, 6, 5, 2, 2, 6, 5, 4, 6, 2, 1, 6, 2, 4 Solution : We know, sample mean $\bar{x} = \sum (\text{Value} \cdot \text{Relative Frequency})$ Rather than stopping with 20 tosses, if we imagine a very large number of tosses of a die, the relative frequencies will approach the probabilities, each of which is for a fair die. The mean of the (infinite) collection of tosses of a fair die should then be calculated as

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 187 We can first count the frequency of each point and use the relative frequencies to calculate the mean as : $\bar{x} = 1*(2/20) + 2*(5/20) + 3*(1/20) + 4*(4/20) + 5*(3/20) + 6*(5/20) = 3.8$ Note : Like many concepts of probability, the idea of the mean or expectation originated from studies of gambling. When X refers to the financial gain in a game of chance, such as playing poker or participating in a state lottery, the name "expected gain" is more appealing than "mean gain." In the realm of statistics, both the names "mean" and "expected value" are widely used. The concept of expected value also leads to a numerical measure for the spread of a probability distribution—namely, the standard deviation. Because the mean μ is the center of the distribution of X , we express variation of X in terms of the deviation $X - \mu$. We define the variance of X as the expected value of the squared deviation $(X - \mu)^2$. To calculate this expected value, we note that $(X - \mu)^2$ Takes Value Probability $(x_1 - \mu)^2 f(x_1)$ $(x_2 - \mu)^2 f(x_2)$ $(x_k - \mu)^2 f(x_k)$ The expected value of $(X - \mu)^2$ is obtained by multiplying each value $(x_i - \mu)^2$ by the probability $f(x_i)$ and then summing these products. This motivates the definition : Variance of $X = \sum (\text{Deviation})^2 \cdot (\text{Probability}) = \sum (x_i - \mu)^2 \cdot f(x_i)$ The variance of X is abbreviated as $\text{Var}(X)$ and is also denoted by σ^2 . The standard deviation of X

100%	MATCHING BLOCK 57/88	SA MATH 201 BUSINESS STATISTICS.pdf (D40557061)
is the positive square root of the variance and is		

denoted by $\text{sd}(X)$ or σ (a Greek lower-case sigma.).

NSOU ? PGSW-VII 188 The variance of X is also called the population variance and σ denotes the population standard deviation. Variance and Standard Deviation of X $\sigma^2 = \sum \text{Var}(X_i)$ $\sigma = \sqrt{\text{Var}(X)}$ Example 4 : Calculate the variance and the standard deviation of the distribution of X that appears in the Table below : x $f(x)$ 0 .1 1 .2 2 .4 3 .2 4 .1 Solution : We calculate the mean μ , the deviations $x - \mu$, $(x - \mu)^2$ and finally, $(x - \mu)^2 \cdot f(x)$. x $f(x)$ $x - \mu$ $(x - \mu)^2$ $(x - \mu)^2 \cdot f(x)$ 0 .1 0 -2 4 .4 1 .2 -1 1 .2 2 .4 0 0 3 .2 6 1 1 .2 4 .1 4 2 4 .4 Total 1.0 2.0 = μ 1.2 = σ^2 $\text{Var}(X) = \sigma^2 = 1.2$ $\text{Sd}(X) = \sigma = 1.2 = 1.095$

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 189 Problem 4 : Given the following probability distribution concerning Web sites visited almost every day: Find $E(X)$, σ^2 , and σ . x $f(x)$ 1 .1 2 .2 3 .3 4 .4 Bernoulli trials : Often, an experiment can have only two possible outcomes. In all these circumstances, a simple probability model can be developed for the chance variation in the outcomes. Moreover, the population proportion need not be known. Instead, the probability distribution will involve this unknown population proportion as a parameter. Sampling situations where the elements of a population have a dichotomy abound in virtually all walks of life. A few examples are : ? Survey a sample of voters and observe how many favours an increase of public spending on welfare. ? Examine the case histories of a number of births and count how many involved deliveries by Cesarean section. ? Inspect a specified number of items coming off a production line and count the number of defectives. Selecting a single element of the population is envisioned as a trial of the (sampling) experiment, so that each trial can result in one of two possible outcomes. Our ultimate goal is to develop a probability model for the number of outcomes in one category when repeated trials are performed. We call each repetition by the simpler name—a trial. Furthermore, the two possible outcomes of a trial are now assigned the technical names success (S) and failure (F) just to emphasize the point that they are the only two possible results. These names bear no connotation of success or failure in real life. Customarily, the outcome of primary interest in a study is labeled success (even if it is a disastrous event). Further conditions on the repeated trials are necessary in order to arrive at our intended

NSOU ? PGSW-VII 190 probability distribution. Repeated trials that obey these conditions are called Bernoulli trials after the Swiss mathematician Jacob Bernoulli. Perhaps the simplest example of Bernoulli trials is the prototype model of tossing a coin, where the occurrences head and tail can be labelled S and F, respectively. For a fair coin, we assign probability to success and to failure. $p = 1/2$ to success and $q = 1/2$ to failure. Bernoulli Trials 1. Each trial yields one of two outcomes, technically called success (S) and failure (F). 2. For each trial, the probability of success $P(S)$ is the same and is denoted by $p = P(S)$. The probability of failure is then $P(F) = 1 - p$ for each trial and is denoted by q , so that $p + q = 1$. 3. Trials are independent. The probability of success in a trial remains unchanged given the outcomes of all the other trials. Example 5 : Consider a lot (population) of items in which each item can be classified as either defective or non-defective. Suppose that a lot consists of 15 items, of which 5 are defective and 10 are non-defective. Do the conditions for Bernoulli trials apply when sampling (1) with replacement and (2) without replacement? Solution : 1. Sampling with replacement. An item is drawn at random (i.e., in a manner that all items in the lot are equally likely to be selected). The quality of the item is recorded, and it is returned to the lot before the next drawing. The conditions for Bernoulli trials are satisfied. If the occurrence of a defective is labelled S, we have $P(S) = 5/15$. 2. Sampling without replacement. In situation (2), suppose that 3 items are drawn one at a time but without replacement. Then the condition concerning the independence of trials is violated. For the first drawing, $P(S) = 5/15$. If the first draw produces S, the lot then consists of 14 items, 4 of which are defective. Given this information about the result of the first draw, the conditional probability of obtaining an S on the second draw is then $4/14$ which is not certainly equal to $5/15$ and that establishes the lack of independence.

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 191 This violation of the condition of independence loses its thrust when the population is vast and only a small fraction of it is sampled. Consider sampling 3 items without replacement from a lot of 1500 items, 500 of which are defective. With S_1 denoting the occurrence of an S in the first draw and S_2 that in the second, we have $P(S_1) = 500/1500 = 5/15$ and $P(S_2) = 499/1499$. For most practical purposes, the latter fraction can be approximated by $5/15$. Strictly speaking, there has been a violation of the independence of trials, but it is to such a negligible extent that the model of Bernoulli trials can be assumed as a good approximation. Note : If elements are sampled from a dichotomous population at random and with replacement, the conditions for Bernoulli trials are satisfied. When the sampling is made without replacement, the condition of the independence of trials is violated. However, if the population is large and only a small fraction of it (less than 10%, as a rule of thumb) is sampled, the effect of this violation is negligible and the model of the Bernoulli trials can be taken as a good approximation. Problem 5 : Is the model of Bernoulli trials plausible in each of the following situations? Discuss in what manner (if any) a serious violation of the assumptions can occur. (a) Seven friends go to a blockbuster movie and each is asked whether the movie was excellent. (b) A musical aptitude test is given to 10 students and the times to complete the test are recorded. (c) Items coming off an assembly line are inspected and classified as defective or non-defective. (d) Going house by house down the block and recording if the newspaper was delivered on time. The Binomial Distribution : With a sample, we summarize such variables by counting the number or the proportion of cases with an outcome of interest. For instance, with a sample of size $n = 5$, let the

NSOU ? PGSW-VII 192 random variable X denote the number of people who vote yes about some issue in a referendum. The possible values for X are 0, 1, 2, 3, 4, and 5. Under certain conditions, a random variable X that counts the number of observations of a particular type has a probability distribution called the binomial. Consider n cases, called trials, in which we observe a binary random variable. This is a fixed number, such as $n = 5$ for a sample of five voters. The number X (trials in which the outcome of interest occurs) can take any one of the integer values 0, 1, 2, ..., n . The binomial distribution gives probabilities for these possible values of X when the following three conditions hold : Conditions for Binomial Distribution ? Each of n trials has two possible outcomes. The outcome of interest is called a success and the other outcome is called a failure. ? Each trial has the same probability of a success. This is denoted by p , so the probability of a failure is denoted by $1 - p$. ? The n trials are independent. That is, the result for one trial does not depend on the results of other trials. The binomial random variable X is the number of successes in the n trials. Flipping a coin n times, where n is determined in advance, is a prototype for the binomial distribution : ? Each trial is a flip of the coin. There are two possible outcomes for each flip, head or tail. Let's identify (arbitrarily) head as success. ? The probability p of a head equals 0.50 for each flip if head and tail are equally likely. ? The flips are independent, since the result for any specific flip does not depend on the outcomes of previous flips. The binomial random variable X counts the number of heads (the outcome of interest) in the n flips. With $n = 3$ -coin flips, $X =$ number of heads could equal 0, 1, 2, or 3. Example 6 : An experiment is conducted in which a person in one room picks one of the integers 1, 2, 3, 4, 5 at random and concentrates on it for one minute. In another

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 193 room, Robin identifies the number he believes was picked. The experiment is done with three trials. After the third trial, the random numbers are compared with Robin's predictions. Robin got the correct result twice. If Robin does not actually have extrasensory perception and is merely guessing the number, what is the probability that he'd make a correct guess on two of the three trials? Solution : Let X = number of correct guesses in $n = 3$ trials. Then $X = 0, 1, 2, \text{ or } 3$. Let p denote the probability of a correct guess for a given trial. If Robin is guessing, $p = 0.2$ Robin's prediction of one of the five possible integers. Then, $1 - p = 0.8$ is the probability of an incorrect prediction on a given trial. Denote the outcome on a given trial by S or F , representing success or failure for whether Robin's guess was correct or not. Table below shows the eight outcomes in the sample space for this experiment. For instance, FSS represents a correct guess on the second and third trials. It also shows their probabilities by using the multiplication rule for independent events. Outcome Probability $SSS 0.2 * 0.2 * 0.2 = (0.2)^3$ $SSF 0.2 * 0.2 * 0.8 = (0.2)^2 (0.8)$ $SFS 0.2 * 0.8 * 0.2 = (0.2)^2 (0.8)$ $1 FSS 0.8 * 0.2 * 0.2 = (0.2)^2 (0.8)$ $1 SFF 0.2 * 0.8 * 0.8 = (0.2) (0.8)^2$ $FSF 0.8 * 0.2 * 0.8 = (0.2) (0.8)^2$ $FFS 0.8 * 0.8 * 0.2 = (0.2) (0.8)^2$ $FFF 0.8 * 0.8 * 0.8 = (0.8)^3$ The three ways John Doe could make two correct guesses in three trials are $SSF, SFS,$ and FSS . Each of these has probability equal to $(0.2)^2 (0.8) = 0.032$. The total probability of two correct guesses is $3(0.2)^2 (0.8) = 3(0.032) = 0.096$.

NSOU ? PGSW-VII 194 In terms of the probability $p = 0.2$ of a correct guess on a particular trial, the solution $3(0.2)^2 (0.8)$ for $x = 2$ correct in $n = 3$ trials equals $3p^2 (1 - p)^1 = 3p^2 (1 - p)^{n - x}$. The multiple of 3 represents the number of ways that two successes can occur in three trials (SSF or SFS or FSS). You can use similar logic to evaluate the probability that $x = 0, \text{ or } 1, \text{ or } 3$.

Try $x = 1$, for which you should get $P(1) = 0.384$. Note : For independent events, $P(A \text{ and } B) = P(A)P(B)$. Thus, $P(FSS) = P(F)P(S)P(S) = 0.8 * 0.2 * 0.2$. Problem 6 : Jane Doe claims to possess extrasensory perception (ESP). She says she can guess more often than not the outcome of a flip of a balanced coin in another room. In an experiment, a coin is flipped three times. If she does not actually have ESP, find the probability distribution of the number of her correct guesses. a. Do this by constructing a sample space, finding the probability for each point, and using them to construct the probability distribution. The formula for binomial probabilities (Optional) : When the number of trials n is large, it's tedious to write out all the possible outcomes in the sample space. But there's a formula you can use to find binomial probabilities for any n . Probabilities for a Binomial Distribution Denote the probability of success on a trial by p . For n independent trials, the probability of x successes equals $P(x) = \binom{n}{x} p^x (1 - p)^{n - x}$

Did You Know? The term with factorials at the start of the binomial formula is $\binom{n}{x} = \frac{n!}{x!(n - x)!}$ which is also called the binomial coefficient. It is the number of outcomes that have x successes in n trials, such as the $323213!!!$ outcomes ($SSF, SFS,$ and FSS) that have $x = 2$ successes in $x = 3$ trials The symbol $n!$ is called n factorial. It represents $n! = 1 * 2 * 3 * \dots * n$, the product of all integers from 1 to n . That is, $1! = 1, 2! = 1 * 2 = 2, 3! = 1 * 2 * 3 = 6, 4! = 1 * 2 * 3 * 4 = 24$, and so forth. Also, $0!$ is defined to be 1. For given values for p and n , you can find the probabilities of the possible outcomes by substituting values for x into the binomial formula. Let's use this formula to find the answer for the above Example: ? The random variable X represents the number of correct guesses (successes) in $n = 3$ trials ? The probability of a correct guess in a particular trial is $p = 0.2$. ? The probability of exactly two correct guesses is the binomial probability with $n = 3$ trials, $x = 2$ correct guesses, and $p = 0.2$ probability of a correct guess for a given trial, $P(2) = \binom{3}{2} (0.2)^2 (0.8)^1 = 3(0.04) (0.8) = 0.096$

Problem 7 : Let us introduce a case involving possible discrimination against female employees. A group of women employees has claimed that female employees are less likely than male employees of similar qualifications to be promoted. Suppose the large employee pool that can be tapped for management training is half female and half male. In a group recently selected for promotion, none of the 10 individuals chosen were female. What would be the probability of 0 females in 10 selections, if there truly were no gender bias? Suppose the population of individuals to choose for promotion contained only four people, two men and two women (instead of the very large pool of employees), and the number chosen was $n = 2$. Do the binomial conditions apply for calculating the probability, under random sampling, of selecting 0 women in the two choices for promotion?

NSOU ? PGSW-VII 196 Mean and Standard Deviation of the Binomial Distribution : As with any discrete probability distribution, we can use the formula $\mu = \sum xP(x)$ to find the mean. However, finding the mean μ and standard deviation σ is actually simpler for the binomial distribution. There are special formulas based on the number of trials n and the probability p of success on each trial. Binomial Mean and Standard Deviation The binomial probability distribution for n trials with probability p of success on each trial has mean μ and standard deviation σ given by $\mu = np$ and $\sigma = \sqrt{np(1 - p)}$. The formula for the mean makes sense. If the probability of success is p for a given trial, then we expect about a proportion p of the n trials to be successes, or about np total. If we sample $n = 10$ people from a population in which half are female, then we expect that about $np = 10(0.50) = 5$ in the sample will be female. When the number of trials n is large, it can be tedious to calculate binomial probabilities of all the possible outcomes. Often, it's adequate merely to use the mean and standard deviation to describe where most of the probability falls. The binomial distribution has a bell shape when n is large (as explained in a guideline at the end of this section), so in that case, we can use the normal distribution to approximate the binomial distribution and conclude that nearly all the probability falls between $\mu - 3\sigma$ and $\mu + 3\sigma$.

Example 7 : For the binomial distribution with $n = 3$ and $p = .5$, calculate the mean and the standard deviation. Solution : Employing the formulas, we obtain Mean = $np = 3 * .5 = 1.5$ Sd = $\sqrt{np(1 - p)} = \sqrt{3 * .5 * .5} = \sqrt{0.75} = 0.866 \dots$ Problem 8 : An exit poll is taken of 3000 voters in a statewide election. Let X denote the number who voted in favor of a special proposition designed to lower property taxes and raise the sales tax. Suppose that in the population, exactly 50% voted for it. a. Explain why this scenario would seem to satisfy the three conditions needed to use the binomial distribution. Identify n and p for the binomial. b. Find the mean and standard deviation of the probability distribution of X .

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 197 c. Using the normal distribution approximation, give an interval in which you would expect X almost certainly to fall, if truly $p = 0.50$. d. Now, suppose that the exit poll had $x = 1706$. What would this suggest to you about the actual value of p ? Normal distribution : A random variable is called continuous when its possible values form an interval. For instance, a recent study analyzed the time that people take to commute to work. Commuting time can be measured with real number values, such as between 0 and 150 minutes. Probability distributions of continuous random variables assign probabilities to any interval of the possible values. For instance, a probability distribution for commuting time provides the probability that the travel time is less than 15 minutes or that the travel time is between 30 and 60 minutes. The probability that a random variable falls in any particular interval is between 0 and 1, and the probability of the interval that contains all the possible values equals 1. When a random variable is continuous, the intervals of values for the bars of a histogram can be chosen as desired. For instance, one possibility for commuting time is $\{0 \text{ to } 30, 30 \text{ to } 60, 60 \text{ to } 90, 90 \text{ to } 120, 120 \text{ to } 150\}$, quite wide intervals. By contrast, using $\{0 \text{ to } 1, 1 \text{ to } 2, 2 \text{ to } 3, \dots, 149 \text{ to } 150\}$ gives lots of very narrow intervals. As the number of intervals increases, with their width narrowing, the shape of the histogram gradually approaches a smooth curve. We'll use such curves to portray probability distributions of continuous random variables. Probability Distribution of a Continuous Random Variable Many intervals

NSOU ? PGSW-VII 198 A continuous random variable has possible values that form an interval. Its probability distribution is specified by a curve that determines the probability that the random variable falls in any particular interval of values. Each interval has probability between 0 and 1. This is the area under the curve, above that interval. The interval containing all possible values has probability equal to 1, so the total area under the curve equals 1. Some probability distributions merit special attention because they are useful for many applications. They have formulas or tables that provide probabilities of the possible outcomes. We next learn about a probability distribution, called the normal distribution, that is commonly used for continuous random variables. It is characterized by a particular symmetric, bell-shaped curve with two parameters—the mean μ and the standard deviation σ . Normal Distribution The normal distribution is symmetric, bell-shaped, and characterized by its mean μ and standard deviation σ . The probability within any particular number of standard deviations of μ is the same for all normal distributions. This probability equals 0.68 within 1 standard deviation, 0.95 within 2 standard deviations, and 0.997 within 3 standard deviations. See Figure 6.5. Interval Smooth curve approximation Probability

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 199 The property of the normal distribution in the definition tells us probabilities within 1, 2, and 3 standard deviations of the mean. The multiples 1, 2, and 3 of the number of standard deviations from the mean are denoted by the symbol z in general. For instance, The Normal Distribution. The probability equals 0.68 within 1 standard deviation of the mean, 0.95 within 2 standard deviations, and 0.997 within 3 standard deviations. The Probability between $\mu - z\sigma$ and $\mu + z\sigma$. This is the area highlighted under the curve. It is the same for every normal distribution and depends only on the value of z . Figure 6.5 showed this for $z = 1, 2, \text{ and } 3$, but z does not have to be an integer—it can be any number.

NSOU ? PGSW-VII 200 $z = 2$ for 2 standard deviations. For each fixed number z , the probability within z standard deviations of the mean is the area under the normal curve between $\mu - z\sigma$ and $\mu + z\sigma$. For every normal distribution, this probability is 0.68 for $z = 1$, so 68% of the area (probability) of a normal distribution falls between $\mu - \sigma$ and $\mu + \sigma$. Similarly, this probability is 0.95 for $z = 2$, and nearly 1.0 for $z = 3$ (that is, between $\mu - 3\sigma$ and $\mu + 3\sigma$). The total probability for any normal distribution equals 1.0. The normal distribution is the most important distribution in statistics, partly because many variables have approximately normal distributions. The normal distribution is also important because it approximates many discrete distributions well when there are a large number of possible outcomes. The main reason for the prominence of the normal distribution is that many statistical methods use it even when the data are not bell shaped. Note : the z -score for an observation is the number of standard deviations that it falls from the mean. The z -score can be used with any distribution for a quantitative variable. This includes both normal and non-normal distributions. Finding Probabilities for the Normal Distribution : As we'll discuss, the probabilities 0.68, 0.95, and 0.997 within 1, 2, and 3 standard deviations of the mean are no surprise, because of the empirical rule. But what if we wanted to find the probability within, say, 1.43 standard deviations? We have a table that enables us to find normal probabilities. It tabulates the normal cumulative probability, the probability of falling below the point $\mu + z\sigma$. The leftmost column of the above-mentioned table lists the values for z to one decimal point, with the second decimal place listed above the columns. $\mu + z\sigma$ Cumulative probability

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 201 Table below shows a small excerpt from the original table. The tabulated probability for $z = 1.43$ falls in the row labeled 1.4 and in the column labeled 0.03. It equals 0.9236. For every normal distribution, the probability that falls below $\mu + 1.43\sigma$ equals 0.9236. Second Decimal Place of z z .00 .01 .02 .03 .04 .05 .06 .07 .08 .09 0.0 .5000 .5040 .5080 .5120 .5160 .5199 .5239 .5279 .5319 .5359 ... 1.3 .9032 .9049 .9066 .9082 .9099 .9115 .9139 .9147 .9162 .9177 1.4 .9192 .9207 .9222 .9236 .9251 .9265 .9278 .9292 .9306 .9319 1.5 .9332 .9345 .9357 .9370 .9382 .9394 .9406 .9418 .9429 .9441 Part of the original Table for Normal Cumulative (Left-Tail) Probabilities. The top of the table gives the second digit for z . The table entry is the probability falling below $\mu + z\sigma$, for instance, 0.9236 below $\mu + 1.43\sigma$ for $z = 1.43$. Since an entry in Table A is a probability below $\mu + z\sigma$, one minus that probability is the probability above $\mu + z\sigma$. For example, the right-tail probability above $\mu + 1.43\sigma$ equals $1 - 0.9236 = 0.0764$. By the symmetry of the normal curve, this probability also refers to The Normal Cumulative Probability, Less than z Standard Deviations above the Mean. Table A lists a cumulative probability of 0.9236 for $z = 1.43$, so 0.9236 is the probability less than 1.43 standard deviations above the mean of any normal distribution (that is, below $\mu + 1.43\sigma$). The complement probability of 0.0764 is the probability above $\mu + 1.43\sigma$ in the right tail.

NSOU ? PGSW-VII 202 the left tail below $\mu - 1.43\sigma$, which you'll find in the original table by looking up $z = -1.43$. The negative z-scores in the table refer to cumulative probabilities for random variable values below the mean. Since the probability is 0.0764 in each tail, the total probability more than 1.43 standard deviations from the mean equals $2(0.0764) = 0.1528$. The total probability equals 1, so the probability falling within 1.43 standard deviations of the mean equals $1 - 0.1528 = 0.8472$, about 85%. For instance, 85% of women in North America have height between $\mu - 1.43\sigma = 65.0 - 1.43(3.5) = 60$ inches and $\mu + 1.43\sigma = 65 + 1.43(3.5) = 70$ inches (that is, between 5 feet and 5 feet, 10 inches). Normal Probabilities and the Empirical Rule : The empirical

52%

MATCHING BLOCK 59/88

W

rule states that for an approximately bell-shaped distribution, about 68% of observations fall within 1 standard deviation of the mean, 95% within 2 standard deviations,

and all or nearly all within 3. In fact, those percentages came from probabilities calculated for the normal distribution. For instance, a value that is 2 standard deviations below the mean has $z = -2.00$. The cumulative probability below $\mu - 2\sigma$ listed in the table opposite $z = -2.00$ is 0.0228. The right-tail probability above $\mu + 2\sigma$ also equals 0.0228, by symmetry. See the figure drawn below. The probability falling more than 2 standard deviations from the mean in either tail is $2(0.0228) = 0.0456$. Thus, the probability that falls within 2 standard deviations of the mean equals $1 - 0.0456 = 0.9544$. When a variable has a normal distribution, 95.44% of the distribution (95%, rounded) falls within 2 standard deviations of the mean.

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 203 Note : The empirical rule stated the probabilities as being approximate rather than exact because that rule referred to all approximately bell-shaped distributions, not just the normal. Normal Probability within 2 Standard Deviations of the Mean. Probabilities in one tail determine probabilities in the other tail by symmetry. Subtracting the total two-tail probability from 1.0 gives probabilities within a certain distance of the mean. To Find the Value of z for a Certain Cumulative Probability : In practice, we'll sometimes need to find the value of z that corresponds to a certain normal cumulative probability. How can we do this? To illustrate, let's find the value of z for a cumulative probability of 0.025. We look up the cumulative probability of 0.025 in the body of the table. It corresponds to $z = -1.96$, since it is in the row labelled -1.9 and in the column labelled 0.06. So, a probability of 0.025 lies below $\mu - 1.96\sigma$. Likewise, a probability of 0.025 lies above $\mu + 1.96\sigma$. A total probability of 0.050 lies more than 1.96σ from μ . Precisely 95.0% of a normal distribution falls within 1.96 standard deviations

of the mean. We've seen previously that 95.44% falls within 2.00 standard deviations, and we now see that precisely 95.0% falls within 1.96 standard deviations. Example 8 : ABC is a society of high-IQ people whose members have IQ scores at the 98th percentile or higher. The XYZ IQ scores that are used as the basis for admission into ABC are approximately normally distributed with a mean of 100 and a standard deviation of 16. a. How many standard deviations above the mean is the 98th percentile? b. What is the IQ score for that percentile? Solution : a. For a value to represent the 98th percentile, its cumulative probability must equal 0.98, by the definition of a percentile. The cumulative probability of 0.980 in the body of the table corresponds to $z = 2.05$. The 98th percentile is 2.05 standard deviations above the mean, at $\mu + 2.05\sigma$. b. Since $\mu = 100$ and $\sigma = 16$, the 98th percentile of IQ scores equals $\mu + 2.05\sigma = 100 + 2.05(16) = 133$. In summary, 98% of the IQ scores fall below 133, and an IQ score of at least 133 is required to join ABC. About 2% of IQ scores are higher than 133. By symmetry, about 2% of IQ scores are lower than $\mu - 2.05\sigma = 100 - 2.05(16) = 67$. This is the second percentile. The remaining 96% of the IQ scores fall between 67 and 133, which is the region within 2.05 standard deviations of the mean. 0.98 probability 0.02 tail probability 98th percentile = $\mu + 2.05\sigma$

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 205 Problem 9 : z-score for given probability in tails For a normal distribution, a. Find the z-score for which a total probability of 0.02 falls more than z standard deviations (in either direction) from the mean, that is, below $\mu - z\sigma$ or above $\mu + z\sigma$. b. For this z, explain why the probability more than z standard deviations above the mean equals 0.01. c. Explain why $\mu + 2.33\sigma$ is the 99th percentile. To find probabilities using Z : We've used the symbol z to represent the number of standard deviations a value falls from the mean. If we have a value x of a random variable, how can we figure out the number of standard deviations it falls from the mean μ of its probability distribution? The difference between x and μ equals $x - \mu$. The z-score expresses this difference as a number of standard deviations, using $z = (x - \mu)/\sigma$. z-Score for a Value of a Random Variable the z-score for a value x of a random variable is the number of standard deviations that x falls from the mean μ . It is calculated as $z = (x - \mu)/\sigma$. The formula for the z-score is useful when we are given the value of x for some normal random variable and need to find a probability relating to that value. We convert x to a z-score and then use a normal table to find the appropriate probability. Example 9 : The Scholastic Aptitude Test (SAT), a college entrance examination, has three components: critical reading, mathematics, and writing. The scores on each component are approximately normally distributed with mean $\mu = 500$ and standard deviation $\sigma = 100$. The scores range from 200 to 800 on each component. a. If your SAT score from one of the three components was $x = 650$, how many standard deviations from the mean was it? b. What percentage of SAT scores was higher than yours?

