3 Netaji Subhas Open University From the Vice-Chancellor's Desk Dear Students, from this Academic Session (2015-17) the Curriculum and Course Structure of B. Ed.- Special Education have been thoroughly revised as per the stipulations which featured in the Memorandum of Understanding (MoU) between the Rehabilitation Council of India (RCI) and the National Council for Teacher Education (NCTE). The newly designed course structure and syllabus is comprehensive and futuristic has, therefore, been contextualized and adopted by NSOU from the present academic session, following the directives of the aforesaid national statutory authorities. Consequent upon the introduction of new syllabus the revision of Self Instructional Material (SIM) becomes imperative. The new syllabus was circulated by RCI for introduction in the month of June, 2015 while the new session begins in the month of July. So the difficulties of preparing the SIMs within such a short time can easily be understood. However, the School of Education of NSOU took up the challenge and put the best minds together in preparing SIM without compromising the standard and quality of such an academic package. It required many rigorous steps before printing and circulation of the entire academic package to our dear learners. Every intervening step was meticulously and methodically followed for ensuring quality in such a time bound manner. The SIMs are prepared by eminent subject experts and edited by the senior members of the faculty specializing in the discipline concerned. Printing of the SIMs has been done with utmost care and attention. Students are the primary beneficiaries of these materials so developed. Therefore, you must go through the contents seriously and take your queries, if any, to the Counselors during Personal Contact Programs (PCPs) for clarifications. In comparison to F2F mode, the onus is on the learners in the ODL mode. So please change your mind accordingly and shrug off your old mindset of teacher dependence and spoon feeding habits immediately.

4 I would further urge you to go for other Open Educational Resources (OERs) - available on websites, for better understanding and gaining comprehensive mastery over the subject. From this year NSOU is also providing ICT enabled support services to the students enrolled under this University. So, in addition to the printed SIMs, the e-contents are also provided to the students to facilitate the usage and ensure more flexibility at the user end. The other ICT based support systems will be there for the benefit of the learners. So please make the most of it and do your best in the examinations. However, any suggestion or constructive criticism regarding the SIMs and its improvement is welcome. I must acknowledge the contribution of all the content writers, editors and background minds at the SoE, NSOU for their respective efforts, expertise and hard work in producing the SIMs within a very short time. Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor, NSOU

10 1.7 References 1.8 “Check Your Progress” 1.9 Let Us Sum Up 1.1 Introduction This module highlights the concept of learning and intelligence. Through this module we would try to understand the basic concepts of learning, the frontier theories and its application in academics. Apart from learning the present module concentrates on another basic concept in Psychology, i.e., intelligence. We will discuss the definitions, characteristics, a brief history of intelligence measurement, followed by leading theories in intelligence. The module will further concentrate on another psychological construct very closely associated with intelligence, i.e., creativity. We will discuss the concept, nature and characteristics of creativity followed by implications of learning in academic settings. At the end of this module students are expected to have a clear understanding about learning and intelligence and its application in academics. 1.2 Objectives At the end of successful completion of the module students will be able to understand the following: – The concept and nature of learning. – The various perspectives and theories of learning principle, with a highlight to behavioristic theories, cognitive theories and social learning theories. – The concept and characteristics of intelligence. – Various intelligence theories with a highlight on Spearman’s two factor theory, Gardner’s multiple intelligence theory and Steinberg’s Triarchic intelligence theory. – The concept, definition and characteristics of creativity. It’s relationship with motivation and intelligence. – The Implications for Classroom Teaching and Learning.

11 1.3 Human learning: Meaning, definition and concept formation Learning can be defined as the process leading to relatively permanent behavioral change or potential behavioral change. In other words, as we learn, we alter the way we perceive our environment, the way we interpret the incoming stimuli, and therefore the way we interact, or behave. Learning is one of the most important activities in which humans engage. It is at the very core of the educational process, although most of what people learn occurs outside of school. For thousands of years, philosophers and psychologists have sought to understand the nature of learning, how it occurs, and how one person can influence the learning of another person through teaching and similar endeavors. Various theories of learning have been suggested, and these theories differ for a variety of reasons. Evolving Theories of Learning The modern psychological study of learning can be dated from the work of Hermann Ebbinghaus (1850-1909), whose well-known study of memory was published in 1885. Other early studies of learning were by Edward L. Thorndike (1874-1949), whose dissertation on problem solving was published in 1898, and Ivan Pavlov (1849- 1936), whose research on classical conditioning was begun in 1899 but first published in English in 1927. These theories focused on explaining the behavior of individuals and became known as behavioral theories. These theories use a stimulus- response framework to explain learning and dominated psychology and education for over half a century. Because behavioral theories focus on environmental factors such as reinforcement, feedback, and practice, they conceptualize learning as something that occurs from the outside in. Behavioral theories provide very good explanations for certain kinds of learning but poor explanations for other types of learning. Operant conditioning, for example, is better than other theories at explaining the rote acquisition of information, the learning of physical and mental skills, and the development of behaviors conducive to a productive classroom (i.e., classroom management). In these situations, the focus is on performing behavioral tasks rather than developing a learner’s cognitive structure or understanding. Although classical conditioning frequently is dismissed as irrelevant to human learning (Pavlov’s initial research paradigm involved dogs salivating), this type of learning provides by far the best explanation of how and why people, including students, respond emotionally to a wide variety of stimuli and situations. The many types of emotional reactions acquired through classical

12 conditioning include: anger toward or hatred for a particular person or group, phobias to a particular subject area or to school itself, and infatuation with another person. However, they are very poor at explaining how individuals come to understand complex ideas and phenomena. But environmental factors are not the only ones that influence learning. Serious consideration of other perspectives began to enter mainstream psychological thinking about learning during the 1960s. For example, people clearly learn by observing others, and a learner's belief about his or her ability to perform a task (i.e., self-efficacy) plays an important role in their learning. In 1963 Albert Bandura and R. H. Walters published the first formal statement of social-learning theory in their book, *Social Learning and Personality Development*. Social-learning theory has clear roots in behavioral theory but differs from these theories in significant ways. During the 1980s the theory became known as social-cognitive theory. Although essentially the same theory, the new name more accurately reflects the cognitive features of the theory and aids in differentiating it from behavioral theories of learning. During the 1970s and 1980s conceptions and definitions of learning began to change dramatically. Behavioral theories gave way to cognitive theories that focused on mental activities and the understanding of complex material. An information-processing metaphor replaced the stimulus-response framework of behavioral theories. These theories emphasized that learning occurred from the inside out rather than from the outside in. During the late 1970s John Flavell and Ann Brown each began to study metacognition—the learners' awareness of their own learning, an ability to reflect on their own thinking, and the capacity to monitor and manage their learning. During the mid 1980s the study of self-regulated learning began to emerge (Zimmerman & Schunk, 2001). Then, especially during the later 1980s and the 1990s, these cognitive theories were challenged by theories that emphasized the importance of social interactions and the sociocultural context of learning. The work of the Russian psychologist Lev Vygotsky (1896-1934) first became available in North America and along with the work of anthropologists such as Jean Lave began to have a major influence on theories of learning. Individuals were seen as initially participating in peripheral activities of a group (known as legitimate peripheral participation) before becoming fully integrated into group activities. Apprenticeship became a metaphor for the way people learn in natural settings. The notion that people learn by observing others, first articulated in social-cognitive theory, was expanded in a new context.

13 The Relationship between Theory and Practice The relationship between theories of learning and educational practices is complicated by several factors. One would think that instructional practices should be based on the best theories of learning available, but this relationship is not as straightforward as one might think. Schools and educational practices are far more likely to be based on philosophical beliefs than on empirical studies and theoretical understanding of learning. Schools are established according to different community and cultural beliefs about the world, the nature of humankind and children, locus of authority, and what should be learned. Schools also differ in their beliefs about teaching and learning, but the philosophical beliefs often come first. Every educational system and instructional program contains a theory of learning, although frequently this theory is implicit and goes unrecognized. These philosophical and theoretical differences are formidable. Many have endured for centuries, and the debate is unlikely to end anytime soon. For example, the "factory model" of schooling dominated education in the United States for many years. This model is based on production and management procedures successful during the industrial revolution. It stands in sharp contrast to the voices of Henry David Thoreau (1817- 1862), John Dewey (1859-1952), and others who advocated discovery, social reform, and freedom as the appropriate means of education. Both perspectives are clearly evident in modern-day discussions of education and instructional practices.

1.3.1 Learning theories

1.3.1.1 Behaviourism

Behaviorism (also called the behaviorist approach) was the primary paradigm in psychology between 1920 to 1950 and is based on a number of underlying assumptions regarding methodology and behavioral analysis: ~

Psychology should be seen as a science. Theories need to be supported by empirical data obtained through careful and controlled observation and measurement of behavior. Watson (1913) stated that "psychology as a behaviorist views it is a purely objective experimental branch of natural science. Its theoretical goal is ... prediction and control".

14 ~

Behaviorism

is primarily concerned with observable behavior, as opposed to internal events like thinking and emotion.

Observable (i.e. external) behavior can be objectively and scientifically measured. Internal events, such as thinking should be explained through behavioral terms (or eliminated altogether). ~

People have no free will - a person's environment determines their behaviour ~

When born our mind is 'tabula rasa' (a blank slate). ~

There is little difference between the learning that takes place in humans and that in other animals.

Therefore, research can be carried out on animals as well as humans ~

Behavior

is the result of stimulus - response (i.e.

all behavior, no matter how complex, can be reduced to a simple stimulus - response

association). Watson described the purpose of psychology as: "To predict, given the stimulus, what reaction will take place; or, given the reaction, state what the situation or stimulus is that has caused the reaction" (1930). ~

All behavior is learnt from the environment. We learn new behavior through classical or operant conditioning. Varieties of Behaviorism Historically, the most significant distinction between versions of behaviorism is that between Watson's original classical behaviorism, and forms of behaviorism later inspired by his work, known collectively as neobehaviorism.

In his book, Psychology

as the Behaviorist Views It Watson (1913) outlines the principles of all behaviorists:

Psychology as the behaviorist views it is a purely objective experimental branch of natural science. Its theoretical goal is the prediction and control of behavior. Introspection forms no essential part of its methods, nor is the scientific value of its data dependent upon the readiness with which they lend themselves to interpretation in terms of consciousness. The behaviorist, in his efforts to get a unitary scheme of animal response, recognizes no dividing line between man and brute. The behavior of man, with all of its refinement and complexity, forms only a part of the behaviorist's total scheme of investigation.

15

The

History of Behaviorism ~ Pavlov (1897) published the results of an experiment on conditioning after originally studying digestion in dogs. ~ Watson (1913) launches the behavioral school of psychology (classical conditioning),

publishing an article, "Psychology as the Behaviorist Views It". ~ Watson and Rayner(1920) conditioned an orphan called Albert B (aka Little Albert) to fear a white rat. ~ Thorndike (1905) formalized the "Law of Effect". ~ Skinner (1936) wrote "The Behavior of Organisms" and introduced the concepts of operant conditioning and shaping. ~ Clark Hull's (1943) Principles of Behavior was published. ~ B.F. Skinner (1948) published Walden Two, in which he described a Utopian society founded upon behaviorist principles. ~

Bandura & Walters (1963) published

a book called the "Social Learning Theory and Personality development" which combines both cognitive and behavioral frameworks. ~

Journal of the Experimental Analysis of Behavior (begun in 1958). ~

B.F. Skinner (1971) published his book. Beyond Freedom and Dignity, where he argues that free will is an illusion. 1.3.1.2

Edward Thorndike Edward Thorndike is often referred to as the founder of modern educational psychology. He is perhaps best-known-for his famous puzzle box experiments with cats which led to the development of his law of effect. Thorndike's principle suggests that responses immediately followed by satisfaction will be more likely to occur in the future. The law of effect also suggests that behaviors followed by dissatisfaction or discomfort will become less likely to occur. Thorndike's principle also played an important role in the development of behaviorism and B.F. Skinner's operant conditioning. Whereas classical conditioning depends on developing associations between events, operant conditioning involves learning from the consequences of our behavior. Skinner wasn't the first psychologist to study learning by consequences. Indeed,

16 Skinner's theory of operant conditioning is built on the ideas of Edward Thorndike. Thorndike (1898) studied learning in animals (usually cats). He devised a classic experiment in which he used a puzzle box (see fig. 1) to empirically test the laws of learning. Fig D : Simplified graph of the result of the puzzle box experiment. He placed a cat in the puzzle box, which was encouraged to escape to reach a scrap of fish placed outside. Thorndike would put a cat into the box and time how long it took to escape. The cats experimented with different ways to escape the puzzle box and reach the fish. Eventually they would stumble upon the lever which opened the cage. When it had escaped it was put in again, and once more the time it took to escape was noted. In successive trials the cats would learn that pressing the lever would have favorable consequences and they would adopt this behavior, becoming increasingly quick at pressing the lever. Edward Thorndike put forward a "Law of Effect" which stated that any

behavior that is followed by pleasant consequences is likely to be repeated, and any behavior followed by unpleasant consequences is likely to be stopped. Law of Effect Thorndike termed this the "Law of Effect," which suggested that when satisfaction follows an association, it is more likely to be repeated. If an unfavorable outcome follows an action, then it becomes less likely to be repeated. There are two key aspects of the law of effect: 1. Behaviors immediately followed by favorable consequences are more likely to occur again. In our earlier example, being praised by a supervisor for showing

17 up early for work made it more likely that the behavior would be repeated. 2. Behaviors followed by unfavorable consequences are less likely to occur again. If you show up late for work and miss an important meeting, you will probably be less likely to show up late again in the future. Because you view the missed meeting as a negative outcome, the behavior is less likely to be repeated. The Law of Effect's Influence on Behaviorism Thorndike's discovery had a major influence on the development of behaviorism. B.F. Skinner based his theory of operant conditioning on the law of effect. Skinner even developed his own version of a puzzle box which he referred to as an operant conditioning chamber (also known as a Skinner box). In operant conditioning, behaviors that are reinforced are strengthened, while those that are punished are weakened. The law of effect clearly had a major influence on the development of behaviorism, which went on to become the dominant school of thought in psychology for much of the twentieth-century. 1.3.1.3 B. F. Skinner Operant conditioning developed by B.F Skinner, is a way of learning by means of rewards and punishments. This type of conditioning holds that a certain behavior and a consequence, either a reward or punishment, have a connection which brings about learning. Skinner believed that we do have such a thing as a mind, but that it is simply more productive to study observable behavior rather than internal mental events. Studies on classical conditioning resulted to the emergence of other theories that may explain behavior and learning, and one of these is Operant Conditioning. Operant conditioning tries to negate the belief that internal thoughts and mere motivations would bring about learning a behavior. As a behaviorist, Skinner thought that only external causes of behavior should be considered. The work of Skinner was rooted in a view that classical conditioning was far too simplistic to be a complete explanation of complex human behavior. He believed that the best way to understand behavior is to look at the causes of an action and its consequences. He called this approach operant conditioning. The term "operant" was used by Skinner in order to give us a good overview of his theory. By this term, he meant that this type of conditioning involves only external factors that affect behavior and its consequences. Operant Conditioning deals with operants - intentional actions that have an effect on the surrounding

18 environment. Skinner set out to identify the processes which made certain operant behaviours more or less likely to occur. Skinner's theory of operant conditioning was based on the work of Thorndike (1905). Edward Thorndike studied learning in animals using a puzzle box to propose the theory known as the 'Law of Effect'.

Skinner introduced a new term into the Law of Effect - Reinforcement. Behavior which is reinforced tends to be repeated (i.e. strengthened); behavior which is not reinforced tends to die out-or be extinguished (i.e. weakened).

Skinner (1948) studied operant conditioning

by conducting experiments using animals which he placed in a 'Skinner Box' which was similar to Thorndike's puzzle box.

B.F. Skinner (1938) coined the term operant conditioning; it means roughly changing of behavior by the use of reinforcement which is given after the desired response. Skinner identified three types of responses or operant that can follow behavior. ~ Neutral operants: responses from the environment that neither increase nor decrease the probability of a behavior being repeated. ~ Reinforcers: Responses from the environment that increase the probability of a behavior being repeated. Reinforcers can be either positive or negative.

19 ~ Punishers: Responses from the environment that decrease the likelihood of a behavior being repeated. Punishment weakens behavior. A. Reinforcement Reinforcement is a process of increasing the frequency or rate of a behavior by means of presenting a stimulus shortly after the display of behavior. The event that intensifies the likelihood of the behavior to be repeated is called a reinforcer. There are two types of reinforcer: 1. Positive reinforcers are favorable stimuli that are given after the display of behavior. Positive reinforcement strengthens the probability of a behavior by means of the addition of something. Example : You studied hard and got an A in your Math exam. Your mom rewards you by treating you to your favorite restaurant. After this, you study hard again and also got an A in your History exam. Your mom rewards you by going with you to see a movie you like. For your next examinations, you study hard once more. 2. Negative reinforcers, on the other hand, is the removal of the unfavorable stimuli after the display of behaviour. In negative reinforcement, the behavior or response is intensified by the removal of something. In both positive and negative reinforcements, behavior is increased. B. Punishment In contrast to reinforcement, punishment is a process wherein a stimulus is presented after the display of behavior and causes the decline in the likelihood of behavior to reoccur. There are two types of punishments: 1. Positive punishment is the addition of something which causes the decrease in repeating the behavior that was displayed. Negative punishment, also known as punishment by removal, occurs when a favorable event or outcome is removed after a behavior occurs. Example : A child teased his sister, making her cry so loud. The mother spanked him on his buttocks because of this. The child never teased his sister again. 2. Negative Punishment, on the other hand, is the removal of something which is favorable, in order to decrease the likelihood of the behavior to reoccur.

20 Example : A teenager is caught cheating in an examination. His parents then forbid him to use his car and also reduce his allowance. The teenager does not cheat in his present exams anymore. To have a better understanding of these concepts, here is a table which summarizes the characteristics of positive /negative reinforcement and positive /negative punishment:

Decreases likelihood of behavior	Increases likelihood of behavior	Addition	Positive punishment	Positive reinforcement
Removal	Negative punishment	Negative reinforcement		

C. Schedules of Reinforcement Imagine a rat in a "Skinner box". In operant conditioning if no food pellet is delivered immediately after the lever is pressed then after several attempts the rat stops pressing the lever (how long would someone continue to go to work if their employer stopped paying them?). The behavior has been extinguished. Behaviorists discovered that different patterns (or schedules) of reinforcement had different effects on the speed of learning and on extinction. Ferster and Skinner (1957) devised different ways of delivering reinforcement, and found that this had effects on. 1. The Response Rate - The rate at which the rat pressed the lever (i.e. how hard the rat worked). 2. The Extinction Rate - The rate at which lever pressing dies out (i.e. how soon the rat gave up).

21 Skinner found that the type of reinforcement which produces the slowest rate of extinction (i.e. people will go on repeating the behavior for the longest time without reinforcement) is variable-ratio reinforcement. The type of reinforcement which has the quickest rate of extinction is continuous reinforcement. a. Continuous Reinforcement An animal/human is positively reinforced every time a specific behaviour occurs, e.g. every time a lever is pressed a pellet is delivered and then food delivery is shut off. ~ Response rate is SLOW ~ Extinction rate is FAST b. Fixed Ratio Reinforcement Behavior is reinforced only after the behavior occurs a specified number of times. E.g. one reinforcement is given after every so many correct responses, e.g. after every 5th response. For example a child receives a star for every five words spelt correctly. ~ Response rate is FAST ~ Extinction rate is MEDIUM c. Fixed Interval Reinforcement One reinforcement is given after a fixed time interval providing at least one correct response has been made. An example is being paid by the hour. Another example would be every 15 minutes (half hour, hour, etc.) a pellet is delivered ('providing at least one lever press has been made) then food delivery is shut off.

22 ~ Response rate is MEDIUM ~ Extinction rate is MEDIUM d. Variable Ratio Reinforcement Behavior is reinforced after an unpredictable number of times. For examples gambling or fishing. ~ Response rate is FAST ~ Extinction rate is SLOW (very hard to extinguish because of unpredictability) e. Variable Interval Reinforcement Providing one correct response has been made, reinforcement is given after an unpredictable amount of time has passed, e.g. on average every 5 minutes. An example is a self-employed person being paid at unpredictable times. ~ Response rate is FAST ~ Extinction rate is SLOW D. Behavior Shaping A further important contribution made by Skinner (1951) is the notion of behaviour shaping through successive approximation. Skinner argues that the principles of operant conditioning can be used to produce extremely complex behaviour if rewards and punishments are delivered in such a way as to encourage move an organism closer and closer to the desired behaviour each time. In order to do this, the conditions (or contingencies) required to receive the reward should shift each time the organism moves a step closer to the desired behaviour. According to Skinner, most animal and human behaviour (including language) can be explained as a product of this type of successive approximation. E. Behavior Modification Behavior modification is a set of therapies / techniques based on operant conditioning (Skinner, 1938, 1953). The main principle comprises changing environmental events that are related to a person's behavior. For example, the reinforcement of desired behaviors and ignoring or punishing undesired ones. This is not as simple as it sounds — always reinforcing desired behavior, for example, is basically bribery.

23 There are different types of positive reinforcements. Primary reinforcement is when a reward strengthens a behavior by itself. Secondary reinforcement is when something strengthens a behavior because it leads to a primary reinforcer. Examples of behavior modification therapy include token economy and behavior shaping. Operant Conditioning in the Classroom In the conventional learning situation operant conditioning applies largely to issues of class and student management, rather than to learning content. It is very relevant to shaping skill performance. A simple way to shape behavior is to provide feedback on learner performance, e.g. compliments, approval, encouragement, and affirmation. A variable-ratio produces the highest response rate for students learning a new task, whereby initially reinforcement (e.g. praise) occurs at frequent intervals, and as the performance improves reinforcement occurs less frequently, until eventually only exceptional outcomes are reinforced. For example, if a teacher wanted to encourage students to answer questions in class they should praise them for every attempt (regardless of whether their answer is correct). Gradually the teacher will only praise the students when their answer is correct, and over time only exceptional answers will be praised. 1.3.1.4 Cognitivismn During the 1960s, discontent with the inadequacies of behaviourism another school of thought was developing besides the behavioural thinking, the cognitive aspects. The behaviourist perspective could not easily explain why people attempt to organise and make sense of the information they learn. One example includes remembering general meanings rather than word for word information. Among learning psychologists there emerged a growing realisation that mental events or cognition could no longer be ignored. Cognitivism is "the psychology of learning which emphasizes human cognition or intelligence as a special endowment enabling man to form hypotheses- and develop intellectually" and is also known as cognitive development. The underlying concepts of cognitivism involve how we think and gain knowledge. Cognitivism involves examining learning, memory, problem solving skills, and intelligence. Cognitive theorists may want to understand how problem solving changes throughout childhood, how cultural differences affect the way we view our own academic achievements,

24 language development, and much more. Cognitive psychologists share with behaviourists the belief that the study of learning should be objective and that learning theories should be developed from the results of empirical research. However, cognitivists disagree with the behaviourists in one critical aspect. By observing the responses that individuals make to different stimulus conditions, cognitivists believe that they can draw inferences about the nature of the internal cognitive processes that produce those responses. Many ideas and assumptions of cognitivism can be traced back to the early decades of the twentieth century. Of all theories, the theories of Jean Piaget of Switzerland are the ones that have provided psychology with very elaborated account of developmental changes in cognitive abilities. 1.3.1.5 Jean Piaget Piaget (1936)

was the first psychologist to make a systematic study of cognitive development. His contributions include a theory of child cognitive development, detailed observational studies of cognition in children, and a series of simple but ingenious tests to reveal different cognitive abilities.

Before Piaget's work, the common assumption in psychology was that children are merely less competent thinkers than adults. Piaget showed that young children think in strikingly different ways compared to adults. According to Piaget, children are born with a very basic mental structure (genetically inherited and evolved) on which all subsequent learning and knowledge is based. Jean Piaget (1896-1980)

was one of the most influential cognitive psychologist. He was a student of biology and zoology and learnt that survival requires adaptation. Therefore he viewed the development of human cognition, or intelligence, as the continual struggle of a very complex organism trying to adapt to a very complex environment. There Are Three Basic Components To Piaget's Cognitive Theory:

A. Schemas B. Adaptation

processes that enable the transition from one stage to another (equilibrium, assimilation). C. Stages of Development:

25 ~ sensorimotor ~ preoperational ~ concrete operational ~ formal operational

According to Piaget's theory, human development can be outlined in terms of functions and cognitive structures. The functions are inborn biological processes that are identical for everyone and stay unchanged throughout our lives. The purpose of these functions is to construct internal cognitive structures. The structures, in contrast, changes repeatedly as the child grows. A. Schemas Piaget & Cook (1952)

defined a schema as 'cohesive, repeatable action sequence possessing component actions that are tightly interconnected and governed by a core meaning'. In more simple terms Piaget called the schema the basic building block of intelligent behavior - a way of organizing knowledge. Indeed, it is useful to think of schemas as "units" of knowledge, each relating to one aspect of the world, including objects, actions and abstract (i.e. theoretical) Concepts.

The schemas Piaget described tend to be simpler than this - especially those used by infants. He described how - as a child gets older - his or her schemas become more numerous and elaborate. Piaget believed that newborn babies have a small number of innate schemas - even before they have had much opportunity to experience the world. These neonatal schemas are the cognitive structures underlying innate reflexes.

B. Adaptation Adaptation refers to the tendency of the organism to fit with its environment in ways that promote survival. It is composed of three terms; assimilation, accommodation and equilibration. Assimilation is the tendency to understand new experience in terms of existing knowledge. Whenever we come across something new, we try to make sense of it, built upon our existing cognitive structures. Accommodation occurs when the new information is too complex to be integrated into the existing structure - this means that, cognitive structures change in response to new experiences.

26

Equilibration is the force which moves development along. Piaget believed that cognitive development did not progress at a steady rate, but rather in leaps and bounds. Equilibrium occurs when a child's schemas can deal with most new information through assimilation. However, an unpleasant state of disequilibrium occurs when new information cannot be fitted into existing schemas (assimilation).

Once the new information is acquired the process of assimilation with the new schema will continue until the next time we need to make an adjustment to it. Example of Assimilation A 2 year old child sees a man who is bald on top of his head and has long frizzy hair on the sides. To his father's horror, the toddler shouts "Clown, clown" (Siegler, DeLoache. & Eisenberg, 2003). Example of Accommodation In the "clown" incident, the boy's father explained to his son that the man was not a clown and that even though his hair was like a clown's, wearing a funny costume and doing silly things to make people laugh. With this new knowledge, the boy was able to change his schema of "clown" and make this idea fit better to a standard concept of "clown".

27 C. Stages of Development Piaget

did many experiments on children's way of thinking and concluded that human beings go through several distinct stages of cognitive development. Each stage involves the acquisition of new skills and rest upon the successful completion of the preceding one. The first stage is the sensorimotor, (0-2year). Until about four months of age, the infant can not differentiate itself from the environment. Gradually the child learns to distinguish people from objects and that both have an existence independent of their immediate perception. This stage draws its name, sensorimotor, from that the child learns mainly by touching objects, manipulating them and physically exploring the environment. By the end of this stage the child understands that its environment has distinctive and stable properties. The next stage is called the operational (2years-7years). This is the stage when the child acquires a mastery of a language and becomes able to use words to represent objects and images in a symbolic fashion. Piaget terms this stage pre-operational because children are not yet able to use their developing mental capabilities systematically. At this stage children are egocentric, which means that the child has the tendency to interpret the world exclusively with its own position. The child does not understand, for an example, that others see things and objects from a different perspective from their own. During this phase of development the children have no general understanding of categories of thought that adults take for granted, ideas such as causality, speed, weight or number. The third stage is the concrete operational period (7years-11 years). During this period children master abstract, logical notions. They are able to handle ideas such as causality without much difficulty, and they are fit to carry out the mathematical operations of multiplying, dividing and subtracting. By this stage children are much less egocentric. The fourth stage is called the formal operational period (11years+). During adolescence, the developing child becomes able to comprehend highly abstract and hypothetical concepts. When faced with a problem, children at this stage should be able to review all possible ways of solving it and go through them theoretically in order to reach a solution.

28 According to Piaget, the first three stages of development are general, but not all adults come to the formal operational stage. The development of formal operational thought relies in part on the process of schooling. Adults of limited educational achievement tend to remain to think in more concrete terms and retain large traces of egocentrism. Classroom Implication of Piaget's Work The educational interest of Piaget's work lies firstly in this procedure he used to make educationists aware of the child's thought processes and the conditions under which intellectual structures are established at different ages. There are four principles that are most often cited in Piaget's theory regarding to education. The first is the importance of readiness. This principle follows from his emphasis on assimilation. Experience, educational or otherwise, does not simply happen to a child; rather it must always be assimilated to current cognitive structure. A new experience can only be of any value if the child can make sense of it. Teaching that is far away the child's level is unlikely to be useful. The second principle concerns the motivation for cognitive activity. Educational content that is either too advanced or too simple is unlikely to be interesting. The educational subject has to be slightly beyond the current level of the child so that it provides experience familiar enough to assimilate however challenging enough to provoke disequilibrium. The third is the awareness of what level the child has reached and the information of what it can be expected at that level and what not. Piaget's studies often identify steps and sequences through which particular content domains are mastered. It is therefore possible not only to determine where the child is but also to know the natural next steps for development. The final principle is more functional. It concerns Piaget's emphasis on intelligence as an action. In his view education should be build on the child's natural curiosity and natural tendency to act on the world in order to understand it. Knowledge is most meaningful when children construct it themselves rather than having it imposed upon them. The experience in acquiring a new knowledge through action allows two different kinds of knowledge to develop: the physical experience and the logico-mathematical experience. Physical experience produces knowledge of the properties of the objects

29 acted upon. Logico-mathematical experience results in knowledge, not of the objects, but of the actions themselves and their results. From physical experience, one would gain knowledge of the weight of objects; or the fact that, other things being equal, weight increases as volume increases, and so on. When speaking of logico-mathematical experience the point is that even the highest forms abstract reasoning have their origin in action. The aim for education, according to Piaget, is to make individuals who are critical, creative and inventive discoverers. So the major part of the child's learning relies on active experimentation and discovery. The active classroom has been associated with the term progressive teaching, where pupils are in active role, learning predominantly by discovery techniques, with emphasis on creative expression. Subject matter tends to be combined, with the teacher performing as a guide to educational experiences and encouraging cooperative work. External rewards and punishments are seen as being unimportant, and there is not so much concern with traditional academic standards and testing (Spencer, 1991). As a biologist Piaget tended to look at development more from the physical change and the readiness for each stage to develop any further. Another perspective in the cognitive movement was from those who saw the connection between the environment and the child development in a constructive way, and Jerome Bruner's ideas are those that are well known. Evaluation of Piaget's Theory

The influence of Piaget's ideas in developmental psychology has been enormous. He changed how people viewed the child's world and their methods of studying children. He was an inspiration to many who came after and took up his ideas. Piaget's ideas have generated a huge amount of research which has increased our understanding of cognitive development. His ideas have been of practical use in understanding and communicating with children, particularly in the field of education (

re: Discovery Learning). Some years ago, Jean Piaget's theory of cognitive development during childhood was regarded as the major paradigm in which to understand the complex procedure of mental progression through different levels of thinking and understanding. One of the most important contributions that Piaget made was to establish the fact that the cognitive processes of young children are not simply immature versions of that of an adult, but that they have their very own rules. Piaget's theory and in fact his

30 findings have been widely challenged later on. Never the less, Piaget's ideas still maintain a vital influence in both general psychology and contemporary education. 1.3.1.6 Kohlberg Lawrence Kohlberg (1966, 1969) suggested that children had made a cognitive judgement about their gender identity before they select same sex models for sex typed behaviors. Lawrence Kohlberg's Cognitive Development Theory : Despite the focus on cognition and internal self-regulation in Bandura's more recent work, many theorists argue that there are more fundamental cognitive processes that need to be taken into account when analysing children's gender development. In particular, researchers have suggested that children's concepts of themselves as male or female play a critical role in encouraging children to identify and endorse gender roles. This notion was first set out at the same time as the early social learning approaches to gender development. In Kohlberg's view, boys think "I am a boy, therefore I want to do boy things, therefore the opportunity to do boy things (and to gain approval for doing them) is rewarding". His emphasis, then, is on gender role development as being self-socialised; certainly, there is plenty of information about gender roles in the social environment, but it is the child who actively seeks out, organises, and then behaves in accordance with that information. This contrasts markedly with the view of the child as behaving in a gender-typed 'way simply because he or she is rewarded - or sees someone else being rewarded - for it. A major implication of this perspective is that children's appreciation of- and adherence to -gender roles is dependent on their gender identity, their sense of being male or female. Kohlberg, and other proponents of this approach, argued that children develop a sense of gender identity in a sequence of distinct stages, an idea that owes a great deal to Jean Piaget's influential work on cognitive development. Piaget had argued that children's logical thought could be seen to develop through a sequence of discrete stages, each qualitatively different from the others. Kohlberg connected this development with growth in children's sense of gender identity. The Kohlbergian sequence of gender identity development involves three stages. Kohlberg 's stages of gender development Stage 1: Gender labeling

31 Children can identify themselves and other people as girls or boys (mummies or daddies). However, gender is not seen as stable over time or across changes in superficial physical characteristics (e.g. length of hair, clothes). Stage 2: Gender stability Children recognise that gender is stable over time: boys will grow up to be daddies, and girls will grow up to be mummies. However, the unchanging nature of gender - that it remains the same regardless of changes in superficial appearance or activity choice - is not yet appreciated. Stage 3: Gender consistency Children have a full appreciation of the permanence of gender over time and across situations. By the age of around three years, in the gender labelling stage, children become able to label themselves and others as boys or girls accurately. It is not for another couple of years, however, that children are thought to enter the gender stability stage and appreciate that this classification would remain stable over time (i.e. a boy would grow up to be a daddy, and a girl would grow up to be a mummy). This understanding was thought to develop in parallel with classic Piagetian changes in children's appreciation of conservation (e.g. understanding that the volume of water in a beaker would remain the same after the water is poured into a beaker of different dimensions). Most importantly, Kohlberg argued that the "child's gender identity can provide a stable organizer of the child's psychosexual attitudes only when he is categorically certain of its unchangeability" (1966). Thus, the mature understanding of gender constancy was considered critically important for the gender-typing process. Kohlberg's cognitive-developmental theory left the opportunity to further research in cognitive development perspective of children. Evaluation The first issue with this theory is quite easy to get your head around; it is that the theory is descriptive rather than explanative. This means that the theory tells you what happens but not why. Another issue is that it may well be that children are at these stages earlier, but because of limits in their language skills they are not able to verbalise this. Therefore

32 it could be less of a theory of gender development and more a theory of the ability to talk about different concepts of gender. And a final evaluative comment is that it takes a very broad approach. Not all children have the same understanding of gender and it doesn't account for how gender changes over time. For example, 50 years ago childcare would be primarily the job of women, but nowadays it would seem odd if a father didn't get involved in childcare. 1.3.1.7

Social Constructivism Social constructivism maintains that human development is socially situated and knowledge is constructed through interaction with others. It is a sociological theory of knowledge that applies the general philosophical constructivism into the social. The concept has a long history in sociological and philosophical thought, but the term has been coined by Peter L. Berger and Thomas Luckmann with their book *The Social Construction of Reality*. Assumptions of Social Constructivism Social constructivism is based on specific assumptions about reality, knowledge, and learning. To understand and apply models of instruction that are rooted in the perspectives of social constructivists, it is important to know the premises that underlie them. Reality: Social constructivists believe that reality is constructed through human activity. Members of a society together invent the properties of the world (Kukla, 2000). For the social constructivist, reality cannot be discovered: it does not exist prior to its social invention. Knowledge: To social constructivists, knowledge is also a human product, and is socially and culturally constructed (Ernest, 1999; Gredler, 1997; Prawat & Floden, 1994). Individuals create meaning through their interactions with each other and with the environment they live in. Learning: Social constructivists view learning as a social process. It does not take place only within an individual, nor is it a passive development of behaviors that are shaped by external forces (McMahon, 1997). Meaningful learning occurs when individuals are engaged in social activities.

33 General Perspectives of Social Constructivism on

Learning 1.3.1.8 Lev Vygotsky The work of Lev Vygotsky (1896-1934) has become the foundation of much research and theory in cognitive development

over the past several decades, particularly of what has become known as Social Development Theory.

Vygotsky's theories stress the fundamental role of social interaction in the development of cognition Vygotsky (1978), as he believed strongly that community plays a central role in the process of "making meaning." Unlike Piaget's notion that children's development must necessarily

precede their learning, Vygotsky argued, "learning is a necessary and universal aspect of the process of developing culturally organized, specifically human psychological function" (1978). In other words, social learning tends to precede (i.e. come before)

development. Vygotsky has developed a sociocultural approach to cognitive development. He developed his theories at around the same time as Jean Piaget was starting to develop his ideas (1920's and 30's), but he died at the age of 38 and

so his theories are incomplete - although some of his writings are still

being translated from Russian. No single principle (such as Piaget's equilibration) can account for development. Individual development cannot be understood without reference to the social and cultural context within which it is embedded, Higher mental processes in the individual have their origin in

social processes. Vygotsky's theory differs from that of Piaget in a number of important ways: 1.

Vygotsky places more emphasis on culture affecting/shaping cognitive development - this contradicts Piaget's view of universal stages and content of development. (Vygotsky does not refer to stages in the way that Piaget does). (i) Hence Vygotsky assumes cognitive development varies across cultures, whereas Piaget states cognitive development is mostly universal across cultures. 2. Vygotsky places considerably more emphasis on social factors contributing to cognitive development (Piaget is criticized for underestimating this). (i) Vygotsky states cognitive development stems from social interactions from guided learning within the zone of proximal development as children and their partners co-construct knowledge. In contrast Piaget maintains that cognitive development stems largely from independent explorations in which children construct knowledge of their own.

34 (ii) For Vygotsky, the environment in which children grow up will influence how they think and what they think about. 3. Vygotsky places more (and different) emphasis on the role of language in cognitive development (again Piaget is criticized for lack of emphasis on this). For Vygotsky, cognitive development results from an internalization of language. According to Piaget, language depends on thought for its development (i.e. thought comes before language). For Vygotsky, thought and language are initially separate systems from the beginning of life, merging at around three years of age, producing verbal thought (inner speech). 4. According to Vygotsky adults are an important source of cognitive development. Adults transmit their culture's tools of intellectual adaptation that children internalize. In contrast Piaget emphasizes the importance of peers as peer interaction promotes social perspective taking. Effects of Culture : Tools of intellectual adaptation Like Piaget, Vygotsky claimed that infants are born with the basic materials/ abilities for intellectual development. Lev Vygotsky refers to Elementary Mental Functions - Attention, Sensation, Perception, Memory, Eventually, through interaction within the sociocultural environment, these are developed into more sophisticated and effective mental processes/strategies which he refers to as Higher Mental Functions. Vygotsky refers to tools of intellectual adaptation - these allow children to use the basic mental functions more effectively/adaptively, and these are culturally determined (e.g. memory mnemonics, mind maps). Vygotsky therefore sees cognitive functions, even those carried out alone, as affected by the beliefs, values and tools of intellectual adaptation of the culture in which a person develops and therefore socio-culturally determined. The tools of intellectual adaptation therefore vary from culture to culture - as in the memory example. In order to gain an understanding of Vygotsky's theories on cognitive development, one must understand two of the main principles of Vygotsky's work: the More Knowledgeable Other (MKO) and the Zone of Proximal Development (ZPD).

35 A. More Knowledgeable Other The more knowledgeable other (MKO) is somewhat self-explanatory; it refers to someone who has a better understanding or a higher ability level than the learner, with respect to a particular task, process, or concept. Although the implication is that the MKO is a teacher or an older adult, this is not necessarily the case. Many times, a child's peers or an adult's children may be the individuals with more knowledge or experience. For example, who is more likely to know more about the newest teenage music groups, how to win at the most recent PlayStation game, or how to correctly perform the newest dance craze - a child or their parents? In fact, the MKO need not be a person at all. Some companies, to support employees in their learning process, are now using electronic performance support systems. Electronic tutors have also been used in educational settings to facilitate and guide students through the learning process. The key to MKOs is that they must have (or be programmed with) more knowledge about the topic being learned than the learner does. B. Zone of Proximal Development The concept of the More Knowledgeable Other is integrally related to the second important principle of Vygotsky's work, the Zone of Proximal Development. This is an important concept that relates to the difference between what a child can achieve independently and what a child can achieve with guidance and encouragement from a skilled partner. For example, the child could not solve the jigsaw puzzle (in the example above) by itself and would have taken a long time to do so (if at all), but was able to solve

36 it following interaction with the father, and has developed competence at this skill that will be applied to future jigsaws. Vygotsky (1978) sees the Zone of Proximal Development as the area where the most sensitive instruction or guidance should be given - allowing the child to develop skills they will then use on their own - developing higher mental functions. Vygotsky also views interaction with peers as an effective way of developing skills and strategies. He suggests that teachers use cooperative learning exercises where less competent children develop with help from more skillful peers - within the zone of proximal development. Evidence for Vygotsky and the ZPD Freund (1990) conducted a study in which children had to decide which items of furniture should be placed in particular areas of a dolls house. Some children were allowed to play with their mother in a similar situation before they attempted it alone (zone of proximal development) whilst others were allowed to work on this by themselves (Piaget's discovery learning). Freund found that those who had previously worked with their mother (ZPD) showed greatest improvement compared with their first attempt at the task. The conclusion being that guided learning within the ZPD led to greater understanding/performance than working alone (discovery learning). Vygotsky and Language Vygotsky believed that language develops from social interactions, for communication purposes. Vygotsky viewed language as man's greatest tool, a means for communicating with the outside world. According to Vygotsky (1962) language plays 2 critical roles in cognitive development :

37 1: It is the main means by which adults transmit information to children. 2: Language itself becomes a very powerful tool of intellectual adaptation. Vygotsky (1987) differentiates between three forms of language: social speech which is external communication used to talk to others (typical from the age of two); private speech (typical from the age of three) which is directed to the self and serves an intellectual function; and finally private speech goes underground, diminishing in audibility as it takes on a self-regulating function and is transformed into silent inner speech (typical from the age of seven). Perhaps the main criticism of Vygotsky's work concerns the assumption that it is relevant to all cultures. Rogoff (1990) dismisses the idea that Vygotsky's ideas are culturally universal and instead states the concept of scaffolding - which is heavily dependent on verbal instruction - may not be equally useful in all cultures for all types of learning. Indeed, in some instances observation and practice may be more effective ways of learning certain skills. 1.3.1.9

Albert

Bandura The social learning theory proposed by Albert Bandura has become perhaps the most influential theory of learning and development. While rooted in many of the basic concepts of traditional learning theory, Bandura believed that direct reinforcement could not account for all types of learning. While the behavioral theories of learning suggested that all learning was the result of associations formed by conditioning, reinforcement, and punishment, Bandura's social learning theory proposed that learning can also occur simply by observing the actions of others. His theory added a social element, arguing that people can learn new information and behaviors by watching other people. Known as observational learning (or modeling), this type of learning can be used to explain a wide variety of behaviors.

Bandura explained: "Learning would be exceedingly laborious, not to mention hazardous, if people had to rely solely on the effects of their own actions to inform them what to do. Fortunately, most human behavior is learned observationally through modeling: from observing others one forms an idea of how new behaviors are performed, and on later occasions this coded information serves as a guide for action." Albert Bandura, Social Learning Theory, 1977.

38 Albert Bandura combines both behavioral and cognitive philosophies to form this theory of modeling, or observational learning. He sees the human personality as an interaction between the environment and a person's psychological processes. Bandura says that humans are able to control their behavior through a process known as self regulation. This process involves three steps: 1) Self observation Humans look at themselves and their behavior and keep track of their actions. 2) Judgment Humans compare these observations with standards. These standards can be rules set by society, or standards that the individual sets for him or herself. 3) Self responderif, after judging himself or herself, the person does well in comparison with the set standards, he or she will give him or her- self a rewarding self-response. If the person does poorly he or she then administers a punishing self-response to him or herself, Self regulation has been incorporated into self control therapy which has been very successful in dealing with problems such as smoking. Dealing with modeling is his study with Bobo Dwed a video to children in which an adult beat vided the children into three groups, and each The first video showed the adult being rewarded for his behavior, the second video showed the adult being punished for his behavior, and the third video showed no consequences for the behavior. He then studied the differences between how male children and female children reacted to this video in regard to whether they imitated the observed behavior or not. The results are shown to the left. This graph represents the number of imitative responses by males and females after observing one of the three different

39 videos. The results show that males in all cases imitated the viewed behavior more so than females. In social learning theory Albert Bandura (1977) agrees with the behaviourist learning theories of classical conditioning and operant conditioning. However, he adds two important ideas: A. Mediating processes occur between stimuli & responses. B. Behavior is learned from the environment through the process of observational learning. A. Mediation Processes SLT is often described as the 'bridge' between traditional learning theory (ie. behaviourism) and the cognitive approach. This is because it focuses on how mental (cognitive) factors are involved in learning. Unlike Skinner, Bandura (1977) believes that humans are active information processors and think about the relationship between their behavior and its consequences. Observational learning could not occur unless cognitive processes were at work. These mental factors mediate (i.e. intervene) in the learning process to determine whether a new response is acquired. Therefore, individuals do not automatically observe the behaviour of a model and imitate it. There is some thought prior to imitation and this consideration is called mediational processes. This occurs between observing the behaviour (stimulus) and imitating it or not (response).

40 There are four mediational processes proposed by Bandura: ~ Attention: The extent to which we are exposed/notice the behaviour. For a behaviour to be imitated it has to grab our attention. We observe many behaviours on a daily basis and many of these are not noteworthy. Attention is therefore extremely important in whether a behaviour has an influence in others imitating it. ~ Retention : How well the behaviour is remembered. The behaviour may be noticed, but is it not always remembered which obviously prevents imitation. It is important therefore that a memory of the behaviour is formed to be performed later by the observer. Much of social learning is not immediate so this process is especially vital in those cases. Even if the behaviour is reproduced shortly after seeing it, there needs to be a memory to refer to. ~ Reproduction : This is the ability to perform the behavior that the model has just demonstrated. We see much behaviour on a daily basis that we would like to be able to imitate but that this not always possible. We are limited by our physical ability and for that reason, even if we wish to reproduce the behaviour, we cannot. This influences our decisions whether to try and imitate it or not. Imagine the scenario of a 90-year-old-lady who struggles to walk watching Dancing on Ice. She may appreciate that the skill is a desirable one, but she will not attempt to imitate it because she physically cannot do it. ~ Motivation : The will to perform the behaviour. The rewards and punishment that follow a behaviour will be considered by the observer. If the perceived rewards outweighs the perceived costs (if there are any) then the behaviour will be more likely to be imitated by the observer. If the vicarious reinforcement is not seen to be important enough to the observer then they will not imitate the behaviour. B. Observational Learning Children observe the people around them behaving in various ways. This is illustrated during the famous Bo bo doll experiment (Bandura, 1961). Individuals that are observed are called models. In society, children are surrounded by many influential models, such as parents within the family, characters on children's TV, friends within their peer group and teachers at school. These models provide examples of behavior to observe and imitate, e.g. masculine and feminine, pro and anti-social etc.

41 Children pay attention to some of these people (models) and encode their behavior. At a later time they may imitate (i.e. copy) the behavior they have observed. They may do this regardless of whether the behavior is 'gender appropriate' or not, but there are a number of processes that make it more likely that a child will reproduce the behavior that its society deems appropriate for its sex. First, the child is more likely to attend to and imitate those people it perceives as similar to itself. Consequently, it is more likely to imitate behavior modeled by people of the same sex. Second, the people around the child will respond to the behavior it imitates with either reinforcement or punishment. If a child imitates a model's behavior and the consequences are rewarding, the child is likely to continue performing the behavior. If parent sees a little girl consoling her teddy bear and says "what a kind girl you are", this is rewarding for the child and makes it more likely that she will repeat the behavior. Her behavior has been reinforced (i.e. strengthened). Reinforcement can be external or internal and can be positive or negative. If a child wants approval from parents or peers, this approval is an external reinforcement, but feeling happy about being approved of is an internal reinforcement. A child will behave in a way which it believes will earn approval because it desires approval. Positive (or negative) reinforcement will have little impact if the reinforcement offered externally does not match with an individual's needs. Reinforcement can be positive or negative, but the important factor is that it will usually lead to a change in a person's behavior. Third, the child will also take into account of what happens to other people when deciding whether or not to copy someone's actions. A person learns by observing the consequences of another person's (i.e. models) behaviour e.g. a younger sister observing an older sister being rewarded for a particular behaviour is more likely to repeat that behaviour herself. This is known as vicarious reinforcement. This relates to attachment to specific models that possess qualities seen as rewarding. Children will have a number of models with whom they identify. These may be people in their immediate world, such as parents or older siblings, or could be fantasy characters or people in the media. The motivation to identify with a particular model is that they have a quality which the individual would like to possess.

42 Identification occurs with another person (the model) and involves taking on (or adopting) observed behaviors, values, beliefs and attitudes of the person with whom you are identifying. The term identification as used by Social Learning Theory is similar to the Freudian term related to the Oedipus complex. For example, they both involve internalizing or adopting another person's behavior. However, during the Oedipus complex the child can only identify with the same sex parent, whereas with Social Learning Theory the person (child or adult) can potentially identify with any other person. Identification is different to imitation as it may involve a number of behaviors being adopted, whereas imitation usually involves copying a single behavior. Critical Evaluation The social learning approach takes thought processes into account and acknowledges the role that they play in deciding if a behaviour is to be imitated or not. As such, SLT provides a more comprehensive explanation of human learning by recognising the role of mediational processes. In addition to influencing other psychologists, Bandura's social learning theory has had important implication in the field of education. Today, both teachers and parents recognize the importance of modeling appropriate behaviors. Other classroom strategies such as encouraging children and building self-efficacy are also rooted in social learning theory. 1.4 Intelligence 1.4.1 Concept and Definition Intelligence has been an important and controversial topic throughout psychology's history. Despite the substantial interest in the subject, there is still considerable disagreement about what exactly constitutes intelligence. In addition to questions of exactly how to define intelligence, the debate continues today about whether accurate measurements are even possible.

At various points throughout recent history, researchers have proposed some different definitions of intelligence. While these definitions can vary considerably from one theorist to the next, current conceptualizations tend to suggest that intelligence involves the ability to:

43 Learn. The acquisition, retention, and use of knowledge is an important component of intelligence. Recognize problems. To put knowledge to use, people must first be able to identify possible problems in the environment that need to be addressed. Solve problems. People must then be able to take what they have learned to come up with a useful solution to a problem they have noticed in the world around them. Intelligence involves some different mental abilities including logic, reasoning, problem-solving and planning.

While the subject of intelligence is one of the largest and most heavily researched, it is also one of the topics that generate the greatest controversy. Intelligence, the dictionary says, is "The capacity to acquire and apply knowledge." A number of definitions have been evolved by psychologists according to their own concept of the term intelligence. Being dissatisfied by the number of definitions and their interpretation, Boring defined "Intelligence is what intelligence tests test." All the definitions have been systematized by Vernon and Freeman. Let us examine the classification of the definitions of intelligence done by these psychologists. Vernon classified all the definitions under three broad categories such as biological, psychological and operational. Freeman, though, classified all definitions of intelligence into three categories but his approach differs from Vernon.

1.4.2 Vernon's Classification

1) Biological approach. This category of definitions emphasizes the adaptive nature of human beings. Man is one kind of organism among a million on earth who adapts to his environment. If we interpret psychology as a biological science then there is little doubt that we must also interpret intelligence as adaptation to environment. Any other view of intelligence is superficial. This is the most far reaching and general view of intelligence. According to Vernon, this idea of intelligence is the most fundamental of all. Intelligence according to this approach is the capacity to adapt relatively in new situations of life. But if we critically examine the biological concept of intelligence we find that many great men to whom one could hardly deny an assessment of exceptional intelligence (Pascal, Kafka and numerous academic experts) have been spectacularly ill-adapted in their social and physical environment. The biological concept of intelligence is not of great use from practical point of view in the study of individual differences within a culture.

44 (2) Psychological approach. The second category of definitions, according to Vernon, is psychological. Few of the definitions advanced by experts contained a clear commitment about the relative effects of hereditary and environmental influences in the development of intelligence. C. Burt, an English psychologist, defined intelligence as innate general cognitive ability. Since scores on existing intelligence tests have often been shown to be susceptible to environmental influences, a consequence of this definition is that intelligence as defined differs from intelligence as measured by tests.

(3) Operational approach. The third category of definitions of intelligence is operational. Operational definitions are important to understand the concept of intelligence in clear and definite terms. Scientific terms are defined not in isolation, as in a dictionary but by stating the observable conditions under which a sentence containing the term is true or false, instead of defining the word by itself. Such definitions are called for they frequently state what must be done in order to make certain observations. For instance, in order to determine a child's I.Q., we must first administer a test of specific kind. Then we observe his performance, on the test and finally make certain calculations and decisions. All of these conditions define the meaning of I.Q. as it appears in the sentence. Ramu has an I.Q. of 115. It would certainly be of great advantage to have an operational definition of intelligence that everyone would accept for scientific work and would distinguish it from vague popular conceptions of the term.

Freeman's Classification

(1) Adjustment or adaptation ability. The definitions of this category lay emphasis on the adjustment ability of an individual to his environment. The individual is thought intelligent in proportion to his ability to adjust to new situations and problems of life. The person who is intelligent has no difficulty in the adjustment. He adjusts in an effective way and can vary his behaviour according to the situation. A person who is less intelligent is rigid and has less responses to make in the process of social interaction. The definition, given by Stern, comes under this category. He defined intelligence as a general capacity of an individual, consciously to adjust his thinking to new environment.

(2) Ability to learn. The definitions of this category emphasize the importance of an individual's ability to learn. Learning ability is an index of one's intelligence. Buckingham says, "Intelligence is the learning ability."

45 (3) Ability to carry on abstract thinking. This category of definitions lays more emphasis on the effective use of concepts and symbols in dealing with situations,

especially, presenting a problem to be solved through the use of verbal and numerical symbols. Terman, defining intelligence, says, "

An individual is intelligent in proportion as he is able to carry on abstract thinking."

Two comprehensive definitions: D.

Wechsler "

Intelligence

is

the aggregate or global capacity of the

individual

to act purposefully, to think rationally and to deal effectively with his environment.”

Stoddard (1943) presented comprehensive description “

Intelligence is

the ability to

undertake activities that are characterized by (1) difficulty, (2) complexity, (3) abstraction, (4) economy, (5) adaptiveness to a

goal, (6) social value and (7)

the emergence of originals, and to maintain such activities under conditions that demand a concentration of energy and a resistance to emotional forces.” 1.4.3

Types of Intelligence E.L. Thorndike has classified intelligence into three categories which are as follows : (a) Concrete intelligence. (b) Abstract intelligence. (c) Social intelligence. (a) Concrete Intelligence. Concrete intelligence means intelligence in relation to concrete materials. It is the ability of an individual to comprehend actual situations and react to them adequately. The concrete intelligence is evident from various activities of daily life. This kind of intelligence is measured by performance tests and picture tests in which the individual has to manipulate concrete materials. (b) Abstract intelligence. It is the ability to respond to words, numbers and letters etc. All tests of intelligence which require manipulation of symbols are tests of abstract intelligence. Abstract intelligence is required in the ordinary academic subjects in schools, such as reading, writing and history and so on. The highest level of abstract intelligence is manifested in the thought of philosophers and in ease of mathematical formula. (c) Social intelligence. Social intelligence means ability of an individual to react to social situations of daily life. Social intelligence would not include the 46 feelings or emotions aroused in us by other, but merely our ability to understand others and to react in such a way towards them that the ends desired should be attained. High social intelligence is possessed by those who are able to handle people well. Adequate adjustment in social situations is the index of social intelligence. Measuring Intelligence The term “intelligence quotient,” or IQ, was first coined in the early twentieth century by a German psychologist named William Stern. Psychologist Alfred Binet developed the very first intelligence tests to help the French government identify schoolchildren who needed extra academic assistance. Binet was the first to introduce the concept of mental age or a set of abilities that children of a certain age possess. Since that time, intelligence testing has emerged as a widely used tool that has led to the development of many other tests of skill and aptitude. Eventually, Binet and colleague Theodore Simon came up with a test that not only distinguished between fast and slow learners but also between children of different age groups as well (Binet & Simon, 1916). They noticed that the fast learners seemed to give answers to questions that older children might give, whereas the slow learners gave answers that were more typical of a younger child. Binet decided that the key element to be tested was a child’s mental age, or the average age at which children could successfully answer a particular level of questions. STANFORD BINET AND Q Terman (1916), a researcher at Stanford University, adopted German psychologist William Stern’s method for comparing mental age and chronological age (number of years since birth) for use with the translated and revised Binet test. Stern’s (1912) formula was to divide the mental age (MA) by the chronological age (CA) and multiply the result by 100 to get rid of any decimal points. The resulting score is called an intelligence (quotient, or IQ. A quotient is a number that results from dividing one number by another.) $IQ = \frac{MA}{CA} \times 100$ Today, the Stanford-Binet Intelligence Scales, Fifth Edition (SB5) (Roid, 2003) is often used by educators to make decisions about the placement of students into special educational programs. Most children are given this test at around the second grade, or age 7 or 8. See Table 8.3 for descriptions of some items from the SB5. THE WECHSLER TESTS David Wechsler (1981, 1989, 1991) was the first to devise a series of tests designed for specific age groups (also given to an individual,

47 not just groups, as is the Stanford-Binet test). Originally dissatisfied with the fact that the Stanford-Binet was designed for children but being administered to adults, he developed an IQ test specifically for adults. He later designed tests specifically for older school-age children and preschool children as well as for those in the early grades. The Wechsler Adult Intelligence Scale (WAIS-IV), Wechsler Intelligence Scale for Children (WISC-IV), and the Wechsler Preschool and Primary Scale of Intelligence (WPPSI-III) are the three versions of this test, and are now used more frequently than the Stanford-Binet. These tests differ from the Stanford-Binet in that they each have a verbal and a performance (nonverbal) scale, as well as providing an overall score of intelligence. The verbal component scale tests vocabulary, comprehension, and general knowledge, whereas the performance component scale tests such skills as arranging blocks to match a pattern, identifying missing parts in pictures, and putting pictures representing a story in order.

1.4.4 Theories of Intelligence

Different researchers have proposed a variety of theories to explain the nature of intelligence. The following are some of the major theories of intelligence that have emerged during the last 100 years. Theories of intelligence, as is the case with most scientific theories, have evolved through a succession of models. Four of the most influential paradigms have been psychological measurement, also known as psychometrics; cognitive psychology, which concerns itself with the processes by which the mind functions; cognitivism and contextualism, a combined approach that studies the interaction between the environment and mental processes; and biological science, which considers the neural bases of intelligence.

1.4.4.1 Charles Spearman - General Intelligence

One of the earliest of the psychometric theories came from the British psychologist Charles E. Spearman (1863-1945), who published his first major article on intelligence in 1904. He noticed what may seem obvious now—that people who did well on one mental-ability test tended to do well on others, while people who performed poorly on one of them also tended to perform poorly on others. To identify the underlying sources of these performance differences, Spearman devised factor analysis, a statistical technique that examines patterns of individual differences in test scores. He concluded that just two kinds of factors underlie all individual differences in test scores. The

48 first and more important factor, which he labeled the “general factor,” *g*, pervades performance on all tasks requiring intelligence. In other words, regardless of the task, if it requires intelligence, it requires *g*. The second factor is specifically related to each particular test. For example, when someone takes a test of arithmetical reasoning, his performance on the test requires a general factor that is common to all tests (*g*) and a specific factor that is related to whatever mental operations are required for mathematical reasoning as distinct from other kinds of thinking. But what, exactly, is *g*? After all, giving something a name is not the same as understanding what it is. Spearman did not know exactly what the general factor was, but he proposed in 1927 that it might be something like “mental energy.” As time progressed, Spearman increasingly argued that *g* was not, from a psychological point of view, a single ability but composed of two very different abilities which normally worked closely together. These he called “eductive” ability and “reproductive” ability. The former term comes from the Latin root “educere” - which means to “draw out” and thus refers to the ability to make meaning out of confusion. He claimed that to understand these different abilities “in their trenchant contrast, their ubiquitous cooperation, and their genetic interlinkage” would, for the study of “individual differences - and even cognition itself - be “the very beginning of wisdom.” Despite Spearman arguing that *g* was what emerged from a large battery of tests, i.e., that it was not measured perfectly by any single test, the fact that *g*-theory suggested that much of ability could be captured in a single factor, and his suggestion that “the eduction of relations and correlates” underlay this general factor led to the quest for tests of this general ability. Raven’s Progressive Matrices might be regarded as one of these although Raven himself clearly stated that his tests should not be regarded as “intelligence” tests.

49

1.4.4.2 Howard Gardner Multiple Intelligences

One of the more recent ideas to emerge is Howard Gardner’s theory of multiple intelligences. Instead of focusing on the analysis of test scores, Gardner proposed that numerical expressions of human intelligence are not a full and accurate depiction of people’s abilities. His theory describes eight distinct intelligences based on skills and abilities that are valued in different cultures. The eight intelligences Gardner described are: ~ Visual-spatial Intelligence ~ Verbal-linguistic Intelligence ~ Bodily-kinesthetic Intelligence ~ Logical-mathematical Intelligence ~ Interpersonal Intelligence ~ Musical Intelligence ~ Intrapersonal Intelligence ~ Naturalistic Intelligence

Howard Gardner initially formulated a list of seven intelligences. His listing was provisional. The first two have been typically valued in schools; the next three are usually associated with the arts; and the final two are what Howard Gardner called ‘personal intelligences’ (Gardner 1999).

50 Linguistic Intelligence involves sensitivity to spoken and

written language, the ability to learn languages, and the capacity to use language to accomplish certain goals.

This intelligence includes the ability to effectively use language

to express oneself rhetorically or poetically; and language as a means to remember information. Writers, poets, lawyers and speakers

are among those that Howard Gardner sees as having high linguistic intelligence. Logical mathematical intelligence consists of the capacity to analyze problems logically, carry out mathematical operations, and investigate issues

scientifically. In Howard Gardner's words, it entails the ability to detect patterns, reason deductively and think logically.

This intelligence is most often associated with scientific and mathematical thinking. Musical intelligence involves skill in the performance, composition, and appreciation of musical patterns. It encompasses the capacity to recognize and

compose musical pitches, tones, and rhythms. According to Howard Gardner musical intelligence runs in an almost

structural parallel to linguistic intelligence. Bodily kinesthetic intelligence entails the potential of using one's whole body or parts of the body to solve problems. It is the ability to use mental abilities to coordinate bodily movements. Howard

Gardner sees mental and physical activity as related. Spatial intelligence involves the potential to recognize and use the patterns of wide space and more confined areas. Interpersonal intelligence is concerned with

the capacity to understand the intentions, motivations and desires of

other people. It allows people to work effectively with others. Educators, salespeople, religious and political leaders and counsellors all need a well-developed interpersonal intelligence. Intrapersonal intelligence entails the capacity to

understand oneself, to appreciate one's feelings, fears and motivations. In Howard Gardner's view it involves having an

effective working model of ourselves, and to be able to use such information to regulate our lives. In Frames of Mind

Howard Gardner treated the personal intelligences 'as a piece'. Because of their close association in most cultures, they are often linked together. However, he still argues that it makes sense to think of two forms of personal intelligence.

Gardner claimed that the seven intelligences rarely operate independently. They are used at the same time and tend to complement each other as people develop skills or solve problems.

51 In essence Howard Gardner argued that he was making two essential claims about multiple intelligences. That : First, the theory is an account of human cognition in its fullness. The intelligences provided 'a new definition of human nature,

cognitively speaking' (Gardner 1999). Human beings are organisms who possess a basic set of intelligences. Second,

people have a unique blend of intelligences. Howard Gardner argues that the big challenge facing the deployment of

human resources 'is how to best take advantage of the uniqueness conferred on us as a species exhibiting several

intelligences'. These intelligences, according to Howard Gardner, are amoral — they can be put to constructive or

destructive use. Impact of multiple intelligences on educators Howard Gardner's theory of multiple intelligences has not

been readily accepted within academic psychology. However, it has met with a strongly positive response from many

educators. It has been embraced by a range of educational theorists and, significantly, applied by teachers and

policymakers to the problems of schooling. A number of schools in North America have looked to structure curricula

according to the intelligences, and to design classrooms and even whole schools to reflect the understandings that

Howard Gardner develops. The theory can also be found in use within pre-school, higher, vocational and adult

education initiatives. 1.4.4.3 Robert Sternberg Triarchic Theory of Intelligence Psychologist Robert Sternberg defined

intelligence as "

mental activity directed toward purposive adaptation to, selection and shaping of, real-world environments relevant to one's life."

While he agreed with Gardner that intelligence is much broader than a single, general ability, he instead suggested some

of Gardner's intelligences are better viewed as individual talents. Sternberg proposed what he referred to as 'successful

intelligence' comprised of three different factors: ~ Analytical Intelligence: This component refers to problem-solving

abilities. ~ Creative Intelligence: This aspect of intelligence involves the capacity to deal with new situations using past

experiences and current skills. ~ Practical intelligence: This element refers to the ability to adapt to a changing

environment.

52 Sternberg's Triarchic Theory of Human Intelligence (1977, 1985, 1995) subsumes both Spearman's g and underlying

information processing components. His triarchic theory includes three facets or subtheories: • Analytical

(componential) • Creative (experiential) • Practical (contextual) Sternberg's theory builds on his earlier componential

approach to reasoning. His theory is mostly based on observing Yale graduate students. Sternberg believes that if

intelligence is properly defined & measured it will translate to real-life success. Sternberg's Triarchic Theory is an

important effort to synthesize the various theories of intelligence. Analytical (componential) Facet (or Subtheory)

53 Analytical Intelligence similar to

the standard psychometric definition of intelligence e.g. as measured by Academic problem solving: analogies and puzzles, and corresponds to his earlier componential intelligence.

Sternberg considers this reflects how an individual relates to his internal world. Sternberg believes that Analytical Intelligence (Academic problem-solving skills) is

based on the joint operations of metacomponents and performance components and knowledge acquisition components of intelligence. 1.5

Creativity: Concept, Definition and Characteristics.

Creativity

is the act of turning new and imaginative ideas into reality.

Creativity

is characterized by the ability to perceive the world in new ways, to find hidden patterns, to make connections between seemingly unrelated phenomena, and to generate solutions. Creativity

involves two processes: thinking,

then producing. If you have ideas, but don't act on them, you are imaginative but not creative. "Creativity is the process of bringing something new into being. Creativity requires passion and commitment. It brings to our awareness what was previously hidden and points to new life. The experience is one of heightened consciousness: ecstasy." - Rollo May, *The Courage to Create*. "A product is creative when it is (a) novel and (b) appropriate. A novel product is original not predictable. The bigger the concept, and the more the product stimulates further work and ideas, the more the product is creative." —Sternberg & Lubart, *Defying the Crowd*. Creativity is the development of ideas and products that are both original and valuable. It is essential for something to be both original and valuable to be creative. It is possible that something could be very original but not valuable. We probably would not view something as creative if it is not valuable.

For example, a person could write a book that was just random sentences. This may be highly original, but it would not be of value to anyone. Examples of creativity include a scientist who develops a theory to explain human behavior, a musician who writes original songs that are enjoyed by many people, and a writer who writes a book that provide new ideas for fundraising. Not all creative people are alike, which makes defining creativity a challenge and assessing it a monumental undertaking. The traditional psychological definition of creativity includes two parts: originality and functionality. "You can't be creative

54 unless you come up with something that hasn't been done before," - Dean Keith Simonton, "The idea also has to work, or be adaptive or be functional in some way; it has to meet some criteria of usefulness." Motivation and intelligence There are other components of creativity—domain-relevant skills, quality processes and intrinsic task motivation—according to a componential theory of creativity developed by Teresa Amabile. But Amabile points out that environmental factor such as freedom, support and positive challenges also play a key role in fostering creativity. Another important factor in creativity is intelligence, but contrary to beliefs at the turn of the 20th century, it is not the only factor, says Simonton. In the 1920s, psychologist Louis Terman began looking at the relationship between intelligence and creativity. In a longitudinal sample of intelligent children, not all ended up developing their creative abilities, he found. That's when psychologists started to realize more than intelligence was required—also critical is having an ability to see things from a different perspective, Simonton says. "You need an IQ of around 140 to learn enough physics to be truly creative in it," Simonton says. "But once you have that minimal IQ, there's still something else that must be there for a person to be truly creative." The personality creativity connection

55 Big-C creativity The field of the Psychology of Creativity applies empirical, scientific rigor to the study of this type of pioneering creativity, or what research psychologists call “big-C” creativity. Convergent vs. Divergent thinking Convergent thinking refers to intelligence rated by IQ tests, or tests that measure rational, problem-solving abilities. Convergent thought is analytical, logical and controlled. It means one “right answer” for a given problem. Standardized tests and intelligence tests measure convergent thinking. Divergent thinking refers to the ability to come up with many solutions or ideas for problems that don’t have one solution. It refers to associative and intuitive thought, and thinking that requires flexibility. It’s the ability to ask simple questions to develop unique and novel ideas. Theories of creativity Up until the middle of the last century, creativity wasn’t widely discussed among psychologists, let alone studied. However, in a speech to the American Psychological Association in 1950, psychologist J.P. Guilford proclaimed that creativity had been overlooked as a research topic, and challenged researchers to study it empirically— to come up with a plausible way of describing how creativity actually occurs. The six “P’s” of Creativity To develop theories on creativity, research psychologists focus their emphases and investigations on one or more central aspects of creativity, which they have labeled the six “P’s.” Process. Process refers to how creative processes take place cognitively, or more specifically what types of processing occur during creative thought and invention. Product. Research psychologists rate and quantify the creativity of a particular creative output, such as a Harry Potter book, a painting by Pablo Picasso, or a new product, such as Facebook. Scientists rate the ingenuity and novelty of a product against more traditional, conventional, and less creative outputs. Personality. Early research tended to focus heavily on personality traits, as certain traits apply to creative individuals across domains, such as mathematics, science, business, or the arts. Most theories today regard personality traits as only one aspect or influence of creative behavior.

56 Place. Place is also referred to as “press” for pressure, or high-demand environments vs. low-demand environments. Creativity thrives in less controlled environments, where there is “low” pressure for quick results, and managers, parents or superiors reward differences rather than behaviors that fit in with conventional ways of doing things. Persuasion. Creativity persuades or initiates change, so those highly creative individuals with innovative ideas and products must have the ability to convince others in a field of expertise of the output’s true novelty. Potential. Potential research focuses on potential creative outputs, or the as-of- yet unfulfilled creative potential of individuals. This “P” focuses more research on everyday creativity, and most specifically on the potential of children and the educational supports needed for creativity to flourish. 1.6 Implications for Classroom Teaching and Learning Pedagogical theory and practice have seen a great number of advancements over the past half-century, but perhaps the most significant of these is the recognition by educators that the teaching-learning process must be seen as a single transaction. In other words, if something has not been learned, then it has not been taught. Educators have taken ownership of the process and, in today’s world, they accept that their teaching has not reached its objective, and they have not met their obligation, if all students have not learned the material at hand. This approach to teaching and learning has forced educators to focus on how individual students learn. It has always been recognized, of course, that sensorial experience and activity are the fundamentals of anyone’s learning process, whether child or adult, and effective teachers have always provided the opportunity for these in their lesson plans. It is only in recent years, however, that educational theory has focused on learning styles as a way of helping students who are not achieving normal learning objectives. If some children do not succeed well by one approach, then perhaps they will do better by another. Educators normally refer to fundamental learning styles as auditory, visual, and tactile. It would be a mistake, however, to imagine that any individual student relies on a single style of learning. The reality is that humans learn through a variety of processes and all of them involve fundamental sensorial and motor components. What the teacher must realize is that some students require more sensorial or motor engagement than others in order to learn effectively.

57 Auditory instruction is by far the weakest in terms of reaching teaching learning objectives. Even adults have difficulty listening to a speaker for any length of time. Most children are unable to listen and learn effectively without other stimuli, and a child who can succeed well through listening alone, an auditory learner, is a rare child indeed. Visual perception is an essential component of the learning process for most people. Though blind persons, for example, are able to learn much about the world through other means, the formation of certain concepts are impossible for them. Educators over the past three centuries have considered visual stimulation to be the essence of concept formation, and it is for this reason that classroom teachers have always considered visual aids to be a basic necessity in any lesson. Listening and seeing, then, are vital requirements in the learning process for most children and adults. But it is the hands on approach that characterizes effective teaching in today's classroom. Though some students are identified as auditory or visual learners, the reality is that all children, and probably all adults, learn most effectively through practical involvement in the task at hand. Effective teachers everywhere understand the importance of providing tactile experience for their students. Certainly, some students may succeed quite well without a hands-on approach, but it is undeniable that learning is enhanced for all of them when an opportunity for tactile experience is added to auditory and visual instruction. Learning styles are an important consideration to any teacher who is determined to succeed. Today's teachers are well trained and they know that they have not succeeded as long as some students have not reached the objectives of their teaching. A knowledge and understanding of the learning process, the importance of sensorial stimuli and activity, and a recognition of the significance of learning styles, will enable today's educators to succeed where perhaps their predecessors did not. Implications for teaching practice of some key ideas from learning theories

1. Learning is a process of active construction. Learning is the interaction between what students know, the new information they encounter, and the activities they engage in as they learn. Students construct their own understanding through experience, interactions with content and others, and reflection.

58 Teaching Implication Provide opportunities for students to connect with your content in a variety of meaningful ways by using cooperative learning, interactive lectures, engaging assignments, hands-on lab/field experiences, and other active learning strategies.

2. Students' prior knowledge is an important determinant of what they will learn. Students do not come to your class as a blank slate. They use what they already know about a topic to interpret new information. When students cannot relate new material to what they already know, they tend to memorize—learning for the test—rather than developing any real understanding of the content. Teaching Implication Learn about your students' experiences, preconceptions, or misconceptions by using pretests, background knowledge probes, and written or oral activities designed to reveal students' thinking about the topic.
3. Organizing information into a conceptual framework helps students remember and use knowledge. Students must learn factual information, understand these facts and ideas in the context of a conceptual framework, and organize knowledge in ways that facilitate retrieval and application in order to develop competence in a new topic. Teaching Implication Support students by using concept maps, flowcharts, outlines, comparison tables, etc., to make the structure of the knowledge clear.
4. Learning is a social phenomenon. Students learn with greater understanding when they share ideas through conversation, debate, and negotiation. Explaining a concept to one's peers puts knowledge to a public test where it can be examined, reshaped, and clarified. Teaching Implication Use Cooperative learning strategies, long-term group projects, class discussions, and group activities to support the social side of learning.
5. Learning is context specific. It is often difficult for students to use what they learn in class in new contexts (i.e., other classes, the workplace, or their personal lives).

59 Teaching Implication Use problem-based learning, simulations or cases, and service learning to create learning environments similar to the real world. 6. Studentes' metacognitive skills (thinking about thinking) are important to their learning. Many students utilize few learning strategies and have a limited awareness of their thinking process. Teaching Implication Help students become more metacognitively aware by modeling your thinking as you solve a problem, develop an argument, or analyze written work in front of the class. Teach metacognitive strategies, such as setting goals, making predictions, and checking for consistency. Focus attention on metacognition by having students write in a learning journal or develop explanations of their problem-solving processes. Principles of Learning and Their Implications Principle : Effort Produces Achievement For a long time individuals have operated on the belief that inherited intelligence mainly determines academic achievement. It is now clear that the amount of effort the student makes has much more to do with one's academic achievement than inherited ability. Given the right conditions and support, almost everyone can achieve at high levels. Implications of Principle A primary condition for high achievement is high expectations and challenging targets. The single biggest obstacle to high achievement is the belief by faculty members that certain students—often those from low-income families and minority groups—can't achieve at high levels. The principal has to engage the faculty in setting challenging targets and find a way to create a culture of high expectations in which the whole faculty expects all of the students to reach those targets and communicates those expectations lo the students. High expectations and pressure LO achieve must he accompanied by appropriate support. Because different students need different amounts and kinds of help to reach the targets, one of the most important roles of the principal is to see to it that the school is organized to accurately assess where every student is with respect to the standards at any point in time. And for those students who are falling behind, the

60 principal must ensure that programs of assistance are in place that will get those students to the standards, no matter how far behind the students are when they start out. While the standards remain the same for everyone, the support given to students must be varied according to individual need. Principle 2 : Learning is About Making Connections Knowledge is a "constructive process." We learn by adding new knowledge to the knowledge we already have and integrating it with that knowledge. To make that process of integration effective, we have to organize our existing knowledge into some sort of structure. Among the most useful functions of formal education is the way in which it provides powerful frameworks on which students can "hang" new knowledge. Those frameworks come in the form of the theories and concepts associated with the academic disciplines and the very structures of the disciplines themselves. It is the very process by which we fit new and unfamiliar facts to frameworks we have made our own that constitutes what we mean by the word "understanding/'And it is understanding that permits us to use what we have learned to solve problems that are not quite like any that we have encountered before. Either the new knowledge that we acquire fits the structures we carry with us, or we must alter the structure to accommodate the new knowledge. The act of fitting the new knowledge with the old and adjusting the structure until it fits both new and old knowledge is a creative act, not simply a passive act of "adding another book to our shelf of knowledge." We are constantly selecting what new knowledge we want to integrate with what we already know, making connections to that old knowledge and then making adjustments to our whole understanding of the world and how it operates. We learn by activating and constructing networks of related concepts or "schemata." This is an active process that is greatly facilitated by constant interaction with other people and the larger world around us- interaction that helps us try out new frameworks on which to "hang" our knowledge, provides challenges from which we can learn and problems for us to solve, and thereby provides both new knowledge and an opportunity to find out whether our explanations of how the world works hold up in practice. Implications of Principle 2 The principal has an important role to play encouraging teaching that places a premium on students as active learners and problem solvers. This involves encouraging teachers to present the core concepts of the subject matter clearly and straightforwardly, on the one hand and, on the other, to create an environment in which students:

61 ~ Internalize those concepts ~ Test their own knowledge against them ~ Use the concepts and theories as frameworks in which they can hang new knowledge ~ Challenge the concepts and theories constantly, both as a means to better understand them and to make changes to the frameworks of their understanding as they interact with the world. Thus principals should not only coach teachers to help students create the structures on which they can hang new knowledge, but also to create classrooms that are busy places, full of talk and movement, so that they can become the scene of a constant interplay between ideas and action. Principle 3 : We Learn with and Through Others Most learning is done in a setting in which others are present. We teach one another, exchange ideas, reinforce concepts, solve problems, debate ideas, and challenge assertions with others. Student learning is greatly enhanced when students understand and accept the conventions that structure such social interactions in the classroom. This embraces rules of discourse including everything from the criteria for demonstrating that a mathematical solution is correct to making a point about a piece of literature based on evidence taken from the text, to understanding the conventions for determining what order students are recognized in class. Implications of Principle 3 The principal's role is to recognize the link between social interaction and learning and to encourage the notion of a "community of learners" in which students articulate and justify their thinking, and listen and respond constructively to the views of their peers. The principal can also seek opportunities to promote cooperative learning and the use of powerful strategies such as peer- and cross-age tutoring, which have been shown to exert a powerful impact on learning. Principled 4 : Learning Takes Time How much we can learn is a function of how much time we have to learn it. A given task will be learned only if the learner spends the amount of time needed to learn it. Moreover, individuals need different amounts of time in order to learn the same things.

62 Implications of Principles 4 When time is not available to do all that the curriculum calls for, then priorities must be set on the basis of what it is most important to learn. When time is not available in the regular school day to teach all that is high priority, then time must be made available outside the regular school day to teach it. It is mainly up to the principal to set the priorities for what is most important to learn during the regular school day. This may mean providing double periods for students who are having difficulty, and making sure that those double-period courses are properly staffed, which will entail cutting back on some other aspect of the curriculum or of the sports program. Similarly, it is the responsibility of the principal to make sure that students who are behind get the extra instructional time they need before school, after school, on Saturdays and during the summer break. Of course, it is not just the total amount of time available for learning that matters, but rather the amount of engaged learning time. This implies that the principal will take action to minimize interruptions and disruptions and maximize the time students are on task. Principles 5 : Motivation Matters Our levels of motivation affect our readiness to learn. Students who see a connection between something they want for themselves and what they are being asked to learn, who believe in their ability to learn and who feel good about themselves as learners, make more progress than those who see no purpose in learning, who doubt their abilities, who are fearful of failure, or who are excessively anxious about their results. Deep understanding and a feeling of mastery can produce highly motivated students. So can the demonstration of what they have learned to peers and adults when they have met a high standard of accomplishment. Finally, high levels of motivation can arise when students see purpose and meaning in what they are learning at school. Implications of Principle 5 The principal has a key role to play in promoting across the school a culture in which students have a belief in their capacity to succeed as learners and in which positive reinforcements are given for effort and achievement, as opposed to punishments for failure to learn. This could mean establishing a system of rewards that give tangible recognition to all students who meet expectations and achieve excellence.

63 It also means listening to students' feelings about learning and themselves as learners and constantly encouraging positive attitudes. Principle 6 : The Teacher Matters How much a student learns depends much more on which teacher within the school the student gets than what school he or she goes to. This suggests that if all teachers in the school in a given subject taught as well as the best teacher, the result would be far higher student achievement throughout the school as a whole. It follows that improving the quality of teaching is the key to school improvement. Implications of Principle 6 The principal must become knowledgeable about every teacher with respect to his or her ability to enable the students in his or her classes to reach high standards. He or she must know what practices produce effective teaching and provide detailed coaching assistance to teachers to enable them to improve their teaching in a standards- based environment. He or she must also create a school culture in which the constant monitoring and improvement of teaching practice is one of the highest values of the professional staff of the school and make sure that the resources (chief among them time) are made available to support that priority. Establishing the new culture will mean breaking down the old culture in which how the teaching of any one teacher is the business of no other teacher. It will involve the creation of a culture in which teachers are constantly collaborating to define what good teaching is and learning from and critiquing the teaching of one another to advance the practice of teaching throughout the school. Principle 7: Focused Teaching Promotes Accelerated Learning The key to accelerating learning lies in matching instruction to the level of the learner. When students are presented with tasks that are well beyond their level of competence, learning is unlikely to occur. Instead they become anxious and quickly give up. When they are presented with tasks that are easy and well within their competence, learning is also unlikely to occur, because they have already learned how to do the task and without specific motivation to repeat it, they quickly become bored. Rapid learning is likely when the difficulty of the task is in alignment with the ability of the learner. Teaching that aligns instruction we refer to as "focused teaching." The teacher's role is to 'scaffold' the learning of the new task, revealing to the learner how to move from what he or she can currently do independently to a higher

64 level of cognitive functioning. Vygotsky referred to this critical zone in which learning can be facilitated as the "zone of proximal development." He defined this zone as, " the distance between the actual development level as determined by independent problem solving and the level of potential development as determined through problem solving under adult guidance or in collaboration with more capable peers".

Higher levels of understanding occur as a result of focused teaching and of performance in the zone of proximal development. Implications of Principle 7 The concept of the zone of proximal development has far-reaching implications for teaching and for school and class organization. It implies constant monitoring of each student to establish starting points for instruction and to enable matching of instruction to the development level of the student. It also implies that teaching is driven by knowledge of what students can do and what assistance they need to move to a higher level of cognitive functioning. The principal has an important role to play in legitimating teaching that seeks to accelerate learning by supporting students to move from actual to potential levels of development. The principal can also assist by facilitating forms of school and class organization that allow teachers to respond effectively to the wide range of student abilities encountered within a given grade, such as cross-age grouping and use of within-class instructional groups.

Principle 8 : Clear Expectations and Continuous Feedback Activate Learning Students achieve at higher levels when they have a clear image of what is expected of them. The most effective image for that purpose is an example of student work that meets the standards to which they are expected to work. Their chances of producing work that meets those standards is further enhanced if they have access to clear criteria for judging the quality of their work, in addition to examples of work that meet the standard. Finally, students are most likely to produce work that meets the standard when they have access to continuous feedback on their work so that they know how to bring it up to the required standard. Implications of Principle 8 The principal must ensure that standards are at the heart of classroom teaching and that each lesson is focused on meeting those standards. The most effective way to help students internalize these standards is to prominently display them, along with criteria that indicate whether the standard has been met and examples of student work that meet the standards.

65 The principal should visit classrooms on a daily basis. These visits should be purposeful and focused. The primary focus should be on student work and the extent to which it is meeting the standards. The principal should seek to establish the extent to which students are aware of the standards and the criteria for meeting them. Finally, the principal should be alert to the extent to which students are receiving feedback on their work related to the standards. Principle 9 : Good Teaching Builds on Students' Strengths and Respects Individuals' Differences Each child arrives at school with a unique mix of strengths and weaknesses. Learners make use of different ways knowing and have individual strengths that they exploit in learning a new task. Some may have strong language skills and others may have unusual artistic talent. Some may get along very well with other people and others may have gift for logical-mathematical reasoning. Individuals find it easier to learn using a particular ability or adopting a particular style. But these are not set in concrete; abilities and styles are capable of being developed in school. Implications of Principles 9 The principal can establish a culture within the school that seeks to respond to and develop different learning styles and a wide range of cognitive abilities. Within schools, there is a danger that teaching will focus on and value a narrow range of abilities and be insensitive to different learning styles. Good teaching builds on student strengths and respects differences in the learning styles of individuals because by doing so, students are able to progress more rapidly to address areas of weakness. Principle 10 : Good Teaching Involves Modelling What Students Should Learn Much of what students need to know and be able to do is best learned the time-honored way, by apprenticing to an expert, in the form of a teacher. The student is presented with a challenge. The facilitator models the behavior the student is being asked to demonstrate. Then the student is asked to attempt the set task. In the early stages, the teacher provides a lot of guidance and support; later on, progressively less guidance is provided until the student is able to perform the task independently. For example, the teacher might begin by reading to a group of young students. Later on, they work together in shared or guided reading sessions, finally moving to independent reading.

66 The students' performance is evaluated in relation to explicit standards and associated criteria, and the student is asked to make revisions in response to the feedback provided. The assigned tasks get progressively more demanding as time goes by. The teacher sets the level of difficulty of each new task at a level that is within the students "zone of proximal development." That is, it is demanding but not so demanding as to demoralize the student, thus enabling the student to make rapid progress. At key points the student's work product is presented to a wider audience. This process is repeated through as many cycles as necessary to enable the student to produce work that meets the standard. Implications of Principle 10 In schools one frequently encounters teaching that reflects very different but equally dangerous, views of effective teaching. One is that students are "empty vessels" that need to be "filled up" and that the role of the teacher is to "tell" the students what they need to know. The other is that learning is a natural process and that the role of the teacher is to simply be on hand to "facilitate" the learning. While there are times for telling and times for facilitating, accelerated learning calls for a form of cognitive apprenticeship of the kind described above in which the teacher models the desired behavior, initially providing a lot of structure as students learn to perform independently. The principal can act as a coach to teachers in assisting them to find the right balance in their teaching. Principle 11 : The Curriculum Should Focus on Powerful Knowledge In a world in which information is growing exponentially and in which much higher levels of knowledge and skill are needed by most people to do the work for which they will be responsible, it is vital that educators provide students with access to powerful knowledge. Knowledge is powerful when it provides a basis for further learning and when it concerns important and validated knowledge. Three of the most important kinds of powerful knowledge are: • The new basics, since these provide the foundations of learning in almost all other areas. According to Levy and Murnane (1996), they include: - The ability to read at a ninth grade level or higher - The ability to do math at the ninth grade level or higher - The ability to solve semi structured problems where hypotheses are formed and tested

67 - The ability to work in groups with persons of various backgrounds - The ability to communicate effectively, both orally and in writing - The ability to use personal computers to carry out simple tasks like word processing. • Discipline-based subjects (especially history, mathematics, and science), since these provide entry-points to the stock of human knowledge and foundations for understanding validated and important knowledge; and • Skills, strategies, and attitudes that support independent, purposeful learning and problem solving, since these are capabilities that remain important throughout one's life in coping with change. Implications Principle 11 Principle 12 : All Students Should Experience a "Thinking Curriculum" Our culture believes that some people are born smart and others are not, and that there is nothing that can be done about it. But research shows that it is quite possible to learn how to act intelligently. We can all be taught to manage our own thinking and learning processes. Challenging tasks that support deep thinking will stimulate intelligent behavior, as will explicit teaching of cognitive and metacognitive strategies. It is not true that students must be taught basic facts and procedures before they can engage in challenging tasks that require deep thinking and learning. The contrary is true. Students can more easily acquire those facts and learn those procedures if they have conceptual framework on which to hang those facts and can understand why the procedures work the way they do. Thus the learning of basic skills and higher- order thinking should go hand in hand. Higher-order thinking is particularly facilitated by an emphasis on extended problem-solving around "fertile questions" that are of intrinsic interest and relevance to students, that have no one correct answer, that are open-ended, that lead in many directions and that tap into a number of disciplines or fields of knowledge. Implications of Principle 12 The principal is critical to establishing within the school a curriculum in which there is an emphasis on higher-order thinking. All too often, teachers feel pressured to cover far too much content and because of the lack of time, do so in a very shallow and superficial way. The principal can promote the idea that covering less content in greater depth can mean greater understanding. To facilitate in-depth learning,

68 the principal can create larger blocks of instructional time. The principal can also encourage explicit teaching of cognitive and metacognitive strategies and teaching in which all students are provided with challenging tasks that stimulate and support deep thinking.

Introduction All the information of the outside world comes to us through the sense-organs. They are described as ‘the gate-ways of knowledge’. Through our five sense organs we acquire knowledge of the conditions outside our bodies. It is only when a particular sense organ is stimulated that we have a sensation. It is a response or reaction aroused in us by the stimulus. It is the stimulus that comes to us and the sensation is our own act, aroused by the stimulus. So, a sensation is an elementary mental process. In this unit you will be studying the concept of sensation and its meaning, definition and sensory process. 2.1.2 Objectives After reading this unit students will be able to: • Explaining the meaning of sensation • Define the term sensation Express the nature of motivation • Express the types of sensation Unit -2 : Learning Process and Motivation

75 2.1.3 Sensation 2.1.3.1 Meaning and Definition: Sensation is an important mental process for getting knowledge. Some of the psychologists described that "sensation is a gateway of knowledge or window of soul and the mind." All kinds of information first we receive from the outside of the environment through our different sense organs i.e. eyes, noses, tongue, ears and skin. In the process of sensation it reacts to certain stimuli from outside or itself. Thus the eyes react to light and give us colour, the ears respond to sound waves in the atmosphere and give us noises and rhythmic music; the nose feel us about smells, the tongue about tastes and the skin about temperature, contact and pain. Sensation is an abstract mental condition. Definition: Some important definitions are discussed here for clear understanding the sensation. According to Sully James: "Sensation is a simple physical phenomenon resulting from the stimulation for the peripheral extremity of an afferent nerve when this is propagated to the brain." Tichener defined that- "A sensation may be defined as an elementary mental process which is constituted of at least four attributes-quality, intensity, clearness and duration." After a discussion of meaning and definition of sensation, we may conclude that- Sensation is defined as the process in which a sensory receptor is stimulated, producing nerve impulses that -travel to the brain, which in turn interprets such impulses as a visual image, a sound, taste odor, touch, or pain. The physical stimulus present in the environment emits energy that is absorbed by a sensory organ, causing sensation. 2.1.3.2 Characteristics of sensation: After discussion the meaning and different definitions of sensation we can find some characteristics of sensation given below: 1. In the sensation process three components are necessary - stimulation, nervous system and mind. 2. Sensation is the simplest form of knowledge. 3. Sources of sensation is stimulus. 4. Sensation is a mental state like feelings. Though sensation is subjective but its feeling is personal.