NSOU ? PGSW-VII 206 Solution : a. The SAT score of 650 has a z-score of $z = 1.50$ because 650 is 1.50 standard deviations above the mean. In other words, $x = 650 = \mu + z\sigma = 500 + z(100)$, where $z = 1.50$. We can find this directly using the formula $z = (x - \mu)/\sigma = 650 - 500 = 100 = 1.50$. b. The percentage of SAT scores higher than 650 is the right-tail probability above 650, for a normal random variable with mean $\mu = 500$ and standard deviation $\sigma = 100$. From Table A, the z-score of 1.50 has cumulative probability 0.9332. That's the probability below 650, so the right-tail probability above it is $1 - 0.9332 = 0.0668$. Only about 7% of SAT test scores fall above 650. In summary, a score of 650 was well above average, in the sense that relatively few students scored higher. Positive z-scores occur when the value x falls above the mean μ . Negative z-scores occur when x falls below the mean. For instance, an SAT score = 350 has a z-score of $z = (x - \mu)/\sigma = (350 - 500) / 100 = -1.50$. The SAT score of 350 is 1.50 standard deviations below the mean. The probability that an SAT score falls below 350 is also 0.0668. Problem 10 : A World Health Organization study (the MONICA project) of health in various countries reported that in Canada, systolic blood pressure readings have a mean of 121 and a standard deviation of 16. A reading above 140 is considered to be high blood pressure. a. What is the z-score for a blood pressure reading of 140? 200 500 650 800 0.0668 0.9332

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 207 b. If systolic blood pressure in Canada has a normal distribution, what proportion of Canadians suffers from high blood pressure? c. What proportion of Canadians has systolic blood pressures in the range from 100 to 140? d. Find the 90th percentile of blood pressure readings. The Standard Normal Distribution has Mean = 0 and Standard Deviation = 1 Many statistical methods refer to a particular normal distribution called the standard normal distribution. Standard Normal Distribution The standard normal distribution is the normal distribution with mean $\mu = 0$ and standard deviation $\sigma = 1$. It is the distribution of normal z-scores. For the standard normal distribution, the number falling z standard deviations above the mean is $\mu + z\sigma = 0 + z(1) = z$, simply the z-score itself. For instance, the value of 2.0 is two standard deviations above the mean, and the value of -1.3 is 1.3 standard deviations below the mean. As Figure drawn below shows, the original values are the same as the z-scores, since $z = (x - \mu)/\sigma = (x - 0)/1 = x$.

NSOU ? PGSW-VII 208 The previous example (example 6) dealt with SAT scores, having $\mu = 500$ and $\sigma = 100$. Suppose we convert each SAT score x to a z-score by using $z = (x - \mu)/\sigma = (x - 500)/100$. Then $x = 650$ converts to $z = 1.50$, and $x = 350$ converts to $z = -1.50$. When the values for a normal distribution are converted to z-scores, those z-scores have a mean of 0 and have a standard deviation of 1. That is, the entire set of z-scores has the standard normal distribution. z-Scores and the Standard Normal Distribution When a random variable has a normal distribution and its values are converted to z-scores by subtracting the mean and dividing by the standard deviation, the z-scores have the standard normal distribution (mean = 0, standard deviation = 1). A Quick Look at the Theory of Probability People talk loosely about chance all the time, without doing any harm. What are the chances of getting a job? of meeting someone? of rain tomorrow? But for scientific purposes, it is necessary to give the word chance a definite, clear interpretation. This turns out to be hard, and mathematicians have struggled with the job for centuries. They have developed some careful and rigorous theories, but these theories cover just a small range The Standard Normal Distribution. This has mean = 0 and standard deviation = 1. The random variable value x is the same as its z-score.

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 209 of the cases where people ordinarily speak of chance. This section of the module will present the frequency theory, which works best for processes which can be repeated over and over again, independently and under the same conditions. Many games fall into this category, and the frequency theory was originally developed to solve gambling problems. One simple game of chance involves betting on the toss of a coin. The process of tossing the coin can be repeated over and over again, independently and under the same conditions. The chance of getting heads is 50%: in the long run, heads will turn up about 50% of the time. Take another example. A die (plural, "dice") is a cube with six faces, labelled 1,2,3,4,5,6. When the die is rolled, the faces are equally likely to turn up. The chance of getting an ace— is 1 in 6, or sixteen and two-third percentages. The interpretation: if the die is rolled over and over again, repeating the basic chance process under the same conditions, in the long run an ace will show about sixteen and two-third percentages of the time. The chance of something gives the percentage of time it is expected to happen, when the basic process is done over and over again, independently and under the same conditions. If something is impossible, it happens 0% of the time. At the other extreme, if something is sure to happen, then it happens 100% of the time. All chances are between these two extremes. Chances are between 0% and 100%. Here is another basic fact. Suppose you are playing a game and have a 45% chance to win. In other words, you expect to win about 45% of the time. So, you must expect to lose the other 55% of the time. The chance of something equals 100% minus the chance of the opposite being Example 1 : A box contains red marbles and blue marbles. One marble is drawn at random from the box (each marble has an equal chance to be drawn). If it is red, you win \$1. If it is blue, you win nothing. You can choose between two boxes :

NSOU ? PGSW-VII 210 ? box A contains 3 red marbles and 2 blue ones. ? box B contains 30 red marbles and 20 blue ones. Which box offers a better chance of winning, or are they the same? Solution : Some people prefer box A, because it has fewer blue marbles. Others prefer B, because it has more red marbles. Both views are wrong. The two boxes offer the same chance of winning, 3 in 5. To see why, imagine drawing many times at random from box A (replacing the marble after each draw, so as not to change the conditions of the experiment). In the long run each of the 5 marbles will appear about 1 time in 5. So, the red marbles will turn up about 3/5 of the time. With box A, your chance of drawing a red marble is 3/5, that is, 60%. Now imagine drawing many times at random with replacement from box B. Each of the 50 marbles will turn up about 1 time in 50. But now there are 30 red marbles. With box B, your chance of winning is $30/50 = 3/5 = 60\%$, just as for box A. What counts is the ratio number of red marbles/total number of marbles. The ratio is the same in both boxes. Problem 1 : A coin will be tossed 1,000 times. About how many heads are expected? Problem 2 : A die will be rolled 6,000 times. About how many aces are expected? Problem 3 : Match the numerical answers with the verbal descriptions (which may be used more than once). Numerical answer Verbal description (a) -50% (i) This is as likely to happen as not. (b) 0% (ii) This is very likely to happen, but it's not certain. (c) 10% (iii) This won't happen. (d) 50% (iv) This may happen, but it's not likely. (e) 90% (v) This will happen, for sure. (f) 100% (vi) There's a bug in the program. (g) 200%

MATCHING BLOCK 61/88

W

probability of event B occurring, given that event A has occurred,

is denoted by P(B|A) and is read as "probability of B, given A. Example 2 : Two cards are selected in sequence from a standard deck of 52 playing cards. Find the probability that the second card is a queen, given that the first card is a king. (Assume that the king is not replaced.) Solution : Because the first card is a king and is not replaced, the remaining deck has 51 cards, 4 of which are queens. So, $P(B|A) = 4/51 = 0.078$ Note : A deck of cards has 4 suits: clubs, diamonds, hearts, spades. There are 13 cards in each suit: 2 through 10, jack, queen, king, ace. So, there are $4 \times 13 = 52$ cards in the deck.

NSOU ? PGSW-VII 212 Standard Deck of Playing Cards Hearts Diamonds Spades Clubs A♠ A♦ A♣ A♣ K♠ K♦ K♣ K♣ Q♠ Q♦ Q♣ Q♣ J♠ J♦ J♣ J♣ 10♠ 10♦ 10♣ 10♣ 9♠ 9♦ 9♣ 9♣ 8♠ 8♦ 8♣ 8♣ 7♠ 7♦ 7♣ 7♣ 6♠ 6♦ 6♣ 6♣ 5♠ 5♦ 5♣ 5♣ 4♠ 4♦ 4♣ 4♣ 3♠ 3♦ 3♣ 3♣ 2♠ 2♦ 2♣ 2♣ Example 3 : The table below shows the results of a study in which researchers examined a child's IQ and the presence of a specific gene in the child. Find the probability that a child has a high IQ, given that the child has the gene. Gene Gene not present present Total High IQ 33 19 52 Normal IQ 39 11 50 Total 72 30 102 Solution : There are 72 children who have the gene. So, the sample space consists of these 72 children, as shown at the left. Of these, 33 have a high IQ. So, $P(B|A) = 33/72 = 0.458$ The probability that a child has a high IQ, given that the child has the gene, is about 0.458.

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 213 Sample Space Gene present High IQ 33 Normal IQ 39 Total 72 Example 4 : A deck of cards is shuffled, and the top two cards are put on a table, face down. You win \$1 if the second card is the queen of hearts. (a) What is your chance of winning the dollar? (b) You turn over the first card. It is the seven of clubs. Now what is your chance of winning? Solution : (a) The bet is about the second card, not the first. Initially, this will seem a little strange. Some illustrations may help. ? If the first card is the two of spades and the second is the queen of hearts, you win. ? If the first card is the jack of clubs and the second is the queen of hearts, you win. ? If the first card is the seven of clubs and the second is the king of hearts, you lose. The bet can be settled without even looking at the first card. The second card is all you need to know. The chance of winning is $1/52$. To see why, think about shuffling the deck. That brings the cards into random order. The queen of hearts has to wind up somewhere. There are 52 possible positions, and they are all equally likely. So, there is 1 chance in 52 for her to wind up as the second card in the deck—and bring you the dollar. (b) There are 51 cards left. They are in random order, and the queen of hearts is one of them. She has 1 chance in 51 to be on the table. Your chance goes up a little, to $1/51$. That is the answer.

NSOU ? PGSW-VII 214 The $1/51$ in part (b) is a conditional chance. The problem puts a condition on the first card: it has to be the seven of clubs. A mathematician might talk about the conditional probability that the second card is the queen of hearts given the first card is the seven of clubs. To emphasize the contrast, the $1/52$ in part (a) is called an unconditional chance: the problem puts no conditions on the first card. Problem 4 : A penny is tossed 5 times. (a) Find the chance that the 5th toss is a head. (b) Find the chance that the 5th toss is a head, given the first 4 are tails. Problem 5 : Five cards are dealt off the top of a well-shuffled deck. (a) Find the chance that the 5th card is the queen of spades. (b) Find the chance that the 5th card is the queen of spades, given that the first 4 cards are hearts. The multiplication rule : To find the probability of two events occurring in sequence, you can use the Multiplication Rule. The probability that two events A and B will occur in sequence is :

75%

MATCHING BLOCK 62/88

W

$P(A \text{ and } B) = P(A) \cdot P(B|A)$. If events A and B

are independent, then the rule can be simplified to $P(A \text{ and } B) = P(A) \cdot P(B)$. This simplified rule can be extended to any number of independent events. Example 5 : Two cards are selected, without replacing the first card, from a standard deck of 52 playing cards. Find the probability of selecting a king and then selecting a queen. Solution : $P(K \text{ and } Q) = P(K) \cdot P(Q|K) = (4/52) \cdot (4/51) = (16/2652) = 0.006$ So,

59%

MATCHING BLOCK 63/88

W

the probability of selecting a king and then a queen without replacement is about 0.006. Example 6 : A coin is tossed, and a die is rolled. Find the probability of tossing a head and then rolling a 6.

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 215 Solution : The events are independent. $P(H \text{ and } 6) = P(H) \cdot P(6) = (1/2) \cdot (1/6) = (1/12) = 0.083$ So,

100%

MATCHING BLOCK 64/88

W

the probability of tossing a head and then rolling a 6

is about 0.083. Problem 6 : A deck of cards is shuffled, and two cards are dealt. What is the chance that both are aces? Problem 7 : A coin is tossed twice. What is the chance of a head followed by a tail? Problem 8 : A coin is tossed 3 times. (a) What is the chance of getting 3 heads? (b) What is the chance of not getting 3 heads? (c) What is the chance of getting at least 1 tail? (d) What is the chance of getting at least 1 head? Independence : Two things are independent if the chances for the second given the first are the same, no matter how the first one turns out. Otherwise, the two things are dependent. Example 7 : Someone is going to toss a coin twice. If the coin lands heads on the second toss, you win a dollar. (a) If the first toss is heads, what is your chance of winning the dollar? (b) If the first toss is tails, what is your chance of winning the dollar? (c) Are the tosses independent? Solution : If the first toss is heads, there is a 50% chance to get heads the second time. If the first toss is tails, the chance is still 50%. The chances for the second toss stay the same, however the first toss turns out. That is independence. Note : If two things are independent, the chance that both will happen equals the product of their unconditional probabilities. This is a special case of the multiplication rule.

NSOU ? PGSW-VII 216 Problem 9 : Every week you buy a ticket in a lottery that offers one chance in a million of winning. What is the chance that you never win, even if you keep this up for ten years? The Addition Rule : This section is about the chance that at least one of two specified things will happen: either the first happens, or the second, or both. The possibility of both happening turns out to be a complication, which can sometimes be ruled out. Two things are mutually exclusive when the occurrence of one prevents the occurrence of the other: one excludes the other. Example 8 : A card is dealt off the top of a well-shuffled deck. The card might be a heart. Or, it might be a spade. Are these two possibilities mutually exclusive? Solution : If the card is a heart, it can't be a spade. These two possibilities are mutually exclusive. We can now state a general principle for figuring chances. It is called the addition rule. Addition Rule : To find the chance that at least one of two things will happen, check to see if they are mutually exclusive. If they are, add the chances. Example 9 : A card is dealt off the top of a well-shuffled deck. There is 1 chance in 4 for it to be a heart. There is 1 chance in 4 for it to be a spade. What is the chance for it to be in a major suit (hearts or spades)? Solution : The question asks for the chance that one of the following two things will happen : ? the card is a heart. ? the card is a spade. If the card is a heart then it can't be a spade: these are mutually exclusive events. So it is legitimate to add the chances. The chance of getting a card in a major suit is $1/4 + 1/4 = 1/2$. (A check on the reasoning: there are 13 hearts and 13 spades, so $26/52 = 1/2$ of the cards in the deck are in a major suit.) Note : If you want to find the chance that at least one event occurs, and the events are not mutually exclusive, do not add the chances: the sum will be too big.

PRINTTECH D/AA (CD) A new compose/MSW-P-VII (M-2) 4TH PROOF NSOU ? PGSW-VII 217 Blindly adding chances can give the wrong answer, by double counting the chance that two things happen. With mutually exclusive events, there is no double counting: that is why the addition rule works. Technically, The probability that events A or B will occur,

64%

MATCHING BLOCK 65/88

SA

StatisticalMethodsSpring2010.docx (D3486631)

$P(A \text{ or } B)$, is given by $P(A \text{ or } B) = P(A) + P(B) - P(A \text{ and } B)$ If events A and B

are mutually exclusive, then the rule can be simplified to $P(A \text{ or } B) = P(A) + P(B)$. This simplified rule can be extended to any number of mutually exclusive events. In words, to find the probability that one event or the other will occur, add the individual probabilities of each event and subtract the probability that they both occur. As shown in the Venn diagram at the left, subtracting $P(A \text{ and } B)$ avoids double counting the probability of outcomes that occur in both A and B. Problem 10 : You select a card from a standard deck of 52 playing cards. Find the probability that the card is a 4 or an ace. Problem 11 : You roll a die. Find the probability of rolling a number less than 3 or rolling an odd number. Note : What's the difference between mutually exclusive and independent? "Mutually exclusive" is one idea; independence is another. Both ideas apply to pairs of events and say something about how the events are related. However, the relationships are quite different. ? Two events are mutually exclusive if the occurrence of one prevents the other from happening. ?

100%

MATCHING BLOCK 66/88

SA

StatisticalMethodsSpring2010.docx (D3486631)

Two events are independent if the occurrence of one does not

change the chances for the other. Note : When do I add and when do I multiply? The addition rule, like the multiplication rule, is a way of combining chances. However, the two rules solve different problems. ? The addition rule finds the chance that at least one of two things happens. ? The multiplication rule finds the chance that two things both happen.

NSOU ? PGSW-VII 218 So, the first step in deciding whether to add or to multiply is to read the question : Do you want to know $P(A \text{ or } B)$, $P(A \text{ and } B)$, or something else entirely? But there is also a second step—because the rules apply only if the events are related in the right way. ? Adding the probabilities of two events requires them to be mutually exclusive. ? Multiplying the unconditional probabilities of two events requires them to be independent. (For dependent events, the multiplication rule uses conditional probabilities.) 7.7 Conclusion We developed a knowledge about measures of central tendencies and dispersion. The solved examples helped us to understand the concept in a better manner. 7.8 Exercise 1. Define measures of central tendencies. 2. What is Range. 3. What is Mean. 4. What is Mode 7.9 References I. NSOU ? PGSW-VII 220 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 1.2 How to determine the strength and direction of a correlation based on Pearson's r 1.3 How to use the coefficient of determination 1.4 How to read scatter grams and correlation tables 8.1 Introduction Introduction: Analyzing relationships between variables that affect people is as important as analyzing relationships between people. Correlational methods help you better understand people, communities, and policy. If you are interested in what protective factors might help develop resilience in your client, correlations help with that. If you have ever wondered whether a person's income can help predict school outcomes for their children, correlations help with that too. Or if you have ever wondered whether older adults who are lonely are more likely to experience poor health outcomes, correlations can provide useful context there too. The relationships between these variables affect the people you work with, and correlations help you analyze variables more effectively. 8.2 What are Independent and Dependent Variables? A variable is an entity that is being measured. There are two kinds of variables: independent and dependent. ? An independent variable (x) is the input, the one that is manipulated in a scientific experiment, or one that is stable and unaffected by the other variables you are trying to measure. ? A dependent variable (y) is the output, the one that has a consequent role in relation to the independent variable; changes made to the independent variable affect the dependent variable.

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 221 For example, in a comparison of income and poverty, income is the independent variable. Poverty is the dependent variable because a person's income level determines whether that person is above or below the poverty line. In a clinical setting, the dose of an antianxiety medication is the independent variable, and level of reported anxiety is the dependent variable. Adjusting the dose of the medication should affect the level of anxiety. The level of anxiety is dependent on adjusting the dosage of medication to find the best fit. 8.3 How do I measure correlation? Pearson's r , also known as the Pearson product-moment correlation coefficient, was named for British statistician Karl Pearson. Pearson's r is a common statistical tool you will come across in academic studies. As its name suggests is a measure of correlation. Specifically, Pearson's r creates a scale for understanding how correlated two variables are with each other. For your social work practice, understanding and interpreting Pearson's r is more important than being able to calculate it. 8.3.1 How Do I know how strong a relationship is? Pearson's r measures both the strength of a relationship and its direction. ? Pearson's r can only have a value between -1 and 1 . ? The strength of a relationship is determined by the distance of r from 0 , or the absolute value of r . ? The direction of a relationship is determined by whether the value is positive or negative. Figure 1.1 : Relationships and correlation If a correlation is positive, one variable increases as the other increases. Variable X Variable Y If a correlation is negative, one variable increases as the other decreases. Variable X Variable Y

NSOU ? PGSW-VII 222 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 When a correlation is positive, one variable follows the other. If one increases, the other increases. If one decreases, the other decreases. This is a direct relationship. When a correlation is negative, one variable behaves the opposite of the other. If one increases, the other decreases. If one decreases, the other increases. This is an inverse relationship. ? If Pearson's r is equal to 1 , then the relationship is a perfect (very strong) direct relationship. ? If Pearson's r is equal to -1 , then the relationship is a perfect (very strong) inverse relationship. ? If Pearson's r is equal to 0 , then there is no relationship. Consider the values for the strength of a relationship as though they fall on a scale like the one depicted in figure 1.2. Figure 1.2 : Measuring magnitude of Pearson's r A scale for measuring the magnitude of Pearson's r where one end begins with -1.0 and a perfect negative correlation and the other end is 1 with a perfect positive correlation. In the middle is a 0 where there is no relationship at all and between the ends and the middle there are strong, moderate, and weak levels of correlation. 8.4 Spurious Correlations A relationship with either a perfect correlation (1 or -1) or no correlation at all (0) is rare. Some variables are correlated even though no causal relationship exists. These correlations are called spurious correlations. A spurious correlation is misleading because the r value indicates that a correlation exists between two variables but the correlation is produced through the operation of a third causal variable that is not examined by the analysis, or the correlation may be due to random chance. For example, the number of marriages in West Bengal is correlated with the annual deaths caused by lightning strikes in the India at $r = 0.89$. You just learned -1.0 -0.5 0 0.5 1.0 Perfect positive correlation Perfect negative correlation Moderate negative correlation No relationship Moderate positive correlation Strong Weak Weak Strong

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 223 that $r = 0.89$ is considered a strong positive correlation. As more people get married in West Bengal, it must be more likely people in India will be struck by lightning. Could the number of people who get married in West Bengal somehow cause more lightning strikes? Or could the fear of getting struck by lightning cause more people in West Bengal to propose? This relationship does not make sense. When a relationship does not make sense, you should look for other possible explanations. Here are two possible explanations in this case: ? A third variable, population, is driving the relationship. The increase in population is leading both to more marriages in West Bengal and to more people who could potentially be struck by lightning. ? Random chance caused these two values to increase at the same time. Another example of spurious correlation in the social work literature has to do with the relationship between family income and child development. Researchers have argued that income effects are driven by unmeasured factors that are correlated with both income and child outcomes but are not captured when simply looking at income and child development. They argue that rather than income driving the relationship, factors such as parental mental health or motivation drive earnings and also affect child development. The underlying relationship between these other factors leads to a spurious correlation between income and child development. If family income has a spurious relationship with child development, the types of interventions you would consider to improve child outcomes are different. Instead of focusing on connecting families to cash assistance programs or helping parents find jobs, you would prioritize addressing any mental health challenges that may be driving both income insecurity and poor child development.

8.5 How can I understand relationships visually? You can understand correlations visually using a scatterplot or scattergram—a diagram or graph that plots variables to show their relationship. The figure below shows examples of this type of graph. Three graphs showing strong positive correlation, no correlation, and strong negative correlation. The positive correlation has fairly closely clustered data around an upward-sloping line with $r = 0.96$. No correlation has data points scattered in a way that appears random, with no clear clustering of points and an r of 0.04 . The

NSOU ? PGSW-VII 224 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 negative correlation has fairly closely clustered data around a downward-sloping line with $r = -0.94$. Figure 1.3: Understanding correlation using scatterplots In figure 1.3, the left graph shows an example of a strong positive or direct correlation ($r = 0.96$, very close to 1). The values of one variable increase with the values of the other variable. For example, this could show the relationship between years of education and income. As the number of years people spend in school increases, so does their eventual annual income, with individuals who have advanced degrees earning the highest incomes. One variable increases (education level measured by number of years) as the other increases (annual salary measured in dollars). The second graph shows an example of no correlation. While r is not quite zero, this is a very weak correlation ($r = 0.04$). No relationship exists between the two variables plotted here. Even though a trend line is included, you see no clear pattern in the points. This could show the relationship between the amount of coffee people drink and the number of pets they own. One variable (coffee consumed measured in ounces) does not increase or decrease in the same way the other variable (pets measured as the number of cats, dogs, birds, etc.) does. We would expect no relationship to exist between these two variables. The final graph in figure 5.3 shows an example of a strong negative or inverse correlation ($r = -0.94$, very close to -1). The values of one variable decrease as the values of the other variable increase. This could show the relationship between college GPA and alcohol use. As the amount of alcohol regularly consumed by college students increases, the value of their GPA decreases. One variable increases (alcohol consumption measured in number of drinks), but the other decreases (GPA). Not all relationships are so clear, with either a strong or weak correlation. In figure 1.4, the relationships are much weaker than those shown in figure 1.3. In $p=0.96$ $p=0.04$ $p=-0.94$ No correlation Strong negative correlation Strong positive correlation

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 225 figure 1.4, despite some outliers and no tightly clustered points, the r value is still 0.6 or -0.6 , a moderate correlation. Figure 1.4: Scatterplots for moderate correlations Two graphs showing moderate positive and negative correlations. The positive correlation has some data points that are closely clustered around an upward-sloping line but others that are further from those clusters; $r = 0.6$. The negative correlation has some data points that are closely clustered around a downward-sloping line but others that are further from those clusters; $r = -0.6$. When you analyze correlation data, you must understand the relationship between the strength or magnitude of a correlation and the direction of the correlation. Of the following r values, which has the stronger correlation? 0.34 Or -0.45 The value of $r = -0.45$ is a stronger correlation than $r = 0.34$. You first use the absolute value of r to determine the magnitude of a correlation and then take into account the direction of the relationship between the variables. The absolute values here are 0.34 and 0.45 , and 0.45 is stronger than 0.34 . A negative sign before the value for r does not affect the strength of the relationship, only the direction. If there is a negative sign, then you know the relationship is inverse. Without a negative sign, the relationship is direct or positive. Correlations, Risk, and Resilience Much of what we know about mental illness, particularly about the risk and resilience factors, is based on studies of correlations between diagnoses and genetic and environmental factors. As a social worker, you will use the results of correlational research to inform your work with clients and to shape your practice. Consider the following statements from an article in the journal Social Work $r=0.60$ $r=-0.60$ Positive correlation Negative correlation

NSOU ? PGSW-VII 226 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 Research: Risk factors are markers, correlates, and—in a best-case scenario— causes. For example, although other factors are related to serious mental illnesses such as schizophrenia, parental psychopathology is thought to influence the likelihood of developing the disorder. How it does that—whether through genetic or environmental influences—is not yet fully understood. But the word “risk” denotes the fact that a group of people with a similar characteristic is more likely than others in the population at large to develop a problem (in this case, schizophrenia). The article is describing correlational research. There is a relationship between mental illnesses such as schizophrenia and whether parents have also experienced a mental illness, but setting up experiments to find a causal relationship is impossible. You cannot control who a person’s parents are, nor whether they have a mental illness. Instead, once an individual has been diagnosed later in life, researchers can look back at factors from the person’s childhood, or at the person’s lifestyle for environmental factors, but cannot limit or control factors in the person’s life to set up a more rigorous experiment. Correlation does not guarantee there is a causal relationship, but when you cannot achieve causal results, correlations can create a body of useful literature for practitioners to draw from. The article goes on to describe some risk factors that are correlated with mental health disorders: Some individual, familial, and extra-familial factors appear to affect many disorders concomitantly and, in that sense, they are “nonspecific” risks. They elevate risk for a variety of conditions. These risk factors include child abuse; chronic family conflict; unskilled parenting; academic failure; peer rejection; poverty; racism, sexism, and other types of discrimination; and neighborhood disorganization. Imagine you are working in a high school. You know from this article that parental psychopathology is correlated with mental illness and that experiences of child abuse, academic failure, and poverty are also correlated with higher risks. This knowledge could help you prioritize students for mental health screenings and early intervention. It could lead you to include questions on your intake form about students’ family history with different conditions. If you work in a school where poverty and racism are common experiences, this correlational research may motivate you to develop resilience tools and training for students to mediate some of these risk factors. Fraser, Mark W., Maeda J. Galinsky, and Jack M. Richman. 1999. “Risk, Protection, and Resilience: Toward a Conceptual Framework for Social Work Practice.” *Social Work Research* 23(3): 131–143.

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 227 8.6 How do I read a correlation table? Scholarly articles that discuss correlation often include a correlation table or correlation matrix. Table 1.1 is an example of a correlation table. You may have never seen a table like this, but it can provide a lot of information. Table 1.1

	1	2	3	4
1. Poverty	1	0.24	0.20	0.70
2. Population	0.24	1	0.53	0.15
3. Violent crime rate	0.20	0.53	1	0.26
4. Unemployment rate	0.70	0.15	0.26	1

1. First, notice that there are numbers beside each variable name and along the top of the table. This is a common shorthand used in correlation tables instead of including the variable names in the table twice. When there is a 1 at the top of the table, it is in place of “Poverty.” This method allows the author to save space, but the numbers could be replaced with the name of the variable without changing the results in the table. Notice that the number 1 is repeated along the diagonal; in other tables, these 1s may be replaced with dashes or blank spaces. The 1 occurs when a variable is compared to itself. For example, where “Violent crime rate” and column 3 meet in the table, there is a 1, indicating a perfect correlation between these two variables because they are the same variable. In figure 1.5 the 1s are highlighted for when a variable is compared to itself.