76 5. Sensation remains passive while receiving but when sensation creates mind becomes active. 6. Sensation attracts attention forcefully. 2.1.3.3 Sensory Process : Sensation is the first step of knowing process. In the classroom situation when the teachers teach, the students feel one type of sensation that helps the learners to think about the subject matter. In every case, mainly our brain is linked with outside world through the five sense organs by which all stimuli reach to the brain through motor nerve. Communication between person and external environment In the sensory process there two different physical organs are used -i) Receptor organs ii) Nervous system Sensory organs Receptor organs nervous system Skin eye Ear nose tongue Central Peripheral Autonomous Types of Sensation : There have five types of sensation:

77 1. Visual sensation: Two eyes are the central part of visual sensation. From different external stimulus light falls up on the eyes. That light enters into cornea and then enters into Iris to pupil. In pupil, there is aqueous humour that falls on lens which controls the light. From the stimulus the light moves to the lenses in a parallel way. After that the light creates an opposite image on the retina. This stimulus goes to visual sensation organ in brain through optic nerve and this organ shows normal image of stimuli that comes through eyes. 2. Hearing sensation : The organ of hearing sensation main and the stimuli are air waves. Light ways can go through vacuum medium but sound wave needs a medium. Every sound wave has three characteristics. I) Pitch, ii) loudness, iii) Timber. Sound waves enter into external auditory organ and hits on tympanic membrane and creates a vibration. This vibration goes to Cochlea (organ of Corte) through middle ear. From the Corte sensation auditory goes to the hearing sensation organ and then we can hear it. 3. Smell sensation: During breathing some smells molecule enters into nasal whole. In the nasal whole smell molecules are absorbed in nasal membrane. The smell sensation is received by olfactory cell and this sensation goes to smell through olfactory nerve. Then sense organ of brain analyses the smell molecules and we feel smell sensation. 4. Sensation of Taste: During eating at first food is dissolved in (Saliva) and comes contact with taste buds. Then taste cells are stimulated and this stimulation goes to taste sensation organ through nerve, then we get the taste of any food. 5. Skin sensation: Any type of skin sensation reaches to brain through skin sensation nerve. Then we feel heat, pressure. Cold, pain and different skin related sensation through our brain. 2.1.4 "Check your progress :"

1. What is sensation?

80 Unit : 2.2 Attention Structure 2.2.1 Introduction 2.2.2 Objectives 2.2.3 Attention 2.2.3.1 Meaning and Definition 2.2.3.2 Characteristics of attention 2.2.3.3 Factors of Attention 2.2.3.3.1 External factors 2.2.3.3.2 Internal factors 2.2.3.4 Implication of factors of attention in education 2.2.4 "

Check your progress" 2.2.5 Let us sum up 2.2.6 Unit end exercises 2.2.7 References 2.2.1

Introduction The term 'attention' is frequently used in our everyday situation. Entering into the classroom, the teacher announces, "attention please 1 '. Attention is a process which the individual to select some particular stimulus according to his interest and attitude out of the multiplicity of stimuli present in the environment. It can never be considered as a force or a faculty of the mind. Attention is of two factors such as external and internal. Teachers and educators can implement these factors of attention for the betterment of their learning and success. 2.2.2 Objectives After reading this unit students will be able to :

81 • Explaining the meaning of attention • Define the term attention • Express the characteristics of attention • Describe the factors of attention • List out the educational significance of different factors of attention. 2.2.3 Attention 2.2.3.1 Meaning and Definition In our daily life we always use the term 'attention'. Generally attention means to concentrate our mind in a particular object from different stimuli in a particular object from different stimuli. In the classroom situation most of the teachers try to become attentive his/ her students on his/her lesson. The teachers often tell his students please pay your attention to the blackboard and text books. But very commonly we can see that our mind cannot strictly point in a particular object. Very frequently it is replaced from one object to another. Thus attention is taken as a power, capacity or faculty of our mind, which can be turned on or off at will or something in kind or form that can be lent or given to this or that situation. Meaning: Attention is the heart of the consciousness process and it is basis to all the mental activities and behaviour. When we are conscious of any object, it means that an individual is aware of its presence in the environment. To attend to an object means to become aware of it more keenly specifically than other stimuli and keep this object in the focus of consciousness. Consciousness is a wider field and includes attention. When a person attends to a part of the field of consciousness, the rest is not attended to. While we are looking on the blackboard in a particular object, we are conscious of a large number of objects in the classroom, But the object of blackboard is at the centre of consciousness and other particulars of the classroom remain at the margin of consciousness. Definition: Attention depends upon the nature and strength of stimulus in the environment. The psychologists have defined attention in a number of ways. According to Ribot - "emotive process translated into action", 82 McDougall (1920) defined that: "Attention is merely conation or striving, considered from the point of view of its effect on cognitive process." B. Dumville(1938): "Attention is the connection of consciousness upon one object rather than upon another.' 1 Stout (1953): "Attention is conation determining cognition." J. B. Ross (1954) : "attention is a process of getting an object of thought clearly before the mind." Roediger et. al. (1987): "attention can be defined as the focusing of perception that leads to a greater awareness of a limited number of stimuli." 2.2.3.2 Characteristics of attention: On the basis of previous discussion and definitions the chief characteristics of attention may be noted as: 1. Attention is a form of activity of the mind. 2. Attention is essentially a process and not a product. 3. It helps our awareness of consciousness of our environment. 4. Attention or the consciousness is selective. 5. At any one time we can concentrate or focus our consciousness on one particular object only. 6. Attention is shifting from one stimulus to another. 7. Attention is cognitive, affective and conative. 8. Attention helps us in the clear understanding of the objects. 2.2.3.3 Factors of Attention: Attention depends on strength and nature of the stimuli and it is the process of selectiveness. In a particular moment we select any object in our focal point of consciousness. There have some factors or conditions in which anybody selects one topic or object in a particular situation. Mainly there are two types of factors such as: 1) External factors of attention 2) Internal factors of attention 83 Factors of attention External factors Internal factors Intensity Extensity Repetition Novelty Movement Suddenness: Clarity Instinct Emotion Habit Interest Sentiment Temperament Attitude Attitude 2.2.3.3.1 External factors: Some important external factors may be noted as: 1. Intensity: The main external factor of attention is intensity of a stimulus. In a normal situation strong or intense stimuli will attract our attention. Such as: red colour, a loud noise, intense perfume etc. 2. Extensity: The size of the stimulus is one of the important external factors to draw the attention. Because the large size of objects have a stimulus value than smaller stimuli. A large building will be more readily attractive than a smaller hut. The advertisement agency used these criteria to attract the audience very easily. 3. Repetition: Repetition is a factor of great importance in securing attention. We may ignore a stimulus

the first time, but when it is repeated, comes to the sense organ in several times it is bound to draw our attention. In the classroom the teacher tries to draw our attention on important word he emphasizes it again and again. 4. Novelty: We generally attracted by new object rather than common household objects. Novelty occupies a unique character that differs from others. That's why new fashion dresses, cars, styles, teaching styles draw our attention very quickly. 5. Movement: A moving stimulus catches our attention more quickly than one which is still. In the market areas different moving electrical advertisements are very easily draw our attention rather than still ones. The stimulus value of moving object is much higher than others. 6. Suddenness: Sudden presence of stimulus bound to draw our attention on these particular stimuli, though we are not ready to draw our attention on it. Such as 84 sudden ringtone of mobile in the classroom, thunder and lightning etc. are bound to draw our attention. 7. Clarity: Clearness or lucidity of stimuli generally draws our attention very quickly because its stimulus value is higher than normal ones. Good handwriting, sweet voice of the singer generally draws our attention most. 2.2.3.3.2 internal factors: In a particular situation a person will attend to a stimulus that depends not only on the external or "objective factors of the stimulus but also depend upon the person's own interest, motives, sentiment, basic instincts etc. these are mainly subjective factors of attention. Let us try to understand the subjective or internal factors of attention in securing the attention of a person. 1. Instinct: Basically our attention draws as per our instincts. Such as food, thirst, sex is our basic instincts. When we feel hungry, we look or attentive to a food plaza or hotel. For our aesthetic instinct we are attracted by red roses. 2. Emotion: Emotion is one of the internal factors to draw our attention. Love, affection, anger, fear, jealousy these emotions draws our attention easily. Such as a person who loves another, he or she always becomes attentive to each other. One who jealous to another, also becomes attracted to him or her style, dresses, behaviour etc. when we become fearful, we want to keep safe place. 3. Habit: The role of habit in our life has immense significance as McDougall opines- "habit is our best friend and worst enemy." When the teacher enters into the classroom, the students stand up, when the teacher evaluates the answer scripts his/ her eyes falls on wrong words or mistakes. Ad agency also uses this factors to draw the public attention such as "idea" 4. Interest: Interest is latent attention which is very helpful factor for securing attention. We attend to objects in which we are interested and we do not attend to those in which we have no interest. In the newspapers, senior members of the family pay attention to the political news as per their interest. On the other hand female members are attracted by entertainment pages (rupcharcha, Horoscope) as per their interests. 5. Sentiment: Sentiment is an emotional complex mental process. By the sentiment different persons pay attention as per their own sentiment. For example we become excited when our country wins in sports against foreign country. A student who is sentimental to a particular teacher, generally draws his/her attention to his/her class normally. 85 6. Temperament: Temperament controls the behaviour of a person. For examples highly aggressive person easily react to face any abnormal situation in public area. 7. Attitude: Attitude means the combination of pre-experience, emotion and his own idea. When a student possesses positive attitude he 'she very easily draws his/her attention to the study. Whereas one who has negative attitude, he/she ignores the study and frustrated to education system. 2.2.3.4 How can you implement the factors of attention in classroom or education? In the field of education it is very essential to draw the student's attention towards classroom teaching and study. It helps the teachers to teach well and helps the students to learn well. There is no doubt that attention is the key factor for the desired achievement of the learners and the success of education. So, the teachers can frequently use the external and internal factors of attention in their teaching learning process to pay the attention of the students towards his/her teaching. 1. When the teacher uses blackboard, he/she must remains careful for writing his topics boldly and clearly. So, that all the students very clearly can follow him. At the same time teachers voice in the classroom should be clearly presented to the students. In case of writing the text books at elementary level font size must be bold and colourful so that it becomes attractive to the learners. 2. Teacher should always try to bring novelty in his teaching. He/she can use TLM which are innovative and novel to the learners, 3. Movable teaching strategies may followed by the teachers during their teaching. They may present their topics for using OHP and PowerPoint presentation. 4. Teachers love and affection towards his/her students easily become attentive to his lesson, It is noticed that students who are paniked to the mathematics teacher cannot do well in mathematics paper. 5. Teacher's major role should be to arouse sentiment among the learners towards schools, teachers, subjects, so that they become easily attentive to their school subject and teacher. 6. It is one of the important duties of the teachers to create interest in different areas among the learners. So, that they become interested in different areas easily. 7. The teacher may create good habits among his students so that they acquire good habit for their life. Such as habit of thinking, attentions etc. are very much essential for higher Studies or success in life.

86 8. Positive attitude generally pays to make attentive very easily. So, the teachers should arouse or awake positive attitude towards subject as well as education to make the learners successful in different fields. 2.2.4 "Check your progress": 1. What do you mean by attention?

..... 2. Write four characteristics of attention?
.....

..... 3. What are external factors of attention?
.....

..... 4. What are internal factors of attention?
.....

..... 2.2.5 Let us sum up Attention is an important mental process for learning. In the process of attention an individual select an object from different stimuli. Attention helps to increase efficiency and remember experiences. Attention depends on two types of factors, such as external & internal. With the help of these factors teachers can very easily become attentive to

87 the students. For securing attention of students the teacher can adopt novel learning experiences, by repetition, use of audio-visual aids etc. 2.2.6 Unit end exercises 1. What is attention? 2. What do you mean by external factors of attention? 3. What do you mean by internal factors of attention? 4. Discuss the characteristics of attention. 5. How can you implement the factors of attention in your classroom teaching? 6. Explain the external factors of attention. 7. Discuss the internal factors of attention with examples. 2.2.7 References 1. Kundu, C. L. & Tundo, D. N. Educational Psychology (fifth revised edition). Sterling Publishers Pvt. 88 2.3 Perception Structure 2.3 Introduction 2.3.2 Objectives 2.3.3 Perception 2.3.3.1 Meaning and Definition 2.3.3.2 Differences between Perception and Sensation: 2.3.3.3 Types of Perception 2.3.4 "

Check your progress" 2.3.5 Let us sum up 2.3.6 Unit end exercises 2.3.7 References 2.3

Introduction Perception is combination of sensation with meaning. We sense qualities and we perceive objects. Perception gives meaning to sensation. Sensation is awareness of objects and perception is the awareness of this or that object. Perception involves two processes. It involves a sensation through the stimulus of a sense organ and an interpretation of the sensation. Perception is sensation plus thought. 2.3.2

Objectives After reading this unit students will be able to know :— •••• Differences between perception and Sensation. •••• Different types of perception •••• How perception is combination of sensation with meaning.

89 2.3.3 Perception A meaningful sensation is called perception. When the sensation process is explained the primary concept of sensation transformed in perception. This is more elaborated in 2.3.3.1. 2.3.3.1 Meaning and Definition: The process of organizing and interpreting sensory information so that it makes sense. Receptor cells in our eyes record - that is, we sense a sleek silver object in the sky, but they do not see a jet plane. Recognizing that silver object as a plane is perception. Sensing and perceiving give us views of the setting sun, the sounds of a rock concert, the touch of soft caresses, the taste of sweets, the fragrance of flowers of all the various stimuli that are present in your environment right now, you are able to sense and perceive only some of them. Every specialist adapted to sense and perceives stimuli that matter to that species' ability survives in its environment. A meaningful sensation is called perception. When the sensation process is explained the primary concept of sensation transformed into perception. Sensation is awareness of objects and perception is the awareness of this or that object. For example, waiting on the road I hear a sound from the back side calling someone with my name. Then at that moment I conclude that it is my friend (Sanlap's) voice. Because such voice (Sanlap) has been previously familiar to me day to day. Thus when a sensation (voice of Sanlap) means an object we call it perception. It involves a sensation through the stimulus of a sense organ and an interpretation of the sensation. 2.3.3.2 Differences between Perception and Sensation In the year 1765 Thomas Reed first differentiates between sensation and perception. He commented that though perception comes from sensation yet perception is more complex than sensation. To Reed sensation is the result of physical activity. But perception is the interaction between body and mind. The difference between sensation and perception is given below:

90 SENSATION PERCEPTION Sensation is the knowledge of object Perception is meaningful sensation. Sensation is not knowledge but components of knowledge Perception is subjective knowledge. Sensation is the primary process for acquiring knowledge Perception depends on sensation. During sensation our mind remains passive. During perception mind becomes active. Sensation is a condition of perception Perception is a mental process Sensation is linked with present Perception is linked with present and past We do not get the full shape of the object in sensation In case of perception we get full shape of object. Its function is to provide components of knowledge Its function is to make sensation meaningful and co-related. 2.3.3.3 Types of Perception: Perception is of four types such as- 1. Direct perception 2. Acquired perception 3. Apperception 4. Deviated perception 1. Direct perception : Perception through direct sense organs is called direct perception. W r hen we look at a red rose or touch a piece of ice, we acquire knowledge about red colour or cool ice directly. 2. Acquired Perception: When we acquire any sensation through such organ which is not wanted, then it is called acquired perception. For example, when we touch ice, we feel it is cold. But when we look at ice, our visual sensation reminds about past experience about icy cold, so through eyes we feel that ice is cold. 3. Apperception: Apperception is readiness to perception. The experiences that is kept in our mind with long before and is viewed with the light of new incidents, it is called apperception, For example, a common person visualizes a tree as a tree but when a botanist observes a tree, he/she analyses it in the light of his past 91 experiences. That is why; apperception plays a vital role regarding an object or matter for conception. When we teach a child a new idea, we try to link with his/her familiar subjects/ elements with the help of apperception. 4. Deviated perception: In our real life we do not perceive many things rightly. We perceive deviated from real situation. For example, in the moonlight night we feel the existence of ghost seeing a big banana leaves. Deviation is of two rypes- a. Illusion b. Hallucination a) Illusion: Illusion is perfect sensation. The mistake that is done is of perception process. As illusion is a primary mental process, so mental tendency is the source of mistakes. b) Hallucination; To perceive such a thing that has no real existence is called hallucination. In the opinion of Stout, it is done due to change in blood flow in brain. But in the opinion of Freud hallucination is one type of mental disease. For example, we feel the existence of ghost without any valid reason. According to our five sense organs we may categorize the perception into five types: 1. Visual perception: Two eyes are the central part of visual sensation. From different external stimulus light falls up on the eyes. That light enters into cornea and then enters into Irish to pupil. In pupil, there is aqueous humour that falls on lens which controls the light. From the stimulus the light moves to the lenses in a parallel way. After that the light creates an opposite image on the retina. This stimulus goes to visual sensation organ in brain through optic nerve and this organ shows normal image of stimuli that comes through eyes. Generally the process of visual perception is like the function of a camera. Through it we can know different things like shape, design, difference of colour, distance, depth etc. it helps to judge comparatively different sizes, shapes of animals and plants. Light rays entering into pupil falls on lens and then it meets at focus. Position of the object determines focal length and for this reason curvature of lens can be

92 changed. When stimulation creates in retina, it reaches to brain through nerves and visual perception takes place, A problem regarding visual perception is given below: Colour perception: Among animals man is the only one who can differentiate among different colours. Young and Helmholtz in their Tri-chromatic theory first mentioned that in our retina there are three types of cone cells. The first one is stimulated by blue colour (wave length 400-500 nm) the second is by green colour (475-600 nm) and third one is by red colour (490-650 nm). Other colours are the mixture of those three colours in different ratio. Later Brown and others mentioned opponent process theory. According to this theory, the chemical reaction that prevails among three cone cells is opposite and sensible to different lights. The function of first cone cell is blue-yellow, second function of cone cell is red-green, third function of cone cell is white-black, But whereas blue light does such chemical reaction, yellow light does the opponent type. 2. Hearing Perception: The main organs of hearing sensation are ear and the stimuli are air waves. Light ways can go through vacuum medium but sound wave needs a medium. Every sound wave has three characteristics. 1) Pitch, ii) Loudness, iii) Timber. When we hear any sound coming behind it is sensation. But after hearing the sound when we look behind and recognize the person who is calling me, is called perception. Such type of perception is called hearing perception. Sound waves enter into external auditory organ and hits on tympanic membrane and creates a vibration. This vibration goes to Cochlea (organ of Corte) through middle ear. From the Corte sensation auditory goes to the hearing sensation organ and then we can hear it. 3. Smell Perception: During breathing some smells molecule enters into nasal whole. In the nasal whole smell molecules are absorbed in nasal membrane. The smell sensation is received by olfactory cell and this sensation goes to smell through olfactory nerve. Then sense organ of brain analyses the smell molecules and we feel smell sensation. When we smell the fragrance of a rose, we recognize it as a flower named rose. One of my friend who uses same perfume and then smell perception happens by me.

93 4. Perception of Taste: During eating at first food is dissolved in (Saliva) and comes contact with taste buds. Then taste cells are stimulated and this stimulation goes to taste sensation organ through nerve, then we get the taste of any food. When we eat a sour fruit we can say it is sour when we take sugar, we can say it is sweet; tongue plays an important role in the function of taste perception. We can taste sweet taste by the front part of the tongue, bitter taste by back part, and sour by the two sides of the tongue. There are nerve cells in the tongue. But there is no taste is selected at the middle part of the tongue. 5. Skin Perception: Any type of skin sensation reaches to brain through skin sensation nerve. Then we feel heat, pressure, cold, pain and different skin related sensation through our brain. When a bite is felt by us it is sensation but when we recognize it that the bite of a mosquito, it is skin perception. Similarly when we feel any pain, it is sensation but after recognizing the cause of the pain, and when it becomes meaningful to us that it is my friends pushing by pen on my skin, it is called skin perception. 2.3.4 "Check your progress" : a) What is perception?

.....
.....

..... b) Write some differences between sensation and perception

.....
.....

..... c) What is hallucination?
.....
.....
.....

94 d) What is illusion?

..... e) How can we visually perceive?

..... 2.3.5 Let us sum up Perception is a very important mental process of learning. Through this process a learner can learn or getting any knowledge of objects. In education perception is very essential for getting or knowing the objects. Sensation and perception both are interrelated to each other. But they have some basic differences. Perception may categorize in different point of view. Generally we categorized the perception on the basis of our five sense organs i.e. visual perception, hearing perception, smell perception, taste perception and skin perception etc. 2.3.6 Unit end exercises a) What do you mean by perception? b) How the perception does differ from sensation? c) What is illusion? d) What is hallucination? e) Explain the types of perception. f) What is perception? Discuss the process of visual perception. g) What is deviated perception? Discuss its different types, h) Write a short note on: a) Colour perception b) Smell perception c) Skin perception

Introduction: Memory is an important factor of learning. In our traditional educational system, memorization is very essential for the success of the learners. Without proper memorization learners cannot succeed in life. So memorization process is to learn something and to memorizing proper situation. It has four components-i) learning ii) retention, in) recall, and iv) recognition.

97 2.4.2 Objectives After reading this unit students will be able to: • Explaining the meaning of Memory • Define the term Memory • Express the stages of Memory • Express the types of Memory • Write the implication of Memory in education

2.4.3 Memory 2.4.3.1 Meaning and Definition One of the aims of school instruction is to expand the knowledge of learners. The teacher's responsibility is to encourage the learners to acquire and to retain the knowledge imparted in school for future use in meeting life problems. Memory increases our efficiency. It enables us to remember important facts, ideas, names etc. and other items of information. Memory is the function of the mind by virtue of which it records, retains and produces ideas gained by its own activity. Many times we use the word 'remembering in place of memorization, both the terms mean the same meaning.

Our mind possess a special ability by virtue of which every experience or learning leaves behind images or Iraces which are conserved in the form of anagrams.

This preservation of memory traces by the central nervous system or brain is known as retaining of the learned act. How long you can retain depends upon the strength and quality of memory traces. When you try to recollect or repeat past experiences, you make use of memory. Definition: Memory has been defined by many psychologists. Some of the important definitions are as follows: According to Woodworth and Marquis-"Memory consists in remembering what has previously been learned." Ryburn views that- "

the power that we have to store our experience and to bring them

98 into the field of consciousness sometime after the experience has occurred is termed memory."

Stout defined that - "The ideal revival, so far as field revival is merely reproductive in which the objects of past experience are reinstated as far as possible in the order and manner of their original occurrence." According to Ross- "Memory is a complex process involving the establishment of dispositions, their retention and the recalling of experience that have left the dispositions behind them." Eysenck (1970) stated that "Memory is the ability of an organism to store information from earlier learning process, experiences, retain and reproduce that information in answer to specific stimulation." 2.4.3.2 Stages of Memory: According to Woodworth four main elements of memory are: learning (acquisition), retention, recall and recognition. 1. Learning : This is the first stage of memory. It is the process of establishing association of the ideas in mind. To remember a poem or a text, the first thing to be done is to learn or get it by heart who never seen 'Tajmahal' cannot explain the beauty of Tajmahal. 2. Retention: It is the process of relegation of the past experience in the subconscious mind of the individual in the form of a mental experience. Progress in learning happens only when the thing learnt is retained. Knowledge develops if the materials learnt are preserved in the mind in the form of images. 3. Recall: It is bringing again to mind the past experience on the basis of association if ideas. Recall is of two types: i) spontaneous and ii) deliberate. In spontaneous recall we make no effort to recall but the experiences or ideas just flow. In deliberate recall, we make an effort to recall something.

99 4. Recognition: It is the capacity to recognize or express knowledge of all seeing a thing that has been seen earlier. The individual is able to identify different objects due to recognition ability. 2.4.3.3 Types of Memory Memory may be categorized in various kinds but we will discuss here only some important types of memory: 1.

Short term memory (STM): Often in daily life situations we need to recall material immediately or after a very short time. The information temporarily stored in short term memory may last as long as thirty seconds even if the material is not being rehearsed. When

we go to a new city we have to remember the names of different streets and persons or telephone numbers. All these situations are the examples of short-

term memory. 2. Long term memory (LTM): Psychologists think of long-term memory (LTM) as a store house where information is stored fairly permanently when we are not recalling it. Long-term memory codes information according to meaning, pattern and other characteristics. It is this memory that helps us to remember a number of things on a relatively permanent basis. Remembering identifying data like one's name, fathers name, date of birth, date of marriage. etc. is the simplest example of long-term memory. 3. Sensory or immediate memory: Sensory or immediate

memory is the memory that helps an individual to recall something immediately after it is

perceived. In this memory the retention time is generally from a fraction of second to several seconds.

Immediate memory is needed when we want to remember a thing for a short time and can then forget it. When we go for a journey in a train talking with co passenger and when we leave the train we forget the person. This is one type of sensory memory. 4. Photographic memory: Photographic memory means memory possessed by a person who can

remember a scene in photographic detail. This memory also known as eidetic imagery memory. Such people can 'see' a picture after it has been taken away, with their descriptions of objects from the picture stating the right colour and the proper locations. 5. Episodic and semantic memory: This memory is based on some episodes and events. This events may be personal events and experiences associated with one's life. At the time of event he/ she stored in the shape of episodic memory traces

100 organized according to the time, space and other characteristics of the events. When we want to recall the events these memory traces are reproduced in the manner and sequence in which they have been organized and stored in one's mental set up. For example, in educational excursion the students can narrate the experiences of excursion through the episodic memory.

2.5.3.4 Economic methods of Memorization:

1. Interest: Interest is essential for useful learning and memorization. If someone has great interest on any subject he/she becomes self-motivated by subject. If one has interest in music, he/she easily grasp the tone of a new composition easily.
2. Attention: Without attention, learning and retention cannot take place properly. "Attention is the control process that governs the flow of information from the sensory register to short-term memory" - Paraswara and Davis, 1984, Triesman and Geladi, 1980). The tor- he/she cannot memorize it properly for a long time.
3. Meaningful learning: If someone reads a topic without understanding the meaning of without understnading the meaning of the topic, he/she cannot memorize it properly for a long time.
4. Chunking and rhythm : Chunking and rhythm also help learning and help in remembering. For example mobile number of 9732562682 can easily be memorized and recalled if we try to group it as 9732 56 26 82. Similarly rhythm provides to be an aid in memorizing. Children learn effectively the multiplication table by reciting then in a sing-song.
5. Principle of association: It is very helpful to follow the principle of association in learning. The letters VIBGYOR have proved to be a very effective aid to remembering the colours of the rainbow. V- Violate, I- Indigo, B-Blue, G- Green, Y-Yellow, R- Red.
6. Over learning: If we learn more and more about an object or material, we cannot forget it after a long time. For example, we never forget our name, address, and best friend's name.
7. Repetition and practice: After learning if we repeatedly practice it, we can easily memorize it and this memory converts into long-term memory. For example, if one does not practice maths or computer for a long time, we easily forget it.

101 8. Emotional equilibrium: While learning we are disturbed emotionally, we can learn it properly and easily forget it. So in the time learning we must not be emotionally disturbed.

9. Uses of multiple sensory organs: While learning if we use multiple organs, it helps us to memorize for a long time. Such as demonstration method and PowerPoint presentation is more helpful to memorize due to use of multiple sense organs.

10. Distributed learning: Affter learning and reading if we give some time space, it helps us to memorize it for a long time.

2.4.4 Problem Solving 2.4.4.1 Meaning and definition

From our early childhood we are facing a lot of problems. There are needs and motives that to be satisfied. So, definite goals or aims are set.

The productive work involved in the evaluation of the situation and the strategy worked out to reach one's set goals is collectively

named as

problem solving. This is an essential exercise for individual advancement as also for the advancement of society.

It is a process of overcoming difficulties that appear to interfere with the attainment of a goal. It helps in the removal of or adjustment with and ultimately helps an individual to reach his goal and satisfy his motives.

The productive work involved in the evaluation of the situation and the strategy worked out to reach one's set goals is collectively termed problem solving, this is an essential exercise for individual advancement as also for the advancement of society. The

psychologists have defined about problem solving in a number of ways.

Woodworth and Marquis (1948) stated that "Problem solving behaviour occurs in novel or difficult situations in which a solution is not obtainable by the habitual methods of applying concepts and principles derived from past experience in very similar situations."

According to Skinner (1968) - "Problem solving is a process of overcoming difficulties that appear to interfere with the attainment of a goal. It is a procedure of making adjustment in spite of interferences."

2.4.4.2 Steps of problem solving behavior : Psychologists have suggested different steps involved in the process of problem-solving according to their respective findings and viewpoints:-

102 John Bransford and Barry Stein (1984) advocated five steps that are basically associated with the task of problem-solving. They referred to these as 'IDEAL' thinking and arranged them in the following order: - I- Identifying the problem. D- Defining and representing the problem. E- Exploring possible strategies. A- Acting on the strategies. L- Looking back and evaluating the effects of one's activities. In general the following steps may be followed in the task of problem solving: - 1. Problem awareness: this is the first step in problem solving. At this step an individual is concerned with his awareness of the problem which needs to be solved. He must be faced with some obstacle in the path of the realization of his goals, needs or motives and consequently he must be conscious of the difficulty or problem. 2. Problem understanding: After facing or encountering the problem, the individual should identify and analyze the problem for its exact nature to become clear to him. 3. Collection of the relevant information: At this stage the individual is required to collect all the necessary information about the problem by all possible means. He may consult with experienced persons, read the related literature, recall his own experiences, think of the numerous possible solutions, and put in all possible efforts to collect comprehensive data and knowledge concerning the problem. 4. Formulation of hypothesis: After understanding the nature of the problem, one may start some cognitive activities to think out the various solutions to the problem. 5. Selection of the correct solutions: In this important step, all the possible solutions, thought out in the previous step, are closely analyzed and evaluated. Gates and others (1948) have suggested the following activities in the evaluation of the assumed hypotheses or solutions. a) Identify the conclusion that completely satisfies all the demands of the problem, b) Find out whether the solution is consistent with other well-established or accepted facts and principles. 103 c) Make a deliberate search for negative aspects which might cast any doubt upon the conclusion. The suggestion mentioned above would help the individual to select the proper solution of his/her problem out of the numerous solutions that may be available. In the final analysis, however, he has to use his own discretion by utilizing his higher cognitive abilities to properly identify the appropriate hypothesis or solution by rejecting all other hypotheses. 6. Verification of the concluded solution or hypothesis: The solution arrived at or conclusion drawn must be further verified by applying it in the solution of various similar problems and only if the derived solution helps in the solution of these problems, should one consider the solution to be acceptable. Such a verified solution may then become a useful product of one's problem-solving behaviour and be utilized in solving other future problems.

2.4.5 Thinking

2.4.5.1 Meaning and Definition: Thinking is a cognitive ability.

Good poetry, a highly developed computer or a robot, a beautiful painting, or nice buildings are all products of the thinking.

Even to understand or to appreciate, we have to employ our power of thinking.

Thinking is a complex process and the most difficult concept in psychology to define or explain. Some of the important definitions are given below for clear explanation about thinking. According to

Ross (1951): "Thinking is mental activity in its cognitive aspect or mental activity with regard to psychological objects."

Valentine (1965) stated that "In strict psychological discussion it is well to keep the thinking for an activity which consists essentially of a connected flow of ideas which are directed towards some end or purpose." Garrett (1968) defined that "

Thinking is behaviour which is often implicit and hidden and in which symbols (images, ideas, and concepts) are ordinarily employed." Mohsin (1967) defined that

104 "Thinking is an implicit problem-solving behaviour." Gilmer (1970) stated that "Thinking is a problem solving process in which we use ideas or symbols in place of overt activity. 2.4.5.2 Theories of thinking: different psychologists have put forwarded various theoretical view points from time to time to explain the nature, mechanism and development of thinking. 1. Behaviouristics learning theory: According to this theory, thinking behaviour is acquired in much the same way as other modes of behaviour, interest, attitude, knowledge and skills etc. J. B. Watson opined that there is association between the movement of one tongue or vocal cords with one's thoughts. Here S-R mechanism takes place. So. the response, an outcome of one's thinking is the product of the associated stimuli—that generates the thinking- process. The same stimuli generate the same type of thought and the organism thus becomes conditioned. The behaviorists viewed thinking as that private behaviour which is determined by stimulus control and reinforcement in the same way as overt behaviour. 3. Gestalt and Holistic theory: In the process of thinking leading to problem solving behaviour the organization of the perceptual field. Thinking behavior is always purposeful and goal-oriented - according to it. While thinking, one gets to look at the whole field or context in which the thinking is occurring. With this wider perception, one is set for the reorganization and restructuring of the perceived field or and optimal solution of the problem in hand. The acts of such restructuring or reorganizing of the perceptual field belong to the process and product of thinking. 4. Bruner's Theory of Cognitive Development: Jerome S. Bruner hypothesized that one's thought processes evolve as a result of maturation, training and experiences through a series of sequential stages. The stages of cognitive development advocated by him for this purpose are- i) Enactive, ii) Iconic and iii) Symbolic. The first stage that is enactive representations stage is characterized by the child's representation of appropriate motor activities. At the stage he is unable to make use of language images or other symbolic representations for carrying out his thought processes and acts out and represents them through no-verbal activities based on motor actions and movement. The second stage that is iconic representation stage is characterized by the child's representation of things and events in terms of sensory images or mental picture. The final stage i.e. symbolic representation stage is that stage of one's cognitive development when thought about things and events is not necessarily dependent upon the motor activities or sensory images and mental pictures. During this stage symbolic representations in the form of words, symbols and other imaginary abstract phenomena take the place motor manipulation or concrete visualization. For example, to understand a question like: "If a child has four apples and his sister has three, how many apples do they have between them? One does not now need to actually have these apples (in physical terms) or to draw a mental picture of these apples for the counting. One may just write the numbers 4 and 3 or mentally visualize these numbers to add them up. 5. Freud's psychoanalytic theory: Sigmund Freud's psychoanalytic theory of thinking may be described as the inherent desire for satisfaction of the sex urge and the role of the unconscious in moulding and shaping or one's behaviour. The thinking behaviour is also governed through those two factors. If the goal is pleasure through sex gratification, the thought process would be naturally colour accordingly and since nine -tenths of one's psyche consists of the unconscious and sub-conscious, the major portion of one's thinking must emerge from it. The wish fulfillment, dreaming and unconscious morbid thinking, should thus be considered to be a major part and parcel of one's thought process influencing one's interests, attitudes and overall behavior. In the process of development of thinking, the new-born infant does not show any sign of thought-related activities. In fact, his mental life is characteristic at this stage and is driven by a set of psycho-physiological drives, for example, when he/she is hungry, he/she cries. Gradually ; Freud maintains, the infant develops a kind of self-centered thinking termed as narcissistic thinking. His behavior is almost entirely dominated by the Id and the pleasure principle and the thoughts of the infant are highly coloured by instinctual impulses demonstrating a total disregard of realities and logic. As the child grows older, another part of his personality, the ego comes into play. He then begins to pay attention to people and his environment in order to be able to

106 cope with it effectively. He now begins to operate according to the reality principle and his thought processes become more rational and logical. Symbols and words also became involved in his thinking but he still remains ego-centric. With the entry of another component of personality, the super-ego his thinking is now fashioned in accordance with the mores and ideals of a society. It becomes more objective. The development of creative thinking, enrichment of fantasy, imagination and abstract thinking is the outcome of emergence of the super-ego and the subsequent expansion of the child's thinking apparatus. 2.5.4 "Check your progress" 1. ..... 2.5.5 Let us sum up: Memorization is most important mental process of learning. In the present formal education system without memorization a learner cannot success in his learning areas. Memory has some steps i.e. learning, retention, recall and recognition. A teacher must have to knowledgeable about memory and how memory can be improved. There have some techniques to improve or strengthening the memory. Thinking refers to a pattern of behaviour in which we make use of internal representations of things and events for the solution of problems. The important theories

108 for understanding the nature, development, and mechanism of thinking are, the behaviourist's learning theory, Gestalt theory, Piaget theory, Freud's theory, Burner's theory etc. Each of these theories explains the human thought processes. Problem-solving is a deliberate and serious act, involves the use of some novel methods, higher thinking and systematic planned steps for the realization of set goals. The systematic steps involved in effective problem-solving may be identified as problem awareness, problem understanding, and collection of relevant information, formulation of hypotheses and selection of a proper solution. 2.5.6 Unit end exercises: 1. What is memory? 2. What do you mean by thinking? 3. What is problem solving behaviour? 4. Discuss the different steps of memory 5. Explain the different steps of problem solving? 6. What are the different steps of memory? Write some economic methods of memory 7. What is thinking? Explain the different theories of thinking 8. Write short not on i) Freud's theory of thinking ii) Gestalt theory of thinking iii) Memory and education iv) Types of memory 2.5.7 References 1. Aggarwal, J. C. Introduction In this world all individuals have an inner drive or urge. This drive or urge is known to as motivation. For useful learning, motivation plays a vital role. There is a need for creating a conducive environment for learning and motivating the children to learn. Children are curious by nature. They always want to learn new things. A teacher has to take advantage of all these facts in order to turn the attention of children to what he/she has to teach them in the classroom. 2.5.2

Objectives After reading this unit students will be able to : • Explaining the meaning of motivation • Define the term motivation

111 • Express the nature of motivation •

Describe the- factors of motivation • Express the types of motivation • Explain the Maslow's theory • Write the implication of motivation in education 2.5.3 Motivation 2.5.3.1 Meaning and Definition The term motivation comes from the Latin word 'moveers' which means to move. Motivation is an internal force which accelerates response or behaviour. Some learners learn the same subject matter more efficiently than others, some find it more rewarding and interesting than others, and some enjoy it more than others. At any time learners vary in the extent to which they are willing to direct their energies to the attainment of goals due to difference in motivation. Motivation is the very heart of the learning process. No learning is possible without motivation. It has been stated that "motivation arouses interest. Interest is the mother of attention and attention is the mother of learning. Thus to secure learning you must first engage the mother, grandmother and great grandmother." The steps involved in motivation are given below: Need ⇒ Drive ⇒ Motive ⇒ Behaviour ⇒ Goal ⇒ Reduction ⇒ Need Definition: Some of the important definitions are given here for having a clear understanding of the term motivation. According to Bernard (1965): "Motivation is the stimulation of actions towards a particular objective where previously there was tittle or no attraction to that goal." Guilford stated that (1950): "A motive is any particular internal factor of condition that tend to initiate and sustain activity." Atkinson (1966) defined motivation as: "The term motivation refers to the arousal of tendency to act to produce one or more effects. 11 Maslow (1954) defined that "Motivation is constant never ending fluctuating and

112 complex and that it is an almost universal characteristic or particularly every organismic state of affairs." Crow and crow (1962) stated that "

Motivation is considered with the arousal of the interest in learning

and to the extent is basic motives.' 2.5.3.2 Nature of Motivation: Motivation is a very complex phenomenon which is influenced by multiple variables operating within the organism and in the environment. Motivation has some unique nature. After discussion different views and definitions of motivation, there are some natures of motivation. These characteristics of nature may be noted as: 1. Motivation creates interest to the learner towards learning. 2. Motivation is controls the behaviour. 3. Motivation leads to self actualization in learning. 4. Motivation is the arousal of tendency to act and product result. 5. Motivation engaged the learner towards activities until the goal is not reached. 6. Motivation is directed to a selective goal. 7. Motivation initiates and-energies activity in learning. 8. Motivation is the internal condition or factor of learning. 9. Motivation provides the energy and accelerates the behaviour of the learner. 10. Motivation releases the tension and helps in satisfying the needs of the learner. 2.5.3.3 Types of Motivation: There have two types of motivation: 1. Internal or intrinsic motivation 2. External or extrinsic motivation I. Internal or intrinsic motivation : Some of the individual feels inner drive to fulfill or reach his own goal. This inner drive mainly intrinsic motivation. Intrinsic motivation creates due to internal urges, drives, needs and appetites. Men possess appetite for food, for water, for rest, and sleep, for change of variety, for play, for sex etc. A great part of life of man in spent in activities which are motivated by these appetites. One of the most important foundations of happiness, contentment and mental health is a feeling

113 of security in terms of basic organic needs. When this security is threatened, one may become a radical in thought, he may try to lay the blame on others or he may do any one of a great number of positive things developed from his training and experience. 2. External or extrinsic motivation: most of the cases motivation arouses through external stimulus like, praise, gifts, certificate, good marks etc. this type motivation is called external or extrinsic motivation. Learning must proceed in the absence of internal motivation. If there is intellectual immaturity and lack of sensitivity to ultimate consequences and ideals in the individual, then internal motivation will fail. In such circumstances recourse is to be taken to external motivation. It has to be built upon the foundation of some existing natural response or tendency. Extrinsic motivation is not permanent rather than intrinsic motivation. 2.5.3.4 Maslow's theory of motivation: Abraham Maslow developed the new humanistic theory of self-actualization in the year 1954. He believed that man can work out a better world for mankind as well as for himself. He critically examined the traditional approach of pain, avoidance, and pleasure seeking and tension reeducation as the major sources of motivating behaviour. According to Maslow human needs arrange themselves in a hierarchy. In other words, the appearance of one need generally depends on the satisfaction of the others. They are closely related to each other and may be arrange from the lowest to the highest development of the personality. He proposed five sets of basic needs that can be arranged in a definite hierarchical order for understanding human motivation as shown below: Fig: Maslow's hierarchy of needs Physiological Safety Love/belonging Esteem Self- actualization

114

The needs of the first category include psychological needs, such as hunger and thirst. Once these needs are satisfied, the person seeks to satisfy safety needs- love needs, belongingness need and esteem needs. In this way the motivational behaviour of a person is always dominated not by his satisfied needs but by his unsatisfied wants, desires and needs. Psychologically, self actualization means to fulfill one's individual nature in all its aspects. When all the basic needs are satisfied self actualization is possible. According to Maslow, when the basic needs are satisfied at least minimally, he will be motivated towards self actualization. A self actualized individual will be dynamic and optimistic. He will be void of anger, distress, malice, selfishness and aggressiveness. He behaves with love, tolerance and spirit of cooperation. Change to the original five Stage model are indented and include a seven stage model and a eight-stage model, both developed during 1960's and 1970's. 1. Biological and Psychological needs—air, food, drink, shelter, warmth, sex, sleep etc. 2. Safety needs—protection from elements, security, order, law, stability, etc. 3. Love and belongingness needs—friendship, intimacy, affection and love, from work-group, family, friends, romantic relationships. 4. Esteem needs—Self esteem, achievement, mastery, independence, Status, dominance, prestige, managerial responsibility etc. 5. Cognitive needs—Knowledge, meaning etc. 6. Aesthetic needs—appreciation and search for beauty, balance, form etc. 7. Self Actualization needs – realizing personal potential, Self-fulfillment seeking personal growth and peak experiences. 8. Transcendence needs—helping others to achieve self actualization. 2.5.3.4 Role of Motivation in education: motivation is very important factor of education as well as teaching learning situation. A motivated student spontaneously pays attention to the learning. The teacher's role should be aroused motivation to the learners. According to Garratte - "motivation is a super highway to learning." M. K. Thomson stated that motivation is that education, by which interest is created in a person who does not have it. Due to interest the students concentrate their attention on studies. The following points show the importance of motivation in education.

115 1. Teachers try to arouse the motivation to his students towards teaching and learning. 2. Teacher may be used different external stimuli for creating motivation. 3. A good teacher always tries to arouse motivation in a intrinsic way. 4. Teachers always try to fulfill the needs of the students, because the needs are the basis of motivation. 5. The teacher should encourage the children to learn by constructing and creating things. 6. Teachers role should be stimulate the impulse of curiosity to learners. 7. Both positive and negative verbal reinforcement be used in the classroom for motivated the learners. 8. Classroom’s environment should be competitive and co-operative among the learners. Competition between groups makes it possible to spread the share of success or failure. 9. The teacher must provide pleasant and satisfying experiences to the students so that they are motivated for further learning. 10. Classroom’s condition also one or the important factor of motivation. The rooms should be ventilated and well decorated with full light and air. 2.5.4 “Check your progress” : 1. What is motivation?

118 UNIT 3 TEACHING LEARNING PROCESS Structure : 3.1.1. Introduction 3.1.2. Concept of mathematics Laboratory 3.1.3. Need 3.1.4. Equipment for setting up a mathematics Laboratory 3.1.1 Introduction : Teaching is an active process in which one person shares information with others to provide them with the information to make desired behavioural changes. Where as learning is the process of assimilating information with a resultant change in behaviours. Therefore, we may say that teaching-learning process is a planned interaction that promotes behavioural changes that is not a result of maturation or coincidence. Teaching-Learning process describe through diagram as stated below : Assess Fig-1, teaching learning process as a digramatic view. Prioritize Establishes objectives Choose content Plan Select strategies Environment Implement Order learning Experiences Evaluate Teaching Guidences Learning Teaching Document 119 The above diagram represents a intimate relationship among the five steps. Assessment is the intial stage to diagnose the learner ability and capability. According to the result assessment the next phase is planned to carryout the teaching. In the same way after implementation it is evaluated for documentation. Fig-2, Model of teaching learning process From the above two figures about the process of teaching-learning reflects that teaching-learning is the process of planning, organizing, leading and controlling the efforts of the variables involved and the resources avialable in the process of teaching- learning in such a way so as to result in the attainment of stipulated teaching- learning objectives with the maximum possible efficiency and effectiveness.

120 The need and significance of teaching-learning process. ● It helps in identifying the teaching-learning objectives. Specifying them in behavioural terms and make the teachers and the pupils conscious of attaining them within the specified time available resources. ● Identifying the needs and characteristics of the learners and help them accordingly. ● Helping in better teacher-pupil relationship, close cooperation and healthy integration in the process of instruction. ● Improving enriching the curricular contents, learning experiences and their proper organization and presentation to the learner. ● Identifying and utilizing the apopriate teaching-learning strategies, methods, tactics, teaching aids, etc., in view of learning experiences, objectives, and the available teaching-learning environment. The relationship between teaching and learning : The teaching and learning are the two sides of the same coin. One cannot succeed without the supprt and success of the other. Teaching style of the teachers should be with the learne's learning style. Learner is the centre of teaching. Knowledge of the learner and his learning style should be considered. Learners become complex individual capable of learning on their own, the repertoire of teaching should also increase. Teaching is the cause and learning is the effect. 3.1.2. Objectives On completion of the unit, the student teachers will be able to ● describe the maxims of teaching. ● understand the stages of teaching. ● comprehend the stages of learning. ●

know learning environment. ● describe leadership role of teachers in classrrom, school and community.

121 3.2.1 Maxims of Teaching : Teaching in simple terms, is referred to as either an occupation or profession of a group known as teachers or an activity or activities of a group undertaken to help an individual to learn or acquire some knowledge, skills, attitude or interests. However, the meaning and concept of teaching is not so simple. It is very complex social, cultural and either process designed in a social or cultural context. According to H. C.

Morrison (1934) : Teaching is an intimate contact between a more mature personality and a less mature one which is designed to further the education for the latter. Therefore, teaching is a skilled job and a complex task. By all means, it is done for the benefit of the pupils i.e. to bring desirable changes or improvement in their behaviour. Success of this operation depends upon a good planning and masterly execution of the same. The educationist, psychologists, research workers and the teachers working in the fields have tried to establish some general principles, psychological principles and maxims of teaching which may prove quite helpful in making the task of teaching quite effective and purposeful. An attempt will be made to present the maxims of teaching. Educationists and teachers engaged in the taks of acutal classroom teaching have evolved certain simple notions and worling ways based on their own experiences which may prove quite helpful in the task of teaching. These are known as maxims of teaching. Some maxims of Teaching are stated below : ■ From known to unknown : This is the basic notion for learning beacuse known can always prove a reliable base for making acquitance with the unknown. Similarly, previous knowldge of a particular subject or topic may help us to collect new information and explore the unknown. After acquiring knowledge and skills solving the problems on addition and subtration, one can learn easily the essentials of multiplication and division. A wise teacher should always plan his teaching on the principle of proceeding from the known to the unknown. ■ From definite to indefinite : A lesson always should begin with difinite to indefinite otherwise it will be very difficult for a learner to concentrate on topic with an indefinite matter. One can

122 always trust the tested or definite and therefore definite things, concepts, events or knowledge may be easily approached for catching the indefinite ones. Definiteness of the known facts in a multiplication table may help a student to acquire the knowledge or skills concerning thousands of odd combinations related to multiplication, division, square or cube roots. Similarly, definite rules of the grammar may help a student learn the concerned language effectively. ■ From simple to complex : It is always better to begin with the relatively simpler things than to fight with the unnecessary difficult and complex ones. Proceeding from simple to complex or easy to difficult always provide an appropriate learning order or sequence. Such properly graded sequence may work as the schedules of automatic reinforcement as the group and understanding of simple ones not only motivates an individual to aspire more and little difficult but also equips him with the understanding and mastery of the difficulty and complex concepts and phenomena in the course of learning. ■ From concrete to abstract : Abstract is confusing, difficult to understand and may be subjective. One may be easily bored, fatigued, perplexed and lose one's patience while attending to an abstract phenomenon. It is difficult to be remembered and applied in practical situations. Whereas concrete is relatively simple, understandable or objective. Acquisition of a new knowledge or skill may become a simpler task when it is supported with concrete examples, objects and events. A good teaching should land from concrete to abstract. The concrete material is to be shown, living, examples are to be given and the children should be given maximum opportunities for acquiring direct experiences in order to make them able to learn the abstract concepts and experiences at the later stage. ■ From actual to representative : Actual or real objects, a piece of knowledge, principle and theorem are always better than their replica or representative in any process of teaching learning. An on-the-spot experience of the thrills and life of a mountain lake, lonely desert, whistling trees and chattering birds is unmatched in terms of direct influence and educative value. Visit to an airport is going to have lasting impression and clarity in thoughts and concepts in comparison to mere talking about aeroplanes and aerodrome verbally or through illustrative aids. Therefore, a wise teacher should always lead his students from actual phenomenon to the artificial representation.

123 ■ From particular to general : Generalized facts, principles, concepts and phenomena are quite abstract in nature, therefore, should not be presented in the beginning of a teaching. A teacher who begins by saying that matter has weight and then presents particular example or provides demonstrations related with particular solids, liquids or gases is placing horse before the cart. One cannot generalize without facing or acquainting oneself with the particular instances leading to the generalization of the fact or behaviour. Therefore, a teacher should always begin with the learning or experiencing of the particular cases, facts or instances and then persuade his students to generalize or conclude. ■ From whole to parts : Whole is always not only greater than the parts but also more understandable, motivating and effective. Therefore, beginning should always be made with the whole, and then step-by-step its various parts or constituents should be presented before the students. For example, in teaching the topic "parts of the flower", the beginning should be made with the actual presentation of the whole flowering plant and then gradually the knowledge of the elements and functioning of the different parts should be presented. Similarly, a model of the water pump and the actual working of this pump should be demonstrated as a whole and then the study and working of its different parts should be taken step-by-step. ■ From induction to deduction : Induction is a way of proving a thing or statement by arguing if it is true for a particular case, and then it should be true for the next similar case, and so on. While employing it in teaching, a teacher is required to place particular instances, examples, facts or experiences before the students. On the basis of similarities of properties and repetition of a phenomenon, the students are thus made to generalize a concept, principle or rule. On the other hand, deduction is the net result of induction. Here, the beginning is made by placing the generalized fact, principle, formula or rule before the students and then they are asked to verify the truth of the generalization by applying it in particular instances or examples. It is needless to say that all good teaching begins with induction. Knowledge is formative and induction is a way of discovering the knowledge. Deduction is the result of such discoveries. Therefore, a teacher should always proceed from induction to deduction in his teaching.

124 ■ From analysis to synthesis : Analysis refers to a process of breaking or separating out a thing into the simpler parts, elements or constituents in order to understand its structure or composition. It is a sort of operation or investigation that is being carried out to know the hidden aspects of a problem, but causes of an event or behaviour or understanding the complex nature of a thing or phenomenon. On the other hand, synthesis works quite opposite to analysis. It refers to a process of combining the different elements or parts of a thing in totality. ■ From empirical to rational : In a teaching-learning process, it is always safe to begin with what we see, fact and experience than with what we agree, generalize or explain. The former approach is empirical while the latter is rational. Development of the rational point of view is a goal, a result of a process of empirical findings. The concrete facts or empirical evidences are the rock bottom of a conclusion or rational knowledge. The rational thinking is not the product of empty ideas or lofty ideals having no naked truth or concrete happenings. A teacher has to place facts, evidence, direct or indirect experiences, examples and instances full of objectivity and validity to arrive at some conclusion or develop to arrive at a some conclusion or develop a rational point of view in understanding the nature and concepts of the objects, people, events and phenomena. Therefore, in good teaching one should always lead the student from empirical to rational point of view. ■ From psychological to logical : In the process of education psychological principles of learning and teaching are very important points of view to emphasize. Because the modern education is childcentric, so the child is the centre of education; his needs, interests, abilities and capabilities are the deciding factors for the planning and organization of the teaching activities. The instructional goals are made to serve the cause of the child. The curriculum, teaching strategies, aid material and teaching-learning environment, all are set in view of the psychology of the child and teaching learning. But it should not mean that a teacher has to go unplanned or move haphazardly in his teaching act. What is to be taught, although based on psychological footing, should

125 have some logic. The proper organization and sequencing of teaching activities in terms of the organizations of learning experiences, teaching strategies, evaluation activities and feedback devices are very much essential for the effectiveness of a teaching act. Therefore, a wise teacher cares for a beautiful integration of psychological principle to logical agreement in his teaching. He is to move on a psychological track, keeping in view the logic behind his sequence of activities.

3.3.1 Introduction : Stages of Teaching : The stages of teaching means series of activities that are carried out by a teacher in his act of teaching in real teaching-learning situation. The stages of teaching is aimed to achieve certain teaching objectives. Therefore, teaching as a job of the person called teacher may involve a number of teaching acts or operations which need systematic planning and careful execution. In doing so, the teaching has progresses in some sequential and organized steps. These steps are known as phases of teaching.

3.3.2 Plan : Planning stage is called the pre-active phase of teaching. It is the beginning of the teaching task. It is very important because a good planning makes the task of the teacher smooth, functionable and successful. There are two major steps involved in the phase, namely Task of Teaching Pre-active phase Interactive phase Post-active phase (planning stage) (Implementation stage) (Evaluation stage) Figure–1, Stages or phases of a teaching task (i) Establishment of some kind of goals or objectives. and (ii) Discovering ways and means to achieve these objectives. Operations and activities concerning the planning phase may be summarized as follows : 1. A logical first step in planning for any teaching is the attempt made by a

126 teaches for the establishment of certain goals or objectives. Accordingly, he formulates, in detail, the specific instructional or teaching objectives and writes them in a proper way in behavioural terms. 2. How can the stipulated objectives be effectively achieved is a thing to be decided in the second step of the pre-active phase. Consequently, planning is done for taking decisions about the following aspects :

- Choice of the content to be taught or learning experiences to be given.
- The organization or sequence of the context or material.
- Consideration about the principle and maxims of teaching.
- Decision and planning about the proper use of teaching aids.
- Choice of methods, techniques and strategies of teaching.
- The duration, place and management of classroom teaching.
- Decisions about the evaluation tools.

3. In short, in the pre-active phase, a teacher has to chalkout the details of his journey that he wants to perform in the classroom along with his students. 3.3.3. Implement : The second phase of teaching is called the interactive or implementation stage. It is concerned with the implementation and carrying out what has been planned or decided at the planning stage. It is the stage for actual teaching, success or failure of which depends on the degree and quality of the classroom interaction between the teacher and pupils. The major activities undertaken in this phase may be grouped as (i) perception, (ii) diagnostic, (iii) reaction processes. ■ Perception : Interaction process demands an appropriate perception on the part of teacher as well as students. When a teacher enters the class, his first activity is concerned with a perception of classroom climate. He tries to weigh himself, his abilities and pre-planning for teaching against the classrroup. Similarly, the students also try to have a perception of the abilities, behaviour and personality characteristics of the teacher in order to seek desirable interaction in the teaching learning-process. ■ Diagnosis : A proper diagnosis of the abilities and behaviour of both students 127 and the teacher is very essential for the appropriate interaction. A teacher, therefore, tries to asses and diagnose the achievement level of his students with respect to their abilities, academic background, intelligence, interest and aptitude. The diagnosis work analysis done in several ways. He may ask some questions or assess their performances and behaviour potential by providing opportunity for performing or behaving. The students also, through verbal or non-verbal interaction get the opportunity to asses and diagnose the abilities, interest, aptitude and behaviour performance of their own responses and reactions for contributing towards effective interaction in the teaching act. ■ Reaction processes : Action-reaction processes play the central role in the task of classroom interaction. For this purpose, a teacher has to take right decisions with regard to the selection and use of the proper stimuli, schedule of reinforcement and feedback devices, and development of suitable strategies suiting the needs of the pupils, teaching environment and teaching objectives. The pupils or learner have also to learn the proper ways of reacting and responding to the various stimuli and teaching techniques presented to them. In this way, the interactive phase of teaching is responsible for establishing appropriate verbal and non-verbal classroom interaction between the teacher and pupils by arranging suitable teaching-learning activities and on equally suitable and controlled classroom environment. 3.3.4 Evaluate : The third stage of teaching is called post-active phase of teaching. It is concerned with the evaluation activities. First of all, the stipulated objectives are considered and attempts are made to measure or assess the degree or qualities of the expected behavioural changes in the students as result of the teaching activities performed in the interactive phase. This can be done in a number of ways including tests or quizzes or by observing students reactions to questions, comments, structured or unstructured situation and behaviour situation. The teacher should bring to take right decision about the selection of the appropriate evaluation devices for this purposes. The results of the carried evaluation may be used by the teacher as well as students for bringing desirable improvement in their roles and activities. It may take the following Steps.

128 1. The suitability of the stipulated objectives may be properly assessed. The extent or quality of their accomplishment makes them take decision about further contribution, alteration, or improvement. 2. The suitability of the content and its organization may be suggested. Decisions regarding re-teaching the content or moving to new content may be introduced in the strategies and techniques of teaching. 3. The suitability of the instructional process, aid material and teaching strategies are evaluated. As a result, change and improvement may be introduced in the strategies and techniques of teachings. 4. The role of the classroom environment and learning situations may be evaluated. Accordingly, the desired changes may be affected in the management of these elements. In the nutshell, the post-active concerning evaluation help the teacher and the students in bringing desirable improvement in their performance by providing necessary corrective feedback. All the above three phases of teaching, although described separately, are closely interrelated. They present continuous cycle of the teaching, influencing and directing each others shown in Figure–2. Pre-active phase (planning) Interactive phase Post-active phase (Implementation) (Evaluation) Figure – 2. Interaction among the phases or operations of teaching. It may help us to conclude that the process of teaching does not confine itself with mere classroom interaction or presentation of the content, teaching material or learning experiences. A teaching task can never be confined to the face-to-face dialogue between the teacher and the students carried out in the interaction phase. It begins even before the teachers enters the classroom, with the work of planning in teaching tasks, and continues after the interaction stage in the form of evaluation, feedback and similar others post-active activities, many times even after the teacher leaves the class.

3.3.5. Reflect : In teaching, reflection is very important aspect because using reflection as a basis for improving learning and teaching. Not only this, the professional standards for teachers, tutors and trainers in the lifelong learning sector state that those working in the sector should value reflection and evaluation of their own practice and their continuing professional development as teachers. In addition, their professional knowledge and understanding includes way to reflect evaluate and use research to develop own practice and to share good practices with others. As part of their professional practice, they should share good practice with others and engage in continuing professional development (CPD) through reflection, evaluation and the appropriate case of research. In a professional setting, reflection is : • deliberate • purposeful; • structured; • about linking theory and practice; • to learning; • about change and development; Therefore, reflection is a form of mental processing that we use to fulfil a purpose or to achieve some anticipated outcome. It is applied to gain a better understanding of relatively complicated or unstructured ideas and is largely based on the reprocessing of knowledge, understanding and possibly, emotions that we already possess.

130 Reflection in teaching and learning through diagram. Teaching and learning session Reflection in action Observing yourself Monitoring Writing notes immediately on completion of the session. Planning the next session What can I incorporate from my reflections? Shall I try something new? What works with these learners on this course? Reflection action Time to ponder; mull over what happened; why things happened; how does it relate to theory; what have I learned; what can I use in future planning ? Teaching and learning session 'Reflection in action' Observing yourself Monitoring Writing notes immediately on completion of the session. Figure – 3 Using reflection in and on action to improve teaching and learning. Reflection in teaching practice is very essential because it encourages us to understand over learners and their needs and abilities. Every learner is different and there are likely to be varying interpretations of what we say and do within any group of learners. There are different worlds within our classrooms and skilled teachers will try to see themselves as their students see them. If we practice reflection we can more effectively encourage learners to reflect on, analyse, evaluate and improve their own learning. Reflection can also help us to develop our emotional intelligence, particularly if we conclude a consideration of feelings as part of our reflections. Starting point

131 Finally, and most importantly, reflective practice is the key for improvement. If we do not think about, analysis and evaluate our professional practice we cannot improve. 3.4.1 Introduction : Stages of Learning : Learning occupies a very important place in our life.

An individual starts learning immediately after his births or in a strict sense even earlier in the womb of the mother. So, learning is definitely a vital thing to think about its mechanism and related aspects. It will be very clear if we see some definition

of learning. According to

crow and crow (1973), learning is the acquisition of habits, knowledge and attitudes. It involves new ways of doing things, and it operates in an

individual's attempts to overcome obstacles or to adjust to new situations.

It represents progressive changes in behaviour. It enables him to satisfy interests to attain goals. According to Hilgard (1958), learning is the process by which an activity originates or is changed through reaching to an encountered situation, provided that the characteristics of the changes in activity cannot be explained on the basis of native response, tendencies, maturation, or temporary states of the organism (e.g. fatigue or drugs etc.)

According to the above definitions we may say that learning is a process. As because of process it should have some stages with purpose and goal. 3.4.2 Stages of Learning : ● Acquisition : Acquisition refers to the first stage of learning when a response is established. It is the process of acquiring the skill. In classical conditioning, it refers to the period when the stimulus comes to evoke the conditioned response. Consider Pavlov's classical experiment with dogs. By associating the presentation of food with the sound of a tone, Pavlov was able to condition the dogs to salivate to the sound. The phase in which the dogs began to salivate to the sound is the acquisition period. ● How does it work ? How does acquisition occur? In classical conditioning, repeated pairing of the conditioned stimulus (CS) and unconditioned stimulus (UCS) eventually leads to acquisition. Remember, the unconditioned stimulus is one that naturally evokes the unconditioned response (UCR).

132 After pairing to (UCS) with the UCS repeatedly, the CS alone will come to elicit the response, which is now known as the conditioned response (CR). During acquisition, the conditioned stimulus and unconditioned stimulus are repeatedly paired to create an association. Multiple pairings are required, but the number of trials needed can vary depending on what is being learned.

For example, imagine that you are teaching a dog to fear the sound of a rattle- snake. This type of learning will occur much more quickly since the animal may already be primed to form such an association. As a result, the acquisition will happen much faster than if you are teaching your dog to play dead. The strength of the conditioned response will continue to increase up to a certain point before it begins to level off. Once the association between the CS and UCS has been established, the response is said to have been acquired. At this point, the behaviour is still often reinforced to strengthen the association. □ What factors influence acquisition ? A number of factors can affect how quickly acquisition occurs. First, the salient feature of the conditioned stimulus can play an important role. If the CS is too subtle, the learner may not notice it enough for it to become associated with the unconditioned stimulus. Stimuli that are more noticeable usually lead to faster acquisition. For example, if you are training a dog to salivate to a sound, acquisition will be more likely if the sound is noticeable and unexpected. The sound of a bell will produce a better result than a quiet tone or a neutral sound that the animal hears regularly. Secondly, timing plays a critical role. If there is too much of a delay between presentation of the conditioned stimulus and the unconditioned stimulus, the learner might not form an association between the two. The most effective approach is to present the CS and then quickly introduce the UCS so that there is an overlap between the two. As a rule, the greater the delay between the UCS and the CS, the longer time will be needed for acquisition. 3.4.4 Maintenance : Maintenance is a very important aspect of learning. The fundamental aim of maintenance in learning is retention of skills. It tries to maintain a high level of

133 performance over the time after reinforcement ends. It is necessary in order to build on the skills learned. 3.4.3 Generalization : 'Generalization' refers to the ability of an organism dealing with the perception of and response to similar stimuli. A child demonstrates this ability when he successfully subtracts four apples from nine apples after learning to subtract four oranges from nine oranges. In this way, generalization may be understood in terms of a learning process when the organism learns to provide similar operant responses, to stimuli similar to but not the same as the training stimulus. In helping the children to learn appropriate generalization due care should be taken by the parents and teachers to reinforce the behaviour of the children only after they demonstrate the ability to generalize correctly.

Over generalization like calling all four legged animals as cows should be immediately discouraged and they should be helped to learn correct generalization and discrimination for acquiring the proper concept of things and events surrounding them.

3.5.1 Introduction : Learning Environment : The term "learning environment" suggests place and space—a school, a classroom, a library. And indeed, learning takes place in physical location like these. But in today's interconnected can be virtual, online, remote; in other words, it does not have to be a place at all. Perhaps a better way to think of 21st century learning environments is as the support systems that accommodate the unique learning needs of every learner and support the positive human relationships needed for effective learning. Learning environments are the structures, tools and communities that inspire students and educators to attain the knowledge and skills.

3.5.2. Physical Learning Environment : A question definitely will come before setting up a building of an educational institution that what should be the physical learning environment. Studies about student academic achievement and building condition conclude that the quality of physical environment significantly affects student achievement, desirable designs include having 'friendly and agreeable' entrance areas, supervised private place for students as well

134 as public spaces that fosters a sense of community, with particular attention to the colour used.

- Physical environment refers to the level of upkeep, ambient noise, lighting, indoor, air quality and thermal comfort of the building and its location within the community. The physical environment of the school speaks to the contribution that safe, clean and comfortable surroundings make to a positive school climate in which students can learn.
- A well-maintained and safe physical environment fosters students' ability to learn, to show improved achievement scores, and to exhibit appropriate behaviour.
- Creating a positive environment is necessary in order for teachers to teach effectively and for students to be receptive to learning. Facilities in good conditions, including low noise levels, cleanliness, access to clean air and water and absence of overcrowding are not only conducive to learning, but essential for students and staff overall health and well-being.
- Dilapidated school buildings contribute to teacher despair and frustration, while building renovations can lead teachers to feel a renewed sense of hope and commitment. Overcrowding and heavy teachers workloads create stressful working conditions for teachers and lead to higher teacher absenteeism. Crowded classroom conditions limit the amount of time teachers can spend on innovative teaching methods and result in a constant struggle to simply maintain order. Thus the likelihood increases that teachers suffer from burnout earlier than might otherwise be the case.
- While the condition of school building and grounds are important, the neighborhoods surrounding our nation's schools are not isolated from exerting influence. The condition of a school's neighbourhood exerts a substantial influence on the school as well as the students it serves. Thus schools often inherit the difficulties present in their surrounding neighbourhoods. The conditions of a school often reflect the surrounding neighbourhood's condition. For example, schools with trash on the floors are more likely to be located in neighborhoods where litter and trash are prevalent; schools in which graffiti is evident are more likely to be in neighborhoods with graffiti; and schools with broken windows are more likely to be located in neighborhoods in poor condition. Though, there is a plethora of research that examines the effect of the physical conditions of teaching spaces (which includes seating, furnishings, spatial density, privacy, noise, climate and thermal control, air quality, windowless classroom,

135 vandalism and play-yards, light and colour) on student's engagement, attainment, attendance and well-being. Besides these, educational institutes and classrooms can be more than a place to inhibit. They can also acquire an emotional significance. One perspective is that educators play an important role in constructing classrooms and schools, and therefore, students' identities. An extension of this idea is that children's environment has an effect on their cognitive and behavioural development and on childhood vulnerability.

3.5.3 Psychological Learning Environment

All most all of us have spent a great deal of time in the classroom, beginning in kindergarten and extending for years beyond. Have you ever noticed what the teacher did to make learning more inviting? Was it colourful posters, clear and consistent rules, and fun and interesting teaching methods? If so, you were lucky to have a teacher who paid close attention to the learning environment, or the physical, psychological and instructional atmosphere. From the above discourse, it is obvious fact that learning environment is vital to student success and impacts students in many ways. A negative learning environment, adversely affects students learning, like low student achievement, poor behaviour, student anxiety, or depression, whereas a positive learning environment that allows students to feel comfortable and confident as learners. The psychological learning environment refers to positive learning environment. It is like how students feel about their learning. The psychologically motivated learner can promote their learning both intellectually and socially. The teacher should have positive control over the classroom by being a role model for kind words and actions. Because we know that students react negatively when they feel things are unfair, unclear or are worried about getting in trouble due to negative attitude of teachers. On the other hand while a teacher is clear about instruction and consistent, offers praise and gratitude, and sets a good example, then students are confident and comfortable in the classroom. □

The importance of Motivation on Educational Environment

Motivation is described as a state that energizes, directs and sustains behaviour. Motivations involves goals and require activity. Goals provide the impetus for and the direction of action while action entails effort, persistence in order to sustain

136 activity for a long period of time. There are recognized indices of motivation that are important to be aware of. Indices typically place a value or quantity on an idea; in this case, we can understand the value or quantify of motivation for an individual by these four indices. The selection of a task under free-choice conditions indicates motivation to perform the task, to engage in art activities during free time. This is indicative of being motivated by art and art-type activities. High effort levels, especially when working on different tasks and assignments, are also indicative of motivation. For example, if a student diligently works on a difficult algebra problem again and again this would indicate a higher level of motivation towards math activities. High effort levels, especially when working on different tasks and assignments are also indicative of motivation. For example, a student in physical education class, was able to master jumping rope, but he chooses to continue trying to jump rope during recess; this time on task indicates a high level of motivation toward that mastering the activity of jumping rope. Finally, level of achievement is affected by choice, effort and persistence. The higher these indices, the higher the motivation and the more like task achievement will occur. In the classroom, educators should be aware of these indexes in an effort to reinforce activities and interests that students already show an existing partiality for. There is an actual term for this—it is called situational motivation. Situational motivation is a phenomenon in which aspects of the immediate environment enhance motivation to learn particular things or behave in particular ways. Educators can do many things to create a classroom environment that motivates students to learn and behave in ways that promote their long-term success. □

How motivation Affects Learning & Behaviour

Motivation has several effects on students learning and behaviour. First : motivation directs behaviour towards particular—goals. Motivation determines the specific goals toward which people strive, thus it affects the choices student make. For example, whether to enroll in an art class or physical education class, whether to attend a school basketball game during the week or complete an assignment that's due to next day. 2nd : Motivation also leads to increase effort and energy. Motivation determines

137 whether a student will pursue a task (even a difficult one) with enthusiasm or a lackluster attitude. 3rd : Motivation increases the initiation and persistence of activities. In our first example, Erik continued with art-type activities in his free time and he also tried to perform these type of activities in relations to his other assignments. Motivation will increase students time on task and is also an important factor affecting their learning and achievement. 4th : Motivation enhances cognitive processing. Motivation actually affects what and how information is processed because motivated students are more likely to pay attention and try to understand the material instead of simply going through the motions of learning in a superficial manner. 5th : Motivation determines what consequences are reinforcing and punishing. For example : student with a high level of motivation for classroom achievement and high GPAs are reinforced by receiving a grade of "A" and they will feel punished if they receive a grade of "F". Finally, motivation leads to improve performance. Everything that we have just discussed--effort, initiation, persistence, cognitive processing and the impact of consequences--lead to improve performance. □ The importance of Attention in a Learning Environment : All learning takes place in a physical environment with quantifiable and perceptible physical characteristics. Whether sitting in a large lecture hall underneath a tree or in front of a computer screen, students are engulfed by environmental information. Specific targets within the environment draw the student's attention, such as armchairs, scarves, and teacups and they continuously monitor the ambient properties such as the light of the lamps, the smell of the kettle, and the warmth of the fire. In any learning environment students are in environmental information, only a small fraction of which constitutes the sights and sounds of instructions. So, learning environment should be arranged according to the psychological aspect for better attention of learner. □ The importance of Emotion in a Learning Environment : Emotional attachment is very much related with learning and teaching. The physical characteristics of learning environments can affect learners emotionally, with important cognitive and behavioural consequences. For example, most students probably find learning difficulty in a classroom that is stiflingly warm. It may become a place where student love to learn, a place they seek out when they wish to learn, and a place they remember fondly when they reflect on their learning experiences. In any learning environment, physical characteristics that cause discomfort can be expected to interfere with learning; environment that produce positive emotional states can be expected to facilitate learning and the development of place attachment. Beyond the physical arrangement of a classroom a psychological environment is also created, based on the interaction of key players in the classroom, namely students and teachers. Many teachers equate student engagement and on task behaviour with classroom participation, typically a top concern for teachers. The notion of feeling supported as students has also been extensively examined in the classroom environment literature. Helne Patrick et.al. (Partic, Ryan, & Kap (Cass 2007) found that there is a strong, positive relationship between students level of motivation and engagement and their perceptions of the classroom environment as being socially supportive. The perception of a climate of mutual respect is required in order for students to increase their use of effective study strategies and increase feelings of confidence about their ability to successfully complete assignments. Furthermore, when students perceive that they receive emotional support and encouragement from their teachers and academic support from their peers they are more likely to be on task in the classroom and use self-regulated strategies. 3.6.1.

Introduction : ■■■■■ Leadership

Role of Teacher : The notion of teacher leadership is not new, but recently it has been transformed. In the past, teacher leadership limited in scope and established at the prerogative of school administrators. Teachers have served long as team department chairs, association leaders and curriculum developers. In these roles teachers have often served as rather than "leaders" who enact change. In addition, leadership roles for teachers have traditional flexibility and required a lengthy, ongoing commitment of time and energy. Often the decision to take on leadership accompanied by a decision to get out of teaching and into administration. Recently, reports on the status of teacher education have issued strong and compelling pleas for dramatically different teachers and increased professional development. While recognizing the centrality reports emphasize

139 the need for teachers to extend their sphere of influence beyond the classroom and into school wide activities. Advocacy for teacher professionalism and expanded leadership roles is based on the understanding that teachers, have daily contacts with learners, are in the

best position to make critical decisions about curriculum and instruction are better able to implement changes in a comprehensive and continuous manner to expand teacher roles is also motivated by an ongoing need to attract and retain qualified teachers. ■■■■■

What is Teacher Leadership? Teachers typically define career satisfaction in terms of their ability to be of service to others and make a difference among their students. Similarly, the leadership considerations of teachers are grounded in their improvement in the quality of teaching and learning for all students. Studies have shown that teachers do not subscribe definitions of leadership as “higher” or “superior” positions within the organizational hierarchy but view leadership as a collaborative effort, a “banding together” with other teachers to promote professional development and the improvement of educational services. Today, leadership roles have begun to emerge and promise real opportunities for teachers to impact educational opportunities necessarily leaving the classroom. Teachers are now serving as research colleagues, working as advisor-mentors and facilitating professional development activities as master teachers. Teachers also act as members of school-teams, instructional support teams and leaders of change efforts. In addition, teachers are forging new and unique leadership roles through their own initiative by developing and implementing programs they personally result in positive change. ■■■■■

Teacher Leadership Role in Today’s Perspective: Expectations about the performance of education leaders have changed and expanded considerably in the last decade, extending far beyond the traditional definitions of administrative roles. Responsibilities of education leaders now exceed what individual administrators in educational institutions can be expected to carry out alone. In today’s requirements to increase student learning necessitate a shift in leadership, from managing orderly environments in which teachers work autonomously in their classrooms to one in which administrators, teachers, and others share leadership roles and responsibilities for student learning. Today more than ever, a number of interconnected factors argue for the necessity of teacher leadership in schools. Teaching

140 is a flat profession. In most professions, as the practitioner gains experience, he or she has the opportunity to exercise greater responsibility and assume more significant challenges. This is not true of teaching. The 20- year veteran’s responsibilities are essentially the same as those of the newly recruited novice. In many settings, the only way for a teacher to extend his or her influence is to become an administrator. Many teachers recognize that this is not the right avenue for them. The job of an administrator entails work that does not interest them, but they still have the urge to exercise wider influence in their schools and in the profession. This desire for greater responsibility, if left unfulfilled, can lead to frustration and even cynicism. Teachers’ tenure in schools is longer than that of administrators. In many settings, administrators remain in their positions for only three to four years, whereas teachers stay far longer. Teachers often hold the institutional memory; they are the custodians of the school culture. School that want to improve make a wise investment when they cultivate and encourage teacher leaders, because they are in a position to take the long view and carry out long-range projects. ■■■■■

Qualities and Skills of Teacher Leaders: Teacher leaders serve in two fundamental types of roles: formal and informal. Formal teacher leaders fill such roles as department chair, master teacher, or instructional coach. These individuals typically apply for their positions and are chosen through a selection process. Ideally, they also receive training for their new responsibilities. Formal teacher leaders play vital roles in most schools. In many cases, these teacher leaders manage curriculum projects, facilitate teacher study groups, provide workshops, and order materials. They may also evaluate other teachers, in which case their colleagues are likely to regard them as pseudo administrators. Informal teacher leaders, in contrast, emerge spontaneously and organically from the teacher ranks. Instead of being selected, they take the initiative to address a problem or institute a new program. They have no positional authority; their influence stems from the respect they command from their colleagues through their expertise and practice. Whether they are selected for a formal leadership role or spontaneously assume an informal role, effective teacher leaders exhibit important skills, values, and dispositions. Teacher leaders call others to action and energize them with the aim of improving teaching and learning. A hallmark of leadership, therefore, is the ability to collaborate with others. Teacher leaders must enlist colleagues to support their vision, build consensus among diverse groups of educators, and convince others of

141 the importance of what they are proposing and the feasibility of their general plan for improvement. They must be respected for their own instructional skills. They also understand evidence and information and recognize the need to focus on those aspects of the school's program that will yield important gains in student learning. A number of values and dispositions make certain individuals ideally suited for teacher leadership. Effective teacher leaders are open-minded and respectful of others' views. They display optimism and enthusiasm, confidence and decisiveness. They persevere and do not permit setbacks to derail an important initiative they are pursuing. On the other hand, they are flexible and willing to try a different approach if the first effort runs into roadblocks. Many attributes of good teacher leaders are fundamentally the same as the attributes of good teachers: persuasiveness, open-mindedness, flexibility, confidence, and expertise in their fields. Despite these similarities, however, working with colleagues is profoundly different from working with students, and the skills that teachers learn in their preparation programs do not necessarily prepare them to extend their leadership beyond their own classrooms. To assume a leadership role, they may need expertise in curriculum planning, assessment design, data analysis, and the like. They may also need to develop the abilities to listen actively, facilitate meetings, keep a group discussion on track, decide on a course of action, and monitor progress. These skills are not typically taught in teacher preparation programs. Not every school is hospitable to the emergence of teacher leaders, particularly informal teacher leaders. The school administrator plays a crucial role in fostering the conditions that facilitate teacher leadership, including the following: ■■■■■ A safe environment for risk taking Teachers must be confident that administrators and other teachers will not criticize them for expressing ideas that might seem unusual at first. Some of the most effective approaches to solving difficult issues in schools may not be intuitively obvious but may require that educators think creatively, which can only happen in a safe environment. School administrators should make it clear that teachers are safe to express ideas and take professional risks. ■■■■■ Administrators who encourage teacher leaders Administrators' commitment to cultivating teacher leaders plays an essential role in their development. Administrators must be proactive in helping teachers acquire the skills they need to take advantage of opportunities for leadership (data analysis, 142 meeting facilitation, and so on). Unfortunately, some administrators jealously guard their turf, apparently fearing that ambitious teacher leaders will somehow undermine their own authority. In fact, one of the enduring paradoxes of leadership is that the more an administrator shares power, the more authority he or she gains. ■■■■■ Opportunities to learn leadership skill : As noted earlier, the skills required for teacher leadership are not part of the preparation program for most teachers. If teacher leaders are to emerge and make their full contribution, they need opportunities to learn the necessary skills of curriculum planning, instructional improvement, assessment design, collaboration, and facilitation. Teachers can learn these skills through school-level professional development, of course, but they may also build these skills through district wide or university-based courses and seminars. Whatever the source, the opportunities must be available and sufficiently convenient for teachers to take advantage of them. ■■■■■ The Need for Teacher Leadership: Teacher leadership is an idea whose time has come. The unprecedented demands being placed on schools today require leadership at every level. Yet many schools are still organized as though all the important decisions are made by administrators and carried out by teachers. In the most successful schools, teachers supported by administrators take initiative to improve school wide policies and programs, teaching and learning, and communication. By understanding the phenomenon of teacher leadership and helping teachers develop the skills required to act as leaders, we will improve schools and help teachers realize their full potential. 3.6.2. Leadership Role of Teacher in Classroom: A classroom is a group of learners. Generally speaking, learning groups have at least two basic objectives: ● to complete learning tasks; ● to maintain positive and effective relationships among group members. Leadership consists of actions that help the group to complete its tasks successfully and maintain effective working relationships among its members. For any group to be successful, both task-leadership actions and group maintenance-leadership actions have to be provided. It is important to note that a) any member of a group may become a leader by taking these necessary actions (i.e., the teacher is not necessarily

143 the leader), and b) the various leadership actions may be provided by different group members. Teachers should know that, generally, groups function most effectively when leadership tasks are shared among group members. However, most students are accustomed to being in classes where the teacher plays all of the leadership roles; if you want students to play some of these roles, you must give them permission to do so, and perhaps provide guidance how to best take on these roles. When teachers neglect leadership and do not provide leadership themselves or invite students to take on leadership roles, students may themselves elect to play informal (and frequently inappropriate) leadership roles in the classroom, simply to pull the individuals together as a group. Leadership is a set of skills that anyone can acquire. Responsible leadership depends upon

- flexible behaviour;
- the ability to diagnose what behaviours are needed at a particular time in order for the group to function most efficiently; and
- the ability to fulfil these behaviours or to get other members to fulfil them.

To participate effectively in a group, especially in a leadership role, one must be able to :

- **Communicate** Communication is the first step in cooperating with others. There are two basic categories of skills - sending and receiving. Some essential skills are the ability to:
 - Clearly and unambiguously communicate ideas and feelings.
 - Make messages complete and specific.
 - Make verbal and nonverbal messages congruent with each other.
 - Ask for feedback concerning the way in which your messages are received.
 - Display openness, and maintain eye contact.
 - Listen without response until the other person has sent a full message.
 - Paraphrase accurately and non evaluative the essence of the sender's message.
 - Listen beyond words - that is to be aware of nonverbal messages and behavior

144

- Listen for requests and intentions in others' messages, particularly in complaint These skills are ones well know to teachers as important classroom skills. They are skills needed by and leader, in any situation.
- **Build and Maintain Trust** : Acceptance and support are essential in building and maintaining trust. Acceptance is communicating to others that you have high regard for them. Support is communicating to others that you recognize their strengths and believe they are capable of productively managing their situation. Underlying all significant learning is the element of trust. Stephen Brookfield (1990) proposes that those playing the role of teacher in a learning group must pay attention to the balance between two important characteristics that make teachers more trustworthy in students' eyes: credibility and authenticity.
- **Manage Conflict** Since participation in a group will inevitably produce some conflicts, it is essential that members of learning groups have the skills required for managing controversies constructively, including the ability to:
 - Understand the point-of-view of another person in the group.
 - Approach controversy from a problem-solving perspective. First, explore all differences. Then, look for ways to integrate ideas. Recognize the legitimacy of different ideas and viewpoints and search for a solution that accommodates the needs of all group members.
 - Be critical of ideas, not persons.
 - When large societal problems are being played out in the classroom, keep returning to the course "text1 whenever possible—how can it help members of the learning group make sense of the conflict they are experiencing?"

The extended Role of a Teacher in the Classroom Situation:

- Facilitates the collection, analysis, and use of classroom- and school-based data to identify opportunities to improve curriculum, instruction, assessment, school organization, and school culture.
- Engages in reflective dialogue with colleagues based on observation of instruction, student work, and assessment data and helps make connections to research-based effective practices.

145

- Supports colleagues' individual and collective reflection and professional growth by serving in roles such as mentor, coach, and content facilitator.
- Serves as a team leader to harness the skills, expertise, and knowledge of colleagues to address curricular expectations and student learning needs.
- Uses knowledge of existing and emerging technologies to guide colleagues in helping students skilfully and appropriately navigate the universe of knowledge available on the Internet, use social media to promote collaborative learning, and connect with people and resources around the globe.
- Promotes instructional strategies that address issues of diversity and equity in the classroom and ensures that individual student learning needs remain the central focus of instruction.
- **The specific functions of a teacher leader in the classroom:**
 - He has leadership qualities to perform different activities (pre-active, interactive and post active functions) in a classroom.
 - He guides the instructional process.
 - He plans and organizes the curricular and co-curricular programmes.
 - He selects the appropriate teaching strategy.
 - He prepares lessons plans, assignments and teaching aids, etc.
 - He creates an appropriate classroom climate for better learning.
 - He provides motivation and positive reinforcement.
 - He gets feedback from students and evaluates their learning.
 - He communicates with parents if necessary.
 - He maintains the cumulative records.
 - He organizes tutorials classes.
 - He maintains inter-personal relations.
 - He performs leadership role in co-curricular and extra-curricular activities and sets the tone of the schools.

From the above discussion, it may be concluded that teacher is not only confined within the role of teaching itself but perform as a leader as well as facilitator to

146 continue the instructional activities as better in the classroom situation. Because the teacher understand the principles of learning and knows how to develop a collaborative culture of collective responsibility in the classroom. The teacher uses this knowledge to promote an environment of collegiality, trust, and respect that focuses on continuous improvement in instruction and student learning. Therefore, a teacher not only performs as a role of leader but he is a friend, philosopher and guide in the classroom situation.

3.6.3. Leadership Role of Teachers in School : Leadership by teachers is essential to serving the needs of students, schools and the teaching profession. The teacher leadership as a vehicle to transform schools for the needs of the 21st century. The teacher leadership can be used to guide the preparation of experienced teachers to assume leadership roles such as resource providers, instructional specialists, and curriculum specialists, classroom supporters, learning facilitators, mentors and school team leaders. Leadership is the process of guiding and directing the behaviour of others to work enthusiastically toward achieving set objectives. A group flourish as a result of the efficient leadership. A school in the able hands of a headmaster can make tremendous progress. Leadership requires specific characteristics, which an effective leadership must possess. ■■■■■ Leadership of teacher must have the following qualities, characteristics and skills:

- He should be an able administrator in organizing the varied programmes of his institution with active cooperation of other members working under them.
- He must be known for his human relations. He must be kind, courteous and friendly. He must understand the problems of others and take steps to solve them.
- He should be a scholar. He should try to keep himself up to date with the knowledge of his profession and other allied problems.
- He should be democratic in outlook. He should also be the practitioner of the democratic principles.
- He should also be disciplined man. Self - confidence is a must for him.
- He should be really a model to others by his good words and deeds.
- He should enjoy an influential personality so as to execute the various policies and programmes of the institutions with cooperation from others.

147 ● As a supervisor he must be constructive and creative. ■■■■■ The Function of Teacher as a Leader in School :

- Collaborates with colleagues and school administrators to plan professional learning that is team-based, job-embedded, sustained over time, aligned with content standards, and linked to school/district improvement goals.
- Uses information about adult learning to respond to the diverse learning needs of colleagues by identifying, promoting, and facilitating varied and differentiated professional learning.
- Facilitates professional learning among colleagues.
- Identifies and uses appropriate technologies to promote collaborative and differentiated professional learning.
- Works with colleagues to collect, analyze, and disseminate data related to the quality of professional learning and its effect on teaching and student learning.
- Advocates for sufficient preparation, time, and support for colleagues to work in teams to engage in job-embedded professional learning.
- Provides constructive feedback to colleagues to strengthen teaching practice and improve student learning, and
- Uses information about emerging education, economic, and social trends in planning and facilitating professional learning.

3.6.4 Leadership Role of Teacher in Community :

The teacher leader understands that families, cultures, and communities have a significant impact on educational processes and student learning. The teacher leader works with colleagues to promote ongoing systematic collaboration with families, community members, business and community leaders, and other stakeholders to improve the educational system and expand opportunities for student learning. Teachers interact with parents, students mid other teachers regularly, affecting the lives of their students daily. In addition to the classes they teach, instructors often find themselves involved in many community projects and serving the community at large as leaders. They also regularly take leadership positions within their school districts, communities of teachers, parent-teacher organizations, and professional teacher organizations and teachers associations.

148 ■■■■■ Functions of the teacher leader in community: ● Uses knowledge and understanding of the different backgrounds, ethnicities, cultures, and languages in the school community to promote effective interactions among colleagues, families, and the larger community. ● Teaches effective communication and collaboration skills with families and other stakeholders focused on attaining equitable achievement for students of all backgrounds and circumstances. ● Facilitates colleagues' self-examination of their own understandings of community culture and diversity and how they can develop culturally responsive strategies to enrich the educational experiences of students and achieve high levels of learning for all students. ● Develops a shared understanding among colleagues of the diverse educational needs of families and the community. ● Collaborates with families, communities, and colleagues to develop comprehensive strategies to address the diverse educational needs of families and the community. ■■■■■ The Roles of a Teacher as a Community Leader: ● Local Government Teachers are active members of their local government and are regularly involved as leaders in the government, through running for the city council of their cities and towns and sitting on commissions and local government committees. Within the school setting, teachers encourage their students and colleagues to become involved in their local politics and to create positive change in the community at large. ● Political Action Teachers often take leadership roles for current political events affecting their lives, communities and school. When a bill dealing with schools and teachers is presented in Legislative Assembly, teachers mobilize to show their support for the bill. The leaders of many teachers' political action groups were teachers in the classroom at one time. ● Advisory Boards Teachers regularly sit on the boards of and are involved in community organizations and nonprofits centres such as the Red Cross, Salvation Army and Boys and Girls

149 Clubs etc. Their direct involvement in the leadership of community organizations allows teachers to help change the lives of students outside of the classroom. ■■■■■ The Roles of a Teacher outside the Classroom A teacher has a very diverse role within the educational environment. In the classroom she must be an instructor, critic, disciplinarian, motivator, role model and adviser. However, a teacher's job can expand to include other roles outside the classroom. Many teachers assume roles outside of the classroom to facilitate the development of a good rapport or for other reasons. Roles for a teacher outside of the instructional environment include: coach, club sponsor, tutor and counsellor. ● Teacher as a Counsellor Most schools employ counsellors to address non-instructional issues and problems that impact a student's progress through school. However, many teachers end up serving as counsellors to their students. Usually this is because a student feels more comfortable confiding in a teacher with whom she already has a rapport than the school counsellor. Since teachers interact on a daily basis with students, they may be the first to recognize a student's problem. ● Teacher as a Tutor In the light of increased emphasis on schools meeting minimum state and federal performance standards, many schools pay teachers for after-school tutoring. Teachers may agree to serve as after-school tutors to supplement their income or to provide additional instruction so that their students will pass standardized tests. After-school tutoring increases the likelihood that the students will succeed and also increases a teacher's class pass rate. After-school tutoring helps the student and the teacher. 3.7.1. Let Us Sum up The learning may be happened in both formal and informal way. When learning is concerned with formal way in the field of education a number of generalized notions, ideas, work mode and practices that can be properly employed for getting desired success in the tasks of teaching. In the language of educational psychology, these are referred to as maxims of teaching. The notable among them are: proceeding from known to unknown, from defiant to indefinite, from simple to complex, from

150 concrete to abstract, from actual to representation, from particular to general, from whole to parts, from analysis to synthesis, from empirical to rational, and from psychological to logical. In the class room situation when teaching is organized it maintains some basic steps. These steps or stages are known as the stages or phase of teaching. In general, a teaching task involve four such stages of phase, namely planning stage is also known as preactive phase, implement stage is known as interactive and evaluation and reflection stages are known as postactive phase of teaching. It is a sequential process which begins with planning and ended with evaluation as well as reflection.

The behaviour of an individual is changed through direct or indirect experiences. This change in behaviour brought about by experiences is commonly known as learning. In

the class room situation, it happens with some specific steps are known as acquisition, maintenance and generalization. In the process of acquisition the skill and knowledge are acquired through the direct instruction. The aim is accuracy of response. In the maintenance where learner retains accuracy and fluency....periodically evaluates and when necessary reinforce. Aim is retention of the skill. In the generalization, transfers skill to new situations and settings provide direct instruction in alternate setting when fails to generalize program for generalization. Aim is expansion of the skill across situations, behaviours and time. The learning environment means surrounding or atmosphere of learning where learning can take place such as a school, a class room, a library, etc. The learning environment may be different types but mainly we are concerned with physical and psychological learning environment. The physical learning environment consists of infrastructure such as building and available facilities as per requirements where as psychological learning environment refers positive learning environment where learner can promote their learning both intellectually and socially. Like other fields, in education leadership role is pivotal factor to continue the whole process of teaching, learning, evaluation, management and administration of education. In education leadership means teachers leading power or role of a teacher as a leader with desired goals and objectives to fulfil. Leadership by teachers is essential to serving the needs of students, schools and the teaching profession. The teacher leadership as a vehicle to transform schools for the needs of the 21st century. The teacher leadership can be used to guide the preparation of experienced teachers to assume leadership roles such as resource providers, instructional specialists, and

151 curriculum specialists, classroom supporters, learning facilitators, mentors and school team leaders. 3.8.1. Check Your Progres : 1. What is the maxim of teaching?

References 4.1.1. Introduction: Assessment is the process of gathering and discussing information from multiple and diverse sources in order to develop a deep understanding of what students know, understand and can do with their knowledge as a result of their educational experiences. Assessment is indispensable component of curriculum practices in the school system. In system of education, one of the prime considerations of administrators, teachers and students alike are the outcomes of learning, what ability students can demonstrate because of increase in their knowledge and changes in understanding because of experience in school. In this aspect, Van Den Akker (2003) describes assessment as essential component of the curriculum practice, So, it may be said that assessment is a process for obtaining information in curriculum operation in order to make decisions about students learning, curriculum, and programme and on educational policy matters.

155 4.1.2. Objectives: Upon completion of the sub-unit, the student learners will be able to — ❖ Understand the conventional meaning and constructivist perspective of assessment. ❖ Identify the meaning and differences of assessment of learning and assessment for learning. ❖ Critically analyse, comparing and contrasting assessment, evaluation, measurement, test and examination, ❖ Explain formative and summative evaluation and curriculum based measurement. Elucidate key concepts in school evaluation

such as filtering learners, marks, credit, grade, choice, alternate certifications, transparency, internal- external proportion, improvement option. 4.1.3. Conventional Meaning and Constructivist Perspective of Assessment. Conventional Meaning of Assessment: Conventional, more traditional, assessment tools evaluate what skills students can perform with success. They are generally knowledge-based, versus hands-on or performance-based. Assessment is one of the most significant areas of an educational system. Assessment in education is mainly associated with the growth of learning of the students. How much learning experience a student has acquired at a particular point of time against the expected learning outcomes? What are the strengths and weaknesses of a learner in the stipulated area of learning? To what extent the results of assessment can be helpful in strengthening the learning? These are some of the usual questions associated with educational assessment. It defines what students take to be important, how they spend much of their academic time and in many ways how they value themselves. According to Rowntree, "if we wish to discover the truth about an educational system, we must look to its assessment procedures". In addition, assessment is important because students cannot avoid it, as Boud says.

156 Rowntree suggests that assessment procedures offer answers to the following questions : 1. What student's qualities and achievements are actively valued and rewarded by the system? 2. How are its purposes and intentions realized? 3. To what extent are the hopes and ideals, aims, and objectives professed by the system ever truly perceived, valued and striven for by those who make their way within it? From the above discussion it may be stated that assessment has two main purposes as mentioned below : 1. The first reason is to assist learning. When looking at this area we must always strive to make the assessment relevant to the overall goals of the unit and to make our assessment part of the learning process. 2. The second is to determine the effectiveness of the education system. Only with this can we as educators improve the education of our students. However we must be able to determine not only the overall learning but which areas are not effective and need modification. The overall purposes of assessment: Ø To determine pass or fail of a student, Ø To make grade or rank of a student. Ø To select for future course. Ø To predict success in future courses. Ø To provide a profile of what a student has learnt, Ø To diagnose students strengths and weaknesses. Ø To provide feedback to students to improve their learning. Ø To help students to develop their skills of self assessment, Constructivist Perspective of Assessment: Our instructional processes and practices are characterized largely by lectures where students are passive listeners. Such instructional processes contribute at best to lower order cognition, memorization and fragile learning; together, they make a grand nexus for large-scale failing in examination. Students lack problem-solving ability, higher order thinking and cognition,

157 and creativity. If the education system sets its target for students to be able to think critically, solve problems individually and collectively, be creative, instructional processes must undergo a paradigm shift as suggested in National Curriculum Framework 2005. Instructional processes must bring students at the centre of stage where they primarily learn to learn through peer interaction, problem-solving, experiential learning, etc. In this new instructional scenario, teachers will be facilitators of learning. This new instructional scenario is characterized by constructivist perspective of learning. Through constructivism, students will learn to construct their learning according to their own worldview that unfolds over the years of schooling. It is this learning to construct learning that will hold them into the adult life at work and later. In addition to these, the emerging constructivist approach as has been recognized in the NCF 2005 requires self-assessment, peer assessment, individual and group assessments also to be part of the school evaluation programme. In this context, the teacher educators need to be acquainted with new processes of learning assessment evolving with the technological interventions, so that, they can not only update their knowledge, but shall be capable enough to impart appropriate skills to the teachers for improving the quality of students learning. Comparatively, conventional education system, particularly school education is guided and controlled by concern for results in examination irrespective of the quality of learning –whether fragile or sustainable. The competition, though artificial, for securing percentage of marks in the final examination creates unusual stress in the students leading often to mental break down and suicides. This must be changed. Change in the mechanics of examination will be too simplistic a solution, amounting to treating the symptoms, not the disease itself. Examination-stress is directly related to facing the challenge of examination with ‘fragile’ learning due to memorizing huge stock of information. In order to manage the stress factor in examination it will be necessary to ensure sustainable learning. Yet, it will be necessary to reconstruct and redesign examination system with attributes like flexibility where a student can achieve mastery learning in a flexible time frame and accumulate credits; eliminating power tests (fixed duration), adopt continuous and comprehensive evaluation. The practice of mark sheets indicating marks in certain subjects must be replaced by a portfolio that would accommodate a student’s performance in a variety of domains like life skills, academic/non-academic and vocational subjects, personal qualities, etc. The portfolio should be comprehensive, revealing of the total being of the student (CABE Committee, 2005).

158 Standardized or teacher made achievement tests take relatively little time to administer and are inexpensive. In addition, the results are simple to report and understand. Often a single score, such as a percentile rank, standard score, or grade equivalent is reported for each student, and aggregate scores are reported for a classroom, school. Finally, and very significantly, standardized achievement tests are promoted as objective measures of achievements, meaning that the results are not affected by the personal values or biases of the person who scores the test. Standardized achievement tests are promoted as scientifically developed instruments which are valid and reliable measures of what a student knows and is able to do. They originated at a time when it seemed both necessary and logical to teach students a given body of subject matter content. Furthermore, many learning theorists believed that teaching and learning were most effective when concepts and ideas were broken into smaller and smaller components. Standardized achievement tests reflected these assumptions and practices, for they were specific to each discipline and typically used a set of multiple choice items to sample the scope of a particular discipline. Advocates of standardized testing assumed that a student who had a command of the pieces (e.g., specific knowledge and facts) also would have a good understanding of the larger content domain. As our focus has been shifted from behaviourist to constructivist approach and our National Curriculum Framework, 2005 has put paramount importance to this new paradigm of assessment from constructivist perspectives, there is an urgent need of bringing about a change in the system of assessment. In these circumstances, this sustainable learning is possible in the process of Continuous and comprehensive assessment of learning considered as inalienable part of the teaching learning process has acquired more significance in the emerging context of learning-centred education within the framework of the constructive approach to learning. Therefore, from the above discussion it may be understood that constructivist assessment means, “Students go beyond initial information levels (knowledge and comprehension) through elaboration doing in-depth analysis of big ideas, issues and concepts” (Brooks & Brooks, 1993). According to Zahorik, “assessments are tailored to specific modules and teaching situations”. In the same way, assessments include higher order thinking skills, i.e., application, evaluation, analysis, synthesis (Burry- Stock, 1995; Yager, 1991). From the above statement it is stated that assessment can be used to build understanding through reflection and -interaction. There is great promise for deeper understanding and appreciation of the creative, generative process we call learning

159 when a student is aware of scholastic expectations and understands how to effectively review and critique his or her own work. This process has three steps: 1. The teacher must help students understand from the outset the criteria by which their work will be judged. 2. Students must document their work process for the duration of the project or unit. 3. Through performance and feedback, students come to understand the complex nature of judging and improving upon one's work. Assessment and Constructivist Classroom : Constructivism is basically a theory - based on observation and scientific study - about how people learn. It says that people construct their own understanding and knowledge of the world, through experiencing things and reflecting on those experiences. When we encounter something new, we have to reconcile it with our previous ideas and experience, maybe changing what we believe, or maybe discarding the new information as irrelevant. In any case, we are active creators of our own knowledge. To do this, we must ask questions, explore, and assess what we know. In the classroom, the constructivist view of learning can point towards a number of different teaching practices. In the most general sense, it usually means encouraging students to use active techniques (experiments, real-world problem solving) to create more knowledge and then to reflect on and talk about what they are doing and how their understanding is changing. Constructivist teachers encourage students to constantly assess how the activity is helping them gain understanding. By questioning themselves and their strategies, students in the constructivist classroom ideally become "expert learners." This gives them ever-broadening tools to keep learning. With a well-planned classroom environment, the students learn how to learn. Constructivism transforms the student from a passive recipient of information to an active participant in the learning process. Guided by the teacher, students construct their knowledge actively rather than just mechanically ingesting knowledge from the teacher or the textbook. In the constructivist classroom, the focus tends to shift from the teacher to the students. The classroom is no longer a place where the teacher ("expert") pours knowledge into passive students, who wait like empty vessels to be filled. In the constructivist model, the students are urged to be actively involved in their own

160 process

of learning. The teacher functions more as a facilitator who coaches, mediates, prompts, and helps students develop and assess their understanding, and thereby their learning. One of the teacher's biggest jobs becomes asking good questions. As is the case with many of the current/popular paradigms, you're probably already using the constructivist approach to some degree.

Constructivist teachers pose questions and problems, and then guide students to help them find their own answers. They use many techniques in the teaching process. For example, they may be able to: Ø prompt students to formulate their own questions (inquiry), Ø allow multiple interpretations and expressions of learning (multiple intelligences), Ø encourage group work and the use of peers as resources (collaborative learning). Characteristics of Constructivist Assessment: In the context of constructivist approach, assessments need to gauge the progress of students in achieving the three major learning outcomes of constructivist approach: Ø conceptual understanding, Ø abilities to perform scientific inquiry, Ø and understandings about inquiry. All learners come to learning tasks with some relevant knowledge, feelings and skills. Meaningful learning occurs when the learners seeks to relate new concepts and propositions to relevant existing concept and propositions in her/his cognitive structure (Mintzes, Novak, Wandersee, 2000).

Constructivist approach to assessment is a formative rather than a summative. Its purpose is to improve the quality of student learning, not to provide evidence for evaluating or grading students. Assessment

has to respond to the particular needs and characteristics of the teachers, students and subject content. Assessment is context- specific: what works well in one class will not necessarily work in another. Assessment is ongoing process. Teachers get feedback from students of their learning. Teachers then complete the loop by providing students with feedback on the results of the assessment and suggestions for improving learning. Benefits of Constructivist Classroom: Ø Students learn more, enjoyably and are more likely to retain learning; Ø Students learn how to think and understand; 161 Ø It is a transferable skill to other settings; Ø Students have ownership of their own learning; Ø It applies natural curiosity to real world situations; Ø Promotes social and communication skill within a group setting. 4.1.4. Meaning and Difference of Assessment of Learning and Assessment for Learning. Meaning of Assessment of Learning: The purpose of this kind of assessment is usually summative and is mostly done at the end of a task; unit of work etc.

Assessment of Learning is the assessment that becomes public and results in statements or symbols about how well students are learning. It often contributes to pivotal decisions that will affect students' futures. It is important, then, that the underlying logic and measurement of assessment of learning be credible and defensible. Generally, Assessment of learning

is concerned with assessment of learners' performance after the completion of a course or more specifically at the end of an instructional unit, term or academic year. It is comprised of one or several combinations of different methods of assessment like oral, written and performance. They provide learners scope to synthesize their learning experiences up to the end of the stipulated period and demonstrate how well they have learned the essential skills, procedures and concepts to which they were exposed during the given instructional period. Assessment of learning is the most familiar and universally used mode. In spite of being the oldest practiced mode, this very often is teacher-dominated and becomes confined to the norm referenced quantitative approaches neglecting the evaluation of broader aspects of learning. The Role of Teacher

in Assessment of Learning: The consequences of assessment of learning are often far-reaching and affect students seriously,

teachers have the responsibility of reporting student learning accurately and fairly, based on evidence obtained from a variety of contexts and applications. Effective assessment of learning requires that teacher provide. Ø a rationale for undertaking a particular assessment of learning at a particular point in time.

Ø clear descriptions of the intended learning.

162

Ø

processes that make it possible for students to demonstrate their competence and skill.

Ø

a range of alternative mechanisms for assessing the same outcomes. Ø public and defensible reference points for making judgements.

Ø transparent approaches to interpretation Ø descriptions of the assessment process Ø

strategies for recourse in the event of disagreement about the decisions

Planning for Assessment of Learning: Purposes of Assessment: The purpose of assessment of learning is to measure, certify, and report the level of students' learning, so that reasonable decisions can be made about students. There are many potential users of the information: Ø teachers (who can use the information to communicate with parents about their children's proficiency and progress) Ø parents and students (who can use the results for making educational and vocational decisions) Ø potential employers and post-secondary institutions (who can use the information to make decisions about hiring or acceptance) Ø principals, district or divisional administrators, and teachers (who can use the information to review and revise programming) Assessment of learning requires the collection and interpretation of information about students' accomplishments in important curricular areas, in ways that represent the nature and complexity of the intended learning. Because genuine learning for understanding is much more than just recognition or recall of facts or algorithms, assessment of learning tasks need to enable students to show the complexity of their understanding. Students need to be able to apply key concepts, knowledge, skills, and attitudes in ways that are authentic and consistent with current thinking in the knowledge domain.

163

Method

of Assessment: In assessment of learning, the methods chosen need to address the intended curriculum outcomes and the continuum of learning that is required to reach the outcomes. The methods must allow all students to show their understanding and produce sufficient information to support credible and defensible statements about the nature and quality of their learning, so that others can use the results in appropriate ways. Assessment of learning methods include not only tests and examinations, but also a rich variety of products and demonstrations of learning—portfolios, exhibitions, performances, presentations, simulations, multimedia projects, and a variety of other written, oral, and visual methods.

Process of quality Assessment:

Assessment of learning needs to be very carefully constructed so that the information upon which decisions are made is of the highest quality. Assessment of learning is designed to be summative, and to produce defensible and accurate descriptions of student competence in relation to defined outcomes and, occasionally, in relation to other students' assessment results. Certification of students' proficiency should be based on a rigorous, reliable, valid and equitable process of assessment and evaluation. Reliability: Measuring reliability is very important task for assessment otherwise so many error may come.

Reliability in assessment of learning depends on how accurate, consistent, fair, and free from bias and distortion the assessment. Teachers might ask themselves: Ø Do I have enough information about the learning of this particular student to make a definitive statement? Ø Was the information collected in a way that gives all students an equal chance to show their learning?

Ø
Would another teacher arrive at the same conclusion? Ø Would I make the same decision if I considered this information at another time or in another way?

164 Reference Points:

Typically, the reference points for assessment of learning are the learning outcomes as identified in the curriculum that make up the course of study.

Assessment tasks include measures of these learning outcomes, and a student's performance is interpreted and reported in relation to these learning outcomes. In some situations where selection decisions need to be made for limited positions (e.g. university entrance, scholarships, employment opportunities), assessment of learning results are used to rank students. In such norm-referenced situations, what is being measured needs to be clear, and the way it is being measured needs to be transparent to anyone who might use the assessment results. Validity: Because assessment of learning results in statements about students' proficiency in wide areas of study, assessment of learning tasks must reflect the key knowledge, concepts, skills, and dispositions set out in the curriculum, and the statements and inferences that emerge must be upheld by the evidence collected.

Record-Keeping: Whichever approaches teachers choose for assessment of learning, it is their records that provide details about the quality of the measurement. Detailed records of the various components of the assessment of learning are essential, with a description of what each component measures, with what accuracy and against what criteria and reference points, and should include supporting evidence related to the outcomes as justification. When teachers keep records that are detailed and descriptive, they are in an excellent position to provide meaningful reports to parents and others. Merely a symbolic representation of a student's accomplishments (e.g., a letter grade or percentage) is inadequate. Reports to parents and others should identify the intended learning that the report covers, the assessment methods used to gather the supporting information, and the criteria used to make the judgement.

Guidelines for Grading: Ø Use curriculum learning outcomes or some clustering of these (e.g., strands) as the basis for grading.

165

Ø
Make sure that the meaning of grades comes from clear descriptions of curriculum outcomes and standards. If students achieve the outcome, they get the grade, Ø Base grades only on individual achievement of the targeted learning outcomes. Report effort, participation, and attitude, for example, separately, unless they are a stated curriculum outcome. Any penalties (e.g., for late work, absences), if used, should not distort achievement or motivation.

Ø
Sample student performance using a variety of methods. Do not include all assessments in grades. Provide ongoing feedback on formative performance using words, rubrics, or checklists, not grades.

Ø
Keep records in pencil so they can be updated easily to take into consideration more recent achievement. Provide second-chance assessment opportunities (or more). Students should receive the highest, most consistent mark, not an average mark for multiple opportunities.

Ø
Crunch numbers carefully, if at all. Consider using the median, mode, or statistical measures other than the mean. Weight components within the final grade to ensure that the intended importance is given to each learning outcome.

Ø

Make sure that each assessment meets quality standards (e.g., there should be clear targets, clear purpose, appropriate target-method match, appropriate sampling, and absence of bias and distortion) and is properly recorded and maintained (e.g., in portfolios, at conferences, on tracking sheets). 8. Discuss and involve students in grading at the beginning and throughout the teaching and learning process.

Assessment and Feedback to Students: In assessment students' feedback is very important because assessment of learning comes most often at the end of a unit or learning cycle, feedback to students has a less obvious effect on student learning than assessment for learning and assessment as learning

rely on their marks and on teachers' comments as indicators of their level of success, and to make decisions about their future learning endeavours. Differentiating Learning: In assessment of learning, differentiation occurs in the assessment itself. It would make little sense to ask a near-sighted person to demonstrate driving proficiency

166 without glasses. When the driver uses glasses, it is possible for the examiner to get an accurate picture of the driver's ability, and to certify him or her as proficient. In much the same way, differentiation in assessment of learning requires that the necessary accommodations be in place that allow students to make the particular learning visible. Multiple forms of assessment offer multiple pathways for making student learning transparent to the teacher.

A particular

curriculum outcome requirement, such as an understanding of the social studies notion of conflict, for example, might be demonstrated through visual, oral, dramatic, or written representations. As long as writing were not an explicit component of the outcome, students who have difficulties with written language, for example, would then have the same opportunity to demonstrate their learning as other students. Although assessment of learning does not always lead teachers to differentiate instruction or resources, it has a profound effect on the placement and promotion of students and, consequently, on the nature and differentiation of the future instruction and programming that students receive.

Therefore, assessment results need to be accurate and detailed enough to allow for wise recommendations. Reporting:

There are many possible approaches to reporting student proficiency. Reporting assessment of learning needs to be appropriate for the audiences for whom it is intended, and should provide all of the information necessary for them to make reasoned decisions. Regardless of the form of the reporting, however, it should be honest, fair, and provide

sufficient detail and contextual information so that it can be clearly understood. Traditional reporting, which relies only on a student's average score, provides little information about that student's skill development or knowledge. One

alternate mechanism, which recognizes many forms of success and provides a profile of a student's level of performance on an emergent-proficient continuum, is the parent student- teacher conference. This forum provides parents with a great deal of information, and reinforces students' responsibility for their learning

In order to ensure comprehensive, valid and fair assessment of student learning, one need to take all possible

precautions, some of which are: Ø In order to provide an accurate picture of a student's achievement, one must gather enough evidence to determine "justifiable" grades across all aspects of achievement (Knowledge, Understanding, Thinking, Communication and Application).

167 Ø Evidence must be gathered using a variety of assessment strategies so that all students can find sufficient scope to demonstrate their learning. Ø There should be student choice within assessment tools/tasks to address individual needs.

Ø Prior to a final demonstration of learning, practice and feedback for improvement must be provided to the student. Ø Evaluator's (teacher's) professional judgment of on students' learning achievement should not be based on single incident of evaluation rather on several evaluation events conducted formally and/or informally over a period of time.

Assessment of learning should be based on the most consistent and more recent levels of evidence gathered. Ø

"Numerous" and "varied" opportunities contribute to the concept of most consistent as it helps to identify trends in student's learning. The grade should reflect the development of learning at any point in time. Ø Inconsistencies in

student's performance should be reviewed to determine the reason for their occurrence and whether they impact on the student's achievement. Ø Recent evidence should be used when looking for growth over time. Recent evidence may not be applicable to the acquisition of discrete facts and information. Meaning

of

Assessment for

Learning: Assessment for Learning is the process of seeking and interpreting evidence for use by learners and their teachers to decide where

the

learners are in their learning, where they need to go and how best to get there.

Assessment

for Learning is also known as formative assessment. Assessment for learning is best described as a process by which assessment information is used by teachers to adjust their teaching strategies, and by students to adjust their learning strategies. Assessment, teaching, and learning are inextricably linked, as each informs the others. Assessment is a powerful process that can either optimise or inhibit learning, depending on how it's applied. Teachers make professional judgements on learners' performance in every teaching and learning session undertaken, whether consciously or subconsciously. Using these

168 professional judgements and translating them into feedback on the quality of individuals' work is the focus of Assessment for Learning. Successful Assessment for learning strategies result in improved learner progress on a continual basis. The principal characteristic of Assessment for Learning is effective feedback provided by teachers to learners on their progress. The value of the feedback is dependent on two factors: ❖ the quality of the feedback ❖ how learners receive and ultimately use it. Teachers, therefore, need training and support to enable them to make valuable assessment decisions, to provide quality feedback to learners, and to teach learners to receive feedback positively and use the information contained within it effectively to improve their work. Assessment for Learning and quality feedback can and do promote increased learner progress. Assessment as part of classroom activities is a fundamental process required to promote learning and ultimately achievement. Learners need to know and understand the following before learning can take place: ❖ What is the aim of the learning? ❖ Why do they need to learn it? ❖ Where are they in terms of achieving the aim? ❖ How can they achieve the aim? When learners know and understand these principles, the quality of learning will improve. Sharing this information with learners will promote ownership of the learning aims and a sense of shared responsibility between the teacher and learner to achieve those aims. Improving learners' confidence and self-esteem reflects positively in learners' work and their motivation is improved. Assessment for Learning and Teacher: Assessment for learning helps teachers gather information to: ❖ plan and modify teaching and learning programmes for individual students, groups of students, and the class as a whole.

169 ❖ pinpoint students' strengths so that both teachers and students can build on them. ❖ identify students' learning needs in a clear and constructive way so they can be addressed. ❖ involve parents, families, and while in their children's learning. ❖ explain the learning aims to learners and check their understanding. ❖ demonstrate the standards learners are required to achieve and help them recognise when they have achieved that standard. ❖ give effective feedback on assessment decisions, so that learners know how to improve. ❖ demonstrate high expectations and make it obvious to learners that they believe that they can improve on their past performance. ❖ provide regular opportunities for teachers and learners to reflect on the last performance and review learners' progress. ❖ develop learners' self-assessment skills, so that they can recognise what aspects of their own work need to improve. Pattern of scale to measure learner performance of Learning in teaching and learning session: given below is six point scales. 1= excellent 2 = very good 3 = good 4 = satisfactory 5 = poor 6 = very poor Teachers need to; ❖ decide what is going to be learnt in a particular session. ❖ define the learning goals. ❖ communicate the learning goals to the learners.

170 ❖ compile questions and design tasks to check learner understanding of the learning goals. ❖ explain to the learners the criteria which will be used to assess their work. ❖ decide how feedback is going to be provided. ❖ define how learners will take an active part in the assessment process. ❖ plan opportunities for learners to use the feedback provided on the assessment decision to further progress. Effective session learning plans: Teachers need to make sure that every session learning plan includes: ❖ details of the learning intentions/outcomes ❖ how learning intentions/outcomes are going to be shared with learners and methods of checking their understanding ❖ information on the assessment criteria and marking ❖ assessment opportunities ❖ methods of feedback to be provided ❖ details of the differentiated range of learners making up the group ❖ information on teaching and learning styles incorporated into the session ❖ how review times are to be used ❖ the specifications of the differentiated teaching and learning materials to be used to meet individual learner needs and create effective learning opportunities ❖ an evaluation section for the teacher to complete to say what did or did not work well and why. Assessing learning: the effective use of questioning: No matter how well a teaching and learning session is planned, or how well a teacher may feel at the conclusion to the session, it is not how well the teacher has performed, but the reaction of the learners that matters. The real test is whether learners have learnt and ultimately progressed against the learning objectives defined at the start of the session. Testing learning is an important part of classroom practice, and questioning is one of the most common methods of checking learner understanding.

171 Feedback on assessment: Successful Assessment for Learning strategies hinge on the nature of feedback, its content and the way it is received and used by learners. ❖ Feedback is providing information to an individual who focuses on their performance or behaviour. ❖ The feedback provided should be delivered in a positive manner and lead to action to affirm or develop an individual's performance or behaviour. ❖ Feedback provided should not be of a personal nature and should focus on hard data, facts or observed examples of evidence. Differences of Assessment of Learning and Assessment for Learning: Why What How Ensuring Quality Assessment for Learning to enable teachers to determine next steps in advancing student learning and Information for teachers' instructional decisions each student's progress and learning needs in relation to the curricular outcomes range of methods in different modes that make students' skills and understanding visible accuracy and consistency of observations and interpretations of student learning ❖ clear, detailed learning expectations ❖ accurate, detailed notes for descriptive feedback to each student Assessment of Learning to certify or inform parents or others of student's proficiency in relation to curriculum learning outcomes and Judgments about placement, promotion, credentials, etc. the extent to which students can apply the key concepts, knowledge, skills, and attitudes related to the curricular outcomes range of methods range of methods in different modes that assess both product and process accuracy, consistency, and fairness of judgements based on high-quality information ❖ clear, detailed, learning expectations ❖ fair and accurate summative reporting 172 indicate each student's level of learning ❖ provide the foundation for discussions on placement or promotion ❖ report fair, accurate, and detailed information that can be used to decide the next steps in a student's learning descriptive feedback to further his or her learning ❖ differentiate instruction by continually checking where each student is in relation to the curricular outcomes • provide parents or guardians with descriptive feedback about student learning and ideas for support Using the Information 4.1.5. Comparing and Contrasting Assessment, Evaluation, Measurement, Test Examination: Comparing, and Contrasting Assessment, Evaluation and Measurement: Educational discourse has many words that relate to the broad task of judgement the way a person, programme, or piece of work, including, evaluating, measuring, assess appraising, examining, testing, marking, grading, and scoring. Such words are confused: one person's testing, is another person's assessing, making in one country grading in another. Nevertheless, these words are not all synonymous. In this area the discussion will be limited within assessment, evaluation and measurement Assessment: In education assessment is the process by which one attempts to measure the quality learning using various assessment techniques, assignments, project, continuous assess objective type tests. As far as possible, the term assessment should be reserved for application to people. It (activities included in grading (formal and non-formal) examining, certifying and ; Students' achievement on a particular course may be assessed according to (a critical dictionary of education in 1982). Assessment is a process by which information is obtained relative to some known objective or goal. Assessment is a broad term that includes testing. A test is a special form of assessment. Tests are assessments made under contrived circumstances especially so that they may be administered. In other words, all tests 173 are assessments, but not all assessments are tests. We test at the end of a lesson or unit. We assess progress at the end of a school year through testing. Whether implicit or explicit, assessment is most usefully connected to some goal or objective for which the assessment is designed. A test or assessment yields information relative to an objective or goal. In that sense, we test or assess to determine whether or not an objective or goal has been obtained. Assessment of skill attainment is rather straightforward. Either the skill exists at some acceptable level or it doesn't. Skills are readily demonstrable.

In the most general sense, assessment is the process of making a judgment or measurement of worth of an entity (e.g., person, process, or program). Learner assessment is best conceived as a form of two-way communication in which feedback on the educational process or product is provided to its key stakeholders (McAlpine, 2002). Specifically, learner assessment involves communication to teachers (feedback on teaching); students (feedback on learning); curriculum designers (feedback on curriculum) and administrators (feedback on use of resources). For teachers and curriculum/course designers, carefully constructed learner assessment techniques can help determining whether or not the stated goals are being achieved. According to Brissenden and Slater (n.d.), classroom assessment can help teachers answer the following specific questions: ❖ To what extent are my students achieving the stated goals? ❖ How should I allocate class time for the current topic? ❖ Can I teach this topic in a more efficient or effective way? ❖ What parts of this course/unit are my students finding most valuable ❖ How will I change this course/unit the next time I teach it? ❖ Which grades do I assign my students? For students, learner assessment answers a different set of questions (Brissenden and Slater, n.d.): Do I know what my instructor thinks is most important? ❖ Am I mastering the course content? ❖ How can I improve the way I study in this course? ❖ What grade am I earning in this course?

174 The Importance of Assessment: First and foremost, assessment is important because it drives students Learning (Brissenden and Slater, n.d.). Whether we like it or not, most students tend to focus their energies on the best or most expeditious way to pass their 'tests.' Based on this knowledge, we can use our assessment strategies to manipulate the kinds of learning that takes place. For example, assessment strategies that focus predominantly on recall of knowledge will likely promote superficial learning. On the other hand, if we choose assessment strategies that demand critical thinking or creative problem-solving, we are likely to realize a higher level of student performance or achievement. In addition, good assessment can help students become more effective self-directed learners (Angelo and Cross, 1993). Types and Approaches to Assessment: ❖ Formative - Summative ❖ Informal- Formal ❖ Continuous- Final ❖ Process- Product ❖ Divergent - Convergent Formative vs. Summative Assessment: Formative assessment is designed to assist the learning process by providing feedback to the learner, which can be used to identify strengths and weakness and hence improve future performance. Formative assessment is most appropriate where the results are to be used internally by those involved in the learning process (students, teachers, curriculum developers). Summative assessment is used primarily to make decisions for grading or determine readiness for progression. Typically summative assessment occurs at the end of an educational activity and is designed to judge the learner's overall performance. In addition to providing the basis for grade assignment, summative assessment is used to communicate students' abilities to external stakeholders, e.g. administrators and employers.

175 Informal vs. Formal Assessment: With informal assessment, the judgments are integrated with other tasks, e.g., lecturer feedback on the answer to a question or preceptor feedback provided while performing a bedside procedure. Informal assessment is most often used to provide formative feedback. As such, it tends to be less threatening and thus less stressful to the student. However, informal feedback is prone to high subjectivity or bias. Formal assessment occurs when students are aware that the task that they are doing is for assessment purposes, e.g., a written examination. Most formal assessments also are summative in nature and thus tend to have greater motivation impact and are associated with increased stress. Given their role in decision-making, formal assessments should be held to higher standards of reliability and validity than informal assessments. Continuous vs. Final Assessment: Continuous assessment occurs throughout a learning experience (intermittent is probably a more realistic term). Continuous assessment is most appropriate when student and/or instructor knowledge of progress or achievement is needed to determine the subsequent progression or sequence of activities. Continuous assessment provides both students and teachers with the information needed to improve teaching and learning in process. Obviously, continuous assessment involves increased effort for both teacher and student. Final (or terminal) assessment is that which takes place only at the end of a learning activity. It is most appropriate when learning can only be assessed as a complete whole rather than as constituent parts. Typically, final assessment is used for summative decision-making. Obviously, due to its timing, final assessment cannot be used for formative purpose. Process vs. Product Assessment: Process assessment focuses on the steps or procedures underlying a particular ability or task. i.e., the cognitive steps in performing a mathematical operation or the procedure involved in analyzing a blood sample. Because it provides more detailed information, process assessment is most useful when a student is learning a new skill and for providing formative feedback to assist in improving performance.

176 Product assessment focuses on evaluating the result or outcome of a process. Using the above examples, we would focus on the answer to the math computation or the accuracy of the blood test results. Product assessment is most appropriate for documenting proficiency or competency in a given skill, i.e., for summative purposes. In general, product assessments are easier to create than product assessments, requiring only a specification of the attributes of the final product. Divergent vs. Convergent Assessment: Divergent assessments are those for which a range of answers or solutions might be considered correct. Examples include essay tests, and solutions to the typical types of indeterminate problems. Divergent assessments tend to be more authentic and most appropriate in evaluating higher cognitive skills. However, these types of assessment are often time consuming to evaluate and the resulting judgments often exhibit poor reliability. A convergent assessment has only one correct response (per item). Objective test items are the best example and demonstrate the value of this approach in assessing knowledge. Obviously, convergent assessments are easier to evaluate or score than divergent assessments. Unfortunately, this "ease of use" often leads to their widespread application of this approach even when contrary to good assessment practices. Specifically, the familiarity and ease with which convergent assessment tools can be applied leads to two common evaluation fallacies: the Fallacy of False Quantification (the tendency to focus on what's easiest to measure) and the Law of the Instrument Fallacy (moulding the evaluation problem to fit the tool). Evaluation: According to the dictionary of education (1977), explains evaluation as "Value judgement on an observation, 'performance test,' or indeed any 'data' whether directly measured or inferred. For example, if a pupil gains a score of 32 on a test of education, this measure is evaluated by placing a meaning on it relative to a standard, norm or some other situation. Thus, the score may be 'above average', 'fail', or indicative of below or above average effort on the part of the individual, or again that the score is 'good' for his/her age, but 'average' for his/ her particular class." According to Dr.K. Sudha Rao (1986), "Educational evaluation is a process of estimating and appraising, the degree and dimension of appraising the proficiency level of the particular educational practice, which is being conducted. It is way of appraising the application of educational theory in practice."

177 Characteristics of Evaluation: 1. Evaluation is a continuous process. 2. Evaluation includes academic and non-academic subjects. 3. Evaluation is a procedure for improving the product. 4. Discovering the needs of an individual and designing the learning experiences. Main Generalizations about Evaluation; 1. Evaluation is function of the learner and instruction and therefore, good evaluation is one which is done by the teacher, of the taught as a individual. 2. Evaluation provides quality control at every stage of the teaching learning process. 3. Evaluation provides feed-back. 4. Remedial teaching is possible through this evaluation. The Purposes of Evaluation: According to Oguniyi (1984), educational evaluation is carried out from time to time for the following purposes: (i) to determine the relative effectiveness of the programme in terms of students' behavioural output; (ii) to make reliable decisions about educational planning; (iii) to ascertain the worth of time, energy and resources invested in a programme; (iv) to identify students' growth or lack of growth in acquiring desirable knowledge, skills, attitudes and societal values; (v) to help teachers determine the effectiveness of their teaching techniques and learning materials; (vi) to help motivate students to want to learn more as they discover their progress or lack of progress in given tasks; (vii) to encourage students to develop a sense of discipline and systematic study habits; (viii) to provide educational administrators with adequate information about teachers' effectiveness and school need;

178 (ix) to acquaint parents or guardians with their children's performances; (x) to identify problems that might hinder or prevent the achievement of set goals; (xi) to predict the general trend in the development of the teaching-learning process; (xii) to ensure an economical and efficient management of scarce resources; (xiii) to provide an objective basis for determining the promotion of students from one class to another as well as the award of certificates; (xiv) to provide a just basis for determining at what level of education the possessor of a certificate should enter a career. Measurement: International dictionary of education (1977), defines measurement as, "Act of finding dimensions of any object and the quality found by each act." Pantom, M.Q.(1985) states that measurement implies assigning a numerical quantity. While instruments such as rulers and stopwatches can be used to determine height, speed, and so on, any intellectual capacities or other quantities of educational interest must be measured indirectly. Thus, tests are typically used on measures such as dimensions and levels of intelligence. It may be included in an assessment. According to the dictionary of education, (1981) defines measurement as fundamentally, we can say that measurement entails certain rules and producers for assessing numbers represent the quantity of the attribute.

Measurement refers to the process by which the attributes or dimensions of some physical object are determined. One exception seems to be in the use of the word measure in determining the IQ of a person. The phrase, "this test measures IQ" is commonly used. Measuring such things as attitudes or preferences also applies. However, when we measure, we generally use some standard instrument to determine how big, tall, heavy, voluminous, hot, cold, fast, or straight something actually is. Standard instruments refer to instruments such as rulers, scales, thermometers, pressure gauges, etc. We measure to obtain information about what is. Such information may or may not be useful, depending on the accuracy of the instruments we use, and our skill at using them. There are few such instruments in the social sciences that approach the validity and reliability of say a 12" ruler. We measure how big a classroom is in terms of square feet, we measure the temperature of the room by using a thermometer, and we use Ohm meters to determine the voltage, amperage, and resistance in a

179 circuit. In all of these examples, we are not assessing anything; we are simply collecting information relative to some established rule or standard. Assessment is therefore quite different from measurement, and has uses that suggest very different purposes.

Proposition in Measurement: Thorndike and Hagen in (1979) list six propositions that seem to us to provide the foundations for a contemporary view of educational and psychological measurement procedures and their role in our schools and our society. 1. Various types of decisions have to be made. 2. The more relevant and more accurate the information, the better the decision. 3. Measurement instruments and procedures provide an important set of tools for improving the information available for decision making. 4. The use of any type of information for decision making needs to know what that information signifies and how far it can be trusted. 5. The facts and values involved in any decision are complex. 6. The wisdom of the decider is crucial. According to Thorndike and Hagen (1979), measurement in any field involves three common steps: 1. Identifying and defining the quality or attitude that is to be measured, 2. Determining a set of operation by which the attribute may be made manifest and perceivable, and 3. Establishing a set of procedures or definitions for translating observations into quantitative statements of degree or amount. Assessment versus Evaluation:

Depending on the authority or dictionary consulted, assessment and evaluation may be treated as synonyms or as distinctly different concepts. As noted above, if a distinction exists, it probably involves what is being measured and why and how the measurements are made. In terms of what, it is often said that we assess students and we evaluate instruction. This distinction derives from the use of evaluation research methods to make judgments about the worth of educational activities. Moreover, it emphasizes an individual focus of assessment, i.e., using information

180 to help identify a learner's needs and document his or her progress toward meeting goals. In terms of why and how the measurements are made, the following table (Apple & Krumsieg,1998) compares and contrasts assessment and evaluation on several important dimensions, some of which were previously defined. Dimension Assessment Evaluation

Timing	Formative	Summative	Focus of Measurement	Process -oriented	Product - oriented	Relationship between Administrator and Recipients	Findings and uses	Diagnostic	Judgemental	Modifiability of criteria
Flexible	Fixed	Standards	measurement	Absolute	individual	Comparative	Relation with objectives	Cooperative	Competitive	From: Apple, D.K. & Krumsieg. K.(1998). Process education teaching institute handbook.

Evaluation Vs Measurement: Evaluation and Measurement have similar meaning and are closely related with each other. Nevertheless, these terms are not synonymous. Measurement is a procedure for assigning numbers to specified attributes or characteristics of person in a manner that maintains the real world relationship among persons with regard to what is being measured." Whereas, evaluation involves judging the value or worth of a pupil on an instructional method or on an educational programme. Such judgements may or may not be based on information obtained from tests. Measurement they process of obtaining numerical description of the degree to which an individual possesses particular characteristics. Answer the question, how much?

181 Evaluation the

systematic process of collecting, analysing and interpreting information to determine. The context to which pupils are achieving instructional

objects. Answer the question how good? Measurement, for all practical purposes assessment and measurement can be considered synonymous. When assessment is taking place, information or data are being collected and measurement is being conducted. Evaluation, evaluation is a process that includes measurement and possibly testing but it also contains the notion of value judgement. Measurement is an act or a process that involves the assignment of a numerical index to whatever is being assessed. Whereas evaluation = quantitative description of learner's achievement + qualitative description of learner's abilities + value judgements about achievements and abilities. Test: To understand the concept of "test" you must recall the earlier definitions of "assessment" and "evaluation". Note that we said people use these terms interchangeably. But in the real sense, they are not the same. Tests are detailed or small scale task carried out to identify the candidate's level of performance and to find out how far the person has learnt what was taught or be able to do what he/she is expected to do after teaching. Tests are carried out in order to measure the efforts of the candidate and characterize the performance. Whenever you are tested, as you will be done later on in this course, it is to find out what you know, what you do not know, or even what you partially know. Test is therefore an instrument for assessment. Assessment is broader than tests, although the term is sometimes used to mean tests as in "I want to assess your performance in the course". Some even say they want to assess students' scripts when they really mean they want to mark the scripts. Assessment and evaluation are closely related, although some fine distinctions had been made between the two terms. Evaluation may be said to be the broadest. It involves evaluation of a programme at the beginning, and during a course. This is called formative evaluation.. It also involved evaluation of a programme or a course at the end of the course. This is called summative evaluation. Testing is part of assessment but assessment is more than testing.

182 Tests involve measurement of candidates' performance, while evaluation is a systematic way of assessing the success or failure of a programme. Evaluation involves assessment but not all assessments are evaluation. Some are reappraisal of a thing, a person, life, etc Purpose of Tests: This section discusses the reasons for testing. Why do we have to test you? At the end of a course, why do examiners conduct tests? Some of the reasons are outlined in this section. 1. We conduct tests to find out whether the objectives we set for a particular course, lesson or topic has been achieved or not. Tests measure the performance of a candidate in a course, lesson, or topic and thus, tell the teacher or course developer that the objectives of the course or lesson have been achieved or not. If the person taught performed badly, we may have to take a second look at the objectives of the course or lesson. 2. We test students in the class to determine the progress made by the students. We want to know whether or not the students are improving in the course, lesson, or topic. If progress is made, we reinforce the progress so that the students can learn more. If no progress is made, we intensify teaching to achieve progress. If progress is slow, we slow down the speed of our teaching. 3. We use tests to determine what students have learnt or not learnt in the class. Tests show the aspects of the course or lesson that the students have learnt. They also show areas where learning has not taken place. Thus, the teacher can re-teach for more effective learning. 4. Tests are used to place students/candidates into a particular class, school, level, or employment. Such tests are called placement tests. The assumption here is that an individual who performs creditably well at a level can be moved to another level after testing. Thus, we use tests to place a pupil into primary two, after he/she has passed the test set for primary one, and so on. 5. Tests can reveal the problems or difficulty areas of a learner. Thus, we say we use tests to diagnose or find out the problems or difficulty areas of a student

183 or pupil. A test may reveal whether or not a learner, for example, has a problem with pronouncing a sound, solving a problem involving decimal, or constructing a basic shape, e.g. a triangle, etc. 6. Tests are used to predict outcomes. We use tests to predict whether or not a learner will be able to do a certain job, task, and use language to study in a university or perform well in a particular school, college, or university. Examination: The dictionary of education (1959) by Good defines examination as "An appraisal of ability, achievement, or present status in any respect; or the instrument used in making such an appraisal." International Dictionary of Education (1978) by G. Tarry Page and J.B. Thomas explains the concept of examination as "(1) Assessment of ability, achievement or present performance in a subject. (2) Instrument of assessment can be long easy or mixed form of assessment. May be used for qualifying for entrance to professions and higher education" Functions of Examination: 1. To evaluate the achievement of the students. 2. To measure personality. 3. To measure the efficiency of the teacher and the school. 4. To help in diagnosis. 5. To act as incentive. 6. To help in prognosis 7. To provide uniformity of standard. 8. To help in guidance 9. To measure fitness for admission to higher course. 10. To help in selection by competition 11. Study of every subject. 12. Parent's point of view.

184 13. To certify competency. 14. To link schools with the world. Exam Vs Tests : The difference between exam and test is mostly in the usage of the terms. Test and exam are most of the times used as synonyms. That is not completely wrong as in the field of education test is a series of questions that measures the knowledge of the student on a particular lesson. Exam is a more formal form of test that measures the knowledge of a student on a number of lessons. As you can see, in the educational field, both are inspecting the knowledge of the student. However, depending on the seriousness or the formality of this examination you have to use the two words appropriately. The two terms are used frequently in other fields such as medical field too. Let us try to understand more about each term and the implied difference between both. According to the American Heritage Dictionary test means 'a series of questions, problems, or physical responses designed to determine knowledge, intelligence, or ability.' A test, as we discussed earlier, is a short exam that a teacher gives to his or her students at the end of a lesson. A teacher gives this test in order to understand how much of what he or she has taught has gone into the students' minds. A test is not very formal. Usually, this is held at the class level. A teacher usually takes a period of his or her teaching time to conduct this sort of test. The students have to answer some questions that evaluate the level of each student's understanding of the lesson. This can be a written test or an oral test. Other than in the field of education, the word test is also used in other field such as the field of medicine. For example, when you give your blood to a lab to check if everything is alright in your body by examining the blood, that procedure is called a blood test. Also, when you want to check your eyesight, the procedure involved is known as an eye test. Then, if you remember the procedure you had to follow when obtaining your driving license, there was a driving test involved. That test checked how much you could perform the activity of driving. So, a test can also be a test of actions.

185 Forms of Difference Exam Test Meaning Exam refers to a procedure Test refers to a procedure where your knowledge about where your knowledge is a number of lessons is tested. tested about a lesson. Nature Exams are more formal Tests are less formal in nature. in nature. Form Exam is usually written. Test can be a written, oral or Some written exams have a practical test in form. practical test attached to it too. Uses in the field Exam is usually used in the Test is used in fields such as educational field. medicine other than the educational field. As you can see, in the field of education, both exam and test refers to the activity that is given to you by your teacher to test your knowledge. With each word the formality changes. Test is used in more fields that the field of education. Basically both have same types of functions. 4.1.6. Formative and Summative Evaluation, Curriculum based Measurement: Assessment is the process of gathering data. More specifically, assessment is the ways instructors gather data about their teaching and their students' learning (Hanna & Dettmer, 2004). The data provide a picture of a range of activities using different forms of assessment such as: pre-tests, observations, and examinations. Once these data are gathered, you can then evaluate the student's performance. Evaluation, therefore, draws on one's judgment to determine the overall value of an outcome based on the assessment data. It is in the decision-making process then, where we design ways to improve the recognized weaknesses, gaps, or deficiencies. There are mainly two types of evaluation conduct in the class room situation namely summative and formative evaluation. This present discourse will discuss in details about summative and formative evaluation. Summative Evaluation: Summative assessment takes place after the learning has been completed and provides information and feedback that sums up the teaching and learning process.

186

Typically, no more formal learning is taking place at this stage, other than incidental learning which might take place through the completion of projects and assignments. According to A.J. Nitko (1983), “summative evaluation describes judgements about the merits of an already completed programme, procedure or product”. In the words of Gilbert Sax (1989), “a summative evaluation can provide evidence that the programme is satisfactory and should be continued for next year’s students or that student learning and learning attitudes are so negative that a new programme is needed”. A perusal of the above definitions shows that the summative evaluation has the following chief elements: 1. There should be some instructional programme before summative evaluation, 2. The instructional programme should be for the attainment of some objectives. 3. Summative evaluation is done at the end or completion of a particular instructional programme whose duration may vary from a semester to whole year. 4. Summative evaluation should check whether there has been learning or not. If the answer is yes, then what is the quantity and quality of the learning in relation to predetermined objectives? 5. Summative learning provides feedback to the classroom teacher for the success or failure of the programme or and of the student. Chief Characteristics of the Summative Evaluation: 1. It lends to the use of well-defined evaluation designs. 2. It focuses on analysis. 3. It provides descriptive analysis. 4. It tends to stress local effects. 5. It is unobtrusive and non-reactive as far as possible. 6. It is concerned with broad range of issues. 7. Its instruments are reliable and valid.

187 Types of Summative Assessment: ❖ Examinations (major, high-stakes exams) ❖ Final examination (a truly summative assessment) ❖ Term papers (drafts submitted throughout the semester would be a formative assessment) ❖ Projects (project phases submitted at various completion points could be formatively assessed) ❖ Portfolios (could also be assessed during its development as a formative assessment) ❖ Performances ❖ Student evaluation of the course (teaching effectiveness) ❖ Instructor self-evaluation High-stakes summative assessments typically are given to students at the end of a set point during or at the end of the semester to assess what has been learned and how well it was learned. Grades are usually an outcome of summative assessment: they indicate whether the student has an acceptable level of knowledge-gain—is the student able to effectively progress to the next part of the class, to the next course in the curriculum, to the next level of academic standing. Summative assessment is more product-oriented and assesses the final product, whereas formative assessment focuses on the process toward completing the product. Once the project is completed, no further revisions can be made. If, however, students are allowed to make revisions, the assessment becomes formative, where students can take advantage of the opportunity to improve. Formative Evaluation: Formative assessment provides feedback and information during the instructional process, while learning is taking place, and while learning is occurring. Formative assessment measures student progress but it can also assess your own progress as an instructor. For example, when implementing a new activity in class, you can, through observation and/or surveying the students, determine whether or not the activity should be used again (or modified). A primary focus of formative assessment is to identify areas that may need improvement. These assessments typically are not graded and act as a gauge to students’ learning progress and to determine teaching effectiveness (implementing appropriate methods and activities).

188 In another example, at the end of the third week of the semester, you can informally ask students questions which might be on a future exam to see if they truly understand the material. An exciting and efficient way to survey students' grasp of knowledge is through the use of clickers. Clickers are interactive devices which can be used to assess students' current knowledge on specific content. For example, after polling students you see that a large number of students did not correctly answer a question or seem confused about some particular content. At this point in the course you may need to go back and review that material or present it in such a way to make it more understandable to the students. This formative assessment has allowed you to "rethink" and then "re-deliver" that material to ensure students are on track. It is good practice to incorporate this type of assessment to "test" students' knowledge before expecting all of them to do well on an examination. Following are the implications of the above definitions for the class room teacher: 1. Formative evaluation is done during an instructional programme. 2. The instructional programme should aim at the attainments of certain objectives during the implementation of the programme also. 3. Formative evaluation is done to monitor learning and modifying the programme if needed before its completion. 4. Formative evaluation is for current students.

Characteristics of Formative Evaluation: 1. It relatively focuses on molecular analysis. 2. It is cause seeking. 3. It is interested in the broader sense of experiences of the programme users. 4. Its design is exploratory and flexible. 5. It tends to ignore the local effects of a particular programme. 6. It seeks to identify influential variables. 7. It requires analysis of instructional material for mapping the hierarchical structure of the learning tasks and actual teaching of the course for a certain period. Types of Formative Assessment: ❖ Observations during in-class activities; of student's non-verbal feedback during lecture

189 ❖ Homework exercises as review for exams and class discussions. ❖ Reflections journals that are reviewed periodically during the semester. ❖ Question and answer sessions, both formal—planned and informal—spontaneous ❖ Conferences between the instructor and student at various points in the semester ❖ In-class activities where students informally present their results. ❖ Student feedback collected by periodically answering specific question about the instruction and their self-evaluation of performance and progress. Some of the instructional strategies that can be used formatively include the following: Criteria and goal setting : In order to be successful, students need to understand and know the learning target/goal and the criteria for reaching it. Establishing and defining quality work together, asking students to participate in establishing norm behaviours for classroom culture, and determining what should be included in criteria for success are all examples of this strategy. Using student work, classroom tests, or exemplars of what is expected helps students understand where they are, where they need to be, and an effective process for getting there. Observations: Observations assist teachers in gathering evidence of student learning to inform instructional planning. This evidence can be recorded and used as feedback for students about their learning or as anecdotal data shared with them during conferences. Questioning strategies: Asking better questions allows an opportunity for deeper thinking and provides teachers with significant insight into the degree and depth of understanding. Questions of this nature engage students in classroom dialogue that both uncovers and expands learning. When a comprehensive assessment program at the classroom level balances formative and summative student learning/achievement information, a clear picture emerges of where a student is relative to learning targets and standards. Students should be able to articulate this shared information about their own learning. When this happens, student-led conferences, a formative 1 assessment strategy, are valid. The more we know about individual students as they engage in the learning process, the better we can adjust instruction to ensure that all students continue to achieve by moving forward in their learning.

190 Difference between Summative and Formative Evaluation: Gloria, Hitchok and others (1986) state the difference between the summative and formative evaluation in these words, "it is fairly straight forward to produce an 'ideal' type of either a summative or a formative profile. It is far more difficult to combine the two into one unified system. The underlying of the two appears difficult to reconcile". Following are the main differences between these two types of evaluation: 1. They differ in purpose, nature and timing. 2. Summative evaluation is the terminal assessment of performance at the end of instruction but formative evaluation in the assessment made during the instructional phase to inform the teacher about progress in learning and what more is to be done, 3. The summative evaluation limits the use of profiles and record of achievement but they are regularly used informative evaluation. 4. The main consideration in summative evaluation is the determination of the extent to which the examinee has mastered the knowledge and skills associated with a course. On the other hand, the main consideration informative evaluation is to reveal the processes by which the examinee achieved these outcomes. 5. In summative evaluation, the assessment is done to test learning outcomes against a set of objective criteria without revealing the details of the route to the teacher which the student followed in reaching that point. Formative evaluation takes the form of a dialogue between the student and teacher in which the task is determined by both. 4.1.7. Revisiting Key Concepts in School evaluation Marks: Marking systems are frequent subjects of educational controversy because the process is difficult, because different educational philosophies call for different marking systems, and because the task is sometimes disagreeable. Claims that marks diminish the effectiveness of the educational system do not seem to be generally valid, and properly assigned marks to measure the degree of attainment of the basic objectives

191 of education. Two basic systems of marking, relative and absolute, are compared, and means of improving marking through institutional standardization are discussed. Pass-fail grading and other alternatives to conventional marking systems are evaluated. Weighting of various measures of achievement in assigning marks is discussed, and detailed computational procedures for assigning marks are developed. Credit: Credit Point refers to the 'Workload' of a learner. It is an index of the number of learning hours deemed for learning of a certain segment. These learning hours broadly classified into hours spent on attending actual lectures/tutorials/laboratory work/seminar etc and notional hours spent on reading, reflecting, discussing, attending counselling sessions, watching especially prepared videos, writing assignments, preparing for examinations, etc.. 1 credit point corresponds to 30 to 40 learning hours. A single course may be assigned between 2 to 8 credit points taking into account as to how many hours it would take for a learner to complete a single course successfully. The learner is said to have earned the credits on successful completion of the course including the evaluation. Credit completion and Credit accumulation: Credit Completion or Credit Acquisition takes place after the learner has successfully cleared all the evaluation criteria with respect to a single course. Thus, a learner who successfully completes a 4 CP (Credit Point) course will be considered to have collected or acquired 4 credits. His level of performance above the minimum prescribed level (viz, grades / marks obtained) has no bearing on the number of credits collected or acquired i.e. if, for a given course which carries 4 credits and the passing marks are 35 out of 100, then whether a student scores 40 out of 100 or 90 out of 100, the credits earned by both the students are 4. A learner keeps on adding more and more credits as he completes successfully more and more courses. Thus the learner 'accumulates' course wise credits. Credit Bank: The process of accumulating Credits over a period of time, leads to the idea of a "Credit Bank". In short, this would involve maintaining all the Credit-related transactions of an individual. Credit Banking, when practiced would facilitate learner mobility and credit transfers.

192 Credit transfer: Performance transfer: When a learner successfully completes a certain academic program, he/she is allowed to transfer his /her past performance to another academic program having some common courses and Performance transfer is said to have taken place. Block transfer: Block transfer refers to a group of courses, such as a completed certificate or diploma program that are accepted for transfer of credit into a degree program. Dimensions of Credit Transfer: When a learner successfully completes the courses included in an academic program at a certain level, he/she is allowed to transfer his/her credits in some of these courses to another same-level academic program having these courses in common. This is referred to as 'Horizontal or Lateral Credit Transfer'. 'Vertical Credit Transfer', sometimes is also referred to as 'Career Laddering' is said to occur when a learner's performance in some courses within a certain academic program at a particular level is carried over to a higher-level academic program having these or equivalent courses in common. Credit Transfer is conceived as operating along lateral (or horizontal) and vertical transfers. Grading: Grading in education is the process of applying standardized measurements of varying levels of achievement in a course. Another way the grade point average (GPA) can be determined is through extracurricular activities. Grades can be assigned as letters (generally A through F), as a range (for example 1 to 6), as a percentage of a total number of questions answered correctly, or as a number out of a possible total (for example out of 20 or 100). The grading system is a methodology by which the marks secured by a student are replaced by some grade which is an alphabet. The grading scale is a varying component which varies between countries and institutions also. For the implementation of grading system credit based system will be used i.e. the whole curriculum will be divided into various subjects to be studied in a semester or year.

193 Whereas each subject will have its own weightage in the semester or year; the weightage of a particular subject is known as credits. In the current scenario, every academic institution is trying to impose grading system and Ministry of Human Resource Development (MHRD) is also in the favour of grading system not only in higher education but in school education also. Central Board of School Education (CBSE) has already adopted grading system in their examination pattern. The major intention behind grading system is to reduce the mental stress among the students, reduction in the accident as well as depression cases, inclusion of choice based system etc. Since every coin has two sides therefore grading system is also having its pros and cons. Absolute v/s Relative Grading: These are the two types of grading systems where absolute grading system is a percentage based method for awarding grades. In this method there will be a specific range of percentage and each range associated with a particular grade. Whereas relative grading is a rank based or curve based method for providing grades i.e. the grades will be provided on the basis of the performance of the group or class in a particular subject or course. It encompasses standard deviation which is a statistical tool. Generally a university in India follows both types of grading systems i.e absolute and relative, The criterion behind choosing absolute or relative grading is the total number of the students in a group. If the group is having students less than twenty than absolute grading system will be followed whereas for the group above twenty; any one of the grading system can be followed preferably relative. GPA v/s CGPA: Semester Grade Point Average (SGPA) indicates the performance of the student in current semester whereas. Cumulative Grade Point Average (CGPA) indicates the overall performance of the student including current performance. Merits of Absolute Grading: ❖ Allows grade to be directly correlated to student's achievement. ❖ There is no chance of manipulation of grades.

194 ❖ Easy to understand as well as easy to implement. ❖ It can be applicable to any group irrespective of group's strength. ❖ It increases the tendency of labour within group because to attain the desirable grade one has to attain a minimum percentage of awards. ❖ Reduces competition between students as all students having marks between fixed ranges of percentage will get the same grade. For example all students having marks in a subject between 91 and 100 will be awarded with A+ grade. Demerits of Absolute Grading: ❖ It can allow all students to receive the same grade which creates problem in competitive circumstances for the judgment of the potential of the students. ❖ Since it's a static system for the award of grades irrespective of the nature of subject therefore sometime it becomes very challenging to get high percentage in theoretical subjects in comparison with practical or mathematical subjects. ❖ The grades are somehow influenced by the evaluation style of the instructor i.e. leniency or strictness in the award of marks will certainly affect the grade. Merits of Relative Grading: ❖ The students will get the grades based upon their performance relative to their peers. ❖ Useful as well as required for today's competitive environment. ❖ It will reflect the actual performance of the students irrespective of the nature of the subject. Demerits of Relative Grading: ❖ It cannot be applied to a small group of students.. ❖ It undergoes moderation of grads to obtain the normal bell shaped curve, which sometimes affects the actual performance of the students. ❖ The actual performance of the student in a particular subject remains hidden.

Alternate Certification:

Alternate certification is a process by which a person is awarded a teaching licence even “though that person has not completed a traditional teacher certification programme.

195 Alternative certification programme first appeared in the 1980s. A deadline in the number of students seeking a degree in education was creating a shortage of teachers in America elementary and high schools. States began to search for a way to recruit and train people who had already earned a four year degree and wanted to become teachers.

Transparency: Transparency means improvement of reporting to schools, families and students about student achievement and school performance and improved public reporting of individual and comparative school performance as well as reporting on the performance of schooling overall. Internal External Proportion: The internal external proportion means mix of assessment. It will be better understood through example, student A studies mathematics and sciences about one third of credits are likely to be internally assessed, and two thirds by external examinations. Student B studies mainly English and the social sciences (geography, history, and economics) - typically about half of the credits will be internally assessed, and half by externally examinations. Student C studies mainly the arts—about 60% of credits are likely to be internally assessed, and 40% externally assessed.

Impacts of standards alignment : Some of the changes will impact on the mix of internal and external assessment. ❖ Achievement standards only will be used to assess curriculum linked knowledge and skills. ❖ Unit standards will cover other skills and knowledge. ❖ In each subject there will be a maximum of three externally assessed standards. This will change the ratio of internally and externally assessed standards that are available in some subjects. There will be an examination for each externally assessed standard. Three externally assessed standards will be examined in a three hour examination. This

196 will give students sufficient time to complete the examination and ensure assessment is reliable. Mix of internal and external assessment and learning experiences: At the general level, not all students cope with the pressure of external examinations. The major benefit of internal assessment is assessment when students are ready, used in inspects of learning that simply cannot be assessed adequately by external examination. Many of these could, of course, be externally assessed by having outsiders in to look at performance. examine things being produced or to watch demonstrations. This approach carries considerable cost and disruption to programmes without adding a significant increase in confidence in the accuracy of the assessment. We are happy to have our internal assessment moderated and find it reassuring and useful. Governance and Implementation: The common policy challenges that emerge concerning governance and implementation are: ensuring articulations within the evaluation and assessment framework; developing competencies for evaluation and for using feedback; securing links with classroom practice; and overcoming the challenges of implementation. Student Assessment: Several common policy challenges arise concerning student assessment: aligning educational standards and student assessment; balancing external assessments and teacher-based assessments in the assessment of learning and integrating student formative assessment in the evaluation and assessment framework. Teacher Evaluation: Common policy challenges in teacher evaluation are: combining the improvement and accountability functions of teacher evaluation; accounting for student results in evaluation of teachers; and using teacher evaluation results to shape incentives for teachers. School Evaluation: School evaluation presents common policy challenges concerning: aligning external evaluation of schools with internal school evaluation; providing balanced public reporting on schools and improving data handling skills of school agents.

197 System Evaluation: Common policy challenges for evaluation of education systems are: meeting information needs at system level; monitoring key outcomes of the education system; and maximising the use of system-level information. Improvement option is the basic criteria in the assessment and evaluation for updating all elements of education. 4.1.8 Let us Sum-up: Assessment means basing decisions about curriculum, pedagogy, staffing, advising, and student support upon the best possible data about student learning and the factors that affect it. A process that involves 1) establishing goals for student learning, 2) gathering qualitative and quantitative evidence for how well students meet those goals, and 3) uses the information to improve. Assessment is the very important aspect of school system because without assessment we cannot understand the learning outcomes. We can see this assessment from the existing point of view and from the conventional point of view. The conventional assessment means summative types of assessment. Whereas updated assessment means formative assessment supported by constructivist point of view.

Assessment for Learning offers an alternative perspective to traditional assessment in schools. Simply put, Assessment for Learning shifts the emphasis from summative to formative assessment, from making judgments to creating descriptions that can be used in the service of the next stage of learning.

Whereas assessment of learning refers to

the predominant kind of assessment in schools is Assessment of Learning. Its purpose is summative, intended to certify learning and report to parents and students about students' progress in school, usually by signalling students' relative position compared to other students

Assessment:

The process of gathering information to monitor progress and make educational decisions if necessary. An assessment may include a test, but also includes methods such as observations, interviews, behaviour monitoring, etc.

Evaluation:

Procedures used to determine whether the subject (i.e. student) meets preset criteria, such as qualifying for special education services. This uses assessment (remember that an assessment may be a test) to make a determination of qualification in accordance with a predetermined criteria.,1

198 Measurement, beyond its general definition,

refers to the set of procedures and the principles for how to use the procedures in educational tests and assessments. Some of the basic principles of measurement in educational evaluations would be raw scores, percentile ranks, derived scores, standard scores, etc.

Test: A method to determine a student's ability to complete certain tasks or demonstrate mastery of a skill or knowledge of content. Some types would be multiple choice tests, or a weekly spelling test. While it is commonly used interchangeably with assessment, or even evaluation, it can be distinguished by the fact that a test is one form of an assessment.

Examination: The dictionary of education (1959) by Good defines examination as "An appraisal of ability, achievement, or present status in any respect; or the instrument used in making such an appraisal."

Formative Assessment: Formative assessment provides feedback and information during the instructional process, while learning is taking place, and while learning is occurring. Formative assessment measures student progress but it can also assess your own progress as an instructor.

Summative Assessment: Summative assessment takes place after the learning has been completed and provides information and feedback that sums up the teaching and learning process.

Typically, no more formal learning is taking place at this stage, other than incidental learning which might take place through the completion of projects and assignments. There is different aspect of assessment such as grading, credit, improvement option etc. According to the situation and suitability anything may be used. 4.1.9. Check your progress: 1.

Refererences 5.1 Introduction : The word "assessment" has taken on a variety of meanings within education. The term can refer to the process teachers use to grade student course assignments, to standardize testing imposed on institutions as part of increase pressure for external accountability, or to any activity designed to collect information on the success of a program, course, or curriculum. Definition:

Assessment is the systematic collection and analysis of information to improve student learning.

Why Assess? .. To Improve Student Learning Assessment can facilitate improvement of pupils in classes and in their programs Or constantly variety of venues. When faculty members are directly considering what worked well and what didn't, and involved in the development, implementation, and using those observations and impressions to make analysis of assessment activities, a number of specific changes is ushered in the curriculum. What formal assessment benefits can result are as follows:

203 Potential Benefits of Assessment: Because Assessment can provide information about the knowledge and skills students have as they enter a course Because Assessment can provide reliable data on student learning and information from student evaluations Because Assessment can make available richer data about the effects of the curriculum or teaching methods Because Assessment can yield more reliable data about instruction Because Assessment can provide evidence that faculty members make a difference in student learning. Because Assessment can offer a larger view of student needs and accomplishments Teachers Can design instruction to target the knowledge and skill levels students should have upon finishing a course and better determine the levels of thinking or reasoning appropriate for the course. Teachers Can rely less on the comments that appear on student evaluations as indicators of success in teaching. Teachers Can engage in more productive conversations about the status of student achievement and make better decisions about how it might be improved. Teachers Can make reliable decisions about innovations or experimental projects in instruction and share successes more easily Teachers Can enjoy greater satisfaction in their work as educators. Teachers Can identify directions for future instructional development.

204 5.2

Objectives After studying this unit one will be able to : • Explain the concept of

Assessment and its beneficial effect on education. • Enlist the different Assessment Strategies and Practices. • Differentiate between the typology and levels of Assessment. • Elucidate the processes of analysis, reporting, interpretation, documentation, feedback and pedagogic decisions. • Understand the needs of diverse learners and their assessment. • Describe different forms of school exam.

5.3 Assessment: Strategies and Methods

The different types of Assessment strategies that are in use in the present constructivist teaching learning scenario are being discussed briefly:

Observations
Description : Observation as a method of assessment is an unobtrusive tool that can yield significant information about how and why students learn. You may choose to observe any relevant interactive event, such as classes, club meetings, or social gatherings. This tool is generally used when you are interested in how students study, are concerned about the effectiveness of study sessions or other supplementary activities, or when you are focusing on the relationship between out-of-class behavior and in-class performance. Data collected through observation can be correlated with test scores and/or course grades to help provide further insight into student learning.

Strengths and Weaknesses: Data collected through observation can yield important insight into student behavior that may be difficult to gauge through other assessment methods. This method is typically designed to describe findings within a particular context and often allows for interaction between the researcher and students that can add depth to the information collected. It is especially useful for studying subtleties of attitudes and behavior. Observed data, however, is not precise and cannot be generalized to larger populations. Conclusions may be suggestive rather than definitive, and others may feel that this method provides less reliable data than other collection methods.

205 Performance Assessment
Description: Performance assessment uses student activities to assess skills and knowledge. These activities include class assignments, auditions, recitals, projects, presentations and similar tasks. At its most effective, performance assessment is linked to the curriculum and uses real samples of student work. This type of assessment generally requires students to use critical thinking and problem-solving skills within a context relevant to their field or major. The performance is rated by faculty or qualified observers and assessment data collected. The student receives feedback on the performance and evaluation.

Strengths and Weaknesses: Performance assessment can yield valuable insight into student learning and provides students with comprehensive information on improving their skills. Communication between faculty and students is often strengthened, and the opportunity for students' self-assessment is increased. Performance assessment, like all assessment methods, is based on clear statements about learning objectives. This type of assessment is also labor-intensive, is sometimes separate from the daily routine of faculty and student, and may be seen as an intrusion or an additional burden. Articulating the skills that will be examined and specifying the criteria for evaluation may be both time-consuming and difficult.

Portfolio Evaluations
Description: Portfolios are collections of student work over time that are used to demonstrate student growth and achievement in identified areas. Portfolios can offer information about student learning, assess learning in general education and the major, and evaluate targeted areas of instruction and learning. A portfolio may contain all or some of the following: research papers, process reports, tests and exams, case studies, audiotapes, videotapes, personal essays, journals, self-evaluations and computational exercises. Portfolios are often useful and sometimes required for certification, licensure, or external accreditation reviews.

Strengths and Weaknesses: Portfolios not only demonstrate learning over time, but can be valuable resources when students apply to graduate school or for jobs. Portfolios also encourage students to take greater responsibility for their work and open lines of discussion between faculty and students and among faculty involved in the evaluation process. Portfolios are, however, costly and time-consuming and require extended effort on the part of both students and faculty. Also, because portfolios contain

206 multiple samples of student work, they are difficult to assess and to store and may, in some contexts, require too much time and effort from students and faculty alike.

Pre-test/Post-test Evaluation Description: This method of assessment uses locally developed and administered tests and exams at the beginning and end of a course or program in order to monitor student progression and learning across pre-defined periods of time. Results can be used to identify areas of skill deficiency and to track improvement within the assigned time frame. Tests used for assessment purposes are designed to collect data that can be used along with other institutional data to describe student achievement

Strengths and Weaknesses: Pre-test/post-test evaluations can be an effective way to collect information on students when they enter and leave a particular program or course, and provide assessment data over a period of time. They can sample student knowledge quickly and allow comparisons between different students groups, or the same group over time. They do, however, require additional time to develop and administer and can pose problems for data collection and storage. Care should be taken to ensure that the tests measure what they are intended to measure over time (and that they fit with program learning objectives) and that there is consistency in test items, administration and application of scoring standards.

Reflective Essays Description: Reflective essays may be used as an assessment tool to gauge how well students are understanding class content and issues. They are generally short essays (5 to 10 minutes) on topics related to the course curriculum and may be given as in-class assignments or homework. Reflective essays may be voluntary or required, open-ended questions on surveys required in student portfolios or capstone composition courses.

Strengths and Weaknesses: Reflective essays as an assessment tool can offer data on student opinions and perspectives at a particular moment in a class. Essays will provide a wide array of different responses and might lead to increased discussion among faculty and students. On the other hand, poorly worded, ambiguous questions will yield little, and opinions and perceptions may vary in accuracy. Analysis of essay content also takes additional time and expertise.

207 Standardized and Local Test Instruments Description: Selecting a standardized instrument (developed outside the institution for application to a wide group of students using national/regional norms and standards) or a locally-developed assessment tool (created within the institution, program or department for internal use only) depends on specific needs and available resources. Knowing what you want to measure is key to successful selection of standardized instruments, as is administering the assessment to a representative sample in order to develop local norms and standards. Locally-developed instruments can be tailored to measure specific performance expectations for a course or group of students.

Strengths and Weaknesses: Locally-developed instruments are directly linked to local curriculum and can identify student performance on a set of locally-important criteria. Putting together a local tool, however, is time-consuming as is development of a scoring key/method. There is also no comparison group and performance cannot be compared to state or national norms. Standardized tests are immediately available for administration and, therefore, are less expensive to develop than creating local tests from scratch. Changes in performance can be tracked and compared to norm groups and subjectivity/misinterpretation is reduced. However, standardized measures may not link to local curricula and purchasing the tests can be expensive. Test scores may also not contain enough locally-relevant information to be useful.

Student Surveys and Exit Interviews Description: Surveys and interviews ask students to respond to a series of questions or statements about their academic experience. Questions can be both open-ended (respondents create answers) and close-ended (respondents answer from a list of simple and unambiguous responses). Surveys and interviews can be written or oral (face-to-face) or phone. Types of surveys include in-class questionnaires, mail questionnaires, telephone questionnaires, and interviews. Interviews include structured, in-person interviews and focus group interviews.

Strengths and Weaknesses: Surveys can be relatively inexpensive and easy to administer, can reach participants over a wide area, and are well suited for short and non-sensitive topics. They can give you a sense of what is happening at a given moment in time and can be used to track opinions. Data is reasonably easy to collect and tabulate, yet the sample may not be representative of the population (particularly with a low response rate). Ambiguous, poorly written items and insufficient responses may not generate enough

208 detail for decision making. An interview can follow-up on evasive answers and explore topics in-depth; collecting rich data, new insights, and focused details. It can, however, be difficult to reach the sample and data can be time-consuming to analyze. Information may be distorted by the respondent, who may feel a lack of privacy and anonymity. The success of the interview depends ultimately on the skills of the interviewer.

Group Discussions Description: These are structured discussions among homogeneous groups of 6-10 individuals who respond to specific open-ended questions designed to collect data about the beliefs, attitudes and experiences of those in the group. This is a form of group interview where a facilitator raises the topics for discussion and collects data on the results. Emphasis is on insights and ideas.

Strengths and Weaknesses: Focus groups can provide a wide variety of data about participants' experiences, attitudes, views and suggestions, and results can be easily understood and used. These groups allow a small number of individuals to discuss a specific topic in detail, in a non-threatening environment. Data collected in this way, however, is not useful for quantitative results, and qualitative data can be time-consuming and difficult to analyze because of the large amount of non-standardized information. Ultimately, the success of this method depends on a skilled, unbiased moderator and appropriate groups of participants.

Open Book Assignments Description: Such assignments offer students the opportunity to put together the knowledge and skills they have acquired in the major, provide a final common experience for majors, and offer teachers a way to assess student achievement across a number of discipline-specific areas. Open Book assignments are generally designed for seniors in a major or field to complete in the last semester. Their purpose is to integrate knowledge, concepts and skills that students are expected to have acquired in the program during the course of their study. This is obviously a curricular structure as well as an assessment technique and may consist of a single test (a "capstone" test) or a small group of tests designed to measure competencies of students who are completing the program. A senior assignment is a final culminating project for 209 seniors such as a performance portfolio or a thesis that has the same integrative purpose as the capstone test.

Course-embedded Assessment -Projects, Surprise tests, Untimed tests Description: Course-embedded assessment refers to methods of assessing student learning within the classroom environment, using course goals, objectives and content to gauge the extent of the learning that is taking place. This technique generates information about what and how students are learning within the program and classroom environment, using existing information that instructors routinely collect (test performance, short answer performance, quizzes, essays, etc.) or through assessment instruments introduced into a course specifically for the purpose of measuring student learning.

Strengths and Weaknesses: This method of assessment is often effective and easy to use because it builds on the curricular structure of the course and often does not require additional time for data collection since the data comes from existing assignments and course requirements. Course-embedded assessment does, however, take some preparation and analysis time and, while well documented for improving individual courses, there is less documentation on its value for program assessment.

OTHER INNOVATIVE MEASURES Scoring Rubrics Description: Scoring rubrics are typically grids that outline identified criteria for successfully completing an assignment or task and establish levels for meeting these criteria. Rubrics can be used to score everything from essays to performances. Holistic rubrics produce a global score for a product or performance. Primary trait analysis uses separate scoring of individual characteristics or criteria of the product or performance.

Strengths and Weaknesses: Scoring rubrics allow the instructor to efficiently and consistently look at complex products or performances and to define precise outcomes and expectations. They also are easily shared with students. However, developing an effective rubric can be time-consuming and often requires ongoing edits to fine tune criteria and anticipated outcomes. Training raters to use the scoring rubrics in a consistent manner also involves a significant time commitment.

210 Alumni Surveys Description: Surveying department alumni can provide a wide variety of information about program satisfaction, how well students are prepared for their careers, what types of jobs or graduate degrees majors have gone on to obtain, starting salaries for graduates, and the skills that are needed to succeed in the job market or in graduate study. These surveys provide the opportunity to collect data on which areas of the program should be changed, altered, improved or expanded. Strengths and Weaknesses: Alumni surveying is usually a relatively inexpensive way to collect program data from individuals who have a vested interest in helping you improve your program as well as offering the opportunity for improving and continuing department relationships with program graduates. However, without an easily accessible and up-to-date directory of alumni, they can be difficult to locate. It also takes time to develop an effective survey and ensure an acceptable response rate. Institutional Data Description: A variety of departmental and student data are routinely collected at the university level. These data can enhance and elaborate on data you collect in the department. Institutional data can tell you whether the program is growing, what the grade point average is for majors in the program, and what the retention rate is for your students. Strengths and Weaknesses: Institutional data are generally easily accessible and readily available .. Student and departmental data are collected on a systematic and cyclical schedule that can offer you both current and longitudinal information. On the other hand, these data sets are generally large and may be difficult to sort through, particularly for those individuals who are not used to working through large databases. The data may be less useful to specific departments or programs because the information collected is very often general (age, gender, race, etc.) and may not directly relate to program goals and objectives. Transcript Analysis Description: Transcript analysis involves using data from student databases to explore course-taking or grade patterns of students. This tool can give you a picture of students at a certain point in their academic careers, show you what classes students took and in what order, and identify patterns in student grades. In sum, transcript 211 analysis gives you a more complete picture of students' actual curricular experiences. Specific information can be drawn from transcripts to help answer research questions, and course pattern sequences can be examined to see if there is a coherence to the order of courses taken. Strengths and Weaknesses: Transcript analysis is an unobtrusive method for data collection using an existing student database. This information can be linked to other variables such as sex or major, or used to measure outcomes. It is important to keep in mind, however, that course patterns may be influenced by other variables in students' lives that don't show up on their transcripts. Also, solutions that arise from results of the analysis may not be practical or easily implemented. It is critical to have specific questions whose answers can lead to realistic change before conducting the analysis. 5.4 Typology and Levels of Assessment Item : Assessment can be either formal or informal depending upon the level and nature of activities designed to assess students' achievement. The different types and levels of assessment are: Direct method "require students to display their knowledge and skills as they respond to the instrument itself. Objective tests, essays, presentations, and classroom assignments all meet this criterion Indirect methods such as surveys and interviews ask students to reflect on their learning rather than to demonstrate it" (Palomba and Banta, 1999, pp. 11-12). Qualitative measures "rely on descriptions rather than statistical interpretation. The different types of Qualitative Assessment Techniques are - ethnographic studies - participant observations - open-ended questions on surveys and interviews - writing sample - exit interviews - formal recitals Quantitative measures assess teaching and learning by collecting numbers" and analyzing numeric data using statistical techniques. The different types of Quantitative Assessment Techniques are- -GPA -primary trait analysis scores - exam scores

5.6 Analysis, Reporting, Interpretation, Documentation, Feedback and Pedagogic Decisions The American Association of Higher Education (AAHE) asserts in its "Nine Principles of Good Practice for Assessing Student Learning" (1992) that ...

214 ... Assessment makes a difference when it begins with issues of use and illuminates questions that people really care about. An assessment plan's value to the department lies in the evidence it offers about overall department or program strengths and weaknesses, and in the evidence it provides for change (Wright, 1991). The key factors in attaining the real value of all your work is to make the most out of the information you collect through appropriate analysis and interpretation.

5.5.1. Best Ways to Analyze, Report, Interpret and Document Assessment Information are: In its faculty handbook on program assessment, the University of California at Chico (1998) recommends:

- Presenting data in relation to identified goals and objectives
- Selecting and using appropriate procedures for data analysis
- Using qualitative and quantitative methods to present a well-balanced picture of the program
- Keeping in mind the audiences who will access and use the data, and varying your analysis and reporting procedures according to the identified audience
- Preparing written statements that identify and elaborate on the pros and cons of the academic program
- Developing recommendations based on analysis of data, and using identified goals as a framework within which to accomplish these changes

Also consider the extent to which your findings can help you answer the following questions :

- What do the data say about your students' mastery of subject matter, of research skills, or of writing and speaking?
- What do the data say about your students' preparation for taking the next step in their careers?
- Are there areas where your students are outstanding? Are they consistently weak in some respects?

215 • Are graduates of your program getting good jobs, accepted into reputable graduate school. 5.5.2 Feedback - The Feedback approach to assessment practices addresses the following issues: 1. Did you have a positive or negative experience implementing your assessment methods? 2. What were students' reactions to the assessment process? 3. What did you find especially effective in the assessment process? 4. What did you particularly dislike about the process? 5. What would you change about the process? Why? 6. What will you do again? Why? 5.5.3 Pedagogic Decisions: In designing Pedagogic Decisions consider and include the following Learning Processes To what learning experiences and strategies will students be exposed to achieve these learning objectives? Assessment Methods By what measure(s) will you know that students are meeting learning objectives? From whom, and at what points, will you gather data? How will the information be collected? Assessment Processes When will you conduct the assessment? Who will be responsible for each component? What is the overall timeline for the assessment plan? Status, Outcomes and What did you find out? How do the data support these Resultsfindings? Decisions, Plans and Based on your findings, what do you plan to do now? Recommendations

216 5.7 School Exam: Examination according to H.C. Barnard and J.A. Lauwreys is "A test of knowledge acquired ,or more generally a means of intellectual capacity or ability There are three types of examination 1) a set of questions to check a pupil's progress on the result of a course of instruction; 2) A mean of qualifying candidates for a certificate or degree in which they are required to attain a certain standard;3)a competitive test on the strength of which a scholarship or award is made to the successful candidate. Examination may be conducted by means of written answer to set questions or by local methods. " School Exams is used to connote the process of estimating learning on the basis of a few questions posed to learners under specified conditions. Specifications in respect of time, duration, mode of questioning. The two landmark in recent school scenario that have exerted potential influence in school system are NCF 2005 and RTE 2009. 5.7.1 Salient Features of NCF 2005. The NCF 2005 emphasizes a National System of Education with special focus on: 1) Values enshrined in the Constitution of India. 2) Reduction of Curriculum Load. 3) Ensuring quality Education For All(EFA) 4) Systemic Changes 4) Common School System The NCF 2005 has recommended five guiding principles for curricular development: a) Connecting Knowledge to life outside school b) Ensuring that learning shifts from rote method. c) Enriching curriculum so that it goes beyond text books. d) Making examination more flexible and integrating them with classroom life. e) Nurturing an overriding identity informed by caring concerns within the democratic polity of the country.

217 Apart from these five guiding principles ,NCF 2005 also emphasizes Learning without Burden. It emphasizes on learning and construction of knowledge. • Correspondence between learner development and learning is intrinsic to curricular practices. • Knowledge is different from information • Organising learning experiences for construction of knowledge and creativity • Connecting knowledge across disciplinary boundaries for insightful construction of knowledge. • Learning experiences for developing critical perspectives on social issues. • Plurality of textbooks and other material incorporating local knowledge mediated through constitutional values and principles. 5.7.2

RTE ACT 2009

The Right of Children to Free and Compulsory Education Act (2009)

or Right to Education Act (RTE) enacted on 4th August 2009, describes the modalities of the importance of free and compulsory education for children between 6 and 14 in India under Article 21A of the Indian Constitution.

The important features are: v Free and Compulsory Education -It is obligatory for the Government to provide free and compulsory elementary education up to class 8th to each and every children. The free education includes the provision of textbooks, uniforms, writing materials, special materials for children with disabilities. v Minimum Standards for Teaching Learning-RTE Act lays down norms and standards relating to Pupil - Teacher Ratios, classrooms, separate toilets for girls, drinking water facility.number of school-working days, working hours of teachers etc. • Admission for all-The Act mandates that every student irrespective of their abilities and disabilities be admitted to school to enable them to come up to age appropriate learning level. v Quantity and Quality of Teachers-It provides for rational deployment of teachers

218 by ensuring the specified Pupil-Teacher Ratio is maintained ,appointment of trained teachers and also ensures that there is no urban-rural imbalance . v No Discrimination and Harassment -The Act prohibits physical punishment and mental harassment, discrimination based on gender, religion, caste, class etc. v All Round Development-RTE emphasizes building child's knowledge ,human potential and talent.. v No Detention-RTE Act mandates that no child can be held back or expelled from school until class 8th. It mandates Continuous Comprehensive Evaluation(CCE) method of assessment. v Justiciable-The RTE Act is justiciable and is backed by a Grievance Redressal Mechanism that gives opportunity to people to take action against non compliance of various provisions of the act. v Establishment of School Management Committees (SMC) to strengthen participatory democracy and governance in elementary education. v Reservation -According to this Act all private schools to reserve 25 percent of the seats for children belonging to socially disadvantaged, economically weak to ensure better inclusion. 5.8.1 Unit End Exercises. 2) Long Answer Type i) Explain the concept of Assessment with special reference to teaching learning situation. ii) Write down the salient features ofNCF 2005. 2) Short Answer Type. i) Differentiate between Portfolio And Open Book Assessment. ii) Enlist four types of assessment mentioning the category of learners 3) Objective Type. i) EF A stands for

219 ii) ----- is an assessment strategy suited for higher education learners. iii) RTE 2009 was enacted under ----- of the Constitution. 5.8.2 Check Your Progress. 1) Name two innovative strategies of Assessment.

.....
.....
..... 2) Enumerate two important clauses of RTE 2009

.....
.....
..... 3) Identify two guiding principles ofNCF200S.

.....
.....
..... 4) State two pedagogic skills that can be assessed.

.....
.....
.....

220 Answers To Check Your Progress. 1) Transcript Analysis, 2) Free and Compulsory Education, No Detention 3) Connectin g Knowledge to life outside school, Ensuring that learning shifts from rote method 4) Status, Outcome and results, Decisions, plans and recommendations 5.9. 3 Netaji Subhas Open University From the Vice-Chancellor's Desk Dear Students, from this Academic Session (2015-17) the Curriculum and Course Structure of B. Ed.- Special Education have been thoroughly revised as per the stipulations which featured in the Memorandum of Understanding (MoU) between the Rehabilitation Council of India (RCI) and the National Council for Teacher Education (NCTE). The newly designed course structure and syllabus is comprehensive and futuristic has, therefore, been contextualized and adopted by NSOU from the present academic session, following the directives of the aforesaid national statutory authorities. Consequent upon the introduction of new syllabus the revision of Self Instructional Material (SIM) becomes imperative. The new syllabus was circulated by RCI for introduction in the month of June, 2015 while the new session begins in the month of July. So the difficulties of preparing the SIMs within such a short time can easily be understood. However, the School of Education of NSOU took up the challenge and put the best minds together in preparing SIM without compromising the standard and quality of such an academic package. It required many rigorous steps before printing and circulation of the entire academic package to our dear learners. Every intervening step was meticulously and methodically followed for ensuring quality in such a time bound manner. The SIMs are prepared by eminent subject experts and edited by the senior members of the faculty specializing in the discipline concerned. Printing of the SIMs has been done with utmost care and attention. Students are the primary beneficiaries of these materials so developed. Therefore, you must go through the contents seriously and take your queries, if any, to the Counselors during Personal Contact Programs (PCPs) for clarifications. In comparison to F2F mode, the onus is on the learners in the ODL mode. So please change your mind accordingly and shrug off your old mindset of teacher dependence and spoon feeding habits immediately.

I would further urge you to go for other Open Educational Resources (OERs) - available on websites, for better understanding and gaining comprehensive mastery over the subject. From this year NSOU is also providing ICT enabled support services to the students enrolled under this University. So, in addition to the printed SIMs, the e-contents are also provided to the students to facilitate the usage and ensure more flexibility at the user end. The other ICT based support systems will be there for the benefit of the learners. So please make the most of it and do your best in the examinations. However, any suggestion or constructive criticism regarding the SIMs and its improvement is welcome. I must acknowledge the contribution of all the content writers, editors and background minds at the SoE, NSOU for their respective efforts, expertise and hard work in producing the SIMs within a very short time. Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor, NSOU

9 Unit - 1 Nature & Significance of Science Structure : 1.1 Introduction 1.2 Objectives 1.3 Nature, Scope, Importance & Value of Science 1.4 Science as an integrated area of study 1.5 Science & Modern Indian Society : Relationship of Science & Society 1.6 Impact of Science with Special reference to issues related with environment, industrialization & Disarmament 1.7 Role of Science for sustainable Development 1.8 Let us sum up 1.9 Check Your Progress 1.10 References 1.1 Introduction Nature implies two things, one is the natural world & the other is character of an individual or a thing. It is the usual way in a person's behavior, i.e, a part of their character & the basic qualities of a thing. It is this meaning of nature with which we are concerned when we deal with the nature of science. When we talk about the nature of all Sciences, we are concerned with their characteristic features. To understand the nature of Sciences, we have to see how Science works. Science is a particular way of understanding the natural world. It extends the intrinsic curiosity with which humans are born. The world in which we live is by and large the same as it has been always. It is the world of sun, light and darkness; the world of earth, land, sea plants and animals; the world of seasons, climate; the world of being born, growing and dying. The world also has the simplest of tools and the most complicated of equipments. There are infinite things and events like these which are governed by science. Human beings have learnt how to live in this world by adjusting to the nature. They explore, understand and change the surroundings according to their needs and requirements. This process of diligently observing, describing, exploring and using the world is science. Children often try to find answers to their questions which begin with "what is it?". Science as a process involves various stages of an activity, establishing steps for gathering information and then retaining it. Two types of skills are required through the process of science-basic skills and special skills. Through these skills, students learn about nature and adjust to it according to their needs and requirements. Thus, a systematic process of learning takes place. Science is an accumulated and systematized learning in general usage restricted to natural phenomenon.

It is an endless series of empirical observations which result in the formation of concepts and theories subject to modification in the light of further empirical observations. Hence Science is both a body of knowledge and the process of acquiring it. Learners should be able to appreciate the contribution of science in the progress of civilization. The appreciation must come as an outcome of science teaching and the teacher must make the learners conscious of the benefits bestowed by science for the comforts of the mankind. The adventures of scientists in exploring the truth should be told by the teachers. The objectives of teaching science have been changing from time to time. The rapid progress of science and technology in recent years and the stress from mere knowledge of facts was shifted to the development of concepts, abilities attitudes, skills, appreciation etc. Since education is a dynamic process, the whole life in the school constitutes the curriculum that plays an important role in the evolution of balanced personality of the child. There is an increasing trend in science teaching in some developed countries to emphasize the social implications of science. In addition to being an integral part of general Education, whole science programme at secondary stage should prepare the learners for some vocation and specialization in the individual subjects. So, a different type of knowledge and training should be given to those learners who intend to go for higher studies or want to enter some profession. This should form a basis for further pursuit in the field of science. 1.2 Objectives Upon completion the learners will be able to- 1) gain an in depth knowledge of nature, scope, importance and value of science 2) analyse science as an integrated area of study 3) relate science and modern Indian society 4) explain the impact of science on different socio-cultural issues 5) comprehend the role of science pertaining to sustainable development 1.3 Nature, Scope, Importance & Value of Science Definition of Science : In the words of J.W.N. Sullivan, "Science is the activity where truthfulness is obviously an essential condition for success. Its success in fact is measured by its truthfulness. Henri Poincare explains, "Science is built of facts as a house is built of stones; but an accumulation of facts is no more a science than a heap of stones." In another way it could be said that science is more a verb than it is a noun. Science is an accumulated & systematized learning in general usage restricted to natural phenomenon. The progress of Science is marked not only by an accumulation of fact, but by the emergence of Scientific method & of the Scientific attitude. Science is a cumulative & endless series of empirical observations which result in the formation of concepts & theories,

with both concepts & theories being subjects to modification in the light of further empirical observation. Science is both a body of knowledge & the process of acquiring it.