1 2 3 4 1. Poverty 1 0.24 0.20 0.70 2. Population 0.24 1 0.53 0.15 3. Violent crime rate 0.20 0.53 1 0.26 4. Unemployment rate 0.70 0.15 0.26 1

Figure 1.5: Perfect correlations in a correlation table A correlation table highlighting the places where a variable intersects with itself in the table and therefore has a perfect correlation. Where this happens, a 1 is shown in the table, and those 1s create a diagonal line through the center of the correlation table. To find the value of the Pearson’s r for each set of variables, you find the intersection where the two variables meet. In figure 1.6, you can see that if you want to find the r value for the relationship between Poverty and Violent crime rate (indicated by the number 3 at the top of the table), you find the point where the row and column intersect. In this case, the intersection point is at r = 0.20.

	1	2	3	4
1. Poverty	1	0.24	0.20	0.70
2. Population	0.24	1	0.53	0.15
3. Violent crime rate	0.20	0.53	1	0.26
4. Unemployment rate	0.70	0.15	0.26	1

Figure 1.6: Finding correlations in a correlation table A correlation table indicating the intersection between the variable Poverty and the variable Violent crime rate. The row for Poverty is highlighted, as is the third column, which corresponds to Violent crime rate. The Pearson’s r for this relation- ship is found where the two highlighted areas cross. You may also see data tables that looks like table 1.2.

	1	2	3	4
1. Poverty	–	–	–	–
2. Population	0.24	–	–	–
3. Violent crime rate	0.20	0.53	–	–
4. Unemployment rate	0.70	0.15	0.26	1

In this table, half of the table is left blank because the values simply repeat those listed in the lower half of the table. All the information represented in table 1.1 is still present in table 1.2, but repeating values are only displayed once. If you look again at table 5.1, you will notice that if you find where Poverty intersects with column 3 for Violent crime rate, it is 0.20. If you follow Poverty in row 1 to column 3 for Violent crime rate in table 1.2, you will not find a value. Instead, follow row 3 for Violent crime rate to column 1 for Poverty to find the same 0.20.

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 229 1 2 3 4 1. Poverty 1 0.24 0.20 0.70 2. Population 0.24 1 0.53 0.15 3. Violent crime rate 0.20 0.53 1 0.26 4. Unemployment rate 0.70 0.15 0.26 1

Figure 1.7: Mirrored data in correlation tables In a correlation table, there are two places where the same variables intersect. When looking for the relationship between violent crime and poverty you can either go to the first row for Poverty and the third column for Violent crime rate to find the Pearson's r , or you can look at the third row and the first column. The values you find in these two locations will be the same.

8.7 How can I predict variance? You may want to use correlations to predict what will happen in the future rather than examine what has already happened. Pearson's r cannot help with this, but the coefficient of determination, referred to as r^2 , can. Variance is simply a measure of how much a set of numbers differs from their average value.

72%

MATCHING BLOCK 67/88

SA MATH 201 BUSINESS STATISTICS.pdf (D40557061)

The coefficient of determination determines the proportion of the variance in the dependent variable that is predictable from the independent variable. For example, the coefficient of determination

might indicate that an increase in the amount of exercise people do each day can predict 20 percent of the change in their weight over a given period of time. The calculation for r^2 is relatively simple. Once you find the value of r , you square this value. Because all r values are between -1 and 1 , the squaring operation results in a smaller value for r^2 than for r . Suppose, for example, that $r = 0.65$. $r^2 = 0.65^2 = 0.65 \times 0.65 = 0.42$ When $r^2 = 0.42$, then 42 percent of the variation in one variable is predicted by the variance in the other variable, or one variable is 42 percent effective at predicting the other.

NSOU ? PGSW-VII 230 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 Setting Priorities Using the Coefficient of Determination Often social workers have to make choices about how to target services. Resources are limited, and they need to be used effectively. Understanding correlations and coefficients of determination can provide context for decisions about how to use scarce resources. For example, if you work for an organization that addresses intimate-partner violence (IPV) and you want to start a prevention program, what population should you focus your resources on? You may not have the capacity to serve everyone. Is there a way to target your services to have the greatest effect? Some studies have tried to find predictive variables for the incidence of IPV. These studies looked for relationships among variables such as education level, employment status, self-esteem, experience or viewing of domestic violence as a child, previous criminal justice system interactions, and many other factors. If you can only serve a limited number of people, what factors should you prioritize to increase the likelihood of achieving your goal of decreasing IPV in the future? If the education level for your potential participants varies, you can look at the correlation between education level and incidences of IPV. Suppose a study found $r = 0.60$ for incidence of IPV and partner education level. $r^2 = 0.60^2 = 0.60 \times 0.60 = 0.36$ So, a partner's education level can account for 36 percent of the variation in incidence of IPV. A partner's education level may not be the best way to prioritize participation in the program, but in social science 36 percent is quite strong. Another study found $r = 0.77$ for experiencing physical abuse in childhood and being abusive as an adult. $r^2 = 0.77^2 = 0.77 \times 0.77 = 0.59$ Therefore, experiencing abuse in childhood can account for 59 percent of the variation in being abusive as an adult, a much higher percentage than education

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 231 level. While 59 percent may not seem like a strong predictor, in social science this is considered a strong result. Given this information, you might prioritize potential clients who report experiencing abuse in childhood over those who do not report experiencing abuse in order to better target your resources. You should consider the implications of using predictions like this, though. Many predictions use data about relationships that are based on behaviors of groups of people and not the individuals themselves. In this case, targeting people to receive additional services can be helpful. Using the same information in a punitive way, such as denying someone custody of her children, is unethical. While being abused as a child in general leads to a higher risk of perpetuating abuse as an adult, it does not predict any one's individual's likelihood of perpetuating abuse. In summary, these are some of the characteristics of r^2 :

- The value of r^2 ranges from 0 to 1.
- If the value of r^2 is 0, then the dependent variable cannot be predicted using the independent variable.
- If the value of r^2 is 1, then the dependent variable can always be predicted without error using independent variable.
- Any value for r^2 indicates what percent of variance in the dependent variable can be predicted using the independent variable.
- If r^2 is 0.5, then 50 percent of the variation in

65%

MATCHING BLOCK 68/88

SA MATH 201 BUSINESS STATISTICS.pdf (D40557061)

the dependent variable can be predicted using the independent variable. An r^2 of 0.6 means that 60 percent can be predicted,

and so on. Again, correlation is not causation, but understanding these relationships and where the strong and weak relationships exist, can help you tailor more effective interventions, or at least better understand the individuals or populations you are working with. There are limitations to using r^2 . To use r^2 , the relationship must be linear. If the data are curvilinear, r^2 is no longer an appropriate tool. If you graph your data on a scatterplot and find that they resemble the curvilinear graph, in figure 1.8, you cannot use r^2 to assess your data.

NSOU ? PGSW-VII 232 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 Figure 1.8: Linear and Curvilinear Distributions On the left is a linear distribution, with data points on the scatterplot clustering along a straight upward-sloping line. On the right is a curvilinear distribution, with data values on the scatterplot beginning in the lower left-hand corner, increasing, and then decreasing, to cluster around a curve. 8.8 Computing the correlation coefficient Here is the procedure for computing the correlation coefficient. Convert each variable to standard units. The average of the products gives the correlation coefficient. This procedure can be given as a formula, where x stands for the first variable, y for the second variable, and r for the correlation coefficient: $r = \text{average of } (x \text{ in standard units}) \times (y \text{ in standard units})$ Compute r for the hypothetical data in table 1. Table 1. Data. x y 1 5 3 9 4 7 5 1 7 13 Note. The first row of the above table represents two measurements on one subject in the study; the two numbers are the x - and y -coordinates of the corresponding point on the scatter diagram. Similarly for the other rows. The pairing matters: Linear Curvilinear

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 233 r is defined only when you have two variables, and both are measured for every subject in the study. Solution. The work can be laid out as in table below. Computing r . x in standard y in standard x y units units Product 1 5 "1 .5 "0 .5 0.75 3 9 "0 .5 0.5 "0 .25 4 7 0.0 0.0 0.00 5 1 0.5 "1 .5 "0 .75 7 13 1.5 1.5 2.25 Step 1. Convert the x -values to standard units, as in chapter 5. This is quite a lot of work. First, you have to find the average and SD of the x -values: average of x -values = 4, SD = 2. Then, you have to subtract the average from each x -value, and divide by the SD: $(1 - 4)/2 = -1.5$, $(3 - 4)/2 = -0.5$, $(4 - 4)/2 = 0$, $(5 - 4)/2 = 0.5$, $(7 - 4)/2 = 1.5$ The results go into the third column of the table above. The numbers tell you how far above or below average the x -values are, in terms of the SD. For instance, the value 1 is 1.5 SDs below average. Step 2. Convert the y -values to standard units; the results go into the fourth column of the table. That finishes the worst of the arithmetic. Step 3. For each row of the table, work out the product (x in standard units) \times (y in standard units) The products go into the last column of the table. Step 4. Take the average of the products: $r = \text{average of } (x \text{ in standard units}) \times (y \text{ in standard units}) = (0.75 + 0.25 + 0.00 + 0.75 + 2.25)/5 = 0.40$

NSOU ? PGSW-VII 234 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 This completes the solution. If you plot a scatter diagram for the data, the points slope up but are only loosely clustered. Why does r work as a measure of association? In figure below, the products are marked at the corresponding dots. Horizontal and vertical lines are drawn through the point of averages, dividing the scatter diagram into four quadrants. If a point is in the lower left quadrant, both variables are below average and are negative in standard units; the product of two negatives is positive. In the upper right quadrant, the product of two positives is positive. In the remaining two quadrants, the product of a positive and a negative is negative. The average of all these products is the correlation coefficient. If r is positive, then points in the two positive quadrants will predominate, as in figure b. If r is negative, points in the two negative quadrants will predominate, as in figure c. (a) Scatter Diagram (b) Positive r (C) Negative r Figure. How the correlation coefficient works There is another way to compute r , which is sometimes useful: $r = \text{cov}(x, y) / (\text{SD of } x) \times (\text{SD of } y)$ Where, $\text{cov}(x, y) = (\text{average of products } xy) - (\text{ave of } x) \times (\text{ave of } y)$.

REGRESSION Regression is a tool that allows you to quantify a relationship between variables while also controlling for other factors. When you learned about correlations and saw scattergrams of data for two variables plotted, the line that best fit those data was

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 235 created using regression analysis. This tool allows you to isolate the effect of one variable on another while holding other factors constant. If you wanted to know how participation in a religious community affects health outcomes like blood pressure or anxiety, then you would want to hold constant factors like income level, education level, age, and other health conditions to ensure that you were only seeing the effect of the variable of interest. A common type of regression is linear regression. Linear regression fits a straight line to the data in a way that ensures that each point is as close as possible to the line, or the line is the "best fit." The line does not intersect every point, but it is the best description of all the points taken together to show a relationship. In figure 9.1, you can see that a line has been fit to the data points. This line is created using regression analysis and the equation $y = ax + b$,

NSOU ? PGSW-VII 236 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 To graphs of linear regressions modeling the relationship between two variables. Many studies you see that discuss relationships but are not randomized control trials use regression analysis. The key to successful regression analysis is choosing which variables should be isolated and how best to do so. If you overlook a key variable and do not control for it, your results may reflect a relationship that is not the one you believe you are studying. When using regression analysis, you are limited in the same ways as you are for any type of inferential statistics. You have selected data relevant to the question you are trying to answer, but those data only represent a certain group of people at a certain time. You still have to determine if the results can be applied to other populations. When you come across a regression analysis in the literature, you should check for a few things before deciding whether to use this information in your practice. 1. Is the relationship linear? If the pattern created by the data points does not generally follow a straight line, then linear regression is not appropriate. 2. Are all important variables controlled for? If age is likely to have a big effect on any health outcomes of interest, does the study control for age? What about income? Are there other factors that could contribute to this relationship that have not been addressed? 3. Is the sample used in the analysis similar to the people you work with? The results of these analyses are only applicable to samples that are similar. If you work with children, a sample made up of adults is unlikely to be useful to you. If you work with people who live in cities, a sample of rural farmers is unlikely to be useful to you. 4. Remember that correlation is not causation. Regression analysis cannot tell you that one variable caused an effect in the other. You may find a statistically significant relationship between two variables that have nothing to do with each other but happen to behave in similar ways. Beware of spurious correlations.

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 237 8.9 Quick Look at the Theory of Probability People talk loosely about chance all the time, without doing any harm. What are the chances of getting a job? of meeting someone? of rain tomorrow? But for scientific purposes, it is necessary to give the word chance a definite, clear interpretation. This turns out to be hard, and mathematicians have struggled with the job for centuries. They have developed some careful and rigorous theories, but these theories cover just a small range of the cases where people ordinarily speak of chance. This section of the module will present the frequency theory, which works best for processes which can be repeated over and over again, independently and under the same conditions. Many games fall into this category, and the frequency theory was originally developed to solve gambling problems. One simple game of chance involves betting on the toss of a coin. The process of tossing the coin can be repeated over and over again, independently and under the same conditions. The chance of getting heads is 50%: in the long run, heads will turn up about 50% of the time. Take another example. A die (plural, "dice") is a cube with six faces, labelled 1,2,3,4,5,6. When the die is rolled, the faces are equally likely to turn up. The chance of getting an ace— is 1 in 6, or sixteen and two-third percentages. The interpretation: if the die is rolled over and over again, repeating the basic chance process under the same conditions, in the long run an ace will show about sixteen and two-third percentages of the time. The chance of something gives the percentage of time it is expected to happen, when the basic process is done over and over again, independently and under and the same conditions. If something is impossible, it happens 0% of the time. At the other extreme, if something is sure to happen, then it happens 100% of the time. All chances are between these two extremes. Chances are between 0% and 100%. Here is another basic fact. Suppose you are playing a game and have a 45% chance to win. In other words, you expect to win about 45% of the time. So, you must expect to lose the other 55% of the time. The chance of something equals 100% minus the chance of the opposite thing.

NSOU ? PGSW-VII 238 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 Example 1: A box contains red marbles and blue marbles. One marble is drawn at random from the box (each marble has an equal chance to be drawn). If it is red, you win \$1. If it is blue, you win nothing. You can choose between two boxes: • box A contains 3 red marbles and 2 blue ones. • box B contains 30 red marbles and 20 blue ones. Which box offers a better chance of winning, or are they the same? Solution: Some people prefer box A, because it has fewer blue marbles. Others prefer B, because it has more red marbles. Both views are wrong. The two boxes offer the same chance of winning, 3 in 5. To see why, imagine drawing many times at random from box A (replacing the marble after each draw, so as not to change the conditions of the experiment). In the long run each of the 5 marbles will appear about 1 time in 5. So, the red marbles will turn up about 3/5 of the time. With box A, your chance of drawing a red marble is 3/5, that is, 60%. Now imagine drawing many times at random with replacement from box B. Each of the 50 marbles will turn up about 1 time in 50. But now there are 30 red marbles. With box B, your chance of winning is $30/50 = 3/5 = 60\%$, just as for box A. What counts is the ratio number of red marbles/total number of marbles. The ratio is the same in both boxes. Problem 1: A coin will be tossed 1,000 times. About how many heads are expected? Problem 2: A die will be rolled 6,000 times. About how many aces are expected? Problem 3: Match the numerical answers with the verbal descriptions (which may be used more than once). Numerical answer Verbal description (a) –50% (i) This is as likely to happen as not. (b) 0% (ii) This is very likely to happen, but it's not certain. (c) 10% (iii) This won't happen. (d) 50% (iv) This may happen, but it's not likely. (e) 90% (v) This will happen, for sure. (f) 100% (vi) There's a bug in the program. (g) 200% Some Definitions A probability experiment is

91%

an action, or trial, through which specific results (counts, measurements, or responses) are obtained. The result of a single trial in a probability experiment

is an outcome.

100%**MATCHING BLOCK 72/88****W**

The set of all possible outcomes of a probability experiment

is the sample space. An event is a subset of the sample space.

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 239 It may consist of one or more outcomes. The probability that event E will occur is written as $P(E)$ and is read as "the probability of event E."

Probabilities can be written as fractions, decimals, or percent. Here is a simple example of the use of the terms probability experiment, sample space, event, and outcome. Probability Experiment: Roll a six-sided die. Sample Space: {1, 2, 3, 4, 5, 6} Event: Roll an even number, {2, 4, 6}. Outcome: Roll a 2, {2}. Conditional probabilities: A conditional probability is

76%**MATCHING BLOCK 73/88****W**

the probability of an event occurring, given that another event has already occurred.

The conditional

100%**MATCHING BLOCK 74/88****W**

probability of event B occurring, given that event A has occurred,

is denoted by $P(B|A)$ and is read as "probability of B, given A. Example 2: Two cards are selected in sequence from a standard deck of 52 playing cards. Find the probability that the second card is a queen, given that the first card is a king. (Assume that the king is not replaced.) Solution: Because the first card is a king and is not replaced, the remaining deck has 51 cards, 4 of which are queens. So, $P(B|A) = 4/51 = 0.078$ Note: A deck of cards has 4 suits: clubs, diamonds, hearts, spades. There are 13 cards in each suit: 2 through 10, jack, queen, king, ace. So, there are $4 \times 13 = 52$ cards in the deck.

NSOU ? PGSW-VII 240 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 Example 3: The table below shows the results of a study in which researchers examined a child's IQ and the presence of a specific gene in the child. Find the probability that a child has a high IQ, given that the child has the gene. Gene Gene not present present Total High IQ 33 19 52 Normal IQ 39 11 50 Total 72 30 102 Solution: There are 72 children who have the gene. So, the sample space consists of these 72 children, as shown at the left. Of these, 33 have a high IQ. So, $P(B|A) = 33/72 = 0.458$ The probability that a child has a high IQ, given that the child has the gene, is about 0.458. Sample Space Gene present High EQ 33 Normal IQ 39 Total 72 Example 4: A deck of cards is shuffled, and the top two cards are put on a table, face down. You win \$1 if the second card is the queen of hearts. (a) What is your chance of winning the dollar? (b) You turn over the first card. It is the seven of clubs. Now what is your chance of winning? Solution. (a). The bet is about the second card, not the first. Initially, this will seem a little strange. Some illustrations may help. • If the first card is the two of spades and the second is the queen of hearts, you win. • If the first card is the jack of clubs and the second is the queen of hearts, you win. • If the first card is the seven of clubs and the second is the king of hearts, you lose. The bet can be settled without even looking at the first card. The second card is all you need to know.

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 241 The chance of winning is $1/52$. To see why, think about shuffling the deck. That brings the cards into random order. The queen of hearts has to wind up somewhere. There are 52 possible positions, and they are all equally likely. So, there is 1 chance in 52 for her to wind up as the second card in the deck—and bring you the dollar. (b) There are 51 cards left. They are in random order, and the queen of hearts is one of them. She has 1 chance in 51 to be on the table. Your chance goes up a little, to $1/51$. That is the answer. The $1/51$ in part (b) is a conditional chance. The problem puts a condition on the first card: it has to be the seven of clubs. A mathematician might talk about the conditional probability that the second card is the queen of hearts given the first card is the seven of clubs. To emphasize the contrast, the $1/52$ in part (a) is called an unconditional chance: the problem puts no conditions on the first card. Problem 4: A penny is tossed 5 times. (a) Find the chance that the 5th toss is a head. (b) Find the chance that the 5th toss is a head, given the first 4 are tails. Problem 5: Five cards are dealt off the top of a well-shuffled deck. (a) Find the chance that the 5th card is the queen of spades. (b) Find the chance that the 5th card is the queen of spades, given that the first 4 cards are hearts. The multiplication rule: To find the probability of two events occurring in sequence, you can use the Multiplication Rule. The probability that two events A and B will occur in sequence is:

75%**MATCHING BLOCK 75/88****W**

$P(A \text{ and } B) = P(A) \cdot P(B|A)$. If events A and B

are independent, then the rule can be simplified to $P(A \text{ and } B) = P(A) \cdot P(B)$. This simplified rule can be extended to any number of independent events. Example 5: Two cards are selected, without replacing the first card, from a standard deck of 52 playing cards. Find the probability of selecting a king and then selecting a queen. Solution: $P(K \text{ and } Q) = P(K) \cdot P(Q|K) = (4/52) \cdot (4/51) = (16/2652) = 0.006$ So, the probability of selecting a king and then a queen without replacement is about 0.006. Example 6:

90%

MATCHING BLOCK 76/88

W

A coin is tossed, and a die is rolled. Find the probability of tossing a head and then rolling a 6.

NSOU ? PGSW-VII 242 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 Solution: The events are independent. $P(H \text{ and } 6) = P(H) \cdot P(6) = (1/2) \cdot (1/6) = (1/12) = 0.083$ So,

100%

MATCHING BLOCK 77/88

W

the probability of tossing a head and then rolling a 6

is about 0.083. Problem 6: A deck of cards is shuffled, and two cards are dealt. What is the chance that both are aces? Problem 7: A coin is tossed twice. What is the chance of a head followed by a tail? Problem 8: A coin is tossed 3 times. (a) What is the chance of getting 3 heads? (b) What is the chance of not getting 3 heads? (c) What is the chance of getting at least 1 tail? (d) What is the chance of getting at least 1 head? Independence: Two things are independent if the chances for the second given the first are the same, no matter how the first one turns out. Otherwise, the two things are dependent. Example 7. Someone is going to toss a coin twice. If the coin lands heads on the second toss, you win a dollar. (a) If the first toss is heads, what is your chance of winning the dollar? (b) If the first toss is tails, what is your chance of winning the dollar? (c) Are the tosses independent? Solution. If the first toss is heads, there is a 50% chance to get heads the second time. If the first toss is tails, the chance is still 50%. The chances for the second toss stay the same, however the first toss turns out. That is independence. Note: If two things are independent, the chance that both will happen equals the product of their unconditional probabilities. This is a special case of the multiplication rule. Problem 9: Every week you buy a ticket in a lottery that offers one chance in a million of winning. What is the chance that you never win, even if you keep this up for ten years?

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 243 The Addition Rule: This section is about the chance that at least one of two specified things will happen: either the first happens, or the second, or both. The possibility of both happening turns out to be a complication, which can sometimes be ruled out. Two things are mutually exclusive when the occurrence of one prevents the occurrence of the other: one excludes the other. Example 8. A card is dealt off the top of a well-shuffled deck. The card might be a heart. Or, it might be a spade. Are these two possibilities mutually exclusive? Solution. If the card is a heart, it can't be a spade. These two possibilities are mutually exclusive. We can now state a general principle for figuring chances. It is called the addition rule. Addition Rule. To find the chance that at least one of two things will happen, check to see if they are mutually exclusive. If they are, add the chances. Example 9. A card is dealt off the top of a well-shuffled deck. There is 1 chance in 4 for it to be a heart. There is 1 chance in 4 for it to be a spade. What is the chance for it to be in a major suit (hearts or spades)? Solution: The question asks for the chance that one of the following two things will happen: • the card is a heart. • the card is a spade. If the card is a heart, then it can't be a spade: these are mutually exclusive events. So, it is legitimate to add the chances. The chance of getting a card in a major suit is $1/4 + 1/4 = 1/2$. (A check on the reasoning: there are 13 hearts and 13 spades, so $26/52 = 1/2$ of the cards in the deck are in a major suit.) Note: If you want to find the chance that at least one event occurs, and the events are not mutually exclusive, do not add the chances: the sum will be too big. Blindly adding chances can give the wrong answer, by double counting the chance that two things happen. With mutually exclusive events, there is no double counting: that is why the addition rule works. Technically, The probability that events A or B will occur, $P(A \text{ or } B)$, is given by

NSOU ? PGSW-VII 244 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022

82%

MATCHING BLOCK 78/88

SA

StatisticalMethodsSpring2010.docx (D3486631)

$P(A \text{ or } B) = P(A) + P(B) - P(A \text{ and } B)$ If events A and B

are mutually exclusive, then the rule can be simplified to $P(A \text{ or } B) = P(A) + P(B)$. This simplified rule can be extended to any number of mutually exclusive events. In words, to find the probability that one event or the other will occur, add the individual probabilities of each event and subtract the probability that they both occur. As shown in the Venn diagram at the left, subtracting $P(A \text{ and } B)$ avoids double counting the probability of outcomes that occur in both A and B. Problem 10: You select a card from a standard deck of 52 playing cards. Find the probability that the card is a 4 or an ace. Problem 11: You roll a die. Find the probability of rolling a number less than 3 or rolling an odd number. Note: What's the difference between mutually exclusive and independent? "Mutually exclusive" is one idea; independence is another. Both ideas apply to pairs of events and say something about how the events are related. However, the relationships are quite different. • Two events are mutually exclusive if the occurrence of one prevents the other from happening. •

88%

MATCHING BLOCK 79/88

SA StatisticalMethodsSpring2010.docx (D3486631)

Two events are independent if the occurrence of one does not change the

chances for the other. Note: When do I add and when do I multiply? The addition rule, like the multiplication rule, is a way of combining chances. However, the two rules solve different problems. • The addition rule finds the chance that at least one of two things happens. • The multiplication rule finds the chance that two things both happen. So, the first step in deciding whether to add or to multiply is to read the question: Do you want to know $P(A \text{ or } B)$, $P(A \text{ and } B)$, or something else entirely? But there is also a second step—because the rules apply only if the events are related in the right way. • Adding the probabilities of two events requires them to be mutually exclusive. • Multiplying the unconditional probabilities of two events requires them to be independent. (For dependent events, the multiplication rule uses conditional probabilities.)

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 245 8.10 Data Processing and Analysis Coding Qualitative Data: In quantitative research, data coding is a phase after you have collected all data. You code by arranging the measures of variables, already in the form of numbers, into a machine-readable format to facilitate statistical analysis. Coding data has a different meaning in qualitative research. You code by organizing the raw data into conceptual categories (i.e., concepts and themes). Instead of a simple clerical task to prepare for statistical analysis as in quantitative research, qualitative data coding is an integral part of data analysis. Coding encourages higher-level thinking about the data and research questions. It moves you toward theoretical generalizations. In a qualitative study, you engage in two simultaneous activities as you code: mechanical data reduction and analytic data categorization. Coding data is the hard work of reducing mountains of raw data into a manageable size. Beyond making a huge mass of data more manageable, coding is a way to impose order onto the data. In addition, coding allows you to retrieve relevant parts of the data. Coding huge amounts of qualitative data is no simple, easy task. Between the moments of thrill and inspiration, coding qualitative data, or "filework," is often wearisome and tedious. The three forms of qualitative coding are open coding, axial coding, and selective coding. We examine each next. Open Coding. You perform open coding as a first pass through the collected data. As you review the data, you are identifying concepts and themes and assigning initial codes or labels to them. This is your first attempt to condense the mass of raw data into analytic categories. To code, you slowly examine field notes, historical sources, or other data looking for critical terms, key events, or shared themes. If you have pages of written data notes, you write a preliminary code or label at the edge of a page and might highlight relevant text with brightly coloured ink. If your data is in electronic files, you can do something similar. In this process, you want to remain open to creating new themes and to changing initial codes in subsequent analysis. Having a general theoretical framework can help if you use it in a flexible manner.

NSOU ? PGSW-VII 246 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 During open coding, you are bringing concepts and themes buried deep inside the data to the surface. The concepts and themes are at a low level of abstraction. They come from your initial research question, concepts in the literature, terms used by people in the social setting you are studying, or new thoughts you have stimulated by this immersion in the data. You can see an example of how to open code based on LeMasters's (1975) field research study of a working-class tavern. He found that the topic of marriage came up in many conversations. If he reviewed his field notes, he could have open coded the field notes with the theme marriage. Following is an example of hypothetical field notes that could be open-coded with the theme marriage: I wore a tie to the bar on Thursday because I had been at a late meeting. Sam noticed it immediately and said. "Damn it, Doc. I wore one of them things once—when I got married—and look what happened to me! By God, the undertaker will have to put the next one on." I ordered a beer, then asked him, "Why did you get married?" He replied, "What the hell you goin' to do? You just can't go on shacking up with girls all your life—I did plenty of that when I was single" with a smile and wink. He paused to order another beer and light a cigarette, then continued, "A man, sooner or later, likes to have a home of his own, and some kids, and to have that, you have to get married. There's no way out of it—they got you hooked." I said, "Helen [his wife] seems like a nice person." He returned, "Oh, hell, she's not a bad kid, but she's a goddamn woman and they get under my skin. They piss me off. If you go to a party, just when you start having fun, the wife says 'let's go home.'" [Based on LeMasters, E. E. (1975). Blue collar aristocrats. Madison: University of Wisconsin Press.] When coding qualitative data, you have a choice. You can code every line of data or code entire paragraphs or code entire pages of notes. You will find that some raw data are not important to code. They become dross or left over and unused. The degree of detail when you code depends on your research question, the "richness" of the data, and your purposes. Axial Coding. This type of coding is a "second pass" through the data. During open coding, you focused on the raw qualitative data (e.g., field notes, historical

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 247 documents, photos, open interview transcripts). You assigned codes for the concepts, themes, relationships, and so forth that you saw in a review of the data. In open coding, your primary focus was on the data. You were little concerned about connecting themes or elaborating on the concepts. By contrast, in axial coding, your primary focus is on the collection of codes and the initial, preliminary concepts or themes from the open-coding process. In this second pass, you focus on the initial concepts and themes more than on the raw data. Nonetheless, you can continue to review the data and add new concepts and themes. In this sense, a milder kind of open coding continues as you axial-code. During this second pass through the data, new codes, themes, or concepts may emerge, and you should add them. You elaborate on and identify connections among themes or concepts as you review the codes. As you review your initial set of codes, your primary focus is on organizing the concepts and themes of the codes. While doing this, you identify a few key analytic axes, or central principles, around which you can connect and organize the concepts and themes. This is the source of the name "axial coding." During axial coding, you are constantly considering causes and consequences, conditions and interactions, strategies and processes. You are looking for categories of concepts and sets of concepts and themes that cluster together. You ask yourself questions, Can I divide this concept into subtypes? Should I combine these three closely related concepts into a general one? Does it make sense to organize these themes into a time sequence (i.e., A, then B, then C) or by their physical location? For example, in a field research study on working-class life in a tavern you divide the general theme of marriage into sequential subparts (e.g., engagement, weddings, or parenting). You mark all notes involving the parts of marriage and then relate marriage to other themes of sexuality, division of labour in household tasks, views on children, and so on. When a theme reappears in different areas of the field notes, you compare it to elsewhere to see connections and develop new themes (e.g., men and women have different attitudes toward marriage).

NSOU ? PGSW-VII 248 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 Axial coding both stimulates thinking about linkages among the open-coding concepts and themes and introduces new codes, concepts, and questions. During the coding, you may decide to drop some themes or explore others in greater depth. In addition, it reinforces the connections between evidence and concepts as you consolidate codes, re-evaluate themes, and return to the data for new evidence. The axial coding process helps you build a dense web of support in the data for increasingly interconnected themes and codes. This is analogous to the idea of multiple indicators in quantitative research. Multiple instances of concepts in the empirical evidence help to strengthen the connections between concepts and data. Selective Coding. This is a last pass through the data. By this phase you probably have identified the major themes for your study. Selective coding involves scanning the data using the central themes and concepts. You add an empirical grounding to themes and concepts and elaborate on them. You are looking selectively in the data for several strong examples that offer clear support for each concept and theme. You also seek data to compare and elaborate on major concepts and themes. Selective coding occurs after data collection ended, after you have well-developed concepts and themes, and as you are finalizing concepts and themes into an overall analysis. In this phase, you organize the concepts and themes and build toward a few main generalizations or central themes. During selective coding, you may adjust the generalizations and central themes as you find multiple supporting instances of them in the data. For example, in a study of working-class life in a tavern you decide to make gender relations a major theme. In selective coding, you go through the field notes and search for strong examples of male–female differences in talk about dating, engagements, weddings, divorce, extramarital affairs, or husband–wife relations. You then compare male and female attitudes about each area to your other major theme, marriage. During the selective coding phase, you refine, reorganize, and elaborate on themes and concepts as you re-examine the data and select supporting evidence. For example, in the working-class tavern study, you re-examine the theme "opinions on marriage" and connect evidence about it to themes of gender relations and stages of the life cycle. You seek evidence on how marriage relates to gender relations and the life cycle. The three phases of coding work together to move you from a mass of raw data toward a final, integrated analysis.

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 249 Figure: The Coding Process for Qualitative Data Analysis

NSOU ? PGSW-VII 250 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 Coding the Data: Before you examine quantitative data, you collected in a study to test hypotheses and answer your research question, you must first organize them in a different form. Here, data coding means systematically reorganizing raw numerical data into a form usable by computer software. You must do this by applying consistent rules for how to transfer information from one form to another. If you collected data in certain ways, such as a well-organized coding sheet, coding can be a simple clerical task. However, when the data are not well organized or not originally in the form of numbers, it gets complex. You must develop rules for assigning numbers to variable attributes. Each category of a variable and missing information needs a code. For example, you want to examine gender, so assign or code the males as 1 and the females as 2. All of your rules and procedures for coding are put into a document called a codebook. In addition to describing the coding rules and procedure, it has information on the location of data for variables in a format usable by computer software. It is essential to create a well-organized, detailed codebook and make multiple copies of it. If you fail to write down the details of the coding procedure or misplace the codebook, you have lost the key to the data and may have to recode the data again, requiring many hours or even days of additional work. You should think about a coding procedure and codebook before you collect any data. For example, you plan to conduct a survey. You should precode the questionnaire before collecting data. Precoding means placing the code categories (e.g., 1 for male, 2 for female) on the questionnaire.¹ Some survey researchers also place the location in the computer format on the questionnaire. If you do not precode a questionnaire, your first step after collecting data is to create a codebook. You need to give each respondent an identification number to keep track of them. Information on each respondent is a data record. Next, you transfer the information from each respondent questionnaire into a data record format that computer software can read.

Master Sheet If you are doing tabulation manually, it is always wise to enter the data into a master chart. The master chart is a large sheet which will enable you to enter all the codes of different variables into it. It will help you to generate tables easily.

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 251 After a code book is prepared, the data can be transferred either to a master chart or directly to computer through a statistical package. Going through master chart to computer is much more advantageous than entering data directly to computers because one can check the wrong entries in the computer by comparing 'data listing' as a computer output and master chart. Entering data directly to computer is disadvantageous, as there is no way to check wrong entries, which will show inconsistencies in tabulated data at the later stages of tabulation. A sample of master chart prepared in accordance with the code book is presented in Table below: In the master chart you can enter the data of 14 sample respondents. Likewise you can expand the number of respondents in the column and variables in the rows. It is always better to enter code (numerical number) in the master chart.

NSOU ? PGSW-VII 252 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 ANALYSIS OF QUANTITATIVE DATA The purpose of data analysis is to prepare data as a model where relationships between the variables can be studied. Analysis of data is made with reference to the objectives of the study and research questions if any. It is also designed to test the hypothesis. Analysis of data involves re-categorisation of variables, tabulation, explanation and casual inferences. The first step in data analysis is a critical examination of the processed data in the form of frequency distribution. This analysis is made with a view to draw meaningful inferences and generalisation. The process of categorisation in accordance with the objectives and hypothesis of Data Processing and Analysis the study is arrived at with the help of frequency distributions. Re-categorisation is a process to arrange categories with the help of statistical techniques. This helps researcher to justify the tabulation. We have seen earlier that the responses to a statement may be assigned scores or weightage. These scores or weightage are summated and re-categorised on the bases of high, medium and low. The basic principle in the process of categorisation or re-categorisation is that the categories thus obtained must be exhaustive and mutually exclusive. In other words, the categories have to be independent and not overlapping.

Univariate Analysis Univariate analysis refers to tables, which give data relating to one variable. Univariate tables which are more commonly known as frequency distribution tables show how frequently an item repeat. Examples of frequency tables are given below. The distribution may be symmetrical or asymmetrical. The characteristics of the sample while examining the percentages, further properties of a distribution can be found out by various measures of central tendencies. However, researcher is required to decide which is most suited for this analysis. To know how much is the variation, the researcher has to calculate measures of dispersion. Univariate analysis is the technique of comparing and analysing the dependency of a single predictor and a response variable. The prefix "uni" means one, emphasizing the fact that the analysis only accounts for one variable's effect on a dependent variable. Univariate Analysis is thought to be one of the simplest forms of data analysis as it doesn't deal with causes or relationships, like a regression would. Primarily, Univariate Analysis simply takes data and provides a summary and associated pattern.

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 253 Univariate Analysis works by examining the effects of a singular variable on a set of data. For example, a frequency distribution table is a form of univariate analysis as frequency is the only variable being measured. Alternative variables may be age, height, weight, etc., however it is important to note that as soon as a secondary variable is introduced it becomes bivariate analysis. With three or more variables, it becomes multivariate analysis. Univariate Analysis is a common method for understanding data. Another common example of univariate analysis is the mean of a population distribution. Tables, charts, polygons, and histograms are all popular methods for displaying univariate analysis of a specific variable (e.g., mean, median, mode, standard variation, range, etc). Example: Usually, frequency distribution tables are prepared to examine each of the independent and dependent variables. Tables below present two independent variables and one dependent variable. Table: Table Showing Awareness of the Respondents (The Independent Variable) Level of Awareness Distribution of Respondents Frequency Percentage High 110 39.3 Medium 106 37.9 Low 64 21.8 Total 280 100 Table: Table Showing the Respondents by Regional Development (The Independent Variable) Regional Development Distribution of Respondents Frequency Percentage High 142 57.7 Medium 86 30.7 Low 52 14.6 Total 280 100

NSOU ? PGSW-VII 254 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 Table: Table Showing Wage Differentials of the Respondents (The Dependent Variable) Wage Differential Distribution of Respondents Frequency Percentage High 78 27.9 Medium 134 47.9 Low 68 24.2 Total 280 100 Let us consider the frequency distribution (Tables given below) which describes the awareness, wage differentials and regional development of respondents. The tables have four rows, the first three being the categories of variables, which appear in the left-hand columns and the right-hand columns show the number of observations in each category. The last rows are the totals of all frequencies appearing in tables. To analyse the data, it is necessary to convert the frequencies into figures that can be interpreted meaningfully. Note, for instance, while distribution of respondents by regional development displayed in Table above clearly shows the predominance of respondents from 'high' development region whereas, distribution of respondents by wage differential in last Table indicates that the proportions of respondents with 'high' and 'low' wage differentials are almost equal. Bivariate Analysis: Bivariate statistics are much more valuable. They let us consider two variables together and describe the relationship between variables. Even simple hypotheses require two variables. Bivariate statistical analysis shows a statistical relationship between variables—that is, things that tend to appear together. For example, a relationship exists between water pollution in a stream and the fact that people who drink the water get sick. It is a statistical relationship between two variables: pollution in the water and the health of the people who drink it. Statistical relationships are based on two ideas: covariation and statistical independence. Covariation means that things go together or are associated. To covary means to vary together; cases with certain values on one variable are likely to have certain values on the other one. For example, people with higher values on the income variable are likely to have higher values on the life expectancy variable. Likewise, those with lower incomes have lower life expectancy. This is usually stated in a shorthand way by saying that income and life expectancy are related to each other, or covary. We

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 255 could also say that knowing one's income tells us one's probable life expectancy, or that life expectancy depends on income. Statistical independence is the opposite of covariation. It means there is no association or no relationship between variables. If two variables are independent, cases with certain values on one variable do not have a special value on the other variable. We usually state hypotheses in terms of a causal relationship or expected covariation; if we use the null hypothesis, it is that there is independence. It is used in formal hypothesis testing and is frequently found in inferential statistics. We use several techniques to decide whether a relationship exists between two variables. Three elementary ones are a scattergram, or a graph or plot of the relationship; a percentage table; and measures of association, or statistical measures that express the amount of covariation by a single number (e.g., correlation coefficient). We use the bivariate contingency table in many situations. It presents the same information as a scattergram in a more condensed form. One advantage of it over the scattergram is that the data can be measured at any level of measurement, although interval and ratio data must be grouped. The bivariate contingency table is based on cross-tabulation (i.e., tabulating two or more variables simultaneously). It is "contingent" because the cases in each category of a variable are distributed into each category of a second (or additional) variable. The table distributes cases into the categories of multiple variables at the same time and shows us how the cases, by category of one variable, are "contingent upon" the categories of other variables.

NSOU ? PGSW-VII 256 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 257 FIGURE: Age Group by Attitude about Changing the Drinking Age, Raw Count Table Trivariate Analysis: Sometimes researcher might be interested in knowing whether there is a third variable which is affecting the relationships between two variables. In such cases the researcher has to examine the bivariate relationship by controlling the effects of third/variable. This is performed in two ways. One way of controlling the effects of a third/variable is to prepare partial tables and examine the bi-variate relationship, and the second method of assessing the effects of a third/variable is to compare the co-efficient of partial correlations. Let us take an example. In the above table, if researcher wants to examine whether there is effect of regional development on the bivariate relationship, he may prepare three partial tables giving data relating to awareness of the Act and wage differential for high, medium and low regional development. Table: Regional Development = High (N = 142) Awareness about the Act Wage Differential Total High Medium Low High 7 10 3 20 -21.9 -21.8 -9.3 Medium 13 26 9 48 -40.6 -33.3 -28.1 Low 12 42 20 74 -37.5 -53.8 -62.5 Total 32 78 32 142

NSOU ? PGSW-VII 258 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 Table: Regional Development = Medium (N = 86) Awareness about the Act Wage Differentials Total High Medium Low High 8 11 4 23 36.4) -25.6 -19 Medium 9 17 8 34 -40.9 -39.5 -38.1 Low 5 15 9 29 -34.9 -34.9 -42.9 Total 22 43 21 86 Table: Regional Development = Low (N = 52) Awareness about the Act Wage Differential Total High Medium Low High 14 7 7 28 -58.3 -53.8 -46.7 Medium 8 4 6 18 -33.3 -30.8 -40 Low 2 2 2 6 -8.3 -15.4 -13.3 Total 24 3 15 52 On examination of these three partial tables, if the researcher finds out that bivariate relationships do not hold good, he/she may infer that it is the third variable, the regional development which is affecting the bivariate relationship. In the partial tables for higher regional development, the proportion of people perceiving high wage differential are those who are having high level of awareness about the Act. The similar trend can be noticed in the remaining two partial tables. Which means regional development does not affect the bivariate relationships between wage differential and awareness about the Act.

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 259 Multivariate Analysis When a researcher is interested in assessing the joint effect of three or more variables, he/she uses the techniques of multivariate analysis. The most common statistical technique used for multivariate analysis is regression analysis. In the first step of multivariate analysis, the researcher has to obtain the correlation between the variables which are having statistically significant correlation. These variables are put in the regression analysis. One important point in applying correlation and regression analysis is the data must be measured on ratio or interval level. Another point a researcher has to keep in mind is that these two statistical techniques are based on certain assumptions. Hence, before applying these techniques, the researcher has to see whether the sample selected by him fulfils those conditions. Multiple regression's great advantage is its ability to adjust for several control variables (i.e., alternative explanations) simultaneously. With percentage tables, you can rarely use more than one control variable at a time. In addition, multiple regression is widely used, and you are likely to encounter it when reading research reports or articles. Multiple regression results tell the reader two things. First, it tells the overall predictive power of the set of independent and control variable on the dependent variable. A statistic, R-squared (R^2), tells us how well a set of variables "explains" a dependent variable. Explain here means making fewer errors when predicting the dependent variable scores on the basis of information about the independent variables. A good model with several variables might account for, or explain, a large percentage of variation in a dependent variable. For example, an R^2 of 0.50 means that knowing the independent and control variables improves the accuracy of predicting the dependent variable by 50 percent and that you would make one-half as many errors in predicting the dependent variable with the variable as you would not knowing about the independent and control variables. Second, multiple regression results give the direction and size of the effect of each variable on a dependent variable. The effect is measured precisely with a numerical value. The higher the value, the larger the effect of a variable on predicting the dependent variable. The sign (positive or negative) of the effect tells you the direction of the impact on the dependent variable. For example, you can see how five independent or control variables simultaneously affect a dependent variable with all variables controlling for

NSOU ? PGSW-VII 260 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 the effects of one another. This is especially valuable for testing theories that state that multiple independent variables cause one dependent variable. Summary of Major Types of Descriptive Statistics 8.11 Hypothesis Testing and Inferential Statistics Hypothesis testing generates new knowledge. The human brain is constantly trying to find connections and draw conclusions about the world around us. These conclusions become ideas, hunches, or gut feelings that we believe are true about the world. You can operate in many parts of life solely by using these ideas or hunches, but as a social worker you want to use evidence-based practices. Rigorously testing your ideas about how the world works is an important way to ensure that your judgment, preconceptions, and biases are not infiltrating your work. Inferential statistics are a tool to test ideas—or hypotheses, in the jargon of statistics—to determine if the differences or relationships are due to chance or to the treatment being tested. WHAT IS A HYPOTHESIS? A hypothesis begins as a question about the world that forms the basis of a theory to be tested. You can think about a hypothesis as "an educated guess." Anytime you

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 261 observe the world, you look for relationships and try to make sense of what you are seeing. Hypotheses are a way to make explicit the ideas you have about how any given relationship works. They allow you to rigorously test your educated guesses. When doing research, you start by assuming no relationship exists between the variables you are studying. You seek to prove this assumption incorrect, and you use statistical tests to quantify the likelihood that the relationship occurred by chance. Imagine observing that when you offer childcare for attendees at a community meeting, more people show up for the event. You might think that the opportunity to bring their children and have someone to watch them allowed more people to come. That might be enough for you to start offering childcare at your next community meeting, but maybe the change in attendance just occurred by random chance. Maybe what drove the change was that you had the meeting on a Monday instead of a Friday and the timing worked better for people. Maybe your last meeting conflicted with an event at the local school. Maybe it was raining. Maybe parents decided tonight was a better night than other nights. You cannot know if childcare drove the increased turnout unless you test your hypothesis. In any given inferential test, there are two hypotheses at play: 1. Null hypothesis 2. Alternative hypothesis

NULL HYPOTHESIS The null hypothesis (expressed mathematically as H_0) represents the possibility that there is no significant difference between the populations you are interested in. The null hypothesis argues that any differences are due to error or chance, or that the two groups are the same. This would mean that there is no difference in turnout for your event whether you offer childcare or not. Any variation is either random or linked to another factor.

ALTERNATIVE HYPOTHESIS The alternative hypothesis (expressed mathematically as H_a) represents your assumption that the intervention made a difference. The alternative hypothesis is your expectation about how the independent variable affects the dependent variable. Your alternative hypothesis is that more people attend community meetings when childcare is offered.

NSOU ? PGSW-VII 262 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 The null hypothesis is a check on your assumption. It represents the possibility that, even after the intervention, there is no difference between the group that received the intervention and the group that did not. The null and alternative hypotheses are structured like this: H_0 : There is no difference between the group that received the intervention and the one that did not. H_a : There is a difference between the group that received the intervention and the one that did not, and the difference is due to the independent variable (the intervention). Here is another example: H_0 : $M_1 = M_2$ (The null hypothesis is that the first mean is equal to the second.) H_a : $M_1 \neq M_2$ (The alternative hypothesis is that the first mean is not equal to the second.) The first equation indicates that the mean for the first group is the same as the mean for the second group; there is no difference between the groups. This is the null hypothesis. The second indicates that the mean for the first group differs from the mean for the second group. This is the alternative hypothesis.

NONDIRECTIONAL ALTERNATIVE HYPOTHESIS Stating that there is a difference makes this alternative hypothesis a nondirectional alternative hypothesis. The hypothesis in this case is that there is a difference, but the direction is not specified. An example would be "Parental engagement affects child behaviour." This hypothesis does not venture a guess about whether parental engagement will improve child behaviour or worsen child behaviour, but it asserts that there will be a difference.

DIRECTIONAL ALTERNATIVE HYPOTHESIS A directional alternative hypothesis goes a step further. If the evidence or your experience makes you confident in the direction of a relationship, then you can incorporate that into a hypothesis. "Providing childcare improves attendance" is a directional hypothesis, as is "Parental engagement improves child behaviour."

CONSIDERING THE MEANS As we have discussed previously, the mean of a dataset can provide quick, useful information about groups you are comparing. You are more likely to find a statistically significant difference and reject the null hypothesis if the means of the groups are very different. Of the two groups shown in table below, without further testing, which one is more likely to result in rejecting the null hypothesis? Table: Comparing Groups

Without any additional information, you might guess that the first experiment makes rejecting the null hypothesis more likely. The means in experiment 1 appear much more different than those in experiment 2. You would assume that there is less overlap between those distributions compared to the second set of distributions, even without having any other information. Using figure 1, you can see by looking at the two distributions on a graph that the overlap in the second pair is greater than the overlap in the first. You can think of the shaded area as the area where you could not differentiate a person who was part of sample A from a person who was part of sample B. The larger that area, the more difficult it is to determine if there are significant differences between the two groups. Comparing distributions using the means and standard deviations gives you a sense of whether your inferential test will return a significant result.

FIGURE .1 Using distributions to see group differences

NSOU ? PGSW-VII 264 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 Two sets of distributions are graphed. Each set includes two curves that graph the data for two groups. In the first set, there is a very small area where the two curves overlap. In the second set, the curves have a much large area of overlap. Telling the difference between the two groups where the distributions have a lot of overlap would be more difficult than telling the difference between the groups with only a small area of overlap. HOW DO I TEST A HYPOTHESIS? Now that you understand how to make your assumption explicit by identifying a hypothesis, you can test that hypothesis. The goal of inferential statistics is to establish a level of confidence that a difference you observe is due to the independent variable you are testing. In figure 1, the first pair of distributions has little overlap, which is promising for finding a statistically significant result. Little overlap is not sufficient though. You must do an inferential test. This chapter will introduce the t-test, a test for two groups. The following chapter will build on that concept with ANOVA and chi-square tests, which are used if there are three or more groups. WHAT IS A T-TEST? As a professional, you will want to know whether interventions you deliver have the desired effects. To do this, you first identify a group of people who could benefit from the intervention. These may be your clients, community members, or some other group. From there, you develop a test for your intervention. The most common tests are to evaluate a group prior to providing the intervention and then again after receiving the intervention (a pre/post-test) or to give the intervention only to a subset of the larger group, so some members receive the intervention and others do not (experimental design). In either of these situations, you are focusing on only two groups, so the t-test is the most useful option in your statistics toolkit.

A t-

88%

test is used to determine whether there is a statistically significant difference between

two groups.

There are two kinds of t-tests (table 2):

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 265 Table 2: T-Test Matrix HOW DO I INTERPRET A TEST STATISTIC? Results for t-tests in academic literature will look something like this: image (image) Unless you are doing research, interpreting the results of t-tests is more important than calculating a t-value. We do not cover the calculation for finding a t-value, but the results from a t-test break down into three distinct pieces of information, and you should understand how to interpret these results. 1. $t = 2.04$: The t-value is a test statistic, which is a standardized value calculated from your data, but not in the same units as your measurements. While knowing $t = 2.04$ may not tell you much, knowing that a t-test was done tells you that the study had two groups—either two samples from the same groups (pre/post) or two independent groups. 2. $df = 30$: The notation df refers to degrees of freedom. For t-tests, $df = n - 1$. If you remember from previous chapters that n is the notation for sample size, the degrees of freedom are one less than the sample size. If you know the degrees of freedom, you also know the size of the sample. 3. $p < .05$: To know if there was a statistically significant result, you need to understand the p-value. You will learn in the next section that the most common threshold for statistical significance is $p < .05$. These results meet that threshold, so the results are statistically significant. Dependent t-Test A t-test for dependent means is used when a single group of subjects is being studied under two conditions—for example, evaluating the same subjects before an intervention (pre) and after an intervention (post). Use this test when: The same participants are being tested more than once. There are two samples (before and after). Independent t-Test The independent groups t-test is used to evaluate whether the means of two independent samples are equal—for example, comparing the effectiveness of an intervention by comparing the mean for a treatment group (intervention received) and a control group (no intervention). Use this test when: Differences between two separate groups are examined. Participants are being tested only once.

NSOU ? PGSW-VII 266 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 Consider if, instead, you see results like these: 1. $t = 1.7$: A t-test was done, so you are dealing with only two groups—either two samples from the same groups (pre/post) or two independent groups. 2. $df = 24$: The sample size was $n = 25$. 3. $p > .10$: The most common level for statistical significance is $p < .05$. These results do not meet that threshold, so they are not statistically significant. WHAT IS STATISTICAL SIGNIFICANCE? Statistical significance is a key concept for consuming research findings and understanding the limitations of “knowing” based on statistical tests. Statistical significance is the probability that a value has a certain level of precision. P-VALUE We describe statistical significance with something called a p-value. The p-value can also be referred to using the Greek symbol alpha (α). The most commonly used threshold for statistical significance is $p < .05$. A p-value, or significance level, of $p < .05$ indicates less than a 5 percent chance of seeing the results you found if the null hypothesis is true. If there is truly no difference between the two groups, then there is less than a 5 percent risk that these results would occur by chance. Put another way, a 5 percent significance level means that there is a 5 percent risk of

rejecting the null hypothesis when it is true. (This is called a Type I error;

you will learn about error in the next section.) Prior to conducting an inferential test, the p or alpha (α) level must be set to determine the level of risk that is acceptable for rejecting or accepting the null hypothesis. The alpha level is most commonly set at $p = .05$, but it could be set higher or lower based on the appetite for risk in a given situation. You could imagine that in a scenario where the treatment could cause harm or the side effects might be severe, your appetite for risk would be lower, so a p -value of $p = .01$ would be more appropriate. Consider a situation in which a teenager is tested for and diagnosed with a severe mental illness. This teenager will now be prescribed medications that can have serious side effects and will have to face potential stigma from this diagnosis. Would

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 267 you be willing to accept a 5 percent risk that the test generated a false positive and the teenager does not have the diagnosed condition? Would a 1 percent chance be more acceptable? When the consequences are severe, you accept less risk. You use p -values to set the acceptable level of risk. Statistical Significance in Political Polling Statistical significance is regularly mentioned in the news. For example, during political campaigns, the media often report the results of public opinion polling in the form "Candidate A has the support of 52 percent of the electorate, with a 4 percent margin of error." Given that most polling uses the standard alpha (α) level of $p = .05$, this means that there is a 95 percent chance that the true rate of support among the entire population for candidate A is between 48 and 56. When the next week the media report a "fall" in support for candidate A to only 49 percent (with the same margin of error), all that means is that there is now a 95 percent chance that the true rate of support among the entire population for candidate A is between 45 and 53. Even though the media reported a "drop in support," in reality candidate A's support may have held steady at anywhere between 48 and 53 (figure 2). The distributions representing support of a candidate over two weeks have a large area of overlap, which means that the candidate's support level could have been the same despite being reported as having declined. FIGURE 7.2 Distributions for support of a candidate over two weeks

NSOU ? PGSW-VII 268 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 If a test results in a p -value that is equal to or less than the alpha (α), then reject the null hypothesis (thus accepting the alternate hypothesis—your "educated guess"). If the result is greater than the α level, then you cannot reject the null hypothesis. If you cannot reject the null hypothesis, then there is not a statistically significant difference between the groups. Remember that if a test does not reach the desired α level, you do not know that the intervention failed. The null hypothesis may not be true, but the sample data used in the calculation did not provide sufficient evidence to reject it. Similarly, a p -value of $.05$ does not mean that you have proved the alternative hypothesis. Even if the null hypothesis were true, there would still be a 5 percent chance of getting your result. If you were so convinced of the relationship that you kept testing for it, in 1 out of every 20 tests, you would be able to get a result where $p \geq .05$. Remember that each time you see a positive result reported in research literature, you may not see hundreds of attempts to test the same thing that did not find significant results. Another risk is adhering too closely to the standard of $p = .05$. If a study found that the results of an intervention were significant to $p \geq .06$, that result would not reach the α level of $p \geq .05$, but it might still be promising enough to continue testing the intervention. The strict focus on $p \geq .05$ can be an overly narrow way to indicate the success of an intervention. The focus on this "bright line" result in published academic research has had the unfortunate consequence of driving some researchers to manipulate data in ways they otherwise might not have to find $p \geq .05$. (This is called p -hacking.) HOW DO I KNOW IF A SIGNIFICANT RESULT IS MEANINGFUL? Statistical significance does not always translate into meaningful differences that non-statisticians appreciate. A "significant" result in statistics refers to solely the p -value, even though that use does not necessarily match the colloquial use of the word. A small p -value does not necessarily ensure a larger or more important effect, and a larger p -value does not mean the results are unimportant or prove that the intervention does not work. With a large enough sample size, any effect, no matter how tiny, can produce a small p -value, and with a small sample or imprecise measurements, even an intervention that has a large effect may result in a nonsignificant p -value.