The Structure of Science : It consists of the following— Facts are the basis of all knowledge. They are said to be grass-roots for any theory or law. The whole process of the Scientific enterprise is continuously replenished by new facts & discoveries. **Concepts :** is a generalized idea suggested to the individual by object, symbol or situation. It is an understanding of almost undefinable something. **Generalization :** are very helpful in deriving useful conclusions regarding the scientific facts. Actually, the facts, concepts & generalizations are inter- related & interdependent. **Theory :** is based on facts, it is precise & clear & it must be grounded in empirical data. It follows the law of parsimony & open to interpretation & verification. It has applicability & a meaningful structure as well.

12 How : A scientific law may be defined as a factual statement of what always happens in certain circumstances. **Nature of Science :** learning of science is a lengthy & continuous process Knowledge acquired through this is referred to as product. The following are the criteria of nature of Science. **Science is a process :** A process involves planning various stages of an activity, establishing steps for gathering information & then retaining it. In Science, gathering information, thinking, solving problems, etc. are called the 'processes of Science.' Two types of skills are acquired through this—basic skills & special skills. **Basic Skills** **Observation :** It is not merely 'looking' at or 'seeing' something. Through observation they come to know their environment. **Classification :** What ever is observed by the students is grouped on the basis of similarities. **Communication :** Students observe & learn many things. This learning is transmitted to others through some means of communication. Communicating the knowledge could be in the form of a name, label, sign, symbol etc. **Measurement :** It is recording the precise & accurate observation. **Estimation :** are made by the learners whenever accuracy is not required. **Predictions :** This skill enables to know the behaviour of a particular object or phenomenon before it happens. **Inferences :** On the basis of above mentioned skills, ability to draw inferred develops, inferences can be made about any process or phenomenon. **Special Skills :** Along with basic skills, certain special skills are needed for an experiment or to solve any problem. These skills are as under— **Identification & control of variables :** There are dependent independent & extraneous variables in any experimental set up. So, identification & control of these variables, (excepting the constants) are an important parameters. **Hypothesis formation :** Science students acquire a basic skill of prediction. If the predictions are tested, they are called hypothesis. They are the guess about the result of an experiment. **13 Experimentations :** Experiments are conducted to test a hypothesis. The effects of various variables are studied here. **Tabulation :** Data collected in the experiments is tabulated in an organized manner. **Interpretation :** The analysis of the tabulated data leads to the interpretations & conclusion. Through these basic & Special skills, students learn about nature & adjust to it according to their needs & requirements. Thus a systematic process of learning takes place. **Science as a product :** The information that is acquired through the process of sciences or the body of knowledge formed is called 'product of science'. Knowledge of any form consists of development of facts, concepts, principles, theory & ultimately law. **Importance & values of Science :** Science helps to develop a scientific temper, scientific outlook & a Scientific attitude. There are certain values (Fig 2) attached to science which are as follows : **Intellectual value :**

The great value of science is that it has introduced us to new ways of thinking & reasoning.

The chief part played by Science in helping to develop consciousness of man is to be found in the new thoughts that it has made us think. Science helps us to understand, evaluate & solve the problems of life. It enables the students to become more logical, develop reasoning ability & creativity. Students get various opportunities to develop the power of observation, reasoning, thinking, analysis, synthesis and evaluation. **Utilitarian value :** of Science need not be emphasised. Science has entered in our life & daily activities to such an extent that our existence would become impossible without it. Its achievements in almost all spheres are marvellous science has wrested from nature almost all the hidden treasures. If we look around ourselves & will see that somehow or the other connected with sciences. No subject can claim to be as utilitarian as science. Modern age is the age of scientific inventions & we are surrounded with electrical gadgets, everything is guided by Science. **Vocational Value :** In today's world, many Science based interdisciplinary vocations have come up, eg, poultry, dairy, agriculture etc. knowledge of science is needed for research work as well. Amongst all, mobile repair & cyber cafe are the latest vocations which are based on science & technology.

14 Disciplinary value : Science promoter team work, healthy exchange of thoughts, spirit of enquiry & a balanced judgement. Science promotes organized behaviour & systematisation in every work. Study of Science enables an individual to live a confident & disciplined life. Moral & aesthetic value : Science inculcates moral & aesthetic values in the students. A highly moral person is honest, truthful & has an integrated personality. By studying Science, qualities of punctuality, patience, Self-control, self respect & determination are developed in students, making them highly moral individuals. In the words

of Keats, "Truth is Beauty". In nature everywhere we come across what Einstein calls 'Pre-established harmonies', which is beautiful & the discovery

of such harmonies is the concern of Science. So, again there is a compromise between the artist & the man of Science or in other words science & art are basically the same. Social & cultural value :

Science has played an important role in determining the culture & civilization of a country from time to time. It has affected

our way of thinking & way of living. The effect of Science is

multifarious. It has a direct influence in dispelling many traditional beliefs & the adoption of others suggested by the success of scientific method.

As a result of which the social organizations have been amply changed & hence there is corresponding political changes.

Science has its own literatures which makes an appeal is no way less powerful & elevating than the humanistic studies.

The cultural & social aspect of science should, be fully appreciated by science students. Indian Education Commission, 1968, documents, "If science is to

be pursued with full vigour & zest & is to become a mighty force in the Indian renaissance, it must draw its 'nourishment' from our cultural & spiritual heritage & not

by pass

it. Science must become an integral part of our cultural & spiritual heritage."

Psychological Value :

The teaching of Science is based on sound psychological footing. The principle of activity is the main basis of teaching of Science & satisfies the instincts of curiosity, creativeness, self-assertion, self-expression etc. of the pupils.

It is quite clear that science has a subject which is closely connected with our daily life, is justified to be included in the curriculum. Science is the result of an intense struggle of human intellect & has wrested from nature not only her secrets but processes also which underline them. It has emerged as almost a decisive force & its role in education needs to be adequately understood.

15 Training in the Scientific method : This comprises of

the following steps : Making an accurate survey of the problem. Setting up the method of attacking the problem.

Collecting data regarding the problem. Drawing conclusions from the collected data.

It is

due to this scientific method of attacking a problem that has achieved wonders in all fields of human activity.

Development of Scientific attitudes : This value is monopolised involve critical observation, open-mindedness, suspended judgement, free from superstition & false belief etc., The attitude once developed in the student proves useful in later life of the child. Fig : 1—Values of Science

1.4 Science as an integrated area of study Background Science

Education in India has suffered from an inherited separation of the study of natural worlds (material & biotic) & the human worlds. As a result, natural Intellectual values Scientific method Social & cultural values Psycho- logical value

Utilitarian value Moral & aesthetic value disciplinary value Vocational values Values of Science Scienti- fication attitudes

16 sciences and humanities & social sciences. Insulated spaces have developed in India as two insulated spaces, each with its exclusive and narrow focus. However our experiences of the 'real world' show us repeatedly that the real world is

never split into two restricted worlds - the natural and the human; these two worlds are far from separate; they are interconnected, inter-related and often flows into each other; such that natural science studies are not just studies of

natural phenomena; they have to them large elements of the human world. Hence, at the level of knowledge production what we need is an integrated approach - integrating objects of enquiry and methodologies emanating from the hitherto

separate study of both worlds. Given the separation and the divide, the Integrated Science Education needs an integrated approach connecting not just natural and social sciences but also:- (i) Extant disciplines within the natural/social

sciences, (ii) Material, biotic and human worlds, (iii) Experiences and knowledge (iv) Service delivery and the recipient (v)

Technology and technology user (vi) Interests of stakeholders. Fig. - 2 : Concept of Integrated Science

17 Historical basis of Integration efforts in India & abroad It is not that in India, we have not had anxieties about this separation. Our best attempts at attending to this separation - the setting up of Humanities and Social Science (HSS) departments, in a largely techno-scientific atmosphere in the IITs - have not solved the problem of the inherited separation. Instead, science students have found HSS courses to be an unnecessary and alien addition to their already demanding science-technology courses. In this model of integration HSS departments are in effect never integrated within the science- technology institution. Here social science and humanities questions and methods are seen not as offering anything fundamental to science but merely imparting some version of value-based education to science students. The other model of integration is one where primarily three social science subjects, namely philosophy, sociology and history emerge as gatekeepers or final arbiters of what science is doing, through philosophy of science, sociology of scientific knowledge and history of science. Here social science subjects emerge as critiques of science, of scientific knowledge production and of laboratory life. Social sciences in this case seem to be judgemental in establishing its credibility. The 20th century in the USA has witnessed a continuous discussion about integrated Science education. Intertwined with this discussion has been a discussion of progressive education based on Dewey's ideas. The demand for integrated education reached its climax in 1970 when the U.S. Advisory Committee for Science Education of the National Science Foundation recommended a curriculum that related Science and Technology to human and social affairs. During the same time period, two large international organisations started a continuous mapping and development of integrated Science education. One of these organisations is UNESCO, which publishes the report series 'New trends in integrated Science teaching' and the other is CASE, the International Council of Associations for Science Education, an association of teacher organisations with the goal of integrating Science education. Science Education : Integration, content & structure: The Science education community expresses different views about how Science education should be organised. The relative merits of integrated versus subject- specific Science in compulsory schools are disputed among teachers, scientists and teacher educators. Fensham gives a comprehensive description of a problem area in Science education. First, Fensham points to the social changes of the 1960's that gave Science new groups of learners, with all the difficulties entailed. Arbitrarily, the academic disciplines have developed over the years in response to the expansion of knowledge. However, this nature of disciplines is not a justification for the destruction or elimination of disciplinary boundaries. Every discipline possesses characteristics that are clearly unique to that discipline. Integrated and thematic curriculum/ instructional approaches ignore the conceptual, procedural, and epistemological differences that exist between the various areas of mathematics and the sciences. For example, problem solving is quite different among the various sciences let alone across mathematics and science in general. Within an interdisciplinary approach, the unique and valuable aspects of the various academic disciplines can be maintained while still developing students' understanding of interconnectedness. Fig-3 : Inter-relationship of Science subject Inter-relatedness of science & other subjects: It is always said that science cannot be taught in isolation. All the branches of science are inter dependent upon each other & there are a number of facts & principles which are common to various science subjects. As a result of this new subjects like

19 physical chemistry, Geo-physics, Bio- Physics, Bio-Chemistry, Soil- Chemistry etc have been introduced. One of the most important factors that is responsible for the ineffectiveness in teaching in teaching science is the lob-sided specialization of teachers. For eg, a teacher while teaching the sense organs say, eye, should be able to make a parallelism with a camera, which the students have learnt in Physics. In Basic Scheme of education, inter-relationship of subjects occupies the pivotal position & it is not the craft that makes the school basic but it is this relationship that makes it really basic. For over all development of the students, various subjects are included in the curriculum. These subjects are selected on the basis of decision taken after proper consideration and analysis. Usually those subjects are included in the curriculum that are complementary to each other, as the main objective of all of them is to achieve a given set of objective of education that is over all development of the students. Science is quite a complex and a vast kind of subject, because of which the task of correlating it with other subjects of curriculum seems to be quite an easy task. Deliberate effort should be made by the science teacher to bring about co-relation in between the science and other subjects of the curriculum, that are being imparted to the students. By the help of this, students will find the opportunity to relate the knowledge which they have already gained, with the knowledge which they are gaining. This kind of relation activity leads to development of interest among the students. While imparting knowledge of one subject, teacher gets much help in communicating her ideas if she makes use of examples or reference of concepts covered by other subjects. Although it is not very easy to co-relate various subjects with the complex subject like science, but it is not impossible. This can be done in the following manner: - Science and Language: Since science is a practical subject, it is very important for the learners to be able to express their views and ideas in clear and attractive form. For this purpose, it is necessary that they should have thorough knowledge of language which they use. Student who does not have good control over the language cannot express his views

20 and various scientific laws and principles in front or others and especially in front of teacher. Today, as a result of adoption of uniform technical terms and symbols, vocabulary of different languages have been enriched to considerable extent. In making students able to give answers of various scientific queries, in effective manner, either in written form or orally, science teacher and language teacher should take up a joint responsibility on their shoulders. To co-relate science with language subjects, students can be asked to write essays on some scientific topic. If student make any kind of grammatical mistake, then the teacher can ask him to make correction in his language. Likewise, language teacher can give the task of writing about some scientific happening in the assignment designed for them. In this manner, he can correlate science with the language. Science with Mathematics : A large number of scientific principles and rules are represented in the form of mathematical expressions, for which it is very necessary for the student or person intending to get advanced study of science subjects to have sound mathematical basis. Without making use of mathematical expressions and rules, it is not possible for any teacher to conduct science teaching in effective manner. The significance of mathematics in the science can be proved by the views of the experts that mathematics has given sound footing to the scientific laws and principles. Before beginning any topic in the science, it is essential for the teacher to make sure that mathematical basis of all the students is strong and vast. Probably, mathematics is considered to be sole language of science because of which real understanding of science is considered to be impossible without adequate knowledge of mathematics. Some of the useful mathematical tools which are generally used in the science teaching are Algebraic equations, Geometrical formulas, Graphs etc. Correlation existing in between one of the subject of science and mathematics can be understood. Astrology is an advanced branch of science in which it is predicted or enumerated that which planet revolves at which speed and when it will get appeared to the people of earth.

21 This is quite complex area, and no one can enter into this complex area without having a sound mathematical basis. Likewise, mathematical rules and theories are also applied to considerable extent in physics, in which no one can intend to take even single step without relying on the subject of mathematics. Thus, it can be said that science teacher should make all efforts by which she can establish co-relation in between the subjects of science and mathematics. It will not be improper in any way to consider both of these subjects as complementary to each other, which can be studied simultaneously or at the same time. Hence, it can be said that without making use of examples from mathematics, it is not possible for a science teacher to explain various scientific principles and concepts properly to the students. To make it possible, sincere and deliberate efforts should be made by science as well as mathematics teacher to co-relate both the subjects in accordance with the syllabus. Science and History : It sounds quite amazing that some kind of correlation can exist in between the science and history as earlier subject is practical in nature while nature of later subject is purely theoretical. However, it is possible to co-relate these subjects with each other. While mentioning about the various scientific discoveries taken place in the earlier periods, teacher can relate with the major events of the world history. Students should be told about that what was the situation of science at the time of various kings or rulers. Teacher should narrate to the incidences which inspired various scientists to find out the medical remedies of various diseases. Not only this, the function of co-relating science with history can be done by mentioning the kind of standard of living people used to experience at different parts of the human history. With such knowledge, they will become aware of the scientific concepts like sanitation and healthy living. Science and Geography : Geography is the subject in which various concepts relating to earth on which we live are dealt with. Everything existing on earth, on different planets of the universe are also main subjects of geography. Which kind of crop should be sown in which kind of soils, how many kinds of rocks are found on the earth are some

22 of the main topics which are covered by Geography. One will be surprise by this fact as these topics are also covered by the subject of Science. In science, various concepts relating to the atmosphere and earth in which living and non-living beings exist are made. For this reason, temperature, wind directions and measurement of rainfall are conducted in the subject of science by making use of various apparatus. Results obtained by science in terms of climate and the manner in which it affect the human beings and earth are being interpreted by subject of Geography. The manner in which it is mentioned by the geography that how soil gets produced through crushing process of rocks, it makes the subject a special branch of science. Therefore, geography lessons on these subjects will be best understood and appreciated if they have been discussed in length by the science teacher. There are various topics which are of common interest for geographers and scientists. Thus, it can be said that both of these subjects are complementary to each other. Both of these subjects are very near to each other, thus science teacher will not find any kind of problem in relating science with the subject of geography. Science and Social Studies : If one explores the history of development of human society, he will find various incidences in which human got victory over forces of nature, by which he got control over the land, sky and seas. As said that an important impact of science teaching is that outlook and perspective of students or people become scientific in nature, as a result of which, various kinds of changes take place in their way of living. Scientific thinking affects the standard of living of human beings to considerable extent, as through such information, outlook and perspective of human beings become more wide and they can free themselves successfully from the clutches of superstitions and false beliefs. Various evidences can be found in our life which can show the significant way in which life style of human beings have got affected by inclusion of scientific developments in their life. Today, we can find various kinds of machines for performing different functions, about which primitive men even did not think. As a result of these machines, our life has become very easy and smooth and now we can accomplish complex functions within short period of time, which were considered to be very time consuming. Not only this, various research works has led

23 to development of various medicines with the help of which physicians have found the remedies of various diseases, which were once considered to be incurable and were responsible for bringing about heavy loss of life in earlier times. Not only this, earlier a large number of manpower was being engaged in the agricultural sector, but now we are moving towards industrialization era, as a result of which we are ready to participate in the competition taking place in global market. We have third highest number of professionals engaged in different areas of the world. Now a large number of students intend to get education from foreign universities, but they want to serve their own nation and want to play effective role in bringing about development of the nation with greater pace. Earlier people were not provided with the developments taking place in the scientific area, as a result of which they used to accept all the orders imposed on them. But now, in a scientific advanced time, people have learned that being human beings, they have certain rights, and if any attack is being made on their rights, they begin to agitate. This can be the possible reason that why women of our nation has attained those rights which were not permitted to them in the earlier time. Another change which has taken place in our society through such reasoning ability is the manner in which people belonging to minority section of the society are asking or reservations in various spheres of the life. They are asking about reservations in educational institutions and even in parliament of the nation. Thus it can be said that science and social sciences are two subjects which can be co-related with each other without much problem. A science teacher can correlate science with social studies on different occasions by providing suitable relations of relevance. Science and Civics : The main objective of imparting information of both the subjects is to create good and useful citizens for the nation, thus it is possible to correlate both of these subjects with each other. Through science, students become able to understand the utility of scientific inventions in their life, by which they become more responsible. They begin to realise a sense of responsibility, which help them in playing important role in development of the nation. Through information of scientific facts, students get to know about various kinds of diseases and the role which they can

24 play in creating a healthy and clean atmosphere around them. Through this kind of information, they become more responsible citizens and play an important role in creating an ideal civic life in the society and nation as a whole. Science and Art: It is considered by the majority of people that it is science who has contributed a great deal in developing the field of art, but this is not true, as both of these subjects or areas has played important roles in enriching each other. All types of arts have got enriched as a result of scientific developments, but it is not possible for a science teacher to impart information relating to various scientific facts and principles without having thorough control over the art. As known that science is a practical subject, as a result of which, science teacher is required to draw various kinds of diagrams, models and charts, which cannot be performed unless he does not have sound artistic skills. Not only this, it is equally important for an artist to have thorough knowledge of scientific principles, as without it, he will find it difficult to keep the colour contrast of his images in attractive and controlled position. An artist should know the principles of light and shade, objects and background for drawing or keeping the colour contrast in attractive condition. Thus, it can be said that some common features are found in the subjects of science and art, because of which they can be co-related with each other effectively. Science and Music : In our nation, music has its own importance as different kinds of songs are found in different parts of the nation. There are songs and theories of music in different languages. Various musical stars got born in our nation, but the number of persons engaged in musical area has diminished to considerable extent as now people consider it as wastage of time and efforts. To encourage people and especially students to get involve themselves in professions having their roots in music, this has been accepted as an independent subject in various schools and institutions and it forms an integral part of school curriculum. For the students of music, knowledge of resonance, vibration systems in strings and air columns is very necessary and important. To make improvements in their voice and manner of singing, various scientific equipments are being used today, which could not come into being without scientific

25 developments. Thus, it is only through the utilization of scientific developments in the real life that led to the development of various apparatuses used in the musical field. Science teacher can relate subject of science with the music by narrating the students that what led to development of various equipments used by the musicians and on which principles do they operate or function. Science and Craft Works : Some people will find it quite unsound to relate science and craft works with each other, but various kinds of improvements can be brought about in ability of students to understand various scientific principles and facts. During craft periods, students can be provided with the task of designing various pieces of scientific apparatuses and equipments. Through such step, scientific interest can be developed in the students, which will help in arousing the interest of students in various scientific incidences. An urge will get developed in them to see or observe the equipments or apparatuses designed by them in reality, by which they will be motivated to get more and more information regarding the research functions conducted in the scientific field through various means and sources. Thus, it can be said that if a science teacher can relate science with other subjects of the curriculum, then more justifiable and satisfactory results will be obtained. 1.5 Science and Modern Indian Society : Relationship of Science and Society Science : Accordingly to J.W.N. Sullivan "Science is the activity where truthfulness is obviously an essential condition for success. Its success in fact is measured by its truthfulness." Actually there is no one definition of science which is universally accepted.

What is Science and how does it grow are the basic questions which all students of science must understand.

26

Modern Indian Society : The society in which more dramatic changes occurs, specially in the area such as Urbanization, liberalization, globalisation of the economy, the IT revolution, the affirmation of religions identities and reaffirmation of ancient world views and new political landscapes denote some of these processes. As the world's largest democracy emerges as an economic and cultural super power, there is a pressing need for a more sophisticated and renewed understanding of Indian culture and Society. So the science plays an important role for the development of Indian society. Relationship between Science and Society : Actually without science, our society would not be able to function. Science has allowed us to take control of and develop the world where we live intoday. Nobody can deny that science has rendered invaluable service to mankind in various spheres. It is due to discovery of science that we have been able to find a cure of most diseases and prevent the out break of epidemics, thereby vastly increasing life expectancy. Science gives to mankind the supreme self confidence. It has given man the assurance that instead of being a slave to his environment, he can control and modify it to suit his needs in the environment. With the help of Science we have built huge dams to supply waters through Perennial canals, manufactured fertilizers which enormously increase agriculture production, produced effective pesticides, learnt how to prevent soil erosion, introduced multiple cropping and devised other ways to improve output. Population control would still be needed if food production is to keep pace with the growth in numbers, but the Spectral progress with scientific cultivation has made possible in the field of agriculture. So thanks to the application of science to industry. The machine has not only relieved man of heavy burdensome tasks, but has also provided him with ample leisure in which he can engage himself in cultural pursuits, cultivate various kinds of hobbies and travel. It is through science that has been able to invent new sources of entertainment and education, such as cinema, radio, television and etc.

27 Democracy would have been impossible without the printing press. The modern media of mass communication is another fruitful source of education, are being spent on manufacturing weapons on mass annihilation and space exploration. The rapid increase of communication like railways, the telegraph, internet has developed by the enhancement of science progress. By the application of science we can create a rule of law which compels all organisation to submit their disputes to negotiate, mediate and arbitrate rather than settle them by strikes which paralyse national life and put the community to get inconvenience. 1.6 Impact of Science with special reference to issues related with Environment, Industrilisation and Disarmament. Impact of Science on Environment : Science has the Universal impact on different areas. By relating science education with the environment of a learner has been the prime concern of educationists. In science we learn about the environmental phenomena of both natural and man made interventions affecting the environment. The science education should be made to integrate science with learning environment. So the Science curriculum should address issues and concerns related to environment such as climate change, acid rain, growth of water eutrophication and varions types of pollution etc though teaching- learning of science at all stages. Learner will be attracted towards science when they realise its significance to society and relevance to their lives. They should be engaged to construct the knowledge of science though an interdisciplinary approach appreciating its relation and impact on the social and natural environment. The significance of Chemical Science to society can be high lighted by discussing the chemical components used in products that have altered agriculture, food, health, medicine, electronics, transportation and the natural environment. Similary importance of physical Science to different areas like agriculture, transportation, household products electronics, define communication, cugineering menufacturing and environment. To understand to relevance to home economics, one can think what happens to the electricity bill if solar cooker solar heater and

28 compact Fluorescent lamp (CFL). Activities such as use of pressure cooker and greasing the moving parts of a vehicle reduce energy loss. So the role of science education has very much impact on the environment. Impact of Science on Industrilisation : Industrialisation means the development of big equipment and application of industrial management methods to Scientific activities them selves. The industrial Revolution was not closely linked to Science at the outset, but rather was produced by craftsmen and engineers, often trained on the job. The most famous example is the steam engine, which was invented almost a century before the principles thermodynamics were understood. It is important to realise that the industrial developments depends on the special condition is that the concept of science should be properly integrated between the scientists and the laboratories into the production process. The impact of science on industrialisation also altered and extended the scientist's role in the different institution. The innovation process in the industrial development has become increasingly dependent on the findings and methodology of science. So the knowledge of science has a great impact on the industrialisation. 1.7 Role of Science for Sustainable Development Understanding of sustainable development : Role of the sciences should be to provide information to better enable formulation and selection of environment, it will be essential to enhance scientific understanding, improve long-term scientific assessments, strengthen scientific capacities in all countries and ensure that the sciences are responsive to emerging needs. Scientists are improving their understanding in areas such as climatic change, growth in rates of resource consumption, demographic trends, and environmental degradation. Changes in those and other areas need to be taken into account in working out long-term strategies for development. A first step towards improving the scientific basis for these strategies is a better understanding of land, oceans, atmosphere and their interlocking water, nutrient and biogeochemical cycles and energy flows which all form part of the Earth system. This is essential if a more accurate estimate is to be provided of the carrying capacity of the planet Earth and of its resilience under the many stresses placed upon it by human activities. The sciences can provide this understanding through increased research into the underlying

29 ecological processes and through the application of modern, effective and efficient tools that are now available, such as remote-sensing devices, robotic monitoring instruments and computing and modelling capabilities. The sciences are playing an important role in linking the fundamental significance of the Earth system as life support to appropriate strategies for development which build on its continued functioning. The sciences should continue to play an increasing role in providing for an improvement in the efficiency of resource utilization and in finding new development practices, resources, and alternatives. There is a need for the sciences constantly to reassess and promote less intensive trends in resource utilization, including less intensive utilization of energy in industry, agriculture, and transportation. Thus, the sciences are increasingly being understood as an essential component in the search for feasible pathways towards sustainable development. Scientific knowledge should be applied to articulate and support the goals of sustainable development, through scientific assessments of current conditions and future prospects for the Earth system. Such assessments, based on existing and emerging innovations within the sciences, should be used in the decision-making process and in the interactive processes between the sciences and policy-making. There needs to be an increased output from the sciences in order to enhance understanding and facilitate interaction between science and society. An increase in the scientific capacity and capability to achieve these goals will also be required, particularly in developing countries. Of crucial importance is the need for scientists in developing countries to participate fully in international scientific research programmes dealing with the global problems of environment and development so as to allow all countries to participate on equal footing in negotiations on global environmental and developmental issues. In the face of threats of irreversible environmental damage, lack of full scientific understanding should not be an excuse for postponing actions which are justified in their own right. The precautionary approach could provide a basis for policies relating to complex systems that are not yet fully understood and whose consequences of disturbances cannot yet be predicted. Recommendations of the International conference : The programme areas, which are in harmony with the conclusions and recommendations of the International Conference on an Agenda of Science for Environment and Development into the 21 st Century are categorized as : (a) Strengthening the scientific basis for sustainable management;

30 (b) Enhancing scientific understanding; (c) Improving long-term scientific assessment; (d) Building up scientific capacity and capability. Scientific as well as relevant indigenous and local knowledge play a critical role in helping to meet the development challenges of today and tomorrow. Based on progress achieved towards the Millennium Development Goals, the post 2015 agenda should be built in an inclusive manner, so as to take into account not only increased economic wealth but also equitable access to education for all (including in the sciences), reducing the gap in the availability and transfer of sustainable technologies between developing and developed countries, and the need to ensure social inclusion in an era of major social transformation. Analysis of Science and Sustainable Development Science is critical to help meet the challenges for sustainable development, as it lays the foundations for new approaches and technologies to identify, clarify and tackle global challenges for the future. Science can thus significantly contribute to sustainable development, but requires to that end a broad understanding of science as such. Basic science and applied science complement each other, they are the two sides of the same coin. Science is universal. It does not only bring about progress on the way towards a more sustainable world; it is also in itself away of crossing national, cultural and mental borders and thus helps lay the foundation for a sustainable world. Science possesses a strong educational component. Science literacy provides the basis for solutions to everyday problems, generally, in uncontroversial ways. Science education and capacity building in science need to be strengthened to make the most of the transformational power of science. Science is a public good and has to be considered as such. Science can also further democratic practices. Sustainable Development: Its priority in the Society The conservation, sustainable use of, and equitable access to natural resources and the sharing of benefits arising thereof, the need to adapt to climate change, the promotion of inclusion on the basis of the universal declaration of human rights and ethical principles constitute the main imperatives guiding the work of UNESCO in the areas of natural, social and human sciences and their contribution to sustainable development. An effective science-policy interface will require a regular and systematic

31 assessments of scientific and other relevant knowledge in relation to social transformation and intercultural dialogue, climate change, biodiversity and key ecosystems such as fresh water and the ocean. Through normative and technical assistance for ethically based inclusive public policies, UNESCO will accompany countries' efforts to develop their own innovative solutions to the challenges and opportunities posed by sustainable development and cultural diversity. Hence, the highest priority needs to be given to the promotion of capacity development in the sciences, especially at the national level, and to the enhancement of the capacity of societies to take informed decisions about their future. Science is part of almost every aspect of our lives. Although we rarely think about it, science makes extraordinary things possible. At the flick of a switch, we have light and electricity. When we are ill, science helps us get better. It tells us about the past, helps us with the present, and creates ways to improve our future. Scientific endeavor is as much about us as it is for us. Its place in society, therefore, is not to unfold quietly at the sidelines but to become a fundamental part of the game. Now more than ever, science must engage with us, and we must engage with science. There are times when science can seem to lose its connection to society and its needs, and sometimes its objectives are not fully understood, even if they are well intended. The lack of a common language and rapid progress in many areas of research has increased the public's concern or contributed to ambivalence about the role that science and technology play in everyday life. But science cannot work in isolation, and advances in science and technology are not an objective in their own right. The Science in Society (SIS) Programme addresses societal engagement from many perspectives, such as encouraging dialogue between scientists and other members of the public, by promoting an adherence to ethical standards, and by developing better ways for the results of research to be accessed by all. The SIS Programme also supports new ways to interest young people in science and in research careers, and new ways to achieve greater gender equality in science. The SIS Programme has also been charged with the responsibility of supporting the following specific research activities: the connection between science, democracy and law; ethics in science and technology; the reciprocal influence of science and culture; the role and image of scientists; gender aspects; science education methods; and science communication.

32 Significance of science and technology for sustainable development Sustainable development is probably the most daunting challenge that humanity has ever faced, and achieving it requires that the fundamental issues be addressed immediately at local, regional and global levels. At all scales, the role of science and technology is crucial; scientific knowledge and appropriate technologies are central to resolving the economic, social and environmental problems that make current development paths unsustainable. Bridging the development gap between the North and the South, and alleviating poverty to provide a more equitable and sustainable future for all, requires novel integrated approaches that fully incorporate existing and new scientific knowledge. The Scientific and Technological (S&T) community can make a leading contribution to tackling major problems identified in the Millennium Declaration - "Freedom from want" and "Sustaining our future". These issues include: i) fighting against disease; ii) population growth and urbanization; iii) the digital/information divide; iv) coping with climate change; v) confronting the water crisis; vi) defending the soil; vii) preserving forests, fisheries and biodiversity and viii) building a new ethic of global stewardship. Whatever the cultural, geographical, socio-economic and environmental setting, a strong partnership between the Science & Technology community and other members of civil society, the private sector and governments is a fundamental prerequisite for sustainable development.

1.8 Let Us Sum Up : The process of diligently observing, describing exploring & using the world is science.

Science is both a body of knowledge & the process of acquiring it.

It consists of facts, concepts, generalisations, theory & Law.

33 It possesses basic skills as well as special skills as predicted by its nature. Science is a process as well as a product. Science accumulates various values & has significance to the existence of human mankind. Current levels of investment in S&T for sustainable development are far too low in both developed and developing countries. This is true both with respect to the scope of the problems and with respect to the promising rate of return on S&T investments. Larger investments in S&T should be seen primarily as increased investment in a country's socio-economic development and in preserving natural life-support systems for the present and future generations, rather than simply as research expenditures. For this reason, public sector funding for S&T activities targeted on sustainable development goals should be augmented significantly in both all corners of the world. The private sector should reorient its S&T investments in a manner, which integrates sustainable development objectives and should increase its S&T investments generally. Strategic partnerships should be forged between the public and private S&T sectors at national and regional levels. 1.9 Check Your Progress-1 1. What is science?

Lesson planning, importance and basic steps. 2.6

Unit Planning-Format of a unit plan 2.7 Pedagogical Analysis : Meaning and need, Guidelines for conducting Pedagogical analysis. 2.8 Let Us Sum Up 2.9 Check Your progress 2.10 Reference 2.1 Introduction Good science education is true to the child, true to life and true to science.

This simple Observation leads to the following basic criteria of validity of a science curriculum & its teaching-learning perspective there

to: a)

Cognitive validity requires that the content, process, language and pedagogical practices of the curriculum are age appropriate, and within the cognitive reach of the child. b) Content validity requires that the curriculum must convey significant and correct scientific content. Simplification of content, which

is necessary to adapt the curriculum to the cognitive

level of the learner, must not be so trivialized as to convey something basically

flawed and/

or meaningless.

37 c) Process validity requires that the curriculum engage the learner in acquiring

the methods and processes that lead to generation and validation of scientific knowledge,

and nurture the natural curiosity and creativity of the child

in science.

Process validity is an important criterion since it helps the student in 'learning to learn' science.

d)

Historical validity requires that science curriculum be informed by a historical perspective, enabling the learner to

appreciate how the concepts of science evolve with time. It also helps the learner to view science as a social enterprise

and to understand how social factors influence the development of science.

e)

Environmental validity requires that science be placed in the wider context of the learner's environment, local and global, enabling him/her to

appreciate the issues at the interface of science, technology and society

and preparing him / her with the requisite knowledge and skills to enter the world of work.

f) Ethical validity requires that the curriculum promote the values of honesty, objectivity, co-operation, freedom from fear and prejudice, and develop in the learner a concern for life and preservation of environment.

Looking at the complex scenario of science education in India, three issues stand out noticeably. First, science education is still far from achieving the goal of equity enshrined in our constitution. Second, science education, even at its best,

develops competence but does not encourage inventiveness and creativity. Third, the overpowering examination system

is basic to most, if not all, the fundamental problems of science education. 2.2 Objectives Upon completion, the students will be able to : 1. delineate the aims and objectives of teaching Science in Elementary and Secondary school 2.

comprehend Bloom's Taxonomy of Educational objectives 3. explain and design lesson planning and related areas 4.

format and demonstrate unit planning 5. gain an understanding of pedagogical analysis & apply skills to design it

38 2.3 Aims and Objectives of Teaching Science in Elementary and Secondary School. Many students often say, 'why should I study science'? Then we might ask ourselves, 'why teach science'? The typical answer for these frequent questions is 'Because science is all around us, so we need to know about it. However pupils hardly find its relevance in their day to day life. As a result we observe a declining trend in the enrolment of children opting science at higher levels. To address this issue, first we need to understand the aims and objectives of learning science at the elementary and secondary level, because to reach at the higher studies, the concept about the science should be developed from the initial stages. Since teachers are the key agents to implement the curriculum, so they need to have a clear vision of the rationals, needs, aims and objectives of learning science to help them plan the stages to specify the proper teaching learning strategies for its effective transaction. The origin of the aims of science follows essentially from the nature and structure of science and its interrelation to the society. So the teaching learning process of science education should convey the significant aspects of science content at appropriate level and engage the child in the learning process of scientific knowledge at the elementary level. Harmonious development of child's personality and social efficiency etc. are the general aims of education. If science teaching is to be made effective, then its aims should be in consonance with the general aims of education. We deal with the following main objectives of science teaching.

A. Knowledge. This aim has received the top priority as compared to other aims. Pupils studying general science should acquire the knowledge of :

- (i) Fundamental principles and concepts useful in daily life.
- (ii) Facts for science study.
- (iii) Inter-dependence and relationship of different branches of science.
- (iv) Knowledge of plants and animals.
- (v) Natural phenomena going on.

39 (vi) Knowledge of general rules of health and human body etc.

B. Skills. Science students should acquire skills in experimentation, construction, observation, drawing etc. Experimentation and construction skills include handling, arranging, preserving, and repairing scientific instruments.

C. Abilities. The general science teaching should develop certain abilities such as ability to

- (i) Sense a problem
- (ii) organize and interpret
- (iii) Analyse
- (iv) Generalise
- (v) Predict
- (vi) Organise exhibitions, excursions and fairs
- (vii) Discuss, argue and express scientific terminology
- (viii) Improvise and manipulate instruments using his acquired knowledge.

D. Attitudes. Science teaching directly inculcates the scientific attitudes among the students. So the students should be taught directly and systematically and every individual should be paid heed to ascertain that he develops the desired attitudes and practices them. A man with the scientific attitude is

- (a) Critical in observation and thought
- (b) Open-minded
- (c) Respectful of others' view point and is ready to discuss his problems with others and accepts what appears correct.
- (d) In search of the answers to 'What's' and 'Whys' and 'How's' of the things he observes and accepts the natural things as such.
- (e) Objective in his approach to problems.
- (f) Not a believer of superstitions and misbelieves.
- (g) Follower of cause and effect relationship.

40 (h) Truthful in his experimentation and conclusions.

- (i) Impartial and unbiased in his judgments.
- (j) Adopts planned procedure in solving a problem.

E. Reflective Thinking. With the above attitudes developed, a science student will handle a problem scientifically. He will sense a problem, define it, collect evidence, organize and interpret the data, formulate the hypothesis, test its validity and finally draw conclusions impartially. The training in the scientific method should be one of the important aims of teaching science. All these attributes leads to reflective thinking.

F. Habits. Certain socially desirable habits like honesty, truth, tolerance, self-confidence, self-reliance etc. should be inculcated through the science teaching.

G. Interests.

The teaching of science should also aim at developing some interests in reading scientific literature, in scientific hobbies, in activities of clubs, excursions, in natural phenomena; in drawing, in leadership, etc. The motivational techniques like rewards and punishments, praise and blame, rivalry and emulation etc. should be implied by the teacher.

H. Appreciation. The appreciation of natural beauty, scientific inventions, scientists' endeavour is the outcome of science teaching. For such purpose, the teacher should arrange outings, should relate the life histories of scientist and should keep the students in touch with the new inventions in science.

I. Providing Work for Leisure. As the empty mind is devil's workshop, a science student should not waste his leisure. He can prepare inks, soaps, boot polishes and other daily useful things or he can keep hobbies of stamp collecting, coin collecting, photography, drawing, gardening, study of plants and animals or of minerals etc. He can learn to improvise certain

41 instruments, learn to play for musical instruments along with its construction knowledge, etc. J. Training for Better Living. A science student should know the ways and means of prevention and eradication of diseases to maintain good health, and should be able to adjust himself with his own domestic, social environment and economic and cultural conditions. K. Forming Basis for Career. The attitudes and interests of the students should well be adjudged by the science teachers and they should impart them the knowledge accordingly so that they may prosecute the desired professions. An artist can never be a doctor. So nothing should be forced into the minds of the students. Acceleration should be provided in his own direction to get a suitable vocation and fit himself well in society and prove an asset to it. Aims & Objectives of Teaching Science Primary Level The aims and objectives of Teaching Science at Primary School level should be: 1. Arousing and maintaining interest in nature and in the physical and social environment, arousing love for nature and its sources. 2. Developing the habit of observation, exploration, classification and systematic way of thinking. 3. Developing the child's powers of manipulative, creative and inventive faculties. 4. Developing neat and orderly habits. 5. Inculcation of habits of healthful living. 2. Middle School Level In addition to the above, the following aims and objectives are suitable for inculcation at the Middle School, level. 1. Acquisition of a kind of information concerning nature and science which may also serve as the basis for a late General Science Course. 2. Developing the ability to reach generalisation and to apply them for solving every problem.

42 3. Understanding the impact of science upon one way of life. 4. Developing interest in scientific hobbies. 5. Inspiring children by stories about scientists and their discoveries. 3. Higher Secondary Levels At the higher secondary stage, the aims of General Science teaching should be, 1. To familiarize the pupil with the world in which he lives and to make him understand the impact of science on society so as to enable him adjust himself to his environment. 2. To acquaint him with the 'scientific method' and to enable him to develop proper scientific attitude. 3. To give the pupil a historical perspective, so that he may understand the evolution of the scientific development. The Indian Education Commission (1964-66) has suggested the aims and objectives of teaching science at various levels: 1. Lower Primary Stage (i) At the lower primary stage the accent should be on the child's environment- social, physical and biological. (ii) In classes I and II, the accent should be on cleanliness and formation of healthy habits. (iii) Development of power of observation. (iv) In classes III and IV the study should also include personal hygiene and sanitation. (v) In classes IV and V children should be taught the roman alphabets. This is essential as the internationally accepted symbols for the units of the scientific measurement and the symbols for chemical elements and compounds are written in the Roman alphabet. (vi) Developing proper understanding of the main facts, concepts, principles and processes in the physical and biological environment. 2. Upper Primary Stage (i) At this stage emphasis may shift to the acquisition of knowledge together with the ability to think logically, to draw conclusions and to make decisions at a higher level.

43 ii) Science should be taught as physics, chemistry, biology, and astronomy. A disciplinary approach to science learning instead of general science would be more effective in providing the necessary scientific base to young people. 3.

Secondary stage (i) At the secondary stage science should be taught as a discipline of the mind and a preparation for higher education. (ii) At the lower secondary class physics, chemistry, biology and earth sciences should be taught as compulsory subjects. (iii) At the higher secondary stage there should be diversification of courses and provision for specialisation.

2.4 Bloom's Taxonomy of Educational Objectives & Writing Objectives in behavioral terms. Bloom's Revised Taxonomy Taxonomy of Cognitive Objectives-1950s-developed by Benjamin Bloom is a means of expressing qualitatively different kinds of thinking. It was adapted for classroom use as a planning tools continues to be one of the most universally applied models to organize thinking skills into six levels, from the most basic to the more complex levels of thinking. Lorin Anderson (former student of Bloom) revisited the taxonomy, as a result, a number of changes were made. Original Domain New Domain Fig: 1. Revised Bloom's Taxonomy of Educational Objectives Source : tip'uark.edu

44 Revised Bloom's Taxonomy of Educational objectives
The names of six major categories were changed from noun to verb forms. As the taxonomy reflects different forms of thinking and thinking is an active process, verbs were used rather than nouns. The subcategories of the six major categories were also replaced by verbs and some subcategories were reorganized. The knowledge category was renamed. Knowledge is an outcome or product of thinking

and
not a form of thinking per se. Consequently, the word knowledge was inappropriate to describe a category of thinking and was replaced with the word remembering instead. Comprehension and synthesis were

renamed
to understanding and creating respectively, in order to better reflect the nature of the thinking defined in each category.

The Cognitive Dimension Process LEVEL 1 Categories & Alternative Definition Cognitive Processes Names Remember Retrieve knowledge from long- term memory Recognizing Identifying Locating knowledge in long-term memory that is consistent with presented material Recalling Retrieving Retrieving relevant knowledge from long-term memory

A

Taxonomy for Learning, Teaching and Assessing: A Revision of Bloom's Taxonomy.

New York.

Longman

Publishing. BEHAVIORAL OBJECTIVES An objective is an intent communicated by a statement describing a proposed change in a learner. Is a statement of what the learner is to be like when he/she has successfully completed a learning experience. A behavioural or instructional objective describes an intended outcome. A usefully stated objective is stated in behavioral, or performance, terms that describe what the learner will be doing when demonstrating his/her achievement of the objective. An instructional objective must. Describe what the learner will be doing when demonstrating that he/she has reached the objective; i.e., What should the learner be able to do? (Performance)

47 Describe the important conditions under which the learner will demonstrate his/her competence; i.e., Under what conditions do you want the learner to be able to do it? (Conditions) Indicate how the learner will be evaluated, or what constitutes acceptable performance; i.e., How well must it be done? (Criterion) A behavioral objective, or an Instructional objectives, which is student-oriented, places the emphasis upon what the student is expected to do, not upon what the teacher will do. Sometimes teachers use instructional goals which emphasize what they are expected to do rather than what they expect of their students. Instructional objectives may also be called performance objectives, behavioral objectives, or simply objectives. All of these terms are used interchangeably. Objectives are specific, outcome based, measurable, and describe the learner's behavior after instruction. Behavioral objectives that are useful in the classroom must meet certain criteria. The four essential elements of a well-written behavioral objective are outlined below. When writing a behavioral objective, evaluate it using these criteria. 1. Good behavioral objectives are student-oriented. A behavioral objective, which is student-oriented, places the emphasis upon what the student is expected to do, not upon what the teacher will do. Sometimes teachers use instructional goals which emphasize what they are expected to do rather than what they expect of their students. Such teacher- oriented objectives only have the value to the extent that they direct the teacher to do something, which ultimately leads to student learning. 2. Good behavioral objectives describe learning outcomes. The important thing to keep in mind here is that we are interested in what the students will learn to do. In other words, it is the learning outcome that is important, not the learning activities that should lead to that outcome. It may be helpful to you as a teacher to determine what kind of learning activities you may want your students to carry out. However, determining which learning experiences and activities are most appropriate for your students can only be made after you have decided what it is you want your students to

48 accomplish. Once learning outcomes are identified and described, then activities that are appropriate for attaining those outcomes can be determined. 3. Good behavioral objectives are clear and understandable. The first prerequisite for a clear and understandable objective is explicitness. It should contain a clearly stated verb that describes a definite action or behavior and, in most cases, should refer to an object of that action. 4. Good behavioral objectives are observable. The evaluation of learning outcomes hinges on the ability to observe those outcomes. The key to an observable objective is an observable verb. Consequently, when selecting behavioral objectives for use in your teaching, watch the verbs! The verb must describe an observable action or an action that results in an observable products. Course objective: What a successful learner is able to do at the end of the course. Is a description of a product, of what the learner is supposed to be like as a result of the process. The statement of objectives of a course/programme must denote measurable attributes observable in the graduate of the program; otherwise it is impossible to determine whether or not the program is meeting the objectives. Undesirable words Desirable words (open to many interpretations) (open to fewer interpretations) To KNOW To WRITE To UNDERSTAND To RECITE To ENJOY To IDENTIFY To APPRECIATE To DIFFERENTIATE To GRASP THE SIGNIFICANCE OF To SOLVE To COMPREHEND To CONSTRUCT To BELIEVE To LIST To COMPARE

49 Steps to Write Behavioural Objectives : Steps to write objectives that will describe the desired behavior of the learner:

1. Identify

the terminal behavior or performance by name; i.e., specify the kind of behavior that will be accepted as evidence that the learner has achieved the objective. 2. Define the desired behavior further by describing the important conditions under which the behavior will be expected to occur. 3. Specify the criteria of acceptable performance by describing how well the learner must perform to be considered acceptable.

Performances may be visible, like writing, repairing, or painting; or invisible, like adding, solving, or identifying. If a statement does not include a visible performance, it isn't yet an objective. An Example: Stated in behavioral terms Stated in performance terms "To develop an appreciation for music" "The learner correctly answers 95 multiple choice questions on the vibration mechanism in music" "To be able to recall various factors of To be able to write a summary of the factors environmental degradation" leading to the environmental degradation" To state an objective that will successfully communicate your educational intent, you will sometimes have to define terminal behavior further by stating the conditions you will impose upon the learner when he/she is demonstrating his/her mastery of the objective.

2.5 Lesson Planning, importance and basic steps

Lesson plan is an out line

of important points of a

lesson arranged in a order in which they are to be presented.

It includes objectives, points to be presented, question to be asked, references, assignments etc. Importance for planning a lesson : Lesson planning makes the teaching regular, well organised, and systematic. It enhances the Self-confidence and self-reliance of the teacher. It facilitates appropriate use of aids of appropriate places. It is economical in terms

of time, as every step has been planned with fore thought. Repetition is hence avoided.

50

It

establishes proper connection between different lessons of study, the teaching learning process

to be continued in a proper way. Student's

interest can be retained by planning suitable activities and assignments, according to the mental level of the students.

A good lesson plan must contain three components : 1. Objectives : (

Why should this lesson be taught?) 2. Content : (What should be taught?) 3. Method : (How should be taught?) Steps :

According to J.F. Herbart, six formal steps should be followed during the development of a lesson plan. 1. Introduction / Motivation 2. Presentation 3. Comparison / Association 4. Generalisation 5. Application 6. Recapitulation

51 Differences between Unit Plan & Lesson Plan
 Unit Plan Lesson Plan
 Time : The time span of planning Time Span is relatively short. is relatively long.
 Objective : It includes relatively more It includes specific objectives general objectives.
 Activity : Teacher's activity and pupils In this plan, both activities expected activities are not written are written briefly.
 Model : Here, we just write about Here we should prepare the model and demonstration, where experiment if any used and when used it any.
 Examples : Examples and Illustration, are Illustrations and examples are not included with content included with content in planning in planning
 Flexibility : Unit plan is mere flexible Lesson plan is comparatively than lesson plan. less flexible than unit plan.
 How to prepare a good lesson? Step-I Consider your overall objectives. Step-II Consider the group. Step-III Consider the time available. Step-IV Consider the Resources available. Step-V Plan and Schedule the subject matter.

Lesson Plan format Name of the student teacher : ----- Name of the School :
 ----- Class : -----

Date : Subject : ----- Period : Topic : ----- Lesson No.- Entry Behaviour :
 Objectives :

52 Method : Media : Introduction Presentation : Teaching Point Instructional Teachers Students Evaluation objectives
 Activity Activity 1. 2. 3. Recapitulation : Home Assignment : Summary of Black Board work : 2.6 Unit Planning : Format of a Unit Plan

According to Samford, '

a

unit is an outline of carefully selected subject matter which has been isolated because of its relationship to pupil's needs and interests."

The unit plan gives an idea about how to go about instructional or daily lesson plan. It is an overview of number of lessons or periods required, audio-visual aids to be used, objectives to be achieved, methods or strategies to be adopted, reference books for further studies for the teachers and students. Every unit is a substantial part of text book and every unit is a set of several concepts and related skills and can be taken up in subsequent days. Criteria for a good unit plan : During preparing of a unit plan, the following points should be kept in mind : It should be related to the social and physical environments, of the students. It should be based on the need, capabilities and interest of the students. It should be as a result of co-operative planning between teacher and pupil. It should provide project work, excursions, film viewing, demonstration etc.

53 Students should be provided with enough time to plan, organise and work on their own. Provision should be there for evaluation and follow up. It should be flexible so as to allow the above average pupils to go beyond the limits of the units. It should help in anticipating and satisfying the future needs of the students. Steps of Unit Planning : During planning of a unit the following factors should be kept in mind. 1.

Content Analysis (the what of the unit) 2. Objectives with specifications (the why of the unit) 3. Learning activities (the now of the unit) 4. Testing Procedures (evidence of Achievement)

Format of a unit plan :

Subject : Class : Name of the Unit : Date : No. of Classes : 1.

Content Analysis. 1. 2. 3. 2. Objectives with specification. 1. 2. 3. 3. Learning activities. 4. Evaluation and testing Procedures. Student activities Teaching Strategies

54 Example of Unit Planning : Subject : Chemistry Name of the Unit : Chemical Compounds Class : IX No. of classes : 08

1. Content Analysis : * Washing Soda * Baking Soda * Bleaching Powder * Cement
 2. Learning Objectives : The students will : develops an awareness of various chemical compounds. recalls the formulae for washing soda, baking soda, bleaching powder and cement. recognises the properties of the above mentioned salts. describes with a clearly labeled diagram of solvey process. interprets the bleaching effect of bleaching powder. illustrates the manufacture of port land cement.
 3. Learning activities Students activities : The students will Perform experiment to find out the reaction of Na_2CO_3 with acid. Sketches the diagram of solvey process with reactions. Develops skill in using washing soda, bleaching powder etc.
 Teaching strategies : Dmonsration on a) reaction of Na_2CO_2 with acid. b) bleaching action of bleaching powder. c) application of chosen salt in daily life.

55 Drawing on the Black Board : Solvey Process Manufacture of Portland cement Visit to a neighbour cement factory. Valuation and Testing Procedures : Problems at the end of the chapter in Prescribed Text Book. Test framed with questions in relation to content mentioned on the basis of their learning objectives. Exercises to evaluate whether the student can :— i) balance equations ii) Identify the different salts. iii) List the composition of cement. 2.7 Pedagogical Analysis : Meaning and need, Guidelines for conducting Pedagogical analysis Previously, pedagogy was defined as a study of the methods of teaching a subject or methods of instructions given to the students to change their behaviour. But at present pedagogy is perceived not merely as a science of instruction, but also as a culture or set of cultures which reflect different context and different teaching behaviours-inside and outside the classroom. Using culture-sensitive pedagogy would mean incorporating different aspects of students' cultural background into the teaching-learning Process. In the National Curriculum Framework of Teacher Education (NCFTE, 2009), it was pointed out : Pedagogical analysis of school teaching subjects has been thought of as an essential component of practice teaching. By way of pedagogical analysis, a pupil-teacher becomes conversant with the objectives of teaching a unit, the entry behaviour of students, classroom management and evaluation strategies. With this background of having looked into the pedagogical aspects of school teaching subjects, the pupil-teacher is likely to become more effective and confident in the classroom.

1. Pre-active stage 2. Interactive stage
56 3. Post-active stage The basic element of the model is pedagogical analysis, sometimes referred to as 'task analysis', which is a major part of pre-active (planning) stage. It emphasizes the need to undertake separate but linked investigations of the learners' and teachers' tasks, and proposes helpful procedures for affecting both of these. The analysis of the teaching task hinges the teacher's ability to identify the 'type of learning' involved in the learning task. This requires sound knowledge and understanding of the learning theories. With the employment of procedures stipulated in the model, knowledge can be gained through a reasoned inquiry into the relevance and usefulness of such theories. The interactive (implementation) stage is subsequently directly assisted by -this analysis because it has 'classroom reality'.

Major Steps in Pedagogical Analysis While performing pedagogical analysis of a unit, topic or content, we proceed with the help of the following steps : Step 1 : Identification of major concepts and their inclusive concepts, i.e. sub- concepts. Step 2 : Translate them into behavioural objectives. Step 3 : Teaching methods to be used. Step 4 : Learning experiences to be given. Step 5 : Type of learning which will take place. Step 6 : Pupil's response pattern. Step 7 : Evaluation strategies to be adopted. Example of Pedagogical Analysis Pedagogical analysis of the topic 'Flower' Step 1: Identification of major concepts and their inclusive concepts or sub- concepts : 1. The meaning of flower

57 2. Different types of flower 3. Parts of flower (a) Calyx (sepals) (b) Corolla (petals) (c) Androecium (stamens) (d) Gynoecium (carpels) 4. Functions of a flower and its various parts 5. Floral symmetry (a) Actinomorphic or regular flower (b) Zygomorphic or irregular flower (c) Assymetrical flower 6. Position of floral whorl on the thalamus Step 2: Objectives specification in behavioural terms After the class is over, the students should be able to : Recall the definition of flower. Recognize different types of flowers. Discriminate between different parts of a flower, such as calyx, corolla, androecium, and gynoecium. Draw a labelled diagram of a flower. Dissect the flower easily and classify the parts on the basis of floral symmetry. Illustrate the position of floral whorl on the thalamus. Show interest in knowing about parts and functions of flowers grown in the school botanical garden. Step 3: Teaching method to be used Lecture-cum-demonstration Group activity with the samples of flowers Constructive approach

58 Step 4: Learning experiences to be given Discussion and activity-based learning experiences will be given, which are briefly described here: 1. Discussion will be supported with: (a) Demonstration of an actual flower (b) Group activity with flowers (c) Sketching and drawing on blackboard (d) Charts and pictures of different kinds of flowers, see Figure 6.1. Figure 7.1 Diagram showing a typical flower and its parts. 2. The main points will be highlighted and concepts explained properly with suitable support system such as: (a) Definition of flower, its structure and functions (b) Providing diagram, pictures, models to show internal parts of flower (see Figure 7.2) (c) Providing points of differences between different types of flowers

59 Figure 7.2 Showing the internal parts of a flower. Through this diagram the students will be able to understand parts and functions of a flower. 3. Different types of flowers will be discussed and demonstrated properly, as given here: (a) Dioecious, e.g. mulberry (b) Complete flower, e.g. rose (c) Incomplete flower, e.g. raspberry, strawberry (d) Bisexual flower, e.g. mustard, china rose (e) Unisexual flower, e.g. papaya (f) Sessile flower, e.g. Ficus, Trillium 4. Flowers will be distributed to all the students to help them understand floral symmetry and they will be instructed to observe and dissect them to analyse the features. (a) Actinomorphic, e.g. mustard. The flower can be divided into two equal

60 halves by any plane. (b) Zygomorphic, e.g. pea. The flower can be divided into two equal halves by one plane only. (c) Assymetrical, e.g. canna. The flower can not be divided into two equal halves along any plane. 5. The position of floral whorl on thalamus. After the students dissected the flower, diagram will be made and pictures used for their understanding (Figure 6.3). The students will be asked to write their observation and give examples of hypogynous, perigynous and epigynous flowers. Figure 7.3 Types of flowers on the basis of the position of thalamus. 6. Students will be provided opportunities to examine the structures of flowers by dissecting them. They will be told to note down the specific characteristics found in the flowers and compare them with the flowers of other students. Step 5: Type of learning which will take place Activity-based constructive learning will occur. Students will dissect their flowers and form knowledge by exploring parts of flowers, floral symmetry, position of the floral whorl on thalamus as shown in Figure 6.3. Step 6: Students response pattern Students will listen to the lecture, participate in discussion and activities. They will observe and 'dissect the given flowers and try to analyse their structure and functions. The pupils will then draw diagrams and compare various flowers with regard to their structures and functions of different parts.

61 Step 7: Evaluation strategies to be adopted Evaluation will be based on objective and short answer-type questions. For example: 1. Give answers in one word for the following: (a) A modified shoot having condensed nodes and internodes with leaves modified into floral parts. (b) Male and female parts in the same flower. (c) Part of flower which receives pollen grains. (d) A flower in which ovary occupies the highest position, and all whorls arise below it. 2. Complete the following sentences : (a) When a flower is divided into two equal halves in one plane, the flower is said to be (b) Petals and sepals are collectively called as (c) Thalamus is also known as (d) Flowers lacking stalks are called (e) Part of flower which protects essential whorl during bud stage is called 3. See Figure 7.4 and give answers to the following questions: Figure 7.4 Parts of a flower indicated by numbers from 1 to 8. (a) Label the parts 1 to 8.

62 (b) Name the floral symmetry of the flower shown in Figure 6.4. (c) Name the position of floral whorl on thalamus. (d) List one function of any two parts from the above diagram. 2.8 Let us sum up

The general aims of science education follow directly from the six criteria of validity : cognitive, content, process, historical, environmental and ethical. To summarize,

science education should enable the learner

to : know the facts and principles of science and its applications, consistent with the stage of cognitive development, acquire

the

skills and understand

the methods and processes that lead to generation and validation of scientific knowledge,

develop a historical and developmental perspective of science and to enable her to view science as a social enterprise, relate to the

environment (natural environment, arti facts and people), local as

well as global, and

appreciate the issues at the interface of science, technology and society,

acquire the requisite theoretical knowledge and

practical technological skills to enter the world of work, nurture the natural curiosity, aesthetic sense and creativity in science and technology, imbibe the values of honesty, integrity, cooperation,

concern for life and preservation of environment, and cultivate 'scientific temper' -objectivity, critical thinking and freedom from fear and prejudice.

Within the frame of reference of general aims, the objectives, content, pedagogy and assessment would differ across different stages on the scope and gradation of the school curriculum. While deciding on gradation of science curriculum, it must be borne in mind that a majority of students learning science as a compulsory subject up to Class X are not going to train as professional scientists or technologists in their

63 later careers; yet they need to become 'scientifically literate', since several of the social, political and ethical issues put forward by contemporary society increasingly revolve around science and technology. As a result, the science curriculum up to Class X should be oriented more towards developing awareness among the learners about the interface of science, technology and society & especially to the issues of environment and health, and enabling them to acquire practical knowledge and skills to enter the world of work. It should stress not only the content of science, but, more importantly, the process skills of science, that is, the methods and techniques of learning science. This is necessary since the process skills are more enduring and enable the learner to cope with the ever changing and expanding field of science and technology. This does not mean that the content can be ignored. Facts, principles, theories and their applications to understand various phenomena are at the core of science and the science curriculum must obviously engage the learner with them appropriately. However, science up to Class X should be learnt as a composite subject and not as separate disciplines such as physics, chemistry and biology. At the higher secondary stage, however, the requirements of different disciplines of science become important and they need to be learnt in depth and with rigor appropriate at that stage.

- 2.9 Check Your Progress 1. What is the difference between aims & objectives?

 2. Define behavioural objectives.

 3. Mention the revised Bloom's Taxonomy of Educational objectives by help of a schematic diagram.
 64

 4. Define lesson plan & unit plan & state any 3 differences between the two concepts.

 5. State the importance of lesson planning.

 6. What is meant by action verb?

 7. Define Pedagogical analysis according to NCFTE 2009.

 8. Mention the major steps of pedagogical analysis.

 9. Enumerate the basic steps of unit planning.
 65

 10. What is the need of pedagogical analysis of a content in science teaching.

66 Unit 3 Approaches & Methods of Teaching Science Structure : 3.1 Introduction 3.2 Objectives 3.3 Different approaches & methods 3.4 Lecture, Demonstration, Discussion & other teaching methods 3.5 Project method & Heuristic method 3.6 Creating different situations of learning engagement 3.7 Constructivist approach & its use in Teaching Science 3.8 Let us sum up 3.9 Check Your Progress 3.10References 3.1 Introduction About 3000 BC, with the advent of writing, education became more conscious or self-reflecting, with specialized occupations such as scribe and astronomer requiring particular skills and knowledge. Philosophy in ancient Greece led to questions of educational method entering national discourse. In his literary work, 'The Republic', Plato described a system of instruction that he felt would lead to an ideal state. In his dialogues, Plato described the Socratic method, a form of inquiry and debate intended to stimulate critical thinking and illuminate ideas. Comenius, in Bohemia, wanted all children to learn. In his 'The World in Pictures', he created an illustrated textbook of things children would be familiar with in everyday life and used it to teach children. Much later, Jean-Jacques Rousseau in his 'Emile', presented methodology to teach children the elements of science and other subjects. During Napoleonic warfare, the teaching methodology of Johann Heinrich Pestalozzi of Switzerland enabled refugee children, of a class believed to be unteachable, to learn.

67 The Prussian education system was a system of mandatory education dating to the early 19th century. Parts of the Prussian education system have served as models for the education systems in a number of other countries, including Japan and the United States. The Prussian model required classroom management skills to be incorporated into the teaching process. Newer teaching methods may incorporate television, radio, internet, multimedia and other modern devices. Some educators believe that the use of technology, while facilitating learning to some degree, is not a substitute for educational methods that encourage critical thinking and a desire to learn. Inquiry learning is another modern teaching method. A popular teaching method that is being used by a vast majority of teachers is hands on activities. Hands-on activities are activities that require movement, talking, and listening, it activates multiple areas of the brain. School science programs are traditionally designed to give children lots of information, have them memorize that information, and then ask them to recall the information on written tests. That approach may be a significant reason for students' less-than-enthusiastic response to science, because that type of instruction does not allow for the active involvement of students in their own learning, nor does it allow children's opportunity to think creatively about what they are learning. Yet, teachers and parents intuitively know that when students, no matter what their abilities or interests, are provided with opportunities to manipulate information in productive ways, learning becomes much more meaningful. This is a process approach to learning - an approach which provides students with an abundance of projects, activities, and instructional designs that allow them to make decisions and solve problems. Through this approach students get a sense that learning is much more than the commission of facts to memory. Rather, it is what children do with that knowledge that determines its impact on their attitudes and aptitudes. A teaching method comprises the principles and methods used for instruction to be implemented by teachers to achieve the desired learning in students. These strategies are determined partly on subject matter to be taught and partly by the nature of the learner. For a particular teaching method to be appropriate and efficient it has to be in relation with the characteristic of the learner and the type of learning it is supposed to bring about. Davis (1997) suggests that the design and selection of teaching methods must take into account not only the nature of the subject matter but also how students learn. In today's school the trend is that it encourages a lot of creativity. It is a known fact that human advancement comes through reasoning. This reasoning

68 and original thought enhances creativity. The approaches for teaching can be broadly classified into teacher centered and student centered. In Teacher-Centered Approach to Learning, Teachers are the main authority figure in this model. Students are viewed as "empty vessels" whose primary role is to passively receive information (via lectures and direct instruction) with an end goal of testing and assessment. It is the primary role of teachers to pass knowledge and information onto their students. In this model, teaching and assessment are viewed as two separate entities. Student learning is measured through objectively scored tests and assessments. In Student-Centered Approach to Learning, while teachers are an authority figure in this model, teachers and students play an equally active role in the learning process. The teacher's primary role is to coach and facilitate

student learning and overall comprehension of material. Student learning is measured through both formal and informal forms of assessment, including group projects, student portfolios, and class participation. Teaching and assessments are connected; student learning is continuously measured during teacher instruction. Commonly used teaching methods may include class participation, demonstration, recitation, memorization, or combinations of these. Science teachers have an exciting opportunity to teach kids about how science makes the world work. Unfortunately, reduced teaching budgets and apathy on the part of students sometimes makes it difficult to get students interested in topics like biology, earth science, anatomy, physics, and chemistry. Some teachers are now using techniques such as peer learning, role-playing, and incorporating current events in science lesson plans. These techniques help engage students and help them understand the importance of science. They also make it fun to teach scientific concepts and help students understand common topics in the scientific world.

3.2 Objectives Upon completion of the subunit, the students will be able to-

- 1) Know the various approaches and methods of teaching sciences
- 2) Understand the different strategies of teaching sciences
- 3) Create different situations of learning engagement

69 3.3 Different approaches & methods Process approach Educators' emphasis to improve students' learning experience, to enrich such experience has led them to search for more effective instructional strategies, strategies that can be described as student centered and that students are the main focus of the learning process, especially those processes that enable the student to use and practice higher level thinking skills and to train him to obtain knowledge, use critical thinking skills in assessing this knowledge and to implement the acquired knowledge in the different life situations. Educators emphasized that one of the goals of science education is to teach students how to think and not to memorize the learning material without understanding it or how to employ it in their daily life. To achieve such an objective, science instruction must focus on assisting students acquire scientific thinking skills, focus on science methods and processes. Students' acquisition of science processes is a priority in science instruction where, if students are fully trained how to use them, enable students to be more practical in their thinking. Therefore; science teachers have the responsibility of providing students with scientific opportunities and effective learning situations, activities leading to the practice of higher order thinking skills such as the use of problem solving skills, using science processes. A process approach to science is one in which children do something with the concepts and generalizations they learn. It implies that students can manipulate, decide, solve, predict, and structure the knowledge of science in ways that are meaningful to them. When teachers and parents provide opportunities for students to actively process information - particularly information related to nature, then learning becomes more child-centered. This results in attitudes, perceptions, and beliefs that the natural world can be actively explored and personally investigated - and that the environment, both near and far, is full of incredible learning possibilities along with a whole lot of fun. Science processes are divided into :

- Basic science processes
- : Simple processes relatively and include observation, classification, measurement, communication, prediction, using space and time relationships and using figures and inferences. Integrated science processes :

70 These are advanced processes and more progressive than basic science processes in the scientific processes hierarchy and include data interpretation and procedural definitions, variables control, testing hypotheses and experimentation. The objective of science teaching are constantly changing, developing and they arise from the science attributes, society needs and its characteristics. The most important objectives of science teaching include. Help students functionally acquire concepts, facts and scientific thinking skills. Help students functionally acquire and develop science processes. To develop students' skills in scientific thinking and problem solving. To help students develop and promote their science attitudes and tendencies. The great challenge in modern instructional methods has become to give learners a greater part in the learning- teaching process to acquire the different experiences and develop his thinking skills as this contributes in raising individuals' sense of responsibility for self -learning and not just a recipient of information. Process Approach based science teaching method is one of the teaching method that can help in achieving as this approach help on providing the individual learner with the necessary skills helping him make solutions and make the suitable decisions for the problem he faces at present and in the future. In light of this, the main objective of this approach is to provide the learner with the adequate competencies in science methods and scientific skills. This approach enables the learner develop a desire to learn. Direct Experience Approach Direct Experience approach has its roots in Experiential Education that paved the way for progressive Education. Experiential education is a philosophy of education that describes the process that occurs between a teacher and student that infuses direct experience with the learning environment and content. The term is not interchangeable with experiential learning; however experiential learning is a sub- field and operates under the methodologies of experiential education. The Association for Experiential Education regards experiential education as "a philosophy that informs many methodologies in which educators purposefully engage with learners

in direct experience and focused reflection in order to increase knowledge, develop skills, clarify values, and develop people's capacity to contribute to their communities Johnn Dewey was the most famous proponent of experiential education, compiling

71 Experience and Education (1938). Dewey advocated that education be based upon the quality of experience. The methodologies reflected in experiential education have evolved since the time of Hahn and Dewey. For experiential education to become efficient Pedagogy, physical experience must be combined with reflection. Direct Experience approach in Science Education informs many educational practices underway in schools (formal education) and out-of-school (informal education) programs. Many teaching methods rely on experiential education to provide context and frameworks for learning through action and reflection. They can be listed as follows : Outdoor education uses organized learning activities that occur in the outdoors, and uses environmental experiences as a learning tool. Service learning is a combination of community service with stated learning goals, relying on experience as the foundation for meaning. Cooperative learning alters homogeneous groupings in order to support diverse learning styles and needs within a group. Active learning, a term popular in US education circles in the 1980s, encourages learners to take responsibility for their learning, requiring their experience in education to inform their process of learning. Environmental education is based in educating learners about relationships within the natural environment and how those relationships are interdependent. Students participate in outdoor activities as part of their learning experience. Direct Experience serves as an umbrella for linking many diverse practices into a coherent whole. Its philosophy is closely linked to numerous other educational theories, but it should not be conflated with progressive education, critical pedagogy, youth empowerment, feminist-based education, and constructivism. Inductive-Deductive Approach

Two very distinct and opposing instructional approaches are inductive and deductive. Both approaches can offer certain advantages, but the biggest difference is the role of the teacher. In a deductive classroom, the teacher conducts lessons by introducing and explaining concepts to students, and then expecting students to complete tasks to practice the concepts; this approach is very teacher-centred.

72 Conversely, inductive instruction is a much more student-centred approach and makes use of a strategy known as 'noticing'.

What is deductive instruction This method is just opposite of Inductive method. In this method, facts are being deduced by application of established formula or experimentation. In this method,

one proceed from general to particular principles, from unknown to known and from abstract to concrete facts. A deductive approach to instruction is a more teacher-centered approach. This means that the teacher gives the students a new concept, explains it, and then has the students practice using the concept. For example, when teaching a new Science concept, the teacher will introduce the concept, explain the rules related to its use, and finally the students will practice using the concept in a variety of different ways. According to Bob Adamson, "The deductive method is often criticized because: a) it teaches concept in an isolated way; b) little attention is paid to meaning; c) practice is often mechanical." This method can, however, be a viable option in certain situations; for example, when dealing with highly motivated students, teaching a particularly difficult concept, or for preparing students to write exams. What is inductive instruction Inductive method is an important procedure to prove a universal law. In this method, this is done by showing that if the law is true in a particular condition, then it will also prove to be true in other similar condition at any place of the world. This method proceeds from concrete to abstract and from a specific example to the universal law. As all the scientific principles and conclusions are result of induction, thus this method is considered to be one of the most important methods of teaching science. In contrast with the deductive method, inductive instruction makes use of student "noticing". Instead of explaining a given concept and following this explanation with examples, the teacher presents students with many examples showing how the concept is used. Source : www.sasked.gov.policy.in

Generalization (or Rule) Specific Examples or Activities Specific Examples or Activities Generalization (or Rule)

73 Using any learning situation from above, the teacher would present the students with a variety of examples for a given concept without giving any preamble about how the concept is used rule as a final check that they understand the concept. Both deductive and inductive sequences are valuable for teaching concepts, generalizations, processes, and skills. When choosing, the teacher should consider a number of factors: How personalized should the learning be? Students will usually be more involved in the learning experience and tend to participate more actively when an inductive approach is used. If a deductive approach is chosen, it is important to structure the learning experience in order to draw on students' prior experiences and learning, and to provide for their active involvement. Should learning experiences be predictable? The deductive approach is more predictable because the teacher selects the information and the sequence of presentation. What depth of understanding and rate of retention is desired? Students tend to understand and remember more when learning occurs inductively. How much time is available to teach the material? The deductive approach is faster and can be an efficient way to teach large numbers of facts and concrete concepts. Merits of Inductive Method By making use of this method, following merits get accrue to the students as well as to teacher: a. As this is a scientific method, thus it helps to considerable extent in developing scientific outlook among the students. b. This method helps to develop scientific attitude among the students. c. With the help of this method, teacher can develop qualities of critical thinking and habit of keen observation among the students properly and accurately. d. This is a very logical and psychological approach of teaching science. e. By this method, students get various opportunities to play an active role in learning process.

74 Demerits of Inductive Method This method has certain limitations, some of which are as follows: a. The results or conclusions drawn from such method are not found to be final in case where the amount of data is very large in number. b. All the topics of science cannot be dealt with this method properly. c. This method can only be used when teacher have much time for teaching process. Merits of Deductive Method This method has following merits: a. As students of lower classes are being provided with established scientific principles, thus this method can prove to be effective for them. b. This method is quite time saving as students are not required to analyse the universal principles. c. Teacher's duty or burden gets lessen to some extent by making use of this method as a result of which teachers find themselves in a comfortable and secured position. d. Through this method, a teacher can cover the lengthy syllabi of class in shortest period of time. Demerits of Deductive Method This method suffers from the following demerits: a. As the approach of this method is non-conform and non-explanatory, because of which it is considered to be an unscientific method of teaching. b. Through this method, it becomes difficult for the teacher to develop scientific attitude among the students. c. As in this method, students do not get any opportunity to play active role in learning process, thus, some experts consider it as unpsychological in nature. d. Rote memory is being encouraged by this method among the students as a result of which they do not become self-independent.

75 3.4 Lecture, Demonstration, Discussion & other teaching Methods A lecture (from the French 'lecture', meaning 'reading' is an oral presentation intended to present information or teach people about a particular subject, for example by a university or college teacher. Lectures are used to convey critical information, history, background, theories and equations. A politician's speech, a minister's sermon, or even a businessman's sales presentation may be similar in form to a lecture. Usually the lecturer will stand at the front of the room and recite information relevant to the lecture's content. Lecture method of teaching is the oldest teaching method applied in educational institution. This teaching method is one way channel of communication of information. Students' involvement in this teaching method is just to listen and sometimes pen down some notes if necessary during the lecture, combine the information and organize it. One of the problems in this method is to grab the attention of students in class room. Another big problem is that many students in the class cannot follow the theme. Learning has a strong influence on method of teaching. The literature on teaching and learning contains other examples of techniques to maintain students' attention in a lecture setting: Avoid direct repetition of material in a textbook so that it remains a useful alternative resource. Make connections to current events and everyday phenomena. Begin each class with something familiar and important to students. End each class by summarizing the main points you have made. Adopt a reasonable and adjustable pace that balances content coverage and student understanding. Consider using slides, videos, films, CD-ROMs, and computer simulations to enhance presentations, but remember that : Students cannot take notes in darkened rooms. The text needs to be large enough to read from the back of the room. Students need time to summarize their observations and to draw and note conclusions.

76 Pay attention to delivery:- Maintain eye contact with students in all parts of the room. Step out from behind the lecture bench when feasible. Move around, but not so much that it is distracting. Talk to the students, not the blackboard. If using the board, avoid blocking it with A V projectors or screens. Shift the mood and intensity. Vary presentation techniques. Advantages of Lecture Method of Teaching : 1. In this teaching method a large amount the topics can be covered in a single class period. 2. Using of this method exclude the use of any equipment or Lab. 3. Learning material is not required. 4. Student listening skills develops. 5. Logical arrangement of the material in order to present it orally. 6. Help to learn languages. Disadvantages of Lecture Method of Teaching : 1. Psychologically this method is acceptable because individuals are not alike. Teacher delivers the same lecture to both students without recognizing the individual differences. 2. Learning is an active process thus study should encourage to actively participate in the class room instead of just listening the teacher. 3. If the language used in the lecture is above the standard of the students, they are not able to get full advantage of the lecture. 4. Lectures are often forgotten by the students soon after, while learning is retained if activities are experienced. 5. Attention level is not the same while listening the lecture.

77 Demonstration Method Demonstration involves showing by reason or proof, explaining or making clear by use of examples or experiments. Put more simply, demonstration means 'to clearly show'. In teaching through demonstration, students are set up to potentially conceptualize class material more effectively. Demonstrations often occur when students have a hard time connecting theories to actual practice or when students are unable to understand application of theories. Criteria for good demonstration: Identify the intended learning outcomes of the demonstration, so that you can communicate them to your students. Consider the various steps involved in the demonstration, listing the equipment and other materials that you will need to collect together before the lesson. Check whether you require teaching aids such as charts, pictures, posters and models to complement the demonstration. The board may be used to highlight key words and important points. Check that the classroom seating arrangements provide your students with a clear view of the demonstration. Rehearse the demonstration so that you are sure of the order in which to do things and can address any possible problems. List the questions that you can ask your students before, during and after the demonstration to engage them and focus the attention. Identify as many opportunities as possible to develop scientific enquiry. Allow your students to predict what will happen, observe any perceptible changes, record their observations and draw their own conclusions. A good classroom demonstration should capture your students' interest from the start, with an appropriate introduction to the topic, reference to the intended learning outcomes and some exploratory questions to establish their current knowledge and understanding. It is important to carry out the demonstration neatly and systematically. The intention is to provide a good example to your students if they later carry out the activity themselves.

78 Advantages 1. This method of teaching serves as model laboratory instruction. 2. Experiment shown as demonstration points out this matter of observation and indicates this inference. 3. It makes the pupils familiar with the nature and use of apparatus. 4. Experiments requiring special skill will merely be shown by the teacher. In this method no time is wasted. 5. Teacher's time is properly utilized in watching the students doing experiments. 6. While doing practical, there remains no necessity for explaining except educating precautions. 7. This method proves more useful if the pupils are told beforehand that they are going to do practical in the laboratory.

Disadvantages 1. There is danger of students being dishonest when teacher has to play the main role in the discussion and demonstration of the topic. 2. Teachers may be tempted to lecture rather than to teach. 3. Teachers do not try for more experiments than those given in the text book prescribed. 4. Oral discussion may not be encouraged, since it will go to restrict the demonstration experiment. 5. Practical as required may not go hand in hand with demonstration work. DISCUSSION AS A METHOD Small group discussion sessions often are used in large-enrollment courses to complement the lectures. In courses with small enrollments, they can substitute for the lecture, or both lecture and discussion formats can be used in the same class period. The main distinction between lecture and discussion is the level of student participation that is expected, and a whole continuum exists. Discussions can be instructor-centered (students answer the instructor's questions) or student-centered (students address one another, and the instructor mainly guides the discussion toward important points). In any case, discussion sessions are more productive when students are expected to prepare in advance.

79 Focused discussion is an effective way for many students to develop their conceptual frameworks and to learn problem solving skills as they tryout their own ideas on other students and the instructor. The give and take of technical discussion also sharpens critical and quantitative thinking skills. Decide on the goals of your class discussion. Keep in mind that the goals may change as you progress through the material during the course. Explain to the students how discussions will be structured. Will the discussion involve the whole class or will students work in smaller groups? If you want students to discuss questions and concepts in small groups, explain to students how the groups will form. Do not allow a few students to dominate the discussion. Some students will naturally respond more quickly, but they must be encouraged to let others have a chance. Be sure that all students participate at an acceptable level Look for opportunities for you or your students to bring to class mini- demonstrations illustrating important points of the day's topic. Be willing to adjust to the needs of your students and to take advantage of your own strengths as a teacher. Advantages : emphasis on learning instead of teaching. participation by everyone in the class. development of democratic way of thinking. training in reflective thinking. training in self-expression. spirit of tolerance is inculcated. learning is made interesting. Limitations: discussion method is not appropriate for all the topics. it can be used only to students who have some basic knowledge in the topic. some of the students may feel shy or reluctant to take part while others may try to dominate. teacher may lose control over the students and they may end up in quarelling.

80 PROBLEM-SOLVING METHOD

Problem-solving is a process-

an ongoing activity in which we take what we know to discover & what we don't know. It involves overcoming

obstacles by generating hypo theses, testing those predictions, and arriving at satisfactory solutions. Problem-based learning is a method of educating adult learners that combines theoretical knowledge with practical application. The process engages participants in considering complex and challenging issues and encourage them to work collaboratively towards finding an appropriate Solution.

Problem-solving

involves three basic functions: 1. Seeking information 2. Generating new knowledge 3. Making decisions Problem-solving is,

and should be,

a very real part of the curriculum. It presupposes that students can take on some of the responsibility for their own learning and can take personal action to solve problems, resolve conflicts, discuss alternatives, and focus on thinking as a vital element of the curriculum. It provides students with opportunities to use their newly acquired knowledge in meaningful, real-life activities and assists them in working at higher levels of thinking.

Fig : A

Problem-Solving cycle Problem Identification Organizing information about a problem Constructing a strategy for problem solving Definition of Problem Problem-Solving Allocation of resources Monitoring problem solving Evaluating problem solving 5 4 6 7 1 2 3

81 Here is

a five-stage model that most students can easily memorize and put into action and which has direct applications to many areas of the curriculum as well as everyday life:

Here are some techniques that will help students understand the nature of a problem and the conditions that surround it: List all related relevant facts. Make a list of all the given information. Restate the problem in their own words. List the conditions that surround a problem. Describe related known problems. For younger students, illustrations are helpful in organizing data, manipulating information, and outlining the limits of a problem and its possible solution(s). Students can use drawings to help them look at a problem from many different perspectives. 1.

Understand the problem It is important that students understand the nature of a problem and its related goals.

Encourage students to frame a problem in their own words. 2. Describe any barriers Students need to be aware of any barriers or constraints that may be preventing them from achieving their goal 3.

Identify various solutions. After the nature and parameters of a problem

are understood, students will need to select one or more appropriate strategies to help resolve the problem. Students need to understand that they have many strategies available to them and that no single strategy will work for all problems. Here are some problem-solving possibilities: Create visual images. Many problem-solvers find it useful to create "mind pictures" of a problem and its potential solutions prior to working on the problem.

Guesstimate. Give students opportunities to engage in some trial-and-error approaches to problem-solving.

Create a table. A table is an orderly arrangement of data.

Use manipulatives. By moving objects around on a table or desk, students can develop patterns and organize elements of a problem into recognizable and visually satisfying components.

Look

for a pattern.

Looking for patterns is an important problem-solving

82 strategy because many problems are similar and fall into predictable patterns.

Create a systematic list. Recording information in list form is a process used quite frequently to map out a plan of attack for defining and solving problems. Encourage students to record their ideas in lists to determine regularities, patterns, or similarities between problem elements. 4. Tryout a solution. When working through a strategy or combination of strategies, it will be important for students to try out & monitor strategies. 5.

Evaluate the results. It's vitally important that students

have multiple opportunities to assess their own problem-solving skills and the solutions they generate from using those skills.

CONCEPT-MAPPING A concept map is a way of representing relationships between ideas, images, or words in the same way that a sentence diagram represents the grammar of a sentence, a road map represents the locations of highways and towns, and a circuit diagram represents the workings of an electrical appliance. In a concept map, each word or phrase connects to another, and links back to the original idea, word, or phrase. Concept maps are a way to develop logical thinking and study skills by revealing connections and helping students see how individual ideas form a larger whole. Concept-mapping as a teaching method to promote critical thinking is based on the theoretical foundation laid down by educational psychologists (Ausubel 1963; Ausubel, Novak & Hanesian 1978). The fundamental idea is to determine how learning occurs and how thinking develops. Steps in Developing a Concept Map The process of concept mapping involves three major steps : Step 1 : List key concepts/terms related to the topic Step 2 : Build up concepts to elaborate key concepts Step 3 : Identify links between concepts Step 1 : List key concepts related to the topic List all the concepts related to the topic which you consider essential to understanding the topic. for example, for the topic "cooperative learning," Jose determined the key concepts to be:

83 Team Responsibilities Individual Responsibilities Characteristics Roles Basic Elements Expected Behaviors Step 2 :

Build up concepts to elaborate key concepts After defining the key concepts, you then expand on those concepts. Ask yourself the question: "What are the important concepts, facts, ideas, terms, etc. that explain the key concept?" Step 3 :

Identify links between concepts It is important to show how or why certain concepts relate to one another. This is called linking explaining the connection between two separate parts of your concept map. Fig 2 : A Concept mapping cycle

Source : www.scienceedu.gov.in

84 Characteristics of Concept Maps Focus question - clearly specifies the problem or issue the concept map should help to resolve. Propositions - a concept map consists of a graphical representation of a set of propositions about a topic. Hierarchical structure - the most general concepts are at the top of the map and the more specific, less general concepts are arranged hierarchically below. Cross-Links - relationships or links between concepts in different segments or domains or the concept map. Cross-links often represent new insights on the part of the knowledge producer. PROGRAMMED INSTRUCTION Programmed learning (or programmed instruction) is a research-based system which helps learners work successfully. The method is guided by research done by a variety of applied psychologists and educators.

Programmed instruction is an instructional method where learning content is broken down into small sections or short chunks. The behavioural principles devised by Skinner, the famous researcher in behaviourism, are used in many classrooms around the world today.

Characteristics of Programmed Instruction/learning: 1. The aims of the course are stated in terms which are objective, and can be measured. 2. A pre-test is given, or the initial behaviour is stated. 3. A post-test is provided. 4. The materials have been tried out and revised according to results (developmental testing). 5. The materials are constructed according to a predetermined scheme (stimulus control). 6. The material is arranged in appropriate steps. 7. The learner has to respond actively (not necessarily overtly). 8. Arrangements are made for responses to be confirmed (knowledge of results).

85 9. The teaching medium is appropriate for the subject-matter and the students. 10. The materials are self-paced or presented in a manner which suits the learner. Learning or training? The terms "programmed learning" and "programmed training" are interchangeable, because the principles and methods were almost identical. If the target audience is industrial or military, researchers used the term programmed training, because training budgets supported the work. But in schools and colleges, the work is often described as programmed learning. Many accounts used either or both terms according to which interest was paying for the work. Sometimes researchers used both terms as explicit alternatives.

Some surveys standardised on using just one of the terms. Types of Programme Instruction: Linear programme : Skinner's approach has been called linear in nature and involves the following features: Learners are exposed to small amounts of information and proceed from one frame or one item of information, to the next in an orderly fashion (this is what is meant by linear) Learners respond overtly so that their correct responses can be rewarded and their incorrect responses can be corrected. Learners are informed immediately about whether or not their response is correct (feedback) Learners proceed at their own pace (self-pacing) Branching programme: Branching programmed learning is similar to linear programmed learning except that it is more complicated because it attempts to diagnose the learner's response. It usually involves a multi- choice format. After the learners have been presented a certain amount of information, they are given a multiple- choice question. If they answer correctly they branch to the next body of information. If they are incorrect, they are directed to additional information, depending on the mistake they made.

86 Fig : Types of Program Advantages of Programmed Instruction. 1. Learners will work individually. 2. Students can proceed at their own pace and at time convenient to them. A slow learner is not embarrassed. 3. This offers a method of teaching project leaders and others in local communities. 4. Those who setup programmed instruction units may be motivated to plan their efforts more deliberately and more thoroughly than with traditional teaching. 5. It may be less complicated to keep materials in current Programmed Instruction unit than it is to update in a textbook. 6. Programmed Materials can be prepared for and adapted to fit almost any local situation related to nationality, economic or cultural variations in a community. 7. Material can be exchanged from country to country and from state to state, giving flexibility and variety to extension offering. Disadvantages of Programmed Instruction. Programmed Instruction has disadvantage too, among them are- 1. The preparation of Programmed Instruction material is time demanding, many hours are usually required to produce a unit. Branching Program Linear Program 1 2 3 4 5 etc. 2 3 4 5 etc. Repeat Section 1 Test 4a 4b

87 2. Motivation is necessary for students, whether they're staff members or layman, to complete units of programmed instruction. It may be that job promotion in their own organization would be sufficient enticement. Possibly an item in the individual personnel record would motivate him to complete a unit. 3. The extension teacher must keep in touch with their students working on units and let them know he's interested in progress and keeping in touch. This may be difficult to do in some cases, like in case of high rate of competition. 4. The technique may be new to the particular students and they may not complete units satisfactorily because they don't adequately understand Programmed Instruction. 5. Programmed Instruction done on an individual basis at student's home or offices would likely have to be limited to the linear type. While this could be effective, it may not have the potential that more sophisticated computers would have. 6. The problem of teacher motivation, one of the human factors is missing here. TEAM TEACHING : In team teaching

a group of teachers, working together, plan, conduct, and evaluate the learning activities for the same group of students. In practice, team teaching has many different formats but in general it is a means of organising staff into groups to enhance

teaching. Team teaching involves a group of instructors working purposefully, regularly, and cooperatively to help a group of students of any age learn. Teachers together set goals for a course, design a syllabus, prepare individual lesson plans, teach students, and evaluate the results. They share insights, argue with one another, and perhaps even challenge students to decide which approach is better.

The team-teaching approach allows for more interaction between teachers and students. Faculty evaluate students on their achievement of the learning goals; students evaluate faculty members on their teaching proficiency. Emphasis is on student and faculty growth, balancing initiative and shared responsibility, specialization and broadening horizons, the

clear and interesting presentation of content and student development, democratic participation and common expectations,

and cognitive, affective, and behavioral outcomes.

This combination of analysis, synthesis, critical

88 thinking, and practical applications

can be done on all levels of education. from kindergarten through graduate school. Working as a team, teachers model respect for differences, interdependence, and conflict-resolution skills. Team members together set the course goals and content, select common materials such as

texts and films, and develop tests and final examinations for all students. They set the sequence of topics and supplemental materials. They also give their own interpretations of the

materials and use their own teaching styles. The greater the agreement on common objectives and interests, the more likely that teaching will be interdependent and coordinated. Teaching periods can be scheduled side by side or consecutively. For example, teachers of two similar classes may team up during the same or adjacent periods so that each teacher may focus on that phase of the course that he or she can best handle. Students can sometimes meet all together, sometimes in small groups supervised by individual

teachers or teaching assistants, or they can work singly or together on projects in the library, laboratory, or fieldwork.

Teachers can be at

different sites, linked by video-conferencing, satellites, or the Internet. Breaking out of the taken-for-granted single-subject, single-course, single-teacher pattern encourages other innovations and experiments. For example, students can be split along or across lines of sex, age, culture, or other interests, then recombined to stimulate reflection. Remedial programs and honors sections provide other attractive opportunities to make available appropriate and effective curricula for students with special needs or interests. They can address different study skills and learning techniques. Team teaching can also offset the danger of imposing ideas, values, and mindsets on minorities or less powerful ethnic groups. Teachers of different backgrounds can culturally enrich one another and students.

SEMINAR : A seminar is a form of academic instruction, either at an academic institution or offered by a commercial or professional organization. It has the function of bringing together small groups for recurring meetings, focusing each time on some particular subject, in which everyone present is requested to actively participate. This is often accomplished through an ongoing Socratic dialogue with a seminar leader or instructor, or through a more formal presentation of research. It is essentially a place where assigned readings are discussed, questions can be raised and debates can be conducted.

It is relatively informal, at least compared to the lecture system of academic instruction.