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 269 A study may be statistically significant but not meaningful. If a study found statistically significant results that extracurricular activities for teenagers lowered their use of alcohol, administrators would want to fund additional activities. However, if the statistically significant result showed that extracurricular activities lowered alcohol consumption by an average of only 0.5 drinks per week, then the practical implications may be limited. Schools may not be willing to spend more money encouraging students to participate in extracurricular activities or creating new clubs or sports teams to lower alcohol consumption by only half a drink a week if reducing alcohol consumption is their primary goal. Using a t-Test in Practice A city's Department of Human Services plans to launch a new flexible rent-subsidy pilot to reduce the number of families who become homeless and need shelter provided by the city. The subsidy is designed to help low-income families stay in housing despite short-term fluctuations in their income. This flexible subsidy could allow them to adjust for shifting or unstable hours at work or unexpected costs like flat tires or medical bills. There are not enough funds to serve every eligible family, so the city randomly selects families to receive the subsidy and creates a waiting list. They can then compare the families who receive the subsidy ($n = 138$) to those who are still on the waiting list ($n = 234$) to see if there is a difference between the two groups in the average amount spent on social services (table 3). Table 3 Mean Spending for Families in Treatment and Control Groups Received Subsidy On the Waiting List Mean spending per family \$9,329 \$13,321 during program year There are two groups, the treatment and control group, which means that an independent t-test is the most appropriate test to determine if there is a difference in the amount spent on social services for families at risk of homelessness. After completing a t-test, the city staff found the following results: $t = -12.46$, and $p < .0001$. A p-value of $< .0001$ is extremely small. This p-value indicates that there is only a 1 in 10,000 chance that these results are due to chance or that they represent a false positive. Given this result, the staff feel confident that the flexible subsidy has lowered the overall cost of supporting families, and they can use this information to advocate for expanding the program in the next year.

NSOU ? PGSW-VII 270 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 Similarly, if a study found statistically significant results that a job training program placed participants in jobs but that they held those jobs for less than two months, then the practical implications may be limited. The state may not be willing to spend more money on job training programs if they do not lead to long-term employment. In each case, the results were statistically significant, but the implications for practice were not meaningful. Return to the previous examples of t-test results: $t = 2.04$, $df = 30$, $p < .05$ or $t = 1.7$, $df = 24$, $p < .10$. You now know that the commonly accepted level of risk is $.05$. When $p < .05$, you have sufficient confidence that there is a difference between the groups being examined. At $p < .10$, you have not reached a sufficient level of confidence that the difference is produced by the intervention rather than by chance. WHAT DO ERRORS TELL ME ABOUT MY RESULTS? When you think about testing hypotheses, you may think that the alternative hypothesis (your educated guess) will either be rejected or not. Unfortunately, since you are never testing the entire population, determining if your result is valid is more complicated than that. For example, there is some chance that you will find no difference between the group that received the intervention and the one that did not, when in reality there was a difference. Alternatively, your test might find a difference between the two groups, when in reality there was not a difference. TYPE I ERROR Type I errors (α) occur when you conclude there is a difference when there is not (table 4). It is a false positive finding. If you are testing an antidepressant and find that the people who took the medication have lower levels of depression, but really the difference was just due to chance, then that is a Type I error. Table 4 Analysing Hypotheses H_0 is True H_0 is False Reject H_0 Type-I error (false positive) Finding reflects reality Do not reject H_0 Finding reflects reality Type-II Error (False negative)

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 271 TYPE II ERROR Type II errors (β) occur when you do not find a difference that exists. It is a false negative finding. If you found that the antidepressant did not make a difference when it actually lowered levels of depression, you have made a Type II error. You cannot completely eliminate the risk of a Type I or Type II error when conducting tests, but you should understand the risk of each type of error and its implications. Calculating the precise risk of error is beyond the scope of this book. For most practitioners, it is sufficient to understand the implications of either a Type I or Type II error and know that there is always some risk involved. Type II error can occur because a small sample size limits the power of the test. When you review literature, or are testing interventions yourself, keep the risk of Type II error in mind if you are working with only a few people. You will have trouble overcoming Type II error unless you can test the intervention with a larger group. Error in Practice Imagine you are a counsellor at a high school who is concerned about an increase in the number of teenage suicides. You want to help mediate this risk with your students. Your hypothesis is that a crisis intervention you designed will help your students, but you must test your hypothesis to be certain. The null hypothesis is that your intervention does not make a difference and that the risk is the same for a group that receives the intervention and a group that does not. The alternative hypothesis is that your intervention reduces suicidal ideation— thinking about or planning to commit suicide. If you conducted an experiment to test your intervention and found that the intervention was effective at reducing suicidal ideation, but in fact your results were just random chance, that is a Type I error. This result would lead to the belief that the intervention helps when it does not. Teenagers may receive a treatment that does not help them, possibly wasting time and resources or keeping them from an intervention that would be more effective. You obtained a false positive. Instead, imagine you conducted an experiment and found that your intervention did not make a difference in students' suicidal ideation, when in fact it was making a difference. That result is a Type II error. This would lead to the belief that the

NSOU ? PGSW-VII 272 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 intervention did not work when in fact it could reduce the risk of suicide. Here, teenagers are not receiving a treatment that could save lives. If you are the counsellor conducting the test, which risk is more acceptable, Type I or Type II? Do you continue testing an intervention that may not work, or do you set aside an intervention that may be helping but that you do not yet have statistical proof to back up? WHAT IS THE EFFECT SIZE? Effect size is a simple way of quantifying the magnitude of the difference between two groups. Effect size emphasizes the size of the difference in terms of standard deviations, so the difference is more easily compared across groups. The effect size is particularly valuable for quantifying the effectiveness of a particular intervention relative to some comparison. It allows you to move beyond the simplistic "Does the intervention work or not?" to the far more sophisticated "How well does the intervention work in a range of contexts?" Moreover, by placing the emphasis on the size of the effect rather than any statistical significance, you can more easily translate results into their practical implications. HOW DO I CALCULATE THE EFFECT SIZE? The effect size is calculated using Cohen's d. Cohen's d is a measure of effect size based on the difference between two means. Because Cohen's d uses the means for two groups, this measurement of effect size is only useful in conjunction with t- tests. The effect size is calculated as follows: Cohen's $d = (x_1 - x_2) / \{(SD_1 + SD_2) / 2\}$ = (mean of Experimental Group – Mean of Control Group)/Pooled Standard Deviation You can evaluate the effect size using the following guidelines (figure 3). If Cohen's d is around 0.2, then the effect size is small. If it is around 0.5, then the effect size is considered medium. If the effect size is around 0.8, this is considered a large effect size. If the effect size is greater than 1, then that is a very large effect size.

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 273 FIGURE 3 Measuring magnitude of effect size A scale for measuring the magnitude of the effect size, ranging from 0 (no effect) to 1 or more (a large effect). In the middle is a range from about 0.5 to 0.8 where the effect size is considered medium. When calculating Cohen's d, you may find a negative result. If x_1 in your equation is the experimental group and x_2 is the control group, then a negative effect size indicates that the effect was negative (rather than improving the condition, it caused deterioration, or rather than an increase, there was a decrease). In general, the sign of the effect size is not as important as the magnitude. However, you should always verify that the direction of the change matches your assumption. Finding a small effect size does not mean that the treatment under consideration has no effect. Finding a small effect size means that the only way to identify the effect or difference is by using precise instruments with a large sample size. For large effect sizes, you may be able to see the difference between the two groups simply by observing them. Consider an effective antibiotic. If an antibiotic was given to one group of people suffering from an illness while the other group received a placebo, you should be able to tell who received the antibiotic by looking at whose symptoms have ceased. This is an example of a very large effect size. You can observe the difference without careful testing (though you should still conduct tests!). It should make sense that if Cohen's d is larger than 1.0, it is a very large effect size. Effect size indicates how many standard deviations the mean of the experimental group is from the mean of the control group. If Cohen's d is equal to 1, then there is a full standard deviation between the means. You will remember from chapter 4 that nearly all scores fall between $+/-3$ standard deviations from the mean, and that 68 percent of scores fall between $+/-1$ standard deviation from the mean. Finding more than 1 standard deviation between the means is a substantial difference. UNDERSTANDING EFFECT SIZE USING DISTRIBUTIONS Using graphical representations can help clarify the meaning of the effect size.

NSOU ? PGSW-VII 274 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 The goal of the effect size is to standardize the size of a difference between two means using the variance between the two distributions. Start by considering the distribution in figure 4 Two distributions with means that are close together and large standard deviations have a large amount of overlap. In this situation, you would assume the effect size is small. You can see that the means are close and the overlap is large. The distributions are also flat, which indicates larger standard deviations. What does this tell you about the effect size? First, the large amount of overlap between the two distributions indicates that identifying whether a person was in the treatment or control group would be difficult. The differences would not be clear. Second, the large standard deviation (the distributions are more flat than peaked) means that the denominator of the effect size calculation will be larger and the resulting Cohen's d will be smaller. Compare the distributions in figure 4 to the distributions in figure 5. FIGURE 5 Understanding distributions with a medium effect size

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 275 Two distributions with means that are not close together and large standard deviations have a smaller amount of overlap. In this situation, you would assume the effect size is medium. The means in figure 7.5 appear to be more different. There is little overlap between the two distributions, but they also appear to have large standard deviations. The denominator of the effect size calculation will be large, and the resulting Cohen's d will be small, though not as small as in the first set of distributions because the overlap between the two distributions is smaller. Finally, compare the distributions in figure 4 and 5 to the distribution in figure 6. FIGURE 6 Understanding distributions with a large effect size Two distributions with means that are close together and small standard deviations have a small amount of overlap. In this situation, you would assume the effect size is large. The means in figure 6 appear to be more similar, like those in figure 4. But the distributions are quite peaked, indicating smaller standard deviations, so there is little overlap between the two distributions. These distributions will have a larger effect size than the distributions in figure 4.

- T-tests tests allow you to determine if there is a difference between two groups.
- The significance level is the amount of risk you are willing to accept that you rejected the null hypothesis, or said there was a difference between groups, when there was no difference.
- Not all statistically significant results have meaningful practical implications.
- If Cohen's d is around 0.2, it is considered small. If it is around 0.5, it is considered medium. If it is around or above 0.8, then it considered a large effect size.

MORE ON HYPOTHESES: ONE- AND TWO-TAILED TESTS You can further refine your practice by understanding the differences between one- and two-tailed tests. For either a one- or two-tailed test, assume you are still using the significance level of .05. A two-tailed test distributes half of your alpha to testing the statistical significance in one direction and half to testing statistical significance in the other direction (figure 7). This means that each tail of the distribution uses an alpha of .025. A two-tailed test analyses the possibility that a relationship exists, without predicting its direction. For example, it tests for the possibility that a treatment improved outcomes or worsened outcomes. Similarly, you could be interested in whether an intervention affected a family's earnings; a two-tailed test would test if incomes were either greater than or less than the value of the null hypothesis. With a two-tailed test, in order to be statistically significant, the results must be in either the top or the bottom 2.5 percent of the distribution, resulting in a p-value less than .05. FIGURE 9.2 One- and two-tailed tests

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 277 A one-tailed test indicates a hypothesis that specifies whether the effect of a treatment or a relationship will be greater or less than the control. A two-tailed test is used for nondirectional hypotheses. For a one-tailed test, the area under the curve that represents $p < .05$ is situated at one end of the distribution, where the effect is expected to be found. For a two-tailed test, the area is split, with an area of .025 under each end of the curve. Alternatively, a one-tailed test distributes the alpha of .05 exclusively to one end of the distribution and does not test the other end of the distribution at all. If you wanted to know if an intervention increased family income, a one-tailed test would give you more power to detect the increase, but it would not test for a decrease at all. You are more likely to find a statistically significant result, but you risk missing results on the other end of the distribution. In some situations, missing an effect on the other end of the distribution can be a serious problem. Consider the possibility that you are interested in testing an antipsychotic medication. You want to maximize the chance of finding a statistically significant result for improved functioning on the medication, so you use a one-tailed test. In doing so, you can no longer find evidence that the medication is less effective than an existing drug or no treatment, whichever control you are using. Because this type of oversight is not acceptable in many situations, two-tailed tests are generally preferred. One-tailed tests should only be used when there is no risk or ethical concern in disregarding one direction of the effect. P-HACKING: THE PRESSURE FOR STATISTICAL SIGNIFICANCE In previous chapters, you have learned that the standard threshold for statistical significance is $p < .05$. This standard has been central to decisions about what studies are published and spread through the academic literature, but there is now a debate about its utility. A growing number of studies that reached the $p < .05$ threshold have not been replicable, calling into question their original validity. Additional studies have also found that there is a preponderance of published studies with results exactly equal to $p < .05$. Stuningly, about 90 percent of the papers published in academic journals documented positive findings where $p < .05$. The problem with the struggle to find statistical significance is that researchers can consciously, or unconsciously, alter their results in such a way that they reach a statistically significant result and are able to publish a more interesting article than one that fails to reject the null hypothesis.

NSOU ? PGSW-VII 278 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 Suppose some researchers are considering the effect of income on mental health. They first consider income as all resources of the household (pay checks, food stamps, tax refunds, health insurance, and gift), and they do not find a statistically significant result. Then maybe they consider income to be only money coming in from pay checks. This time they do find a statistically significant result, and they publish this finding instead. In this case, the researchers can likely justify the change without using complicated calculations to achieve a statistically significant p-value (though that can also happen). The problem arises when, in the search for statistical significance, the researcher keeps trying until a statistically significant result is found. A disturbing number of published findings cannot be replicated when the experiment is conducted again by different researchers. This has led to calls to lower the p-value required for statistical significance or to abandon statistical significance in favour of effect size and the inclusion of descriptive statistics. One other emerging trend is prominent academic journals' actively promoting the publishing of results that fail to reach statistical significance, emphasizing that data from studies that are not statistically significant should also be considered as part of the body of literature. For your practice, you should be aware that while the $p < .05$ level is a useful threshold and can be suggestive of interesting results, a study that finds this result does not necessarily mean you will get the same outcome if you repeat the intervention with the population you work with.

8.12 Conclusion

Thus we get an elaborate idea about the vari our statistical application's along with this we developed a concept about Coding & Hypothesis.

8.13 Exercise 1.

You manage an agency that provides tutoring services. You are interested in starting a new literacy program for clients at your agency. You serve many people at your agency, but logistically you think you can only study the effect of the new program with 60 people. You randomly assign those 60

PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 NSOU ? PGSW-VII 279 people so that 30 people receive services as usual and 30 people participate in your new literacy program. The results are shown in table 5. Mean Score on Standardized Standard Deviation Reading Test (Out of 200) Services as usual 150 29 Literacy program 175 35 a. What are the null and alternative hypotheses? b. Which t-test should you use? c. What significance level would you set? 2. Identify if each of the following situations is an example of an independent or a dependent t-test. a. You want to know if there is a difference in stress level between a group that did not participate in a meditation training workshop and a group that did. b. You test older adults' stability while walking before and after completing a falls-prevention and physical activity program. c. You gauge whether or not a campaign against bullying changed student attitudes. 3. Identify if each of the following situations is an example of Type I or Type II error. a. You track stress levels for children who are taken into the foster care system, measuring their stress level when they are removed from the home, when they are in foster care, and once family reunification has occurred. Your results indicate that family reunification does not lower children's stress levels, but in reality, reunification does lower stress levels. b. You are working with patients recently released from the hospital who need to monitor and manage their diabetes. You test a system of text- message reminders for when they should take their medicine and check their blood sugar. The results show that this intervention improved their

NSOU ? PGSW-VII 280 PRINTTECH D/AA (CD) A new compose/MSW-P-VII U-8 (M-2) 3RD PROOF 27-09-2022 management of the disease, but in reality, the improvement was just random chance. 4. Which of the following represents a statistically significant result? a. $t = 1.350$, $df = 13$, $p > .08$ b. $t = 2.074$, $df = 22$, $p > .025$ c. $t = 1.108$, $df = 8$, $p > .15$ 5. Calculate Cohen's d using the information in table 6. Table 6 scores for Experimental and Control Groups Mean Standard Deviation Experimental Group 20 2 Control Group 15 4 ANSWER KEY FOR REVIEW QUESTIONS 1. a. H_0 : The literacy program has no effect on scores on the standardized reading test. H_1 : The literacy program increases scores on the standardized reading test. or H_1 : The literacy program affects scores on the standardized reading test. b. independent t-test c. $p > 0.05$ 2. a. Independent b. Dependent c. Dependent 3. a. Type II b. Type I 4. b Cohen's $d = (20-15) / \{(2+4)/2\}$ Cohen's $d = 5/3$ 5. Cohen's $d = 1.67$

NSOU ? PGSW-VII 282 Unit 9 ? Computer Applications in Social Research Structure 9.0 Objective 9.1 Introduction 9.2 The internet and social research 9.3 Common packages in social science research – qualitative and quantitative 9.4 Types of E-Resources 9.5 Conclusion 9.6 Exercise 9.0 Objective The learner will learn about— • The internet and social research • Common packages in social science research – qualitative and quantitative • E-resources and its proper use. 9.1 Introduction Computer has become a very important device of our life. It has also made our life very easier. We cannot think of a life without it. Computer can be very effectively used in conducting research activities also. This unit will help us to discover how computer application can be used while we carry out our data collection & interpretation & analysis. 9.2 The Internet and Social Research The employment of digital technologies in social research is a rapidly growing area of development, deliberation and reflection. At its core is the employment of Internet technologies, tools and services as an object of research, as well as a tool and 282

NSOU ? PGSW-VII 283 platform for the conduct of research and the creation of innovative methodological practices. Social researchers put forward the premise that digital technologies can both expand existing research interests and yield new themes and questions for research. For instance, hyperlinks have given rise to (hyper) link research. Similarly, web sites and web content have given rise to website analysis, while search engines have fed the study of search-engine results and their politics. At the same time, digital technologies have driven researchers to revisit old methods and devise new methodological tools for research. To overcome the drawbacks of offline methods of research, researchers often employ Internet tools and application that alter conventional methodologies and create virtual or online versions of them. Some have even stressed the need for the research community to dispose the necessary capacity so as to treat digital methods as 'mainstream methodology'. Along these lines, the employment of digital technologies in research suggests the collaboration of social and computer researchers, with knowledge elements from various disciplines being combined so as to boost new areas of research or niche spaces for the operation of new knowledge networks and fields of study (e.g., artificial intelligence). This leads to the deployment of new research models (e.g., computational social science, agent-based models) and data, the pursuit of large-scale research and the initiation of new practices and communities of inter-disciplinary collaboration that often involves technology experts, funders, creative practitioners, industry actors and ordinary technology users. Integrating Data and Documentation To what extent can the various tasks mentioned above be integrated into a single process? Using a single computer program or an integrated set of programs to carry out these tasks simplifies data management, reduces costs, and is more reliable. It is advisable to determine which program or programs will handle data management and documentation tasks at the outset of the project. Computer-assisted interviewing. Computer-assisted interviewing (CATI/CAPI) is increasingly being used for both telephone and personal interviews. These programs — e.g., Blaise, CASES — typically perform a number of functions simultaneously including direct data entry, integrity checks, and skips and fills. Somewhat similar software can be used to

NSOU ? PGSW-VII 284 format mail questionnaires and prepare data entry templates. Be aware that not all CAPI-generated variables are needed in the data file that is deposited in an archive; variables that are artefacts of the CAPI process do not contribute useful information for analysis. If possible, it is desirable to program the instrument to be fielded according to specifications of the resulting data files. Keeping a focus on the ultimate desired form of the data collection can make dataset preparation much easier. Using integrated software. Most large-scale data collection efforts now involve computer assisted interviewing, but there are still situations in which data entry will be required — e.g., inputting of administrative records, observation data, or open-ended question responses. A number of software tools are available to make the documentation task easier. For projects requiring data entry directly from mail questionnaires or interview instruments, a variety of programs will not only make data entry easier, but also carry out data integrity checks as the data are entered and create programming statements to read the data into other programs. A good data-entry program will also recognize automatic skips and fills. For example, suppose that a questionnaire contains a series of items on work experience. If the respondent has never worked, then as soon as that code is keyed, the program skips to the next valid entry, filling in missing data codes in intervening fields as appropriate. Spreadsheets and databases. Spreadsheet packages can also be used for data entry. These packages usually can be programmed to perform integrity checks as data are entered. In addition, a variety of database packages such as Microsoft Access, MySQL, and Oracle can be used for both data entry and documentation. Note that when such systems are intended to serve as the format for deposit, it is important to provide full documentation for all of the fields and relationships built into the files. Other kinds of software can be used to perform many documentation tasks. For example, word processing packages like Microsoft Word can be used for data entry, maintenance of dataset documentation, and similar tasks, but they are not suitable tools for data integrity checks. Producing an attractive final document using word processing is also quite simple. In fact, if the basic document has been set up in a word processor, retrieving and merging statistical information such as frequencies and descriptive statistics from computer output stored in an external file is a relatively easy task.

NSOU ? PGSW-VII 285 9.3 Common packages in social science research – qualitative and quantitative One of the most obvious ways to categorize information is by whether it is quantitative or qualitative. Some sources contain either quantitative information or qualitative information, but sources often contain both. Many people first think of information as something like what's in a table or spreadsheet of numbers and words. But information can be conveyed in more ways than textually or numerically. Examples of social science data include: • survey data (opinion polls, voting records) • nonsurvey data (images, maps, sound, video, multimedia) • raw measurements, numeric tables, government statistics, and indices • text (fieldnotes, transcripts, blogs, e-mails) • spatial (zonal, event, spatial referent) Quantitative Information – Involves a measurable quantity—numbers are used. Some examples are length, mass, temperature, and time. Quantitative information is often called data, but can also be things other than numbers. Qualitative Information – Involves a descriptive judgment using concept words instead of numbers. Gender, country name, animal species, and emotional state are examples of qualitative information. Examples of types of qualitative data that may be archived for secondary analysis include: • In-depth/unstructured interviews, including audio and video • Semi-structured interviews • Structured interview questionnaires containing substantial open comments • Focus groups • Unstructured or semi-structured diaries • Observation field notes/technical fieldwork notes • Case study notes • Minutes of meetings • Press clippings Data Analysis Tools for Social Sciences R is free to download and use, and all the codes are open. At the same time, users can easily add their own programs (once they are familiar with statistics and programming).

NSOU ? PGSW-VII 286 SAS is a powerful statistical-analysis and data-management system for complex data sets. It is especially strong in analysis of variance (ANOVA), the general linear model, and their extensions. SPSS performs statistical analysis on quantitative data. The graphical user interface makes statistics analysis easier, including most complex models. It is a software that is widely used on computers and it is used for scientific, social and econometric research. SPSS is also used as an optimal tool for parametric analysis, correlation analysis, scale reliability testing. PSPP is a statistical analysis tool developed to be a free, open-source alternative to SPSS (which is now developed by IBM). Although not identical, it is similar in many respects, and allows one to work with file formats common to SPSS. Unlike SPSS, PSPP does not limit the number of cases or variables which you are able to use, nor will it require you to purchase add-ons to gain access to more advanced functions. As a fully functional statistical analysis program, it is capable of performing descriptive statistics, *t*-tests, linear regression, as well as non-parametric tests. Included in its basic design is the ability to perform analyses as quickly as possible, regardless of the volume of data entered. In addition, you have the option of using the program through its graphical user interface (GUI), or through the more traditional method of utilizing syntax commands. Stata is a command-based statistical package that offers a lot flexibility for data analysis. The program language keeps a simple structure, so is easy to learn, allowing users to focus on the statistical modeling. Excel is good is for the simplest descriptive statistics, or for more than a very few columns. It is easy to use for basic data analysis, and is much more convenient for data entry and shape manipulating. NVivo is a qualitative data analysis package. It helps researchers organize and analyze complex non-numerical or unstructured data, both text and multimedia. The software allows users to classify, sort, and arrange thousands of pieces of information. It also accommodates a wide range of research methods. It supports documents in many languages. Quantum GIS (QGIS) is open source GIS software, available for both Windows and Mac OS. This software is free and comes with surprisingly powerful and useful tools.

NSOU ? PGSW-VII 287 Codes and Coding Before survey data are analyzed, the interview or questionnaire responses must be represented by numeric codes. Common coding conventions (a) assure that all statistical software packages will be able to handle the data, and (b) promote greater measurement comparability. Computer-assisted interviewing systems assign codes automatically by programming them into the instrument, so that most coding decisions are made before the instrument is fielded. The principles discussed here apply to such situations as well as those in which coding follows data collection. E-resources and its proper use The term 'e-resources' an acronym used in reference to electronic resources or electronic information resources. These are collections of information in electronic or digital format that are accessed on an electronic device, such as a mobile phone, computer, etc. They are published resources in electronic versions or format such as encyclopaedias, pamphlets, e-books, e-journals, databases, etc. A number of authors have also provided their own definitions. Adams and Bonk (1995), Scan (2010), Moyo (2004), Liu (2006) and Nicholas et al. (2009) defined electronic resources as databases, books, journals, newspapers, magazines, archives, theses, conference papers, examination papers, government papers, research reports, scripts and monographs in an electronic format. Swain and Panda (2009a) regarded e-resources as reservoirs of information that may be milked through various electronic devices such as computers, smart phones, tablets, etc. 'They are fine grained and restructured and often stored within the cyberspace in a compact form'. The major advantage of e-resources is that they can be simultaneously accessed ubiquitously around the world by a great number of users. Nicholas et al. (2017) also concurred that the use of electronic resources, such as search engines, was highly popular among early-career researchers irrespective of country, language and discipline. According to AACR2, an electronic resource is: "Material (data and/or program(s)) encoded for manipulation by a computerized device. This material may require the use of a peripheral directly connected to a computerized device (e.g., CD-ROM drive) or a connection to a computer network (e.g., the Internet)." IFLA defines Electronic Resources as "to those materials that require computer access, whether through a personal computer, mainframe, or handheld mobile device. They may

NSOU ? PGSW-VII 288 either be accessed remotely via the Internet or locally". Some of the most frequently encountered types are: E-journals, E-books, Full-text (aggregated) databases, Indexing and abstracting databases, Reference database (biographies, dictionaries, directories, encyclopedias, etc.), Numeric and statistical databases, E-images, E-audio/visual resources (IFLA,2012). The rapid advancement of information and communication technology has brought a revolutionary change in the information scenario and gives rise to a number of options to handle varied information sources conveniently and effortlessly. Electronic resources (E-resources) have become the most sought after modern library's reserves in satisfying varied needs of students, teachers, and researchers with minimum risk and time. Information technology has changed the world and has become one of the important tools for retrieving information. The electronic information resources have acquired a major portion of library collections. The value and use of information resources, particularly E-resources, have increased with the time. Therefore, there is necessity to make study on the different aspects of resources and the issues relating to the use of E-resources by users, more particularly by the faculty members of academic institutions. 9.4 Types of E-Resources The Internet is a heterogeneous channel with vast educational resources. These resources include: e-books, ejournals, e-mail, inter-linked hypertext documents, online help centres, expert's view, file transfer protocol and so on. Each of these resources has its own set of rules, but they relate to one another in several ways (Monereo et al., 2000). Some of these resources are discussed as follow. E-books:- An e-book is the electronic version of a book covering its full contents (text, tables, diagrams, illustrations, etc.). An e-book collection is usually set up in an e- database, which supports full-text searching within and across titles, advanced search and bookmark functions. Users can view full text of e-books in HTML or PDF format online. Ebooks are usually read on dedicated e-book readers or tablets using e-reader applications. Personal computer and many smart phones can also be used to read e- books.

NSOU ? PGSW-VII 289 E-thesis:- An e-thesis or electronic thesis describes a thesis in digital form that is generally accessed via the internet. It is intellectual works or research of a researcher. It provides a technologically advanced medium for expressing ideas with less expensive, small space, easy handling and high longevity. Access to, and storage of, electronic theses is usually facilitated by open access repositories such as the UCC (Uniform Commercial Code) institutional repository, CORA (Cork Open Research Archive). UCC is developing an e-thesis programme to ensure that postgraduate research conducted in UCC is widely disseminated. In many countries, a move has been made in recent years to electronic submission of theses, in parallel with hard-copy submission, enabling theses to be searchable and readable online. E-thesis is stored in CORA, the UCC institutional repository. This is an open access repository based on DSpace software. There is no file size limit imposed on e-theses in CORA. E-journals:- With the advent of the internet, researchers and academics have recognized the capabilities of the information and communication technologies as efficient means to share results and to get around barriers by full transfer of intellectual property rights from the author to the publisher; it is also a means of improving the slow turn-over of traditional publishing (Correia and Neto, 2006). An electronic journal is a periodical publication which is published in electronic format, usually on the Internet. An e-journal is a journal available online or offline containing research papers, review articles, scholarly communications etc. It is useful in higher education. Electronic journals relatively provide efficient access to information and thus they are easier to distribute to library patrons than traditional print; in the financial stringent environment of higher education system, electronic journals have become a medium which is cheaper than the traditional printed journals (Ellis and Oldman, 2005). According to Rowley (2006) electronic journals take two different forms: journals that are published in print form, available in digital form and electronic journals which do not necessarily need a publisher, and which can be managed by an editor and the scholarly community. Both types may have a significant impact on scholarly communication and in the way knowledge is created and disseminated.

NSOU ? PGSW-VII 290 Online databases:- The most effective way to provide access to electronic books/journals in University libraries is through subscription to online databases which can be accessed through the internet. Online databases are a collection of electronic information sources (e-journals/e-books) by publishers from various fields and disciplines (Afolabi, 2007). Some of these databases are provided free of charge to libraries in developing countries by their publishers or vendors. CD-ROM databases:- CD-ROM databases allow users access to relevant databases without robust Internet connectivity in libraries. It is therefore cost effective than online databases as information could be accessed off-line without paying for telecommunications fee (Afolabi, 2007). Besides, CD-ROM databases are of immense value over print if the system is networked, as patrons at their terminals could access information without coming to the library. The information revolution brought forth by advances in information and communication technology has enabled universities and colleges around the world to take advantage of these developments. New modes of teaching, learning and accessing information have emerged as a result of Internet and World Wide Web (Darkwa et al., 2007). CD-ROM databases are important tools for identifying the bibliographic details of potentially useful documents and ensure easy access to large volumes of literature for research. Electronic Mail (e-mail):- This is an instantaneous electronic message from a sender to the recipient. It is the most used application on the internet. Another variant of the e-mail is to provide a list through which a subscriber receives and participates in a group discussion through e-mail. Each user has a mail box address to which messages are sent (Griffith, 2002; UCB Library; 2004c&d, University Libraries, 2003; Steinger, 2001). The e-mail is relevant for communication between teachers and students, peers (teacher-teacher, student-student), and with parents. File Transfer Protocol (FTP):- File Transfer Protocol (FTP) is a standard internet protocol for transmitting files between computers on the internet. It allows a computer to rapidly retrieve complex files intact from a remote computer and view and save such files on your computer (UCB Library, 2004d). Remote Login:-

NSOU ? PGSW-VII 291 This permits a computer user to log on to another computer and use it as if the user were there. Through remote login, lecturers can access to their university's computer from any other computer connected to the internet anywhere in the world. Files can be downloaded, even common computer operation like rebooting can be accomplished (UCB Library, 2004c&d). To remote login to a computer, you must know its address which can be words (mail.yahoo.com) or numbers (216.109.127.28). Gopher:- It is one of the earliest resources on the internet. It is the only method for accessing internet documents. Some gopher texts may still be found linked on the web page, but they are more or less subsumed in the World Wide Web (Griffith, 2002; UCB Library, 2004d). The World Wide Web (WWW):- The World Wide Web (www, W3) is an information system of interlinked hypertext documents that are accessed via the internet. It has also commonly become known simply as the Web. The WWW incorporates almost every protocol available on the internet (e-mail, FTP, Telnet, Usenet, etc.). The web provides opportunities for retrieving text documents, viewing images, animation, and video, listening to sound, speaking and hearing voices, provided one's computer has the capacity and software (UCB library, 2004a&d; University Libraries, 2003). The web relies on hypertext as its means of information retrieval. Hypertext is a document that connects to other documents, that is, the ability to have web pages containing links, which are areas on pages or button or graphic which can be clicked to retrieve another file unto the user's computer. Advantages of E resources Accessing information through electronic Libraries:- Electronic Libraries which offer an important advantage in accessing information required from related sites are classified into two different groups: open or closed access web sites of universities, and other web sites which are completely open through the internet. The closed sources in Electronic Libraries in universities are based on e-books and e-journals and are completely trustworthy. These collections are ideal for the undergraduate, post-graduate students, researchers, and academicians.

NSOU ? PGSW-VII 292 Helpful in conducting research:- The e-resources is a powerful tool for assisting students and educators with conducting research. Going to a library and searching through a card catalogue by hand can be laborious and inefficient compared to searching for the same information on a computer. Many institutions offer online library systems which allow students to find information on books using lab computers and to access databases of scholarly articles that they can read online. Submission of assignment through e-mail:- E-mail allows students and teachers to contact one another even if they cannot physically meet. It enables educators to send out announcements, such as assignments or a course syllabus, without having to hand out paper copies. Students can submit assignments via email or some other online submission system, which can cut down on the amount of paper waste produced by the institution. E-mail is also advantageous for those students who miss the class and important class-notes. Data/ File storage through Cloud Computing:- Cloud computing offers the possibility of outsourcing IT requirements to suppliers on the internet. To take full advantage of the opportunities offered requires a professional approach to procuring cloud services and culture change in the way ICT is provided and exploited within research, teaching- learning and the management of universities. Sourcing from the cloud is one way of meeting short-term peaks in demand for computing requirements, individual software applications, or larger and long-term support and processing services. Concerns of using E resources Besides the benefits of e-resources use, a number of publications have shown the adverse impact of e-resources on university and college students, such as discomfiture in reading on the screen, problems in internet access and speed, poor infrastructure, lack of sufficient skills to use the e-resources, and perceptual change resulting from right to use rather than physical possession (Chauhan, 2004) etc. Some of the adverse impact are discussed as follow: Plagiarism:- The abundance of e-resources on the internet do encourage students to copy out others work to be presented as theirs. These resources are free and downloadable.

NSOU ? PGSW-VII 293 Even though they are easily acquired, the continuity of availability of such resource would be an important issue. Lack of reliability and quality of information:- Not every information on the Internet is useful for educational purposes. At times information comes from unknown and sometimes unreliable sources. The e-resources on the internet are sometimes not regulated or monitored, for there is no quality control. (Monereo et al., 2000; Paris, 2003). Quality control issues with online information:- Part of what makes the issue of information overload so problematic is that not all of the information on the internet is of high quality, and there is no quality control mechanism to help parcel out the reliable from unreliable information. Many papers that have not been peer reviewed or gone through some other vetting process are now out in the public domain. This results in the need for scholars to sort through and figure out what is quality information on their own. Overload of information:- Because of the large amount of material on the internet, many scholars feel that they are overloaded with information, and many faculty and students surveyed report that this can be overwhelming for them. Financial constraints:- E-resources are expensive in nature. Downloading and printing each article will be a costly affair. This means a net increase in economic and ecological costs and it becomes a relatively expensive way to acquire a single copy. Many e- journals do charge subscription fees. The pricing schemes of some suppliers are very complicated and limiting, and this might hinder libraries from utilizing e- journals. Changes in work habits:- Changes in work habits include reading from a computer screen, and the physical discomfort of eyestrain and hunched posture that accompanies this. Further, many faculty and students expressed a preference for something they can hold in their hands (e.g. a book and journal). A combination of these factors leads faculty and students to print out most online materials. They will read an abstract of an article or glance through an online document to judge if it is something they want to read further, but will print it out in order to read it fully.

NSOU ? PGSW-VII 294 9.5 Conclusion This unit gave us a detailed information about the use of Internet in Social Research & how various software may be used. This unit also helped us to know about the e-resources and how we may use these e-resources in developing our material without getting thepped into plagicrism. 9.6 Exercise (1) What are advantages of E-resources. (2) Discuss some common packager in Social Science Research. (3) Explain spread sheet. (4) Discuss the use of Internet in Social Research. 9.7 Reference 1. American Psychological Association. NSOU ? PGSW-VII 295 Unit 10 ? Research Reports 10.0 Objectives 10.1 Introduction 10.2 Planning outline of report 10.3 Editing for accuracy and neatness 10.4 Standard formatting for referencing 10.5 Footnotes and bibliography 10.6 Dissemination of findings 10.7 Preparing research abstract 10.8 Book review 10.9 Conclusion 10.10 Exercise 10.0 Objectives In this unit our learners will know how to develop a Research report. 10.1 Introduction Writing a Perfect Research Report in a special Skill. A Report will considered upto the mark it follows all the steps, of Research. It should be well planned, properly edited with lot of accuracy & if I must have proper referencing. Let us we how we can develop of good Research Report this will also help our learner to writ their dissection also. 10.2 Planning Outline of Report Dissertation / Research is an integral part of academic discipline. The project/ research work must be systematically written in a form of report. The first task to be completed before starting a report is to determine what needs to be addressed. 295

NSOU ? PGSW-VII 296 According to Paul V. Anderson's text, *Technical Communication: A Reader-Centered Approach*, the basic structure for a report and the questions to be answered in each section are the following. • Introduction - What will the readers gain from reading the report? • Method of obtaining facts - Are the facts reliable? • Facts - What have you found that is useful for the readers? • Discussion - How do the facts work from the reader's point of view? • Conclusions - Why are the facts significant to the readers? • Recommendations - What do you think the readers should do? • References - You should provide a list of all the authors you have cited in your report where from you take ideas, theoretical knowledge etc. • Attachments /Appendices / Annexure: These contain supporting information, such as transcripts of interviews, results of surveys, a glossary and results from experiments. This is a basic structure, not an outline. Some of these elements may be in a different order, addressed together, or completely omitted. An effective report includes these elements to improve the usability and usefulness of the report. Synchronization of elements should be kept in mind while formulating the final points and outline of the report. Introduction: For some reports, the introduction may only need to be a sentence or two, but for longer more extensive reports it may take multiple pages. The introduction is where the objective of research is stated and briefly explained. An introduction should tell the reader what the main focus of the report is and in doing so tell the reader why the research and report is important for them to read. Essentially we answer the question "What will we gain from reading this report?" The introduction should explain the problem that the report is aiming to solve. For longer reports, your introduction may take multiple pages. Such things such as 1) What problem your report solves, 2) what activities you performed toward solving that problem and 3) how your readers can apply your information to their own efforts towards solving the problem should be answers within the introduction. Also, ensure that within your introduction your main points are stated.

NSOU ? PGSW-VII 297 Method of obtaining facts: The purpose of this section is to show the readers how you obtained your information. Stating where you obtained your information will help to tell the readers if your research is reliable. Your method will help readers to understand the uses and limitations of your research. A good, descriptive method section will allow anyone else to recreate your experiment exactly and obtain the same result. Be very detailed in the method section and reread it as if you were trying to do this experiment for the first time based on your method section. Results: The results section is the most valuable part of the report to readers. The whole point of research is to find the results so they need to be conveyed clearly and effectively. A results section may likely contain tables, graphs, text, and pictures. Include anything that is important in showing the reader what was found through research. Do not include extraneous information as it will only clutter the results section. Make sure you check the date of your information, where it comes from, and who the source was. Keep the prose simple and descriptive in this section, leave the analysis of the results for the discussion section. Discussion: The discussion section is where you interpret your results. Your results section may be nothing but tables and graphs with a few accompanying sentences. Your discussion section is where you make sense of those tables and graphs and explain how they relate to the problem or question the report is trying to research. The discussion also explains what the results mean to the company. In some reports, mainly shorter ones, the discussion and facts sections may be put into one to make reading the report shorter and easier. Conclusion: The conclusion section explains why the results are important and how they affect the reader. It is a good practice to summarize your facts and restate the problem so the reader clearly understands the importance of your findings. This is your chance to tell the reader how they or the company will benefit from your findings. The conclusion usually does not make recommendations for action but will inevitably get the reader thinking about it. Recommendations: Here is where you state the purpose of the report and what you want to be accomplished after the readers are done with your report. This section may not be in some reports because the decision to be made may be beyond your knowledge and power.

NSOU ? PGSW-VII 298 10.3 Editing for Accuracy and Neatness Revising isn't the first step in the process of writing a research paper, but it is perhaps the most important. Many students skip the revision process, mistaking editing for revision. While editing is also very important, revision is an integral part of any good writing process. During revision, you should try to see your work from different perspectives and different angles. When you revise, it's particularly important to keep your target audience in mind. You may need to make changes to content and organization. You may have to go back to the research stage of your process to find more information. You may need to cut out information that doesn't relate to your thesis or focus. Revision is about making big changes to your writing to improve flow, development, and focus. Editing is a stage of the writing process in which a writer or editor strives to improve a draft by correcting errors and making words and sentences clearer, more precise, and as effective as possible. The process of editing involves adding, deleting, and rearranging words to cut the clutter and streamline overall structure. Revision and editing are both important parts of the writing process, yet many students skip revision and don't spend enough time editing. It's important to remember that these steps are separate and that each step takes time. The following pages will help you develop strong revision and editing strategies for your writing process. The revision process is an essential aspect of writing and one that you should build in time for before submitting your written work. Revision means to "re-see" the piece of writing. It isn't just proofreading your paper or correcting grammar, punctuation, or spelling errors. Revision is stepping back and looking at your paper as a whole and seeing if you are effectively saying what you intend to say. It is giving your paper a thorough look to see how you can make it stronger. Your goal should always be to write clearly, concisely, and in an engaging way. One way to go about re-seeing your writing is to do it in three stages. Many people skip the first stage, but looking at the big picture is crucial in making sure you have a well-developed essay that expresses your ideas. Importance of Editing: Whether you're working toward completing an assignment or hoping to get something published, tightening your writing and fixing mistakes

NSOU ? PGSW-VII 299 can actually be a remarkably creative activity. Thoughtful revision of a work can lead to clarification of ideas, a reimagining of images, and sometimes, even a radical rethinking of the way you've approached your topic. Types of Editing: There are two types of editing: the ongoing edit and the draft edit. Most of us edit as we write and write as we edit, and it's impossible to slice cleanly between the two. You're writing, you change a word in a sentence, write three sentences more, then back up a clause to change that semicolon to a dash; or you edit a sentence and a new idea suddenly spins out from a word change, so you write a new paragraph where until that moment nothing else was needed. That is the ongoing edit. For the draft edit, you stop writing, gather a number of pages together, read them, make notes on what works and doesn't, then rewrite. It is only in the draft edit that you gain a sense of the whole and view your work as a detached professional. It is the draft edit that makes us uneasy, and that arguably matters most. Editing Checkpoints The final step for the writer is to go back and clean up the rough edges... Here are some checkpoints: Facts: Make sure that what you've written is what happened; Spelling: Check and recheck names, titles, words with unusual spellings, your most frequently misspelled words, and everything else. Use a spell check but keep training your eye; Numbers: Recheck the digits, especially phone numbers. Check other numbers, make sure all math is correct, give thought to whether numbers (crowd estimates, salaries, etc.) seem logical; Grammar: Subjects and verbs must agree, pronouns need correct antecedents, modifiers must not dangle (make your English teacher proud); Style: When it comes to repairing your story, leave the copy desk feeling like the washing machine repair guy who has nothing to do. Editing is shaping and creating the writing as much as it is something that refines and polishes it. 10.4 Standard Formatting For Referencing In order to reach unity and standard through which articles, research reports and other scientific documents published, many different kinds of scientific writing styles have been provided to present final research reports in an acceptable and uniform manner. For this reason, different kinds of styles are introduced to the researchers. One of the most comprehensive one was presented by American Psychology

NSOU ? PGSW-VII 300 Association (APA). Another one is AMA which is presented by American Medical Association. In addition to the mentioned styles, there are many other styles like IEEE, Harvard and Chicago. Many journals and research centers, based on their scientific domain, choose one of these standard styles. Some journals and academic centers have their own styles and formatting, but theirs are mostly or slightly similar to standard styles introduced by (APA, AMA and on). Styles try to establish a simple set of procedures, or rules, which would codify the many components of scientific writing to increase the ease of reading comprehension. Rules of style in scientific writing encourage full disclosure of essential information and allow us to dispense with minor distractions. Style helps us express the key elements of quantitative results, choose the graphic form that will best suit our analyses, report critical details of our research protocol, and describe individuals with accuracy and respect. It removes the distraction of puzzling over the correct punctuation for a reference or the proper form for numbers in text. The authors of all scientific papers, whether university students or researchers, need to have enough knowledge about the specific styles based on which they are going to write. Among authors, university students are the largest group who are asked to prepare many different kinds of scientific essays during their academic years. Styles and formatting have an important role in increasing access to the content and meaning of text. The importance of obeying styles and formatting rules is of significant importance so that many articles and research reports may be rejected due to lack of adherence to these styles. In this regard, all authors must have a comprehensive knowledge about writing and formatting style so that they could be able to produce their contents according to the standards which are required by each style. Any research article and research report typically has a standard structure. This structure helps to ease communication and interaction between reader and writer. This standard structure is known as IMRAD which stands for introduction, method, results and discussion. IMRAD is a method to make any scientific text look much more logic. It provides many facilities to writer in expressing his or her ideas in more systematic way and also helps the reader to effectively get the main ideas and gist

NSOU ? PGSW-VII 301 of the text and enables the reader to scan or skim for information in a more rapid way. IMRAD shape the skeleton and frame of research reports. Cargill and O'Connor in their book "Writing Scientific Research Articles: Strategy and Steps" considered the needs of those who are early-career researchers in the sciences. This book uses a practical approach to develop scientific skills. The book consists of three necessary stages for providing any successful text like: Developing strategy, developing story and using language. The materials provided in this book are presented in a step by step manner to help the authors prepare their manuscript scientifically. Booth and Colomb and Williams in their book known as "The Craft of Research" provided some information to meet the needs of all researchers in any field such as academic, political, or commercial. It provides the researchers with information about how to extract a research problem from a topic or a question, how to organize and provide a draft as well as how to revise a research report in order to make it more understandable and comprehensive. APA stands for the American Psychological Association. Most papers that use APA formatting and citation style are those written in the Social Sciences: Psychology, History, Political Science, Economics, Geography, and Sociology. In addition to the Publication Manual of the American Psychological Association from time to time, the APA maintains its own website with multiple examples of how to format your paper and cite your sources. Papers constructed according to APA guidelines generally include the following elements: Title Page, Abstract, Body, Subsections within the body, with headings, Tables and Figures, Basic Form: APA style dictates that authors are named with their last name followed by their initials; publication year goes between parentheses, followed by a period. The title of the article is in sentence-case, meaning only the first word and proper nouns in the title are capitalized. The periodical title is run in title case, and is followed by the volume number which, with the title, is also italicized. If a DOI has been assigned to the article that you are using, you should include this after the

NSOU ? PGSW-VII 302 page numbers for the article. If no DOI has been assigned and you are accessing the periodical online, use the URL of the website from which you are retrieving the periodical. Exposing the self-knowledge myth [Review of the book *The self-knower: A hero under control*, by R. A. Wicklund & M. Eckert]. *Contemporary Psychology*, 38(5), 466–467. MLA stands for the Modern Language Association. Most papers that use MLA formatting and citation style are those written in the humanities, especially in languages and literature. In 2016, the MLA Handbook was updated in an effort to simplify much of the documentation process in MLA format. The Chicago Manual of Style, favored by some fields in the humanities, such as history, uses a raised numeral in the text after the item cited, and then either a footnote at the end of the page or an endnote at the end of the essay. These notes contain full bibliographic information about the source. Additionally, a complete bibliography is typically included at the end of the paper.

10.5 Footnotes and Bibliography The foot/end note list is a list of all the sources that have been cited in the assignment. The list is in numerical order showing books, journals, webpages and other sources. All sources are in this list regardless of type. There may be items which you have consulted for your work, but not cited. These can be listed at the end of your assignment in a bibliography. These items should be listed in alphabetical order by author and laid out in the same way as items in your foot/endnote list. Footnotes are a very useful way of providing extra information to the reader. Usually, it is non-essential information which can be placed at the bottom of the page. This keeps the main body of text concise. You can either have a footnote list where all the references are at the bottom of each page or an endnote list at the end of the assignment/chapter.

NSOU ? PGSW-VII 304 • The list should be in numerical order and each number matches and refers to the one in the text • Books, paper journal articles, e journal articles, and so on are laid out in a particular format that must be followed • Ibid. can be used when the details of an item have been referred to directly before in the previous reference • Op. Cit. can be used when the details of an item have been referred to before but other references have occurred in between • You can use square brackets or superscript

The Use of Footnotes Footnotes are the acceptable method of acknowledging material which is not your own when you use it in an essay. Basically, footnoted material is of three types: 1. Direct quotations from another author's work. (These must be placed in quotation marks). 2. Citing authority for statements which are not quoted directly. 3. Material of an explanatory nature which does not fit into the flow of the body of the text. In the text of an essay, material to be footnoted should be marked with a raised number immediately following the words or ideas that are being cited. Bibliography The bibliography should be on a separate page. It should list the relevant sources used in the research for the paper. This list should be arranged alphabetically by the surname of the author. (Unlike the footnote reference, the surname is shown first, set off from the rest of the information.) The information required is: author, title, place of publication, publisher and date of publication.

10.6 Dissemination of findings Research dissemination, as the written or oral representation of project findings, usually happens at the end of a research project. Dissemination refers to "a planned

NSOU ? PGSW-VII 305 process that involves consideration of target audiences and the settings in which research findings are to be received and, where appropriate, communicating and interacting with wider policy and...service audiences in ways that will facilitate research uptake in decision-making processes and practice" (Wilson, Peticrew, Calnan, & Natareth, 2010, p. 91). In other words, dissemination of research findings involves careful planning, thought, consideration of target audiences, and communication with those audiences. Writing up results from your research and having others take notice are two entirely different propositions. In fact, the general rule of thumb is that people will not take notice unless you help and encourage them to do so. Successful dissemination of your research findings requires you to determine who your audience is, where your audience is, and how to reach them. When considering who your audience is, think about who is likely to take interest in your work. Your audience might include those who do not express enthusiastic interest but might nevertheless benefit from an awareness of your research. Your research participants and those who share characteristics with your participants are likely to have some interest in what you've discovered in your research. Other scholars who study similar topics are another obvious audience for your work. Perhaps there are policymakers who should take note of your work. Organizations that work in an area related to the topic of your research are another possibility. Finally, any and all inquisitive and engaged members of the public represent a possible audience for your work.

10.7 Preparing research abstract

Communicating research findings is an essential step in the research process. On occasion, you need to write a short abstract of the research paper that precedes the introduction. When you write an abstract, pay attention to these issues:

- o Position the theme or case within the framework of theories and discussions
- o Formulate a clear objective
- o Briefly describe the most significant results of the research
- o Make a list that contains at least three relevant keywords

NSOU ? PGSW-VII 306

1. Title (short title) Title should be short but informative
2. Abstract An abstract must accompany every article. It should be a brief summary of the significant items of the main paper. An abstract should not normally exceed 200 words. It should not contain literature citations or illusions to the tables or illustrations. All non-standard symbols and abbreviations should be defined. It may be strictly written by following the subheadings.
 - i. Purpose of the study: In simple words tell readers about the aim of this study. No discussion, no story only aim of this study .
 - ii. Methodology: Give name, brand, type of tools, methods, software, review, and survey that has been used to do this study. No discussion or explanation.
 - iii. Main Findings: Write only the main results in few words. No discussion or explanation.
 - iv. Applications of this study: where this study can be useful, give the name of area, disciplines etc.
 - v. Novelty/Originality of this study: what is new in this study that may benefit readers or how it is advancing the existing knowledge or creating new knowledge in this subject?
3. Keywords List of all keywords proposed by the authors, separated by commas. Avoid big phrases
4. Text
 - introduction: subject, scope of the subject, goals of your paper and finally the organization of your paper are to be mentioned
 - main text: all important elements of your scientific message are to be mentioned
 - conclusion: summary of the paperResults and Discussion - may be combined or kept separate and may be further divided into subsections. This section should not contain technical details. Abbreviations and acronyms should be used sparingly and consistently. Where they

NSOU ? PGSW-VII 307 first appear in the text, they should be defined; authors may also explain large numbers of abbreviations and acronyms after the conclusion part.

Computational Part - in theoretical papers, technical details such as the computational methods, and models applied or newly developed models should be presented in an appropriately named section. Sufficient detail should be provided to enable readers to reproduce the calculations.

Acknowledgements - Information concerning research grant support and the assistance of colleagues or similar notes of appreciation should appear in an Acknowledgements section.

Tables Authors should use tables only to achieve concise presentation, or where the information cannot be given satisfactorily in other ways. Tables should be numbered and referred to in the text by number. Each table should have an explanatory caption which should be as concise as possible.

Figures Authors may use line diagrams and photographs to illustrate these from their text. The figures should be clear, easy to read and of good quality. Styles and fonts should match those in the main body of the article. Lettering and lines should be of uniform density and the lines unbroken. Axis labels should be in bold face. Units should be placed next to variables in parentheses. All figures must be mentioned in the text in consecutive order and be numbered.

Schemes These are sequences of reactions. They should have brief titles describing their contents. Schemes should be numbered.

Images Authors can attach files in formats like BMP, GIF, JPEG formats.

5. Reference list

A complete reference should give the reader enough information to find the relevant article. Please pay particular attention to spelling, capitalization and punctuation here. Completeness of references is the responsibility of the authors. A complete reference should comprise the following:

NSOU ? PGSW-VII 308

10.8 Book review

A book review describes, analyzes and evaluates. The review conveys an opinion, supporting it with evidence from the book. Writing a book review can help increase your understanding of, and appreciation for books you read. Reviews you write can help others decide whether or not to read the book. If this is an assignment, or if you have decided to share your opinions of a book you have recently read, this course can guide you in writing a helpful review.

89%**MATCHING BLOCK 83/88****W**

Book reviews typically evaluate recently-written works. They offer a brief description of the text's key points and often provide a short appraisal of the strengths and weaknesses of the work. Readers sometimes confuse book reviews with book reports, but the two are not identical. Book reports commonly describe what happens in a work; their focus is primarily on giving an account of the major plot, characters, and/or main idea of the work. By contrast, book reviews are most often a college assignment,

100%**MATCHING BLOCK 87/88****W**

but they also appear in many professional works: magazines, newspapers, and academic journals. They typically range from 500-750 words, but may be longer or shorter. A book review gives readers a sneak peek at what a book is like, whether or not the reviewer enjoyed it, and details on purchasing the book.

The objectives of this course are to: 1. Describe the purpose and elements of a book review, 2. Explore examples of good book reviews, 3. Help you form opinions about a book as you read it, 4. Identify questions to consider as you read, assess, and report on a book, 5. Suggest topics to include in a book review, 6. Help you organize and write a book review While this course specifically refers to book reviews, the same approach can be followed to review articles or similar publications. Begin by deciding if you are writing a book report or a book review. A book report is an essay discussing the contents of a book, written as part of a class

NSOU ? PGSW-VII 309 assignment issued to students in schools, particularly in the United States at the elementary school level. In contrast, a book review is a form of literary criticism in which a book is analyzed based on content, style, and merit. This course focuses on writing a book review.

100%**MATCHING BLOCK 84/88****W**

Book reviews typically evaluate recently-written works. They offer a brief description of the text's key points and often provide a short appraisal of the strengths and weaknesses of the work.