89 Advantages : 1. A wealth of knowledge usually, presented by many speakers at one time in one place. A lot of "learning" at one clip, with most material compressed into two or three days' worth of time. 2. A sense of camaraderie, where individuals can meet others with the same interests/problems/concerns that they may have in their chosen field. 3. A sense of renewed hope and inspiration (this is especially true for Internet marketing seminars), as sometimes business concerns are lessened by sharing experiences with others. Being with others that "understand" individual's problems or concerns, is usually a great morale booster! 4. A great way for those that don't like to read, or attend classes, to improve their knowledge of a specific subject. Disadvantages: 1. Cost, of course, as all attendees must absorb their own costs. The seminars themselves sometimes also have an entry fee that can be quite high. All travel costs, food costs, hotel costs, and other miscellaneous costs must be absorbed by the attendees. 2. The chance that the speakers may be sharing incorrect knowledge, or not at all knowledgeable themselves (it pays to make your own assessments of presented topics, not just blindly "follow the pack"). Tips, tricks, and strategies need to be weighed as to "worth" and "accuracy" before using these. Careful thought rules here. 4. The chance that the topics may not actively help your learning or your concerns, and that the seminar will be a waste of time, where nothing you learn is of any use to you. 5. The chance that attendees will expect too much from a seminar and thus be disappointed. Realism must rule here. These are not "instant answers" to anything. COMPUTER ASSISTED LEARNING (CAL) :

Computer-assisted instruction (CAI) refers to instruction or remediation presented on a computer.

Computer programs

can

allow students to progress at their own pace

90 and work individually or problem solve in

a group. Computers provide immediate feedback, letting students know whether their answer is correct.

Computers being a graphic user interface, provide a wide range of additional features that can prove to be more effective for self-learning material. Though, CAI and self-learning books pertain to individualized learning, instructions through computers differ from SLM (Self learning material). Characteristics of CAI can be listed as follows: 1) Interactivity: Asking the learner to perform tasks during the package, keeps him alert and attentive. It prevents from getting bored. Immediate feedback is given. The learner is asked to select the correct answer. As soon as he responds, he is given feedback. The correct and wrong answers are shown. The wrong answer is in a faded colour whereas the correct answer is in bold colours and also some additional information about the question asked is supplied. This helps the learner to form a pictorial image of the answer in his mind. If the response of the learner is incorrect then he is asked to try again, till he gives the correct answer. Encouraging words such as "Very good!" or "You did it correctly" are used to increase the morale of the learner and also to motivate him to learn further. 2) Language: The learner is usually alone during while using the package. Isolated learning can tend to boring and the learner may eventually lose interest in the package. Hence it is necessary that the language be very interesting that would attract the attention of the learner and encourage him to learn further Conversational language is used, due to which the learner feels as if the narrator is speaking to him. This motivates the learner. 3) Use of a narrator: Many a times, a graphic narrator is shown which does the job of narrating the topic or the content and usually guides the learner through the entire package. Narrators directly converse with the learner and explain how to use the package. It may sometimes appear as if the graphic narrator is teaching the learner or he is learning along with the learner. This narrator gives a sense of some virtual guide, helping the learner through the process of learning.

91 4) Content Treatment: The content is structured. It is broken into small chunks, sections, subsections, units etc. The learner thus gets a whole picture of the content that he is going to learn in the package. The programmer beforehand decides upon the inter-relation and inter-dependence of the components and accordingly places the material in a sequential order or non-linear manner. 5) Multimedia: Multimedia includes the use of sounds, graphics, animations, motion to any animations, film clips and various other features. All such features have made the CAI packages very interesting. The eye catches any motion and it is easier to grasp attention. It is very interesting to watch a graphic animation performing the unexciting chemical equations or drawing some tedious geometrical figures. If there are any funny sounds in the background then all such boring lessons become fun and frolic. Thus apart from learning, such activities become amusement games for the learner. This keeps the learner motivated and he does not feel as if he is studying some difficult chapter. When there is some definition to be learnt, sounds clip can be added to the text, which would make a double impact on the brain and the learner is able to remember the definition by visual as well as auditory mode. Another advantage of multimedia is that real film clips can be inserted in the packages. Say for example, in a package for Universe, real film clips of the moon or now even the Mars, can be inserted which would create a better impression on the minds of learners. 6) User-friendly Layout: The package first introduces the topic to learner. The introduction may be based upon some previously known events or some situations that are familiar to the learner. The introduction through familiar topics leads to the main subject to be learned. After the introduction, the user comes to the first page or the homepage. This page contains link to all subunits and subsections. When the components are independent of each other, the learner may opt for any sub unit of his choice. For example, if the package is about different types of fruits and vegetables, he may select fruits or vegetables according to his wish and then learn further about them. Fruits and vegetables are not interdependent on each other. The learner can study these topics individually. Thus he has the freedom of choice in such a situation.

92 Unique Features of CAI: There are many unique features of CAI which make it an exciting field of study : One of the most useful is its adaptability for distance learning. Before the dominance of microcomputers, distance learning was mostly accomplished through PI or the US mail system supplemented by telephone contact. On the contrary, CAI provides regular and timely interaction with the instructor and current feedback. Students can repeat tutorials as often as needed and work at their own pace. CAI also can be used with greater numbers of students than a traditional classroom would hold. CAI and web-based instruction have opened avenues of access to individuals with disabilities that were not possible before. Intelligent computer-assisted instruction (ICAI) is programmed so that the CAI adapts to the student's individual needs. It acquires information about the student's current knowledge of a subject and his/her goals in learning the subject and then creates a user profile based on this knowledge. It can then adjust itself to the individual student. Web-based instruction is unique in that students and/or instructors can communicate with each other anywhere in the world within seconds via the Internet. Feedback from the instructor can be obtained immediately. 3.5 Project Method & Heuristic Method The project method is a medium of instruction which was introduced during the 18th century into the schools of architecture and engineering in Europe when graduating students had to apply the skills and knowledge they had learned in the course of their studies to problems they had to solve as practitioners of their trade, for example, designing a monument, building a steam engine. In the early 20th Century, William Heard Kilpatrick expanded the project method into a philosophy of education. His device is child-centred and based in progressive education. Both approaches are used by teachers worldwide to this day. Unlike traditional education, proponents of the project method attempt to allow the student to solve problems with as little teacher direction as possible. The teacher is seen more as a facilitator than a deliver of knowledge and information.

93

The term project is no longer reserved for the planned undertaking calling for the constructive thought and action. Project means almost any undertaking. It is activity oriented but it is more than the simple activity. It advocates that the education should be related to the life situation. The main focus of this strategy is socializing the child and developing the problem solving ability. DEFINITION

OF PROJECT "

A

project is

a whole-hearted purposeful activity proceeding in a social environment" -

W. H.

Kilpatrick. "

A project is a problematic act carried to completion in its natural selection" - R. L. Stevenson.

TYPES OF PROJECTS According to Kilpatrick there are four types of projects. They are: 1. Constructive project: Practical or physical tasks such as construction of article, making a model, digging the well and playing drama are done in this type of projects. 2. Aesthetic project: Appreciation powers of the students are developed in this type of project through the musical programs, beautification of something, appreciation of poems and so on. 3. Problematic project: In this type of project develops the problem solving capacity of the students through their experiences. It is based on the cognitive domain.

For instance, how to operate a bank account? or how to send a thing at distant place? 4.

Drill project: It is for the mastery of the skill and knowledge of the students. It increases the work efficacy and capacity of the students. For instance, this type of project may be taken up to give drill in singing or swimming.

Other types Individual and Social (Group) projects :

94 In individual projects, every student solve the problem in their own according to their interest, capacity, attitude and needs. It develops the problem solving qualities individually and not the social qualities. In Group projects, the problem is solved by the group of pupils in the class. Here the social, citizenship qualities and synergism are developed. **Simple and Complex project:** In the simple projects, the students complete only one work at a time. They also focus the work in one subject or one area only. It gives the deep information about the project in one angle. The students get deeper and broader knowledge about the problem. In the complex projects, the students carry out more than one work at a time. They focus on the work in various subject and angles. Here the students get the knowledge about the work in various activities and dimensions.

PRINCIPLES OF PROJECT METHOD 1. Principle of Purposefulness The project should be purposeful, and that should have some main objective. The objective should give the enthusiasm and work to the students, otherwise that will be a wastage of time and energy. 2. Principle of Utility The project should be useful to the students and the society. It should be of some value to the students. From a good project, the students as well as the society may get the benefit a lot. 3. Principle of Freedom The students should be free to select the topic and execute the work according to their will and wish, interest, attitude and capacity. The teacher should only be a "guide on the side" and give guidelines to execute that. 4. Principle of Activity Project means the purposeful activity so at the end of the project the students must gain knowledge through their activity. It is also a demand of the principle of learning by doing.

95 5. Principle of Reality Project should be real and related to the life situation of the students and the society. Only then they would be able to complete the project naturally and really. Imaginary problems must not be taken up in the project. 6. Principle of Social Development A good project focuses society needs, social development, and usefulness to the society. A single project solves the problem of the thousands of the people or the society. 7. Principle of Planning The students plan in advance about the project. They find solutions for - How? When? What? Where? Why? So, good project develops the problem solving capacity and prior planning for the execution. **PARADIGM OF PROJECT METHOD** Project method has the following steps: 1. Creating Situation In the first step teacher creates the proper situation to the students in the class. He shares the knowledge about the project method procedure, steps, and uses with the students. After that he provides proper motivation through conversation about the day to day life problems to the students. 2. Selection of the problem Then the teacher helps the students to select the problem and guide them. Here the students are having freedom to choose the topic or problem based on their interest and ability. Before choosing the topic the principles should be taken in to an account. 3. Planning The teacher discuss with the students about the problem through various angles and points. He should create the situation of the discussion with the students and they are allowed to talk freely and openly. After the free expression of the students' opinion about the problem, the teacher writes down the whole program of action stepwise on the blackboard. The grouping is made by the teacher based on the interest and ability of the students.

96 4. Execution The students start their work in this step. They collect the relevant information/ data and materials at first. The teacher should give time to the students according to their own speed, interest and ability. If need arises, he may provide the necessary help and guidelines to the students. He demands the groups to complete the project in the particular time. 5. Evaluation Here the students evaluate their task. They determine whether the objectives have been achieved or not. After that they criticize and express their feeling about the task freely. The planning, selecting the task, and execution are discussed in the class. All these things are collectively reported to the teacher. 6. Reporting and Recording It is the last step of the project method in which each and every step of the work are reported. The reported things are recorded in a certain order in a book form. The record is useful for the further use and future reference about the project. It reveals many ideas about the concerned project. The book formatted report is submitted to the teacher at the end. **ADVANTAGES OF PROJECT METHOD** 1. It is students centered, activity based method. 2. Students involves whole-heartedly in the learning process according to their needs, attitude, interest and ability. 3. This method is related to the life situation of the students. 4. This method develops the problem solving ability to the students. 5. It makes the students independent and confident. 6. It gives the real work experience to the students. 7. It develops the social qualities and synergism in the students' heart. 8. It develops the responsibility realization of the students. **LIMITATIONS OF PROJECT METHOD** 1. It is a time consuming method.

97 2. It is difficult to complete the prescribed syllabus in a particular time. 3. It is a very costly method. 4. It is not applicable for the lower classes. 5. All topics cannot be through this method. 6. It is not applicable for the all schools. 7. It needs so much material for the execution.

HEURISTIC METHOD : A heuristic method (a Greek word means to "find" or "discover"), often called simply a heuristic, is any approach to problem solving, learning, or discovery that employs a practical method not guaranteed to be optimal or perfect, but sufficient for the immediate goals. **Meaning of Heuristic Method of Teaching** : A problem is placed before the learners and they are asked to find the solution of the problem through various literacy means, like library, laboratory, and workshops etc. Teacher's role is to initiate the learning and pupils are active throughout the learning process. By using their creative thinking and imaginative power, they try to find out the relevant solutions based on some logic. They learn by self-experience. This teaching strategy is focused on: 1. To develop problem 2. Solving attitude 3. To develop scientific attitudes towards the problem 4. To develop power of self-expression Its basic principles are: 1. To each as little as possible at one time 2. To encourage learner to learn himself as much as possible. **Advantages** : 1. Students are put into the situation to learn by self-experience. It certainly develops self-confidence and self-reliance in the learners.

98 2. It helps in developing scientific attitude and creativity in the learners. 3. Teacher encourages the learners to explore the environment in search of the solution of the problems. By doing so, some new knowledge is discovered by them. 4. Teacher is always ready to provide individual guidance regarding the solution of the problem. Thus interaction between the teacher and the learner takes place in a cooperative, conducive environment. **Disadvantages of Heuristic Teaching Method** 1. It cannot be used at primary level of education. 2. Higher intelligence and divergent thinking is required in the learners. But, there are some students who are below average and fail to succeed in discovering the solutions of the problems. It frustrates them. 3. In true sense, none of the teachers have patience for providing individual guidance to the learner: 4. And learners, too, feel hesitation to approach the teacher for seeking his help. **Suggestions** There can be number of solutions for a problem. So, it is the teacher's duty to provide guidance to the learners to select the most relevant solution of the problem. 1. Problem should be related to the course and curriculum and a definite time period should be allotted to the learners to finish their research work. 2. Students' abilities capabilities, interest and choice of the subject should be taken into consideration in allotting the problems. 3. There should be an eligibility criteria for providing the problems. **3.6 Creating Different Situations of Learning Engagement** Three Main Types of Cooperative Learning in Science are : Cooperative Learning, Group Learning Small group Learning Collaborative or Cooperative learning "is

an umbrella term for a variety of educational approaches involving joint intellectual effort by students, or students and teachers together".

Cooperative learning, a form of collaborative learning, is an

99 instructional technique in which students work in groups to achieve a common goal, to which they each contribute: out-of-class study groups in-class discussion groups project groups (in and/or out of class) groups in which roles (leader, timekeeper, technician, spokesperson, and so forth) are assigned and rotated. Cooperative learning is the most commonly used group work teaching strategy by all science teachers. Johnson & Johnson, two well-known pioneers in modern methods of cooperative learning have identified the three main types of cooperative learning: cooperative base groups, informal cooperative learning groups and formal cooperative learning groups (Johnson, Johnson, 1994). I. Cooperative Base Groups Cooperative base groups are long-term, heterogeneous cooperative learning groups (lasting for at least one semester or year) with a stable membership, whose primary responsibility is to give each member the support, encouragement, and assistance he or she needs to progress academically and develop cognitively and socially in healthy ways. II. Informal Cooperative Learning Groups An informal cooperative learning group is one in which students work together in temporary, ad hoc groups that last for only one discussion or class period to achieve joint learning goals. In formal cooperative learning groups are used to focus student attention on the material to be learned, create an expectation set and mood conducive to learning, ensure students cognitively process the material being taught, and provide closure to an instructional session. The one-period long group work activity designed for conducting any laboratory work in small groups (usually of 3- 4 students) is an example of an informal cooperative learning group. Group work is appropriate for laboratory work in science lessons because it is not always possible to provide material for individual manipulation. III. Formal Cooperative Learning Groups The formal cooperative learning group is the most widely used method as almost

100 all teaching examples provided in the on-line seminar were classified under this method. A formal cooperative learning group is when students work together for one or several class sessions to achieve shared learning goals and jointly complete specific tasks and assignments. These groups provide the foundation for all other cooperative learning procedures. They are structured through pre- instructional decisions, setting the task and the cooperative structure, monitoring the groups while they work, intervening to improve task-work and teamwork, evaluating student learning, and processing group functioning. Peer- Tutoring : Peer tutoring is an intervention in which students work in pairs to master academic skills or content. Peer tutoring can involve partners who are the same age or different ages (cross-age). Cross-age peer tutoring involves older students serving as tutors for younger, lower-functioning students. Cross-age tutoring occurs for example, when students in a high school child development class spend regularly scheduled time each week reading with struggling students in a fourth grade class. In this instance, the tutors might be expected to gain less from the content being tutored but may be expected to gain more in social responsibility or understanding of learning as a process. In same-age tutoring, in which students of the same age tutor each other, more skilled students may be paired with less skilled students. In this case, students with stronger skills may provide the first responses, providing a model for the less skilled partner. In other cases, the teacher may decide to pair students of similar ability and have them alternate tutoring roles, which is sometimes referred to as reciprocal peer tutoring. Class-wide Peer Tutoring (CWPT) occurs when the teacher creates highly structured tutoring materials for use during the tutoring session. Peer tutoring is differentiated from tutoring between adults, such as community volunteers, and students. It is also distinguished from cooperative learning, in which students work collaboratively in groups. Clearly, peer tutoring is a general term that encompasses many tutoring models. All methods are designed to increase practice, responding, and feedback For students, and they often result in increased student motivation and achievement. These models differ, however, in how tutoring pairs are assigned, how tutoring content is developed, and how extensively the tutoring is employed. For example, in cross-age tutoring the expert tutor is typically the older student, while in reciprocal peer tutoring and CWPT the paired students are the same age and can take turns assuming the expert role. In cross-age and reciprocal tutoring, the student tutor is typically responsible For learning the content and then teaching the information to the tutee, while in CWPT the teacher is more responsible.

101 The instructional components of the peer tutoring approach include (a) explicit teaching of students in how to be tutoring experts, (b) purposeful partner assignment, (c) careful preparation of tutoring materials, (d) highly structured tutoring procedures that include specific Feedback For tutors to provide tutees, (e) expert role reversal, and (f) active teacher monitoring. Also, some type of systematic performance is typically included. Jigsaw : Jigsaws are particularly relevant to science because they model the way in which science, engineering, and medicine work in the real world. Groups of experts often collaborate in multi- disciplinary teams to accomplish goals and complete projects. Jigsaw lessons provide unique opportunities for students to learn from each other and practice the 21 st century skills of collaboration and communication in an authentic setting. By using the jigsaw method in our classes, we are preparing our students for the careers that await them. How to Set Up Jigsaw Activities: Carefully arrange both sets of groups (the first "expert" ones and the second "multi-disciplinary" ones) to ensure diversity of skill levels and leadership ability. Assess students individually (not as a group) to make sure that their marks truly represent their own level of mastery (and not what the group overachiever knows). Give students lots of guidance about what they should be doing in each group. Choose a captivating, authentic experience for them. If you teach the human body, let them become specialists in a body system. If you are studying fossils, assign your students to become experts on different time periods. Later, give the mixed groups mysteries to solve, like unidentified bones or undiagnosed medical conditions.

102 Learning with reference to children with Disabilities : One of the four guiding principles of the National Science Education Standards is simply "science for all students" (NRC 1996). This principle underscores the belief that all students, regardless of race, gender, or disability, should have the opportunity to learn and understand the essential science content described in the Standards. Because of increasingly widespread inclusion practices and more thorough identification procedures, students with documented learning disabilities (LD) are becoming a larger percentage of the science classroom. Because many practicing science teachers have little training or experience in identifying and meeting the needs of students with disabilities basic educational principles that support the unique learning needs of these students have been formulated. Each principle is accompanied by examples of how a science instructor might put that principle into practice. Principle1: Learning is enhanced when teachers recognize and teach to diverse learning styles and strengths. Learners have diverse ways of making meaning, constructing knowledge, and expressing understanding; using this perception as a starting point in our science teaching is particularly important for students with disabilities. These students-who show deficits in certain aspects of their learning such as organization, reading, memory, and writing-have benefited when instructors accommodate and teach to a variety of learning styles (Carbo and Hodges 1988). Teachers interested in reaching the broadest range of students can offer multiple means of representing the content in their classroom and provide students with multiple means of expressing their mastery of that content. This universal design approach to education is strongly advocated by organizations that work to expand learning opportunities for those with disabilities, such as the Center for Applied Special Technology. Principle-to-practice examples Although this principle may require more time to implement, the field of science lends itself well to teaching to a diversity of learning styles. Teachers can apply the following approaches.

103 Provide instruction that reaches the full spectrum of diverse learners. Example: Students can see or perform a demonstration of osmosis (real or computer-based), view and/or construct a diagrammatic depiction of diffusion versus osmosis, read a text-based description of cell transport mechanisms, and enact a role play that shows active transport kinesthetically. Provide various means of assessment that capitalizes on students' learning strengths or preferences. Example: Students can choose from-or the teacher can alternate among-varied-format tests, graphic organizers, oral interviews, three-dimensional models, written summaries, PowerPoint slide presentations, or posters. The teacher could also have a set order to cycle through. Principle 2: Content learning is supported by explicit instruction in skills and strategies. The science curriculum is embedded with an ever-increasing array of thinking, study, and organizational skills that are predictors of future academic success. Principle 3: Learning is facilitated when instruction and assessment are clearly organized. Although explicit organizational schemes are useful for all students, they are particularly important for CWSN (children with special needs) who are most successful when provided with high structure (Minskoff and Allsopp 2003). Explicit organization of instruction and assessment can positively affect student planning, prioritizing, and goal-setting, all typical areas of difficulty these students (Raskind et al. 1999). Teachers should pay special attention to organizing routines and pacing, which are frequently difficult for these students. Principle 4: Learning is maximized when instruction and assessment are based on explicit objectives. In the Guide to Teaching Science to Students with Special Needs in the Inclusive Setting, Mastropicri and Scruggs (1993) emphasize clearly stated objectives as a hallmark of effective instruction for such students. Certainly, understanding the purpose of a lesson or an assessment will enhance the learning of any student, but this understanding is particularly salient for such students, whose memory capabilities 104 are likely to be compromised as a part of their diagnosis (Hulme and Mackenzie 1992), clearly articulated objectives, which are easily available and frequently referred to, can be an important reference point, allowing such students to access and re-access information that is likely to provide both clarification and motivation. The following points provide strategies for making learning objectives explicit during instruction and assessment. Make a direct connection, orally and in writing, between each class task and its associated learning objective. Example: When facilitating a role-playing demonstration of active transport, the teacher must make explicit at the outset the purpose of the demonstration and provide an opportunity at the end for students to articulate the main idea of the demonstration. Provide scoring rubrics that describe the qualities of excellent work for the various components of each assignment. Example: If assigning a lab report on some aspect of cell transport from an inquiry-based investigation, the teacher can give students a rubric that describes the qualities of an excellent, adequate, partial, or poor hypotheses statement. Each component of the assignment (e.g., data table, graph) would include similar descriptors of quality. Provide (or assign) some form of study guide for students to review before any quiz or exam. Example: The instructor can generate a study guide for early units in the course and eventually assign it to students. Principle 5: Learning is improved when teachers provide consistent feedback. In addition to providing important self-assessment information, frequent feedback enhances motivation, which is important to academic achievement. The benefits of feedback, while important to all students, some ways to offer consistent and helpful feedback for students in science exist. Principle 6: Learning is sustained when students develop self-knowledge. By increasing their own understanding of learning styles and disabilities, science teachers can help impart this information to their students, thus increasing students' metacognition and their ability to begin advocating for themselves as learners.

105 3.7 Constructivist Approach and its use in Teaching Science Constructivist teaching is based on constructivist learning theory.

Constructivist teaching is based on the belief that learning occurs as learners are actively involved in a process of meaning and knowledge construction

as opposed to

passively receiving information. Learners are the makers of meaning and knowledge. Constructivist teaching fosters critical thinking, and creates motivated and independent learners.

Characteristics of Constructivist Teaching

According to Audrey Gray, the characteristics of a constructivist classroom are: the learners are actively involved the environment is democratic

the activities are interactive and student-centered the

teacher facilitates a process of learning in which students are encouraged to be responsible and autonomous

Role of teachers in a constructivist classroom:

In the constructivist classroom, the teacher's role is to prompt and facilitate discussion. Thus, the teacher's

main

focus should be on guiding students by asking questions that will lead them to develop their own conclusions on the subject.

It is unanimously suggested that good teachers join self, subject, and students in the fabric of life because they teach from an integral and undivided self, they manifest in their own lives, and evoke in their students, a capacity for connectedness". There are three major roles for facilitators or teachers to support students in constructivist learning environments (CLE): Modeling - Modeling is the most commonly used instructional strategy in CLEs. Two types of modeling exist: behavioural modeling of the overt performance and cognitive modeling of the covert cognitive processes. Behavioural modeling in CLE demonstrates how to perform the activities identified in the activity structure. Cognitive modeling articulates the reasoning that learners should use while engaged in the activities. Coaching - the role of coach is complex. She acknowledges that a good coach motivates learners, analyzes their performance, provides feedback and advice on the performance and how to learn about how to perform, and provokes reflection and 106 articulation of what was learned. Moreover, she posits that coaching may be solicited by the learner. Scaffolding - Scaffolding is a more systemic approach to supporting the learner, focusing on the task, the environment, the teacher, and the learner. Scaffolding provides temporary frameworks to support learning and student performance beyond their capacities. The concept of scaffolding represents any kind of support for cognitive activity that is provided by an adult when the child and adult are performing the task together. Constructivist Learning Environments (CLEs)

In CLEs, learning is driven by the problem to be solved; students learn content and theory in order to solve the problem. This is different from traditional objectivist teaching where the theory would be presented first and problems would be used afterwards to practice theory. Depending on students' prior experiences, related cases and scaffolding may be necessary for support. Instructors also need to provide an authentic context for tasks, plus information resources, cognitive tools, and collaborative tools. Constructivist assessment Traditionally, assessment in the classrooms is based on testing. In this style, it is important for the student to produce the correct answers. However, in constructivist teaching, the process or gaining knowledge is viewed as being just as important as the product. Thus, assessment is based not only on tests, but also on observation of the student, the student's work, and the student's points of view. Some assessment strategies include: Oral discussions. The teacher presents students with a "focus" question and allows an open discussion on the topic. KWL(H) Chart (What we know, What we want to know, What we have learned, How we know it). This technique can be used throughout the course of study for a particular topic, but is also a good assessment technique as it shows the teacher the progress of the student throughout the course of study. Mind Mapping. In this activity, students list and categorize the concepts and ideas relating to a topic. Hands-on activities. These encourage students to manipulate their environments or a particular learning tool. Teachers can use a checklist and observation to assess student success with the particular material.

107 Pre-testing. This allows a teacher to determine what knowledge students bring to a new topic and thus will be helpful in directing the course of study

of findings. Significance of Teacher in a constructivistic Science classroom: In constructivists' view, teachers in science classrooms as authority figures play two essential roles. One is to introduce new ideas or cultural tools where necessary and to provide the support and guidance for students to make sense of these for themselves. The other is to listen and diagnose the ways in which the instructional activities are being interpreted to inform further action. The essential role of the teacher is controlling the 'flow of discourse' (Mortimer & Scott, 2000) in the classroom. The ability to guide the classroom discourse as ideas are explored and explanations are introduced, is central to the science teacher's skill and is critical in influencing students' learning. Teacher's role may be summarized as; develop key ideas relating to the new concepts being introduced; introduce points relating to epistemological features of the new way of knowing; promote shared meaning amongst all of the students in the class, making key ideas available to all; check student's understanding of newly introduced concepts. 3.8 Let Us Sum Up Whether in lecture, discussion, laboratories, or individual encounters, questioning is an important part of guiding students' learning. When students ask questions, they are often seeking to shortcut the learning process by getting the right answer from an authority figure. In the learning process, it is the processes of arriving at an answer and assessing the validity of an answer that are usually more important, particularly if the student can apply these processes to the next question. Both of these processes are obscured if the teacher simply gives the requested answer. Often, the Socratic method- meeting a student's question with another (perhaps leading) question- forces students (while often frustrating them) to offer possible answers, supporting reasons, and assessments. In fact, posing questions can be an effective teaching technique. Here are some tips for the effective use of questions: Wait long enough to indicate that you expect students to think before answering. Some students know that if they are silent the professor will give the answer (Rowe, 1974).

108 Solicit the answer from a volunteer or a selected student. Determine the student's confidence level as you listen to the answer. Solicit alternative answers or elaboration to provide material for comparison, contrast, and assessment. Solicit additional responses from the same students with a leading question or follow-up observation. It is often seen, that questioning on the part of the learners provide an actual learning, if they are directed properly in the path of learning. 3.9 Check Your Progress 1. What is the meaning of method & approaches in teaching–learning situation?

111 Unit 4 Learning Resources with References to Children with Disabilities for Teaching Science Structure : 4.1 Introduction 4.2 Objectives 4.3 Needs for Teaching learning aids for Science Teaching 4.4 Importance of Co-curricular activities 4.5 Science Laboratory with Reference to Children with Disabilities 4.6 Aquarium, vivarium–Role in Teaching with Setting & Maintaining 4.7 Museum, Botanical & Zoological Garden : Role in Teaching 4.8 Let Us Sum Up 4.9 Check Your Progress 4.10 References 4.1 Introduction According to Kothari Commission (1964-66) “The supply of teaching aids to every school is essential for the improvement of the quality of teaching. It would indeed bring about an educational revolution in the country.” Our day to day life experiences have three aspect cognition, affection and conation. None of these can be experienced independently. Montessori Stressed the import of human senses. At the first step stimulation of sense produces in him or her just a sensation but later his Sensation became a meaning to it and at the end it visit convert to perception. Perception leads to ideas or concepts. The pupils interested to see concrete objects. They want to handle, manipulate and the teacher should provide a situation for the pupils to satisfy their curiosity of doing thing. According to Burton, “Teaching learning aids are those sensor objects or images which initiate or stimulate and re-inforce learning.”

112 4.2

Objectives After going through this unit, the learners will be able to: Understand the need & importance of teaching-learning aids. Signify & delineate different co-curricular activities Plan & interpret science lab with reference to children with disabilities. Explain & demonstrate aquarium, museum, botanical & zoological garden. 4.3 Needs for Teaching learning aids for Science Teaching The use of Teaching learning aids is necessary for the following reason : 1. The aids help in drawing the attention of students. 2. These help in arousing interest and motivating force for the students activity. 3. These help in providing direct experience as the objects are presented in concrete form. 4. These are helpful to the students to have clear understanding of the concept. 5. Teaching learning aids break monotony and provide variety of learning situations. 6. These help in making the students remain active all together. 7. These stress on the principles of learning by observing and doing. 8. They help teacher for in creasing classroom interaction style. 9. They help in catering to the needs of all kinds of students in the classroom. 10. Teaching aids help developing scientific attitude and train the teacher for applying scientific method in the class room. Importance of teaching learning aids : There is an old saying which reads. I Hear, I Forget : The traditional teacher depended to much on verbal exposition, pupil hears and forget. I See, I Remember : As a sensory organ, the eye is very highly developed when compare to the other sensory organs. So, what one sees, one remembers.

113 I do, I Understand : When one is engaged in any Practical activity, involving physical more all the Senses are used to perceive. Hence flow of knowledge is quick, complete and more accurate. So importance of teaching learning aids can be given for the following reasons : i) It reduces verbalism or meaning less use of words and phrases and contributes towards the clearness of percept and accuracy in learning. ii) It extends first hand experience when students see a demonstration, handle the apparatus, perform experience themselves and prepare chart model etc. iii) It is the most natural and easiest way of learning. Image is the greatest instrument of instruction. When a Pupil sees an object, he/she forms an image of the object. iv) Some type of freedom prevails in the classroom. Pupil can talk, ask, comment and discuss and they are motivated to do work and they work freely in the classroom situation. v) The large number of pupils can learn though proper teaching learning aids used by the teacher. vi) New curricula have broadened and extended the field of Education which can be satisfactory covered only with the help of teaching aids. Principles for Selection of Teaching learning aids 1. The aids Should be integrated with learning. It should be an integral part of educative process and appropriate to the curriculum of the class. It should not be merely recreational but should accomplish some significant end and co- ordination with day-to-day lessons. For example, while teaching about a scientist, the taperecorded speech may be reproduced in the classroom. This will provide life-like situations and the pupils will feel interested. 2. It should be according to the age, intelligence and experiences of the students. It should neither be too simple nor too complex. It should suit to the physical, psychological, intellectual and social development of the group wli which it is used. 3. The language should be familiar and understandable to the pupils. 4. It should be truthful, accurate and realistic and should be a substitute for reality. For example, a model of red-rose should represent a true flower in its

114 proportion, colour, symmetry etc, If the aid used is just a misrepresentative of the actual thing the whole aim of the aid or teaching is defeated for all children will learn wrong things. 5. It should be motivational and highly informative, The aid used should attract and capture the attention of pupils. 6. It should be available where and when required. 7. It should have desirable utility and should be according to local conditions and needs. The aid selected should satisfy the purpose with which it is used. Principles for the Use 1. The teacher should be well skilled in the use of aid. Aid should be actually taught and not merely displayed, It should not substitute but supplement the teacher's work. 2. While using the aid active participation of students should be sought. There should be adequate preparation on the part of pupils, They should be told what they should look for. The pupils should ask questions, answer questions, comment and discuss. 3. The aid should be properly protected and preserved for nothing discourages or mars the interest of the students more than a spoiled picture, broken model or a cracked slide. 4. It should be located conveniently so that it is easily available when need arises. 5. The aids should be evaluated at regular intervals in order to know their use and effect on learning. Types of Teaching-learning aids on the basis of experiences : All the experiences that human beings derive are mainly from three sources : (i) Direct sensory contact which involves doing. (ii) Pictures or some other forms of representation of objects by observing. (iii) Oral or printed words which involve symbolising. All the learning experiences which can be utilised for class room teaching are shown by Edgar Dale in a pictorial device—"Pinnacle form which he called "Core of experiences."

115 Effectiveness increases Projected Aids More effective than non-projected aids. Projected Aids More effective than non-projected aids. Figure 2.1 Relative Effectiveness of Teaching Aids Source : Sampath et al Coloured Chalk Charts Word, word, word least effective method Teaching Aids Non-projected Chalk Board White Chalk Display boards Models Static Models Sectional Epidiascope Slide Projection-Black and White Coloured Slides Flimstrip Projection-Colour Overhead Projector Motion Picture-Silent, Black and White Motion Picture-Sound-Colour Loop (Cassette) Colour Film CCTV. 116 Teaching learning Aids to Promote Effective Learning—Comparative Study Classification of Teaching learning aids Visual i) Chalk-Board ii) Charts, Diagrams Sketches, models, graphs iii) Motion pictures film strips and slides iv) Flannel graph, Bulletin Board and scrap book etc. Auditory i) Radio ii) Gramophone iii) Tape-recorder etc. Audio-Visual i) Films (Sound motion pictures) ii) Television iii) Video etc. Information Technology 1. CD/DVD 2. Multimedia etc. Software needed 7 Information available from manufacturers. Teachers can themselves make slides Commercial TV stations often broadcast many programmes. But teachers. Sl. No. 1 2 Tool Hardware 2 2x2 slide viewer TV receiver (C.C.T.V.) How to use 3 Individual or small group instruction depend on type of viewer Small or large group instruction Features and Utilisation 4 Student can use alone in classroom or industrial an resource centres Ideal for students in make up work Useful in areas where space or safety limitations prevent students from clearly Conditions for Use 5 With proper screen little or no darkening of the laboratory is necessary School plant must be specially equipped Accesories available 6 Some models built-in- screens in covers, slide carries, slide trays, manual or automatic changers, automatic timers, remote control changers, adapters for single-frame vertical filmstrips Auxiliary speakers, glare shields, coaxial cable with impedance How many 8 One in each laboratory, one in resource centre Considering cost one is usually enough if a planning room or Maintenance 9 Low Normal Mainten

117 7 must develop own TV films for use in regular lessons possible. Teachers may record own tapes to suit lessons Both sending and receiving equipment is necessary (see TV Receiver) Spare reels, 2 track tape, check cata-logues/ disc records (33, 45, 78, r.p.m. Discs) Light Sensitive transparency blanks, laminates 1 3 4 5 6 2 Audio- tape recorder (Listening station) Portable Video-tape machine Tape- recorder and record player Trans- parency equipment 3 Used with individual or small group instruction, can be used with other audio- visual equipment Entire class viewing Small or large group instruction replaying recorded educational broadcast To make transparency for us with overhead projector 4 viewing demonstrations Ideal for mock up lectures or dictated tests Instructors and students can programme tape to be used for classroom demonstrations Avoid crowding around machines where safety problems could arise Lectures may be given during teacher's absence Students may review lecture as they wish or listen to recordings Can be used to make transparencies 5 Needs carphones and jacks. Students use the equipment independently. Need not disturb teacher or classmates Can tape teacher's demonstrations, allowing him freedom to work with students None None 6 matching transformer for connectting 300 ohm antenna or camera system Earphones, Jacks sound proof individual desk units Portable video monitor special effects generators empty reels, wide angle lens, telephoto lens, vidicon camera Additional speakers, microphones, stereo head phones, earphones Carrying case, dust cover 8 resource centre is available One per lab or resouce centre One in a resource centre One per department One per department 9 Specialised maintenance needed Requires specialised maintenance Spectalise maintenance may be sometimes needed Spectalise maintenance 118 7 Many commercially available 35 mm film- strips, check film and audio- visual catalogues Check catalogues for film listings Commercial films available, consult film catalogues for lists of films for rent or free. Some teachers can make their own films 1 7 8 9 10 2 Wall charts and posters Filmstrip Projector or Slide projector 8mm sound projector 16 mm sound projector 3 Small or large group instruction Small or large g roup instruction Small or large group instruction Small or large group instruction 4 Can be used for a variety of purposes Can be used for 2x2" slides or 35 mm filmstrip, teacher may stop and discuss any time Student can assist by reading or operating the projector during class Through commercially available films, more up-to-date information can be brought into the classroom to assis t the industrial arts teacher in clarifying lessons Can be used in classroom or laboratory 5 A darkened room may be necessary Same as 16 mm motion picture projector Darken room except for newly developed day-light screen 6 Dust cover, carrying case lenses, automatic timer, remote control film advance, rewind take-up self-contained unit with screen, PA system in some models Loudspeaker 20 mm to 32 mm f/1 Projection zoom lens, universal splicer, remote control microphone, variable speed control, automatic and semi- automatic threading devices, stop motion devices Speakers 10 and 25 hours 1000 watt lamps, protective covers, automatic threading devices remote control, wide angle lenses 8 As may as available One for each area in the department, one for the resource centre is ideal One per department One per department is usually enough 9 No maintenance problem Low, but specialised work may have to be done Specialised maintenance Specialised maintenance may be necessary

119 Source : Sampath et al 4.4 Importance of Co-curricular Activities In the 21century, the pure academic type of education that students are introduced to, is steadily paving way to a whole new type of education with a special focus to incorporate three major genres of education: reasoning, psychomotor and emotional learning. Education is a pretty broad concept that surpasses the four walls of a classroom. The core aim of education is to foster all round development of a child. All round development essentially means intellectual, physical, moral, sensible and social development. All round development can be achieved only through education. 7 Empty cartridges film splicers, make use of the filmstrip projector one of the newest and best audio- visual aids in the market Much software available but trans- parenncies can easily be made by the teacher Teachers can make own 1 11 12 13 2 Continuous loop film projector Overhead projector (Trans- parency parency Projector Opaque projector 3 Individual or small group instruction ideal but can also be viewed by a large group Whole class instruction Individual or small group instruction 4 Continuous loop enables students to review materials as they wish Can be used in a lighted room or laboratory with teacher facing students during presentation Use of this machine can replace overhead 5 Some darkening of the room may be necessary None Darkened classroom 6 Carrying case, screen, automatic cartridges, zoom lens, auxiliary speaker, listening centre (head phones) Roll feed attachment build-in projection pointer, heat filter carrying case light flash shield copy trays plastic dust cover Roll feed attachment glass pressure plate dust 8 Two or three would be ideal but one per deparment is usually enough One per department enough, two or three optimum Depending upon size of the department two or three 9 Low Low Low

120 Education plays a fundamental role in the making of a man and his development as a culturally well developed social animal. To fulfil these objectives, there is a prime need of striking a balance between syllabus, curriculum, books and also co-curricular activities beyond that. They actually complement the curricular activities and groom the students in the "Art of living and working together." They are the true and practical experiences gained by students by their own learnings. Children herald a new tomorrow and education plays an influencing role in shaping the worldview of children by creating a society that is inclusive and without barriers. It is in this context that schools are acknowledged as a crucial sphere for developing a tolerant and plural community by means of imparting education and developing equal opportunities for all. Schools adopting inclusive means are the beacons to an inclusive world that is tolerant to the differences. SCIENCE CLUB : A science club is an out-of-school-hours club that offers children the chance to do science-related activities that extend and enhance the science they experience in the classroom. Each science club is different, as the club programme reflects the interests of the children, the club organiser and the facilities available. Most clubs use the opportunity to explore areas of science not covered by the curriculum and to give the club members plenty of opportunities to do practical science. A science club can be run in a lunch break or after school. Some organisations are able to offer special Saturday clubs. A science club session typically lasts for about 45 minutes. In this time, the members might complete a challenge, plan a science project or have a special scientific visitor. Guiding Principles : There are many guiding Principles that govern the activities of children. They are : solve a relevant, science-based problem, set within a scenario. work in pairs or small groups, independently of adults. take part in practical, hands-on science activities. think and talk about science, during the activity and when sharing their results

121 share their results using a variety of media. solve increasingly complex problems, from a wider range of contexts make more decisions themselves about how to carry out, record and interpret the activity the increase in the length of the activities. reflect on, discuss and share the ideas about increasingly complex ideas share the results more widely, and in more diverse media. SCIENCE EXHIBITION : In order to develop scientific instinct among the youth, the National Curriculum Framework (NCF)- 2005 encourages implementation of various curricular activities viz. organization of "Science Exhibition" at school, block, tehsil, district, region and state levels. The vision of this activity is the exploration of the surrounding's resources to enable children to express themselves. The science instinct among the children begins at the unit (school) in the form of student projects; materials and activities. The following objectives could be illustrated : Objectives : To provide a forum to nurture science and inventive interest from the surrounding environment and connecting new ideas to their existing ideas from materials and activities. To explore and encourage scientific and technological talent and creative thinking among children and inculcate in them a sense of pride in their talent; To developed an understanding about the role of science and technology to meet the needs of the society; To analyse how science and technology have affected individuals, cultures and societies; To motivate the youth that science and technology are instrument for achieving self-reliance in socio-economic development; and To encourage them as an architect of the nation and visualize future of the nation;

122 Significance : In an exhibition, students get a chance to apply or do the practical aspect of the things that they have learned from the classroom. These are real opportunities for the kids to easily implement the things that they have learn from schools. It helps in being Creative. The school exhibition that is held in most of the schools is a great platform for the kids to do things. This is really a great chance for the kids to speak well. In most cases, the students need to explain to the faculties, their fellow students, judges and may also need to explain to people who come from outside to see the exhibition. This can help in boosting in their skills in speaking and thus their confidence. Here is teacher's different role. He can act as a motivator. Teacher has a great opportunity to develop student's creativity by preparing science kits or models involving students directly (teacher as a facilitator). The great way is teacher play a role as a facilitator in learning. SCIENCE TEXTBOOKS : In the teaching-learning process, the text-book occupies an important place. There is a saying "As is the text-book, so is the teaching and learning". A good text- book can even replace class-room teaching. The science text-book should aim at aiding the pupils in the development of their personalities, in developing open mindedness,

developing appreciation and understanding of nature and not merely stuffing their minds with facts. Characteristics of a good science text-book 1. The author: A good text-book is judged, at face, by the author, his qualification and experience. 2. Mechanical features of the text-book: (a) The print and paper used and the binding of the text-book should be attractive. It should be hard and durable. (b) The printing should be clear, legible and appropriately spaced. (c) The book should be well-illustrated with diagrams, sketches and pictures. (d) The size of the print, the language and experiments discussed should suit the age of the child and standard of the child.

123 3. The subject matter-its nature and organisation : (a)

The subject-matter should be developed as far as possible in psychological sequence. Care must be taken of

the mental growth and interest of pupils. (b) There should be consistency of the subject-matter and the text-book should satisfy the objectives of science teaching. (

c)

Each chapter should begin with a brief introduction and end with a summary. (

d) Subject-matter should lead to the inculcation of scientific attitudes, disciplinary and cultural values. (e) Each chapter should contain assignments at the end. (f) During treatment of subject-matter, numerical examples should find place where necessary. (g) Headings and sub-headings are given in bold letters. (h)

Each text-book should contain detailed table of Contents and an index. (i) The

language of the book should be simple, clear, lucid, scientific and precise. The English equivalents of the terms should be always given in brackets. (j) The text-book should give suggestions for improving scientific apparatus. (k) Examples in the

text-book should be given from local environment and from life experience. (l) During the treatment of science subject in the text-book, care should be taken to see that it is correlated with other subjects like craft, social environment and

physical environment. (m) Each text-book should be accompanied by a laboratory manual. Besides these characteristics, the UNESCO Planning Mission has given some principles of writing text-books. They are as follows: (i) It should be first of

all according to the requirements of the syllabus. It should also help in the improvement of the syllabus. (ii) The facts, concepts etc., should be modern and within the comprehension of the pupils. (iii) The contents should contain not only the established facts but also

124 the problems which are being researched and thereby, arousing the interest in the pupils in these problems. (iv) It

should help in linking up science with life and practice. The pupils should be equipped with 'know-how' utilizing the knowledge in everyday life. (v) The whole content of the text-book should be aimed at shaping the integrated modern scientific outlook which ensures success in mastering scientific knowledge and solution of the problems of vital issues.

The content should be simple, brief, exact, definite and accessible. 4.5 Science Laboratory with Reference to Children with Disabilities Individuals with physical disabilities often encounter barriers to one of modern society's most important rites of passage. It is that crucial process of obtaining a good education, so natural and uncomplicated for most people-that opens the door to productive employment and full participation in society. Today's barriers are rarely physical or architectural. More often, they involve perceptions and misperceptions of not just disability but also ability. One misperception is that a physical disability somehow disqualifies a person from a career in science, engineering, or mathematics. Well-intentioned but misinformed adults still discourage students with disabilities from pursuing careers in these fields. Often it occurs indirectly and implicitly, when adults withhold the mentoring and encouragement that can nudge young people toward science careers and sustain their interest. In addition, adults may set artificial limits on what the student with disabilities should attempt. These limits may be based not on reality but on the adults' own low expectations for the student or sincere concerns that the student may fail and not cope well with failure. In reality, students with disabilities benefit from the freedom to establish their own horizons, cope very well with the process, and learn from it. Application of universal design to a science lab :— Students with disabilities face access and challenges to typical science labs in educational settings. Access barriers may prevent a student from : gaining knowledge,

125 demonstrating knowledge, and fully participating in lab activities. There are two approaches to making academic activities accessible to students with disabilities- accommodations and universal design (UD). Accommodations are alternate formats, assistive technology, and other adjustments for specific students once they are enrolled in a class. Universal Design (UD) The Center for Universal Design defines universal design as "the design of products and environments to be usable by all people, to the greatest extent possible, without the need for adaptation or specialized design." Applications of UD in education take proactive steps to create academic products and environments that are accessible to students with a wide range of characteristics, including disabilities, thereby minimizing the need for future accommodations. For example, if a science lab contains an adjustable-height workstation, an accommodation will not be needed for a future student who uses a wheelchair that is too high for standard-height workstations. This workstation may also be comfortable for a student who needs to remain seated because of a health impairment or someone who is very tall or short in stature. In a science lab, UD can be applied to : lab climate; physical access, usability, and safety; delivery methods; information resources; interaction; Feedback; assessment; and plans for accommodations. Making accommodations is reactive, whereas universal design is proactive. Accommodations Following are examples of accommodations that might benefit a student with a disability. Use wheelchair-accessible labs and field sites.

126 Talk to a student about special learning needs and accommodation alternatives. Provide a lab partner. Use plastic instead of glass. Allow extra time for set up and completion of lab work. Address safety procedures for students with a variety of sensory and mobility abilities. Use institutional resources for students with disabilities. Typical science lab accommodations for students with specific disabilities include those in the following lists. Blindness Verbal descriptions of demonstrations and visual aids. Braille text and raised-line images. Braille or tactile ruler, compass, angles, protractor, Braille equipment labels, notches, staples, fabric paint, and Braille at regular increments on tactile ruler, glassware, syringe, beam balance, stove, other science equipment. Different textures (e.g., sand paper) to label areas on items. Low Vision verbal descriptions of demonstrations and visual aids preferential seating to assure visual access to demonstrations large print, high contrast instructions and illustrations raised-line drawings or tactile models for illustrations large print laboratory signs and equipment labels video camera, computer or TV monitor to enlarge microscope images hand-held magnifier, binoculars large print calculator

127 Mobility Impairments wheelchair-accessible field site uncluttered lab; clear, wide aisles preferential seating to avoid physical barriers and assure visual access to demonstrations mirrors above the instructor giving a demonstration an enlarged screen wheelchair-accessible, adjustable-height work surface non-slip mat utility and equipment controls within easy reach from seated position electric stirrer, container filler support stand, beaker and object clamp; test tube rack handles on beakers, objects, and equipment surgical gloves to handle wet or slippery items modified procedures to use larger weights and volumes extended eyepieces so students who use wheelchairs can use microscopes flexible connections to electrical, water, and gas lines single-action lever controls in place of knobs alternate lab storage methods (e.g., "Lazy Susan/ storage cabinet on casters) Deaf and Hard of Hearing preferential seating to view demos and watch instructor captioning for video presentations written instructions prior to lab visual lab warning signals Learning and Attention Disabilities combination of written, verbal, and pictorial instructions with scaffolding repeated demonstration of procedure and support practice

128 frequent, brief breaks preferential seating to avoid distractions and minimize extraneous stimuli scanning and speaking "pen" Health Impairments avoid chemical materials to which student is allergic or provide alternate assignment flexible schedule and time allocation Universal Design Considerations Some of the accommodation suggestions listed above could be implemented within a lab now, anticipating that at some point a student with a disability may need access to the lab and that some changes may benefit all students. Here are some strategies that could be implemented in a science lab as a part of universal design efforts: Provide both written and verbal instructions. Give verbal and visual descriptions of demonstrations and visual aids. Use plastic instead of glass. Allow extra time for set up and completion of lab work. Address safety procedures for students with a variety of sensory and mobility abilities, including the provision of visual lab warning signals. Make laboratory signs and equipment labels in large print, with high contrast. Ensure that field sites are wheelchair accessible. Maintain wide aisles and keep the lab uncluttered. Incorporate an adjustable-height work surface for at least one workstation. Install a mirror above the location where demonstrations are typically given. Use lever controls instead of knobs. Install flexible connections to water, gas, and electricity. Buy lab products that can be used by students with a variety of abilities (e.g., plastic lab products instead of glass, tactile models, large-print diagrams, non-

129 slip mats, support stands, beaker and object clamps, handles on beakers and equipment, surgical gloves to handle slippery items, video camera with computer or TV monitor to enlarge microscope image). Ensure that utility and equipment controls are within easy reach from a standing or seated position. Provide surgical gloves for handling wet or slippery items. Treat people with disabilities with the same respect and consideration with which you treat others. There are no strict rules when it comes to relating to people with disabilities. However, here are some helpful hints. General Ask a person with a disability if he or she needs help before providing assistance. Talk directly to the person with a disability, not through the person's companion or interpreter. Refer to a person's disability only if it is relevant to the conversation. If so, mention the person first and then the disability. "A man who is blind" is better than "a blind man" because it puts the person first. Avoid negative descriptions of a person's disability. For example, "a person who uses a wheelchair" is more appropriate than "a person confined to a wheelchair." A wheelchair is not confining-it's liberating. Blind or Low Vision Be descriptive. Say, "The computer is about three feet to your left," rather than "The computer is over there." Speak all of the content presented with overhead projections and other visuals. When guiding people with visual impairments, offer them your arm rather than grabbing or pushing them. Learning Disabilities Offer directions or instructions both orally and in writing. If asked, read instructions to individuals who have specific learning disabilities. Mobility Impairments Sit or otherwise position yourself at the approximate height of people sitting in wheelchairs whcr. you interact.

130 Speech Impairments Listen carefully. Repeat what you think you understand and then ask the person with a speech impairment to clarify or repeat the portion that you did not understand. Deaf or Hard of Hearing Face people with hearing impairments so they can see your lips. Avoid talking while chewing gum or eating. Speak clearly at a normal volume. Speak louder only if requested. Use paper and pencil if the person who is deaf does not read lips or if more accurate communication is needed. In groups raise hands to be recognized so the person who is deaf knows who is speaking. Repeat questions from audience members. When using an interpreter, speak directly to the person who is deaf; when an interpreter voices what a person who is deaf signs, look at the person who is deaf, not the interpreter.

Psychiatric Impairments Provide information in clear, calm, respectful tones. Allow opportunities for addressing specific questions. 4.6 Aquarium, vivarium–Role in Teaching with Setting & Mainfaiming AQUARIUM : An aquarium (plural: aquariums or aquaria) is a vivarium of any size having at least one transparent side in which water-dwelling plants or animals are kept and displayed. Fishkeepers use aquaria to keep fish, invertebrates, amphibians, aquatic reptiles such as turtles, and aquatic plants. The term, coined by English naturalist Philip Henry Gosse, combines the Latin root aqua, meaning water, with the suffix -arium, meaning "a place for relating to". The aquarium principle was fully developed in 1850 by the chemist Robert Warington, who explained that plants added to water in a container would give off enough oxygen to support animals, so long as their numbers do not grow too large.

131 Educational Benefits of Aquariums Reading Reading is an essential part of our everyday lives. Students will enjoy researching topics such as fish species, plants, or reefs to learn more about aquarium keeping. Who has not heard of the "selective" reading habits of children who only read books on topics of interest to them? The wide variety of aquarium-related topics can help foster good reading habits in children who may not otherwise be interested in reading. Writing Students can be asked to write reports or daily journal entries about the classroom aquarium. Students can also write letters to fish or aquatic experts with their questions. Both are great ways to help sharpen grammar and writing skills. Developing Critical Thinking & Problem-solving Skills Students collect data from an aquarium by measuring and recording water temperature, pH, ammonia, and nitrate levels. Chart or graph the information and look for trends that coincide with events in the aquarium. Any event, even the loss of a fish, is an opportunity to discuss possible causes and their effects, preventions, and ways to improve existing conditions. The teaching and learning opportunities are endless. Science Biology, chemistry, ecology, and physics are just a few of the sciences involved in aquarium keeping. A classroom aquarium can be used to teach students about specific topics such as fish anatomy or more complex topics such as the food chain, the water cycle, or the nitrogen cycle. Bringing Children & Parents Together An aquarium is a fun, educational tool that parents and children can enjoy together. Students not only develop learning skills but because they get excited about their aquarium, arc eager to share what they learned with family members and friends. Involved parents are more likely to participate in other school activities with their child. Setting up a teaching aquarium is a great way for students of all ages to learn about a variety of topics and gain valuable life lessons. However, the decision to set up an aquarium should never be done on a whim. Carefully evaluate the amount of time, effort, and finances you will be able to commit to the aquarium and its inhabitants.

132 Patience and proper research are key to a successful aquanum. VIVARIUM : The Vivarium program began in 1986, and is overseen by its principal designer, Alan Kay. Alan, in addition to being a computer scientist, is a musician, mathematician, biologist, physicist, philosopher, cognitive scientist ... and as such is able to bring a wide range of thought and influences to bear on the many issues inherent in such a grand goal, or grand direction, as Alan might prefer to phrase it. Alan is fond of pointing out that really good research simply cannot have a well stated goal, it can only have a useful direction. If you could state at the outset that you were going to now invent the flying buttress or vaulted arch, then you'd already have your goal so well defined that you'd have no need to perform the research. The literal definition of a "Vivarium" is an enclosure or reserve for keeping plants and animals alive in their natural habitat in order to observe and study them. A vivarium is an enclosure, container, or structure adapted or prepared for keeping animals under semi natural conditions for observations or study or as pets; an aquarium or terrarium. Impact on student learning is higher than expected because it plays an important role in teaching them about the conservation of plants and animals. A vivarium is a portion of an ecosystem. 1. a vivarium for smaller land animals, especially reptiles, amphibians, or terrestrial invertebrates, typically in the form of a glass-fronted case. 2. a sealed transparent globe or similar container in which plants are grown. There are many ways to bring classmates together and learning at the same time. Many times this is done with a class pet or aquarium. There is, however, a less expensive and just as fun alternative! Classroom terrariums are a great learning tool, can be created in any setting, and can be big or small. They are usually used for learning about habitats, ecosystems, biology, etc. Children can get their hands in the dirt and play around while learning valuable lessons about the Earth. Here are just a few examples of what students can learn from terrariums: life Cycle of Plants The life cycle of plants is easy to learn, and what better way to learn it than to witness it yourself? The students can observe the plants they grew themselves go from seed, to root, to bud, and then create new seeds! This is a standard life cycle that applies to other things as well, like humans and animals.

133 Care of The Earth Terrariums can also teach children how important it is to care for the Earth. Even if their terrariums are small (a bean seed in a cup for example) it's a little living thing kids can take care of. Caring for those little beans can teach responsibility in a way that kids will respond well to. Their small terrarium can be considered in scale to the Earth because all the basic resources are represented (sun, water, nutrients). Their small demonstration shows that the Earth needs people to care for it too. Systems Interacting Terrariums teach how plants, animals, and insects interact similar to the real world. You can include small animals, like turtles, in addition to the plants, soil and water provided. It shows that all living things have the same resources and need to learn to share and keep everything in balance. Overall they help raise children's awareness of the Earth and how important maintaining harmony is, while having tons of fun! For information on the kinds of projects we do and how they align with our philosophy. 4.7 Museum, Botanical & Zoological Garden : Role in Teaching MUSEUM : A museum is an institution that cares for (conserves) a collection of artifacts and other objects of artistic, cultural, historical, or scientific importance and makes them available for public viewing through exhibits that may be permanent or temporary.l' Most large museums are located in major cities throughout the world and more local ones exist in smaller cities, towns and even the countryside. Museums have varying aims, ranging from serving researchers and specialists to serving the general public. The purpose of modern museums is to collect, preserve, interpret, and display items of artistic, cultural, or scientific significance for the education of the public. The purpose can also depend on one's point of view. To a family looking for entertainment on a Sunday afternoon, a trip to a local history museum or large city art museum could be a fun, and enlightening way to spend the day. To city leaders, a healthy museum community can be seen as a gauge of the economic health of a city, and a way to increase the sophistication of its inhabitants. To a museum professional, a museum might be seen as a way to educate the public about the museum's mission, such as civil rights or environmentalism. Museums are, above all, storehouses of knowledge.

134 While there is an ongoing debate about the purposes of interpretation of a museum's collection, there has been a consistent mission to protect and preserve artifacts for future generations. Much care, expertise, and expense is invested in preservation efforts to retard decomposition in aging documents, artifacts, artworks, and buildings. All museums display objects that are important to a culture. As historian Steven Conn writes, "To see the thing itself, with one's own eyes and in a public place, surrounded by other people having some version of the same experience can be enchanting"

BOTANICAL GARDEN : A botanical garden or botanic garden is a garden dedicated to the collection, cultivation and display of a wide range of plants labelled with their botanical names. It may contain special ist plant collections such as cacti and succulent plants, herb gardens, plants from particular parts of the world, and so on; there may be greenhouses, shadehouses, again with special collections such as tropical plants, alpine plants, or other exotic plants. Visitor services at a botanical garden might include tours, educational displays, art exhibitions, book rooms, open-air theatrical and musical performances, and other entertainment. Botanical gardens are often run by universities or other scientific research organizations, and often have associated herbaria and research programmes in plant taxonomy or some other aspect of botanical science. In principle, their role is to maintain documented collections of living plants for the purposes of scientific research, conservation, display, and education, although this will depend on the resources available and the special interests pursued at each particular garden. Over the years, botanical gardens, as cultural and scientific organisations, have responded to the interests of botany and horticulture. Nowadays, most botanical gardens display a mix of the themes mentioned and more; having a strong connection with the general public. There is the opportunity to provide visitors with information relating to the environmental issues being faced at the start of the 21 st century, especially those relating to plant conservation and sustainability.

Roles & Fuctions : Availability of plants for scientific research display of plant diversity in form and use display of plants of particular regions (including local)

135 plants sometimes grown within their particular families plants grown for their seed or rarity major timber trees plants of economic significance glasshouse plants of different climates all plants accurately labelled records kept of plants and their performance catalogues of holdings published periodically research facilities utilising the living collections studies in plant taxonomy examples of different vegetation types student ed ucation a herbarium selection and introduction of ornamental and other plants to commerce studies of plant chemistry report on the effects of plants on livestock at least one collector maintained doing field work

ZOOLOGICAL GARDEN : The term zoological garden refers to zoology, the study of animals, a term deriving from the Greek z o ion ("animal") and logos ("study"). The abbreviation "zoo" was first used of the London Zoological Gardens, which opened for scientific study in 1825 and to the public in 1857. The number of major animal collections open to the public around the world now exceeds 1,000, around 80 percent of them in cities. In India there are more than 150 zoos. On the basis of the area, number of animals and variety, exhibited as well as the number of visitors, zoos are classified into large, medium and small. They attract as many as 50 million visitors annually. We have urban, rural, literate and illiterate people who visit zoos. India too has

136 recognised the importance of zoos as a site for education and learning. Significance Scope of Education and Interpretation in Zoos, are like large classrooms where a number of activities, specifically for children, teachers and school groups can be conducted. Zoos displaying live animals can capture the attention and affection of the public for wildlife and nature like no other institution. Living animals clearly have an enormous power of attraction and are the great and unique feature of zoos and form the very basis of zoo education. People visiting zoos are interested in learning about the animals, their habitat, behaviour and conservation status. Zoos are therefore appropriate places to impart to the visitor information about animals, their habitats, biology and threats to their existence. An array of biological and other themes can be explained through zoo education. These include themes such as animal adaptations, behaviour, reproduction, and nutrition, and also complex subjects such as evolution and ecology. Zoo programmes can explain how easily the subtle balances in natural habitats and ecosystems are disturbed by human interference and the connections between human consumption and life style and the survival of species and biological systems. Zoos provide a range of opportunities to educate a great variety of people and groups of all ages and levels. Many people of diverse groups visit zoos including different age and educational levels and different social, ethnic and cultural backgrounds. Providing education, communication and information relevant to all these groups is a challenge. Several educational and interpretive facilities could be provided in zoos to enhance, sensitize, educate and enrich the visitors' experience. In zoos, such programmes help visitors understand the uniqueness of each animal and its relationship to its surrounding. Interpretation is defined as an educational activity which aims to reveal meaning

137 and relationships through the use of original objects, by first-hand experience, and by illustrative media rather than communicating factual information. 4.8 Let Us Sum Up Co-Curricular activities are those which are undertaken side by side with the curricular activities. Aco-curricular activity essentially takes place outside a typical pen and pencil classroom experience. It gives the students an opportunity to develop particular skills and exhibit their non-academic abilities. These activities might be compulsory, such as music, art or drama classes that take place during the day. Others generally are voluntary, such as participating in school sports team, school debating team or student newsletters. In either case, participation can assist students in more than one ways. In Science education Co-curriculum takes a variety of forms like science clubs, exhibitions, visit to museums, botanical and zoological garden etc. Also maintainence & nurturing of aquariums & vivariums, their significance as an aid to learning. Another aspect in the purview of science education includes two pertinent aspects : science text books & laboratory set up that have been dealt in this unit very elaborately. While discussing on laboratory, stress is given on universal design for to accomodate children with special needs. 4.9 Check Your Progress 1. Why are teaching aids essential in our science teaching?

.....
.....
..... 2. Mention different types of teaching learning aids used in science teaching.
.....
.....
138 3. What are the principles for selection of teaching learning aids in our science teaching.

.....
..... 4. Mention the significance of Co-curricular activities.
.....
..... 5. What is meant by UDL.
.....
..... 6. How an aquarium is maintained?
.....
..... 7. Define vivarium.
.....
..... 8. Hist the functions of botanical garden.

139 9. Give the importance of museum in Science teaching.
.....
..... 10. What are the characteristics of a good science text books?

..... 4.10 References Ahmed, J. 2006, Teaching of Biological Sciences, Prentice Hall of India, New Delhi. 140 Unit - 5 Evaluation Structure 5.1 Introduction 5.2 Objectives 5.3 Evaluation - concept, nature & need 5.4 NRT & CRT, CCE : Concept & Significance, Scholastic & Co. Scholastic Assessment. 5.5 Tools & Techniques for Formative & Summative Assessments. 5.6 Preparation of Diagnostic Test & Achievement tests. 5.7 Adaptations of Evaluation procedure with reference to children with disabilities. 5.8 Let us sum up. 5.9 Check your progress. 5.10 References. 5.1 Introduction Evaluation is

a continuous appraisal of the achievement of the aims of education as well as the method of teaching

learning process. It is a wider concept than testing and measurement and is supposed to judge the worth of all educational outcomes brought about as a result of Teaching and learning.

If also involves the self appraisal by the students of their success and failure from time to time. As a result the students come to know of their own drawbacks and try to improve. On the basis of day to day records of the pupils it becomes easy to know the present status of the students. So evaluation provides essential information for an effective guidance of the teaching learning programme. 5.2

Objectives After completing this unit the student teacher will be able to : i) Know about the concept of evaluation. ii) Understand the nature and need of evaluation. iii) Explain NRT, CRT & CCE

141 iv) Construct or form tools and techniques of formative and summative assessment. v) Prepare Diagnostic test and Achievement test. vi) Prepare various types of tests and questions. vii) Differentiate between 'tool' and 'technique' of evaluation. 5.3 Evaluation - concept, nature & need According to Dandekar (1971), "Evaluation may be defined as a systematic process of determining the extent to which educational objectives are achieved by pupils."

According to Kothari commission (1964-66), "Evaluation is a continuous process, it

forms an integral part of the total system of Education, and is intimately related to educational objectives. It exercises a great influence on the pupil's study habits and teachers' methods of instruction and thus helps not only to measure educational achievement but also to improve it

the techniques of evaluation are means of collecting evidences about the students development in desirable directions."

Nature of Evaluation : Evaluation may work as a connecting bridge between the objectives of teaching science and the ways and means of attaining these objectives in the form of learning experience learning methods and learning environment. A pupil's learning is evaluated in terms of the extent....of achievement and their behavioural objectives specified for a course of study in science. A close relationship that exists between objectives, learning experiences and evaluation can be formed as follows. Objectives Teaching learning Process Learning Experiences Evaluation Fig :

Evaluation triangle

142

Evaluation is a term which has overtones that distinguish it from measurement.

Evaluation 1. It emphasis on overall growth of pupil. 2. It based on wide range of objectives. 3. It concerned total personality of the pupils 4. It is a continuous process. 5. It uses variety of techniques. Measurement 1. It focus on a single aspect or subject matter achievement. 2. Measurement is not based on pre- determined objectives. 3. It has limited in scope 4. It is done as and when required. 5. It used a limited set of techniques Needs of Evaluation : Evaluation process is very much necessary in the major two kind of processes : i) Educational ii)

Administrative The educational needs of evaluation are primarily concerned in our teaching learning process. i) Learning : This includes such functions as monitoring student progress, diagnosing student weakness, determining the need of remedial work and improving the quality of the learning environment. 2) Teaching : This is concerned with assessing the effectiveness of teaching structure and techniques. 3) Curriculum : This includes improving courses and curricular, texts, students and teaching materials. Administrative Needs of Evaluation Include : a) Society : This includes accountability to society in terms of the demands and requirements of the employment market. b) Parents : This mainly manifests itself in a perceived need for regular reporting to parents.

c) Education System : This includes the requirements of education system itself for purpose of selection, such as for introduced to a higher grade or tertiary level.

143 However is a broader perspectives, the need of evaluation can be studied at the following six levels. i) learning level. ii) Teaching level iii) Guidance and counselling level iv) Curricular Development level v) School administration level vi) Classroom research level. Types of Evaluation Evaluation Process may be classified broadly into four categories : i) Placement Evaluation : It determine Pupil performance at the beginning of instruction. ii) Formative Evaluation : It monitor learning progress during instruction iii) Diagnostic Evaluation : It diagnose learning difficulties during instruction. iv) Summative Evaluation : It evaluate achievement at the end of the instruction. 5.4 NRT & CRT, CCE : Concept & Significance, Scholastic & Co. Scholastic Assessment. The learning experiences of the students are lively to bring about behavioural changes in the learner as specified through differenet behavioural objectives Evaluation of Student's performance is generally done interms of marks or grades. Sometimes students may be compared with some absolute performance standard instead of making comparism with other students of a given group. There are two types of Evaluation : i) Norm references Test (NRT) and ii) Criterion Reference Test (CRT) NRT : It assesses the students performance relative to other students of the group. Students are awarded marks and relative rank is this method of Evaluation. CRT : It assesses the students performance is terms of specified performed standard or criterion without any mention of the performance levels of the other students of the group. This evaluation method is related to mastery learning and developmental tests of the students.

144 Comprehensive and Continuous Evaluation : (CCE) It is a process to provide holistic profile of the learner through regular assessment of scholastic and co-scholastic domains of development. It aims at making evaluation an integral part of teaching learning process. It focuses on all round development of personality of the learners. It improves on going teaching-learning processes by diagnosing the learning gaps and offering corrective and enrichment input. It brings about a paradigm shift from examination to effective pedagogy. Scholastic and Co-scholastic Assessment : The assessment procedure of different aspects of learners, which are related to intellect or the brain is called scholastic Assessment. It includes assessment of learners in curricular subjects, assignments, project work, practical and oral work etc. On the other hand the assessment procedure of different aspects of learners, which are related to hand and heart. The include psychomotor skills, physical development, life skills, attitude, values, interests and participation in co-curricular activities. 5.5 Tools and Techniques for Formative and summative Assessment Since Evaluation of students' learning out comes is one of the most important functions of teaching learning process. Student's learning out comes are evaluated with the help of different tools and techniques. These learning outcomes are generally. devided into cognitive and non-cognitive learning outcomes. Cognitive learning out comes are related to scholastic areas of students' performance where as non-cognitive learning out comes are concerned with non-scholastic areas. Evaluation of cognitive out comes is done with the help of certain tools and techniques whereas some other tools and techniques are used for the assessment of students performance in non-cognitive areas. Basic techiques of Evaluation : i) Testing ii) Observation iii) Inquiry iv) Content Analysis

145 Testing : The Tests are broadly classified as follows : Testing Standardized test Teacher made test Aptitude Achievement Interest Personality Attitude Test Test inventories Test Scales ii) Observation An assessment for which the primary data source is viewing or listening in the teaching- learning environment is a classroom observation. Observation is a techniques of evaluation which requires an observe to record the activities, experience and expressions of individual pupil either seperately or in a group. Observation may be two types : (a) Direct Observation : When observation is restricted to selected aspects of pupils behaviour and when records are made systematically and as objectively as possible. This is known as an direct observation. e.g. situations where tasks like drawing, painting, clay modelling are given the teacher can observe certain set of behaviours (Pre-planned) like accuracy, heatness, originality, initiation, precision, design etc (b) Indirect Observation : When a classroom teacher can observe and note pupils' performance either in the classroom or outside the classroom. The teacher can observe informally the pupils conduct, social adjustment or their personal and emotional adjustment. This iis called indirect observation. iii) Inquiry : Certain details about the students can be obtained by inquiring and securing information from the students themselfe parents, school teachers and administon, peer group and so on.

146 e.g. Assessment of the success of a course can be obtained by securing the opinion of students on a questionnaire.

iv) Content Analysis : Analysis means where a given qualitative material ismented into its constituent parts which is studied in detail for its characteristics or attributes. The content analysis is a mostly used method for analysing the materials. It is also termed as information analysis since it deals with classification, generalisation, evaluation and comparison e.g. The content of open-ended Questionnaire, interviews and focusdiscussions that is observed and are communicated qualitatively may be analysed. Different tools of Evaluation : Generally experimental techniques are used for the collection of different information from the students. The most common tools used for applying experimental techniques are Tests. The different types of test can be used as a tools of Evaluation. These are given below: Achievement Test Teacher Made Test Psychological Test Written Test Oral Test Intelligent Personality Aptitude Objective type Class Test Essay type Structured Unstructured Standardised Diagnostic Selection test test test Tests

147 5.6 Preparation of Diagnostic Tests & Achievement tests Diagnostic Tests are generally used to find out the learning difficulties and deficiencies of the students. The process of determining the causes of educational diagnosis is called educational diagnosis. The scope of educational diagnosis is much larger than the use of tests and examinations. An adequate diagnosis may involve the use of intelligence tests, rating scales, controlled observations, questionnaires, interviews etc. etc. A satisfactory level of diagnosis can be reached when the teacher has gained sufficient insight into the nature of the pupil's problem. Major aspects of diagnostic tests: 1. To determine the extent through which the desirable educational objectives are achieved. 2. To identify the factors that may be interfering with the optimum growth of the individual. 3. To understand the learning difficulties faced by the students. Characteristics of Diagnostic Tests: 1. Objectives: The essence of educational diagnosis is the identification of some of the causes of learning difficulty and some of the potential educational assets. 2. Validity : It refers to the evidence of casual factors to the attainment of the objectives. The methods of diagnosis may be valid for discovering certain factors which create different difficulties among the students. 3. Reliability: The increase in reliability is related to the decrease in the fluctuation in conclusion that can be secured by providing a more adequate and representative sample of pupil reaction upon which the conclusions are drawn. 4. Comparability: Diagnostic procedures that give comparable results are basics for intelligent interpretation. 5. Exactness: The exactness may be increased by analyzing the characteristics of the progress in learning more minutely and utilizing the symptoms. Diagnostic Test: A diagnostic test is a test used to diagnose or reveal an individual's weakness and strengths in a certain course of study.

148 Steps involved in the diagnostic testing: 1. Identifying the students who are having learning difficulties. 2. Locating the errors of learning difficulties .. 3. Discover the casual factors which are responsible for learning difficulties. Functions of diagnostic test: 1. Direction of curriculum which is emphasized by any important objectives of education. 2. Provision of educational guidance of the pupils 3. Stimulation of learning activities of pupils. 4. Motivation of administrative and supervisory efforts. Steps for preparation of diagnostic test: 1. Planning 2. Writing items 3. Assembling the test 4. Providing direction 5. Preparing scoring key and marking scheme 6. Administering the test 7. Making interpretation. Criteria for administration of Diagnostic Test: 1. The teacher is to win the confidence of the students and reassure them that test is to help them in the improvement of their learning rather than for declaring pass or fail. 2. It should be administered in a relaxed environment. 3. Students should be seated comfortably. 4. Students should be asked not to consult each other while taking the test. 5. If any student is not able to follow something, he should be allowed to seek clarification from the teacher. 6. The teacher may ensure that the students taking the test attempt all questions. 7. Time schedule should not be enforced strictly. If any student takes a little more time, he should be allowed to do so.

149 Role of Computers in Diagnostic Testing: Computers can be used for diagnostic testing in education. Several commercial test publishers have developed programmes for interpreting scoring of available diagnostic tests and for combining test scores and other data in the prescriptive formulation of individual used instructional programmes.

Preparation of Achievement Test: Achievement Tests are used to find out how much a student has learnt from a given course of study taken by him or her in a particular time. The tests are expected to yield information on the performance of individual students who are tested as well as the performance of group of students as a whole. Considerations for constructing a achievement test: 1. Deciding the purpose of the testing programme. The testing of students may be i) in a class or within a class ii) in a board examination iii) in an achievement survey 2. Assess the objectives to be covered. It should cover the cognitive level of educational objectives, i.e. Knowledge, Understanding, Application, Analysis, Synthesis, Evaluation. 3. Coverage the prescribed syllabus. It should determine the weightings in terms of marks to be assigned in each content area, large number of such questions which can be answered in short time in better coverage and limit the number of essay type questions. Type of questions; The common selection type questions are: 1. MCQ 2. True-False 3. Matching Type 4. Essay Type 5. Short Answer Type 6. Completion type

150 Factors which decide time to be allowed for answering questions: Availability of resources. Course content to be covered. Class for which testing is to be done. Number and type of questions to be included. Table : Assigning weightage to Objectives and difficulty level. Objectives Knowledge Understanding Application % 40 30 30 Difficulty Level Easy Average Difficulty % 25 50 25 Table : Preparation of Blue Print of the Question Paper: Sample Blue print : Objectives Knowledge Understanding Application Total Types of Question MCQ VSA SA MCQ VSA SA MCQ VS/\ SA Subunit-I 1(1) 3(1) 1(1) Subunit-II 2(1) 1(2) Subunit-III 1(2) 2(1) 3(1) Subtotal N. B: Figures outside the bracket indicate marks allotted for question and figures within the brackets indicate number of questions. After preparing blue print, the question paper should be framed and marking scheme should be prepared. Then the question paper should be reviewed, moderated and finalized for administration. Hence achievement test can be constructed for both school examinations and achievement surveys. The question paper should be well balanced combining all types of questions e.g. Multiple Choice Questions, Short Answer Type and ,very Short Answer Type Questions. The type of questions should be included in the question paper as per the

151 particular percentage ratios. After developing the question paper it should be reviewed by one or experts to ensure the quality of constructed questions. Moderation of question papers should be done to ensure that no question is out of syllabus and the difficulty level of the question is according to plan. Questions that are too easy or too difficult may be replaced with those that are neither too easy nor too difficult.

5.7 Adaptations of Evaluation procedure with reference to Children with disabilities Introduction to Assessment and Overview An assessment in special education is the process used to determine a child's specific learning strengths and needs, and to determine whether or not a child is eligible for special education services. Assessment in special education is a process that involves collecting information about a student for the purpose of making decisions. Assessment, also known as evaluation, can be seen as a problem-solving process (Swanson & Watson, 1989) that involves many ways of collecting information about the student. According to Gearheart and Gearheart, 1990; Pierangelo and Giuliani, 2006, assessment is "a process that involves the systematic collection and interpretation of a wide variety of information on which to base instructional/intervention decisions and, when appropriate, classification and placement decisions. Assessment is primarily a problem-solving process".

Importance of Assessment The importance of assessment should never be underestimated. In special education, you will work with many professionals from different fields. You are part of a team, often referred to as a multidisciplinary team, that tries to determine what, if any, disability is present in a student. The team's role is crucial because it helps determine the extent and direction of a child's personal journey through the special education experience (Pierangelo and Giuliani, 2006). Consequently, the skills you must possess in order to offer a child the most global, accurate, and practical evaluation should be fully understood. The development of these skills should include a good working knowledge of the following components of the assessment process in order to determine the presence of a suspected disability: Collection: The process of tracing and gathering information from the many sources of background information on a child such as school records, observation, parent intakes, and teacher reports.

152 Analysis: The processing and understanding of patterns in a child's educational, social, developmental, environmental, medical, and emotional history Evaluation: The evaluation of a child's academic, intellectual, psychological, emotional, perceptual, language, cognitive, and medical development in order to determine areas of strength and weakness Determination: The determination of the presence of a suspected disability and the knowledge of the criteria that constitute each category Recommendation: The recommendations concerning educational placement and program that need to be made to the school, teachers, and parents Purpose of Assessment Assessment in educational settings serves five primary purposes: screening and identification: to screen children and identify those who may be experiencing delays or learning problems eligibility and diagnosis: to determine whether a child has a disability and is eligible for special education

services, and to diagnose the specific nature of the student's problems or disability IEP development and placement: to provide detailed information so that an Individualized Education Program (IEP) may be developed and appropriate decisions may be made about the child's educational placement instructional planning: to develop and plan instruction appropriate to the child's special needs evaluation: to evaluate student progress. (Pierangelo and Giuliani, 2006) The Difference Between Testing and Assessment There is sometimes confusion regarding the terms "assessment" and "testing." While they are related, they are not synonymous. Testing is the administration of specifically designed and often standardized educational and psychological measures of behavior and is a part of the assessment process. Testing is just one piece of the assessment process. Assessment encompasses many different methods of evaluation, one of which is using tests. Role of the Education Professional in the Special Education Process The professional involved in special education in today's schools plays a very critical role in the overall education of students with all types of disabilities. The special

153 educator's position is unique in that he or she can play many different roles in the educational environment. Whatever their role, special educators encounter a variety of situations that require practical decisions and relevant suggestions. No matter which type of professional you become in the field of special education, it is always necessary to fully understand the assessment process and to be able to clearly communicate vital information to professionals, parents, and students (Pierangelo and Giuliani, 2006). Assessment Law: The Individuals with Disabilities Education Act (IDEA), lists 13 separate categories of disabilities under which children may be eligible for special education and related services. These are: autism:

a developmental disability significantly affecting verbal and nonverbal communication and social interaction, generally evident before age 3 deafness: a hearing impairment that is so severe that the child is impaired in processing linguistic information, with or without amplification deaf-blindness : simultaneous hearing and visual impairments hearing impairment : an impairment in hearing, whether permanent or fluctuating mental retardation : significantly sub average general intellectual functioning existing concurrently with deficits in adaptive behavior multiple disabilities : the manifestation of two or more disabilities (such as mental retardation- blindness), the combination of which requires special accommodation for maximal learning orthopedic impairment : physical disabilities, including congenital impairments, impairments caused by disease, and impairments from other causes other health impairment : having limited strength, vitality, or alertness due to chronic or acute health problems serious emotional disturbance: a disability where a child of typical intelligence has difficulty, over time and to a marked degree, building satisfactory interpersonal relationships; responds inappropriately behaviorally or emotionally under normal circumstances; demonstrates a pervasive mood of unhappiness; or has a tendency to develop physical symptoms or fears specific learning disability: a disorder in one or more of the basic psychological processes involved in understanding or in using language, spoken or written, which may manifest itself in an imperfect ability to listen, think, speak, read, write, spell, or do mathematical calculations

154 speech or language impairment : a communication disorder such as stuttering, impaired articulation, a language impairment, or a voice impairment traumatic brain injury: an acquired injury to the brain caused by an external physical force, resulting in total or partial functional disability or psychosocial impairment, or both visual impairment: a visual difficulty (including blindness) that, even with correction, adversely affects a child educational performance. Types of Tests Used in Special Education Developmental assessments Screening tests Individual intelligence tests Individual academic achievement tests. Adaptive behavior scales Behavior rating scales Curriculum-based assessments End-of-grade, end-of-course, and alternate assessments Developmental Assessments Developmental assessments are norm-referenced scales designed to assess the development of infants, toddlers, and preschoolers in key areas. These areas include fine- and gross-motor, communication and language, social, cognitive, and self-help skills. If a very young child is thought to be experiencing delays, and especially if the child is going to be served in an infant- toddler program, professionals will use developmental assessment scales to identify strengths and weaknesses. The scales are administered through direct observations of the young child and parent questionnaires. From the results of the assessment, the evaluator can determine how delayed or advanced the child is in the key areas mentioned above. Screening Tests Schools often use screening tests to help find children who might be below the norm in different areas. Screening instruments are very easy to administer, contain relatively few items, and can be completed in a relatively brief time, often requiring only a few minutes per child. They may be pencil-and-paper tests, rating scales or checklists used 155 to document certain behaviors, or direct observations of skills or abilities. Their purpose is to alert the school to a potential problem so that more in-depth assessments can be conducted. Individual Intelligence Tests . Only a psychologist or diagnostician trained and certified in the administration of specific intelligence tests, often called IQ (intelligence quotient) tests, can administer them. This is because, in order for the test to be considered reliable and valid, it must be administered and scored in a very precise manner. Most intelligence tests report an overall or general IQ score as well as subscores in areas such as verbal skills, motor performance, and visual reasoning. Intelligence tests commonly used in the public schools are the Wechsler Intelligence Scale for Children (3rd ed.) (WISC-III) (Wechsler, 1991), the Stanford-Binet Intelligence Scale (4th ed.) (Thorndike, Hagen, & Sattler, 1986), and the Woodcock-Johnson III Tests of Cognitive Abilities (WJ III) (Woodcock, McGrew, & Mather, 2001). Individual Academic Achievement Tests Most students in special education, and those referred for special education consideration, will be weak in one or more academic areas. In order to determine most precisely which academic areas are of concern, a psychologist or educational evaluator will administer at least one broad ranging, multiple-skill academic achievement test to the child. The results of the test will tell how the child stands in key academic skills such as reading, written expression, arithmetic, general information, and specific school subjects. Traditionally, professionals have used norm-referenced academic achievement tests for formal evaluations to help determine a student's special education eligibility, placement, and IEP goals. These tests will also be useful for documenting the academic progress of students over a long period of time. Adaptive Behavior Scales A student with mental retardation (or intellectual disabilities) must exhibit a deficit in adaptive behavior. Adaptive behavior skills are those that are especially useful for daily functioning. Typical items on adaptive behavior scales include daily living skills; community participation skills; and functioning in specific ability areas such as demonstrating appropriate social behaviors, communication, motor abilities, and applying basic academic skills.

156 Among the most commonly used scales are the second edition of the AAMR Adaptive Behavior Scales (ABS), including the Residential-Community versions (ABS-RC:2) (Nihira, Leland, & Lambert, 1993) and the School version (ABS-S:2) (Lambert, Nihira, & Leland, 1993). Other useful scales are the Vineland Adaptive Behavior Scales (2nd ed.) (Vineland-I) (Sparrow, Cicchetti, & Balla, 2005) and the Scales of Independent Behavior-Revised (Bruininks, Woodcock, Weatherman, & Hill, 1996). Behavior Rating Scales Like adaptive behavior scales, a parent or a teacher may complete the scale or an evaluator can obtain the relevant information from someone else who knows the child. After rating different behaviors, the evaluator can then calculate summary scores; and because the scales are norm-referenced, the scores for the child can be used to determine his or her behavioral status compared to others. Rating scales that are frequently used in schools are the Devereux Behavior Rating Scale- School Form (Naglieri, LeBuffe, & Pfeiffer, 1993) and the Social Skills Rating System (Gresham & Elliot, 1990). Curriculum-Based Assessment Curriculum-based assessments are often made by the teacher to determine the student's skill level in specific curriculum areas at a certain point in time. For example, if a student has an IEP goal to learn to read on the fifth-grade level, the teacher is not likely to regularly administer a standardized reading test to see if the goal is being achieved. Instead, the teacher might ask the student to read aloud two or three times a week from a fifth-grade reader and answer comprehension questions about the material. At each session, the teacher would record and chart the number of words read correctly, the number misread, and the number of comprehension questions answered. By using this form of curriculum-based assessment, the teacher could determine if the student was making progress toward the goal. Curriculum-based assessment provides a viable approach for evaluating how well a student responds to intervention (Fuchs et al., 2003). For this reason, teachers are likely to use it very often when evaluating students who are participating in early intervening activities. By using the curriculum-based assessment, teachers and other professionals will be able to determine if a particular intervention is succeeding.

End-of-Grade, End-of-Course, and Alternate Assessments The purpose of the No Child Left Behind Act (NCLB) was to close the achievement gap between students with high and low levels of performance. Schools are required to demonstrate adequate yearly progress for all students or make significant changes in the way schools are run. In order to show if schools are making adequate progress, students are tested at the end of each grade. Currently, this testing applies to children between the third and eighth grades. Besides NCLB, many also have educational accountability laws that operate in a similar way. Students in special education are not exempt from these tests; in fact, IDEA 2004 requires their participation. If students with special needs are unable to participate in the general education mandated assessment, there are two possibilities. First, they may take the test with accommodations that allow them to participate. Second, they may participate through an alternate assessment procedure. Most students with academic special needs and with sensory or physical impairments are provided with accommodations, whereas students with more severe intellectual special needs are evaluated using an alternate assessment. In ease, the students IEP must indicate how the end-of-grade or end-of-course test is to be given (Browder & Spooner, 2003).

10 Basic Steps in Special Education When a child is having trouble in school, it's important to find out why. The child may have a disability. By law, schools must provide special help to eligible children with disabilities. This help is called special education and related services. Following are the 10 basic steps: Step 1. Child is identified as possibly needing special education and related services. There are two primary ways in which children are identified as possibly needing special education and related services: the system known as Child Find, and by referral of a parent or school personnel. When a child is identified by Child Find as possibly having a disability and as needing special education, parents may be asked for permission to evaluate their child. Parents can also call the Child Find office and ask that their child be evaluated. Referral or request for evaluation. A school professional may ask that a child be evaluated to see if he or she has a disability. Parents may also contact the child's teacher or other school professional to ask that their child be evaluated. This request may be verbal, but it's best to put it in writing. Parental consent is needed before a child may be evaluated. Under the IDEA regulations, evaluation needs to be completed within 60 days after the parent gives consent.

158 Step 2. Child is evaluated.

Evaluation is an essential early step in the special education process for a child.

It's intended to answer these questions: Does the child have a disability that requires the provision of special education and related services? What are the child's specific educational needs? What special education services and related services, then, are appropriate for addressing those needs? By law, the initial evaluation of the child must be "full and individual"-which is to say, focused on that child and that child alone. The evaluation must assess the child in all areas related to the child's suspected disability. The evaluation results will be used to decide the child's eligibility for special education and related services and to make decisions about an appropriate educational program for the child. If the parents disagree with the evaluation, they have the right to take their child for an Independent Educational Evaluation (IEE). They can ask that the school system pay for this IEE. Step 3. Eligibility is decided. A group of qualified professionals and the parents look at the child's evaluation results. Together, they decide if the child is a "child with a disability," as defined by IDEA. If the parents do not agree with the eligibility decision, they may ask for a hearing to challenge the decision. Step 4. Child is found eligible for services. If the child is found to be a child with a disability, as defined by IDEA, he or she is eligible for special education and related services. Within 30 calendar days after a child is determined eligible, a team of school professionals and the parents must meet to write an individualized education program (IEP) for the child. Step 5. IEP meeting is scheduled. The school system schedules and conducts the IEP meeting. School staff must: contact the participants, including the parents; notify parents early enough to make sure they have an opportunity to attend; schedule the meeting at a time and place agreeable to parents and the school; 159 tell the parents the purpose, time, and location of the meeting; tell the parents who will be attending; and tell the parents that they may invite people to the meeting who have knowledge or special expertise about the child. Step 6. IEP meeting is held and the IEP is written. The IEP team gathers to talk about the child's needs and write the student's IEP. Parents and the student (when appropriate) are full participating members of the team. If the child's placement (meaning, where the child will receive his or her special education and related services) is decided by a different group, the parents must be part of that group as well. Step 7. After the IEP is written, services are provided. The school makes sure that the child's IEP is carried out as it was written. Parents are given a copy of the IEP. Each of the child's teachers and service providers has access to the IEP and knows his or her specific responsibilities for carrying out the IEP. This includes the accommodations, modifications, and supports that must be provided to the child, in keeping with the IEP. Step 8. Progress is measured and reported to parents. The child's progress toward the annual goals is measured, as stated in the IEP. His or her parents are regularly informed of their child's progress and whether that progress is enough for the child to achieve the goals by the end of the year. These progress reports must be given to parents at least as often as parents are informed of their nondisabled children's progress. Step 9. IEP is reviewed. The child's IEP is reviewed by the IEP team at least once a year, or more often if the parents or school ask for a review. If necessary, the IEP is revised. Parents, as team members, must be invited to participate in these meetings. Parents can _make suggestions for changes, can agree or disagree with the IEP, and agree or disagree with the placement. If parents do not agree with the IEP and placement, they may discuss their concerns with other members of the IEP team and try to work out an agreement. There are several options, including additional testing, an independent evaluation, or asking for mediation, or a due process hearing. They may also file a complaint with the state education agency.

160 Step 10. Child is re-evaluated. At least every three years the child must be reevaluated. This evaluation is sometimes called a "triennial." Its purpose is to find out if the child continues to be a child with a disability, as defined by IDEA, and what the child's educational needs are. However, the child must be reevaluated more often if conditions warrant or if the child's parent or teacher asks for a new evaluation. 5.8 Let us sum up As discussed so far there are different types of evaluation tools and techniques. Norm-referenced test, Criterion referenced tests & continuous and comprehensive evaluation are a pre-requisite of today's evaluation system in education. To determine if a child is eligible for classification under one of the 13 areas of exceptionality, an individualized evaluation, or assessment, of the child must be conducted. The focus of evaluation is to take the educator, step-by-step through the assessment process in special education. A referral to Special Education can be made by teachers, parents, doctors, or anyone involved in a student's education. Before a child is placed in Special Education an assessment must be completed to determine their academic level, cognitive ability, adaptive behavior, motor skills, or language processing abilities. The design of the assessment varies according to the suspected area of disability. Assessments are only appropriate when all other classroom interventions are tried. The assessment results are presented at the Individual Educational Plan (IEP) meeting to the IEP team, which is usually composed of the child's parents, a general education teacher, an administrator, and the assessment team. The goal is to understand the student's strengths and weaknesses, to understand the root causes of their learning difficulties, and to determine their eligibility for Special Education services. When the individual pieces of the assessment are put together, they compose a complete picture of the child and their educational needs. If the child qualifies for Special Education, the assessment information is used to develop an IEP.

161 5.9 Check Your Progress. 1. Define Evaluation. Mention Differences between requirement and Evaluation.