In general, a review is a critical evaluation of a text, event, object, or phenomenon. A book review describes, analyzes, and evaluates. The review conveys an opinion, supporting it with evidence from the book. Above all, a review makes an argument consisting of commentary, not merely a summary. A book review addresses the question: "Does the book deliver on its promise?" The two resulting questions: "What does it promise?" and "What does it deliver?" are then answered by citing evidence. Steps to be followed: When writing the review, use the notes gathered above to address the following topics in approximately this order. 1. Introduction— Identify the title, author, publisher, date, length, ISBN, genre (i.e. Fiction, non-fiction?), audience (i.e. age, reading level, interests, specialties...) 2. Content Summary— Briefly summarize the book. If you can convey both the tone and the message of the book in a single sentence, your review will be off to a good start. For nonfiction books identify or formulate the book's thesis statement. Describe the general argument and evidence provided to support that thesis. For fiction books, include a plot summary, themes, character descriptions, background context and how the story corresponds to reality or similar books. Avoid plot spoilers. 3. Analysis and Evaluation—Focus on your subjective evaluation of the book. Consider the list of analysis topics to cover and address those topics that are most relevant and important to this review. Consider the list of questions to answer and address those questions that are most relevant and important to this review. Much of this section will consist of paragraphs of the form: Conclusion, evidence, evidence, and evidence, or Evidence, evidence, evidence, and conclusion. 4. Conclusion—Briefly state your opinion of the book based on the preceding analysis. Answer the question, "Does the book deliver on its promise?" Make a clear recommendation to any prospective readers.

NSOU ? PGSW-VII 310 Reread, reflect, refine, and revise—Read over your first draft and revise it to improve its flow, coherency, clarity, and overall impact. Ensure the review makes clear what you want to say. Request Comments from a colleague— Ask someone who's opinion you trust to read over your draft and suggest how it can be improved. Use their feedback to improve the review. If you are a student ensure this form of collaboration is permitted by the academic policies of your school.

When you are ready to write Begin with a short summary or background of the work, but do not give too much away. Many reviews limit themselves only to the first couple of chapters or lead the reader up to the rising action of the work. Reviewers of nonfiction texts will provide the basic idea of the book's argument without too much detailed. The final portion of your review will detail your opinion of the work. When you are ready to begin your review, consider the following: •••• Establish a Background, Remember your Audience: Remember that your audience has not read the work; with this in mind, be sure to introduce characters and principles carefully and deliberately. What kind of summary can you provide of the main points or main characters that will help your readers gauge their interest? Does the author's text adequately reach the intended audience? Will some readers be lost or find the text too easy? •••• Minor principles/characters: Deal only with the most pressing issues in the book. You will not be able to cover every character or idea. What principles/ characters did you agree or disagree with? What other things might the author have researched or considered? •••• Organize: The purpose of the review is to critically evaluate the text, not just inform the readers about it. Leave plenty room for your evaluation by ensuring that your summary is brief. Determine what kind of balance to strike between your summary information and your evaluation. If you are writing your review for a class, ask your instructor. Often the ratio is half and half. •••• Your Evaluation: Choose one or a few points to discuss about the book. What worked well for you? How does this work compare with others by the same author or other books in the same genre? What major themes, motifs, or terms does

NSOU ? PGSW-VII 311

MATCHING BLOCK 86/88

W

the book introduce, and how effective are they? Did the book appeal to you on an emotional or logical way? •••• Publisher/Price: Most book reviews include the publisher and price of the book at the end of the article. Some reviews also include the year published and ISBN. Revising When making the final touches to your review, carefully verify the following: • Double-check the spelling of the author name(s), character names, special terms, and publisher. • Try to read from the vantage point of your audience. Is there too much/ enough summary? Does your argument about the text make sense? • Should you include direct quotes from the reading? Do they help support your arguments? Double-check your quotes for accuracy. 10.9

Conclusion This unit gave us a detailed understanding about writing the Research Report. Now it will be easier for our learner to also write their Dissertation which they are supposed to submit in MSW-II. 10.10 Exercise 1. What is the structure for writing any Research Report. 2. What is the Importance of Book Review. 3. Explain "Disseminations of finding". 4. How do we prepares the Research Abstract. 5. Davis, F. "The Effective Editor." Poynter, 2000 6. Anderson, Jeff. "Everyday Editing." Stenhouse, 2007 7. Zinsser, William. "On Writing Well." Harper, 2006 8. <https://owl.purdue.edu/>

NSOU ? PGSW-VII 312 Unit 11 ? Open Educational Resources 11.0 Objectives 11.1 Introduction 11.2 Open Educational Resources (OER) 11.3 History and Development 11.4 Challenges of using OER 11.5 OER and resource based learning 11.6 Conclusion 11.7 Exercise 11.8 References 11.0 Objectives The learners will know about Open Educational Resources and how effectively it can be used with CC-licences. 11.1 Introduction OER are teaching resources that have an open-copyright license (such as one from Creative Commons), or they are part of the public domain and have no copyright. Depending on the license used, OER can be freely accessed, used, re- mixed, improved, and shared. Open educational resources (OER) are teaching, learning, and research resources that, through permissions granted by their creator, allow others to use, distribute, keep, or make changes to them." 11.2 Open Educational Resources (OER) Open Educational Resources (OER) are teaching, learning, and research materials that are either (a) in the public domain or (b) licensed in a manner that provides everyone with free and perpetual permission to engage in the 5R activities. • Retain – make, own, and control a copy of the resource • Reuse – use your original, revised, or remixed copy of the resource publicly 312

NSOU ? PGSW-VII 313 • Revise – edit, adapt, and modify your copy of the resource • Remix – combine your original or revised copy of the resource with other existing material to create something new • Redistribute – share copies of your original, revised, or remixed copy of the resource with others

The Open Education program at Creative Commons works to minimize barriers to effective education, supporting the CC mission through education, training, advocacy and outreach on using open licenses and open policies to maximize the benefits of open education (content, practices and policy). Our work spans all levels of education, industry and government. One goal of Creative Commons is to increase the amount of openly licensed creativity in “the commons” – the body of work freely available for legal use, sharing, repurposing, and remixing. Through the use of CC licenses, millions of people around the world have made their photos, videos, writing, music, and other creative content available for any member of the public to use. Examples of OER Types of OER include (but are not limited to) syllabi, lesson plans, learning modules, lab experiments, simulations, course videos, discussion prompts, assignments, assessments, library guides, and course design templates. Open educational resources (OERs) are learning materials that can be modified and enhanced because their creators have given others permission to do so. The individuals or organizations that create OERs—which can include materials like presentation slides, podcasts, syllabi, images, lesson plans, lecture videos, maps, worksheets, and even entire textbooks—waive some (if not all) of the copyright associated with their works, typically via legal tools like Creative Commons licenses, so others can freely access, reuse, translate, and modify them.

OER Definitions The William and Flora Hewlett Foundation Open Educational Resources are teaching, learning, and research resources that reside in the public domain or have been released under an intellectual property license that permits their free use and repurposing by others. OER include full NSOU ? PGSW-VII 314 courses, course materials, modules, textbooks, streaming videos, tests, software, and any other tools, materials, or techniques used to support access to knowledge. The term “open education” to encompass the myriad of learning resources, teaching practices and education policies that use the flexibility of OER to provide learners with high quality educational experiences. Creative Commons defines OER as teaching, learning, and research materials that are either in the public domain or licensed in a manner that provides everyone with free and perpetual permission to engage in the 5R activities—retaining, remixing, revising, reusing and redistributing the resources.” OECD (Organization for Economic Co-operation and Development) “digitised materials offered freely and openly for educators, students, and self-learners to use and reuse for teaching, learning, and research. OER includes learning content, software tools to develop, use, and distribute content, and implementation resources such as open licences.” UNESCO “teaching, learning and research materials in any medium, digital or otherwise, that reside in the public domain or have been released under an open license that permits no-cost access, use, adaptation and redistribution by others with no or limited restrictions.” The Cape Town Open Education Declaration “Open educational resources should be freely shared through open licenses which facilitate use, revision, translation, improvement and sharing by anyone. Resources should be published in formats that facilitate both use and editing, and that accommodate a diversity of technical platforms. Whenever possible, they should also be available in formats that are accessible to people with disabilities and people who do not yet have access to the Internet.” The Wikieducator OER Handbook “The term “Open Educational Resource(s)” (OER) refers to educational resources (lesson plans, quizzes, syllabi, instructional modules, simulations, etc.) that are freely available for use, reuse, adaptation, and sharing.”

NSOU ? PGSW-VII 315 Why are open educational resources beneficial? Applying open licenses to educational materials allows educators to collaborate when building materials specifically differentiated for their students. For example, a mathematics teacher might acquire openly-licensed word problems for her students, but re-write the exercises to include language that is more geographically specific or demographically relevant. In turn, she can share her modified problems with others who may wish to use them. At the same time, collaborating on OERs allows educators to work together when ensuring consistency among their materials. Public school teachers in the United States, for instance, may wish to share resources they’ve developed in order to adhere to government-mandated educational standards, like the Common Core State Standards. Some educators suggest that OERs might help reduce costs associated with producing and distributing course materials in both primary and secondary educational institutions. Teachers can download these materials—often at low costs—for use in their classrooms, but they can also update these materials and share their contributions with others, keeping content timely, relevant, and accurate. In this way, they needn’t wait for textbook companies to issue entirely new editions of their (traditionally copyrighted) learning materials. Students also benefit from open educational resources when they access these materials to supplement the education they might receive in a classroom. Some students do not have access to a high-quality education, but using OERs affords them opportunities to enhance their knowledge independently—in spite of the barriers preventing them from acquiring the knowledge and skills they seek. Using OER can provide tremendous cost savings for students as well as impact student success and completion rates. The cost of textbooks can be a huge financial burden on students, which not only affects student success, but could also delay graduation for students who are taking fewer classes per term because of that cost, further increasing financial costs for students over time. OER provide students with day one access to free course materials, and research reviewed by the Open Education Group shows that most students perform as well or better using OER course materials compared with students using traditional textbooks.

NSOU ? PGSW-VII 316 Open Educational Resources allow students to have learning materials as soon as the course starts, so they can make the most of them to support their learning. They no longer have to wait for financial aid disbursements or delayed shipments from online orders. Open educational resources are most useful when educators distribute them in open formats, so teachers and students can use those resources regardless of the particular technical platforms their schools have adopted. Projects like the OER Commons act as repositories for high-quality open educational resources. What are MOOCs? Massive open online courses (MOOCs) are online courses accessible to anyone with a computer and access to the Internet. People call these courses “massive” because their enrollment is open to more students than traditional educational institutions might permit —meaning that hundreds (even thousands) of students might participate in a particular MOOC. Today, many colleges and universities have joined organizations committed to providing high-quality education through MOOCs. One example is edX, a non-profit education partnership that in 2012 grew from a collaboration between MIT and Harvard (Stanford joined the effort in 2013, and now several dozen colleges and universities from around the world have, too). edX offers students tuition-free opportunities to enroll in courses on a variety of subjects from instructors across the globe. Students register, attend, and complete their classes online. In 2013, edX released the source code for its online learning platform, so programmers could download and help improve it. Others could even use it to build their own education platforms. Similar online educational ventures include Khan Academy and Coursera. The extent to which various MOOCs license their course materials for remixing and reusing differs from one institution to another. 11.3 History and Development OER and the open movement have recently evolved, and in many ways they challenge age-old educational traditions and conventions. The catalyst has been the pervasiveness of the Internet and the ability to copy and distribute digital content. In

NSOU ? PGSW-VII 317 1999, both the University of Tübingen (Germany) and The Open University (UK) released some educational resources for free. However, the most commonly known OER initiative came from the Massachusetts Institute of Technology (USA) in 2001; by 2002, it had released 32 courses with open licences and set a precedent in terms of openness of university courseware. Taking note of this development, UNESCO in 2002 convened the Forum on the Impact of Open Courseware for Higher Education in Developing Countries, where the term OER was coined. Since then, many other education service providers around the world have used open licences and the Internet to share teaching and learning resources. The Cape Town Open Education Declaration (2008) and the Paris OER Declaration (2012) provided guidelines and encouragement for governments to release educational resources—especially those created using public funding—with open licences. The integration of OER into national policy is an ongoing and slow process, but there have been successes in countries such as the USA, South Africa, Kenya, Ghana, Poland, the Netherlands, and the United Kingdom.¹² In 2013, Antigua and Barbuda adopted an OER policy within the framework of its national policy on information and communication technology (ICT) in education. In 2014, the National Mission on Education through ICT (NMEICT) in India adopted an open licence policy¹³ for all of its outputs, releasing as OER all content generated with its funding. Types of OER OER can be divided into as many “types” as there are needs within the education sector. While assets—such as worksheets, lesson plans, lesson resources, reference articles and so on—are perhaps an obvious category, you will remember from lesson 1 that the term also encompasses open courseware (OCW). Although there is no consensus regarding OER categories, Creative Commons⁴⁸ has a useful list that includes the following types: • Digital learning objects (individual digital assets); • Digitised object libraries (online collections of assets); • OER encyclopaedias (collaborative written reference materials); • Open online archives (repositories of collected OER);

NSOU ? PGSW-VII 318 • Open textbooks (free and adaptable texts); • OER courseware (open online university courses and programmes); • OER courses (short courses); • Open course archives (libraries or indexes of courses); • Online tools that support the open community It is useful to keep these categories in mind when searching for OER on the Internet, as each will generate different results. For example: object libraries are more likely to identify individual assets; an OER encyclopedia will yield definitions and descriptive content; OER courseware repositories will have course materials loosely linked together so that one could, theoretically, run the course again; and OER courses provide both content and a learning pathway through the materials. Directories, Platforms and Repositories Another way of organising or categorising OER is according to the level of functionality offered by the OER website. For example; • Directories: A directory provides lists of OER and links to resources available elsewhere on the Web. Examples include COL’s OER Directory and, in the case of open access journals, the Directory of Open Access Journal (DOAJ), which links to research articles in the same way. • Platforms: By platform, we mean specific digital tools designed to “do” something with the OER. This could include tools to develop new, or adapt existing, OER. Alternatively, the platform could be designed to license new OER with an open licence. An example of the former is WikiEducator, which provides an online environment for authoring new resources. We saw in the previous lesson an example of the licensing platform designed by Creative Commons. • Repository: A repository is a database or collection of OER, usually ones developed by a particular institution. A well-known example of an institutional repository is the MIT’s Open Courseware Repository. Of course, some organizations and institutions offer combinations of the above functionality, so it is quite possible to find a mix of these functions within the same OER website.

NSOU ? PGSW-VII 319 11.4 Challenges of using OER Despite the noble intentions behind OER, it turns out that using OER is not always straightforward! Practitioners face various challenges when it comes to harnessing OER. Current frustrations for users of OER often include:

- Sourcing appropriate OER: This is an issue because there is no one-stop shop for OER. They are scattered across the Internet (this problem is explored in lesson 3).
- Understanding open licences: Not everyone is familiar with different open licences and what they permit (to overcome this problem, see lesson 2).
- Adaptation of OER requires new skills: To adapt and repurpose OER, the practitioner needs more than basic ICT skills and also needs practice in revising and remixing resources.
- Traditional mindsets predominate: Many educators feel it is wrong to use other people's work, and thus they protect, rather than share, their own resources
- Robust Internet connectivity and good ICT availability are essential to access and adapt OER.

Schools and universities seldom incentivize lesson creation Institutions Promoting OER The list of institutions, organisations and individuals involved with developing and promoting OER is ever expanding, and growth has accelerated in recent years. Below, however, are three globally active institutions that are worth highlighting. Commonwealth of Learning (CoL) is an intergovernmental organisation created by Commonwealth Heads of Government to encourage the development and sharing of open learning/distance education knowledge, resources and technologies. COL has for many years been at the forefront of the OER movement, facilitating numerous initiatives. It was the first intergovernmental organisation to adopt an open licence for all of its publications. COL encourages governments to officially recognise the importance of sharing OER, through policy development—either as a stand-alone policy or within the broader realm of ICT-in-education policy. COL has developed several resources on OER to build teachers' capacity and develop teaching and

NSOU ? PGSW-VII 320 learning materials as OER. Many such resources are available on its website, and also that of its regional office in New Delhi: the Commonwealth Educational Media Centre for Asia (CEMCA). The United Nations Educational, Scientific and Cultural Organization (UNESCO) believes that OER "provide a strategic opportunity to improve the quality of education as well as facilitate policy dialogue, knowledge sharing and capacity building." The Paris OER Declaration, adopted during the World OER Congress held in June 2012 at UNESCO headquarters, was a significant step for the development of national policies supporting OER. The declaration's ten points encourage governments to contribute to the awareness and use of OER and to develop strategies and policies to integrate OER in education. In 2013, UNESCO adopted an open access policy for all of its publications, in line with its commitment to promote and support OER and OA. OER and e-learning OER is not synonymous with online learning or e-learning, although many people make the mistake of using the terms interchangeably. Openly licensed content can be produced in any medium: paper-based text, video, audio or computer-based multimedia. A lot of e-learning courses may harness OER, but this does not mean that OER are necessarily e-learning. Indeed, many open resources being produced currently – while shareable in a digital format – are also printable. Given the bandwidth and connectivity challenges common in some developing countries, it would be expected that a high percentage of resources of relevance to higher education in such countries are shared as printable resources, rather than being designed for use in e-learning. OER and open learning/open education Although use of OER can support open learning/open education, the two are not the same. Making 'open education' or 'open learning' a priority has significantly bigger implications than only committing to releasing resources as open or using OER in educational programmes. It requires systematic analysis of assessment and accreditation systems, student support, curriculum frameworks, mechanisms to recognize prior learning, and so on, in order to determine the extent to which they enhance or impede openness. Open learning is an approach to education that seeks

NSOU ? PGSW-VII 321 to remove all unnecessary barriers to learning, while aiming to provide students with a reasonable chance of success in an education and training system centred on their specific needs and located in multiple arenas of learning. It incorporates several key principles:

- Learning opportunity should be lifelong and should encompass both education and training;
- The learning process should centre on the learners, build on their experience and encourage independent and critical thinking;
- Learning provision should be flexible so that learners can increasingly choose, where, when, what and how they learn, as well as the pace at which they will learn;
- Prior learning, prior experience and demonstrated competencies should be recognized so that learners are not unnecessarily barred from educational opportunities by lack of appropriate qualifications;
- Learners should be able to accumulate credits from different learning contexts;
- Providers should create the conditions for a fair chance of learner success. (Saide, n.d.)

As this list illustrates, while effective use of OER might give practical expression to some of these principles, the two terms are distinct in both scope and meaning. 11.5 OER and resource based learning There has been significant emphasis placed in OER discussions on the quality of OER. This makes the concept of resource-based learning of particular interest. Despite this, debates over OER have typically made little reference to the concept of resource-based learning until recently. This may be because the emphasis in most global OER discussion has been on the sharing and licensing of existing materials, a significant proportion of which has included simply sharing lecture notes and PowerPoint presentations used in face-to-face lectures. What does the notion of resource-based learning mean, in essence? It means moving away from the traditional notion of the 'talking teacher' to communicate curriculum; a significant but varying proportion of communication between students and educators is not face to face but

NSOU ? PGSW-VII 322 rather takes place through the use of different media as necessary. Importantly, the face-to-face contact that does take place typically does not involve simple transmission of knowledge from educator to student; instead it involves various forms of student support, for example, tutorials, peer group discussion, or practical work. Resource-based learning is not a synonym for distance education. Rather, resource based learning provides a basis for transforming the culture of teaching across all educational systems to enable those systems to offer better quality education to significantly larger numbers of students. Many courses and programmes at all levels of education now incorporate extensive use of instructionally designed resources, as educators have learned the limitations of lecture-based strategies for communicating information to students. The use of resource-based learning does not of course imply any intrinsic improvements in quality of learning experience. The extent to which shifting the communication of curriculum to instructionally designed resources leads improves the quality of education depends entirely on the quality of the resources developed. To summarize:

- There is no direct relationship between OER and resource-based learning.
- Many OER available online have not explicitly been designed as part of a deliberate strategy to shift to resource-based learning.
- Likewise, most practice in resource-based learning currently uses fully copyrighted materials rather than OER. Nevertheless, linking OER and resource-based learning provides an opportunity to leverage both most effectively.

Understanding Copyright Copyright is an exclusive, transferable right given by law to a creator/author for a fixed number of years to copy, print, publish, perform, film, record or otherwise control the use of literary, musical, dramatic or artistic works. Copyright is a legal protection given to the original creator of a work, which may be in any form. In this context, "work" means an explicit description or expression of an idea, not just the ideas themselves; the law only protects the specific and original expression of ideas. Copyright is a legal right created by the law of a country that grants the creator

NSOU ? PGSW-VII 323 of an original work exclusive rights to its use and distribution, usually for a limited time, with the intention of enabling the creator (e.g., the photographer of a photograph or the author of a book) to receive compensation for their intellectual effort. The exclusive rights are, however, not absolute and do not give the creator total control of their work, because the rights are bound by limitations and exceptions to copyright law. Copyright is a form of intellectual property, applicable to any expressed representation of a creative work. The rights that copyright reserves include control over reproduction, derivative works, distribution and public performance, as well as "moral rights," such as attribution. Although copyright law varies by jurisdiction, there is generally a clause that makes special permission for "fair use" or "fair dealing"; normally, this allows a written work (for example) to be copied for the purpose of private study, research, book review, reporting and similar non-commercial uses. Fair use does not give permission to use copyrighted materials in full. Moreover, the extent of the use is limited and not clear, which can lead to litigation. Normally ownership of the intellectual property of an article or book resides with the author, except when the author's employer claims ownership under the conditions of employment. This may be the case when teachers are employed by universities to write learning content. However, works for hire are handled differently in various institutions. As long as the copyright of a work remains with the author, legally the author can undertake economic activity associated with the work. This economic right introduces conflict when certain types of works are developed using public funds. The issue of the "moral rights" related to the work arises when the right of the work is with the employer or the funding agency. The Creative Commons Licensing System In recent years, Creative Commons (CC) has, in education, become the most popular licensing system. Creative Commons has designed a collection of licences to ensure that there is a suitable licence for sharing content under various conditions. The advantages of using a Creative Commons licence are:

- There is almost certainly a ready-made licence that will suit the publisher's requirements, saving time and effort in drawing up a custom licence.

NSOU ? PGSW-VII 324

- Creative Commons licences are easily understood and commonly used, so a potential reader or reuser of a work will immediately understand the conditions of the licence.
- The licences have machine-readable metadata to make it easier for others to find a CC-licensed resource on the Web.
- The Creative Commons licences are based on the following:

- Legal code: Expansive legal language, tested in several cases.
- Commons code: Simple, icon-based approach to recognise the features of a licence
- Digital code: Enables search engines to locate resources using CC Rights Expression Language.

All Creative Commons licences are constructed from a combination of four specific "rights" or conditions that can be reserved by the creator or author of the resource. These include the following:

- Attribution:** All CC licences require that others who use your work in any way must attribute it – i.e., must reference the work, giving you credit for it – the way you request, but not in a way that suggests you endorse them or their use of the work. If they want to use your work without giving you credit or for endorsement purposes, they must get your permission first.
- Non Commercial:** You let others copy, distribute, display, perform, modify (unless you have chosen No Derivatives) and use your work for any purpose other than commercially. If they want to use your work commercially, they must get your permission first.
- No Derivatives:** You let others copy, distribute, display and perform only original copies of your work. If they want to modify your work, they must get your permission first.
- Share Alike:** You let others copy, distribute, display, perform and modify your work, as long as they distribute any modified work on the same terms. If they want to distribute modified works under other terms, they must get your permission first.

NSOU ? PGSW-VII 325 Attribution CC BY This licence lets others distribute, remix, tweak and build upon your work, even commercially, as long as they credit you for the original creation. This is the most accommodating of licences offered. Recommended for maximum dissemination and use of licensed material. Attribution-ShareAlike CC BY-SA This licence lets others remix, tweak and build upon your work, even for commercial purposes, as long as they credit you and license their new creations under the identical terms. This licence is often compared to “copyleft” free and open source software licences. All new works based on yours will carry the same licence, so any derivatives will also allow commercial use. by Wikipedia, and its recommended for materials that would benefit from incorporating content from Wikipedia and similarly licensed projects. Attribution- NoDerivs CC BY-ND This licence allows for redistribution— commercial and non- commercial—as Attribution- NonCommercial CC BY-NC This licence lets others remix, tweak and build upon your work non- commercially, and although their new works must also The most popular combinations of Creative Commons rights or conditions make up these six licences NSOU ? PGSW-VII 326 long as the work is passed along unchanged, in whole and with credit to you. acknowledge you and be non-commercial, they don’t have to license their derivative works on the same terms. Attribution- NonCommercial- ShareAlike CC BY-NC-SA This licence lets others remix, tweak and build upon your work non-commercially, as long as they credit you and license their new creations under the identical terms. Attribution- NonCommercial- NoDerivs CC BY-NC-ND This licence is the most restrictive of the six main licences, only allowing others to download your works and share them with others as long as they credit you, but they can’t change them in any way or use them commercially. While all of these six Creative Commons licences are more open than full copyright (i.e., all rights reserved), some are more open than others. It is up to the author or creator of the resource to determine how open the new resource’s licence should be and to choose the appropriate licence. The less restrictive the licence, the more useful the resource can potentially be for other educators. It is worth trying out the Creative Commons’ online licence generator to help you work out what is the most appropriate licence for you. NSOU ? PGSW-VII 327 How open are various licences? least restrictive most restrictive The diagram below illustrates the relative restrictiveness of each licence: 11.6 Conclusion Our learner understood about licencing & copyright issuer, white using the OER. This will help our learners to get resource from right sitar & develop their own material scientifically. 11.7 Exercise 1. What is OER? 2. What is MOOCs. 3. What are the challenger of using OER. 4. What is creative common licensing system. 11.8 References 1. <p>Science and Scientific Research What is research? Depending on who you ask, you will likely get very different answers to this seemingly innocuous question. Some people will say that they routinely research different online websites to find the best place to buy goods or services they want. Television news channels supposedly conduct research in the form of viewer polls on topics of public interest such as forthcoming elections or government-funded projects. Under- graduate students research the Internet to find the information they need to complete assigned projects or term papers. Graduate students working on research projects for a professor may see research as collecting or analyzing data related to their project. Businesses and consultants research different potential solutions to remedy organizational problems such as a supply chain bottleneck or to identify customer purchase patterns. However, none of the above can be considered "scientific research" unless: (1) it contributes to a body of science, and (2) it follows the scientific method. This chapter will examine what these terms mean. 1.3</p>		<p>Science and Scientific Research What is research? process of systematic logical reasoning called rationalism. In particular, Aristotle's classic work *Metaphysics* (literally meaning "beyond physical [existence]") separated theology (the study of Gods) from ontology (the study of being and existence) and universal science (the study of first principles, upon which logic is based). Rationalism (not to be confused with "rationality") views reason as the source of knowledge or justification, and suggests that the criterion of truth is not sensory but rather intellectual and deductive, often derived from a set of first principles or axioms (such as Aristotle's "law of non-contradiction"). The next major shift in scientific thought occurred during the 16th century, when British philosopher Francis Bacon (1561-1626) suggested that knowledge can only be derived from observations in the real world. Based on this premise, Bacon emphasized knowledge acquisition as an empirical activity (rather than as a reasoning activity), and developed empiricism as an influential branch of philosophy. Bacon's works led to the popularization of inductive methods of scientific inquiry, the development of the "scientific method" (originally called the "Baconian method"), consisting of systematic observation, measurement, and experimentation, and may have even sowed the seeds of atheism or the rejection of theological precepts as "unobservable." Empiricism continued to clash with rationalism throughout the Middle Ages, as philosophers sought the most effective way of gaining valid knowledge. French philosopher Rene Descartes sided with the rationalists, while British philosophers John Locke and David Hume sided with the empiricists. Other scientists, such as Galileo Galilei and Sir Issac Newton, attempted to fuse the two ideas into natural philosophy (the philosophy of nature), to focus specifically on understanding nature and the physical universe, which is considered to be the precursor of the natural sciences. Galileo (1564-1642) was perhaps the first to state that the laws of nature are mathematical, and contributed to the field of astronomy through an innovative combination of experimentation and mathematics. In the 18th century, German philosopher Immanuel Kant sought to resolve the dispute between empiricism and rationalism in his book *Critique of Pure Reason*, by arguing that experience is purely subjective and processing them using pure reason without first delving into the subjective nature of experiences will lead to theoretical illusions. Kant's ideas led to the development of German idealism, which inspired later development of interpretive techniques such as phenomenology, hermeneutics, and critical social theory. At about the same time, French philosopher Auguste Comte (1798-1857), founder of the discipline of sociology, attempted to blend rationalism and empiricism in a new doctrine

called positivism. He suggested that theory and observations have circular dependence on each other. While theories may be created via reasoning, they are only authentic if they can be verified through observations. The emphasis on verification started the separation of modern science from philosophy and metaphysics and further development of the "scientific method" as the primary means of validating scientific claims. Comte's ideas were expanded by Emile Durkheim in his development of sociological positivism (positivism as a foundation for social research) and Ludwig Wittgenstein in logical positivism. In the early 20 th century, strong accounts of positivism were rejected by interpretive sociologists (antipositivists) belonging to the German idealism school of thought. Positivism was typically equated with quantitative research methods such as experiments and surveys and without any explicit philosophical commitments, while antipositivism employed qualitative methods such as unstructured interviews and participant observation. Even

of positivism, such as American sociologist Paul Lazarsfield who pioneered large- scale survey research and statistical techniques for analyzing survey data, acknowledged potential problems of observer bias and structural limitations in positivist inquiry. In response, antipositivists emphasized that social actions must be studied through interpretive means based upon an understanding the meaning and purpose that individuals attach to their personal actions, which inspired Georg Simmel’s work on symbolic interactionism, Max Weber’s work on ideal types, and Edmund Husserl’s work on phenomenology. In the mid-to-late 20 th century, both positivist and antipositivist schools of thought were subjected to criticisms and modifications. British philosopher Sir Karl Popper suggested that human knowledge is based not on unchallengeable, rock solid foundations, but rather on a set of tentative conjectures that can never be proven conclusively, but only disproven. Empirical evidence is the basis for disproving these conjectures or “theories.” This metatheoretical stance, called postpositivism (or postempiricism), amends positivism by suggesting that it is impossible to verify the truth although it is possible to reject false beliefs, though it retains the positivist notion of an objective truth and its emphasis on the scientific method. Likewise, antipositivists have also been criticized for trying only to understand society but not critiquing and changing society for the better. The roots of this thought lie in Das Capital, written by German philosophers Karl Marx and Friedrich Engels, which critiqued capitalistic societies as being social inequitable and inefficient, and recommended resolving this inequity through class conflict and proletarian revolutions. Marxism inspired social

revolutions in countries such as Germany, Italy, Russia, and China, but generally failed to accomplish the social equality that it aspired. Critical research (also called critical theory) propounded by Max Horkheimer and Jurgen Habermas in the 20 th century, retains similar ideas of critiquing and resolving social inequality, and adds that people can and should consciously act to change their social and economic circumstances, although their ability to do so is constrained by various forms of social, cultural and political domination. Critical research attempts to uncover and critique the restrictive and alienating conditions of the status quo by analyzing the oppositions, conflicts and contradictions in contemporary society, and seeks to eliminate the causes of alienation and domination (i.e., emancipate the oppressed class).

Science What is science? To some, science refers to difficult high school or college-level courses such as physics, chemistry, and biology meant only for the brightest students. To others, science is a craft practiced by scientists in white coats using specialized equipment in their laboratories. Etymologically, the word "science" is derived from the Latin word *scientia* meaning knowledge. Science refers to a systematic and organized body of knowledge in any area of inquiry that is acquired using "the scientific method" (the scientific method is described further below). Science can be grouped into two broad categories: natural science and social science. Natural science is the science of naturally occurring objects or phenomena, such as light, objects, matter, earth, celestial bodies, or the human body. Natural sciences can be further classified into physical sciences, earth sciences, life sciences, and others. Physical sciences consist of disciplines such as physics (the science of physical objects), chemistry (the science of matter), and astronomy (the science of celestial objects). Earth sciences consist of disciplines such as geology (the science of the earth). Life sciences include disciplines such as biology (the science of human bodies) and botany (the science of plants). In contrast, social science is the science of people or collections of people, such as groups, firms, societies, or economies, and their individual or collective behaviors. Social sciences can be classified into disciplines such as psychology (the science of human behaviors), sociology (the science of social groups), and economics (the science of firms, markets, and economies). The natural sciences are different from the social sciences in several respects. The natural sciences are very precise, accurate, deterministic, and independent of the person m

aking the scientific observations. For instance, a scientific experiment in physics, such as measuring the speed of sound through a certain media or the refractive index of water, should always yield the exact same results, irrespective of the time or place of the experiment, or the person conducting the experiment. If two students conducting the same physics experiment obtain two different values of these physical properties, then it generally means that one or both of those students must be in error. However, the same cannot be said for the social sciences, which tend to be less accurate, deterministic, or unambiguous. For instance, if you measure a person's happiness using a hypothetical instrument, you may find that the same person is more happy or less happy (or sad) on different days and sometimes, at different times on the same day. One's happiness may vary depending on the news that person received that day or on the events that transpired earlier during that day. Furthermore, there is not a single instrument or metric that can accurately measure a person's happiness. Hence, one instrument may calibrate a person as being "more happy" while a second instrument may find that the same person is "less happy" at the same instant in time. In other words, there is a high degree of measurement error in the social sciences and there is considerable uncertainty and little agreement on social science policy decisions. For instance, you will not find many disagreements among natural scientists on the speed of light or the speed of the earth around the sun, but you will find numerous disagreements among social scientists on how to solve a social problem such as reduce global terrorism or rescue an economy from a recession. Any student studying the social sciences must be cognizant of and comfortable with handling higher levels of ambiguity, uncertainty, and error that come with such sciences, which merely reflects the high variability of social objects. Sciences can also be classified based on their purpose. Basic sciences, also called pure sciences, are those that explain the most basic objects and forces, relationships between them, and laws governing them. Examples include physics, mathematics, and biology. Applied sciences, also called practical sciences, are sciences that apply scientific knowledge from basic sciences in a physical environment. For instance, engineering is an applied science that applies the laws of physics and chemistry for practical applications such as building stronger bridges or fuel efficient combustion engines, while medicine is an applied science that applies the laws of biology for solving human ailments. Both basic and applied sciences are required for human development. However, applied sciences cannot stand on their own right, but instead relies on basic sciences for its progress. Of course, the industry and private enterprises tend to focus more on applied sciences given their practical value, while universities study both basic and applied sciences.

Scientific Knowledge The purpose of science is to create scientific knowledge. Scientific knowledge refers to a generalized body of laws and theories to explain a phenomenon or behavior of interest that are acquired using the scientific method. Laws are observed patterns of phenomena or behaviors, while theories are systematic explanations of the underlying phenomenon or behavior. For instance, in physics, the Newtonian Laws of Motion describe what happens when an object is in a state of rest or motion (Newton's First Law), what force is needed to move a stationary object or stop a moving object (Newton's Second Law), and what happens when two objects collide (Newton's Third Law). Collectively, the three laws constitute the basis of classical mechanics – a theory of moving objects. Likewise, the theory of optics explains the properties of light and how it behaves in different media, electromagnetic theory explains the properties of electricity and how to generate it, quantum mechanics explains the properties of subatomic particles, and thermodynamics explains the properties of energy and mechanical work. An introductory college level text book in physics will likely contain separate chapters devoted to each of these theories. Similar theories are also available in social sciences. For instance, cognitive dissonance theory in psychology explains how people react when their observations of an event is different from what they expected of that event, general deterrence theory explains why some people engage in improper or criminal behaviors, such as illegally download music or commit software piracy, and the theory of planned behavior explains how people make conscious reasoned choices in their everyday lives. The goal of scientific research is to discover laws and postulate theories that can explain natural or social phenomena, or in other words, build scientific knowledge. It is important to understand that this knowledge may be imperfect or even quite far from the truth. Sometimes, there may not be a single universal truth, but rather an equilibrium of "multiple truths." We must understand that the theories, upon which scientific knowledge is based, are only explanations of a particular phenomenon, as suggested by a scientist. As such, there may be good or poor explanations, depending on the extent to which those explanations fit well with reality, and consequently, there may be good or poor theories. The progress of science is marked by our progression over time from poorer theories to better theories, through better observations using more accurate instruments and more informed logical reasoning.

Scientific Knowledge The purpose of science is to create scientific knowledge. Scientific knowledge refers to a generalized body of laws and theories to explain a phenomenon or behavior of interest that are acquired using the scientific method. Laws are observed patterns of phenomena or behaviors, while theories are systematic explanations of the underlying phenomenon or behavior. W [https://courses.lumenlearning.com/suny-hccc-research-methods/chapter/chapter-1-science-and-scient ...](https://courses.lumenlearning.com/suny-hccc-research-methods/chapter/chapter-1-science-and-scient...)

We arrive at scientific laws or theories through a process of logic and evidence. Logic (theory) and evidence (observations) are the two, and only two, pillars upon which scientific knowledge is based. In science, theories and observations are interrelated and cannot exist without each other. Theories provide meaning and significance to what we observe, and observations help validate or refine existing theory or construct new theory. Any other means of knowledge acquisition, such as faith or authority cannot be considered science. Scientific Research Given that theories and observations are the two pillars of science, scientific research operates at two levels: a theoretical level and an empirical level. The theoretical level is concerned with developing abstract concepts about a natural or social phenomenon and relationships between those concepts (i.e., build "theories"), while the empirical level is concerned with testing the theoretical concepts and relationships to see how well they reflect our observations of reality, with the goal of ultimately building better theories. Over time, a theory becomes more and more refined (i.e., fits the observed reality better), and the science gains maturity. Scientific research involves continually moving back and forth between theory and observations. Both theory and observations are essential components of scientific research. For instance, relying solely on observations for making inferences and ignoring theory is not considered valid scientific research. Depending on a researcher's training and interest, scientific inquiry may take one of two possible forms: inductive or deductive. In inductive research, the goal of a researcher is to infer theoretical concepts and patterns from observed data. In deductive research, the goal of the researcher is to test concepts and patterns known from theory using new empirical data. Hence, inductive research is also called theory-building research, and deductive research is theory-testing research. Note here that the goal of theory-testing is not just to test a theory, but possibly to refine, improve, and extend it. Figure 1.1 depicts the complementary nature of inductive and deductive research. Note that inductive and deductive research are two halves of the research cycle that constantly iterates between theory and observations. You cannot do inductive or deductive research if you are not familiar with both the theory and data components of research. Naturally, a complete researcher is one who can traverse the entire research cycle and can handle both inductive and deductive research.

We arrive at scientific laws or theories through a process of logic and evidence. Logic (theory) and evidence (observations) are the two, and only two, pillars upon which scientific knowledge is based. In science, theories and observations are interrelated and cannot exist without each other. Theories provide meaning and significance to what we observe, and observations help validate or refine existing theory or construct new theory. Any other means of knowledge acquisition, such as faith or authority cannot be considered science. Scientific Research Given that theories and observations are the two pillars of science, scientific research operates at two levels: a theoretical level and an empirical level. The theoretical level is concerned with developing abstract concepts about a natural or social phenomenon and relationships between those concepts (i.e., build "theories"), while the empirical level is concerned with testing the theoretical concepts and relationships to see how well they reflect our observations of reality, with the goal of ultimately building better theories. Over time, a theory becomes more and more refined (i.e., fits the observed reality better), and the science gains maturity. Scientific research involves continually moving back and forth between theory and observations. Both theory and observations are essential components of scientific research. For instance, relying solely on observations for making inferences and ignoring theory is not considered valid scientific research. Depending on a researcher's training and interest, scientific inquiry may take one of two possible forms: inductive or deductive. In inductive research , the goal of a researcher is to infer theoretical concepts and patterns from observed data. In deductive research , the goal of the researcher is to test concepts and patterns known from theory using new empirical data. Hence, inductive research is also called theory-building research, and deductive research is theory-testing research. Note here that the goal of theory-testing is not just to test a theory, but possibly to refine, improve, and extend it. Figure 1.1 depicts the complementary nature of inductive and deductive research. Note that inductive and deductive research are two halves of the research cycle that constantly iterates between theory and observations. You cannot do inductive or deductive research if you are not familiar with both the theory and data components of research. Naturally, a complete researcher is one who can traverse the entire research cycle and can handle both inductive and deductive research.

In the preceding sections, we described science as knowledge acquired through a scientific method. So what exactly is the "scientific method"? Scientific method refers to a standardized set of techniques for building scientific knowledge, such as how to make valid observations, how to interpret results, and how to generalize those results. The scientific method allows researchers to independently and impartially test preexisting theories and prior findings, and subject them to open debate, modifications, or enhancements. The scientific method must satisfy four characteristics: ? Replicability: Others should be able to independently replicate or repeat a scientific study and obtain similar, if not identical, results. ? Precision: Theoretical concepts, which are often hard to measure, must be defined with such precision that others can use those definitions to measure those concepts and test that theory. ? Falsifiability: A theory must be stated in a way that it can be disproven. Theories that cannot be tested or falsified are not scientific theories and any such knowledge is not scientific knowledge. A theory that is specified in imprecise terms or whose concepts are not accurately measurable cannot be tested, and is therefore not scientific. Sigmund Freud's ideas on psychoanalysis fall into this category and is therefore not considered a "theory", even though psychoanalysis may have practical utility in treating certain types of ailments. ? Parsimony: When there are multiple explanations of a phenomenon, scientists must always accept the simplest or logically most economical explanation. This concept is called parsimony or "Occam's razor." Parsimony prevents scientists from pursuing overly complex or outlandish theories with endless number of concepts and relationships that may explain a little bit of everything but nothing in particular. Any branch of inquiry that does not allow the scientific method to test its basic laws or theories cannot be called "science." For instance, theology (the study of religion) is not science because theological ideas (such as the presence of God) cannot be tested by independent observers using a replicable, precise, falsifiable, and parsimonious method. Similarly, arts, music, literature, humanities, and law are also not considered science, even though they are creative and worthwhile endeavors in their own right.

The scientific method, as applied to social sciences, includes a variety of research approaches, tools, and techniques, such as qualitative and quantitative data, statistical analysis, experiments, field surveys, case research, and so forth. Most of this book is devoted to learning about these different methods. However, recognize that the scientific method operates primarily at the empirical level of research, i.e., how to make observations and analyze and interpret these observations. Very little of this method is directly pertinent to the theoretical level, which is really the more challenging part of scientific research. Types of Scientific Research Depending on the purpose of research, scientific research projects can be grouped into three types: exploratory, descriptive, and explanatory. Exploratory research is often conducted in new areas of inquiry, where the goals of the research are: (1) to scope out the magnitude or extent of a particular phenomenon, problem, or behavior, (2) to generate some initial ideas (or "hunches") about that phenomenon, or (3) to test the feasibility of undertaking a more extensive study regarding that phenomenon. For instance, if the citizens of a country are generally dissatisfied with governmental policies regarding during an economic recession, exploratory research may be directed at measuring the extent of citizens' dissatisfaction, understanding how such dissatisfaction is manifested, such as the frequency of public protests, and the presumed causes of such dissatisfaction, such as ineffective government policies in dealing with inflation, interest rates, unemployment, or higher taxes. Such research may include examination of publicly reported figures, such as estimates of economic indicators, such as gross domestic product (GDP), unemployment, and consumer price index, as archived by third-party sources, obtained through interviews of experts, eminent economists, or key government officials, and/or derived from studying historical examples of dealing with similar problems. This research may not lead to a very accurate understanding of the target problem, but may be worthwhile in scoping out the nature and extent of the problem and serve as a useful precursor to more in-depth research. Descriptive research is directed at making careful observations and detailed documentation of a phenomenon of interest. These observations must be based on the scientific method (i.e., must be replicable, precise, etc.), and therefore, are more reliable than casual observations by untrained people. Examples of descriptive research are tabulation of demographic statistics by the United States Census Bureau or employment statistics by the

Bureau of Labor, who use the same or similar instruments for estimating employment by sector or population growth by ethnicity over multiple employment surveys or censuses. If any changes are made to the measuring instruments, estimates are provided with and without the changed instrumentation to allow the readers to make a fair before-and-after comparison regarding population or employment trends. Other descriptive research may include chronicling ethnographic reports of gang activities among adolescent youth in urban populations, the persistence or evolution of religious, cultural, or ethnic practices in select communities, and the role of technologies such as Twitter and instant messaging in the spread of democracy movements in Middle Eastern countries. Explanatory research seeks explanations of observed phenomena, problems, or behaviors. While descriptive research examines the what, where, and when of a phenomenon, explanatory research seeks answers to why and how types of questions. It attempts to "connect the dots" in research, by identifying causal factors and outcomes of the target phenomenon. Examples include understanding the reasons behind adolescent crime or gang violence, with the goal of prescribing strategies to overcome such societal ailments. Most academic or doctoral research belongs to the explanation category, though some amount of exploratory and/or descriptive research may also be needed during initial phases of academic research. Seeking explanations for observed events requires strong theoretical and interpretation skills, along with intuition, insights, and personal experience. Those who can do it well are also the most prized scientists in their disciplines.

involves finding what is true for everyone, not just what is true for one person. Gravity is certainly true for everyone, everywhere, but let's consider a social work example. It is objectively true that children who are subjected to severely traumatic experiences will experience negative mental health effects afterwards. A diagnosis of post-traumatic stress disorder (PTSD) is considered objective because it refers to a real mental health issue that exists independent of the social worker's observations, and it presents similarly in all clients who experience the disorder. Objective, ontological perspective implies that observations are true for everyone, regardless of whether we are there to observe them or not observe them. Epistemology, or our assumptions about how we come to know what is real and true, helps us to realize these objective truths. The most relevant epistemological question in the social sciences is whether truth is better accessed using numbers or words. Generally, scientists approaching research with an objective ontology and epistemology will use quantitative methods to arrive at scientific truth. Quantitative methods examine numerical data to precisely describe and predict elements of the social world. This is due to the epistemological assumption that mathematics can represent the phenomena and relationships we observe in the social world. Mathematical relationships are uniquely useful because allow us to make comparisons across individuals as well as time and space. For example, let's look at measures of poverty. While people can have different definitions of poverty, an objective measurement such as an annual income less than Rs25,000 for a family of four is insightful because (1) it provides a precise measurement, (2) it can be compared to incomes from all other people in any society from any time period, and (3) it refers to real quantities of money that exist in the world. In this book, we will review survey and experimental methods, which are the most common designs that use quantitative methods to answer research questions. It may surprise you to learn that objective facts, like income or mental health diagnoses, are not the only facts that are present in the social sciences. Indeed, social science is not only concerned with objective truths, but it is also concerned with subjective truth. Subjective truths are unique to individuals, groups, and contexts. Unlike objective truths, subjective truths will vary based on who you are observing and the context you are observing them in. The beliefs, opinions, and preferences of people are actually truths that social scientists measure and describe. Additionally, subjective truths do not exist

of human observation because they are the product of the human mind. We negotiate what is true in the social world through language, arriving at a consensus and engaging in debate. Epistemologically, a scientist seeking subjective truth assumes that truth lies in what people say, in their words. A scientist uses qualitative methods to analyze words or other media to understand their meaning. Humans are social creatures, and we give meaning to our thoughts and feelings through language. Linguistic communication is unique. We share ideas with each other at a remarkable rate. In so doing, ideas come into and out of existence in a spontaneous and emergent fashion. Words are given a meaning by their creator, but anyone who receives that communication can absorb, amplify, and even change its original intent. Because social science studies human interaction, subjectivists argue that language is the best way to understand the world. This epistemology is based on some interesting ontological assumptions. What happens when someone incorrectly interprets a situation? While their interpretation may be wrong, it is certainly true to them that they are right. Furthermore, they act on the assumption that they are right. In this sense, even incorrect interpretations are truths, even though they are only true to one person. This leads us to question whether the social concepts we think about really exist. They might only exist in our heads, unlike concepts from the natural sciences which exist independent of our thoughts. For example, if everyone ceased to believe in gravity, we wouldn't all float away. It has an existence independent of human thought.

One area that social workers commonly investigate is the impact of a person's social class background on their experiences and lot in life. You probably wouldn't be surprised to learn that a person's social class background has an impact on their educational attainment and achievement. In fact, one group of researchers in the early 1990s found that the percentage of children who did not receive any postsecondary schooling was four times greater among those in the lowest quartile (25%) income bracket than those in the upper quartile of income earners (i.e., children from high- income families were far more likely than low-income children to go on to college). Another recent study found that having more liquid wealth that can be easily converted into cash actually seems to predict children's math and reading achievement (Elliott, Jung, Kim, & Chowa, 2010).

These findings—that wealth and income shape a child’s educational experiences—are probably not that shocking to any of us. Yet, some of us may know someone who may be an exception to the rule. Sometimes the patterns that social scientists observe fit our commonly held beliefs about the way the world works. When this happens, we don’t tend to take issue with the fact that patterns don’t necessarily represent all people’s experiences. But what happens when the patterns disrupt our assumptions? For example, did you know that teachers are far more likely to encourage boys to think critically in school by asking them to expand on answers they give in class and by commenting on boys’ remarks and observations? When girls speak up in class, teachers are more likely to simply nod and move on. The pattern of teachers engaging in more complex interactions with boys means that boys and girls do not receive the same educational experience in school (Sadker & Sadker, 1994).

History of Scientific Thought It may be interesting to go back in history and see how science has evolved over time and identify the key scientific minds in this evolution. Although instances of scientific progress have been documented over many centuries, the terms “science,” “scientists,” and the “scientific method” were coined only in the 19 th century. Prior to this time, science was viewed as a part of philosophy, and coexisted with other branches of philosophy such as logic, metaphysics, ethics, and aesthetics, although the boundaries between some of these branches were blurred. In the earliest days of human inquiry, knowledge was usually recognized in terms of theological precepts based on faith. This was challenged by Greek philosophers such as Plato, Aristotle, and Socrates during the 3 rd century BC, who suggested that the fundamental nature of being and the world can be understood more accurately through a

History of Scientific Thought Before closing this chapter, it may be interesting to go back in history and see how science has evolved over time and identify the key scientific minds in this evolution. Although instances of scientific progress have been documented over many centuries, the terms “science,” “scientists,” and the “scientific method” were coined only in the 19 th century. Prior to this time, science was viewed as a part of philosophy, and coexisted with other branches of philosophy such as logic, metaphysics, ethics, and aesthetics, although the boundaries between some of these branches were blurred. In the earliest days of human inquiry, knowledge was usually recognized in terms of theological precepts based on faith. This was challenged by Greek philosophers such as Plato, Aristotle, and Socrates during the 3 rd century BC, who suggested that the fundamental nature of being and the world can be understood more accurately through a

<p>When social scientists measure concepts, they sometimes use the language of variables and attributes (also called values). A variable refers to a phenomenon that can vary. It can be thought of as a grouping of several characteristics. For example, hair color could be a variable because it has varying characteristics. Attributes are the characteristics that make up a variable. For example, the variable hair color would contain attributes like blonde, brown, black, red, gray, etc. A variable's attributes determine its level of measurement. There are four possible levels of measurement: nominal, ordinal, interval, and ratio. The first two levels of measurement are categorical, meaning their attributes are categories rather than numbers. The latter two levels of measurement are continuous, meaning their attributes are numbers, not categories. 103</p>		<p>When social scientists measure concepts, they sometimes use the language of variables and attributes (also called values). Nominal level of measurement Hair color is an example of a nominal level of measurement. Nominal measures are categorical, and those categories cannot be mathematically ranked. There is no ranking order between hair colors. They are simply different. That is what constitutes a nominal level of measurement. Gender and race are also measured at the nominal level. When using nominal level of measurement in research, it is very important to assign the attributes of potential answers very precisely. The attributes need to be exhaustive and mutually exclusive. Let's think about the attributes contained in the variable hair color. Black, brown, blonde, and red are common colors. But, if we listed only these attributes, people with gray hair wouldn't fit anywhere. That means our attributes were not exhaustive. Exhaustiveness means that all possible attributes are listed. We may have to list a lot of colors before we can meet the criteria of exhaustiveness. Clearly, there is a point at which trying to achieve exhaustiveness can get to be too much. If a person insists that their hair color is light burnt sienna, it is not your responsibility to list that as an option. Rather, that person could reasonably be described as brown-haired. Perhaps listing a category for other color would suffice to make our list of colors exhaustive. What about a person who has multiple hair colors at the same time, such as red and black? They would fall into multiple attributes. This violates the rule of mutual exclusivity, in which a person cannot fall into two different attributes. Instead of listing all of the possible combinations of colors, perhaps you might include a list of attributes like all black, all brown, all blonde, all red, multi-color, other to include people with more than one hair color, but keep everyone in only one category. The discussion of hair color elides an important point with measurement—reification. You should remember reification from our previous discussion in this chapter. For many years, the attributes for gender were male and female. Now, our understanding of gender has evolved to encompass more attributes including transgender, non-binary, or

<p>Interval level of measurement At the interval level, the distance between attributes is known to be equal. Interval measures are also continuous, meaning their attributes are numbers, rather than categories. IQ scores are interval level, as are temperatures. Interval-level variables are not particularly common in social science research, but their defining characteristic is that we can say how much more or less one attribute differs from another. We cannot, however, say with certainty what the ratio of one attribute is in comparison to another. For example, it would not make sense to say that 50 degrees is half as hot as 100 degrees. But we can say it is 50 degrees cooler than 100. At the interval level, attributes must also be exhaustive and mutually exclusive.</p>		<p>Interval level of measurement At the interval level, the distance between attributes is known to be equal. statements to which respondents may agree or disagree (and not as questions or other things). Next, a panel of judges is recruited to select specific items from this candidate pool to represent the construct of interest. Judges may include academics trained in the process of instrument construction or a random sample of respondents of interest (i.e., people who are familiar with the phenomenon). The selection process is done by having each judge independently rate each item on a scale from 1 to 11 based on how closely, in their opinion, that item reflects the intended construct (1 represents extremely unfavorable and 11 represents extremely favorable). For each item, compute the median and inter-quartile range (the difference between the 75th and the 25th percentile – a measure of dispersion), which are plotted on a histogram, as shown in Figure 6.1. The final scale items are selected as statements that are at equal intervals across a range of medians. This can be done by grouping items with a common median, and then selecting the item with the smallest inter- quartile range within each median group. However, instead of relying entirely on statistical analysis for item selection, a better strategy may be to examine the candidate items at each level and selecting the statement that is the most clear and makes the most sense. The median value of each scale item represents the weight to be used for aggregating the items into a composite scale score representing the construct of interest. We now have a scale which looks like a ruler, with one item or statement at each of the 11 points on the ruler (and weighted as such). Because items appear equally throughout the entire 11- pointrange of the scale, this technique is called an equal-appearing scale. Thurstone also created two additional methods of building unidimensional scales – the method of successive intervals and the method of paired comparisons – which are both very similar to the method of equal-appearing intervals, except for how judges are asked to rate the data. For instance, the method of paired comparison requires each judge to make a judgment between each pair of statements (rather than rate each statement independently on a 1 to 11 scale). Hence, the name paired comparison method. With a lot of statements, this approach can be enormously time consuming and unwieldy compared to the method of equal-appearing intervals. 5.7

When you are ready to write Begin with a short summary or background of the work, but do not give too much away. Many reviews limit themselves only to the first couple of chapters or lead the reader up to the rising action of the work. Reviewers of nonfiction texts will provide the basic idea of the book's argument without too much detailed. The final portion of your review will detail your opinion of the work. When you are ready to begin your review, consider the following: •••• Establish a Background, Remember your Audience: Remember that your audience has not read the work; with this in mind, be sure to introduce characters and principles carefully and deliberately. What kind of summary can you provide of the main points or main characters that will help your readers gauge their interest? Does the author's text adequately reach the intended audience? Will some readers be lost or find the text too easy? •••• Minor principles/characters: Deal only with the most pressing issues in the book. You will not be able to cover every character or idea. What principles/ characters did you agree or disagree with? What other things might the author have researched or considered? •••• Organize: The purpose of the review is to critically evaluate the text, not just inform the readers about it. Leave plenty room for your evaluation by ensuring that your summary is brief. Determine what kind of balance to strike between your summary information and your evaluation. If you are writing your review for a class, ask your instructor. Often the ratio is half and half. •••• Your Evaluation: Choose one or a few points to discuss about the book. What worked well for you? How does this work compare with others by the same author or other books in the same genre? What major themes, motifs, or terms does