.....
.....

..... 2. Discuss in brief different types of Evaluation.

.....
.....

..... 3. Explain with suitable example, the difference between NRT and CRT.

.....

..... 4. Why evaluation process are necessary in our teacher learning system.

.....

..... 5. Explain in brief about CCE and scholastic and non scholastic assessment in Evaluation process.

.....

..... 6. Mention different types of tests used in our teaching learning system.

.....

162 7. Classify different types of tools used in Evaluation.

.....
.....

..... 8. Explain about the basic technique of Evaluation implemented in our teaching learning process.

.....

3 Netaji Subhas Open University From the Vice-Chancellor's Desk Dear Students, from this Academic Session (2015-17) the Curriculum and Course Structure of B. Ed.- Special Education have been thoroughly revised as per the stipulations which featured in the Memorandum of Understanding (MoU) between the Rehabilitation Council of India (RCI) and the National Council for Teacher Education (NCTE). The newly designed course structure and syllabus is comprehensive and futuristic has, therefore, been contextualized and adopted by NSOU from the present academic session, following the directives of the aforesaid national statutory authorities. Consequent upon the introduction of new syllabus the revision of Self Instructional Material (SIM) becomes imperative. The new syllabus was circulated by RCI for introduction in the month of June, 2015 while the new session begins in the month of July. So the difficulties of preparing the SIMs within such a short time can easily be understood. However, the School of Education of NSOU took up the challenge and put the best minds together in preparing SIM without compromising the standard and quality of such an academic package. It required many rigorous steps before printing and circulation of the entire academic package to our dear learners. Every intervening step was meticulously and methodically followed for ensuring quality in such a time bound manner. The SIMs are prepared by eminent subject experts and edited by the senior members of the faculty specializing in the discipline concerned. Printing of the SIMs has been done with utmost care and attention. Students are the primary beneficiaries of these materials so developed. Therefore, you must go through the contents seriously and take your queries, if any, to the Counselors during Personal Contact Programs (PCPs) for clarifications. In comparison to F2F mode, the onus is on the learners in the ODL mode. So please change your mind accordingly and shrug off your old mindset of teacher dependence and spoon feeding habits immediately.

4 I would further urge you to go for other Open Educational Resources (OERs) - available on websites, for better understanding and gaining comprehensive mastery over the subject. From this year NSOU is also providing ICT enabled support services to the students enrolled under this University. So, in addition to the printed SIMs, the e-contents are also provided to the students to facilitate the usage and ensure more flexibility at the user end. The other ICT based support systems will be there for the benefit of the learners. So please make the most of it and do your best in the examinations. However, any suggestion or constructive criticism regarding the SIMs and its improvement is welcome. I must acknowledge the contribution of all the content writers, editors and background minds at the SoE, NSOU for their respective efforts, expertise and hard work in producing the SIMs within a very short time. Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor, NSOU

Unit I □ Nature of Mathematics 1.1. Introduction 1.2.

Objectives 1.3 Meaning, Nature, Importance and value of Mathematics 1.3.1 Meaning (Derivation from Greek word; English Dictionary; Indian language, Saying of Maxwell, Bartrand Russell, A.N.Whitehead etc) 1.3.2 Nature (As a science of reasoning; a science of symbols; an abstract science; Science of numbers; a language; survival of mankind; Interpreter for real life phenomenon; deductive reasoning etc) 1.3.3 Importance (in school curriculum; in mathematical aspect; in civilizations and culture; in other subjects). 1.3.4 Value 1.1. Introduction Longback, Comte observes as follows, "All science education which does not commence with Mathematics is, of necessity, defective at its foundation". Roger Bacon observes "Mathematics is the gate and key of the science. Neglect of Mathematics causes injury to all knowledge. Science he who is ignorant of it cannot know the other sciences or the things of the world. What is more, men who are thus ignorant are unable to perceive their own ignorance and so do not seek a remedy." Mathematics plays an important role for acquiring knowledge in any branch of science and scientific theories are also based on mathematical knowledge. Kothari Commission (1964–66) mentioned "we cannot over stress the importance of mathematical in relation to science, education and research. This has always been so, but at no time has the significance of mathematical been greater than today. It is important that deliberate effort is made to place India on the world map of mathematics, within the next two decades or so." National Curriculum Framework– 2005 has emphasised "Developing children's abilities for mathematicalisation is the main goal of mathematics education. The narrow aim of school mathematics is to 10 develop useful capabilities, particularly those relating to numeracy, numbers, number operations, measurement, decimals and percentages. The higher aim is to develop the child's resources to think and reason mathematically, to purpose assumptions to logical conclusions and to handle abstraction. It includes a way of doing things and the ability and attitude to formulate and solve problems." So the role of mathematics, is many folded. Mathematics develops the skills of visualisation and representation of a person about physical phenomena. C. A. Coulson says "Our world is becoming increasingly mathematical" In this perspective we will discuss the nature, importance and value of mathematics. 1.2.

Objectives : At the end of this subunit, you will be able to ● acquire a clear perspective of meaning and nature of mathematics. ● explain the importance of mathematics in multi-dimensional fields. ● appreciate different values of mathematics as a school subject. 1.3.1. Meaning of Mathematics : Etymologically the term 'Mathematics' is derived from two Greek words, 'Manthanein' means 'learning' and 'Techne' means 'an art or technique'. So, mathematics means the art of learning related to faculties. In many Indian languages the vernacular word for mathematics is 'Ganita' which means the science of space and quantity which helps us in solving many problems of life using numeration and calculation. In Sanskrit, it is said, 'Ganita Shastra' which means science of counting and calculation for mankind.

The dictionary meaning of Mathematics is, "it is either the science of number and space or the science of measurement, quantity and magnitude." So mathematics is the science of quantity, measurement and spatial relations. It is a systematised and well organised branch of science

expressed symbolically. Mathematics is defined in different ways by different schools.

11 ● "Mathematics is the indispensable instrument of all physical resource" Kant. ● "Mathematics is engaged in fact in the profound study of art and expression of beauty" –I. B. Shaw ● "Mathematics is the art of saying the same thing in many different ways" – Maxwell ● "Mathematics may be defined

as "The subject in which we never know what we are talking about, nor whether what we are saying is true" – Bertrand Russell ● "

Mathematics is the queen of science and arithmetic is the queen of all mathematics" – Gauss ● "Mathematics is a science of order and measure" – Descartes ● "

Mathematics is a way to settle in the mind a habit of reasoning" –

Loyce. Mathematical culture shares with the humanistic culture some characteristics like beauty, elegance, depth, emotional involvement, artistic nature, creativity, pursuit of truth etc. The National Policy on Education 1986, mentions ● " Mathematics should be visualised as the

vehicle to train a child to think, reason, analyse and to articulate logically. ●

Mathematics is the science of patterns and forms in numbers and space. The thrill of mathematics lies in the discovery of these patterns. ● Mathematics is both an experimental and deductive science. While proofs are important, the discovery of pattern, is even more important and is certainly more exciting. Derived definition : So mathematics can be defined as a systematised, organised branch of science which deals with quantitative facts forming generalisation, establishing relationship and developing logical thinking and reasoning. So the word Mathematics denotes two different senses namely one as a method used to solve the problem of physical nature (tool) and second to generalise truths (logical frameworks)

12 1.3.2 Nature of Mathematics : On the basis of various thoughts of the greatest mathematical scientists of all times the following aspects on nature of mathematics are emerged. 1.3.2.1 As a science of

reasoning : According to Locke 'Mathematics is a way to settle in mind a habit of reasoning'. Mathematics is based on logical reasoning. This logic helps us to come to a conclusion or to prove a statement. The reasoning may be of two types (a) inductive reasoning—based on observation and experience of a individual cases to arrive of a generalised conclusion (b) inductive reasoning—where generalization is made on the basis of predetermined axioms or postulates. Laws of deductive logic are the basis of valid reasoning. These laws are (a) Law of identity (b) Law of excluded middle and (c) Law of contradiction. So mathematics is regarded as a highly disciplined model of thinking.

1.3.2.2. Mathematics as a science of symbols. Symbols are plenty in mathematics. Each symbol has a definite meaning. These symbols are accepted as universal. The main characteristics of mathematical languages are simplicity, accuracy and very precise. Meaning of Mathematics Etymological Vernacular word In Sanskrit Derived definition Mathematicians English dictionary NPE 1986 Mathematical culture

13 The other features of mathematical language are the following. (i) Like other languages, the mathematics language also has its own grammar. A definition must be stated clearly and precisely without confusion. (ii) Mathematical languages, clearly distinguish between number and numeral, fraction and fractional, angle and angular etc. (iii) Some common words are also used in mathematics in different contexts like 'Cone' 'angle', 'root', is used as a root of an equation, as square or cube root and main source etc. (iv) To arrive at a mathematical solution, we have to follow an algorithm that depends on sequence of steps. (v) Verbal statement, can be precisely expressed using mathematical symbols i.e. language. A is greater than B. B is greater than C can be stated $A > B > C$. The commutative law of addition and multiplication of real number system is expressed in verbal language as 'addition and multiplication of two real numbers is independent of order.' In mathematical language it can be stated as $a + b = b + a$, $a \times b = b \times a$, $a, b \in R$ Important mathematical statements relations and operations are $+$, $-$, \times , \div , $>$, $<$, \leq , $\%$, $\sqrt{\quad}$, \sum , etc. (vi) Sometimes, the same mathematical operation can be expressed in different mathematical language. The addition, can be stated as 'find the sum', 'find the value', 'find the whole', 'find the total', 'how many is all', the summation of, \sum , etc. Mathematical symbols may be referred as 'tool of communication'. 1.3.2.3. Mathematics as an Abstract science. Scientific theories, laws etc are expressed also in mathematical language which become abstract. $E = mc^2$, $1^2 + 2^2 + 3^2 + \dots + n^2 = \frac{n(n+1)(2n+1)}{6}$ etc. Some mathematical concepts cannot be physically verified, they are abstract. For example Euclid's lines are assumed to have no width and points are no size similarly,

14 the concept of infinity, negative numbers limit etc. Can not be learned through practical experiences. Hence they are abstract. 1.3.2.4. Mathematics as a study of structure. Mathematical structure is a mathematical system obtained by some sort of arrangement, formation or putting together of parts. For this we apply the properties like commutative, associative and distributive operations. Plane analytic geometry is considered as a superstructure based on the structure known as real number system. Similarly, number system, group, field, ring, vector etc, are examples of mathematical structures. 1.3.2.5. Mathematics as a science of precision and accuracy. Mathematical results are exact and precise. It may be either right or wrong, accepted or rejected. There is no in between the right and wrong. Sometimes we have to give emphasis on approximation in mathematical results but that also depends on degree of accuracy. 1.3.2.6

Mathematics as a deductive science. In deductive reasoning we proceed in the following way : if something is true which is considered as fundamental assumption, then the subsequent deduction based on accepted assumptions must be true. 'If a line intersects two parallel lines, the alternate angles are equal.' Hence the validity of the deduced conclusion depends on the consistency of the assumption i.e., premises Air contains O_2 , N_2 , CO_2 etc in the following percentages, of a mixture of O_2 , N_2 , CO_2 etc contains such percentages, then it may be treated $AB \parallel CD$; E, F , intersects at P and Q points. $\angle EPB = \angle EQC$ etc. $A B D F P C E Q$

15 as air. This type of deduction is made by applying logical reasoning. So the phases of mathematical deduction are (a) Premises (basis consideration or axioms) (b) The process of reasoning and (c) Conclusion (accepted definition or theorem)

1.3.2.7 Mathematics as an inductive science. Inductive reasoning is based on the principle that if a relationship holds good for few particular cases and even for any similar case then the relationship can be generalised into a rule or formula. If $(a+b)(a+b) = a^2 + 2ab + b^2$, $(m+n)(m+n) = m^2 + 2mn + n^2$ etc then $(p+q)^2 = p^2 + 2pq + q^2$. Mathematical definitions and rules are formed through induction based on particular facts, examples. The child may use measurement, manipulation as some constructive activities to arrive at a relationship using mathematical symbols. This symbolic form based on particular instances is called as law or rule. The phases are : Observation and \rightarrow Generalised form/ \rightarrow Use of symbols through direct experiences relationship reasoning (law/rule is formed)

1.3.2.8. Mathematics as a science of number. Before the invention of proper numbers, ancient people uses the notations of 'one' and 'many'. But necessity of man compels them to write symbols for numbers which we use today—1, 2, 3, 4, 5, 6, 7, 8 and 9. Those counting numbers are invented within a centuries of development. Scientific information was expressed by using numbers. Thus mathematica is considered as a science of numbers. For example, (a) 1, 2, 3, 4.....are called numberd. These numbers are used in counting. Hence then unmbers are called counting numbers. (b) On the same way 0, 1, 2, 3, 4.....are called whole numbers. Those are used in meaning. Hence these numbers are called measuring numbers. (c)-4, -3, -2, -1, 2, 3, 4.....are called integers. Those numbers are used to indicate direction. So there are called directional numbers. By using the numbers, we can explain the natural phenomenon, scientific discoveries, economic growth, environmental information etc. } } }

16 1.3.3. Importance of Mathamatics. In the words of Young "Mathematical is the only subject that encourages and develops logical thinking. It enables the student to discriminate between essential and non essential. It helps them to shift facts, to draw conclusions without ambiguity and that is the subject by which they may learn what is meant by rigid reasoning." The importance of mathematics is multidimensional and widespread. So being numberate is becoming more important than being literate. The importance of mathematica can be judged from three aspects namely (a) Social aspect, (b) Application aspect and (c) Mathematical aspect.

1.3.3.1 Importance of Mathematical from social aspect. • Daily life activities of man demand mastery of number and mathematical vocabulary like commission, discount, profit and loss, percent and like. • The study of mathematics helps to develop logical thinking and reasoning, creative imagination. • Mathematics enhances the ability to apply mathematical ideas in other branches of knowledge and even in daily life situation. • Many vocations require mathematical skills. • Mathematics helps man to discover the mysteries of universe and to overcome superstitions.

1.3.3.2 Importance of Mathematics from application aspect. • Mathematics provides sufficient skills to meet the demand of daily life. • It provides a clear understanding of laws of nature. • Various cultural art like painting, drawing and sculpture are based on mathematical knowledge. • Music utilizes mathematics. • Mathematical Quizes, puzzles, magic squares, tools are both entertaining and challenging to develop power reasoning. • Mathematics has a positive correlation with other frames of science as well as with social sciences and also with languages-mathematics in used have as tool of other subjects.

17 • Lofly A Zadeh has dicovered two types of fuzzy set namely Intuitionistic and Neutrosophic fuzzy set which has revolutionied the application areas of mathematics.

1.3.3.3 Importance of Mathematics from mathematical aspect. • Mathematical contents are gradually increasing and other related subjects are also developed by mathematics. • Mathematics improves the ability to perform calculation with speed and accuracy. It also develops the concepts of symmetry, similarity and the skill to use instruments with precision. • Mathematics improves the power of (a) estimation and approximation of results more accuracy. (b) being more systematic in finding relationship, drawing conclusion. (c) interpretation of numerical data using graphs etc. (d) taking independent decisions in administrative and social, issues. (e) thniking alternative methods of solving problems

Importance of Mathematics 1.3.4. Value of Mathematics. In the language of Courant and Robin "Mathematics is an expression of the human mind which reflects the active will, the contemplative reason and the desire for aesthetic perfection. Its basic elements are logic and intuition, eralysis and constructions generality and individuality." Mathematics does not contain only asbtract information, some process laws and In the field of application of mathematics In the field of social and cultural aspect In the field of mathematical aspect

18 formula. It must contain avenues of developing a good number of values. According to Encyclopida "Value means relative worth or importance". We know 'value can not be taught, it must be caught.' Buy by teaching or learning a subject one must obtain such qualities which one essential for a person to live in society and which is desirable for a person. Teaching of mathematics will also foster the following values. 1. Utilitarian value 2. Intellectual value 3. Aesthetic value 4. Moral value 5. Recreational value. 1.3.4.1 Utilitarian value : In the words of I. G. Kemeny "Whether man's travel carries him into space or into theoretical science, his passport must be stamped with the mathematician's seal or approval.' The utilitarian values of mathematics are many and varried consider the applications of mathematics in our daily life. We start our works, complete those following the time schedule and planning. We face comercial transaction, fill payment, construction expenses, use of electronic gudget, tour & travels etc in our daily life. All these activities are directly influenced mathematics. • Other frames We have identified the relationship between mathematics and other branches of science and humanities and have realised the utilitarian value of mathematics starting from scientists, educationists, administrations businessmen teachnicuans and even the foal utilise mathematics knowingly or unknowingly. So mathematics for all. • Mathematics is business and industry--The development of a country depends also on the expression of its business of industry. Both utilise the application on the mathematics. 1.3.4.2 Intellectual value : Intellect is the mental capacity with the help of which we can think and acquire

19 knowledge. It is the mental faculty by which we understand the concrete and abstract life experiences. If regulates our thinking, imagination and responses to any stimulus. All sorts of creation, manipulation and structuring of knowledge are the output of intellectual vaules, mathematics regulates those processes standign from thinking, analysing, arriving at a conclusion and verifying the result. According to Duffon "Mathematics furnishes the power of deliberate thought and accurate statement and to speck trugh." So students must love and enjoy mathematics. To inlucate such mental faculty, the teachers may8 arrnage the following activities. • To allow the students to be exposed in different branches of mathematics. • To arrange mathematics Quizt, Quest, seminar. • To acquaint the student with mathematical logical for solving different problems. • To include the biographies and contributies of national and international mathematics. • To enourage the students to participate in teaching learning process and in mathematics laboratoriaies. • To organise mathematical exhibition, fair, fun for mathematics etc. • To conduct group mathematical project for exchange of views. 1.3.4.3 Aesthetic value : In the words of Thorndike "Education as a whole should foster the higher impersonal pleasure" Mathematics also fulfills that function. Mathematics is alos sources of delight and joy. Geometrical drawings, artistic diagrams, engineering figures etc, are based on the principles of mathematics. Proper shope and appropriate size brings beauty to the objects in nature. Symmetry is the corner stone of beautiful creation of the universe. For example two parts (belt and right) of a human body, loves of a tree, beehibes, nests of birds, spider net has beautiful mathematical structure. The feeling of Aesthetic measure (M) cembe calculated using the formula. $M = O C$ where O = The property of harmony, as symmetry of orders. C = Complexity of the objects.

20 1.3.4.4 Moral values : Morality means the characteristics and conduct of a person with respect to his/her behaviour is the society. The human character and conduct is determind by the culture of the person. The culture includes knowledge, belief, morals, custom, law and habits etc. The culture is influenced both by material components like clothing, machine tools etc as well as non-material components like language, literature, out religion, rule of the government. Moreover, both the material and nonmaterial component of culture are controlled direct by or indirectly by mathematics. Hence mathematics has a strong moral value. The moral value of mathematics are exhibited in multidimensional powers like "discipline', reasoning capacity, concentration of mind, precission in delaing, perfectness in work, neatness in all kinds objects, self confidence in arriving at a conclusion, constructive imagination for solving a problem, capacity of judging the problamatic sitituation. Moral values of Mathematics Precision character and conduct of a person in a society discipline Reasoning Perfectness Self confidence Constructive imagination Judging the situation Material Component cultura like toal, clothing, shelter etc. Non material components like knowledge belief, language, religions, law etc.

21 Thus moral values of mathematics develop in the learner good character, desirable cultura, honesty, attitude of openness, deductive and inductive reasoning etc. 1.3.4.5. Recreation value : Galileo has mentioned 'Mathematics is the language in which God has written the Universe.' For recreation or enjoyment we also explore the language of the universe. For recreation we even undergo such activities which require power of reasoning symbolisation and critical thinking etc. Recreational activities give the person fresh energy for solving problems, performing creative activities. While solving mathematical problem one can enjoy a lot by facing challenging situation and ultimately solving the problem. The learner is delighted by discovering such new knowledge. Mathematical puzzle, induction and finding alternate ways to solve problem are the sources of recreation value of mathematics. 1.2. Axioms, Postulates, assumption and Hypothesis in Mathematics (Mathematical assertions) The word axiom comes from the Greek word 'axioms' means 'That which is thought worthy or fit' or 'that which commends itself as evident'. In mathematics, it is a statement that is so evident as well-established, that it is accepted without controversy or questions. It can be used as the premise or starting point for further reasoning or arguments. Axiom is, a rule as a statement that is accepted as true without proof. In mathematics, there are two types of axioms namely (i) Logical axioms and (ii) non-logical axioms. Logical axioms are usually statements that are considered to be true within the system of logic they define. For example A and B may represent two points A and B when as AB may be a line segment etc. Non-logical axioms is not a self-evident truth, used in deduction to build a mathematical theory.

22 Example : $a + b = b + a$ is true in arithmetic \square Characteristics : (1) It is any mathematical statement from which other statements may be logically derived. (2) An axiom in one system may be a theorem in another and vice versa. (3) An axiom is a self evident assumption which is common to many branches of science. Example : when an equal amount is taken from equals, an equal amount results. In mathematics, a clear distinction can be made between logical and non-logical. Logical axioms are certain formulas in a formal language that are universally valid. They are satisfied by every assignment of values. On the other hand, non-logical axioms are formulas that are theory specific assumptions. For examples the natural numbers and integers involve the same logical axioms. The non-logical axioms aim to satisfy what is special about a particular structure like groups. These are referred as axioms in mathematical discourse. Every mathematical theory starts from a given set of non-logical axioms and ultimately formalised to logical formulas. Example : For natural numbers. Relevant terms '0' (Zero); "number"; "successor" Axioms A1 '0' (Zero) is a number A2. The successor of a number is a number. A3. No two numbers have the same successor A4. 0 is not the successor of any number a5. If p is a property such that (

a) q/ has the property p and (b) whenever n has

the property P, the successor of n has the property P, then every number has property P The 5th axiom is termed as 'The principle of mathematical induction'. \square

Postulate : The meaning of the word is to 'demand'. Euclid demands that 'any two points can be joined by a straight line.' All the foundation of the famous science depend certain additional hypothesis which were accepted without proof. Such a hypothesis were known as postulate.

23 \square Characteristics : (1) The postulates of each particular science were different. (2) The validity of postulate is determined by means of real-world experience. (3) These are very basic, self evident assertions. (4) These are non-logical axioms. From Euclid's Elements, the following five postulates are obtained. 1. Things which are equal to the same thing are also equal to one another. 2. If equals are added to equals, the wholes are equal. 3. If equals are subtracted from equals, the remainders are equal. 4. Things which coincide with one another are equal to one another. 5. The whole is greater than the part. Postulate is a true statement which does not require to be proved. Example : We use postulates SSS. General assumptions : 1. Things which are equal to the same thing are also equal to one another. 2. If equal are added to equals, the wholes are equal. 3. If equals are subtracted from equals, the remainders are equal. 4. Things which coincide with one another are equal to one another. 5. The whole is greater than the part. However, modern mathematics develops theories and axioms like field theory, group theory, topology, vector spaces, hyperbolic geometry without any particular application in mind. Mathematicians now consider that axioms should be regarded as purely formal statements and not as facts based on experience. Modern mathematics strengthens its foundation to such an extent that mathematical theories can be regarded as mathematical objects and mathematics itself can be regarded as a branch of logic. \square Assumption : Something taken for granted or accepted as true without proof, as supposition. A B C D E F

24 It is a statement that is used as the premise of a particular argument but may not be otherwise accepted. Latin 'assumptionem' meaning a taking as receiving." So Assumption is a supposition on the current situation or a presupposition on future course of events, assumed to be true in the absence of positive proof but necessary to establish a rule/law. □ Characteristics : 1. A statement that is assumed to be true and from which a conclusion can be drawn a straight line— which will never meet, but on the surface of earth which has a curvature, it is assumed. 2. It is hypothesis that is taken for granted. 3. From the fundamental assumption something is developed or explained. 4. It is the act of assuming or taking for granted. 5. An assumption may be taken as postulate or axiom. 6. It may be taken as presumption for establishing a theory. 7. It is accepted cause and effect relationship. □ Hypothesis : Hypothesis is the part of a condition statement. It is statement or idea which gives an explanation to a science of observation. Example : If the three sides of a triangle measure the same, the triangle is equilateral. The hypothesis is 'all three sides of a triangle measure the same'. (1) A statement that might be true, which can then be tested. (2) Sometimes the hypothesis would not be tested.

25 (3) Steps underlying the formation of hypothesis are : (to make some observations) 9 Collect some data based on the observations 9 Make a conclusion (Hypothesis) 9 To test the hypothesis taking more evidence/data 9 9 If the evidence is in agreement If the data/evidence contradict 9 9 The hypothesis is correct It must be rejected as amended for verification (4) Mathematics is based on deductive reasoning so a good hypothesis is essential for formation/explanations of a math. 1.3. Historical Development of Notations and Number System 1.3.1 Development of Mathematical Notations. Mathematical notations comprise the symbols used to write mathematical equations and formulas. It implies a set of well-defined representations of quantities and symbols operators. The history includes Hindu-Arabic numbers, better from the Roman, Greek, Hebrew and German alphabets. The development of mathematical notation can be expressed in phases. 1st The rhetorical stage. At this stage calculations are performed by words only. 2nd phase The syncopated stage Operation and quantities are represented by symbols The numerical symbols consisted of strokes or notches cut in wood or stone. The symbolic system was in use by medieval Indian mathematicians and in Europe since the middle of the 17th century. The Egyptian mathematics had a symbol for one, ten, one hundred, one thousand, ten thousand, one hundred-thousand and one million. Some common Mathematical symbols with history. = (the equal sign) means "is the same as" first introduced in the 1557 (book 'The Whetstone of Witte by Robert Recorde.)

26 < (the less than sign) means "is strictly less than", > (greater than sign) means "is strictly greater than sign". First appeared in Artis Analytica Praxis ad Aequationes Algebraicas Regolverdas. ("The Analytical Arts Applied to Solving Algebraic Equation" by Thomas Harriot (1631). ≤ ("less than or equal") and ≥ ("greater than or equals" by Pierre Bouguer in 1734 ∴ (three dots) means "therefore" ("Teach yourself Algebra" (1659) by Johann Rahn ⇒ (the such that sign) means "under the condition that". Commonly to abbreviate 'such that'. ⇒ (the implies sign) means "logically implies that". ⇔ means "if and only if". ∀ (the universal quantities symbol means "for all" Gerhard Gentzen (1935) Investigation on Logical Reasoning ∃ (The existential quantities) means "there exists" first used in 1897 book "Formulaire de mathematiques by Giuseppe Peano Set theory notation : ⊂ (Proper subset) means "This set is a subset of " and ⊃ (the includes sign) means "this set has a subset". Those are used in 1890 book Vorlesungen über die Algebra der Logik ("Lectures on the Algebra of the Logic") by Ernst Schröder. ∈ (Element of) means "in an element of" and first appeared in the 1895 book Formulaire de mathematiques by Giuseppe Peano. ∪ (The union sign) means "take the elements that are in either set", and ∩ (The intersection sign) means "take the elements that the two sets have in common." They were introduced in the 1888 book "Geometric Calculus based upon the teachings of H. Grassman. Preceded by the operations of deductive logic" by Giuseppe Peano. ∅ (The null set or empty set symbol) means "the set without any elements is it", first used in 1939 book "Elements de mathematique" by N. Bourbaki. ∞ (infinity) denotes "a number of arbitrarily large magnitude" First appeared in print in the 1655 book "On Conic Section" by John Wallis. π (The ratio of the circumference to the diameter of a circle) denotes the number 3.141592653589... and was first used by William Gones in his 1706 book

27 Synopsis Plama morum mathematica ("A New Introduction to the Mathematics") Many people speculate that gones chose the letter π because it is the first letter in Greek word perimetron, which roughly means 'around'. 1.3.2.

Development of Number system. The historical development of number system can be grouped into following phases.

1.3.2.1. Egyptians (3000 – 1000 B.C.) Ciphered number system. Important features are. • Two numeration system.. • Important tally system 'Hieroglyphics'. • Those system when based on groupong of 10. • Thy used their numeration system for measruesment. 1.3.2.2. Babylonians (2000 – 200 B.C.) Important features are. • Their number system based on goruping of 60. • Have the position system. • Writing ws as clay tablets. • Problem was spacing between position. • Finally they used dot to seprate those numbers. 1.3.2.3. Maya and Romans (300 B. C.) Important features • Those were similar to Babyglonians. • Problems related to spacing were removed. • Grouping of numbers was based on 20. • Based on odd use of 18.

28 Romans' system was. • Similar to the Egyptian system. • They wrote larger numbers by putting a bar over. • Addition and subtraction can be made. 1.3.2.4. Regarding Place Value of Zero : • Babyglonians started the place value using theri dot. • In 600 A.D. Hindus started to use 10 place value system • Hindu recognized zero as a number • In 9th century, Arabs started to use the Hindu system • Indian word sunyo means absense of quantity • Mahavira proved that number multiplied by zero will become zero. • Bhaskare proved a number divided by zero will result infinite quantity. 1.3.2.5.

Place Value of Zero : • Babylonians started place value using their dot. • In 9th century Arabs accupted Hindus system. • In 18th century zero occupy a place in algebraic equation. 1.3.2.5. Fractions : • Egyptians first use fractions as "parts". • Babylonians started base sixty system to include fraction. • Russian had a unit-fraction method. • In their nine chapters on mathematical art, Chinese mathematicism thought about fraction similar to our. • Chinese avoided using improper fractions. 1.3.2.6. Nagetive Numbers : • In 7th century, Brahmagupta recognised that negative number can be treated as debt.

29 • In 17th century, negative numbers were accpted. • Descartes recognised negative roots as 'false roots'. • Euler recognised negative numbers as debts and treated that product of two negative numbers is a positive number. 1.3.2.7.

Complex Number : • In early times if the quadratic formula was used to square root of a negative number then there was no solution. • Rafael Bombelli formed out a new language to treat these negative radicol. • Bombelli showed that sometimes the square roots of a negative number can be used to find real solution. • Euler used complex numbers a lot, but could not explain about their nature. • Argund represented imaginary numbers geometrically on a plane. • Gauss showed how complex number could be used in Mathematics. Number can be calssified into sets, called number system. main number system of Roman numbers are the following : N Natural 0, 1, 2, 3, 4,...or 1, 2, 3, 4,... Z Integer ..., -5, -4, -3, -2, -1, 0, 1, 2, 3, 4, 5 Q Rational a b where a and a are integer a and b is not 0 R Read The limit of a contergent sequence of rational numbers C Complex a+ib where a and b are real number and i is the square rot of -1 Premitive and prehistoric number system are numbers systems that have been developed when then has been need to express mognitudes. Thus the "bundle-of- sticks" method is used to represent magnitude. It can be used to express anything but quantities.

Following Table shows the number words used amont the

30 Bushmen in South Africa Number Word or Combination 1 Xa 2 t'oa 3 'quo 4 t'oa – t'oa 5 t'oa – t'oa ta 6 t'oa – t'oa – t-oa 1.4. Contribution of Great Mathematics 1.4.1. Srinivasa Ramanujam FRS He was an Indian mathematician. Though he had atmost no formal training in pure mathematics, he made extrordinary contribution to mathematical analysis, number theory, infinite service and continued fractions. During his short life (22 December 1887 – 26 April 1920). Ramanujam idependently compiled neraly 3.900 result (mostly identities and equations) Ramanujum, with the help of Ramanujam

Aiyer, had his work pulished inthe Journal of the Indian Mathematial society. He posed the problem in the Journal as follws. $1^2 + 2^2 + 3^2 + \dots + n^2 = \frac{n(n+1)(2n+1)}{6}$ He waited for a solution over six months. At the end, Ramanujan published the solution himself. On page 105 of his first notebook, he formulated an equation that could be used to solve the infinity rested radical problem $x + n + a = \sqrt[n]{x + n + a}$ using this equation the problems can be solved. Ramanujum has written a good number of creative article. Prof Handy recommended the following seven articles as most significant. They are -- i. Modular Equation and Approximatians to π -- Quarterly journal of mathematics. Vol. 45.

31 ii. Highly composition Numbers– Proceeding London Mathematical Society. Vol. 14 iii. On Certain Arithmetical Functions Trase Continental Philosophical Society. iv. On Certain Trignometirc sums and Their Applications to the Theory of Nunbers. -- Transe Continental Philosophical Society. v. Some Properties of P(n), the Number of Partitions on 'n'. Transe Continent Philisophical Society. vi. Proof of Certin Identities in Combinatory Analysis. vii. Congruance Properties of Partitions--Math. Thematia Zeitschmift. Vo. 9 Besides his published work, Ramanujam left behind several notebooks, which have been the object of research. The Enlish mathematician G. N. Watson wrote a series of papers about them. At present, the American mathematician C. Berndt has written a multi-volume study of the notebook in 1997. Ramanujam worked out the Riemann series, the illiptic integrads, hypergeomtric series, the functional equations of the Zeta functions, the classical theory of quachotic forms as Cauchy's Theorem. Though brilliant, many of his theorems on the theroy of prime numbers were wrong. Objectives and Instruction Planning in Mathematics Structure : 2.1 Aims and Objectives of Teaching Mathematics in Elementary and Secondary Schools. 2.1.1 Introduction 2.1.2 Aims of teaching Mathematics 2.1.3 Objectives of Teaching Mathematics 2.1.4 Objectives of Teaching Mathematics at the Elementary Stage 2.1.5 Objectives at the Secondary Stage 2.1 Aims and Objectives of Teaching Mathematics in Elementary and Secondary Schools. 2.1.1 Introduction We know that education is meant to acquire 3 Rs reading, writing and Arithmetic. The National policy in Education (1986 NPE) has mentioned that Mathematics should be taught to fulfill the aim that each learner is trained to think, on reason, analyze and articulate logically. As far as possible the discovery approach is to be followed. The skills of drawing, measuring and estimation have to be developed. To remembers the knowledge of terms, concepts, principles, processes and symbols. To respect the contribution of great mathematicians. To develop the skills in handling devices like calculators Computers etc. To help the learner to utilize the knowledge of Mathematics and skills to solve problems of daily life. To be fit to understand the content of higher Mathematics. The aims of teaching Mathematics are the goals, targets or universal purpose that may be fulfilled by the teaching of Mathematics. So aims are like ideals. Their attainment needs a stepwise as phasewise a long-term planning. Objectives are the short-term or immediate goals that may be attained within specified classroom activities.

33 2.1.2 Aims of teaching Mathematics Besides helping the students to acquire mathematical knowledge, the teaching of Mathematics also help the students to attain the broad aims of Mathematics. a. Disciplinary aim : The teaching of Mathematics will provide the learner to think logically and will develop the intellectual habits. b. Utilitarianism aim - The students will be given mathematical knowledge to solve the real life the real life problems also. Thus the study of Mathematics will be functional and purposeful. c. Social aim. The knowledge of Mathematics will serve both the individual in particular as well as the society in general. d. Moral aim The contental and the process solution will imbibe morality. e. Aesthetic aim The teaching of mathematics will create intervest and the learners will remain engaged even is their leisure time f. Cultural aim The teaching of Mathematics will also help the learner to understand the contribution of Mathematics in development culture. g. Vocational aim It will help the learner to be fit for any location of his choice. h. Inter disciplinary aim The learner will realise the application of Mathematics in different subjects. 2.1.3 Objectives of Teaching Mathematics The objectives of teaching mathematics at the whole school stage may be classified as follows : (a) Knowledge and understanding objectives (b) Skill objectives

34 (c) Application objectives (d) Attitude objectives (e) Appreciation and interest objectives These objectives are to be expressed in behavioural terms. The instructional objectives are those objectives which the students is expected to active. These objectives are developed for classroom teaching. By teaching knowledge and understanding of Mathematics to the learner it is expected that the pupil acquire the following. A. KNOWLEDGE AND UNDERSTANDING (a) Language of Mathematics – symbols, formula, terms, definitions statements etc (b) Different mathematical concepts like numbers, sets, measurements, directions etc (c) Mathematical process and relationships (d) Development of Mathematics and contribution of mathematicians (e) The nature of Mathematics and its scope (f) Interrelationship between different branches of Mathematics and with different subjects B. SKILL OBJECTIVES Skill means the ability to perform a given act with case and precision. The teaching Mathematics helps the learners to develop the following skills (1) He acquires and develops speed, neatness, accuracy and precision is mathematical calculations (2) He develops skill in the use and understanding mathematical language (3) He develops the ability to estimate, check and verify results (4) He develops the ability to perform calculations orally and mentally (5) The learners develops ability to think correctly, to draw conclusions, generalisations and interences.

35 (6) He develops skills to use mathematical tools and apparatuses skillfully. (7) He develops skill is drawing, meaning, weighing and use of different mathematical tools. (8) He develops necessary skill in drawing geometrical figures and mathematical concept maps. C. APPLICATION OBJECTIVES It is the ability to apply learned knowledge, concepts principles and skills in new and similar situations. It involbs the application of abstruck learning is reallife situations. Learning outcomes is this area require higher level of understanding of mathematical concepts. The students are enable to : (1) Analyze, draw inferences, generalise from collected data. (2) Use mathematical concepts is every day life (3) Solve mathematical problems independent by (4) Apply mathematics is his fortune vocational life. (5) Make use of mathematics is learning of other subjects and equip the self for higher education. D. ATTITUDE OBJECTIVES The development of Mathematics attitude makes learner open minded, helps him to make critical observation and to develop curiosity and impartial thinking The students will be able to (1) To analyse the problem independently (2) Develop the habit of systematic thinking and reasoning (3) Develop huristic attitude (4) Develop originality, independent thinking and creativity (5) Develop mathematical perspective while observing real life physical phenomena.

36 E. APPRECIATION AND INTEREST OBJECTIVES The students will be able to appreciate 1. The value of mathematics as the science of all sciences and art of all arts. 2. The recreational value of mathematics and the utility for leisure time activities. 3. Actively participate in mathematical debates, contests, quiz, quest. 4. The role of Mathematics in every day life. 5. The student will develop interest in mathematical learning and activities. 2.1.4. Objectives of Teaching Mathematics at the Elementary Stage. The main objectives at the elementary stage are the following : A. KNOWLEDGE AND UNDERSTANDING OBJECTIVES 1. Develop The knowledge and understanding of mathematical concepts of number, units of measurement, shape, size, direction, distance, fractions, equal, grouping and sub grouping etc. 2. Develops the knowledge, understanding of mathematical terms, symbols, digits, fractions, percentages etc 3. Develops the knowledge and understanding of mathematical facts like four fundamental operations, percentage, unitary method, mensuration etc 4. Develops the knowledge and understanding of mathematical relationships, notations etc. B. SKILL OBJECTIVES The learner develops the following skills 1. Skill of four fundamental operations with speed and accuracy 2. Ability in counting, reading, writing numbers and simple calculations 3. Skill in the use of mathematical tables 4. Proficiency in making estimates of size, distance and weights.

37 C. APPLICATION OBJECTIVES 1. The learner is able to solve both oral and simple writtens mathematical problems independently. 2. Try to apply elementary mathematical knowledge is every day real life situation 3. Try to estimate the length, mass of visible objects. D. ATTITUDE OBJECTIVES 1. To solve a problem, he tries to follow the systematic steps of solving the problem like reading the verbal problems carefully, analyse the facts, collect data and draws tentative inference. 2. Develop gradually the habit of logical thinking and reasoning 3. Develops the habits of neatness, honesty and regularity. 4. Gradually develops self-confidence for solving elementary mathematical problems. E. APPRECIATION AND INTEREST OBJECTIVES. 1. Appreciates the knowledge of Mathematics is solving problems of daily life. 2. Appreciates the recretional value of Mathematics and try to utilise his leisure time. 3. Develops interest in the learning of Mathematics. 4. Appreciates the contribution of mathematicians and get inspired. 2.1.5 Objectives at the Secondary Stage A. KNOWLEDGE AND UNDERSTANDING OBJECTIVES 1. He understands relationship of concepts, formulas, axioms and properties in the field of mathematics. 2. Gudge sufficiency, superfluency, relevance, inconsistency is the given data. 3. Detects errors in definitions, concepts, principles, process etc. 4. Translate mathematical relationship into symbolic forms and vice-versa. 5. Interpret graphs, charts, tables etc.

38 B. SKILL OBJECTIVES 1. He develops skill in solving the same problem by various methods but with reasonable speed. 2. Make readings from the table quickly and correctly. 3. Draw the geometrical figures neatly and systematically. 4. Check the calculation quickly and can use the instruments and appliances. C. APPLICATION OBJECTIVES 1. He learns the application of Mathematics in daily life, vocational, occupational and recreational life. 2. Formulate hypothesis from observed data and then draw inference. 3. Develop designs using mathematical relationship and principles 4. Solve new problems D. ATTITUDE OBJECTIVES 1. Develops interest and positive attitude towards learning of Mathematics 2. Learner gains confidence in the learning of Mathematics 3. Observe mathematical relationship in the environment 4. Accepts mistakes and point out errors unhesitatingly. E. APPRECIATION AND INTEREST OBJECTIVES 1. He enjoys solving mathematical problems of different types 2. Derive pleasure in observing, finding, interpreting mathematical relationship 3. Express joy and pride over great contribution of mathematicians 4. Regard great mathematicians and mathematics teacher with respect. National curriculum Framework has put forward the objectives of teaching school Mathematics as follows Developing Children's abilities for mathematization is the main goal of mathematics education. The narrow aim of school mathematics is to develop useful capabilities particularly those relating to numeracy-numbers, number operation, measurement, decimals and percentages. The higher aim is to develop the child's

39 resources to think and reason mathematically, to pursue assumptions to logical conclusions and to handle abstraction. It includes a way of doing things and the ability and the attitude to formulate and solve problems.

Accordingly the vision for school Mathematics are : • children learn to enjoy mathematics rather than fear it. • children learn important mathematics. • Mathematics is more than formulas and mechanical procedures. • Children see Mathematics as something to talk about, to communicate, to discuss among themselves, to work together on. • Children pose and solve meaningful problems. • Children use abstractions to perceive relationship to see structure, to reason out things, to argue the truth or falsity of statements. • Teachers engage every child in class with the conviction that everyone can learn mathematics.

40 2.2

Bloom's Taxonomy of Educational objectives and writing objectives in Behavioural terms Structure : 2.2.1 Bloom Taxonomy 2.2.2 There six behavioural objectives are related to specific mental process or ability which can be identified by using related action verbs. 2.2.3 Behavioural objectives under Affective Domain Krathwohl and his associates developed this objectives. These objectives are concerned with feeling aspect i.e changes in interests, attitude and values and also development of appreciations and adjustments. 2.2.4 Behavioural objectives under Psycho-motor domain. 2.2.5 Simpson's Taxonomy to Psychomotor Domain 2.2.6 Writing objectives in Behavioural terms 2.2.1 Bloom Taxonomy B.S. Bloom has included Taxonomy in educational objectives. The word Taxonomy has been derived from two Greek words : 'Taxis means configuration or arrangement and 'Nomos' means Law or rule. So Taxonomy means arrangement based on law. Know that, Bloom and Maric (1964) defined "A Taxonomy is a set of classification based on one or more principles." According to Bloom "The Taxonomy places the behavioural aspect of the objective within a hierarchical framework : each category is assumed to include behaviour more complex, abstract or internalised than the previous category. These categories are arranged along a continuum from simple to complex." In his book "Taxonomy of Educational objectives" (1956). Bloom has defined the educational objectives in terms of behavioural objectives. He mentioned three domains of Taxonomy namely i) Cognitive domain ii) Affective domain and iii) Psychomotor domain. Bloom and others have mentioned different stages of cognitive domain. "The cognitive domain includes those objectives which deal with recall or recognition of

41 Cognitive Domain Higher Level Lower Level 6. Evaluation 5. Synthesis 4. Analysis 3. Application 2. Comprehension 1. Knowledge 1. Knowledge is defined as the remembering of previously learned information. It stresses the Psychological process of remembering. Knowledge can be divided into three components. Psychomotor domain Affective domain Cognitive domain knowledge and the development of intellectual abilities and skills" – B.S. Bloom & others 1956.

42 A. Knowledge of specifics i) Knowledge of terminology Area, Triangle, Ratio Interest etc. ii) Knowledge of specific facts. Area of triangle, Volume of a cube, $(a + b)^3 = ?$ etc. B. knowledge of ways and means dealing with specifics. a) Knowledge of conventions (length) breadth, in a rectangle. b) Knowledge of trends and sequence. $-3 > -2 > -1 > 0 > 1 > 2$ c) Knowledge of classification and categories Area of circle, rectangle, triangle etc. d) Knowledge of criteria Rational and irrational number, equation of inequation etc. e) Knowledge of methodology To prove a geometrical theorem. C. Knowledge of the universal and abstraction in a field. i) knowledge of principles and generalisations the effect of temperature on a volume of gas when pressure remains constant etc. the relation between area of a circle with that of its radius. ii) Knowledge of theories and structure Knowledge 2. Comprehension It is expressed as the ability to grasp the meaning of a concept. It represents the lowest level of understanding. This domain has three sub components i) Translation The abstract ideas can be translated into concrete ideas.

43 a) Translation from one level of abstraction to another. The ability to convert verbal statement into mathematical statement. b) Translation from symbolic form to another form or vice versa. c) Translation from one verbal form to another translate the theorem from Bengali to English $5x + 3y = 15$ Give the graphical representations of the expression. ii) Interpretation It involves a re-ordering, rearrangement as explanation of concept for understanding. Interpret the statement, the correlation coefficient (r) is -0.85 . Interpret the nature of a group of the expression $Y = mx + c$ iii) Extrapolation of trends or tendencies beyond the given data for determining the implication or consequences on the original expression. $x + y + z = 1$ Find the coordinates of points which lie on the state line as to justify whether a particular point lies on the state line. 3. Application: It involves the application of a concept to new or similar situations. The concept includes the following types : i) General idea (Classification of numbers into rational and irrational, Types of triangles as the basis sides as angles.) ii) The rules of procedure iii) The Generalized method A E C D B AD z BC BF z BC etc.

44 Calculation of interest, or principal using the formula i) The technical principles To draw the graphical representation of circle, Parabola, Hyperbola from giving sets of points. v) The ideas The reciprocals of rational numbers are less than the original numbers but it is not true for fractions. vi) The theories/Laws Based on a theorem, the teacher sets different hidden questions to test the application ability of students. 4. Analysis It implies the breaking down of a mathematical concept into its constituent subconcept or parts so that relative hierarchy of ideas/concepts is made more clear. It has three components. i) Analysis of elements In a mathematical problem, There are some elements which do not directly related to the concept but to solve the problem relationship among the dependent variables is essential. Variables is essential. For example in calculating the total interest of say Rs 5000/- for a period from January 15 to October 25 of 1999 at the rate of Rs 8/- per annum, the year 1999 is not related, but if the year be 2000 then it will affect the calculation. ii) Analysis of relationship In a mathematical problem, sometimes there may be two variables, each of which is related to other function independently. For solving the problems two relationship are to be taken into account for example, 12 women can finish a piece of work in 5 days, but 10 men can finish the same work in 4 days. Then in how many days 7 women and 6 men can finish the work? Here rate of finishing a work is different for men and women. So independent relationship has man and women is to be calculated. iii) Analysis of Organisational principles. In teaching-learning of Mathematics, the domain of analysis of organisational principles includes the way the concept is to be presented, steps to be followed in sequence, scope of learners to take part in the discussion and the feedback system etc.

45 For example in proving a geometrical Theorem. The organisational principles will be what is going to proof must be known to learner. • To test the necessary background knowledge for the theorem of the students. To proceed logically with active co-operation of others. etc 5. Synthesis It refers to the ability to rejoin parts together to form a new whole. It gives emphasis to the formulation of new pattern. It is the fifth stage of cognitive domain. It has three components. i) The production of unique communication : • In this stage, the learn gains the ability to express his experience of learning to others • Can construct new problems based on learnt concept. ii) Production of a planned or proposed set of operations • In this stage, the learner achieves confidence to set operations for understanding / solving similar mathematical problems. • Can form unit plan for teaching a unit iii) Derivation of a set of abstract relations • In this stage of teaching-learning, mathematical concept are classified, abstract relations using symbols are established. • Students gain the ability of generalisation, discovery approach and problem solving. 6) Evaluation. It is concern with the ability to judge the value for a given purpose. Judgement are to be based on specific criteria like consistency, sequence and justification or internal determinents. It is of two types : i) Judgement is terms of internal evidence. Here judgement is made considering the accuracy, justification, sequence of the concept presentation. In a class where a geometrical theorem is proved. Judgement will be made considering the internal evidences like whether the necessary back ground knowledge is tested, necessary construction is made, logical proof as well as verification is done, students, participation is adequate and expected outcome has been attained by the learner.

46 ii) Judgement in terms of external criteria. At the finishing stage, to what extent expected outcomes has been achieved, that will be evaluated summatively. The judgement value well be given considering the retaintion, recall value of the content. 2.2.2 There six behavioural objectives are related to specific mental process or ability which can be identified by using related action verbs. Objectives 1. Knowledge 2. Comprehension Mental process / ability 1.1 Recall 1.2 Recognize 2.1 See relationship 2.2 Cite example 2.3 Discriminate 2.4 Classify 2.5 Verify 2.6 Generalise Associated action Verbs 1.a Define 1.b State 1.c Recall 1.d Recognize 1.e Label 1.f Measure 2.1 Identify 2.2 Justify 2.3 Illustrate 2.4 Formulate 2.5 Judge 2.6 Classify Examples 1.a Define rational numbers 1.b State the parallel lines 1.c Recall the meaning of 5% per year 1.d Recognize the figure of triangle from the following 1.e Label the names of the geometrical figures 1.f Measure the length of the sides of the following triangle. 2.1 Identify the might angled triangle from the following figures 2.2 Justify alternative angles are equal 2.3 Illustrate the perpen- dicular distance is the shortest distance 2.4 Formulate the relation among 1, p, R. I 2.5 Judge the relationship between external angle with that sum of intension angles. 2.6 Classify the triangles according to sides and angles. 3.1 Predict whether it will

47 be the angle of elevation or depresion when a man sees the top of a tower form top of a roof which is taller than the lower. 3.2 Assess the number of days from 2nd February to 16 October is 2004. 3.3 Explain the term 'Ratio' and 'Proportion' with examples 3.4 Show the relationship between the angles subtained at the circumtance and at the centre of a circle from a chord. 3.5 Construct a square equal in area of a given rectangle. 3.6 Compute the interest of a principal amounting Rs 6250/- for a period of 2 1 2 yrs at the rali of 8 .25% per anum. 4. Analyse the number of terms of the expression $(ax + by)^7$ as $(ax + by)^5$ 4.2 Differentiate between Rombus and square 4.3 Compare and contrust between 'Frequency polygon and Histogram 4.4 Resolve into factors $(ax + b)^3$ 5.1 Combine the total 3.1 Reason 3.2 Formulate 3.3 Establish 3.4 Inter 3.5 Predict 4.1 analysis 3. Applications 4. Analysis 3.1 Predict 3.2 Assess 3.3 Explain 3.4 Show 3.5 Construct 3.6 Compute 4.1 Analyse 4.2 Differentiate 4.3 Compre and contrust 4.4 Resolve

48 volumes of two cones formed by relating a night angle triangle along its hypotenuse. 5.2 Argue in favour of the statement that only in equilaliral triangle the angle bisectors and the lines joining the vertex and mid point of the opposite side meet in the same point. 5.3 Generalise the sum of interior angles of a polygon have n equal sides. 5.4 Conclude the measure of each angle of a right angled isosceles triangle. 6.1 Judge the value of which fraction is greater than 1. $\frac{3}{4}$ $\frac{7}{9}$ $\frac{26}{25}$ $\frac{9}{10}$ $\frac{99}{100}$, , , . . . 6.2 Evaluate the value of $X \times 3 \frac{1}{3} - \text{When } X \times - = 11$ 6.3 Defend the relation between different sets under Rational numbers NCWCZCQ with diagram where α = set of Rational numbers Z = Set of Integers W = Set of whole numbers N = Set of Natural number 5. Synthesis 6. Evaluation 5.1 Synthesize 6.1 Evaluate 5.1 Combine 5.2 Argue 5.3 Generalize 5.4 Conclude 6.1 Judge 6.2 Evaluate 6.3 Defend

49 2.2.3 Behavioural objectives under Affective Domain Krathwohl and his associates developed this objectives. These objectives are concerned with feeling aspect i.e changes in interests, attitude and values and also development of appreciations and adjustments. Affective taxonomy is divided into five major classes arranged in an hierarchical order characterisation by a value complex (attains the integration of his beliefs and attitude). D Organisation of a value systems (organisation of the value into a system, to determine the interrelationship and to establish the dominant value. D Valuing (acceptance of a value, preference for a value and commitment to certain value) D Responding (Response beyond attending, willingness to respond and satisfaction is response) D Receiving (it includes a awareness willingness to receive and selected affection. D Presentation of material in the classroom Through teaching-learning of Mathematics, the behavioural objective under Affective domain will inculcate the value system among the learners. It will include to create interest in mathematics, to respect mathematicians to appreciate the recreational value of mathematics and appreciate the knowledge of mathematics in solving problems of daily life. While teaching Mathematics, the teacher will try to remove the fear of Mathematics and engage every child with the conviction that every one can learn Mathematics. 2.2.4 Behavioural objectives under Psycho-motordomain. The Psychmotor domain includes those behavioural objectives which deal with manual and motor skills. D

50 In Mathematics teaching-learning we include skill for development of precision and accuracy in calculation as well as for adopting alternative methods for solving a mathematical problem. According to Dr R.H. Dove of the NCERT, the behavioural objectives under psychomotor domain are the following : 1) Imitation of an action, performance The students of Mathematics class also at the initial stage imitate the action of his teachers in respect of calculation, drawing of mathematical figures or diagrams. 2) Manipulation of an act. Here the students will select the proper one among various movements. For accuracy is calculation how to use calculators, Vedic mathematics etc. 3) Precision in reproducing a given act. This includes the motor activities in accurate calculation, exactness in performance by using calculators, computers etc. 4) Articulation among different acts. It includes co-ordination, sequence and balance among acts. How to use instruments is drawing figures, skill of black board use, approximation of the result and follow the sequence. 5) Naturalisation : The motor activities in calculation, drawing figures, using mathematical instruments/aids will attain highest level of proficiency. It will become automatic and will be carried out unconsciously. 2.2.5 Simpson's Taxonomy to Psychomotor Domain Simpson (1966-67) divided the domain in the following ways. i) Perception - by utilising sense organs three types. a) Sensory stimulation - Knowledge about concrete things by sense organs. b) Cue selection - for doing any mathematical operation a cue may be selected. c) Translation - transfer of real activities in to the virtual activities.

51 For examples a learner can visualise is how many seconds a water filled up tank having smaller incoming tap and larger outgoing tap will be emptied. But for calculating such mathematical problem this real life knowledge will be translated into virtual activities. ii) Set : For doing any mathematical activity or learning a mathematical concept, the learners need physical, mental and emotional set of mind. There are three types of set. a) Mental set - For transfer of knowledge from real life experience to mathematics class room activities a mental set is essential. b) Physical set / Anatomical set - whether the learner is physically capable for performing any mathematical activities is to be ascertained. c) Emotional set : For performing the transfer of knowledge emotional set or disposition is essential. All the three set may be treated as mind set for the transfer. iii) Guided response : By initiation of the activities of the teacher or by trial and error method the learner will be acquainted with the guided response in the mathematics classroom. iv) Mechanism - The motor skill will be spontaneous by repetition or by habit formation. For example use of calculator, computer will be accurate after prolonged practice with a limited technical know how. v) Complex over-response At this stage the learner will acquire the motor activity for performing accurate, rapid and speedy movement pattern. The performance will be spontaneous, no hesitation and speed will be higher. In doing calculation, manipulation, drawing diagrams and solving problems is alternative way, the learner will be efficient. vi) Adaptation : In new situation the transfer of motor activity will occur in a modified form. vii) Origination : Creative ability to meet specific situation will also be transferred by motor activity. The skill of drawing geometrical diagram will also help the learner to draw creative picture.

52 2.2.6 Writing objectives in Behavioural terms 2.2.6.1 Introduction The objectives of teaching mathematics at a particular stage will definitely give guidance to the mathematics teacher for planning of his/her classroom activities. It will help in planning what to teach, how to teach, how to teach and when to teach. Objectives have to be formulated for every lesson before teaching. Hence a teacher must know the procedure of writing the objective in terms of behavioural objectives so that the expected outcomes of teaching may be evaluated while writing such behavioural objectives, the teacher must keep in mind the following points : a) The nature of the subject matter as topic to be taught b) The need and interest of his pupil and c) The availability of resources : d) It must follow the outline of objectives of teaching Math 2.2.6.2 Definition of Behavioural as Instructional objectives These are the statements which will express the expected behavioural changes of the learners after the lesson. The characteristics are i) The Broad objectives should be broken down into specific ones ii) It must be observable iii) It must be measurable 2.2.6.3 Guidelines for writing behavioural / Instructional objectives in Mathematics i) Every statement of objectives should not be too large and general. ii) They must fulfill the specific purpose of learning for that particular unit iii) Objectives must be written and the outcomes will be achievable, and observable iv) A teacher must keep in mind the entry behaviour (necessary background knowledge) of the learner. v) It must mention the teaching points of the lesson, the expected behavioural changes of pupils, learning experiences to be organised etc.

53 vi) The statement of an objective should start with an the action verb. vii) The elements of writing specific behavioural objective are a) performer i.e teacher and taught. b) Task (which topic or subtopic to be taught like 1st lesson of Height and distance, Volume of cone etc) c) Condition - (What previous knowledge will be required, how subtopics to be arranged etc) d) Actions related objectives to be discussed. e) Criteria for judgement of the teaching outcome, specification of objectives In setting of behavioural objectives, all cognitive three domains of honourable of objective cognitive affective and psychomotor domains are not utilised in details. 1. Knowledge objectives a) The student will be able recognize different figures, symbols etc b) The students will be able to recall different definitions, laws, mathematical tablets etc. 2. Understanding Objectives The student will be able i) to see relationship between like profit and loss, interest, principal, rate of interest, time etc. ii) to classify rectangles etc. iii) to classify triangles according to sides, angles etc. iv) to discriminate between rational and irrational number etc. v) to verify the result obtained from the problem. vi) to generalize the law like $(a+b)^3 = ?$ $(a + b)^n = ?$ 3. Application objectives : i) The learners will be able to formulate hypothesis like sum of interior angles of a polygon having n sides.

54 ii) The learner will be able to reason out why reciprocal of natural number is less than reciprocal of a fraction. iii) The learner will be able to infer about the statement angle opposite to greater side is greater than the angle opposite to smaller side of a triangle. iv) The learner will be able to predict about say value of size, $\sin 45$, $\sin 60$ and $\sin 90$ etc. 4. Skill (from psychomotor domain) i) The learner will be able to handle the instruments of Geometry Box for drawing figure accurately. ii) The learner will be able to calculate more correctly and precisely iii) The learner will be in a position to solve similar problems in alternative ways. 5. Interest, attitude and appreciation (from affective domain) i) The student will create positive attitude, interest towards solving such problems ii) Mathematics phobia will be reduced. iii) The learner will appreciate the problem solving nature of Mathematics etc.

55 2.3 Lesson Planning – Importance and Basic steps. Planning Lesson of Arithmetic, Algebra and Geometry Structure : 2.3.1 Introduction 2.3.2 Importance of Lesson plan and characteristics 2.3.3 Basic steps in lesson planning 2.3.4 Planning Lesson Arithmetic 2.3.5 Planning Lesson an Algebra 2.3.1 Introduction Mathematics must be taught by a suitable planning Teaching mathematics without preparation and proper planning is like a load without a ladder. To make the classteaching more effective prior planning is essential. A planning may be of the following types. 1. Long range / term planning : The total content is to be divided into few Units 2. Topic as Unit planning : Each topic is to divided into few subunit is to be completed in a class 3. Lesson planning : It is a written note prepared by the teacher containing the subunit to be taught, method to be used, objective in behavioural term, teaching activities, questions to evaluate and home work (assignment) According to N.L.

Bossing "Lesson plan is the title given to a statement of the achievements to be realised and the specific means by which these to be attained as a result of the activities engaged in day-by-day under the guidance of the teacher". It is a detailed planning of a lesson. It is a basic unit of planning for teaching.

It is the teacher's mental and emotional presumption of classroom experience.

It is a plan of action which reflects the philosophy of the teachers, his knowledge of the content to be presented and the ability to use proper method of teaching.

56 Characteristics of Lesson plan. • Lesson plan should be written. • It must give a clear picture of the activities to be performed by the teachers and the learner. It should contain clearly stated behavioural objectives. It should be related to previous knowledge. Home work / assignment must be related to the next days activities in the introduction stage. It should provide. It must cater the individual differences. Age Level and mental level of the students should be kept in. 2.3.2 Importance of Lesson plan and characteristics i) For preparing a lessonplan, teacher has to study the content in details which helps the teacher in the classroom. ii) Prior to teaching, the teacher gets enough time to think over the content, method to be used. iii) Lesson plan helps the teacher to know the different objectives of teaching a particular subtopic. iv) It helps the teacher to know the necessary background knowledge of student prior to teaching. v) Teacher gets the opportunity to think over the content and method to be used as well as to select the teaching aids necessary during the teaching. vi) It helps the teacher to be acquainted with the expected output of the students. vii) It helps the pupils to understand the process of teaching expected outcome and viii) It ensures a proper connection of the new knowledge with the previous knowledge acquired in the class. ix) It helps to maintain steady process with in schedule time. 2.3.3 Basic steps in lesson planning Psychologist Herbart initially mentioned the following steps of 'Lesson Planning'. These steps are 1) clearness 2) Association 3) Systematisation and 4) Method Later the associates of Herbart modified the steps and recommended the following six steps :

57 (a) Preparation or motivation or Introduction (b) Presentation (c) Comparison (d) Generalisation and (e) Application (f) Recapitulation Mathematics is a continuous and sequential content based subject. To maintain the continuity, the lesson plan follows the concept of module preparation. The objectives are stated in terms of behavioural objectives. So, the format of lesson plan will follow the following steps : Format of Lesson plan School General Information Unit Class Sub Units Teacher Name of the Teacher No of students Date Today's Lesson Small description of the content (Major concepts) preparation / Introduction Necessary background knowledge for the sub topic. To test the background knowledge, following question will be asked Instructional Objectives Cognitive domain Knowledge Understanding Application Affective domain To develop interest, attitude and appreciation of the students Psychomotor— Skill Methodology, Presentation by lecture method followed by question and answer method.

58 Teaching aid Teachers activity Student's activity Content Module-1 i Module-2 i Module-3 etc. Evaluation By asking questions Questions will be asked relevant to each module and then few probing questions will be asked. Homework Question of different types like short answer type. (fillup the blanks, match the pair, multiple choice type) and long answer type (may be from Mathematic Text book) may be given. Unit Test in worksheet F.M = 10 A unit Test (F.M. = 10) may be given to students for immediate feed back. 2.3.4 Planning Lesson on Arithmetic Introduction Arithmetic is the science of number and the art and craft of computation. It deals with a system of counting. It is very essential in daily life. So the teaching of Arithmetic has to fulfil the following objectives. i) To inculcate the ability of approximation and counting ii) To develop the power of socialisation through number experiences. Before teaching Arithmetic in the class, the teachers and student must be acquainted with the aims of Teaching Arithmetics. These are : 1) To help the learner to understand verbal statement, to analyse them and to express it in mathematical statement.

59 2) To guide the student for simple computations using four basic operation. 3) To use arithmetic as simple tool in business and daily life problem. 4) To prepare for higher mathematics. Lesson Part - I A. Subject : Arithmetic Sub Units Class VI i) Nature of fraction Unit - Addition of ii) Pure, impure and Fractions have different mixed fractions numerators iii) To express one form to other form Time - 40 minutes iv) To compare the fractions into smaller and greater form Name of the teacher - MVX v) Addition of fractions B. Objectives i) Knowledge : a) The student will be able to give the definition of different forms of fractions b) They will be able to identify which fraction is higher and which is lower in value. ii) Understanding : i) The students will be able to understand different types of fractions ii) They will be able to distinguish between pure and impure and compound fractions iii) They will be able to add different type of fractions iv) Skill a) The students will be able to add different fractions correctly and with speed b) They will be able to draw diagrams showing different types of fraction iv) Application a) The students will be able to add fraction from a verbal statement b) They will be able to convert fractions into decimals v) Interest, Attitude and appreciation. a) The students will be able to get interest from addition of fractions in their daily life. b) They will be motivated to work out such problems c) They will appreciate the existence of such fractional concept in nature and in daily life.

60 C. Necessary background knowledge To test the background knowledge the teacher may ask following type of Question using charts, diagram paper cutting etc. i) Using a square paper whose 1 part is coloured theteachers will ask how many part of the paper is coloured? ii) If another 1/4 part is coloured, then what portion of the paper is coloured? iii) Express different types fraction using the number 7 and 9. iv) Convert the following paise into rupees a) 48 paise b) 125 paise c) 60 paises etc D. Teaching aids a) Chalk, duster, Blackboard b) Low cost and no cost teaching aids like paper cutting, Mathematics tool box. E. Announcement of to-days lesson. Today we shall discuss the different types of fraction and their addition F. Method Presentation : Discussion followed by question answers method P R E S E N T A T I O N Content Module 1 Formation of fraction Module 2 Process of addition i) Find the L.C.M of denominator ii) Convert all fractions having Teacher's activity Write in fraction form 7 th by 8th part, 10 th by 16th part 15th part by 60th part L.C.M. of 8, 16, 60 $7 \times 8 = 210$ $150 \times 60 = 240$ + + Method Student's activity 240

61 Evaluation Add i) Shaded clean portion $\Rightarrow 3/8 + 1/8 + 4/8 = 1$ ii) $2/7 + 5/14 + 1/7 = ?$ Probing Questions 1. Shade 5/30 Part, = 5/30 1 Part by 30 th part = $1/30 \times 7/30 = 7/30$ Add all Count the shaded small squares " " unshaded " " 2. A man gives 1/3 Part this capital to his elder son, 2/9 th part to his servant, 1/2 to his wife. How much capital the man keeps for himself ? Home Work 1. Add .3 + .4 + .04 =

..... 12345678901234567890 12345678901234567890 12345678901234567890 12345678901234567890 12345678901234567890 12345678901234567890 12345678901234567890 12345678901234567890 12345678901234567890 12345678901234567890 12345678901234567890 12345678901234567890 12345678901234567890 12345678901234567890 + + =

. I O N as denomination iii) Add the fractions Module 3 Problem 2 $2/3 + 4/5 + 6/7 + + = ?$ Module 4 Verbal problem. = $4/3 + 3/20 + 240 / / / / / = 4/3 = 1 + 1/3$ What is the answer? How the operation can be verified using origami/ Paper cuttings.

62 2. 13 3. In Proper fraction $N < D$; $N > D$; $N = D$ 4. In mix fraction $N < D$; $N > D$; $N = D$ Work sheet F.M = $10 \times 2 = 20$ a) Add $5/7 + 9/14 + 5/21$ cm cm cm + + b) When $N < D$ The Fraction is ----- c) When $N = D$ The nature Fraction is ----- d) When $N > D$ The Fraction is ----- e) Convert paise into Rs. and then add. 17 paise + 23 Paise + 20 paise = Rs.----- - 2.3.5 Planning Lesson on Algebra Introduction : The word 'Algebra' has originated from the 'Arabic' word 'Al-Jabr' al- muquabulah' where 'al' means 'the', 'Jabar' refers to the operation of transferring a quantity from one side of an equation to another and 'muqabulah' refers the process of subtracting similar quantities from both sides of an equation. Objectives of teaching Algebra. • To formulate the problems into equations and then solving we get the result. • To generalisation of arithmetic problems and also to use in other branches of mathematics trade and industries. • To inculcate the power of analysis and to develop the confidence among students by verifying the results to simple way. • To help the students to express a new symbolic relationship of abstract ideas.

63 PEDAGOGY OF TEACHING MATHEMATICS LESSON - 2 2. B. Objectives (Instructional) (i) knowledge (a) The students will be able to name different components of an algebraic equation. (b) They will be able to know the different sides i.e L.H.S and R.H.S side of the equation. (ii) Understanding (a) The students will be able to understand the relationship among different variables (b) They will be able to form mathematical statement from the verbal statement (iii) Application (a) The students will be able to solve the algebraic equation formed by themselves (b) They will be able solve the mathematical equation formed by themselves covering daily life problems. (iv) Skill (a) The students will be able to solve the equation more accurately. (b) They will be able to form two equations for finding two unknown quantity. (v) Attitude (a) The students will be able to create a positive attitude towards the formation of an algebraic equation has solving problems of arithmetic and even of geometry. Sub - Units 1) Meaning and order of Equation 2) Formation of simple equation 3) Solution of a equation in algebra 4) Solution of a arithmetic problem and problem of others discipline Subject - Algebra Class - IX Unit : Formation of Equation School - Time 40 minutes Name of the teacher Mry

64 (b) Mathematics probia Love for Mathematics will be generated and this will dispel the mathematics probia among the students. 3. Testing previous knowledge (related to the topic by means of asking questions, drawing figures– ankering) (i) What will the algebraic equation of the following verbal statements 8 years more than The age of the father is three times that of his elder son and four times that of his daughters. (ii) What is the value of $\angle ACD$ if $\angle O$ and $\angle O$ (iii) For finding the values of two unknown how many equations are to be formed. 4. Introduction (Presenting the overview of the content) In different branches of Mathematics like arithmetic, algebra and geometry etc mathematical problems are solved by using specific procedure. But by using algebraic equation those problems can be solved easily. Mainsteps of this algebraic procedure are (i) To transform the verbal statement into algebraic equation/s. (ii) To solve the equations (iii) To verify the equations as relationship with the help of the find out solution. (Major concepts (Modulwise) Presentation of the content To day we shall discuss the solution of arithmetic problem by formation of equation. 5. Teaching method Problem solving / discussion followed by question-answer) X C D B A 60 0 40 0

65 6. Teaching acts : Graph papers, Mathematics tool box, Mathematics concept mops. etc 7. Presentation of the content (Transaction of lesson) Teachingpoints •••• Arithmetical statement to algebraic equation prof I. The costof 5 tables and 3 chairs is 13000/- Again 4 tables 4 chairs cost 12000/- Form the equations •••• Prob 2 In a co-operative firm Rs 40,000/- was invested for the productions of rice and wheat in the last year. Meeting all expenditure a profit of 15% on rice and 20% on Wheat (1) Were obtained - In the (2) Present year the rate of expenditure is same but the total profit is 20% and Rs 1200 more profit is obtained. Find the expenditure in each of the cultivation. The teacher will write the relevant portion of the question-answer on the black board Teacher's activity (i) What is the algebraic equation? Let cort if each table be Rs T and Cort of each check is Rs C ii) Try to solve the equations $5T + 3c = 13000$ $20T + 12c = 52000$ - (III) $20 T + 20 c = 60000$ (IV) Eq (IV) – Eq (V) What wegef iii) What is the cost of each chairs? using graph paper the teacher will show the point of interaction of two equations 2.1 If the expenditure for the cultivation of rice be Rs X, then what is the expenditure for wheat 2.2 What is the % of profit is rice? 2.3 What is the amount of profit is rice 2.4 What is% of profit in wheat? Students' activity $5T + 3C = 13000$ $4T + 4C = 12000$ $20T + 20C = 60,000/-$ $20T + 12C = 52,000/$ $8C = 8000$ or, $C = 8000$ $8 = 1000/-$ 2.1 Rs $(4000 - X)$ 2.2 15% 2.3 Rs. $X \times 115$ 100 2.4 20% 2.5 Rs. (,) 40 000 120 100 - $\times X$ Students activities 115 100 40 000 120 100 X X + - (,) 2.8 Rs. 40 000 120 100 , \times 2.9 Rs. 1200/-

66 2.5 What is the amount of profit in wheat? Teacher's activity 2.6 What is the total profit on both rice and Wheat? 2.7 The teacher will use the graph paper to show the students the amount of profit is wheat. 2.8 What is the total profit is the production is the present year on the whole? 2.9 What is the excess profit is this year? 2.10 Comparing the amount of profit of both the years, establish the relation. 2.11 Establish the algebraic equation relating to profits The teachers will solve the equations through question-answer method on the black board. 2.12 What is the value of X=? 2.13 What the amount of expenditure for the production of rice 2.14 What is the amount of expenditure for the cultivation of wheat? 2.10 The difference of profit will be Rs 1200/- 2.11 Rs. 40 000 120 100 , \times R S T U V W \times U V W = 120 100 1200 2.12 X = 24,000 2.13. Rs 24,000/- 2.14 Rs $(40,000 - 24,000) =$ Rs 16,000/-

67 8. Generalisation (Consolidation of contents) The Teacher will generalise the Mathematical concepts of formation of equation on and the steps of solution 9. Application (is other branches of mathematics and is relevant or real life situation) The teacher will give examples showing the solution of geometry, arithmetic problems. i) If the length of a rectangular field be increased by 2 meter and breath be increased by 3 meters, the area will increase by 75 sq. meter. But if the length be less by 2 meter and breath be increased by 3 meter, the area will increase by 15 sq. meter. Find the length and breath of the field. This type of mensuration can also be solved by this method also. 10. Recapitulation (Evaluation of how much of the content has been grasped. To ask few profing type questions.) a) What are the steps to be followed for the solution of a quachatic equation of two unknown. b) Find the equation of the following statement. If three times of a number is subtracted from the square of the numbers, the value will be 18. c) A starts from a place P to go to a place M; at the same time B starts from M for P. After meeting they arrived at their destinations is 2 and 3 hours respectively. Show that the ratio of this speed is 3 2: 10. Home assignment – The Home assignment will comprise different type of questions like objective type, short answer type and long answertypes questions. To fulfill the objectives belonging to cognitive as well as affective domain some activities may be included. Q1. State four consquitive numbers Q 2. Make a diagram to show that $1^2 + 3^2 + 5^2 + 7^2 + \dots + (2n-1)^2 = n^3$ Q 3. Some problems of the Text book Q 4. Divide 48 into two parts such that of one part be multiplied by 8 and the others by 5, the sum of the products shall be 180.

68 Lesson - 3 Class IX Sub unit Subject - Geometry Relation between School extension angle of Time - 40 minutes
 a triangle with opposite angles. 2. Objectives (Instructional) 1) Knowledge a) The students will be able to define extension and opposite angles of a triangle b) They will be able to establish relation between extension and opposite interior angles ii) Understanding a) The students will be able to understand the logical proof of the theorem b) They will be able to proceed sequentially for establishing the relations iii) Application. a) They will be able to apply the theorem in real life situation iv) Skill a) The student will acquire the skill for drawing the geometrical figures with instruments. b) They will be able to draw necessary figures with speed and accuracy. v) Attitude : a) The students will be able to create a positive attitude towards the development of the power of reasoning and analytical thinking. b) To introduce students to the significance of rigor, intelligent generalisation and critical evaluation. 3. Testing previous knowledge (related to the topic) The necessary knowledge for the proposition is i)

The sum of the angles of a triangle is equal to two right angles

ii) A straight angle is equal to two right angles

69 iii) When a straight line stands on another st. line, the sum of adjacent angles so formed is equal to two right angles.

For this the following questions will be asked showing the diagram. a) What is the sum of the angles of a triangle? b)

Draw the figure of a straight angle? c) What is the sum of supplementary angles? d) If a straight line stands on another

straight, what is the sum of adjacent angles so formed? 4. Introduction The teacher will draw different types of triangle and will produce one of the side. He may ask the students that today we shall find out the relation between the exterior

angle with that of the sum of opposite angles of a triangle. 5. Teaching method Deductive method followed by

question answers method. 6. Teaching aid. a) Math Tool Box b) Model showing the relationship c) Geometry Box d) Usual classroom equipment 7. Presentation (Transaction of lesson) Teaching Pts 1) Conclusion through verification 2)

Theoretical proof 3) Alternative Proof Application Teacher's activity Board works The teacher will draw $\triangle ABC$ and the side

BC is produced up to D A 1.1 What is the measure of the angle $\angle ACD$? Students activity / Evaluation The students will

measure the $\angle ACD$ The students will measure $\angle A + \angle B + \angle C$ A side of a triangle is produced so as to form an exterior angle A

B C D Figure-I

70 1.2 What is the measure of $\angle A$ and $\angle B$? 1.3 What is the total measure of $\angle A + \angle B + \angle C$? 1.4 What relationship is obtained? 2.1 What is

given is the Fig- I 2.2 What exterior angle is produced 2.3 What is to be proved? 2.4 What is the sum of three angles of a

triangle? 2.5 Find out another group of angles in this diagram whose sum is equal to 2 rt. angles 2.6 What is the relation

between two equ (i) and (ii) 2.7 If we subtract the angle $\angle C$ from both sides what will happen? 2.8 What inference can we

draw? 3.1 The teacher will draw the following Fig-II 2.1 In triangle = BC is produced to D. 2.2 $\angle C$ exterior angle is formed.

2.3 You prove $\angle ACD = \angle CAB + \angle ABC$ The exterior angle = sum of the two opposite angles. 2.4 $\angle ABC + \angle BCA + \angle CAB$

= 2 rt. angles.....(i) 2.5 2 rt. angles as AC stands on (ii) the line BD 2.6 $\angle ACD + \angle ACB = \angle ABC + \angle ACB + \angle CAB = 2$ rt.

angles 2.7 $\angle ACD = \angle ABC + \angle CAB$ 2.8 The exterior angle = Sum of the two opposite angles. A B C D E

71 8. Generalisation (Consolidation of the contents) The teacher will generalise the theorem to the students with

examples 9. Application (i) In the triangle $\triangle ABC$ angle $\angle C = \angle BAC$ 75° What is the value of $\angle C = \angle ABC$? (ii) $\triangle ABC$ is an isosceles

triangle where $\angle C = \angle A$ Find the value of $\angle A$ and $\angle C$ 10. Recapitulation. The teachers may ask the following probing

questions to the students. i) Given $\angle C = \angle ABC$ 40° $\angle C = \angle ACB$ 60° Find the value a) $\angle CAE$ b) $\angle ACD$ ii) State the theorem

and mention the steps of "given" and "to prove" in this case. 11. Homework Where $CE \parallel BA$. 3.2 The teacher will proceed

referring the corresponding angles. A B C (75° or 135° or D A D B (150° or C E A C D B $\pi/4$

72 i) In an equilateral triangle what will be the value of exterior angle? ii) In an isosceles right angled triangle what will be

the value of exterior angle opposite to the right angle triangle? iii) Prove the theorem in alternative way taking the

corresponding value of the parallel.

73 2.4 Unit Planning - Format of a Unit plan Structure : 2.4.1 Introduction 2.4.2 Characteristics of a Unit 2.4.3 Unit Plan 2.5 Pedagogical Analysis 2.5.1 Meaning : 2.5.2 Need of pedagogical analysis 2.5.3 Types of pedagogy 2.5.4 Procedure for conducting Pedagogical analysis of Mathematics 2.5.4.1 Distribution of Content into Unit and sub Units 2.5.4.2 Writing the Instructional objects for any subunit for the preparation Lesson : 2.5.4.3 Test of Entry Level behaviour Necessary background knowledge for the topic 2.5.4.4 Selection of relevant strategy for teaching learning process and appropriate teaching aids.

2.4.1 Introduction Prof. H.C. Morrison of Chicago University is the founder of unit approach of teaching. According to him 'Unit is a comprehensive and significant aspect of the environment of an organised Science and Art' According to Wesley, "Unit is an organised body of information and experience designed to effect significant outcome of the learner" The Dictionary of Education states a Unit as "an organisation of Varried activities, experiences and types, learning around a central problem, purpose, developed co-operatively by a group pupils under teacher leadership, involve planning, execution of plans and evaluation of results" Thus, Unit is comprehensive instructional plan specifying the 'What', 'how' and 'when' of teaching and organised body of information.

74 2.4.2 Characteristics of a Unit 1. A unit of a curriculum is a purposeful learning activity. 2. It has significant programme. 3. It is designed to effect significant out come of the learner. 4. It also provides opportunities for creative experience. 5. A unit is functional. 6. A unit enables learners to adjust to a life situation more effectively. 7. Every Unit is a contract or obligation to study. 2.4.3 Unit Plan (a) Definition A unit plan is the mapping process that begins with long-term plan which provides a sense of direction and organisation to achieve significant academic gains with is a particular time period. Before the excution of lesson, The teachers plans for the period. So unit planning begins with identifying the particular content to be taught to fulfill the goals for learning out comes. Goals relates the rational for teaching the particular content. It will cover the intended objectives, activities to be performed, time estimation, material needed, assessment procedure and alternatives for students having different ability levels or interests. So it learning tragectory. (b) Characteristics of Unit plan • It is a brood 'road map'. • It designs a structure covering key content, skills, ways of assessment, what students need to know, class time and its productive use. • It can be used with revision

75 (c) Format of Unit Plan. For creating Unit plans we have to follow the eight interdependent steps namely Development of Unit Vision i Creation o Summative Unit assessment i To transfer the learning goals into lesson objectives the basic Unit of teaching i To sequence the content and finalising Lesson Objectives i To schedule the objectives on the school calender i To create beginning -of-Unit diagostic tool i To create a tracing system i, e checkout system of the objectives i Scope far continually adjust the plan for modification So the teacher will plan out several Units over the course of a term or even the entire year. (d) Standard Format of Unit Plan 1. Subject area : Grade level- 2. Unit / Title / Name Period : From – to – 3. Unit goals – Lory term goals. What are the goals for this unit of instructioin? How does this Unit fit with year long goals?

76 4. Specific ways to relate goals to curriculum 5. Characteristics of students To list the needs for the students is the cognitive social, emotional and physical areas— a) Student Goals i) will be able to define ii) will be able to identify iii) will be able to describe iv) will be able to draw/calculate etc. b) Student objectives. i) Will be able to pass a Unit test. ii) Will be able to create. iii) Will be able to understand / apply. 6. Introductory procedures. How the teacher will introduce the Unit and goals to the students. 7. Materials/Media to be used daywise. 8. Assessment and evaluation. Selection of methods to identify students learning levels and needs when teaching will occur during the Unit. 9. Assessment instrument to measure the outcomes. (e) Benefits of Unit planning– i) Unit planning will help the teachers to take decesion about what to teach and how to teach it. ii) A unit plan keeps teachers on pace to fulfill unit and untimately long term goals. iii) To help the teachers to reflect on what they want to accomplish in each unit. iv) How the classtime to be utilised as productive as possible. v) Unit plan provides an opportunity to stimulate students interest through rearrangement of convent that is relevant to students. vi) Will help the teacher to realise What type of revision and adaptation are necessary in the content. vii) Unit plans help the teachers to organise individual lesson into a coherent structure i,e linking each lesson plan to the next. viii) Will help the teacher to keep on tract for the formative and summative evaluation. ix) Will help the teachers to realise how much materials can be realistically fit into a unit. x) A unit plan after execution may help teacher to realise how much time should be allocated for a unit. In practice, a given concept takes more or less time to teach than anticipated.

77 2.5 Pedagogical Analysis 2.5.1 Meaning : The word 'pedagogy' has derived from the Greek word 'paidagogia' means a slave who accompanied a Greek child to school. 'Paidos' means 'Child' 'ago' means 'to lead' So it means 'to lead the child' Pedagogy is the discipline that deals with theory and practice of education. It concerns the study and practice of how best to teach. Pedagogy comprises what teachers do in the classroom but also refers their ideas, knowledge and attitude in relation to the learner. the teaching and learning process and the curriculum. Pedagogy is the art of teaching (creative and intuitive part), The science of teaching (research, decision making and theoretical understanding) and the craft of teaching (To produce skill and practice for habit formation. 2.5.2 Need of pedagogical analysis • Pedagogical analysis not only gives stress on the analysis of content but also how the content can be best presented to the students. • It does not give stress on rote learning but on (i) meaningful learning (ii) discovery learning and (iii) problem solving learning. • Pedagogical analysis not only help the teacher to teach the content systematically but also help the learner to modify their experiences and to apply the new knowledge in real life situation. • It helps the learner for sequential development of individual mental process such as recognising, recalling, analysing, reflecting, applying, creating, assimilating prior knowledge with new knowledge. • Pedagogy develops metacognition in teachers i.e the ability to learn how to learn. • Pedagogy is a basis for auditing teacher's practice. 2.5.3 Types of pedagogy Depending on the area of application, it can be classified into four types a) General pedagogy b) Andragogy - the art and science of helping adult c) Inclusive pedagogy - an alternative approach that has the potential to reduce educational inequalities by enhancing learning opportunities for everyone. d) E-Pedagogy

78 2.5.4 Procedure for conducting Pedagogical analysis of Mathematics Pedagogical analysis of Mathematics the process by which the content of Mathematics for a particular class is analysed by Educational psychology, follow the strategy of teaching in the class room and create an educational environment for transaction of the content. 2.5.4.1 Distribution of Content into Unit and sub Units The whole syllabus of Mathematics for a particular class has been divided into different branches of Mathematics like Arithmetic, Algebra, Geometry, Mensuration, Trigonometry etc. Concepts/Units Factorisation Factorisation of $a^3 + b^3$ using identities HCF and LCM Concepts/Sub-Units Meaning of factorization, finding the factors for the given algebraic expression, factorization of the expressions of the form $a^2 + 2ab + b^2$, $a^2 + 2ab + b^2$ and $a^2 - b^2$ using identities Finding the product of expressions of the form $(x+a)(x+b)(x+c)$ using the identity. Finding the coefficients of x^2 and x using the identity $(x+a)(x+b)(x+c)$ Finding the factors of the expressions of the forms $a^3 \pm b^3$ using identities. Meaning of HCF and LCM of algebraic expressions Finding the HCF and LCM of binomial and trinomials Experted Learning Outcomes Learns the meaning of factorisation, finds the factors for the given algebraic expression, performs the factorization of the expressions of the form $a^2 + 2ab + b^2$, $a^2 - 2ab + b^2$ and $a^2 - b^2$ using identities. Finds the product of expressions of the form $(x+a)(x+b)(x+c)$ using the identity Finds the coefficients of x^2 and x using the identity $(x+a)(x+b)(x+c)$ and factors of the expressions of the forms $a^3 \pm b^3$ using identities Learns the meaning of HCF and LCM Finds the HCF and LCM of binomials and trinomials

79 Concepts / Units Polygons Quadrilaterals Division of polynomials Simultaneous Linear Equations Algebraic structure Division of a monomial by monomial, division of polynomial by a monomial division of a polynomial by a binomial and application of division of polynomials Framing simultaneous linear equations solving simultaneous linear equations by elimination method and graphically, verification of results of simultaneous equations. Verification of closure property w.r.t. a given operation. Definition of binary operation and algebraic structure. Learns the division of a monomial by a monomial, division of a polynomial by a monomial, division of a polynomial by a binomial. Frames simultaneous linear equation, solves simultaneous linear equations by elimination method and verifies results of simultaneous equations. verifies closure property w.r.t. a given operation. Defines binary operation and algebraic structure. Content / Sub-Units Meaning of polygons, identification of polygons, difference between regular and irregular polygons, inscribing regular pentagon, hexagon and octagon Basic concepts of quadrilaterals, identification of elements of a given quadrilateral, properties of quadrilaterals, Experted Learning Outcomes Learns the meaning of polygons, identifies given polygons. Differentiates between regular and irregular polygons and inscribes regular pentagon, hexagon and octagon. Learns the basic concepts of quadrilaterals, identifies elements of a given quadrilateral, states the properties of quadrilaterals, constructs quadrilaterals to given measurements and calculates the area of a

80 Different types of quadrilaterals Theorem on parallelogram Areas of Parallelogram Mid-point theorem construction of quadrilaterals to given measurements, calculation of area of a quadrilateral using the formula. Identification of different types of quadrilaterals, properties of parallelogram, rhombus and trapezium, construction of parallelogram, calculation of area of a parallelogram, construction of rhombus, finding the area of rhombus, construction of a trapezium and finding the area of trapezium Proving of the different properties of the parallelogram logically Meaning of corollary, corollaries of the theorems, problems and riders based on the theorem theorem on areas of parallelogram; corollaries of the theorem, problems and riders based on the theorem Statement of mid-point theorem, proof of mid-point theorem, converse of mid-point theorem, problems and riders based on midpoint theorem. quadrilateral using the formula. Improves skill of constructing more geometrical figures given certain data/ conditions. Identifies different type of quadrilaterals, states the properties of parallelogram, rhombus and trapezium, constructs parallelogram, rhombus and trapezium and calculates the area of these quadrilaterals using the formula. Proves the different properties of the parallelogram logically, Learns the meaning of corollary, states the corollaries of the theorems, solves the problems and riders based on the theorem States and proves the midpoint theorem, states the converse of mid-point theorem, solves the problems and riders based on midpoint theorem. States the definition of circle, radius, circumference, diameter, chord, arc, segment, etc. Identifies the chord property of the circle, central angle and inscribed angle.

81 In the Unit planning of each branch of Mathematics, the content is analysed in terms of concepts/Units, Content /Subunits and corresponding Learning outcomes. For example the content of 9th standard mathematics, the Algebra can be analysed in terms of concepts / Unit like Factorisation, Factorisation of $a^3 + b^3$ using identities, HCF and LCM, Division of polynomials, Simultaneous Linear equations, Algebraic structure similarly, the content of Geometry can be divided into concept/Units like polygons, Quadrilaterals, Different types of Quadrilaterals, Theorems on parallelogram, Area of parallelogram, Midpoint theorem, circles, cyclic quadrilateral, Though in the present curriculum of Mathematics under West-Bengal Board of Secondary There are no such grouping of Arithmetics, Algebra, Geometry etc. Define cyclic quadrilateral, states the properties of cyclic quadrilateral logically, constructs cyclic quadrilaterals, and solves problems and riders based on the theorem on cyclic quadrilateral. States the definition of prism and pyramid, states the properties of prism and pyramid, differentiates between prism and pyramid, calculates the surface areas of prism and pyramid and volume of prisms and pyramids. Circles Cyclic quadrilateral Surface areas and volumes of solids Definition of circle, radius, circumference, diameter, chord, arc segment etc. Identification of chord property of the circle central angle and inscribed angle Definition of cyclic quadrilateral, properties of cyclic quadrilateral, theorem on cyclic quadrilateral logically, construction of cyclic quadrilaterals, problems and riders based on the theorem on cyclic quadrilateral Definition of prism and pyramid properties of prism and pyramid, differentiation between prism and pyramid, calculation of surface areas of prisms and pyramids, calculation of the volume of prisms and pyramids

82 For Pedagogical analysis of a particular unit, the unit is to be divided into corresponding subunits in such a way that a sub unit is to be completed in one period by forming a lesson plan. So the number of periods to be required for the completion of the unit/is to be mentioned in the pedagogical analysis. 2.5.4.2 Writing the Instructional objectives for any subunit for the preparation Lesson : Instructional objectives are the objectives expressed in terms of behavioural objectives for classroom teaching Mathematics to realise through activities Mathematics to realise through activities and working out the problems in the classroom. These instructional objectives like knowledge understanding, skill, application, appreciation etc will follow the Bloom's Taxonomy. In Mathematics, the instructional objective will include under the following dimension knowledge means acquiring knowledge of symbols, terms, definitions, relationships, principles, formulae, aims and properties. The specifications on action verbs are recall and recognition. Understanding means to develop an understanding for symbols, terms, concepts, principles etc. The specification or action verbs pertaining to this domain are illustrate, detect errors, translation mathematical relationships to symbolic forms vice versa, express given statement in different forms, compare, identify, classify, substitute, analyse, judging the sufficiency of data, presentation of proofs, verify results, select proper formula in finding out solution of a problem etc. Developing skills include to be able to do oral or written calculation, drawing neat figure, to select proper table, quick and accurate checking from the table etc. Application : Developing ability to apply mathematical relationship to different situations. The specification as action verb to be used are suggest, modify, establish new relationships, inference, formulates hypothesis, find new application, solve new problems. Application : Developing appreciation of mathematical relationship, achievements, develop self reliance through the habit of verification, develop the power of analysis, ability to work accurately sees relationship between mathematics and environment, makes reasonable estimation etc.

83 2.5.4.3 Test of Entry Level behaviour Necessary background knowledge for the topic To test the background knowledge teacher will select few questions. Teacher will up date the students with necessary knowledge. He will also test the 'concept mapping' of the students for the topic. 2.5.4.4 Selection of relevent strategy for teaching learning process and appropriate teaching aids. There are many methods of teaching Mathematics. They are : a) Dogmatic Psychological Mehtod b) Inductive and Deductive methods c) Analytical and Synthetic methods d) Neuristic mehtod e) Laboratory method f) Lecture method g) Project method h) Play way method The content categories to be taught in Mathematics are the following and the appropriate method of teaching. Content area a) Concepts b) Generalization c) Mathemacical probles d) Geometric Constructions e) Proof Method of Teaching i) Inductive reasonin ii) Verifying specific examples iii) Discovery activities iv) Developing skill of using instruments v) Following logical sequence

84 2.5.4.3 Test of Entry Level behaviour-Necessary background knowledge for the topic. To test the background knowledge teacher will select a few questions. Teacher will up date the students with necessary knowledge. He will also test the concept mapping of the students for the topic. 2.5.4.4 Selection of relevent strategy for teaching learning process and appropriate teaching aids. There are many methods of teaching Mathematics. The are a) Dogmatic Psychological Method b) Inductive and Deductive methods c) Analytical and Synthetic methods d) Neuristic method e) Laboratory method f) Lecture method g) Project method h) Play way method The content categories to be taught in Mathematics are the following and the appropriate method of teaching are as follows : Content area Method of teaching a) Concepts i) Inductive reasoning b) Generalization ii) Verifying specific examples c) Mathematical problems iii) Discovery activities d) Geometric Constructions iv) Developing skill of using instruments e) Proof v) Following logical sequence

85 2.5.4.5 Objectives in pegagogical analysis The knowledge dimension following revised Bloom's Taxonomy-2001 in given below. 2.5.4.5.1 Factual Knowledge The Core knowledge which is essential for solving related problems. This includes : a) knowledge of terminology (mathematical symbols, mathematical Vocabulary etc) b) knowledge of specific and details of elements) Like Types of triangles, Number system 2.5.4.5.2 Conceptual knowledge Formula showing relationship among variables $I = PTR$ 100 ; Interest = Principal Time Rate $100 \times \times$ Relation of angles oppsite to sides. The components are a) Knowledge of classification and categories. •••• Different types of teaching aids used in mathematics class •••• Types of interest •••• Types of quadrilaterals •••• Types of reasoning (deductive and inductive etc.) b) Knowledge of principles and generalization partinent points and their generalization viz. Rules of variation, logarithem, congruance of triangles etc. c) Knowledge of theory, model and structure Viz Effect of increase or decrease in neumenators as denominatop, mathematical modelling, structure of three dimension bodies etc. 2.5.4.5.3 Procedural knowledge How to proced for a proof, for drawing a graph of a line...equation. This includes a) Knowledge of subject specific skills and algorithms

86 Examples i) Procedure for solving quachatic equations ii) To determine the volume of a sphere as prism iii) To find out the ratio of the Components of a mixture etc b) Knowledge of subject specific techniques and methods. Examples i) To find out the value of unknown number in arithmetic and in algebraic problems ii) To solve a problem using synthetic, method iii) To solve a problem using deductive and inductive method etc c) Knowledge of criteria for determining when to use appropriate procedure. Examples i) Statistical analysis for ariving at a conclusion ii) To verify the laws of Biology or others subject thought Mathematics 2.5.4.5.3 Metacognitive knowledge Deep rooted cognitive knowledge to understand the inner meaning of a content and / or express the self creativity is known as Metacognitive knowledge. It includes three types of knowledge objective namely : i) Strategic knowledge ii) Knowledge about cognitive tasks including appropriate contextual and conditional knowledge and iii) Self knowledge. i) Strategic knowledge helps the learner a) to retain the information / Content b) to understand the inner meaning of the content c) to develop divergent thinking on the learnt content etc. The strategic knowledge can be expressed in three ways a) through Rehearsal b) through elaboration and c) through organizational ways. In the Rehearsal procedure repeation with earnestness is essential. This is not applicable in highes studies/education. ii) In the elaboration way, the learners tries to go into the deep of the content by abstracting the content or thinking is details. This helps the learner to graph the content is details. In Mathematics, This is very helpful for creating a deep understanding.

87 iii) Through organisational procedure the learner tries to a) create concept map of the Content....b) tries to improve the cognitive structure (schemata) by incorporating the new content with his/her old concept. c) tries to rearrange the content pattern. He realises 'Product or multiplication is the shortest process of addition as division the shortest process of subdivisions. Verbal statement of mathematics can be organised as algebraic equation etc. ii) Knowledge about cognitive tasks including appropriate contextual and conditional knowledge This dimension of objective helps the learner to select the appropriate steps for solving as understanding the problem. For example, the students put 'x' in place of what is to be find out? sometimes, we select a statement keeping a parameter fixed. When temperature increases, the volume of a gas is also increases keeping the presure fixed or unchanged. In solving a mathematical problem, the student must reached, what steps to be followed? Why this is appropriate? What is the limitation of this process? etc iii) Self knowledge : To acquire Metacognitive knowledge is the highest order is dimension. In the dimation the learner will be able to realise his own strength and weakness of knowledg. This will increase his self confidence at the sametime he will be eager to overcome the weaknesses. This self knowledge will initiate his creativity and the power of selection of might person, might direction and to think over right person for his/her guidance. To enhance this qualities, the students must invite relevent person. 2.5.4.6 Objectives in the cognitive process Dimation of Modified Bloom's Taxonomy. There are six domains in the cognitive process dimension 2.5.4.6.1 Remember It means to recall the exact facts from long term memory. It includes : a) Recognizing From the following geometrical figures recognise the circle. is the symbol for... 3 is the symbol far...

88 Which figure is an example for collinear ● ● ● ● ● Fig 1 Fig 2 b) Recalling i) What is prime number? ii) In the given matmix, which are the row and column elements 2 0 3 1 L N M O Q P 2.5.4.6.2 Understanding The students will be able to understand the concept of inequation, as any mathematical term with the charls! model etc. It includes the following a) Classifying Mathematical concepts can be classified by the learner exampls. Triangles can be classified with respect to sides as angles. Math the named the polygons and sum of the measures of interior angles. Quadilateral 720 0 Hexagon 360 0 Octagon 360 0 b) Interpreting ●●●● Students will be able to interpret verbal statement into algebraric equation ●●●● A geometrical statement can be interpreted by a geometrical diagram. ●●●● Students will be able to draw the concept map relating to a mathematical problem. c) Examplefying Students will be able to give examples of different mathematical concepts. ●●●● From the figure, identify the relation between the angles DCA, ABC, BAC)) A B C D

89 Observe the pattern and fill in the blanks $1^2 = 1$ $11^2 = 121$ $111^2 = 12321$ $1111^2 = 12342321$ $11111^2 = 123454321$ - - - - $111111^2 = 12345654321$ - - - - d) Summarizing If (

$(a + b)^2 = a^2 + 2ab + b^2$ $(a + b)^3 = a^3 + 3a^2b + 3ab^2 + b^3$ Then $(a + b)^4 = 21$
What will be the roots of a quadratic equation $ax^2 + bx + c = 0$ $x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$ - e) Inferring Understanding the mathematical relation, a student will be able to inter the result Observe the pattern in the following and fill in the blanks $2^2 = 4 = 1 + 2 + 1$ $3^2 = 9 = 1 + 2 + 3 + 2 + 1$ $4^2 = 16 = 1 + 2 + 3 + 4 + \dots$ $5^2 = \dots = \dots$ $6^2 = \dots = \dots$ - - - Write the two numbers in the space provided between which the square roots of the following numbers lie. $3 < \sqrt{11} < 4$ $4 < \sqrt{53} < 7$ $7 < \sqrt{50} < 8$

90 f) Comparing ●●●● Students will be able to use Venn diagram for comparing real and imaginary numbers. ●●●● Compare the reciprocals of realnumber and that of a fruction. ●●●● Compare the areas of different circles with that of their is squire of radius. $\pi 4^2 = \pi 5^2 = \pi 6^2 =$ g) Explaining Students will be able to explain the cause and effect of any mathematical operation. Explain with examples why the square of a real number increases but this square of a fraction as decimal numbers decreases Than the original number $5^2 > 5$; but $(0.5)^2 < 0.5$; $1.5^2 > 1.5$ F H G I K J >gt; $6^2 < 6$; but $(0.6)^2 < 0.6$; $1.6^2 > 1.6$ F H G I K J >gt; 2.5.4.6.3 Analysing Students will be able to break a mathematical ideas into its components and to analyse the parts with the whole concepts. This objective will include. a) Differentiating ●●●● What is the different between ratio and proportion? ●●●● What is the difference between Histogram and frequency polygon? b) Organising Students will be able to organise different mathematical activities for realising the inner concepts. ●●●● How a mathematical tool box can be used to clear the idea of speed and time?

91 ●●●● By organising a 'Mathematical quest competition' the teacher can enhance the reasoning power of students. c) Attributing Students will be able to be motivated from the contribution of great mathematicians, or history of mathematics. ●●●● During Vedic period (3000 B.C to 1000 B.C), at one place of samhita we see the relationship $39^2 = 36^2 + 25^2$. Can you mention this is a particular case of which geometrical theorem? An : Pythagoras theorem. This will motivate the students to be acquainted with ancient Indian Mathematics. ●●●● A comprehension test in Mathematics may be given to the students. 2.5.4.6.4 Evaluating Students will be able to evaluate the performance for giving judgement value. This can be done by the following ways. a) Checking After completing or solving a mathematical problem, The students must check different steps or realise by reasoning the correctness of the solutions. ●●●● What is the value of $(999)^2$? The student will check whether the result is below $(1000)^2 = 1000000$ and above $(900)^2 = 810000$. b) Critiquing Students will be able to criticise the pros and cons as suitability of a process for solving a complex mathematical problem. Example : a) For solving an arithemtical problem whether algebraic equation formation is more suitable that can be justified. b) That there is a wide difference between astronomy and astrology that can be established by the learner.

92 2.5.4.6.5 Creating This objective is the highest order in cognitive dimension of Bloom's Taxonomy. This is the manifestation of mathematical creativity. Here the learner will be able to reconcile the small concepts into a general or new mathematical concepts. The graphical representation of linear equation includes the concepts of straight line, nature of straight line, the locus of a point, the co-ordinates of different points which lie on the st-raight line etc. It comprises of the following sub themes. a) Planning ●●●● For enhancing the creativity the students will be able to submit a project proposal say for using multimedia is learning Mathematics or depicting concept maps for different mathematical concepts. ●●●● To fulfill the self inquirtiveness student may submit a proposal for showing the contribution of Sir Asutosh Mukherjee on Mathematics. b) Producing The students will be able to produce new or novel mehtod / thought provocating activities etc. ●●●● Alternative ways of solving a mathematical problem. ●●●● Will be able to produce self learning materials for slow or advance learner. c) Generating ●●●● Students will be able to generate alternative hypothesis for judgement of objectives. ●●●● Students will be able to generate the self evaluating mechanism etc. 2.5.4.6

Achievement Test a) The next step of pedagogical analysis is the construction of Achievement Test. For time saving combined Taxonomic Table is to the prepared is which both the necessary objectives for a particular Unit along with number of questions together with total marks will be defected.

93 All the objectives may not be suitable for questions is a topic. Find out the number of questions suitable for each type of objectives and decide on marks for each question. Now in your combined Taxonomic Table, in each cell, fit in the number of questions and put the total marks for those questions in brackets. The questions you will give must correspond to the objectives you have written. An objective may also account for more than one question. write the total marks for each category of cognitive dimension and knowledge dimension in the extra column and row : Similarly percentages of mark in each column and row are to be noted b) Write items (questions or items) to match the information in each cell of the Taxonomic Table. Beside each questions write the objective number from which it arises. Also write the answer and marks for the question. Cognitive dimension Knowledge dimension Factual Knowledge (F.K.) Conceptual Knowledge (C K) Procedural Knowledge (PK) Metacognitived know MK Total % of marks Remember No. of questions (total marks) Total Marks for remember Understand Total Marks for Understand Apply No. of question (total marks) Total marks for Apply Analyze Total marks for Analyze Create Total marks for create Total Total Marks for PK Total Marks for CK Total Marks for PK Total Mark for MK Grand total 100% % of marks

94 c) Make the final version of the Test so that it can be presentable to the students as a complete question paper. The items should be suitably arranged eg, easy to difficult, same type of questions put together etc. Instruction is to be given at the top of the such question papers mentioning the class, with time, total marks etc. d) Probing questions with answers 2-3 questions are to be set with answer as brainstorming questions. 2.5.4.7 Pedagogical Analysis following Revised Bloom's Taxonomy. Subject Mathematics (Geometry) Class X Unit Theorems related to circle and angles. Unit analysis Subjects Period 1. The Pedagogical analysis on Sub Unit I is made. 1 The angle subtended by an arc at the centre is double the angle subtended by it at any point on the remaining part of the circle 2. The angle in a semi-circle is a right angle and its converse 3. Angles in the same segment of a circle are equal 4. The sum of the either pair of the opposite angles of a cyclic quadrilateral is 180° 5. If a pair of opposite angles of a quadrilateral is supplementary, then the quadrilateral is cyclic. 6. A remedial test on the achievement of above five theorems. 6 Previous knowledge :

95 The following are the necessary background knowledge for the theorem i) Students can define arch, circumference, centre etc ii) They can point out the angle subtended by an arc at the centre and on the circumference iii) They know the measure of an external angle is equal to sum of two opposite interior angles. iv) They are able to draw geometrical figures with the help of geometrical instruments. To Test the necessary background knowledge the teacher may ask the following questions even by drawing figures. a) Draw a circle, name an arch, point out the angle subtended by the arc at the centre. b) Draw any angle subtended by the arc at any point on the remaining part of the circle. c) What is the relation between exterior angle and interior opposite angles of a triangle. Objectives : After the completion of this subunit, the students will be able to acquire the following objective both in cognitive domains as well as in the knowledge domain. 1. Remembering 1.1 (Factual) The students will be able to define arc and angle subtended at the centre. 1.2 (Conceptual) That an arc can subtend many angles on the circumference of a circle. 1.3 (Procedural) Which instruments are essential for drawing circle and arc? 2. Understanding 2.1 (Factual) The students will understand that there is relation between two angles subtended by an arc. 2.2 (Conceptual) Students will be able to state the theorem. 3. Applying 3.1 (Factual) Students will be able to verify the theorem with the help of models 96 3.2 (Conceptual) Students will be in a position to apply the theorem in solving relevant riders. 3.3 (Procedural) Students will be able to prove the theorem by drawing different figures 3.4 (Metacognition) Students will be able to apply the theorem in solving critical relevant problems. 4. Analyzing 4.1 (Factual) Students will be able to analyse the relationship of this theorem with other theorems of subtopics. 4.2 (Conceptual) The expected outcome of the theorem will help the students to form the mathematical concepts relating to subtended angles at the centre and on the circumference. 4.3 (Procedural) The students will be able to analyse the necessary and sufficient conditions for proving the theorem. 5. Creating 5.1 (Factual) Students will be able to draw different figures by changing the arc. They will be able to prepare model on the theorem. 5.2 (Conceptual) They will be able to create different problems by changing the arc and the case when the arc will be semi circle. 5.3 (Procedural) They will be able to prove the theorem by drawing different figures (like Fig 1, 2 & 3) etc. 5.4 (Metacognition) Students will be able to frame different probing questions to express their mathematical creativity. Affective domain : a. Interest 1. Students will show their interest in proving such geometrical theorem. Fig 2 Fig 1 Fig 3 97 2. They will be interested to develop their logical argument. b. Attitude. 1. Students will generate positive attitude towards Geometry 2. They will develop the logical and sequential argument in establishing a geometrical theorem. c. Appreciation. 1. They will appreciate the necessary and sufficient argument in favour of proving a theorem. 2. They will appraise the contribution of great mathematicians d. Habit Students will form the habit of establishing a fact by logical way. Psycho motor Domain : Students will be able to use geometrical instruments in drawing accurate figures with speed. Teaching Strategy : Module related to math concept 1. Verbal statement to mathematical statement of the theorem 2. Drawing figure and necessary constructions 3. Verification with model 4. Logical Proof Teaching Method Question-answer method Analytic method Experimentation Problem solving Relation between $\angle AOD = \angle OAC + \angle OCA = 2 \angle OCA$ $\angle BOD = 2 \angle OCB \therefore \angle AOB = 2 \angle ACB$ Teaching aid Geometrical instrument Showing model. Colour Chalk, Black board, model showing the relationship of C B A D 98 Probing questions with answer 1. How will you prove angle subtended by a semicircle is the greatest angle. Ans. $\angle MOP = 2 \angle MNP$ $2 \angle MNP = 180^\circ \therefore \angle MNP = 90^\circ = 1$ right angle. 2. O is the centre. The angle subtended by the arc $\angle AOB$ at the circumference is 45° . The angle $\angle AOP$ is 40° , what is the measure of $\angle POB$? Ans. $\angle ACB = 45^\circ$ $\angle AOB = 2 \times 45^\circ = 90^\circ$ $\angle AOP = 40^\circ \therefore \angle BOP = 90^\circ - 40^\circ = 50^\circ$ Combined Taxonomic Table Number within the bracket indicates number of question and number outside the bracket indicates value of the question. 99 Question Paper Subject : Mathematics Class X, Subject : Relation between F.M = 25, the angles subtended by an arc at the centre and at circumference. 1. Fill up the gaps : (i) $\angle NMO = \dots\dots\dots$ (ii) $\angle MOQ = ?$ When $\angle NMO = 110^\circ$. (iii) Largest arc of a circle is $\dots\dots\dots$ 2. Define arc of a circle. 3. Draw a circle and mention angles subtended by an arc at the centre and at the circumference of the circle. 4. In the adjacent figure find the ratio of two angles $\angle XZP$ and $\angle XWY$. 5. Prove that the angle subtended by an arc at the centre is double of the angle subtended by the arc at the circumference. 6. In the adjacent figure $\angle ACB = 60^\circ$, $\angle AOD = 25^\circ$, Find $\angle BOD$. 7. In the adjacent figure AC is the diameter. Prove That $\angle ABC : \angle AOC = 1 : 2$ 8. Prove that the angle subtended by an arc which is not a semicircle at the circumference is an acute angle. 9. O is the Centre of the circumcircle of the triangle $\angle ABC$. If $\angle BOC$ is 110° , find the value of $\angle BAC$. 10. Prepare a teaching aid to verify the theorem. $\angle PNM = 110^\circ$, $\angle Q = 60^\circ$, $\angle XYZ = ?$ $\angle O \rightarrow ?$ C B A D 25 \circ O J / 6 O C B A

Strategies for Learning and Teaching Mathematics Structure 3.1 Concept Formation and Concept Attainment 3.1.1 Introduction 3.1.2 Meaning of Concept 3.1.3 Characteristics of Concept 3.1.4 Steps of teaching concepts 3.1.5 Concepts Attainment Model for Learning and Teaching of concept. 3.1.5.1 Strategy of concept Attainment Model. Bruner as mentioned four strategies of the Model namely 3.1.5.2 Types of concept attainment model. 3.1.5.3 The Reception model of concept attainment. 3.1 Concept Formation and Concept Attainment 3.1.1 Introduction The Pioneer of 'concept attainment' is Georm. S. Bruner and his associates Jackue line Goodnow and George Austin. The concept is developed from their research 'A study of Thinking' (1967) the basic considerations of concept Attainment model are : i) Man posses the ability of discrimination and classification of things, persons in groups. ii) For adjustment with the environment, a person encounter varried situations and experiences. It is impossible for a person to restore such huge experiences. So he tries to assimilate such experiences and try to adjust with the environment with these assimilated experiences. In general, the assimilation of such experiences is called concept. iii) A concept has three elements a) example b) attributes and c) attribute values. For example, triangle is concept then each triangle is an example. Here rectangle and pentagon are negative and equilateral triangle is positive.

112 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 112 08.07.2016 Triangles have all the sides are equal is the attribute and all angles are also equal be the attribute values. iv) The categorizing activity has two components (a) The act of category formation (concept formation) and (b) The act of concept attainment. The concept formation is the first step for concept attainment. 3.1.2 Meaning of Concept According to Bruner "A concept is a class as grouping response, an act of categorization, involves rendering different Things equivalent." Archer (1969) mentioned "A concept is simply the level of a set of things that has something is common" A concept is different from a fact, a principle and even a generalization. Halse states 'A concept is a set of feature connected by some rules. A concept of quadrilateral is a geometrical figure bounded by four straight lines selvens (1993) has cleared the idea is the following ways "A concept consists of an individual's organised information about one or more things, objects, ideas, or relations that enable the individual to discriminate a particular thing or class of things and as classes of things. Thus concept is a class or category of all the members of which share a particular combination of attributes or critical properties not shared by another class. 3.1.3 Characteristics of Concept Knowledge of common feature i) It is the knowledge of common feature of person, object, animal or circumstances of similar characteristics Characteristics observational experiences ii) It is observational experiences. Greater the extend of observtional area greater will be the concept area. In framing the concept of triangle the barner must pay attention minutly to the length of different sides of a triangle. iii) Individual differences In concept formation individual differences play active role. Different persons form mathematical concepts in their own ways to some extend. iv) Experience of object At the initial stage a child forms the concept based on the experiences of real

113 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 113 08.07.2016 object. At the later stage due to development, he forms the concept is absence of real objects. At the begining, a child forms the concept of circle as triangle by observing circular as trianglular objects but later stage by imagination only. v) Complex process : Mathematical Concept formation is a complex process. It follows the following route. Observation of symmetry Analysis Comparison Abstraction Generalization Concept formation by name vi) Concept formation may be of three types a) Conjunctive (Combination of different traits, Geometrical figures included may type of figures) b) Disjunctive (A concept may be subdivided into many sub concepts. Fractions may be subdivided is to proper and improper or deciwal etc) c) Relational concept (When there is/are relation among concepts, (Rectangle, Trapezium, Rhombus, Square vii) Conceptual Hierarchies. Each concept is not found in isolation, but rather is relation to other concepts. Simth describes this process of forming new concepts as one of breaking down old categories into smaller and more specialized one. One way of describing the relationship of concepts formed is in terms of super ordinate, co-ordinate and sub- ordinate concepts. These terms refers not only to the scope or inclusiveness of a concept but also to its relationship to other concepts. For example, quadrilateral is more inclusive and also subsumes the concept of parallelogram which in term subsumes the concept of rectangle. In this respect rectangle is described as a sub- ordinate concept of quadrilateral. Related concepts such as parallelograms and trapezium form the co-ordinate concepts. In the conceptual hierarchy of quadrilaterals, parallelogram forms the super-ordinate concept to square. ? → ?? → ?? → ?? → ?? → ?? → ?? → ??

 One angle is right angle. One pair of adjacent sides are equal. No angle is right angle Square i •••••

115 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 115 08.07.2016 VIII) Concept Name Every concept have a name. The concept name is the word used to symbolize the given concept. A concept is an idea or obstruction that exists is people's mind, while the concept name is the word that we arbitrarily use to designate the concept. For example, parallelogram is a concept name designated to a quadrilateral is which both pairs of opposite sides are equal. There are two ways which the concept name is attached to a concept are a) The child learns the concept first and later learns to attach the name to the concept b) The child learns the symbol and then learns the concept IX) Concept definition The deffinition of a concept means to describe typically is verbal statement, the meaning of the concept. It focuses the summarization of important aspects of the experiences which ignoring others. It describes the boundaries of a concept. It helps to determine set inclusion and set exclusion. For example, when we define a quadrilateral as four sided closed geometrical figure, it means that all four sides closed geometrical figures like square, trapezium, parallelogram, rectangle etc can be included is the set of quadrilaterals. But others geometrical figures which are not closed and which do not have four sides can not be included is the set of quadrilaterals. X) Process of observation. Through the process of observation, the essential characteristics i,e the attributes are identified. Identifying the attributes of a concept is essential because without the knowledge of the attributes of a concept, the process of understanding the concept is difficult. For example, the characteristics or attributes of the concept square are four sides which are equal is length and angles are right angle each. These Characteristics are important or essential set where as characteristics such us size colour or special orientation are not important is the set of square. XI) Example in a concept : Examples of a concept are those members of a class which are positive instances of the concept. Examples can appear is word form, is pictorial form or is real life form. XII) Concept formation Concept formation takes place when members of a category are groued together

116 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 116 08.07.2016 and similarities are accepted which ignoring the differences among the members of the categories. Considering the similarities a rule is formed and conceptualization takes place. For example, $\frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \frac{4}{5}, \frac{5}{6}, \frac{6}{7}, \frac{7}{8}, \frac{8}{9}, \frac{9}{10}$, etc are the examples of a concept rational numbers. Rational numbers are defined as numbers expressed in the form of $\frac{p}{q}$, where p and q are integers and p and q do not have common factors and $q \neq 0$.

3.1.4 Steps of teaching concepts Please add page 592 to 598 (Content cum Methodology of Teaching Math B.Ed MC - 06/07 (09) NSOV . 3.1.5 Concepts Attainment Model for Learning and Teaching of concept. The concept learning includes both the phases i.e concept formation and concept attainment.

3.1.5.1 Strategy of concept Attainment Model. Bruner as mentioned four strategies of the Model namely i) Simultaneous Scanning Strategy In this strategy for a particular concept formation, the learners will be given a branch of cards in which different attributes and attribute values are mentioned. The learner will select the cards having positive attributes as well as positive attribute values and will reject which are negative attributes. Concept of Isosceles right angle triangle. For right angle triangle he will select card No 3 and Card No. 4 In card No. 3, one angle is right angle but the others two angles are unequal. So considering the attribute value he will reject So considering the attribute value he will reject card No 3 and will select card No. 4. right angle Card No 4 Card No 1 Card No. 2 Card No. 3 Card No 5

117 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 117 08.07.2016 But he will reject card No. 1 as it is not triangle. He will reject Card No. 2 as it is equilateral triangle and also reject card No 5 as it is not right angle triangle. ii) Successive scanning strategy Here the learner only select the cards having. Positive attributes successively . In this strategy the learner must know the necessary and sufficient positive attributes of the concept. Though he mentally rejects the negative attributes oriented cards iii) Conservative Focusing Strategy : Here every card will contain only one attribute of positive or negative nature. Considering the positive instance he will reject all the negative all the negative instances or non examples. By showing the non example cards he will reject those with classification. Student is asked to pick up red circular disc having less diameter. He will reject circular disc No 1 to 5 by showing reasons and will select disc No 6 as positive instance. iv) Focus Gambling - Here in each card all the attributes (positive example and negative attribute/non examples) are mentioned and in only one and only the positive attributes are mentioned. Students will be asked to pick up the right and as quickly as possible. Here like gambling chance factors will be effective. If adequate time is given, students will be able to form the right concept of circular disc. 3.1.5.2 Types of concept attainment model. On the basis of research work done by Bruner and his associates several models of teaching have been developed. The concept attainment model has three variations. i) The reception model ii) The Selection model iii) The model for unorganized material. Fig 1 r 1 Red Fig 2 r 1 White Fig 3 r 1 Blue Fig 4 r 2 Red Fig 5 r 1 Red Fig 6 r 3 Red r 1 r 3 r 1

118 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 118 08.07.2016 3.1.5.3 The Reception model of concept attainment. A. Focus : Here weightage is given on the development of logical powers. Training is given how conclusion can be drawn by inductive reasoning through use of examples. The focus of the model is to form conception through the stages a) observation b) analysis c) comparison d) abstraction e) generalization and finally naming. Therefore, in addition to help the students in the attainment of a particular concept, it enables them to become aware of the process of conceptualizing. Concept formation The learner can name the concepts by classifying his/her own experience. (Disjunctive) Concept attainment •••• The learner will be able to know the nature of the concepts •••• For learning the concept he will apply the thought process B. Syntax. The sequence of these phase and activities are given in the table. Phase one. Presentation of data and identification Activities i) Presenting examples with 'yes' or 'no' labels by the teacher in a pre-arranged order ii) Ask the students to compare attributes in positive and negative examples iii) Students will frame hypothesis and compare with teacher's hypothesis i

119 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 119 08.07.2016 iv) Naming the concept by students v) Will state the rule as definition of the concept according to needed attributes. a) Students will frame hypothesis for identifying the similarities and dissimilarities of the facts. b) Considering each hypothesis, attributes will be judged. c) By analysis and synthesis of the attributes they will find out the inner concepts d) Will be able to generate own examples. i) Teacher will give more information but will not mention the concept like before. ii) Teacher will ask to identify which information attribute is related to which concept iii) If the student's role is satisfactory he will ask to give more examples iv) Teacher will give general statement about the concept a) Students will be asked to analyse and discuss the process by which they have attained the concept. b) Students will discuss the role of hypotheses and attributes. c) Students will evaluate the process concept attainment. d) They will be encouraged to follow the process for obtaining experiences by this way . Testing for attainment of inner concept General Statement about the concept You are aware about the process of concept formation and thinking strategy Phase Two Phase Three Phase Four

120 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 120 08.07.2016 C. Principle of reactions : The important principles of reaction are the following i) The teacher will be supportive to the student's hypothetical in nature. ii) He will help the students to distinguish between two hypothesis and to evaluate the thinking process by themselves. iii) He has to maintain record about the focus attention on specific feature of examples. iv) He is to encourage the students to analysis the merits of various strategies. D. Social System In this model, in most part of the teaching, the teacher has to exercise control over the social system. The teacher has to collect information as well as examples has a fixed up conception. He has to divide the experiences into positive and negative attributes for the concept. He will communicate the students that the solution of the problem of identifying concepts lies not within the teacher but in the data (examples). The teacher gradually relax the controll and encourage the students to work independently and collaborately. The functions of teacher will include a) to record the activities b) to give clue for collecting attributes c) and to give extra information in the form of examples. The social system functions on the mutual interaction between teacher and taught. For concept attainment, the teacher gives the possitive and negative examples or attributes to the students. The students explain the examples and justify his hypothesis on the basis of positive attributes The interactions are noted on the black board as on the T ag board. The concept is deduced and rule or definition is framed. E. Support systems In this model students will not discover a new concept but will deduce the concept on the basis of examples/experiences /attributes put forward by the teachers. In the first stage, keeping is mind the appropriateconcept, the teacher will give different information or examples to the students. This will include both positive and negative attributes which are essential. By discriminating the positive i,e relevant attributes, the concept is formed. By giving more examples by the students, the teachers from the definition of the concept so is the concept attainment model, the support system is the relevant information is the form of examples. F . Application Concept loyce and will are of the opinion that the concept attainment model is an excellent evaluation tool when teachers want to determine whether important ideas introduced 121 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 121 08.07.2016 earlier have been mastered. It quickly reveals the depth of students understanding and reinforces their previous knowledge'. Mathematics contains a good number of concepts inter related to each other. The model includes both concept formation and concept attainment. In most cases concept is formedby inducting reasoning and follow the process of generalisation and discrimination. 1) So the model is effective is teaching mathematical concepts, grammer and language. 2) For the introduction of this model in class-room teaching, the students may be divided in to small groups so that each of them can participate in the discussion. 3) Before teaching following the model, the teacher may explain the different phases examples (both positive and negative) for a concept. 4) For each group, there will be one leaders who will controll the group discussion, but the teacher will supervise all the group activities. G. Effects of Concepts Attainment Model. Sensitivity to logical reasonning in communication Instructional effect Understanding the nature of concepts Concept Attainment Model Acquire imporved concept building strategies Nurturant effect A wareness of alternative perspectives Develop Inductive reasoning power Tolerance towards ambiguity A wareness about alternative relevent

122 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 122 08.07.2016 3.1.5.4 Advantages/Merits of concept Attainment Model i) Normal environment of class teaching-learning process is maintained. ii) Reasoning powerspecially inducting reasoning power of students is developed iii) In this model the power of observation and imagination of the students are increased iv) In this model the students can apply his/her knowledge in real life is tuation. v) Students get the opportunity to justify their own hypothesis by judging the experiences and drawing conclusions. 3.1.5.5 Disadvantages The model demands the participation of all students and teacher in the teaching learning process. But a good number of students generally remain pasive. So the introvert and under achiever students are not benefited in the model of teaching. Limitation of concept attainment model i) To follow the model both the teacher and students are to take enough responsibility ii) There are individual differences among the learners. So the introvert type students do not participate in this model of teaching iii) All the contents of the syllabus can not be taught using this model. But the model has revolutionised the face to face teaching process. 3.2 Learning By Exposition : Advance Organizer's Model 3.2.1 Introduction There are two terms 'Models of teaching' and 'teaching models' used in teaching learning process. 'Teaching models' are just instructional design where as 'models of teaching' consists of guidelins for designing educational activities and environment. It also specifies ways of teaching and learning for fulfilling the intended goal of teaching. So the function of models of teaching is depicted below.

123 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 123 08.07.2016 It has been accepted that Mathematics should be taught in such a way that each learner is trained to think, reason, analyse and articulate logically. As far as possible the discovery approach followed by teaching through designing and planning suitable aids and models. The fundamentals essential for learning mathematics and solving of problems of daily life should be borne in mind while teaching one should aim to learn the concepts at the mastery level. Activity oriented programme should be used in teaching Mathematics. The most essential thing is that joy and achievement should prevail while learning Mathematics.

3.2.2 Advanced Organizer's Model of Ausubel—David Ausubel designed this model to increase the efficiency of information processing capacities of children. The ideas of this model have emerged in his book 'Theory of Meaningful Learning' According to him the types of learning material related with the content can be learned by the learner quite effectively if presented through. Visual graphics, charts and picture, film, audio tapes and transparencies. He is of opinion that for meaningful verbal learning, the teacher must know the following three issues (i) How knowledge (content of curriculum) (ii) How knowledge (content of curriculum) is organised - (iii) How the mind works during the process of presenting new information (learning) and c) How the above two can be presented to the students (instruction)

According to Ausubel

new ideas can be learned or retained only to the extent that

those ideas can be related to already available cognitive structure of the learner. That acts as necessary linkage or anchors. Designing and mentioning instructional objectives Functions of models of teaching Developing and fixing instructional materials Specifying needed teaching learning activities for cognitive organisation

124 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 124 08.07.2016 Advance organisers, as Ausubel maintains, are the primary means of strengthening learners's cognitive structure. The advance organiser may be of two types i) expository (which is helpful in providing the basic concepts at the highest level of abstraction and essential for understanding new content) and ii) Comparative (designed to discriminate between the old and new concepts to prevent confusion. For teaching the equation of a circle, expository advance organiser may use different shaped circular disc and as comparative advance organiser a diagram showing geometrical figure of circle and the locus of points which are equidistant from a fixed point, called its centre. 3.2.3 Before presenting the Advance organiser Model of teaching we must keep in mind the following Objectives of teaching To enhance the cognitive structure in respect of mathematical content To reconcile /link the new concept with previous knowledge of students Process i) Progressive differentiation (Presenting first simple concept) i Then gradually in depth / related concepts and finally new content) ii) Integrative reconciliation (newly learned content to be assimilated with the old for upgradation) i R O P Q

125 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 125 08.07.2016 Fig 1 Types of learning Meaningful (can be applied in new situation with creativity. Effective in learning of Mathematics) Rote Learning (Collection of informations / data through memorisation which has the scope of forgetting). Output in Mathematics learning Perceptual or direct knowledge about content Abstraction Level - I (At this primary stage, students can present symbolically) i Higher abstraction level (can solve the mathematical problem by using formula / rule etc) i i Conceptual structure of learning (At this stage the learner can deduce the law, can apply in new situation even able to solve the mathematical problem alternatively i Presentation of advance Organizer (A.O) by the teachers Presentation of A.O before teaching Teacher Presentation of Learning material Nature of A.O showing set of verbal or visual information Expository Comparative Creating a linkage between background knowledge with new knowledge Related to learning material but more abstract and coverage. To be presented in logical and psychological sequence

129 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 129 08.07.2016 3.2.4.6 Advantages The wide application area of the model as suggested by Joyce and will (2003) can be stated is teaching Mathematics. i) This model can be used almost all franchises of mathematics systematically in normal classroom situation having mixed ability group. ii) It can help the teachers to understand the existing necessary background knowledge before presenting the advance organiser iii) It follows the mechanism of direct instruction and reorganise the cognitive structure in though advance organiser. iv) Though the Advance organiser at the initial stage act as deductive way on subsequent discussion it is subject to inductive concept attainment stage and evaluate the student's acquisition of new knowledge v) It has both instructional and nurturant effects is different domains. vi) It helps the student to develop critical thinking and interest is mathematical inquiry. 3.2.4.6 Disadvantages i) Sometimes it is difficult to prepare relevent advance organiser of mathematical tpoics. ii) It is different from ordinary teaching aids Effect of Advance organiser Model Instructional effect Formation of conceptual structure Nurturant effect Meaningful assimilation of information and ideas Retention and application of mathematical experiences Interest is mathematical inquiry Habit of specific and precise thinking

130 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 130 08.07.2016 iii) Prior to apply the model, the mathematics curruculum is to be reorganised and teacher must know the interdisciplinary nature of Mathemaics 3.3 Analytic-synthetic, Problem-solving and Project. 3.3.1 Analytic-Synthetic Introduction Most Mathematics orginates from the ideas and concepts associated with physical form, shape and size of objects. Those concepts are present as a systematic abstractstructure in logico-deductive form Analysis and synthesis are methods which use reasoning and systematic arguments arts to find out relationship Meaning. The word 'analytic' means to take a part as to seperate the things that are together or 'breaking up' of the problem so that it gets connected with already known. Analysis is a process of breaking a things into its smaller parts. It proceeds from unknown to known and conclusion to hypotheus. Thorndike says that all the highest intellectual activities of the mind are analysis. 'To analyse' means to loosen or seperate things that are together. Procedure : Ex 1. If $a^2 + b^2 = c^2$, Prove that $ac^2 + bc^2 = a^2c + b^2c$

The analysis will start from the unknown part of the given statement $ac^2 + bc^2 = a^2c + b^2c$ is to be proved $ac^2 + bc^2 = a^2c + b^2c$ will be true $acd - 2b^2d = bc^2 - 2b^2d$ (Cross multiplication) What is the next possibility of further simplification? $\therefore acd = bc^2$ ('c' can be cancelled on both sides as common) $\therefore ad = b^2c$ will be ture Dividing by bd on both sides we get $a^2c^2 = b^2c^2$ which is known and true. \therefore By going back through the chain of argument. We can say that $ac^2 + bc^2 = a^2c + b^2c$ is also true Example 2. Prove that the sum of the three angles of a triangle is two right angles.

131 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 131 08.07.2016 In analysis we start from the conclusion and break it up into simpler arguments for establishing connections with the relationships taken is the hypothesis. For this, we have to find out the missing logical connections and formulate a pattern for the proof. Assuming that the angle sum is 180° , a straight angle, then the angle sum of the triangle equals the angle sum on one side of a straight line such as D E. Again, if D E passes through the vertex A, which is parallel to the base or opposite side. From the properties of the parallel lines, it can be said that the correponding alternate angles are equal in pair. A line D E is drawn paralalled to B C through A. $\therefore \angle ABC = \angle DAB$; $\angle ACB = \angle EAC$ But $\angle DAC + \angle BAC + \angle CAE = 180^\circ$ (alternate angles) $\therefore \angle BAC + \angle ABC + \angle BCA = 180^\circ$ (straight angles) Example 3.

If $a + b + c = 0$, Then prove that $a^3 + b^3 + c^3 = 3abc$ Proof $a^3 + b^3 + c^3 - 3abc = 0$ (a+b) $a^3 + b^3 + c^3 - 3abc = 0$ (a+b) $a^3 + b^3 + c^3 - 3abc = 0$ or (a+b) $a^3 + b^3 + c^3 - 3ab(a+b+c) = 0$ (a+b) $a^3 + b^3 + c^3 = 0$ ($\therefore a + b + c = 0$) $\therefore (a+b)^3 = -c^3$ or, $a + b = -c$ or, $a+b+c = 0$

which is true. Advantages of the Analytic method : - 1. It is a logical mehtod and there is no doubts in teaching a content 2. It motivates the learners to discover and improves the level of understanding. 3. It does not depend on cramming. Each step in its procedure has its reason and justification. A D E C B

132 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 132 08.07.2016 4. In this method students are always guided by the questions like 'How to simplify the two sides of an equation?' 'How to prove the equality of two sides?' 'What are the possible ways of resolving a statement into simpler elements' etc 5. The method is applicable to all types of learners and content of Mathematics. Disadvantages / Drawbacks 1. It is lengthy method 2. It is difficult to acquire efficiency and speed 3. The method may not be applicable to all topics equally well. 4. This method is not suitable to the beginners as during the process many doubts may arise in the minds of the learners which can not be explained properly. Synthetic Method : Meaning and Procedure Meaning. In synthesis, the small constituents or parts are combined so as to give something new. Here one proceeds from known to unknown.

It proceeds with the data available or known and connects the same with the conclusions. In the process we start with hypothesis to conclusion. In practice, synthesis is the complement of analysis. Procedure : Ex-1 If $a^2 + b^2 = c^2$, Prove that $a^2c + b^2c = c^3$ Synthetic proof : $a^2 + b^2 = c^2$ (It is known, and hence the standing point) Subtracting $2bc$ on both sides. (But the question why? Why and how should the child remember to subtract $2bc$ and not any other quantity?) or $a^2 + b^2 - 2bc = c^2 - 2bc$ or $a^2 + b^2 - 2bc + c^2 = c^2 - 2bc + c^2$ -

133 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 133 08.07.2016 Cancelling $1c$ on both sides) Hence the identity is proved. Ex 2. In any triangle, the square on the side opposite to an acute angle

is equal to the sum of the squares on the sides containing the acute angle minus twice the rectangle containing by one of these sides and the projection upon it. Proof. Given $\triangle ABC$, acute $\angle C$ at C . CD is the projection of AC on AB . To prove $AC^2 = AB^2 + BC^2 - 2BC \cdot CD$ In $\triangle ACD$ is a right angle triangle $\angle ADC$ is not angle $AC^2 = AD^2 + CD^2$ (But why we have taken this as first step is not clear) Now $AC^2 = AD^2 + CD^2$ is expanded We have $AC^2 = AB^2 - BD^2 + (BC - BD)^2 \therefore AC^2 = AB^2 - BD^2 + BC^2 - 2BC \cdot BD + BD^2 = AB^2 + BC^2 - 2BC \cdot CD$ (No justification is given for each and every = step) Ex 3. If $a + b + c = 0$ Prove that $a^3 + b^3 + c^3 = 3abc$ $a + b + c = 0$ (It is known) $\therefore a + b = -c \therefore (a + b)^3 = (-c)^3$ (Cubing both sides) $\therefore a^3 + b^3 + 3ab(a + b) = -c^3$ as $a^3 + b^3 - 3abc = 0$ ($\therefore a + b = -c$) $\therefore a^3 + b^3 + c^3 = 3abc$ (proved) Merits of synthetic method 1) It is a short and elegant method 2) It is logical and psychological method because it starts from known to unknown 3) It glorifies memory 4) It is applicable to most of the topics 5) It suits both the teacher and students 6) It follows the same process as mentioned in the text books

Demerits of Synthetic Method : 1) It leaves many doubts in the mind of the learner and can not be explained properly 2) It does not provide full understanding 3) There is little scope of discovery and thinking in the process 4) Memory work and home work are heavy 5) It is not suitable for learner's full understanding 6) It is not suitable for all students and all the topics of Mathematics Conclusion : Synthesis is the complement of analysis and is teaching of Mathematics, the two methods, the two methods should always go together. Analysis leads to synthesis and synthesis makes the process of teaching learning more clear and complete. Analysis helps in understanding and synthesis helps in retaining knowledge. Analysis forms the beginning and synthesis advances the follow-up work. 3.3.1 A comparative study of Analytic and Synthetic Method. Analytic Method 1) Analysis means breaking up into similar elements 2) It proceeds from unknown to the

known facts 3) It starts from the conclusion and goes to the hypothesis Synthetic Method 1) Synthesis means building up separate elements as combination of separate elements to get something new. 2) It proceeds from known to the unknown facts

135 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 135 08.07.2016 Analytic Method 4) It is a general method 5) It is a method of discovery and requires thinking 6) It is a process of thinking (exploration) 7) It is a lengthy method which involves trial and error and time consuming 8) It is a method for the thinkers and discoverer 9) If question arises then it answers states factually 10) There are close contacts between the teacher and taught 11) The students can recall and reconstruct easily any step if forgotten 12) It is psychological 13) In this method we apply inductive reasoning 14) It is formational 15) Each step is explained with 'Why' and 'how'. 16) It is based on heuristic lines 17) It develops originality 18) It is the forerunner of synthesis 19) It builds up a scientific attitude and creativity among students Synthetic Method 3)

It starts with the hypothesis and ends with the conclusion 4) It is a special method 5) It is a process of presentation of the previous by discovered facts. 6) It

is a product of thought 7)

It is concise, elegant, straight forward and does not follow trial and error. 8) It

is a method for the crammers. No scope for thinking

and discovering 9) It does not start by the doubts and question evolved in the mind of learner. 10) There are little scope

for such intimate 11) It is not easy to recall or reconstruct any forgotten step. 12) It

is logical 13) We apply deductive reasoning 14) It is informational 15) 'Why' and 'how' are not explained clearly 16) There

is no heuristic approach is it 17) It develops memory 18) It is the follower of analysis. 19) Little scopes one there.

136 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 136 08.07.2016 3.3.2 Problem-Solving 3.2.2.1

Introduction Teaching any subject is general and teaching Mathematics is particular, we must consider the following

diagram. Teaching of Mathematics is generally done by traditional discussion method using chalk and talk. Some

teachers follow rigid and stereotyped content and methods. It is felt that problem-solving in mathematics may be helpful

to both the teachers and taught at the secondary level. 3.2.2.2 Meaning and Definition of problem solving Problem-

solving is an individual or a small group activity, most efficient when done co-operatively with the scope of discussion. It

is a method of thinking mathematically, analysing and of learning how to find out the answer of a mathematical problem

using known ideas. The productive work involved is the evaluation of the situation and the strategy worked out to reach

one's set goals is collectively known as problem solving. Woodworth and Marquis (1948) : Problem solving occurs in

novel or different situation in which a situation is not obtainable by habitual methods of applying concepts and principles

derived from past experience in very similar situations. Skinner (1968) is of the opinion problem solving is a process of

overcoming difficulties that appear to interfere with the attainment of a goal. It is a procedure of G. Goals R. Restriction

H. How to (Proceed) E. Empirical Background W. What (to teach) 1. Integration with other branches T. Traditional

Method M. Appropriate Methodology

137 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 137 08.07.2016 making adjustment in spite of

interferences. Lester (1975) states 'A problem is a situation in which an individual or group is called upon to perform a

task for which there is no readily accessible algorithm which determines completely the method of solution.' So problem

solving typically involves performing sets of actions to arrive at a solution to some particular task. Lester has defined

problem solving with a cognitive view point and clearly stresses the mental process rather than any overt behaviour of

the problem solver. The cognitive mathematical behaviour can be classified into three broad categories. First, the

memorisation of facts, definitions, rules and procedures. At this level the child is assumed to reproduce what has been

taught. What has been taught The second level of mathematical cognitive behaviour is the mental activity of generalising

or transferring learning from one context to another. The mental activity of recognizing and restructuring will form

relationship which will help in finding a solution in 3rd level. The third level is termed as 'open search' is the crucial stage in

problem solving process. So problem solving behaviour may be said to be a deliberate and purposeful act on the part of

an individual to realise the set goals or objectives by inventing some novel methods or systematically following some

planned step for removal of the interferences and obstacles in the path of the realization of their goals when usual

methods like trial and error, habit formation and conditioning fail. 2. Natural and Characteristics of problem-solving

behaviour i) Problem-solving behaviour arises when there is serious interference or obstacles are perceived to solve the

purposeful goal. ii) One has to utilise some well-organised steps for the removal of the difficulties and obstacles. iii) It

involves quite deliberate and serious efforts on the part of the problem solver. iv) It helps an individual to reach his goals

and also contributes to the process and development of the society. The psychological view point of problem solving :-

Gagne (1966) has presented a model where production of a solution depends on the learner already knowing

'subordinal' rules, searching his memory to find relevant

138 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 138 08.07.2016 rules, selecting the appropriate rules form among the rellevant remembered rules, combining the rules to form 'tries' at a solution and finally verifying the posible solution. In mathematic education George Polya (1957), in his famous work 'How to solve It', outlined a four-stage model for problem 'solving'. i) understanding the problem ii) Devising a plan iii) Carrying out the plan iv) Looking back Research findings as sub sequent years show that students benefited from all poiya's strategies except 'looking back' which was not realy used by the students. In 1962, 1965 Polya published a much, more detailed two-volume work 'Mathematical Discovery : On understanding, Learning and T eaching problem solving (V ol I & V ol V ol II) After a careful review of several models, Lester proposed six distinct stages, not necessarily sequential. i) Problem awareness ii) Problem comprehension iii) Goal analysis iv) Plan development etc. Merits of Problem - solving Method : The problem Method aims at presenting the knowledge to be learnt is the form of a problem. It begins with a problematic situation and consists of continuous, meaningful, well-integrated activity. The problems are set to the students is a natural way. Math is a subject of problems Efficiency and ability is solving problems is a guarantee for success is learning this subject. i) The method stimulates thinking, reasoning and critical judgement is the students. ii) It develops qualities of initiative and self-dependence is the students iii) It is a method of learning by self effort iv) It is a stimulating method. It acts as a great motivating forces. Production of Problems Selecting appropriate rules from subordinate rules 'Tries' at a solution V erifying the possible solution

139 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 139 08.07.2016 v) It develops desirable study habits in the students. It engaged the students is the analysis of the problem, reflectiong thinking, systematic data gathering, verification and critical study vi) It is a method of experience-based learning. vii) There is possibility of close contact between the teacher and taught viii) The students get valuable social experiences like patience, co-operation, self-confidence et. Limitation a) It is difficult to roganise the contents according to the requirements of this method. b) It is time consuming and slow . (c) All the topics and subject areas cannot be covered by this method (d) Teacher's burden becomes heavier (e) Mental activity dominates and there will be neglect of physical and practical experiences. He main objection has been that the Lester's model does not provide specific information about the diagnosis or the development of specific abilities necessary for solving mathematical problems. With this rationate, kulm and Bussmann have formulated a model called the 'Phase-Ability' model for watching specific abilities corresponding to specific problem solving process. STEPS IN EFFECTIVE PROBLEM-SOLVING BEHAVIOUR In general the following steps may be followed is the task of problem solving. i) Problem-awareness – (Semsing the problem) He must be faced with some obstacle in the path of the realization of his goals consequently he must be consious of the difficulty of problem. ii) Problem-Understanding – (Interpreting, defining and delimiting the problem) All the difficulties and obstancles in the path of the goal or solution must he properly naned and identified. iii) Collection of the relevant information – (Gathering data is a systemating manner) He is required to collect all the relevant information about the problem by all possible means. He may consult experienced persons, read the available literature, re call his own expearence etc iv) Formation of hypothesis or hunch for possible solution– (Organising and evalusing the data) He may start some cognitive activities to think out the various solutions to the problem.

140 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 140 08.07.2016 v) Selection of the correct solution – (Formulating tentative solutions) a) Identify the conclusion that completely satisfies all the demands of the problem. b) Find out whether the so....is consistent c) Make a deliberate search for negative aspects vi) V erification of the concluded solution as hypothesis :- The solution must be further verified far the solution if similar problems and then to be accepted for future solving. 5. FACTORS AFFECTING PROBLEM - SOLVING :- There are foru interacting categories of factors (variables) a) T ask V ariable (The nature of the problem) b) The Subject V ariables (The child readiness) c) The process variables (the behaviour of the child) d) The instructional V ariables (to make the child a good problem solves) Problem-Solving Guide UNDERSTANDING THE PROBLEM •••• Read the problem •••• Decide what you are trying to find •••• Find the important data SOLVING THE PROBLEM •••• Look for a pattern •••• Draw picture •••• Guess and check •••• Make an organized list •••• se logical reasoning •••• Use object or acto out •••• works back words •••• Simplify the problem

141 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 141 08.07.2016 ANSWERING THE PROBLEM AND EVALUATING THE ANSWER •••• Be sure you used all the important information •••• Check your work •••• Decide whether the answer makes sense •••• Write the answer is a complete sentence

Problem Solving Stages Guidelines for teachers in helping students solve problems :- Students may lose interest if they do not understand the questions. So the maxims will be :

1. Make sure students understand the problems. For this a) Students should understand the meaning of the terms of the mathematical problem. b) Students must take into consideration all the relevant information. If the student thinks that trapezium is isosceles, then their idea will lead to rhombus. c) They should be able to mention what the problem is seeking to solve. d) Students should be able to state the problems in their own words.
2. To help students to gather relevant though material (mathematical concepts) for creating the plan. a) To assist the students in gathering information in order to analyse the given condition of the problem. b) To help the students to obtain information by analysing an analogous mathematical problem.

1. Problem comprehension and goal analysis 2. Plan development 3. Plan implementation 4. Solution evaluation

142 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 142 08.07.2016

c) To help the students to analyse a problem from a different point of view if it is not solved by a particular approach. x < y < z < p but 3. To provide students an appropriate atmosphere for solving a problem. 4. To encourage the students to verify solutions obtained by inductive process and search for alternative. To find the sum of n natural numbers by induction and using the formula of A.P. series :

5. Help the students to generalise mathematical problems from real life situation.
6. To use the mathematical puzzles, quiz as interesting activities.

Project Method is based on John Dewey's philosophy of pragmatism. According to Dr Kilpatrick, 'A project is a unit of whole hearted purposeful activity, carried out preferably, in its natural setting. Stevenson defined it as 'A problematic act carried to the completion in its natural setting'. Balland described 'A project is a bit of real life that has been imported into the school' project is a modified form of 'concentration of studies' the main feature of this studies is that some subject is considered as the core or centre of all other school subjects. The principles of correction has been given a practical shape through this method. Project method is based on the principles of (i) Learning by doing (ii) Learning by living and (iii) Association, activity and cooperative learning. It is based on the fact that the different branches of knowledge are not separable, though they are studied separately has convenience. The project may be classified as i) Individual project which is to be carried out by the individual and ii) Social projects or group project which are carried out by a group of pupil.

3.4 Techniques of Teaching Mathematics

oral work, written work, Drill work, Brainstorming and computer Assisted Instruction (CAI)

3.4.1 Introduction

In teaching Mathematics, teacher may adopt a particular method or a combination of methods to make the teaching effective and worthwhile. The clarity mathematics lesson tends to follow a standard pattern. Such lesson plan is prepared keeping in view the previously taught lessons. Hence, adequate practice or drill of previously learnt mathematical skills are important task. Similarly, for fulfilling the expected outcome or gaining mastery of new skills some techniques are used for teaching of Mathematics. Some of them are oral work, Written work, Drill work etc. They are discussed below.

3.4.2 Oral Work

It is the work which is done orally without the help of written work and record. It is the

mental work, where in a problem is solved orally or mentally.

In mathematical learning

much of mathematical work has to be completed mentally and many tables have to be learnt by heart :

In teaching elementary Math it is very essential. Oral work helps each child work at the optimum rate which gives maximum accuracy. Function of Oral Work – 1. At the introductory stage of teaching, oral questions are asked students to test the necessary back ground knowledge for today's lesson. Oral questions are also asked at the developmental stage module wise and at the recapitulatory stage. 2. It has an appeal for the eye and ear which is liked by students. 3. Some-time are saved by oral work. 4. Oral questions help the teacher to judge the level of understanding of the students in classroom situation. 5. It arises interest of pupils. 6.

It is a good mental exercise because it develops alertness, readiness of mind, quick hearing, quick thinking and quick responding.

145 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 145 08.07.2016 7. A mathematical idea can be effectively illustrated through a sufficient number of oral examples on questions without much loss of time. 8. It

is an effective means of maintaining class discipline 9. It encourages healthy competition among the students. 10. Oral work provides a rapid drill designed to habituate a fundamental process 11. It helps in completing morework in any given period. 12. Spontaneity in grasping the data and organization of thought in a limited time, are important aspect of oral question-answer 13. Any individual difficulties can be identified and effectively removed by oral work 14. A teacher can throughout remain active in the class with the help of oral question answer. Good planning and adequate preparation are necessary for constructing oral work for the students. 3.4.3 Written Work We know

the principle 'Reading makes a full man, conversation a ready man and writing an exact

man Oral work is not enough to understand and measure the higher order of learning in Mathematics when a teacher requires to check work done by each child or to give children practice in independent work, written work becomes a necessary. Hence oral work is to be supplemented by written work. In Mathematics, too much written work is needed.

Written work should be considered as an extension of oral work. They are complimentary to each other. The teacher in Mathematics class may follow the sequence 1. Oral fundamentals matter 2. Written fundamentals matter 3. Oral problems presentation 4. Written problem presentation Both will work in combination Importance of Written Work : i)

Throughout written work accuracy in computation, legibility of figures and symbols develop

146 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 146 08.07.2016 ii) It facilitates deep understanding of different mathematical concepts and rules iii) It improves speed consistency with accuracy, proper algorithm and neatness of work iv) It fosters thinking and reasoning power v) It motivates the learners to take active participation vi) It

helps the learner to maintain proper logical and sequential arrangement of steps in the mathematical solution vii) It fosters desirable attitude towards Mathematics viii) Written works also keep a collective record for assessing student's progress over a period. ix) It helps the student for self correction and identification of errors committed by him. x) It

helps to develop good study habit for improving achievement in Mathematics. 3.4.4 Drill work Drill is one of the most essential methods of learning Mathematics Drill is the process of repetition to make automatic certain process or activities. Drill work is the most efficient means of fixing the impression in mind. One can not expect to achieve speed and accuracy in solving mathematical problems without. Teacher teaches mathematics concepts, rules as application of those. After this he has to evaluate whether the knowledge given to students has been fixed in their minds and apply those in similar situation. For this drill work and followup action have to be carried out through drill work. Drill work are of three types The first type of lessons for obtaining mastery of basic subject matter like multiplication tables, addition combinations, percentages, factorization, fraction to decimal, construction in geometry etc. Those subject matters are to be learnt at mastery level with respect to speed and accuracy for future learning. The second category includes topics as mathematical concepts for the mastery of procedures. In this type of skill the students will be mastered in translate verbal problems into symbolic form, systematic arrangement of steps, apply correct algorithms, to scrutinise and check each step for finding error, sort out data, to label correctly the geometrical diagram, practice short cuts, back calculation etc.

147 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 147 08.07.2016 The most important i, e third type of drill consists of lesson which develop the power of thinking, reasoning, generalisation and interest, positive attitude of learner etc. Example of such skills are quizze, puzzle, math, talk etc. Teachers must be careful is developing few functional or meaningful drill in mathematics classes. These are prior understanding of content knowledge and its appropriate application, the necessary and sufficient condition for mathematical proof etc. Considerations to be kept in mind for making Drill work more effective. 1. Drill should follow learning as well as understanding of basic principles. It must not must rote memorization without understanding. 2. It should be individualised and follow the principles of reward and punishment 3. Drill should be varied and systematic Mare routine procedures make the learning monotonous and uninteresting 4. If must be sufficient is quantity. For better results the drill work may be divided into parts of appropriate interval. 5. Drill periods should not be planned merely to keep the students 'busy' at work. It must be based upon thought provoking situation. 6. Drill may provide students the diagnostic information and self checking 7. Drill should not be given in the form of punishment 8. Students should be given proper environment for individual and group drill work 9. Mistakes is drill work must be carefully checked and evaluated at an early time. 3.4.5 Brainstorming. 3.4.5.1 Introduction A.F . Osborn (1963) popularized this strategy through his writing 'Applied Imagination'. It is indicates storming of the brain to generate a number of ideas as quickly as possible without passing any judgement 3.4.5.2 Definition This is a strategy for the development of higher cognitive abilities like reflective thinking, creative imagination and problem solving capabilities. This stragegy is used with a group of students to explore a good number of ideas for solution of a problem.

148 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 148 08.07.2016 3.4.5.3 Procedure for using brainstorming as a teaching strategy i) At first a small group of students (10-15 students) of a particular class is formed. They will be asked to sit in a group and will be given a focus topic say . ' How will you findout the hight of a tower without climbing it' . 2) The teacher will then asks the students to think about the solution of the problem and give their ideas one by one or to list out the solution in a paper. They may be instructed as follows : i) The problem is placed before you, think about the possible solution on solutions as you may think suitable. ii) This is not an examination. Don't care for the criticism. Write down the possible solutions without any heritation even if they seem to you quite new or unusual. iii) Students are also free to alter or modify their ideas and solutions given by them earlier in the session. iv) Student members are also free to alter or modify their ideas after discussion with others. 3) In this way , students will be encouraged and inspired for submitting as many as ideas or solution procedures as possible. The group members and the teacher as leader are supposed to collect the different solutions so that : a) All the solutions as ideas are to be encouraged and there will be no criticism during the brainstorming session. b) Ideas are to be listed without any judgement or passing remarks. c) Members are encouraged to supplement this ideas with others. d) All the alternatives or solutions are to be recoded properly on the blackboard for free discussion. 4) At the end of the brains storming session, all the solutions and ideas collected from the group under the guidance of the group leader i, e the teacher will be dis usal for the approval of the experts. Thus a variety of the solution or ideas are evolved. Advantages of the brainstorming strategy. 1) Students become active and discovers of the solution of the problem or new ideas an concepts.

149 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 149 08.07.2016 2) T eachers act as guide. 3) The strategy helps the students to develop higher order cognitive abilities like think, analyse and synthaesize independently . 4) It helps the students to develop their creativity , originality, potentialities and problem solving ability. 5) As it is a group activity, there are scopes for exchange of views, cooperative spirit and development of reasoning power. 6) The student acquires a real understanding and clear notion of the subject as well as mastery of what he has discovered. Disadvantages and limitations : Brainforming strategy has the following dis advantages and limitations. i) It is a time consuming process and the syllabus may not be completed within the period of time ii) The group members may not be homogeneous with respect to cognitive level required for the discussion of the content. iii) The output of the brainstorming session may not be as per with teacher's expectations on expected outcomes. iv) At the concluding session, the result may not be the actual solution of the problem v) This stragegy can not be applied in large class having 50-60 students vi) All the members of the group may not be equally interested for find the solution vii) All the topics of Mathematics may not be covered by this strategy . 3.4.8 Computer Assisted Instruction Introduction : With the introduction of New Education Policy in 1986, initiatives have been taken to use computer in the teaching-learning activities. In Mathematics, the instructional work so carried out with the help of computer is generally known as computer - assisted Instruction (CAI) Definition Computer-assisted instruction is a method of instruction in which there will be a purposeful interaction between a learner and the teaching material as software of the

150 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 150 08.07.2016 computer. It helps the individual learner to achieve the expected instructional objectives designed by the teacher with student's own pace and abilities at his command. Characteristics : i) It is an interaction between a student and a computer controlled display materials. ii) The individual student observes the displayed material and responds to it iii) The instructional material as software is prepared by the teacher keeping in view the multidimensional need and capabilities of the learners. iv) It is a auto-individualised instructions which provides instruction to a large number of learners at a time. v) It provides the opportunity for automatic recoding of the learners performance. vi) It provides a wide variety of methods and approaches for imparting instruction vii) The computer-assisted instruction helps the individual learner to achieve the objectives with his own pace and abilities viii) This type of instruction involves three types of technologies namely , hardware, software and courseware. Fields of Instruction is Mathematics teaching through computer assisted instruction. For providing self individualized instruction to a learner, computer assisted instruction in Mathematics helps in the following fields

- 1) Discrimination of information related to Mathematics content. The main purpose of this type of CAI is to provide essential information as the context for example, a student wants to know the symmetric Matrix. The definition like symmetric matrix is a square matrix in which corresponding elements above and below the principle diagonal are equal should be mentioned. As Symmetric matrix is a square matrix in which the transpose of that is that it self is to be mentioned. Example $A = \begin{bmatrix} 1 & 2 & 3 & 2 & 4 & 6 & 3 & 6 & 7 & 8 \\ 2 & 1 & 3 & 2 & 4 & 6 & 3 & 6 & 7 & 8 \\ 3 & 3 & 1 & 2 & 4 & 6 & 3 & 6 & 7 & 8 \\ 2 & 3 & 2 & 1 & 4 & 6 & 3 & 6 & 7 & 8 \\ 4 & 4 & 4 & 4 & 1 & 6 & 3 & 6 & 7 & 8 \\ 6 & 6 & 6 & 6 & 6 & 1 & 6 & 3 & 6 & 7 & 8 \\ 3 & 6 & 3 & 6 & 3 & 6 & 1 & 6 & 3 & 6 & 7 & 8 \\ 6 & 7 & 6 & 7 & 6 & 7 & 6 & 1 & 6 & 3 & 6 & 7 & 8 \\ 8 & 8 & 8 & 8 & 8 & 8 & 8 & 8 & 1 & 6 & 3 & 6 & 7 & 8 \end{bmatrix}$ Similarly , Super-ordinate and sub ordinate concepts are to be given in the software.

151 SPW/O/D/Education B.Ed./A 4/A 4 Part II Unit 2 1st Proof SPW 151 08.07.2016

- 2) Drill and practice programme. CAI provides different types of drill and practice programme covering specific topics. Example : To draw the conceptual Hierarchy of quadrilaterals like parallelogram, Trapezium, Rhombus, Square etc.
- 3) Simulation type instruction Such type of instructional activities, carefully prepared programme are given to students. They practice it and are trained.
- 4) Problem solving type Here, the students are provided with programme that will allow them to think about the ways and means of solving the problem systematically like drawing of groups with two equations.
- 5) Tutorial type instruction The tutorial programme are prepared, where the students can play effectively through interaction and dialogue. The programme also provides remedial instruction.
- 6) Practical work related instruction CAI can provide help in supplementing practical work like drawing geometrical figures, calculations, checking the result, consultation with tables etc.

Limitation

- 1) It is expensive and uneconomical.
- 2) It is machine oriented it can never match the human beings. No sympathy or human touch are available.
- 3) It is basically a learner - controlled instruction, There is little scope to check the learner causing wasting of time.
- 4) Chances of machine failure are there causing a set back in the system.

111 Unit 3 □

Strategies for Learning and Teaching Mathematics Structure 3.1 Concept Formation and Concept Attainment 3.1.1 Introduction 3.1.2 Meaning of Concept 3.1.3 Characteristics of Concept 3.1.4 Steps of teaching concepts 3.1.5 Concepts Attainment Model for Learning and Teaching of concept. 3.1.5.1 Strategy of concept Attainment Model. Bruner as mentioned four strategies of the Model namely 3.1.5.2 Types of concept attainment model. 3.1.5.3 The Reception model of concept attainment. 3.1 Concept Formation and Concept Attainment 3.1.1 Introduction The Pioneer of 'concept attainment' is Georm. S. Bruner and his associates Jackue line Goodnow and George Austin. The concept is developed from their research 'A study of Thinking' (1967) the basic considerations of concept Attainment model are : i) Man posses the ability of discrimination and classification of things, persons in groups. ii) For adjustment with the environment, a person encounter varried situations and experiences. It is impossible for a person to restore such huge experiences. So he tries to assimilate such experiences and try to adjust with the environment with these assimilated experiences. In general, the assimilation of such experiences is called concept. iii) A concept has three elements a) example b) attributes and c) attribute values. For example, triangle is concept then each triangle is an example. Here rectangle and pentagon are negative and equilateral triangle is positive.

112 Triangles have all the sides are equal is the attribute and all angles are also equal be the attribute values. iv) The categorizing activity has two components (a) The act of category formation (concept formation) and (b) The act of concept attainment. The concept formation is the first step for concept attainment. 3.1.2 Meaning of Concept According to Bruner "A concept is a class as grouping response, an act of categorization, involves rendering different Things equivalent." Archer (1969) mentioned "A concept is simply the level of a set of things that has something is common" A concept is different from a fact, a principle and even a generalization. Halse states 'A concept is a set of feature connected by some rules. A concept of quadrilateral is a geometrical figure bounded by four straight lines selvans (1993) has cleared the idea is the following ways "A concept consists of an individual's organised information about one or more things, objects, ideas, or relations that enable the individual to discriminate a particular thing or class of things and as classes of things. Thus concept is a class or category of all the members of which share a particular combination of attributes or critical properties not shared by another class. 3.1.3 Characteristics of Concept Knowledge of common feature i) It is the knowledge of common feature of person, object, animal or circumstances of similar characteristics Characteristics observational experiences ii) It is observational experiences. Greater the extend of observtional area greater will be the concept area. In framing the concept of triangle the barner must pay attention minutily to the length of different sides of a triangle. iii) Individual differences In concept formation individual differences play active role. Different persons form mathematical concepts in their own ways to some extend. iv) Experience of object At the initial stage a child forms the concept based on the experiences of real

113 object. At the later stage due to development, he forms the concept is absence of real objects. At the begining, a child forms the concept of circle as triangle by observing circular as trianglular objects but later stage by imagination only. v) Complex process : Mathematical Concept formation is a complex process. If follows the following route. Observation of symmetry Analysis Comparison Abstraction Generalization Concept formation by name vi) Concept formation may be of three types a) Conjunctive (Combination of different traits, Geometrical figures included may type of figures) b) Disjunctive (A concept may be subdivided into many sub concepts. Fractions may be subdivided is to proper and improper or deciwal etc) c) Relational concept (When there is/are relation among concepts, (Rectangle, Trapezium, Rhombus, Square vii) Conceptual Hierarchies. Each concept is not found in isolation, but rather is relation to other concepts. Simth describes this process of forming new concepts as one of breaking down old categories into smaller and more specialized one. One way of describing the relationship of concepts formed is in terms of super ordinate, co-ordinate and sub- ordinate concepts. These terms refers not only to the scope or inclusiveness of a concept but also to its relationship to other concepts. For example, quadrilateral is more inclusive and also subsumes the concept of parallelogram which in term subsumes the concept of rectangle. In this respect rectangle is described as a sub- ordinate concept of quadrilateral. Related concepts such as parallelograms and trapezium form the co-ordinate concepts. In the conceptual hierarchy of quadrilaterals, parallelogram forms the super-ordinate concept to square. ?→? ? →? ?→? ? →? ? →? ? →?

114 Conceptual Hierarchy of Quadrilaterals Quadrilateral Trapezium Kite One pair of alternative Two pairs of adjacent sides are parallel sides are equal Parallelogram Isoscles Trapezium Oblic sides are Oblic sides are equal parallel is length (1) i i i i i i i i 1 2 3 Rectangle Rhombus Four sides are equal f Sides are equal and one angle is right angle. One pair of adjucent sides are equal. No angle is right angle One angle is right angle. One pair of adjacent sides are equal. No angle is right angle Square i

115 VIII) Concept Name Every concept have a name. The concept name is the word used to symbolize the given concept. A concept is an idea or abstraction that exists in people's mind, while the concept name is the word that we arbitrarily use to designate the concept. For example, parallelogram is a concept name designated to a quadrilateral in which both pairs of opposite sides are equal. There are two ways in which the concept name is attached to a concept are a) The child learns the concept first and later learns to attach the name to the concept b) The child learns the symbol and then learns the concept IX) Concept definition The definition of a concept means to describe typically in verbal statement, the meaning of the concept. It focuses the summarization of important aspects of the experiences which ignoring others. It describes the boundaries of a concept. It helps to determine set inclusion and set exclusion. For example, when we define a quadrilateral as four sided closed geometrical figure, it means that all four sided closed geometrical figures like square, trapezium, parallelogram, rectangle etc can be included in the set of quadrilaterals. But others geometrical figures which are not closed and which do not have four sides can not be included in the set of quadrilaterals. X) Process of observation. Through the process of observation, the essential characteristics i.e the attributes are identified. Identifying the attributes of a concept is essential because without the knowledge of the attributes of a concept, the process of understanding the concept is difficult. For example, the characteristics or attributes of the concept square are four sides which are equal in length and angles are right angle each. These Characteristics are important or essential set whereas characteristics such as size colour or special orientation are not important in the set of square. XI) Example in a concept : Examples of a concept are those members of a class which are positive instances of the concept. Examples can appear in word form, in pictorial form or in real life form. XII) Concept formation Concept formation takes place when members of a category are grouped together and similarities are accepted which ignoring the differences among the members of the categories. Considering the similarities a rule is formed and conceptualization takes place. For example, $\frac{1}{2}, \frac{3}{5}, \frac{3}{12}, \frac{0}{1}, \frac{1}{3}, \frac{7}{4}, \dots$ etc are the examples of a concept rational numbers. Rational numbers are defined as numbers expressed in the form of $\frac{p}{q}$, where p and q are integers and p and q do not have common factors and $q \neq 0$.

3.1.4 Steps of teaching concepts Please add page 592 to 598 (Content cum Methodology of Teaching Math B.Ed MC - 06/07 (09) NSOV. 3.1.5 Concepts Attainment Model for Learning and Teaching of concept. The concept learning includes both the phases i.e concept formation and concept attainment. 3.1.5.1 Strategy of concept Attainment Model. Bruner as mentioned four strategies of the Model namely i) Simultaneous Scanning Strategy In this strategy for a particular concept formation, the learners will be given a branch of cards in which different attributes and attribute values are mentioned. The learner will select the cards having positive attributes as well as positive attribute values and will reject which are negative attributes. Concept of Isosceles right angle triangle. For right angle triangle he will select card No 3 and Card No. 4 In card No. 3, one angle is right angle but the others two angles are unequal. So considering the attribute value he will reject So considering the attribute value he will reject card No 3 and will select card No. 4. right angle Card No 4 Card No 1 Card No. 2 Card No. 3 Card No 5 117 But he will reject card No. 1 as it is not triangle. He will reject Card No. 2 as it is equilateral triangle and also reject card No 5 as it is not right angle triangle. ii) Successive scanning strategy Here the learner only select the cards having. Positive attributes successively. In this strategy the learner must know the necessary and sufficient positive attributes of the concept. Though he mentally rejects the negative attributes oriented cards iii) Conservative Focusing Strategy : Here every card will contain only one attribute of positive or negative nature. Considering the positive instance he will reject all the negative all the negative instances or non examples. By showing the non example cards he will reject those with classification. Student is asked to pick up red circular disc having less diameter. He will reject circular disc No 1 to 5 by showing reasons and will select disc No 6 as positive instance. iv) Focus Gambling - Here in each card all the attributes (positive example and negative attribute/non examples) are mentioned and in only one and only the positive attributes are mentioned. Students will be asked to pick up the right and as quickly as possible. Here like gambling chance factors will be effective. If adequate time is given, students will be able to form the right concept of circular disc. 3.1.5.2 Types of concept attainment model. On the basis of research work done by Bruner and his associates several models of teaching have been developed. The concept attainment model has three variations. i) The reception model ii) The Selection model iii) The model for unorganized material. Fig 1 r 1 Red Fig 2 r 1 White Fig 3 r 1 Blue Fig 4 r 2 Red Fig 5 r 1 Red Fig 6 r 3 Red r 2 < r 1 r 3 < r 1

118 3.1.5.3 The Reception model of concept attainment. A. Focus : Here weightage is given on the development of logical powers. Training is given how conclusion can be drawn by inductive reasoning through use of examples. The focus of the model is to form conception through the stages a) observation b) analysis c) comparison d) abstraction e) generalization and finally naming. There fore, in addition to help the students is the attainment of a particular concept, it enables them to become aware of the process of conceptualizing. Concept formation The learner can name the concepts by sclassifying his/her own experience. (Disjunctive) Concept attainment ••••• The learner will be able to know the nature of the concepts ••••• For learning the concept he will apply the thought process B. Syntax. The sequence of these phase and activities are given in the table. Phase one. Presentation of data and identification Activities i) Presenting examples with 'yes' or 'no' labels by the teacher in a pre-arranged order ii) Ask the students to compare at tributes in positive and negative examples iii) Students will frame hypothesis and compare with teacher's hypothesis i 119 iv) Naming the concept by students v) Will state the rule as definition of the concept according to needed attributes. a) Students will frame hypothesis for identifying the similarities and dissimilarities of the facts. b) Considering each hypothesis, at tributes will be judge. c) By analysis and synthesis of the attributes they will find out the inner concepts d) Will be able to generate own examples. i) Teacher will give more information but will not mention the concept like before. ii) Teacher will ask to identify which information attribute is related to which concept iii) If the students role is satisfactory he will ask to give more examples iv) Teacher will give general statement about the concept a) Students will be asked to analyse and discuss the process by which They have attained the concept. b) Students will discuss the role of hypotheses and attributes. c) Students will evaluate the process concept attainment. d) They will be encouraged to follow the process for obtaining experiences by this way. Testing for attainment of inner concept General Statement about the concept You aware about the process of concept formation and thinking strategy Phase Two Phase 3 Phase 4 120 C. Principle of reactions : The important principles of reaction are the following i) The teacher will be supportive to the student's hypothetical in nature. ii) He will help the students to distinguish between two hypothesis and to evaluate the thinking process by themselves. iii) He has to maintain record about the focus attention on specific feature of examples. iv) He is to encourage the students to analysis the merits of various strategies. D. Social System In this model, in most part of the teaching, the teacher has to exercise control over the social system. The teacher has to collect information as well as examples has a fixed up conception. He has to divide the experiences into positive and negative attributes for the concept. He will communicate the students that the solution of the problem of identifying concepts lies not within the teacher but in the data (examples). The teacher gradually relax the control and encourage the students to work independently and collaborately. The functions of teacher will include a) to record the activities b) to give clue for collecting attributes c) and to give extra information in the form of examples. The social system functions on the mutual interaction between teacher and taught. For concept attainment, the teacher gives the positive and negative examples or attributes to the students. The students explain the examples and justify his hypothesis on the basis of positive attributes The interactions are noted on the black board as on the Tag board. The concept is deduced and rule or definition is framed. E. Support systems In this model students will not discover a new concept but will deduce the concept on the basis of examples/experiences/attributes put forward by the teachers. In the first stage, keeping in mind the appropriate concept, the teacher will give different information or examples to the students. This will include both positive and negative attributes which are essential. By discriminating the positive i.e relevant attributes, the concept is formed. By giving more examples by the students, the teachers from the definition of the concept so is the concept attainment model, the support system is the relevant information in the form of examples. F. Application Concept loyce and will are of the opinion that the concept attainment model is an excellent evaluation tool when teachers want to determine whether important ideas introduced

121 earlier have been mastered. It quickly reveals the depth of students understanding and reinforces their previous knowledge'. Mathematics contains a good number of concepts inter related to each other. The model includes both concept formation and concept attainment. In most cases concept is formed by inductive reasoning and follow the process of generalisation and discrimination. 1) So the model is effective in teaching mathematical concepts, grammar and language. 2) For the introduction of this model in class-room teaching, the students may be divided into small groups so that each of them can participate in the discussion. 3) Before teaching following the model, the teacher may explain the different phases examples (both positive and negative) for a concept. 4) For each group, there will be one leader who will control the group discussion, but the teacher will supervise all the group activities. G. Effects of Concepts Attainment Model. Sensitivity to logical reasoning in communication Instructional effect Understanding the nature of concepts Concept Attainment Model Acquire improved concept building strategies Nurturant effect Awareness of alternative perspectives Develop Inductive reasoning power Tolerance towards ambiguity Awareness about alternative relevant

122 3.1.5.4 Advantages/Merits of concept Attainment Model i) Normal environment of class teaching-learning process is maintained. ii) Reasoning power especially inductive reasoning power of students is developed iii) In this model the power of observation and imagination of the students are increased iv) In this model the students can apply his/her knowledge in real life situation. v) Students get the opportunity to justify their own hypothesis by judging the experiences and drawing conclusions. 3.1.5.5 Disadvantages The model demands the participation of all students and teacher in the teaching learning process. But a good number of students generally remain passive. So the introvert and under achiever students are not benefited in the model of teaching. Limitation of concept attainment model i) To follow the model both the teacher and students are to take enough responsibility ii) There are individual differences among the learners. So the introvert type students do not participate in this model of teaching iii) All the contents of the syllabus can not be taught using this model. But the model has revolutionised the face to face teaching process. 3.2 Learning By Exposition :

Advance Organizer's Model 3.2.1 Introduction There are two terms 'Models of teaching' and 'teaching models' used in teaching learning process. 'Teaching models' are just instructional design whereas 'models of teaching' consists of guidelines for designing educational activities and environment. It also specifies ways of teaching and learning for fulfilling the intended goal of teaching. So the function of models of teaching is depicted below.

123 It has been accepted that Mathematics should be taught in such a way that each learner is trained to think, reason, analyse and articulate logically. As far as possible the discovery approach followed by teaching through designing and planning suitable aids and models. The fundamentals essential for learning mathematics and solving of problems of daily life should be borne in mind while teaching one should aim to learn the concepts at the mastery level. Activity oriented programme should be used in teaching Mathematics. The most essential thing is that joy and achievement should prevail while learning Mathematics. 3.2.2 Advanced Organizer's Model of Ausubel-David Ausubel designed this model to increase the efficiency of information processing capacities of children. The ideas of this model have emerged in his book 'Theory of Meaningful Learning' According to him the types of learning material related with the content can be learned by the learner quite effectively if presented through. Visual graphics, charts and picture, film, audio tapes and transparencies. He is of opinion that for meaningful verbal learning, the teacher must know the following three issues (i) How knowledge (content of curriculum) is organised - (ii) How the mind works during the process of presenting new information (learning) and c) How the above two can be presented to the students (instruction) According to Ausubel

new ideas can be learned or retained only to the extent that those ideas can be related to already available cognitive structure of the learner. That acts as necessary linkage or anchors. Designing and mentioning instructional objectives Functions of models of teaching Developing and fixing instructional materials Specifying needed teaching learning activities for cognitive organisation

new ideas can be learned or retained only to the extent that

those ideas can be related to already available cognitive structure of the learner. That acts as necessary linkage or anchors. Designing and mentioning instructional objectives Functions of models of teaching Developing and fixing instructional materials Specifying needed teaching learning activities for cognitive organisation

124 Advance organisers, as Ausubel maintains, are the primary means of strengthening learners's cognitive structure. The advance organiser may be of two types i) expository (which is helpful in providing the basic concepts at the highest level of abstraction and essential for understanding new content) and ii) Comparative (designed to discriminate between the old and new concepts to prevent confusion. For teaching the equation of a circle, expository advance organiser may be a diagram of a circle and as comparative advance organiser a diagram showing geometrical figure of circle and the locus of points which are equidistant from a fixed point, called its centre. 3.2.3 Before presenting the Advance organiser Model of teaching we must keep in mind the following Objectives of teaching To enhance the cognitive structure in respect of mathematical content To reconcile /link the new concept with previous knowledge of students Process i) Progressive differentiation (Presenting first simple concept) i Then gradually in depth / related concepts and finally new content) ii) Integrative reconciliation (newly learned content to be assimilated with the old for upgradation) i R O P Q

125 Fig 1 Types of learning Meaningful (can be applied in new situation with creativity. Effective is learning of Mathematics) Rote Learning (Collection of information / data through memorisation which has the scope of forgetting). Output in Mathematics learning Perceptual or direct knowledge about content Abstraction Level - I (At this primary stage, students can present symbolically) i Higher abstraction level (can solve the mathematical problem by using formula / rule etc) i i Conceptual structure of learning (At this stage the learner can deduce the law, can apply in new situation even able to solve the mathematical problem alternatively i Presentation of advance Organiser (A.O) by the teachers Presentation of A.o before teaching Teacher Presentation of L e a r n i n g material Nature of A.O showing set of verbal or visual information Expository Comparative Creating a linkage between background knowledge with new knowledge Related to learning material but more abstract and coverage. To be presented in logical and psychological sequence

126 3.2.4 Fundamental elements of Advance organiser model 3.2.4.1 Focus The model focuses 1. Assisting the teacher for improving the method of presentations for this must know how content is organised 2. Organising large amount of content information teacher must realize meaningfully. For this what is the cognitive structure of students in respect of new content 3. To help the learner to strengthen their existing cognitive structure. For this relevant questions are to be asked and necessary information to be provided. 3.2.4.2 Syntex Activities are to be performed sequentially in the following three phases. Phase I: Presentation of the advance organisers i) the aim of the lesson is to be clarified. By stating the aims and objectives of the lesson, the students will be motivated for acquisition of the presented material ii) Presentation of the advance organiser. The teacher will present the advance organiser (expository or comparative) to the students which contain ideas more distinct and inclusive than the learning content for understanding and grasping the information. ii) Prompting awareness learner's knowledge. The teacher will realise learner's existing cognitive structure in terms of their previous knowledge and experience through questioning related to advance organiser. Phase II presentation of learning task. (Executive i) The teacher will present the content stage) modulewise through appropriate method like discussion, question answer method as problem solving method with necessary teaching aids ii) Presentation will be in line with existing cognitive structure as well as the information supplied to them through advance organiser. iii) As mentioned by Joyce and Will (2003) "The organisation of the learning material needs to be made explicit to the students so that they have an overall sense of direction and can see the logical order of the material and how the organization relates to the advance organiser.

127 Phase III Strengthening Cognitive organisation (Follow-up stage Joyce and Will states "

The purpose of phase three is to anchor the new learning mathematics in the student existing cognitive structure,

that is to strengthen the students' cognitive organization". The following activities are performed in this phase i) Integrative reconciliation Teacher will relate process of solving solving a math problem taking a similar problem. ii) He may ask the students the definition of term, process of solution. He may repeat the concept once again. Teacher may ask the student the relevance of Advance organizer as the teaching aids with the present topic. ii) Active reception learning The teacher may ask students to give additional examples related to the discussion For promoting active reception, the teacher will allow the student to ask question for their reception of facts, while teaching congruence of a triangle, the teacher may ask 'Why the triangles having three angles equal are not congruent? He may ask the students to make a teaching aid for understanding the concept. iii) Eliciting critical approach to content knowledge or the learning material The teacher may ask the students a) How the problem as geometrical theorem can be proved is alternative way? b) Without discussing the concept of probability. The teacher may ask the students to toss a coin 10 times on 20 times and record the result is respect of head' on 'tail'. c) Contradiction or exception of a rule may be asked to explain like $5 < 3 < 2 < 1$ but $1 < 5 < 3 < 1 < 2 < 1 > > > >$; iv) Classification of confusion or source of errors . In this stage the teacher will apply all the techniques, strategies or methods to clarify the misconception, source of error etc. He may apply error correction test or show some practical demonstration to eradicate mis understanding.

128 a) $7 \times 7 = 7 \times 2 < 7 \times 5 = 5 \times 2 < 5$ but $0.7 \times 0.7 = .49 > 0.7$ or $0.5 \times 0.5 = .25 > 0.5$ b) $25 \div 5 = \pm$ or $49 \div 7 = \pm$ but $- \neq \pm 25 \div 5$ or $- \neq \pm 49 \div 7$

3.2.4.3 Social System The social system of the advance organiser model is structured and teacher centered. He relates the advance organiser to the learning material. This acts as an anchor between existing knowledge of the learner to the new knowledge. The social system starts with interaction with the students. Students may ask questions, may improve the advance organiser for their understanding and assimilation of new knowledge. So to devise the advance organiser is a difficult activity which will be appropriate to the students as well as to new content. Moreover, deliberation, discussion and relating the A.O with new learning materials require the efficiencies of the teachers.

3.2.4.4 Support system : To make the model more effective and meaningful in teaching Mathematics the following support system is essential. 1. A well thought and structured learning material 2. Preparation of a well thought, relevant and appropriate advance organiser in the form of story telling, model, software, activity based performance etc 3. Integrating the advance organiser with learning material and presenting before the students keeping in mind their level of understanding 4. The appropriate competencies, teaching skill. Professional efficiency and concern for student's preparedness will help the teacher to make the model more effective. 3.2.4.5 Learning output / Effect of Ashbel's Advance organiser Model The effect is expressed in the following diagram.

129 3.2.4.6 Advantages The wide application area of the model as suggested by Joyce and Will (2003) can be stated in teaching Mathematics. i) This model can be used almost all branches of mathematics systematically in normal classroom situation having mixed ability group. ii) It can help the teachers to understand the existing necessary background knowledge before presenting the advance organiser iii) It follows the mechanism of direct instruction and reorganise the cognitive structure in through advance organiser. iv) Though the Advance organiser at the initial stage act as deductive way on subsequent discussion it is subject to inductive concept attainment stage and evaluate the student's acquisition of new knowledge v) It has both instructional and nurturant effects in different domains. vi) It helps the student to develop critical thinking and interest in mathematical inquiry. 3.2.4.6 Disadvantages i) Sometimes it is difficult to prepare relevant advance organiser of mathematical topics. ii) It is different from ordinary teaching aids Effect of Advance organiser Model Instructional effect Formation of conceptual structure Nurturant effect Meaningful assimilation of information and ideas Retention and application of mathematical experiences Interest in mathematical inquiry Habit of specific and precise thinking

130 iii) Prior to apply the model, the mathematics curriculum is to be reorganised and teacher must know the interdisciplinary nature of Mathematics 3.3 Analytic-synthetic, Problem-solving and Project. 3.3.1 Analytic-Synthetic Introduction Most Mathematics originates from the ideas and concepts associated with physical form, shape and size of objects. Those concepts are present as a systematic abstract structure in logico-deductive form Analysis and synthesis are methods which use reasoning and systematic arguments arts to find out relationship Meaning. The word 'analytic' means to take a part as to separate the things that are together or 'breaking up' of the problem so that it gets connected with already known. Analysis is a process of breaking a thing into its smaller parts. It proceeds from unknown to known and conclusion to hypothesis. Thorndike says that all the highest intellectual activities of the mind are analysis. '

To analyse' means to loosen or separate things that are together. Procedure : Ex 1. If $a^2 + b^2 = c^2$, Prove that $ac^2 + b^2c = bc^2 + 2abd$. The analysis will start from the unknown part of the given statement $ac^2 + b^2c = bc^2 + 2abd$ is to be proved $ac^2 + b^2c = bc^2 + 2abd$ will be true $acd - 2bd = bc^2 - 2bd$ (Cross multiplication) What is the next possibility of further simplification? $\therefore acd = bc^2$ ('c' can be cancelled on both sides as common) $\therefore ad = bc$ will be true Dividing by bd on both sides we get $a^2 + b^2 = c^2$ which is known and true. \therefore By going back through the chain of argument. We can say that $ac^2 + b^2c = bc^2 + 2abd$ is also true Example 2. Prove that the sum of the three angles of a triangle is two right angles.

131 In analysis we start from the conclusion and break it up into simpler arguments for establishing connections with the relationships taken is the hypothesis. For this, we have to find out the missing logical connections and formulate a pattern for the proof. Assuming that the angle sum is 180° , a straight angle, then the angle sum of the triangle equals the angle sum on one side of a straight line such as DE . Again, if DE passes through the vertex A , which is parallel to the base or opposite side. From the properties of the parallel lines, it can be said that the corresponding alternate angles are equal in pair. A line DE is drawn parallel to BC through A . $\therefore \angle ABC = \angle DAB$; $\angle ACB = \angle EAC$ But $\angle DAC + \angle BAC + \angle CAE = 180^\circ$ (alternate angles) $\therefore \angle BAC + \angle ABC + \angle BCA = 180^\circ$ (straight angles) Example 3.

If

$a + b + c = 0$, Then prove that $a^3 + b^3 + c^3 = 3abc$ Proof $a^3 +$

$b^3 + c^3 = 3abc$ If

$a^3 + b^3 + c^3 - 3abc = 0$ $(a+b)^3 - 3$

ab (

$a + b) + c^3 - 3abc = 0$ or (

$a + b)^3 + c^3 - 3ab(a+b+c) = 0$ $(a + b)^3 + c^3 = 0$ ($\therefore a + b + c = 0$) $\therefore (a + b)^3 = -c^3$ or, $a +$

$b = -c$ or, $a+b+$

$c = 0$

which is

ture. Advantages of the Analytic method : - 1. It is a logical method and there is no doubts in teaching a content 2. It motivates the learners to discover and improves the level of understanding. 3. It does not depend on cramming. Each step in its procedure has its reason and justification. A D E C B

132 4. In this method students are always guided by the questions like "How to simplify the two sides of an equation?"

How to simplify the two sides of an equation? How to prove the equality of two sides? "What are the possible ways of resolving a statement into simpler elements" etc 5. The method is applicable to all types of learners and content of Mathematics. Disadvantages / Drawbacks 1. It is lengthy method 2. It is difficult to acquire efficiency and speed 3. The

method may not be applicable to all topics equally well. 4. This method is not suitable to the beginners as during the

process many doubts may arise in the minds of the learners which can not be explained properly. Synthetic Method :

Meaning and Procedure Meaning. In synthesis, the small constituents or parts are combined so as to give something new. Here one proceeds from known to unknown.

It proceeds with the data available or known and connects the same with the conclusions. In the process

we start with hypothesis to conclusion. In practice, synthesis is the complement of analysis. Procedure : Ex-1 If $a^2 + b^2 = c^2$,

Proved that $ac^2 + b^2c = bc^2 + 2abd$ Synthetic proof : $a^2 + b^2 = c^2$ (It is known, and hence the standing point) Subtracting

$2bc$ on both sides. (But the question why? Why and how should the child remember to subtract $2bc$ and not any other quantity?) or $a^2 + b^2 - 2bc = c^2 - 2bc$ or $ac^2 + b^2c - 2bc^2 = c^2d - 2bcd$ or $ac^2 + b^2c - 2bc^2 = c^2d - 2bcd$

133 Cancelling $1c$ on both sides) Hence the identity is proved. Ex 2. In any triangle, the square on the side opposite to an acute angle

is equal to the sum of the squares on the

sides containing the acute angle minus twice the rectangle containing by one of these sides and the projection upon it.

Proof. Given $\triangle ABC$, acute $\angle d$ at B . BD is the projection of AB on BC . To prove $Ac^2 = AB^2 + Bc^2 - 2BC \cdot BD$ In $\triangle ACD$ is a right Angle triangle $\angle ADC$ is not angle $Ac^2 = AD^2 + CD^2$ (But why we have taken this as first step is not clear) Now $AC^2 = AD^2 + CD^2$ is expanded We have $Ac^2 = AB^2 - BD^2 + (BC - BD)^2 \therefore CD = BC - BD = AB^2 - BD^2 + BC^2 + BD^2$

$-2BC \cdot BD = AB^2 + BC^2 - 2BC \cdot BD$ (No justification is given for each and every = step) Ex 3. If $a + b + c = 0$ Prove that

$a^3 + b^3 + c^3 = 3abc$ $a + b + c = 0$ (It is known) $\therefore a + b = -c \therefore (a + b)^3 = (-c)^3$ (Cubing both sides) $\therefore a^3 + b^3 + 3ab$

(

$a+b) = -c^3$ as $a^3 + b^3 - 3abc = 0$ ($\therefore a + b = -c$) $\therefore a^3 +$

$b^3 + c^3 = 3abc$ (proved) Merits of synthetic method 1) It is a short and elegant method A B C D
 134 2) It is a short and elegant method 3) It is logical and psychological method because it starts from known to unknown 4) It glorifies memory 5) It is applicable to most of the topics 6) It suits both the teacher and students 7) It follows the same process as mentioned in the text books Demerits of Synthetic Method : 1) It leaves many doubts in the mind of the learner and can not be explained properly 2) It does not provide full understanding 3) There is little scope of discovery and thinking in the process 4) Memory work and home work are heavy 5) It is not suitable for learner's full understanding 6) It is not suitable for all students and all the topics of Mathematics Conclusion : Synthesis is the complement of analysis and in teaching of Mathematics, the two methods, the two methods should always go together. Analysis leads to synthesis and synthesis makes the process of teaching learning more clear and complete. Analysis helps in understanding and synthesis helps in retaining knowledge. Analysis forms the beginning and synthesis advances the follow-up work. 3.3.1 A comparative study of Analytic and Synthetic Method. Analytic Method 1) Analysis means breaking up into similar elements 2) It proceeds from unknown to the known facts 3) It starts from the conclusion and goes to the hypothesis Synthetic Method 1) Synthesis means building up separate elements as combination of separate elements to get something new. 2) It proceeds from known to the unknown facts 135 Analytic Method 4) It is a general method 5) It is a method of discovery and requires thinking 6) It is a process of thinking (exploration) 7) It is a lengthy method which involves trial and error and time consuming 8) It is a method for the thinkers and discoverers 9) If a question arises then it answers satisfactorily 10) There are close contacts between the teacher and taught 11) The students can recall and reconstruct easily any step if forgotten 12) It is psychological 13) In this method we apply inductive reasoning 14) It is formational 15) Each step is explained with 'Why' and 'how'. 16) It is based on heuristic lines 17) It develops originality 18) It is the forerunner of synthesis 19) It builds up a scientific attitude and creativity among students Synthetic Method 3) It starts with the hypothesis and ends with the conclusion 4) It is a special method 5) It is a process of presentation of the previous by discovered facts. 6) It is a product of thought 7) It is concise, elegant, straight forward and does not follow trial and error. 8) It is a method for the crammers. No scope for thinking and discovering 9) It does not start by the doubts and question evolved in the mind of learner. 10) There is little scope for such intimate 11) It is not easy to recall or reconstruct any forgotten step. 12) It is logical 13) We apply deductive reasoning 14) It is informational 15) 'Why' and 'how' are not explained clearly 16) There is no heuristic approach in it 17) It develops memory 18) It is the follower of analysis. 19) Little scope is there. 136 3.3.2 Problem-Solving 3.2.2.1 Introduction Teaching any subject is general and teaching Mathematics is particular, we must consider the following diagram. Teaching of Mathematics is generally done by traditional discussion method using chalk and talk. Some teachers follow rigid and stereotyped content and methods. It is felt that problem-solving in mathematics may be helpful to both the teachers and taught at the secondary level. 3.2.2.2 Meaning and Definition of problem solving Problem-solving is an individual or a small group activity, most efficient when done co-operatively with the scope of discussion. It is a method of thinking mathematically, analysing and of learning how to find out the answer of a mathematical problem using known ideas. The productive work involved is the evaluation of the situation and the strategy worked out to reach one's set goals is collectively known as problem solving. Woodworth and Marquis (1948) : Problem solving occurs in a novel or different situation in which a situation is not obtainable by habitual methods of applying concepts and principles derived from past experience in very similar situations. Skinner (1968) is of the opinion problem solving is a process of overcoming difficulties that appear to interfere with the attainment of a goal. It is a procedure of G. Goals R. Restriction H. How to (Proceed) E. Empirical Background W. what (to teach) 1. Integration with other branches T. Traditional Method M. Appropriate Methodology

137 making adjustment inspite of interferences. Lester (1975) states "A problem is a situation in which an individual or group is called upon to perform a task for which there is no ready accessible algorithm which determines completely the method of solution :'. So problem solving typically involves performing sets of actions to arrive at a solution to some particular task. Laster has defined problem solving with a cognitive view point and clearly stresses the mental process rather than any overt behaviour of the problem solver. The cognitive mathematical behaviour can be classified into three broad categories. First, the memorisation of facts, definitions, rules and procedures. At this level the child is assumed to reproduce what has been taught. What has been taught The second level of mathematical cognitive behaviour is the mental activity of generalising or transferring learning from are context to another. The mental activity of recoginzing and restructuring will for form relationship which will help is finding a solution in 3rd level. The third level is terned as 'open search' is the crucial stage is problem solving process. So problem solving behaviour may be said to be a deliberate and purposeful act on the part of an individual to realise the set goals or objectives by inventing some novel methods or ..ptematically following some planned step for removal of the interferences and obstacles in the path of the realization of then goals when usual methods like trial and error, habit formation and conditioning tail. 2. Natural and Characteristics of problem-solving behaviour i) Problem-solving behaviour arises when there is serious interference or obstacles are perceived to solve the purposeful goal. ii) One has to utilise some well-organised steps for the removal of the difficulties and obstacles. iii) It involves quite deliberate and serious efforts on the part of the problem solves. iv) It helps an individual to reach his goals and also contributes to the process and development of the society. The psychological view point of problem solving :- Gagne (1966) has presented a model where production of a solution depends on the learner already knowing 'subordinal' rules, searching his memory to find relevant 138 rules, selecting the appropriate rules form among the rellevant remembered rules, combining the rules to form 'tries' at a solution and finally verifying the posible solution. In mathematic education George Polya (1957), in his famous work 'How to solve It', outlined a four-stage model for problem 'solving'. i) understanding the problem ii) Devising a plan iii) Carrying out the plan iv) Looking back Research findings as sub sequent years show that students benefited from all poiya's strategies except 'looking back' which was not realy used by the students. In 1962, 1965 Polya published a much, more detailed two-volume work 'Mathematical Discovery : On understanding, Learning and Teaching problem solving (Vol I & Vol Vol II) After a careful review of several models, Lester proposed six distinct stages, not necessarily sequential. i) Problem awareness ii) Problem comprehension iii) Goal analysis iv) Plan development etc. Merits of Problem - solving Method : The problem Method aims at presenting the knowledge to be learnt is the form of a problem. It begins with a problematic situation and consists of continuous, meaningful, well-integrated activity. The problems are set to the students is a natural way. Math is a subject of problems Efficiency and ability is solving problems is a guarantee for success is learning this subject. i) The method stimulates thinking, reasoning and critical judgement is the students. ii) It develops qualities of initiative and self-dependence is the students iii) It is a method of learning by self effort iv) It is a stimulating method. It acts as a great motivating forces. Production of Problems Selecting appropriate rules from subordinate rules 'Tries' at a solution Verifying the possible solution

139 v) It develops desirable study habits in the students. It engaged the students is the analysis of the problem, reflecting thinking, systematic data gathering, verification and critical study vi) It is a method of experience-based learning. vii) There is possibility of close contact between the teacher and taught viii) The students get valuable social experiences like patience, co-operation, self-confidence etc. Limitation a) It is difficult to reorganise the contents according to the requirements of this method. b) It is time consuming and slow. (c) All the topics and subject areas cannot be covered by this method (d) Teacher's burden becomes heavier (e) Mental activity dominates and there will be neglect of physical and practical experiences. The main objection has been that the Lester's model does not provide specific information about the diagnosis or the development of specific abilities necessary for solving mathematical problems. With this rationale, Kulm and Bussmann have formulated a model called the 'Phase-Ability' model for watching specific abilities corresponding to specific problem solving process.

STEPS IN EFFECTIVE PROBLEM-SOLVING BEHAVIOUR In general the following steps may be followed in the task of problem solving.

- i) Problem-awareness – (Sensing the problem) He must be faced with some obstacle in the path of the realization of his goals consequently he must be conscious of the difficulty of problem.
- ii) Problem-Understanding – (Interpreting, defining and delimiting the problem) All the difficulties and obstacles in the path of the goal or solution must be properly named and identified.
- iii) Collection of the relevant information – (Gathering data in a systematizing manner) He is required to collect all the relevant information about the problem by all possible means. He may consult experienced persons, read the available literature, recall his own experience etc
- iv) Formation of hypothesis or hunch for possible solution – (Organising and evaluating the data) He may start some cognitive activities to think out the various solutions to the problem.

140 v) Selection of the correct solution – (Formulating tentative solutions)

- a) Identify the conclusion that completely satisfies all the demands of the problem.
- b) Find out whether the so...is consistent
- c) Make a deliberate search for negative aspects
- vi) Verification of the concluded solution as hypothesis :- The solution must be further verified for the solution if similar problems and then to be accepted for future solving.

5. FACTORS AFFECTING PROBLEM - SOLVING :- There are four interacting categories of factors (variables)

- a) Task Variable (The nature of the problem)
- b) The Subject Variables (The child readiness)
- c) The process variables (the behaviour of the child)
- d) The instructional Variables (to make the child a good problem solver)

Problem-Solving Guide

UNDERSTANDING THE PROBLEM •••• Read the problem ••••
Decide what you are trying to find •••• Find the important data

SOLVING THE PROBLEM •••• Look for a pattern ••••
Draw picture •••• Guess and check •••• Make an organized list •••• use logical reasoning •••• Use object or act out •••• works back words •••• Simplify the problem

141 **ANSWERING THE PROBLEM AND EVALUATING THE ANSWER** •••• Be sure you used all the important information •••• Check your work •••• Decide whether the answer makes sense •••• Write the answer in a complete sentence

Problem Solving Stages Guidelines for teachers in helping students solve problems :- Students may lose interest if they do not understand the questions. So the maxims will be :

1. Make sure students understand the problems. For this
 - a) Students should understand the meaning of the terms of the mathematical problem.
 - b) Students must take into consideration all the relevant information. If the student thinks that a trapezium is isosceles, then their idea will lead to a rhombus.
 - c) They should be able to mention what the problem is seeking to solve.
 - d) Students should be able to state the problem in their own words.
2. To help students to gather relevant though material (mathematical concepts) for creating the plan.
 - a) To assist the students in gathering information in order to analyse the given condition of the problem.
 - b) To help the students to obtain information by analysing an analogous mathematical problem.

1. Problem comprehension and goal analysis
2. Plan development
3. Plan implementation
4. Solution evaluation

142 c) To help the students to analyse a problem from a different point of view if it is not solved by a particular approach. x < y < z < p but 3. To provide students an appropriate atmosphere for solving a problem. 4. To encourage the students to verify solutions obtained by inductive process and search for alternative. To find the sum of n natural numbers by induction and using the formula of A P series : 5. Help the students to general mathematical problems from real life situation. 6. To use the mathematical puzzles, quiz as interesting activities. Project Project method is based on John Dewey's philosophy of pragmatism. According to Dr kilpatrick, "A project is a unit of whole hearted purposeful activity, carried an preferably, in its natural setting. Stevenson defined it as "A problematic act carried to the completion is its natural setting". Balland described "A project is a bit ob real life that has been imported into the school" project is a modefied form of "concentration of studie's the main feature of this studies is that some subject is considered as the core or centre of all other school subjects. The principles of correction has been given a practical shape through this method. Project method is based on the principles of (i) Learning by doing (iii) Learning by living and (iii) Association, activity and co operative learning. It is based on the fact that the different branches of knowledge are not seperable, though they are studied seperately has convenience. The project may be classified as i) Individual project which is to be cried out by the individual and ii) Social projects or group project which are carried out by a group of pupil. Step of the project Method : follow page NV. 306 to 310 (To be added) Content cum Methodology of Teaching Mulh. B. Ed MC 06/07 (09)

143 Initiation of a Project — Project proplal 1. Title of the project / Name of the topic 2. Elaboration of the Content • Focus of the problem • Content of the problem • Purpose to be coverd (Area of coverage) 3. Objectives i) ii) iii) etc. 4. Equipment / Tools/ Resource required a) Questionnaire b) Information from different sources (Website, Report, documents) c) Syllabus curriculum d) Statical package e) Compules f) Calculator etc 5) Stratigies a) Hypothesis b) Population c) Sample d) procedure for conducting project / Execution e) Collection of data f) Analysis of data g) Findings covering objectives h) conclusion i) Submitting report. 6) Reflection and Feedback on the project Based on Expected out. 7) Limitation Obstacles faced Strategies to be adopted to overcome 8) Conclusion / Epilog.

144 3.4 Techniques of Teaching Mathematics oral work, written work, Drill work, Brainstorming and computer Assisted Instruction (CAI) 3.4.1 Introduction In teaching Mathemaitcs, teacher may adopt a particular method or a combination of methods to make the teaching effective effective and worthwhile. The claity mathematics lesson in tends to follow a standard pattern. Such lesson plan is prepared keeping is view the previously taught lessons. Hences, adquate practice or drill of previously learnt mathematical skills are important task. Similarly, for fulfilling the expected out come or gainin mastery of new kills some techniques are used for teaching of Mathematic. Some of them are oral work, Written work, Drill work etc. They are discussed below. 3.4.2

Oral Work It is the work which is done orally without the help of written work and record. It

is the

mental work, where in a problem is solved orally or mentally.

In mathematical learning

much of mathematical work has to be coupleted mentally and many tables have to be learnt by heart :

In teaching elementary Mathe it is very essential. Oral work helps each child work at the optimum rate which gives maximum accuracy. Function of Oral Work – 1. At the introductory stage of teaching, oral questions are asked students to test the necessary back ground knowledge for today's lesson. Oral questions are also asked at the developmental stage module wise and at the recapitulatory stage. 2. It has an appeal for the eye and ear which is liked by students. 3. Some-time are saved by oral work. 4. Oral questions help the teacher to judge the level of understanding of the students is calssroom situation. 5. It arises interest of publish. 6.

It is a good mental exercise because it develops atertness, readiness of mind, quick hearing, quick thinking and quick responding.

145 7. A mathematical

idea can be effectively illustrated through a sufficient number of oral examples on questions without much loss of time.

8. It

is an effective means of maintaining class discipline 9. It encourages healthy competition among the students. 10. Oral work provides a rapid drill designed to habituate a fundamental process 11. It helps in completing morework in any given period. 12. Spontaneity in grasping the data and organization of thought in a limited time, are important aspects of oral question-answer 13. Any individual difficulties can be identified and effectively removed by oral work 14. A teacher can throughout remain active in the class with the help of oral question answer. Good planning and adequate preparation are necessary for constructing oral work for the students. 3.4.3 Written Work We know

the principle "Reading makes a full man, conversation a ready man and writing an exact

man Oral work is not enough to understand and measure the higher order of learning in Mathematics when a teacher requires to check work done by each child or to give children practice in independent work, written work becomes a necessary. Hence oral work is to be supplemented by written work. In Mathematics, too much written work is needed.

Written work should be considered as an extension of oral work. They are complementary to each other. The teacher in

Mathematics class may follow the sequence 1. Oral fundamentals matter 2. Written fundamentals matter 3. Oral

problems presentation 4. Written problem presentation Both will work in combination Importance of Written Work : i)

Throughout written work accuracy in computation, legibility of figures and symbols develop

146 ii) It facilitates deep understanding of different mathematical concepts and rules iii) It improves speed consistency with

accuracy, proper algorithm and neatness of work iv) It fosters thinking and reasoning power v) It motivates the learners to

take active participation vi) It helps the learner to maintain proper logical and sequential arrangement of steps in the

mathematical solution vii) It fosters desirable attitude towards Mathematics viii) Written works also keep a collective

record for assessing student's progress over a period. ix) It helps the student for self correction and identification of

errors committed by him. x) It helps to develop good study habit for improving achievement in Mathematics. 3.4.4 Drill

work Drill is one of the most essential methods of learning Mathematics Drill is the process of repetition to make

automatic certain process or activities. Drill work is the most efficient means of fixing the impression in mind. One can

not expect to achieve speed and accuracy in solving mathematical problems without. Teacher teaches mathematics

concepts, rules as application of those. After this he has to evaluate whether the knowledge given to students has been

fixed in their minds and apply those in similar situation. For this drill work and followup action have to be carried out

through drill work. Drill work are of three types The first type of lessons for obtaining mastery of basic subject matter like

multiplication tables, addition combinations, percentages, factorization, fraction to decimal, construction in geometry

etc. Those subject matters are to be learnt at mastery level with respect to speed and accuracy for future learning. The

second category includes topics as mathematical concepts for the mastery of procedures. In this type of skill the

students will be mastered in translating verbal problems into symbolic form, systematic arrangement of steps, applying correct

algorithms, to scrutinise and check each step for finding error, sorting out data, to label correctly the geometrical diagram,

practice short cuts, back calculation etc.

147 The most important, the third type of drill consists of lessons which develop the power of thinking, reasoning,

generalisation and interest, positive attitude of learner etc. Example of such skills are quizzes, puzzles, math, talk etc.

Teachers must be careful in developing few functional or meaningful drills in mathematics classes. These are prior

understanding of content knowledge and its appropriate application, the necessary and sufficient condition for

mathematical proof etc. Considerations to be kept in mind for making Drill work more effective. 1. Drill should follow

learning as well as understanding of basic principles. It must not be rote memorization without understanding. 2. It

should be individualised and follow the principles of reward and punishment 3. Drill should be varied and systematic

Monotonous routine procedures make the learning monotonous and uninteresting 4. There must be sufficient quantity. For better

results the drill work may be divided into parts of appropriate interval. 5. Drill periods should not be planned merely to

keep the students 'busy' at work. It must be based upon thought provoking situations. 6. Drill may provide students the

diagnostic information and self checking 7. Drill should not be given in the form of punishment 8. Students should be

given proper environment for individual and group drill work 9. Mistakes in drill work must be carefully checked and

evaluated at an early time. 3.4.5 Brainstorming. 3.4.5.1 Introduction A.F. Osborn (1963) popularized this strategy through

his writing 'Applied Imagination'. It indicates storming of the brain to generate a number of ideas as quickly as possible

without passing any judgement 3.4.5.2 Definition This is a strategy for the development of higher cognitive abilities like

reflective thinking, creative imagination and problem solving capabilities. This strategy is used with a group of students to

explore a good number of ideas for solution of a problem.

148 3.4.5.3 Procedure for using brainstorming as a teaching strategy i) At first a small group of students (10-15 students) of a particular class is formed. They will be asked to sit in a group and will be given a focus topic say. "How will you find out the height of a tower without climbing it". 2) The teacher will then ask the students to think about the solution of the problem and give their ideas one by one or to list out the solution on a paper. They may be instructed as follows : i) The problem is placed before you, think about the possible solution or solutions as you may think suitable. ii) This is not an examination. Don't care for the criticism. Write down the possible solutions without any hesitation even if they seem to you quite new or unusual. iii) Students are also free to alter or modify their ideas and solutions given by them earlier in the session. iv) Student members are also free to alter or modify their ideas after discussion with others. 3) In this way, students will be encouraged and inspired for submitting as many as ideas or solution procedures as possible. The group members and the teacher as leader are supposed to collect the different solutions so that : a) All the solutions as ideas are to be encouraged and there will be no criticism during the brainstorming session. b) Ideas are to be listed without any judgement or passing remarks. c) Members are encouraged to supplement their ideas with others. d) All the alternatives or solutions are to be recorded properly on the blackboard for free discussion. 4) At the end of the brainstorming session, all the solutions and ideas collected from the group under the guidance of the group leader i, e the teacher will be discussed for the approval of the experts. Thus a variety of the solution or ideas are evolved. Advantages of the brainstorming strategy. 1) Students become active and discover the solution of the problem or new ideas and concepts.

149 2) Teachers act as guide. 3) The strategy helps the students to develop higher order cognitive abilities like think, analyse and synthesise independently. 4) It helps the students to develop their creativity, originality, potentialities and problem solving ability. 5) As it is a group activity, there are scopes for exchange of views, cooperative spirit and development of reasoning power. 6) The student acquires a real understanding and clear notion of the subject as well as mastery of what he has discovered. Disadvantages and limitations : Brainstorming strategy has the following disadvantages and limitations. i) It is a time consuming process and the syllabus may not be completed within the period of time ii) The group members may not be homogeneous with respect to cognitive level required for the discussion of the content. iii) The output of the brainstorming session may not be as per with teacher's expectations on expected outcomes. iv) At the concluding session, the result may not be the actual solution of the problem v) This strategy can not be applied in large class having 50-60 students vi) All the members of the group may not be equally interested to find the solution vii) All the topics of Mathematics may not be covered by this strategy. 3.4.8 Computer Assisted Instruction Introduction : With the introduction of New Education Policy in 1986, initiatives have been taken to use computer in the teaching-learning activities. In Mathematics, the instructional work so far carried out with the help of computer is generally known as computer - assisted Instruction (CAI) Definition Computer-assisted instruction is a method of instruction in which there will be a purposeful interaction between a learner and the teaching material as software of the

150 computer. It helps the individual learner to achieve the expected instructional objectives designed by the teacher with student's own pace and abilities at his command. Characteristics : i) It is an interaction between a student and a computer controlled display material. ii) The individual student observes the displayed material and responds to it iii) The instructional material as software is prepared by the teacher keeping in view the multidimensional need and capabilities of the learners. iv) It is a self-individualised instruction which provides instruction to a large number of learners at a time. v) It provides the opportunity for automatic recording of the learner's performance. vi) It provides a wide variety of methods and approaches for imparting instruction vii) The computer-assisted instruction helps the individual learner to achieve the objectives with his own pace and abilities viii) This type of instruction involves three types of technologies namely, hardware, software and courseware. Fields of Instruction in Mathematics teaching through computer assisted instruction. For providing self-individualized instruction to a learner, computer assisted instruction in Mathematics helps in the following fields 1) Discrimination of information related to Mathematics content. The main purpose of this type of CAI is to provide essential information as the context for example, a student wants to know the symmetric Matrix. The definition like symmetric matrix is a square matrix in which corresponding elements above and below the principal diagonal are equal should be mentioned. As Symmetric matrix is a square matrix in which the transpose of that is that it self is to be mentioned. Example $A = \begin{pmatrix} 1 & 2 & 3 & 2 & 4 & 6 & 3 & 6 & 7 \\ 2 & 1 & 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 3 & 0 & 1 & 0 & 0 & 0 & 1 & 0 & 0 \\ 2 & 0 & 0 & 1 & 0 & 0 & 0 & 1 & 0 \\ 4 & 1 & 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 6 & 3 & 0 & 1 & 0 & 0 & 0 & 0 & 1 \\ 3 & 6 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 6 & 7 & 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 7 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ R & S & T & U & V & W & X & Y & Z \end{pmatrix}$, $B = \begin{pmatrix} 1 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 1 \\ 0 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 1 & 0 \\ 1 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 1 \\ 0 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ L & M & N & O & P & Q & R & S & T & U & V & W & X & Y & Z & \end{pmatrix}$ Similarly, Super-ordinate and sub-ordinate concepts are to be given in the software.

151 2) Drill and practice programme. CAI provides different types of drill and practice programme covering specific topics. Example : To draw the conceptual Hierarchy of quadrilaterals like parallelogram, Trapezium, Rhombus, Square etc.

3) Simulation type instruction Such type of instructional activities, carefully prepared programme are given to students. They practice it and are trained.

4) Problem solving type Here, the students are provided with programme that will allow them to think about the ways and means of solving the problem systematically like drawing of groups with two equators.

5) Tutorial type instruction The tutorial programme are prepared, where the students can play effectively through interaction and dialogue. The programme also provides remedial instruction.

6) Practical work related instruction CAI can provide help in supplementing practical work like drawing geometrical figures, calculations, checking the result, consultation with tables etc.

Limitation 1) It is expensive and uneconomical. 2) It is machines oriented it can never match the human beings. No sympathy or human touch are available.

2) It is machine oriented it can never match the human beings. No sympathy or human touch are available. 3) It is basically a learners - controlled instruction, There is little scope to check the learner causing wasting of time.

4) Chances of machine failure are there causing a set back in the system.

152 3.5 Creating Different Situations of Learning Engagement 3.5.1 Group Learning Students grouped together, who are emotionally intellectually engaged in solving a mathematical problem is called group learning, such students grouped together working on usually one project. It is an assembly in which each learner learns autonomously and through the ways of learning of others. In teaching of Mathematics, often teaching one or two Units of contents, the teacher prepares some problems covering the mathematical concepts of those Units and assesses the students to solve the problems in groups. For example, after discussing the topic 'Height and Distance'. The teacher may form two groups comprising of at least 20 students in each group have similar emotional and intellectual levels. Topics of discussion :

1) Devise a plan for finding the height of a tower without climbing on the top of a tower. 2) Solve the following problems related to 'Height and distance' and give the suitable diagrams.

a) Find out the height of a tower situated at a distance of 3 meters whose angle of elevation when viewed from point is 60° and 30° when viewed from the top of a house (height 10 mts) b) The second group of students will be assigned to frame a question paper consisting of items as per table of specifications or the test blue print.

Unit Trigonometry Class IX Behaviour/ Recall Identify Change Find Verify Total Concept Magnitude 4 4

— — 8 of an angle Unit measure 2 — 4 — 6 of an angle Trigonometric 4 — 2 — 4 10 ratio

153 Variations in 2 2 — — 4 trigonometric ratio for $0 < \theta < 90^\circ$ Trigonometric 2 2 — 4 4 12 ratio of specific angles

Angles of 2 — — 2 — 4 elevation and depression Simple cases — — — 4 2 6 of heights and distances 16 8 6 10 10 50

Features of group learning— 1. Members of learning groups include adult (teacher) as well as students of the class. 2. Documentations of learning outcomes must be maintained to evaluate the progress. 3. Members are to be engaged in cognitive, affective and psychomotor dimensions of learning. 4. Learning will be extended beyond the learning of individuals to create a collective body of knowledge. 5. The make up of the group (i.e size, competencies, interest, motivation etc.) is an important consideration. 6. Group learning focuses on how to learn in groups and understanding of others. Advantages of Group learning in Mathematics teaching :

(a) Group learning encourages peer dependence, especially by students with learning difficulties. (b) Working in a group in Mathematics teaching and learning provides learners the opportunities to articulate ideas and understanding.

154 (c) It helps to negotiate with others to create new understanding as reach consensus. (d) It proves the scope to uncover assumptions and misconceptions. (e) It enables the students to discover deeper concepts of Mathematics in the context and improves thinking power. (f) Group learning engages students with higher level content i.e thought provoking, difficult to understand on the multiple interpretations of a simple or concept. 3.5.2 Individual Learning : 3.5.2.1 Meaning Individual learning

is a strategy of instruction in which content, materials and pace of learning are based upon the abilities and interest of each individual learner. This method presumes that needs and capabilities of individual students are different with respect to mathematics learning and thus be differently addressed. 3.5.2.2 Perspective of individual learning 1. Each student learn differently. 2. All students are talented in Mathematics in different ways. 3. This process will meet the unique mathematical needs of the child. 4. This process will meet the unique educational needs of the child in Mathematics. 5. Careful progress are to be carried out in the process. Thus Individualised instruction strategy refers to those classroom practices of teaching which recognise the uniqueness of each student learner and for this provide adequate guidance and other support services suited to them. 3.5.2.3 Characteristics of Individualised Learner : Mathematics develops the ability to each and every student :

(a) How to analyse a situation (b) To make proper estimates and approximations

155 (c) To devise and use formulae, rules of procedure and methods of making comparisons. (d) To represent designs and spatial relations by drawing. (e) To be accurate and to be systematic in our work habits. In this perspective the characteristics as purposes of individual learning are the following : (i) Individual learning provides opportunities to learn at this own pace, in their own way and to be successful. (ii) To prove a learning environment that will maximise the potential for student success in Mathematics. (iii) In this strategy teachers do not stick to the same pattern of teaching rather adopt new ways so that students get multiple options. (iv) The process enables the teacher to explain a lesson or demonstrate to small group of students at a time. (v) In individual learning, importance is given to a child as individual not as group or class. (vi) The method intends to maximise each student's growth and success. (vii) In this process each student has to note down what he/she usually understands which helps the long term retention of mathematical concepts, laws or proceduse. (viii) Individual learning is concept focused and principle driven. 3.5.2.4 Principles of Individual Learning In executing the individual learning strategy, the following principles are adopted: (a) To make the students clear about the key concept and necessary knowledge for gaining strong understading. (b) Assesment should occur before, during and following the instructional strategy. (c) Emphasis and stress will be given more on critical and creative thinking of the students while preparing a lesson plan.

156 (d) Engaging all learners is essential. (e) Guiding factors will be (Tomlinson 2001) (i) Contents (include concepts, generalization of principles, mathematical law, rule and skill) (ii) Process (Varying learning activities to provide appropriate methods for students to explore the concepts) (iii) Products : Below grade students show reduced performance. Above grade students exhibit more advance thinking, understanding and application. 3.5.2.5 Steps of Individual learning Eight steps are followed to support individual learning. 1. Read the curriculum Teachers to be entrusted for the individual learning strategy must be conversent of the goals, subject matter (content) and evaluation criteria of the whole course. 2. Define the core skills of the course : Expectation to be taught. For this the specific content, facts, concepts and skill are to be identified. 3. Mix and match a wide range of learning methods: Any single method can not be the best way for us to learn. Various methods are to be adopted for complete learning. 4. Revise the skills. Repeations is necessary for obtaining mastery on a skill. 5. Allow the students to set this own learning goals. 6. Teach, coach, encourage experiments and evaluate progress at every phase. 7. Give continuous feed back through monitoring and evaluation. 8. Give move support and give more challenging tasks individually.

157 3.5.2.6 Advantages of Individual Learning (i) Individual Learning is student centric. Focus is given on the academic needs and learning abilities of every individual student. (ii) Raises the standard of learning in a big way. (iii) It meets the needs and interests of diverse learns. (iv) Individual learning provides the opportunity for students to learn at this own pace. (v) The strategy recognises students, varying background knowledge readines and preferences in learning. (vi) The method maximises each student's growth and success. (vii) Individual learning helps students in provides the opportunity for students to learn at this own pace. (v) The strategy recognises students, varying background knowledge, readiness and preterences in learning. (vi) The method maximises each student's growth and success. (vii) Individual learning helps students is providing opportunities for the uniqueness of each child interms of his learning style, potentials, talent as well as learning deficiencies. 3.5.2.7 Criticism against individual learning (Disadvantages) ••••• In the individual learning method, students will get insufficient interactions with peers. ••••• The students feel lonelines and the strategy may create boring. ••••• It neglects the norms and values of all round development. ••••• The method requires self discipline which may not be available in mathematics learning. ••••• The strategy of individual learning focuses on self-interest and personal success and ignores the success and/or failues of others. ••••• Class size and teaching load are two biggest constraints in the method. ••••• There is a time constraint in the process. ••••• Teachers preparedness is difficult for the process.

158 •••• In case of drill and practice oriented content, this method is time consuming and not economic. 3.5.3 Small group learning 3.5.3.1 Introduction Like the group learning, small group learning is an educational approach. Here the class is to be divided into few small groups consisting of 5-7 students in each small group. After teaching a unit of Mathematics in a class, the strategy of small group teaching is to be applied for more attention to individual learner. 3.5.3.2 Procedure : The small group work has to be carefully planned and requires a facilitator to ensure group progress group function needs to be assessed and evaluated. A structured activity is to be given to the members of small group to work together. They are individually accountable for their work and the work of the group as a whole. Teachers become learners at times and learners sometime teach. The meta-analysis demonstrate that various forms of small group learning are effective in promoting greater academic achievement in Mathematics. A favourable attitude towards mathematics learning will be developed. In this process every member will respect others. Members must draw upon their past experience and knowledge. Group members are to be invested in their own learning. Diversity is to be celebrated and all contributions by members to be given due value. Advantages 1. Small group learning allows students to develop problem solving ability, interpersonal, presentational and communication skills. 2. It offers tolerance and positive interaction facilities among participant learners. 3. In small group learning students become capable of ownership of new knowledge and skills. 4. They get the opportunity to solve real world problems. 5. Positive attitude towards the content and motivation to learn are also developed.

159 6. Each member gets the opportunity to contribute in small group learning. They learn to deal with conflict. Each of the group members gets the opportunities for personal feedback about their ideas. Disadvantages— 1. Some claim, small group work is an avoidance of teaching. It allows the teacher to escape his/her responsibility. 2. In this learning students' abilities are not accurately reflected. Both high and low achiever get same reward. Suggestion : Teacher will resolve small groups conflicts as soon as they arise. They must help the students to reflect on their progress on a regular basis. Gigsaw Cooperative Learning : Introduction : Gigsaw puzzle is a mysterious problem that can only be solved by connecting several pieces of information. 1. Introduction : It is a research based Co-operative learning technique invented and developed in the early 1970s by Elliot Aronson and his students at The Univ. of Texas and The Univ. of California. It is used with great success. In teaching Mathematics, this technique promotes better learning, improves student motivation thus removes mathematics anxiety and increases enjoyment of the learning experience. 2. Principles : •••• Like Gigsaw puzzle, each part of a lesson as well as each student's participation is essential for the completion and complete understanding of the learnt topic. •••• As each student's participation in the class room teaching is essential so students' absenteeism is reduced. •••• To shift the emphasis from a quite competitive environment of Mathematics class to a more Co-operative one. 3. Steps in Gigsaw techniques of teaching : There are 10 easy steps in the technique.

160 Step one The students of the class is to be divided into 5 or 6 person Gigsaw groups. The groups should be diverse in terms of gender, race and mathematical ability. Step two : One student from each group is to be appointed as the group leader. Initially, this group leader should be a matured and advanced level student in Mathematics. Step three : (i) The day's lesson is to be divided into 5-6 segments. For example in teaching the area and circumference of a circle, the segments may be i) examples of circular figures and objects. (ii) Definition of circle, circumference, area, radius, Diameter etc. (iii) To deduce the formula of the area of a circle with geometrical concepts. (iv) To deduce the formula of the circumference of a circle with geometrical concepts. (v) Practical Verification of the area and circumference with aids. (vi) To solve the problems related to the formulae (Simple to Complex). Step Four Each student is to be assigned with one segment. Care is to be taken so that students have direct access only to their own segment. Step Five Students will be given time to go through or thinkover their segment and become familiar with the content part. Thus is no need to memorise the segment. Step Six Temporary "expert groups" are to be formed having one student from each gigsaw group as leader. Other students will be assigned to the respective segment. Students of these expert groups will be given time to discuss the main points of their segment and to rehearse the presentation that they will give to their gigsaw group.

161 Step Seven All the students are to bring back into their Gigsaw groups. Step Eight Each student will be asked to present his or her segment to the group. Other students of the group will be encourage to ask questions for clarification. Step Nine The teacher/instructor will float from group to group for observing the process. If any group is having trouble (for example, a member is dominating, disrupting or not presenting up to the mark), then the teacher will take appropriate intervention. It will be best for the group leader to handle the task. The leaders can be trained by whispering an Instruction on how to intervenl or controll by the teachers untid it is solved. Step Ten At the end of the session, a quiz session on the topic will be organised. The students will particepate and will come to realise quickly that though the session is enjoyable but it is not just a fun but realy essential.

4. Flow chart of the process Today's Lesson (Topic T) is divided into few sub topics (T 1 , T 2 , T 3 , T 4 T 5) based on sub concepts of Mathematics. Students of the class (S) is divided into few groups having 5-6 students in each groups. These groups are called gigsaw groups (G 1 , G 2 , G 3 , G 4 etc.) Expert Group (E) will be five (E 1 , E 2 , E 3 , E 4 , E 5) for each sub concepts. Gigsaw Groups (G 1G 4) G 1 S 11 , S 12 , S 13 , S 14 , S 15 Assignment to each student (S 11 , T 1); (S 12 , T 2); (S 13 , T 3) (S 14 , T 4) (S 15 , T 5) G 2 S 21 , S 22 , S 23 , S 24 , S 25 (S 21 , T 1); (S 22 , T 2)(S 23 , T 3) (S 24 , T 4) (S 25 , T 5)

162 G 4 S 41 , S 42 , S 43 , S 44 , S 45 (S 41 , T 1); (S 42 , T 2)(S 43 , T 3) (S 44 , T 4) (S 45 , T 5) G 3 S 31 , S 32 , S 33 , S 34 , S 35 (S 31 , T 1); (S 32 , T 2)(S 33 , T 3) (S 34 , T 4) (S 35 , T 5) Assignd E 4 (S 14 , T 4); (S 24 T 4); (S 34 , T 4) (S 44 , T 4) E 2 (S 12 , T 2); (S 21 , T 2); (S 22 , T 2) (S 32 , T 2) (S 42 , T 2) E 3 (S 13 , T 3); (S 23 , T 3); (S 33 , T 3) (S 43 , T 3) E 1 (S 11 , T 1) (S 21 T 1), (S 31 , T 1) (S 41 , T 1) E 5 (S 13 , T 3) (S 23 T 5); (S 33 , T 3) (S 43 , T 5)

Expert groups (E 1 ---E 5) Expert groups formed by subtopics specific Original Groups, (G 1 + G 2 + G 3 + G 4) G 1 + G 2 + G 3 + G 4 Reconvene and listen to final presentation on from each members Similarly for gigsaw groups

163 5. Advantages 1. The techniques works even if only used for a period per day. 2. It can be applied in teaching different subjects along with Mathematics. 3. The teachers feel comfortable by woming with it 4. It is very simple but effective. 5. It is an efficient way for students to become engaged in this learning. 6. Students learn a lot of material quickly. 7. Gigsaw method maximizes intereaction and establishes an atmosphere of Co- operation and respect for others students. 8. This method maximises accountability for students learning. 9. It is verified that students performed significantly better, their interpersonal skill and communication skills are developed. 10. This method helps the students to minimise listing time but expands their thinking and understanding. 6. Limitation (i) It is very difficult to control when a dominant student will talk too much or to control the whole group. (ii) The weak or Underachiever may not be able to create a good report for their group. (iii) The talent group on the other hand may be bored working with slower students. (iv) Teacher may not be satisfied with the expected out comes from the students. 7. Conclusion : The theoretical aspect of gigsaw method has been included in B.Ed curriculum. But to find out the efficacy of the method in teaching Mathematics, the allthough has undertaken a project under centre for pedagogical studies in Mathematics (CPSM).

3 Netaji Subhas Open University From the Vice-Chancellor's Desk Dear Students, from this Academic Session (2015-17) the Curriculum and Course Structure of B. Ed.- Special Education have been thoroughly revised as per the stipulations which featured in the Memorandum of Understanding (MoU) between the Rehabilitation Council of India (RCI) and the National Council for Teacher Education (NCTE). The newly designed course structure and syllabus is comprehensive and futuristic has, therefore, been contextualized and adopted by NSOU from the present academic session, following the directives of the aforesaid national statutory authorities. Consequent upon the introduction of new syllabus the revision of Self Instructional Material (SIM) becomes imperative. The new syllabus was circulated by RCI for introduction in the month of June, 2015 while the new session begins in the month of July. So the difficulties of preparing the SIMs within such a short time can easily be understood. However, the School of Education of NSOU took up the challenge and put the best minds together in preparing SIM without compromising the standard and quality of such an academic package. It required many rigorous steps before printing and circulation of the entire academic package to our dear learners. Every intervening step was meticulously and methodically followed for ensuring quality in such a time bound manner. The SIMs are prepared by eminent subject experts and edited by the senior members of the faculty specializing in the discipline concerned. Printing of the SIMs has been done with utmost care and attention. Students are the primary beneficiaries of these materials so developed. Therefore, you must go through the contents seriously and take your queries, if any, to the Counselors during Personal Contact Programs (PCPs) for clarifications. In comparison to F2F mode, the onus is on the learners in the ODL mode. So please change your mind accordingly and shrug off your old mindset of teacher dependence and spoon feeding habits immediately.

4 I would further urge you to go for other Open Educational Resources (OERs) - available on websites, for better understanding and gaining comprehensive mastery over the subject. From this year NSOU is also providing ICT enabled support services to the students enrolled under this University. So, in addition to the printed SIMs, the e-contents are also provided to the students to facilitate the usage and ensure more flexibility at the user end. The other ICT based support systems will be there for the benefit of the learners. So please make the most of it and do your best in the examinations. However, any suggestion or constructive criticism regarding the SIMs and its improvement is welcome. I must acknowledge the contribution of all the content writers, editors and background minds at the SoE, NSOU for their respective efforts, expertise and hard work in producing the SIMs within a very short time. Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor, NSOU

References 1.1 Introduction Social Science is an integral part of School education. Along with other subject like language,
science and mathematics social science gives the students knowledge and understanding of the concrete realities and
situations of life and aims at developing the skills to deal with several requirements of life. The course on teaching of
Social Science is designed not only to provide the teachers with
the pedagogical principle involved in teaching of

Social Science. In this unit the course focuses on concept, scope and nature of social science, difference between Social Studies and Social Sciences, significance of social science and the role of social science teacher for an egalitarian society. 1.2

Objectives At

the end of

this sub-unit, you will be able to State the meaning of the

concept of

social science. Describe the significance of learning social science.

10 Determine the concept of social science teaching. Know the different perspective of the concept of social science. 1.3

Concept, Scope & Nature of Social Science Concept : Social science has a broader aspect which is related with the diverse concerns of society. Social science include in its course the disciplines of history, geography, political science, economics, psychology and sociology. It is a course of study with the society. It denotes the history of society with its emergence and downfall along with its continuous process. In a broader term "social science is a major categories of academic disciplines concerned with society" but it should be added that social science reveals the relationship among individuals, and their outlook to society. Moreover, it can also be said that the social science exerts an important responsibilities to make the base for social values and also human values, freedom, trust, mutual respect, sense for heritage etc. According to James High "Social Sciences are those bodies of learning and study which recognizes the simultaneous and mutual action of physical and non-physical stimuli which produce social

relation" Social Science is defined as any scholastic discipline that investigates human society. The concept of social science teaching basically should be aimed of

investing in a child a moral energy and mental supports so that he or she can think independently and deal with the social forces,

that threaten these values. Thus, the concept of social science and the

teaching of social science has been linked up to the role of an individual in contributing to this development of personality. Gender concern also

need to be addressed in terms of the perspectives of women.

Environment studies is viable with the concept of social science. From primary education only it should

be introduced, then a child may be initiated to locate and comprehend the relationship between the natural environment and social

science. Later, in higher classes the concept of social science among them could be more explicable and it can discuss the relation between natural diversity and socio-cultural diversity. The skill of observation and experience can create cognitive capacity within the learner thus, the concept of learning and teaching of social science creates a new approach in education.

11 Scope & Nature : The scope of social sciences is multifarious. The study of social science is vital for the future of our civilization and society. The answer of modern problems and its remedies can be detected through social science. As social science is contained with different subjects so

the scope of social science is vast. The scope of analysis of the facts and

figures, problems and other things can provide society with so many important answers and observations that may improve the understanding of our lives

which helps us to improve our interaction with each other. Thus, social science will provide all types of social situation & psychological condition. There are different subjects in social science. It is an important scope to inculcate different areas of social science. As for instance, we should say that

geography and economics may together help in developing a proper perspective related to the issue concerning environment, resource and development at different levels from local to national level similarly Indian history will be taught

emphasizing the concept of plurality and change. Nature : The

nature of

social science is classical based on

a wide range of content drawn from the disciplines of history, geography, political science, economics and sociology.

Social science always tries to find out its relevance with the society. The nature and outlook of social science is

based on scientific approach. Social science advocate for scientific inquiry like other science subjects. To search the logic and reason of human sciences (History, geography, economics, political science etc.) is the specific nature of social science.

The major thrust of social science curriculum has remained utilitarian in nature and it put more emphasis on developmental issues for mankind. Thus social science makes a broader outlook and classic nature. 1.4 Difference between Social Science and Social Studies : There is a debate regarding the difference between social science and social studies. Social science develop ideas on subjects but social studies has an objective outlook regarding subject.

It is social study through which students understand their own social environment and they use to learn the pedagogical approach of subjects. Social science allows them more to learn. It is the philosophy and meaning of the subject which social science brings to them.

12 Generally it can be said that the social studies are concerned with man and his interaction as well as his relation with social, cultural economic and physical environment. In a nutshell it can be said that in social studies, studying human beings and its perspective towards society is important. If we carefully try to understand what is the difference between social science and social studies, we will see that the area of social studies and its objective has a more wider space. In NPE core curriculum (1986) it is described that social studies should deal with the ideas of humanism, secularism, socialism and democracy. The chief aim of reading social studies is to know the society and to develop skills and attitudes for producing conscientious citizens. Through social studies a teacher can equip himself with the needed attitude and outlook absorbed in making a good citizen as well as good students. On the part of learner the social studies has a promising outlook. Actually social studies prepare a student to investigate his past. It can be done through history, learner should be attentive about his whereabouts and surrounding as well as environment through studying geography. Social studies supplies the information on needs and desires of the people along with their psychological condition through reading psychology. How people will be supported financially, what would be his procurement, all of these things can be discussed through economics, sociology and political science. It shows them the way of a broader aspect of administration, nations and civilisation. Thus it is seen that through social studies students would be well aware of his time, space, society, background and outcome. These studies have a confluencing effort. Now we can compare social science with social studies to a specific point. The point is that social science deals with facts and material objects, language with communication and mathematics with quantity accounts but social studies deals mainly with the socio-economic relationship among the people. It makes the study of the life of the pupil in society and it tries to discover society's needs and priorities, the emerging aims and objectives of teaching social studies should be discussed here. In this context we should say that social studies help learners to develop greater awareness among themselves, to classify and examine their values and to establish a sense of self-

identity. It provides learners with a knowledge of human system in areas of economics, culture, and governmental administrative process. Social science is the branches of the study of human society and social relationship. Social science is a subject that deals with the study of social life of people or groups

13 of individual. Social science is related with study and observation. Social science includes different subjects such as history, geography economics, psychology, political science and sociology. All of the subjects are important in relation with social science but study of sociology, history, geography and economics form a very important part of social science. The scope of social studies has a multifarious direction. The objective is also different. Social study is the combined study of social science and humanities. Social study helps to make healthy citizens. Social studies varies greatly among the countries according to their social, cultural and economic set up. The texture of social science remains same and it has a common area in different countries. Social science is the study of society and the manner in which people behave and work and influence the world around us. John Dewey opined that the concept of social science is a social enquiry. According to NCERT. "

The social science encompass diverse concerns of society and include a wide range of content, drawn from the disciplines of history, geography political science, economics and sociology.

The social science carry a normative responsibility to create and widen the popular base for human values, namely freedom, trust, mutual respect for diversity etc." Social

studies has a practical base regarding the utility of education which could be meaningful and necessary for society. It has a wider range of action. It is not only confined to the classroom. It tries to prepare students to become well informed and constructive participants in society and capable of developing healthy relationships. The aims and objectives of social Science are more dynamic because it has to change itself by generation after generation. New generations have started facing new challenges. New social rules are introduced new ideas which used to challenge the old ones due to the change in Socio politico and economic situation. There is a comparative study regarding the difference between social science and social studies. Some scholars say that social studies is no doubt a separate branch of studies but it is called 'Social science' when studied at a higher level. The term social studies is an age old term. According NCERT social studies is 'a field of study which deals with man, his relation with other men and his environment on understanding of human relationships, knowledge of the environment, dedication to the basic principle and values of the society in which it is taught and a commitment to participate in the process through which that society is maintained and improved. A careful analysis will prove that social studies touches all aspect of human life and human relationship, side by side it derives and inculcate knowledge of all social

14 sciences. When not a student but a common man think of social studies, he or she give stress on social problems or current events but in the case soical science he or she will be attentive on subjective mood. Poeples generally concentrate on the theory part of human and social affairs, problems etc. in term of social science but no doubt social studies is the practice part of human and social affairs. Commonly it is told that social science and social studies receiprocate each other from different angle but at a higher level of studies, Social Science concentrate on investigation, research and solutions to social problem. Social scientist is eager to expand the bond of human knowledge. His treatment is more analytical than the treatment given by a specialist of social studies. Social studies is more or less of a descriptive type when the information is truly Presented Social Studies provide a good foundation on which the structure of Social Science can be built. The concept of social studies has been discussed by different scholars. In the words of J. F. Forrester "Social studies as the very name suggest in the study of society and its chief aim

is to help pupils to understand the world in which they have to live and how it came to be, so that they may become responsible citizens. It aims of promoting critical thinking and

a readiness for social change, at creating a dispositions for acting on behalf of the general welfare at an appreciation of other culture and

a realisation of the interdependence of man and man and of nation and nation." The secondary education commission in India (Mudaliar commission 1952-53) states "social studies as a term is comparatively new in Indian education. It is meant, it cover the ground traditionally associated with history, geography economics, civils etc. The whole group of studies has therefore to be viewed as a compact whole where object is to adjust the students to their soical environment which includes the family. Community, state and nation." Thus it is seen that social studies has a seperate identity. Obvioulsy there are some differences between social studies and social science. The focus and emphasis of both are different. Social Science represent an adult approach, while the social studies represent a child approach. Social Science are the theory part of human affairs Social Studies are the practice part of human affairs. The Social Sciences are far larger than the Social Studies.

15 1.5 Aims & objectives of Teaching Social Science

at school level. Aims and objectives of teaching social science of school level has a far reaching effect.

Social science curriculum consist of

a wide range of contents drawn from the disciplines of history, geography, political science, economics and sociology. The selection and organisation of material into a meaningful social science curriculum is the primary aim and objectives of teachig social science at school level. To enable student to develop a critical understanding of society is another aim of social science. Social science expresses the views that student's own life experiences is very important.

The objective of social science is

to create and widen the popular base for human values, nearly freedom, trust, mutual respect, respect for diversity etc.

Thus,

it is seen that

social science teaching basically should be aimed at investing in a child a moral and psychic energy so that he or she can think independently and deal with the hostile social forces while threaten their values. Aim and objectives of teaching social science at school level is to prepare a student philosophically so that he or she can understand the meaning of (Co-existence) between individual good and collective good. Social science tries to create a non-coercive & participatory mode, among childrens and teachers so that the best chance of making teaching and learning interesting as well as enjoyable.

Social science created different disciplines like history, geography, political science and economics and its methodology with pedagogy, gradually social science put some new ideas on teaching different subjects at school level.

Planning the curriculum at the primary stage,

the natural and social environment should be taught as an integral part of language and mathematics

along with other subjects. Children should be engaged in

such activities that

would help them in promoting and understanding about the natural and social environment. Another aim and objective of teaching social science at school is to make the students conscious with gender sensitivity. It is new ideas of

contemporary age. It is also to

be mentioned that

understanding in social sciences

at school level should be based on observation and illustration which is needed to be drawn from

the physical, biological, social and cultural aspects of life

because

it is important for the child to develop the skill of observation, identification and classification.

Through these power of observations, identification and classification a student can be competent to draw the analogies between natural diversity and socio-cultural diversity. Thus, the social science teaching based on observation and experience which can create cognitive

16 capacity within the child.

At the upper primary stage the subject area of social science is generally based on history, geography, political science and economics.

Side by side a new syllabus should be framed by

introducing the learner to social & economic problems and emphasis

should be made on issue like poverty, illiteracy, child and bonded labour, gender and environment.

Indian history will be taught defining and giving stress on the concept of plurality and change. At the secondary stage

the aim and objectives of social science will be broader. It should comprise the elements of history, geography, political science and economics. The higher secondary stage is

considered important as it offer different choice of streams to the students according to their Issues, During this period the teaching of history should be placed on a broader sense. Issues related to

geography should be taught keeping in mind the need to inculcate in the child a critical appreciation for censure and environmental concerns. In political science

the focus should be on discussing the philosophical foundations based on the value framework of the Indian constitution.

If economics as a subject should be discussed from the perspective of the masses, the sense of economic reason to clarify any social economic matter is important. To sum up it can be said that the foundation of teaching social science needs basic knowledge, skills and attitudes to make meaningful contribution in any field, they choose. Thus, it is seen that the aim and objectives of social science are larger to expand the bonds of human knowledge and teachers should resort to the techniques of Team teaching wherever possible to develop and socio scientific culture which is the general need of the hour.

1.6 Significance of Social Science

as a core subject The subject social sciences indicate the importance of the relationships between the key disciplinary contributors to this learning area. Together they provide a broad understanding of how societies work, and how people can participate as critical, active, informed and responsible citizens with high level skills needed for the twenty-first century. Social Science as a core subject of school

aims at enabling the student not only to adjust himself to the environment but also to improve his social, cultural, economic

and physical environment as an active group member.

Social Science also

includes development of knowledge, skills, attitudes and values through the activities of reading, writing, observing, discussing, creating, practicing, playing, problem solving, exhibiting and developing relationships etc.

The significance of Social Science as a core subject has multi-dimensions. It can provide us with so many important answers and observations that may help to improve the understanding of our lives and then help us to improve our interaction with each other. In this context the philosophy of Social Science related with core subject is to be discussed.

It may be defined as the rational and systematic study of human society in all its forms with the aim of arriving at an enduring understanding, acknowledged as such by a broad consensus of researchers of social phenomena. It gives scientific explanations of certain social phenomena. Here, conceptual analysis is needed. Actually the objective of social and behavioural science component of a core curriculum is to increase students knowledge, to discover, describe and explain the behaviour and interaction with individual group, institutional event and ideas. Students develop knowledge and skills to enable them to: better understand, participate in and contribute to the local, national and global communities in which they live and work; engage critically with societal issues; and, evaluate the sustainability of alternative social, economic, political and environmental practices. Social Science/learning as a core subject involves : critically examining society, social practices and social issues incorporating a range of theoretical perspectives such as socio-cultural, feminist, postmodern, postcolonial, indigenous and others used in the contributing disciplines using teaching approaches that are constructivist, socio-ecological, participatory, experiential, inquiry- or problem-based using teaching strategies that promote questioning, problematising, critical inquiry, values exploration, social decision-making gathering, verifying, evaluating and synthesizing multiple sources of data and using information communications technology allowing for personal growth, and the development of individual and collective responsibility

18 connecting with students' social, affective, aesthetic, moral and spiritual development making judgments about appropriate personal and social actions. The Social Science learning as a core subject will be the activity of gathering, analyzing and interpreting information for a variety of social, economic, educational and political purposes. So the Social Science teacher needs to be familiar with a range of social research method. Ability to conduct proper social research is significant to any social science qualification. Thus, it is seen that as a core subject Social Science is important because it helps to knowledge structure. Simultaneously. to prepare the environment of relevant understanding the role of Social Science teacher is creative. Social science as a core subject not only defines and validates societal aims. it also has the capacity to provoke learners to critically examine them on the anvil of universal values of social justice and environmental susiainability.

In most democratic countries Social Science make the greatest possible contribution to citizenship education in the broad sense of maximum personal development, human relationship and loyalty to the principles and practices that support freedom.

Thus, the objective of teaching Social Science as a core subject is to help students to acquire knowledge of their own physical. social and economic environment, and understanding of human relationship. It also helps to achieve certain attitudes and values which are vital for intelligent participation in the affairs of the community, the region, the state, the

nation and the world. 1.7 Role of Social Science Teacher for an Egalitarian society : Egalitarian society is a favourable society for a social science teachers. An egaliterian society believes in treating people equally through giving people equal right and opportunity. This society advocates for the protection of human quality with respect to economic, social and political right. It advocates to drive out of inequality in the society and determination based on gender, race, religion etc. Role of social science teacher in this respect is very important. They should take the role of pioneers to precach these ideas. Social science teacher deals with attitudes, ideas and other knowledgable matter to a large extent. Teacher of social scince have the duties

to assist

pupils to understand this complex world in which we live.

Social science teachers should have faith on the socialisation of the people in society and will

19 develop trust, equality, logical thinking among the students. He should be careful to the mission of egalitarian society for making good citizens of the nation. The role of social science teacher would be as a guide, philosopher and friend. In this respect teacher should make his school as a centre of social reconstruction for a new social order. The teacher should arouse intellectual interests and would be careful to open social insight and understanding. Now, the question comes what the students will learn from the teacher? In this respect we can say that philosophical ideas are important. An egalitarian society is based on philosophical ideas which would be useful for the students. So a social science teacher must be careful about different sociological ideas. Indian society is a multicultural society. In India there are different religions. So an assimilation is important. Teacher will develop the spirit of tolerance and democratic ideas among the students. This role of teacher is very much helpful to form an egalitarian society depends on democracy. After the Renaissance the idea of democratisation in the sphere of education achieved a new dimension in educational thoughts. The idea of citizenship based on it. In this respect teacher should make the student very much aware of social interaction. There are different subjects in social science, so social science teacher should have some preliminary ideas on these subjects. A basic knowledge on social science is also needed. Teacher should try to combine the family, community, state, nations and international understanding through a scientific process. A knowledge of methodology is needed to specify gender, race & religions. Now it is noticed that the process and arena of social science is changing very fast. A teacher must be well aware of it. The reciprocating process is more important to deal with the student. To arouse interest in the matter is more important. Teacher will find the stimulus and helpful areas of social science. Competency of teachers is needed in all respects. Thus it is seen that performance, competency and transaction related competency are important in the life of a social science teacher. Now social inequalities are more prominent especially in developing countries of the world because of the limited capacity for economic growth. In the sphere of education, egalitarian process has identified three aspects to the questions of equal educational opportunities to the people. It gave stress on the idea that a social science teacher should make equal treatment during education irrespective of social origin. The second approach to equalising educational opportunities is to ensure that all students will get equal treatment during educational process. The third approach is to provide equal opportunities for

20 the students. So education is one of the instruments through which most societies advocate for social equality. In an egalitarian society the scope of teaching are based on various mediums. A social science teacher should be well conversant with the use of teaching aids like (epidiascope), films, strips, projector, computers etc. Side by side a social science teacher should be well aware of suitable source material and appropriate method of teaching, good command over the language and good conversational pattern is important. The power of correlation is necessary and ability in planning, supervision, organisation and management makes a teacher competent. Modern educational world opines that "the content of social science changes as the world changes time to time so a social science teaching would be versatile and he/she should cope up with the change. It is expected that he/she should have a full hold on any of the two subjects among, history, geography, sociology and political science. Teacher shall be well aware of extra-curricular activities as well as co-curricular activities. Co-curricular activities like games, daily performance, excursion community and group activities should be guided by social science teacher because these activities help the student to realise the subjects. It provides different thoughts and derived social qualities in students. Lastly, it can be said that to make a successful egalitarian society a teacher should know the proper teaching method. He/she should be careful to choose source material. He/she should have good command over the language and he/she should have the abilities to prepare and use relevant teaching aids. Thus, a teacher would be able to create the atmosphere of learning for all and the aims of egalitarian society.

1.9 Let Us Sum Up

The present unit has attempted to provide the basic concepts about the meaning, nature, scope and significance of social science and various approaches of social science curriculum. This unit also deals with the role of social science teacher which is very significant to develop in pupils an outlook in egalitarian society for making good citizens and new social order. And it is expected that a teacher will be able to create the atmosphere of learning for all and the aims of egalitarian society. 1.10

References 2.1 Introduction

The vital and most significant component of any teaching learning process is the curriculum which reflects the ideology and Philosophy of a nation as enshrined in its constitution. Keeping in mind the learning objectives of a particular stage of education, certain planned experiences are presented before the learners of that stage of education which would help the learners to achieve those specific learning objectives in the long run. These experiences are termed

as 'curriculum'. "The experiences are

24 suited to the age of the learner, the emotional, physical and intellectual maturity of the learner and his previous experiences and learning." Curriculum derives from a Latin word "couriere" which means a 'race course' to be covered within a specific time period to reach the goal. The Secondary Education Commission (1952-53) defined curriculum in a very comprehensive way

that

it "includes the

totality of experiences that a pupil receives through the manifold activities that go on

in the school, in the classroom, library, laboratory, workshop, playground and in the numerous informal contact between teachers and pupils.

In this sense the

whole life of the school becomes the curriculum which can touch the life of the students at all points and keep in the evolution of

a balanced personality."

Curriculum can broadly be classified as (a) subject-matter curriculum which includes separate subjects, correlated subjects and broad fields (b) developmental activity curriculum which takes into account the basic social and organic needs of the learners. In the broad field curriculum subjects are grouped into broad areas like language, natural science, social science etc. "

The social sciences

encompass diverse concerns of society and include

a wide range of content, drawn from the disciplines of history, geography, political science, economics and sociology.

The selection and organisation of material into a meaningful social science curriculum, enabling students to develop a critical understanding of society, is therefore a challenging task. The possibilities of including new dimensions and concerns are immense especially

in view of the student's own life experiences."

The Secondary Education Commission (1952-53) states that, "

The basis of teaching must be the organisation of subject-matter into units or projects which would create opportunities for self-activity on the part of the students." 2.2

Objectives After going through this unit you will be able to : 1.

Explain

how to organize history and Geography curriculum at school level. 2. Describe the various principles of organizing history and Geograph curriculum at school level.

25 3. Analyse the concept of instructional planning, its needs and importance. 4. State the concept of unit plan and lesson plan, its needs and importance. 5. Prepare unit and lesson plan of history and Geography for children with disabilities at school level. 6. Discuss the concept of pedagogical analysis. 7. Construct pedagogical analysis in Social Science for school level. 2.3

Organization of Social Science (History & Geography) Curriculum at School Levels

History is most often said to be the "mother" of the social sciences. The definition of history given by Johnson in his book 'Teaching of History' is very comprehensive. He said "History, in its broadest sense, is everything that ever happenedhistory, in its usual acceptance of the term means history of man."

History is the scientific study of the past, concerned with man in time and space which put emphasis on evolution, growth and development of human civilization through the ages. The scope of history is very wide, vast and comprehensive as it has expanded vertically and horizontally. Therefore, the selection of content and organization of content of history have to be made very carefully and logically while framing the curriculum of history at school levels.

2.3.1(

a) Principles of framing history curriculum : Following principles should be kept in mind for curriculum construction in history : a. The curriculum should be based on the aims and objectives of teaching history at school level. b. The curriculum should be suited to the age, capacity and ability of the pupils for whom it will be framed. So it should be learner centered. c. There should be a functional relationship between the content of the study. d. Curriculum should provide a totality experience of man's evolution on earth. e. It should lay emphasis on promotion of social justice, democratic values, national integration and international understanding.

26 2.3.1.(

b) Principles of Organising Geography Curriculum at school level: a.

Proceed from known to unknown:

Teaching of Geography should start from the micro level or local Geography study. It will follow the maxims of teaching: ? Proceed from known to unknown ? Proceed from concrete to abstract ? Proceed from near to far b.

Emphasis on empirical observations of the learner in selection of Subject matter: The curriculum should provide ample opportunity to the learners so that they can learn by actual experience. Therefore, the curriculum should be practical work oriented. c. Use of Geographical Terminology based on home Geography: An all out effort should be made to provide to the child Geographical vocabulary from their surroundings. For learning island, delta etc. it is essential that they have ample knowledge of the geography of their area for this the geographical vocabulary from their surrounds should be used. d. Idea of human life throughout the world: The Geography curriculum should give an idea of human life and activities throughout the world to understand man-environment relationship. Keeping this aim in mind, students will be able to enter the world as practical citizen. e. Study in the synthetic way:

Various geographical facts should be presented to the child in a synthetic way. Geography is a practical subject and it should not be a collection of Geology and Astronomy etc. It should be presented as an integrated subject.

e. Emphasis on physical and economic Geography: In any curriculum of Geography, physical and economic geography must be given their proper place. More emphasis is placed of these branches of Geography in later school days. e. International understanding: We cannot make a systematic study of all the countries of world in any curriculum of Geography. It makes it all the more important that we make our selection very carefully. An effort is made to put more stress on international understanding and interdependence of nations. h. Selection of subjects: Only elementary things of remote countries are included

27 in curriculum so that students know their situation. Only such topics which have international significance should be taught about these countries. 2.3.2.(b) Curriculum of Geography at school level:

There are three major components of Geography at school level. These are as follows: Physical geography and weather observation Regional geography and Map work The curriculum of geography at school level may be subdivided under the following headings. 1. General study of the world other than the country in which pupil resides. II. Study of home country and its relationship with other countries of the world III. While studying the world geography the following areas may be emphasized:

a. Movement of various planets, sun, earth etc. b.

Formation of day and night, change of seasons, movement of earth, change of weather, longitude and latitude.

c.

Surface of the land, flow of river and its causes, various water divisions of the world, currents, ebb and tide etc. d.

Atmosphere, weather, climate, temperature, pressure, rainfall, bands and divisions of the world, cyclone etc.

e.

Influence of physical conditions on human activities f. Important cereals and crops of the world, raw material.

g.

Mineral wealth and power, industry. h. Routes of trades, communication and development of big cities.

While carrying out the study of home country an effort should be made to acquaint the child about maximum of details of the country. For this purpose, maps, atlases and other teaching aids should be used. To acquaint students with home country

tours and excursions may be organized. For this specific purpose the regional method of teaching geography must be followed. The study of the following should be incorporated while framing the curriculum.

28 I.

Situations and locations of various physical divisions of the world, their longitude, latitude etc. II. Students are asked to measure the length and breadth of a specified region from the map so that they get a clear idea of physical divisions of the world. III. Study of natural or physical conditions including study of mountains, rivers, peaks etc. IV. To know the climate and its qualities a study of maximum minimum thermometer should be included. V. Study of pressure of area and wind. VI. Study of rain fall in the area. VII. A detailed study of mineral wealth of area. VIII. A complete study of animal wealth of area. IX. Study of industry, art, craft and trade. X. Comparative study of location of various trades and industries. XI. Study of industrial tours and cities. XII. Study of population.

While taking up the teaching of world geography different teachers follow different order of treatment of continents. However, it has now been concluded on the basis of various studies that the three southern continents should always be taught before Europe and North America.

The regional study of India should be taught at lower classes. Practical work: Map work should be given due importance and in junior classes we should try to clarify the meaning of map and scale. Maps should be used to teach relief. Before taking up the contour line method of showing relief, heights may be shown by shading. Three dimensional models can be used for interpretation of maps for the visually impaired students.

29

Study of physical and political divisions of the map of the world. Various means of communications like sea routes, land routes, air routes etc. Trade of perishable goods. Science and its influence on human life. Modern inventions. Local environmental studies. To keep a record of weather and seasons and to maintain charts for this purpose. 2.3.2 History Curriculum at school level : History has been given an important place in the school curriculum

for a long time. The scope of history is very large and vast, wide and long. It deals with human achievements in all walks of life-political, social, economic, cultural etc. There are also many types of history like local, regional, national and international. It is comprehensive in nature. There should be a reflection and an adequate coverage of all the aspects and all types of history in any school curriculum, so that the students will be able to get an over all idea of history.

The curriculum of

history can usually be divided into three broad categories : Ancient Period, Medieval Period and Modern Period. The landmark happenings led to the evolution of human civilization both nationally and internationally are selected as content for each period. Ancient Period of history should cover the following topics :

Concept of history-Pre-historic period and the Early man-The stone age-The copper bronze age- The sources of history- The River centric civilizations (

The Harappan civilization, the Mesopotemian civilization, the Egyptian civilization, the Chinese civilization). The iron age-The Roman civilization and the Greek civilization, The Vedic and the later Vedic Civilization, The Protest Movement- rise of Jainism and Buddhism, The rise of Empire or the age of imperialism in India - The Mauryan Empire, The Kushana Empire, The Gupta empire- The history of Bengal, The Deccan and South India, Relations with the outside world.

30 Medieval Period should deal with the following topics : Beginning of the medieval

period and its features, the sources of history-

rise of regional powers in Bengal, North India and South India- The tripartite struggle centering around Kanauj-contact of India with Islam- The Delhi Sultanate, The Mughal Empire, The

history of Vijaynagar and Bahamani kingdom in the south, Administration, society, economy and culture, Relation of India with the outside world. The Arab Empire and

rise of Islam, The Byzantine Empire, Feudalism in Europe, Rise of towns, Trade and commerce, History of China and Japan. Modern Period Should consist of the following topics : Beginning of the Modern Age-Renaissance in Europe, Reformation Movement in Europe, Geographical discoveries and exploration, growth of Nation States, The English Revolution.

The

Industrial Revolution, The American War of Independence, The French Revolution, The Democratic and Nationalist Movement in Russia,

Imperialism and

the First World War, The League of Nations, Rise of Fascism in Italy and Rise of Nazism in Germany, The Second World War, The United Nations Organisation and The Cold War.

The

Indian States and Society in the 18 th Century – The Rise of Regional Powers in Bengal, Maharashtra, Mysore and in Punjab. The beginning of the European settlements in India and the East India Company, The Anglo French Rivalry in the Deccan. The British conquest of India (1757-1856) : Expansion of the British Empire British occupation of Bengal, British imperialist policy, Anglo Maratha, Anglo Mysore, Anglo Sikh war. British administrative policy and the structure of government. British economic policies the drain of wealth, British agrarian policies impact of British economic policies, development of modern industries. British education policies and beginning of modern education. Social and cultural awakening in 19 th century India : Raja Rammohan Roy, Brahma Samaj Movement, Young Bengal Movement, Pandit Iswar Chandra Vidyasagar, Ramkrishna Mission Movement, Prathana Samaj Movement, Arya Samaj Movement, Aligarh Movement.

31 The Revolt of 1857- administrative policies and reform after 1858. India and her neighbours : war with Nepal, Burma and Tibet. The Peasant Movements and the Tribal Movement. Emergence of Indian Nationalism (1858-1950) : Factors behind the emergence of national consciousness, political associations and birth of Indian National Congress, activities of Congress from 1885 to 1995 National Movement (1905-1920) : Growth of militant nationalism and extremist politics, partition of Bengal and Swadeshi Movement, The Muslim League and rise of communalism, the First World War, the Home Rule League, growth of revolutionary movement. Struggle for Swaraj (1920-1947) : National movement after the First World War, Rise of Mahatma Gandhi in Indian National Politics- Three Satyagraha Movements by Gandhiji, Montagu Chelmsford Reform, Rowlatt Act, Jalianwalabag Massacre, Non Co-operation and Khilafat Movement, the Swaraj', Civil Disobedience Movement, The Government of India Act 1935, Growth of Socialist Politics, Working class movement, The Second World War- Quit India Movement, Netaji Subhas Chandra Bose and INA, Royal Navy Movement, Wavel Plan, Transfer of power, partition and independence, New Constitution of Independent India. 2.4

Instructional Planning :

concept, need and importance Planning is preparation for action. It is an essential tool for effective teaching.

Instructional planning is a process of using appropriate curricula, instructional strategies and available resources by a teacher to address various needs of the students. It is the systematic selection of educational goals and objectives and their design for use in the classroom. Prior to each lesson, unit, semester, while teachers are planning the content of instruction, selecting teaching materials, designing the learning activities and grouping methods, and deciding on the pacing and allocation of instructional time, they are actually determining what learning opportunities their students are going to have. Teachers could use learning outcomes developed by professional organisations or school curriculum goals and objectives to plot the sequence of subject topics. However, the most informative source of any instructional planning is the students to whom the teacher would teach in the classroom.

32 A solid planning process is integral to a teacher's efforts in identifying appropriate curricula, instructional strategies, and resources to address the needs of all students. Research shows the following key areas that a teacher should follow while making instructional planning. What should be taught? Effective student learning requires a progressive and coherent set of learning objectives. Effective teachers excel in delineating the intended outcomes of each lesson and describing the behaviours or actions that students should be able to perform after participating in the learning activities. Expert teachers conceive a lesson along two dimensions simultaneously: Teacher's own actions, thoughts, and habits; and students' thinking and understanding of the content. Thus, effective teachers not only plan what to teach, but more importantly, they plan for whom they are going to teach. How should it be taught? After developing the learning objectives, the next step is to translate the instructional plans into actions. Effective teachers follow the predefined plan while remaining open to changes and continuously adjusting their instruction based on student needs. How should instruction and student learning be assessed? Teachers need to link assessment plan to learning objectives. Before the actual instruction starts, teachers need to decide upon valid and reliable assessment techniques that are available to solicit student learning data and judge the success of the instructional plan. Teachers should communicate to their students about what they are expected to achieve and inform them about how they will be assessed after participating in the learning activities. Need and importance of instruction planning Instructional planning assures improved delivery of instruction. It helps in creating effective, meaningful lessons. It helps students make sense of information. Effective lessons make sense of information. Teacher feels comfortable about instruction and giving them a sense of understanding and ownership over the teaching they plan.

33 It established a sense of purpose and subject matter focus. It provides a change to review and become familiar with the subject matter before actually begins to teach it. It links daily lessons to broader integrative goals, units or curriculum topics. Instructional Objectives:

The teacher has to place before the students some definite and specific objectives within a specified classroom period and resources in hand at the time of imparting a particular lesson. Through these specific objectives, commonly known as instructional objectives, the teacher tries to bring necessary behavioural changes among the students. Therefore, the term instructional objectives may be defined as "a group of statements formulated by a teacher for describing what the pupils are expected to do or will be able to do once process of classroom instruction is over."

Instructional objectives are specific and quite narrow. They are predetermined. They are learning outcomes and stated in terms of desired behavioural changes of the learners. Taxonomy of Instructional Objectives: Taxonomy means a system of classification. The taxonomy of educational objectives are framework for classifying statements of what we expect or intend students to learn or show behavioural changes as a result of instruction. The taxonomy of educational and instructional objectives are divided into three domains: cognitive, affective and psychomotor.

The taxonomy related to cognitive domain has been presented by Benjamin S. Bloom and his associates in 1956 under the title, 'Taxonomy of Educational Objectives: The Classification of Educational Goals. Handbook 1: Cognitive Domain'. The second or the affective domains was presented by Krathwohl (1964) and the third one or psychomotor domain by Harrow and Simpson (1966). Structure of Bloom's Taxonomy: Bloom and his associates have classified the objectives related to cognitive domain into six categories arranged from the lowest to the highest level of thinking process which is mentioned below:

34 1.0 Knowledge 1.10

Knowledge of specific 1.11 Knowledge of terminology 1.12 Knowledge of specific facts 1.20 Knowledge of ways and means of

dealing with specifics 1.21 Knowledge of conventions 1.22 Knowledge of trends and sequences 1.23 Knowledge of classifications and categories 1.24 Knowledge of criteria 1.25 Knowledge of methodology 1.30 Knowledge of universals and abstractions

in field 1.31 Knowledge of principles and generalizations 1.32 Knowledge of theories and structures 2.0 Comprehension 2.1

Translation 2.2 Interpretation 2.3 Extrapolation 3.0 Application 4.0 Analysis 4.1 Analysis of relationship 4.3 Analysis of organizational principles 5.0

Synthesis 5.1

Production of unique communication 5.2 Production of a plan, or proposed set of operations 5.3 Derivation of a set of abstract relations 6.0 Evaluation 6.1

Evaluation

in terms of internal evidence 6.2 Evaluation in terms of external criteria

35 The Revised Bloom's Taxonomy The original Bloom's Taxonomy was revised in 2001 (Anderson, Krathwohl, et al., 2001) where any objective is represented in two dimensions – cognitive process dimension and knowledge dimension.

Structure of the cognitive process dimension of the Revised Taxonomy : 1.0 Remember-Retrieving relevant knowledge from long-term memory 1.1 Recognising 1.2 Recalling 2.0 Understand- determining the meaning of instructional messages including

oral, written and graphic communication. 2.1 Interpreting 2.2 Exemplifying 2.3 Classifying 2.4 Summarising 2.5 Inferring 2.6 Comparing 2.7 Explaining 3.0

Apply- Carrying out or using a procedure in a given situation. 3.1 Executing 3.2 Implementing 4.0 Analyze- Breaking material into constituent parts and detecting how the parts relate to one another and to an overall structure of purpose.

4.1 Differentiating 4.2 Organising 4.3 Attributing 5.0 Evaluate-Making judgements based on criteria and standards. 5.1

Checking 5.2 Critiquing 6.0 Create- Putting elements together to form a novel, coherent whole or make an

36 original product. 6.1 Generating 6.2 Planning 6.3 Producing Structure of Knowledge Dimension of the Revised

Bloom's Taxonomy : A. Factual Knowledge- The basic elements that students must know to be acquainted with

a discipline or solve problems in it. Aa. Knowledge of terminology Ab. Knowledge of specific details and elements

B. Conceptual Knowledge- The interrelationships among the basic elements within a larger structure that enable them to function together. Ba. Knowledge of classification and categories Bb.

Knowledge of principles and generalisations Bc. Knowledge of theories, models and structures C. Procedural

Knowledge- How to

do something;

methods of inquiry; and criteria for using skills, algorithms, techniques, and methods. Ca. Knowledge of subject specific-skills and algorithms Cb. Knowledge of subject-specific techniques and methods Cc. Knowledge of criteria for

determining when to use appropriate procedures D. Metacognitive Knowledge-

Knowledge of cognition in general as well as awareness and knowledge of one's own cognition. Da. Strategic Knowledge Db.

Knowledge about cognitive tasks, including appropriate contextual and conditional knowledge Dc. Self-knowledge

Taxonomy of Objectives in the Affective Domain : 1. Receiving (attending) (a) Awareness (b) Willingness to receive (c)

Controlled or selected attention

37 2. Responding (a) Acquiescence in responding (b) Willingness to respond (c) Satisfaction in response 3. Valuing (a)

Acceptance of a value (b) Preference for a value (c) Commitment 4. Organisation (a) Conceptualisation of a value (b)

Organisation of a value system 5. Characterisation by a value or value complex (a) Generalised set (b) Characterization

Taxonomy of Objectives of Psychomotor Domain : 1. Imitation (a) Impulsion (b) Overt repetition 2. Manipulation (a)

Following direction (b) Selection (c) Fixation 3. Precision (a) Reproduction (b) Control 4. Articulation (a) Sequence

38 (b) Harmony 5. Naturalisation (a) Automatism (b) Interiorization The Cognitive Process Dimension The 1.Remember 2.

Understand 3.Apply 4. Analyse 5. Evaluate 6. Create Knowledge Dimension A.Factual Knowledge B.Conceptual

Knowledge C.Procedural Knowledge D.Metacognitive Knowledge Revised Bloom Taxonomic Table 2.5 Unit plan and

lesson plan of Social Science : A unit is a related learning segment made up of a few lessons along with an outline of its actual execution in the class room. Thus a unit will consist of both the subject matter and methodology of its delivery to students. Hoover defines unit as, "

the teaching unit is a group of related concepts from which a given set of instructional and educational experiences

is desired. Unit generally ranges for three to six weeks long". After having divided the prescribed syllabus into a number of teaching units the teachers will decide the time that could be allotted to each unit. After that he can break up each unit in

a number of lessons and each lesson should be complete in itself. Need and importance of unit plan: It provides a basic

course structure around which specific class activities can be organized.

39 It enables the teacher to integrate the basic course concept and those of related areas into various teaching experiences. It provides an opportunity to the teacher to keep a balance between various dimensions of the prescribed course. It enables the teacher to break away from traditional text book teaching. If the prescribed course has to be covered in a number of years then it is necessary to distribute the course into units spread over a number of years.

Lesson Plan : Lesson planning is the most important part of teaching. It means "the planning of a daily lesson related with a particular unit of that subject to be covered by the teacher in a specific school period for the realization of some stipulated instructional objectives."

A teacher has to keep in mind certain things while preparing a lesson plan. These are : Broader objectives of the subjectives. Setting and defining the classroom objectives. Organisation of the relevant subject matter. Selection of appropriate teaching strategies. Provision for feedback and evaluation. Need and importance of lesson plan : Lesson planning makes the work regular, organized and more systematic. It induces confidence in the teacher. It makes teacher quite conscious of the aim which makes him conscious of attitude he wants to develop in his students. It saves a lot of time. It helps in making correlation between the concepts with the pupils' environment. It stimulates the teacher to ask striking questions. It provides more freedom in teaching.

40 It helps a teacher to improvise his teaching. It helps the teacher to prepare, organize and arrange for necessary teaching aids for a particular topic. The criteria of an effective lesson planning The criteria of an effective lesson planning can be summarised as below: 1. An effective lesson planning always needs its planning in the written form. 2. It must have instructional objectives properly expressed in behavioural terms. 3. The teaching aid materials used should be mentioned specifically. 4. It should clearly mention the procedure or the activities adopted for introduction of the lesson. 5. The subject matter should be properly selected, organised and presented in the planning. 6. The methods, techniques and devices related to the presentation should be properly selected and utilised. 7. An effective lesson plan should provide due place and have adequate provision for the effective interaction between the teacher and the students. It should ensure active cooperation and involvement of the students in the teaching- learning process. 8. An effective lesson plan should take care of the age, mental level, previous knowledge, duration of the period, teaching-learning conditions and resources available at the time of delivery of the lesson. 9. It should mention the type of black board work or summary to be developed during the presentation stage. 10. It should follow the principles of correlation and integration in the presentation of subject matter. Approaches to Lesson Planning : For planning the lesson and writing, it various styles and approaches are followed. However, the most common and popular is Herbatian five steps Approach. These steps are : 1. Preparation : This step is concerned with the task of preparing the students for receiving new knowledge. The Herbatian approach puts more emphasis on

41 this step and considers it as a base for the delivery of the lesson. It is also termed as introductory stage. Following points should be taken into consideration : (a) The previous learning of the students (b) The factors responsible for capturing students' attention and motivation (c) The objectives of the lesson 2. Presentation : New learning material is presented before the students and efforts re made to help in acquiring new learning in this stage. This step requires following considerations on the part of the teacher: (a) What learning experiences to be presented and how much (b) How much is to tell and how much the students are to find for themselves (c) What type of techniques, methods, devices to be adopted to deliver the lesson 3. Comparison and association : The step is related with the task of strengthening the acquisition of new learning material. It is based on the assumption that a child grows in knowledge through comparison and association. A teacher requires to compare, contrast and associate every new knowledge to be learnt with the previous knowledge of the learners. 4. Generalisation : it is concerned with arriving at some general ideas or drawing out the necessary conclusion by the students on the basis of the different comparisons, contrasts and associations observed in the presented learning experiences. 5. Application : Efforts are made to seek applications of generalised facts in this step. In fact, it is a step for the fixing up or consolidation of the newly acquired knowledge. Difference between unit plan and lesson plan Unit planning is meant for the division, organisation and planning of the prescribed syllabus being covered in the whole session while daily lesson planning helps in the organisation of teaching- learning in terms of a lesson delivered during a classroom period. The scope of unit planning is much wider than the scope of daily lesson planning.

42 The duration of unit planning may be extended to several days but in case of lesson planning its duration is strictly limited to a single day task. The objectives of unit planning may have wider coverage in comparison to the objectives of daily lesson planning. Unit planning may give birth to a number of daily lesson planning depending upon the number of subunits divided from the main unit.

2.6 Procedure of unit and lesson planning

2.6.1 Unit plan procedure : 2.6.1.1

Organising the subject matter and learning experiences Formation of proper units out of the prescribed syllabus of history of a particular class Combination of various topics of the syllabus in view of the contents and learning objectives to form a unit is important. For example, topics like the Non- cooperation movement, the Civil disobedience movement, the Quit India movement may be combined into a single unit termed as 'Nationalist movement in India (1920- 1947) A.D.' The total number of days and working hours should be kept in mind. Suitability in terms of age, interest, needs and abilities of the learners. Available resources and teaching learning conditions Realization of teaching-learning objectives of the subject Proper correlation, coordination and integration among the different units

2.6.1.2 How to proceed

A unit should be divided into some suitable sub-units. The content of a sub-unit should be selected keeping in mind the duration of a class hour. Teaching-learning objectives should be formulated in behavioural terms and it should be predetermined. Proper decisions should be taken about the methods of teaching, use of teaching aids and the learning experiences provided to achieve the desired goals. Proper decisions should be taken for the evaluation of the unit.

43 2.6.1.3 Unit plan format :

Name of the unit Division of the unit into sub-units Formulation of objectives in behavioural terms Teaching strategies including teaching methods, use of teaching learning materials The utilization of the outcomes of the evaluation for the proper follow-up and remedial teaching.

2.6.2 Procedure of lesson plan

A teacher should take into care the following principles while preparing the lesson plan :

- Principle of clarity and definiteness of the objectives
- Principle of availability of resources and conditions
- Principle of the knowledge of entry behaviour
- Principle of motivating the students
- Principle of maintaining interest in the classroom
- Principle of appropriateness of teaching methods and techniques
- Principle of mastery over the subject matter and related activities
- Principle of active participation of the students
- Principle of providing feedback and reinforcement
- Principle of adequate class control and discipline
- Principle of appropriate evaluation
- Principle of adequate fixation of the learning
- Principle of flexibility

44 2.6.2.1 Model lesson plan format:

I Name of the school: ABC Class: VII Section: B Total no. of students: 40 Duration: 40 minutes Name of the teacher: XY Subject: Social Science Unit: Advent of Middle Age in the West Sub- units: Division and fall of the Roman Empire The migration of the Germanic Tribes into western part of the Roman Empire The invasions of the Huns, Visigoths, Vandals and other Germanic tribes Social, political and religious life of the Germanic tribes- the Roman-German fusion The rise and impact of Christianity Day's lesson: The invasions of the Huns, Visigoths, Vandals and other Germanic tribes Learning objectives in behavioural terms: (According to Revised Bloom's Taxonomy) The students will be able to-

1. Recall the meaning of barbarians (remembering factual knowledge).
2. Memorise the date when they invaded the Roman Empire (Remembering factual knowledge).
3. Distinguish between the characteristic features of the various Germanic tribes (Analysing conceptual knowledge).
4. Compare the invasion pattern of the tribes respectively (understanding conceptual).
5. State reasons for the entry of the Germanic tribes from various parts of North, Central and Eastern Europe (remembering conceptual).
6. Discuss about the military strategies that each of these tribes took to invade the Roman Empire (Understanding conceptual).

45 7. Name the first Germanic tribe to enter to the Roman Empire (remembering factual). 8. List the names of most powerful leaders of each barbarian clans(remembering factual). 9. Justify the statement that the Roman slaves welcomed the invasion of these barbarians(evaluation conceptual). 10. Describe the clever trick used by Pope Leo I to stop Attila from attacking further(remembering factual) 11. Estimate the success and failure of each of these barbaric tribes in the Western Roman Empire.(evaluating conceptual). 12. Discuss the procedure by which each of the tribes attacked Western Roman Empire(Remembering procedural). Previous Knowledge: The students can state and write: 1. About the classification of the barbaric tribes like Huns, Goths, Franks, Vandals and Anglo-Saxons. 2. Time period as to when these barbarians invaded the Empire. 3. The reason behind the invasion of the barbarians. 4. The definition, characteristics and nature of these barbaric tribes. 5. Causes of the migration of the Germanic tribes into the Empire. 6. The procedure used by the tribes to enter the heartland. 7. The direction from where each of these tribes entered Roman heartland. 8. The time span of the Medieval Age in the west with the fall of the Western Empire and coming of the barbarians. 9. The difference between the Ancient Roman culture, habits, ways of life with that of the barbarians. Brief summary: People belonging to various races used to live in North, East and Central Europe outside the territory of the Roman Empire. Their primitive history is not known. But they were not as civilized as the Romans. They were different from the Romans in language, culture, customs, manners and natures etc. They were called barbarians.

46 Teaching strategies: Evaluation: In order to assess how far the students have understood the day's lesson the teacher will ask the following questions: 1. How did the Roman manage to stop the Huns from invading further into the territory? (U/CK) Teaching Strategies Necessary information will be presented partly by lecture method and partly through conversational method. To specify the locations and places the teacher will use outline maps of the world and Europe relevant to the topic. Necessary information, for the first time mentioned names, dates, events will be written on the board. Charts, diagrams, timelines etc. can be drawn on the board. To keep the students interactive In the class developmental and probing questions will be asked. Teaching Method Lecture and conversational method will be followed to deliver the lesson and to make the class interactive question answer technique will be followed. Teaching Aid An outline map of Europe and World to locate different places related to the subunit. A time line Roman Empire. A chart depicting the main points related to the subunit. Work sheet will be given to each student. Use of Board Diagrams showing the classification of the Germanic tribes, their place of origin and the leaders of each tribe will be on written on the board. First time mentioned names, dates and other important information related to the topic will also be written.

47 2. Distinguish between the nature of the Germanic tribes and Huns.(A/CK) 3. Why was Attila called the 'Scourge of God'? (U/CK) 4. Justify the statement that a small gesture on the part of the Romans moved Atilla from invading Rome further.(E/CK) 5. Explain the invasion of the Visigoths under Alaric(U/FK) 2.6.2.2 Model lesson plan format II Name of the School : ABC Subject : Social Science Class X Unit : Work of river and glacier Section B Total no of students : 40 Sub Unit : Work of river in-Middle course. Duration : 45 minutes Name of the teacher : XY To Day's lesson : work of river in middle course. Previous knowledge The teacher is aware about the fact that the students have already learnt the following : (a) Basic knowledge that transportation is the main work of the river in the middle courses with wome deposition and lateral erosion. (b) Idea that some landform are formed in the middle course of a river. Learning objectives in behavioural terms : (According to Revised Bloom's Taxonomy) 1. Remembering : The students will be able to (a) Recall : Recall the extension of the middle course of a river (Remembering Factual) (b) Identify : Identify the different landforms formed in the middle course (Remembering conceptual). 2. Understanding : The students will be able to (a) Differentiate : Differentiates between Alluvial come and Alluvial Fan (Understanding Factual) (b) Explain : Explain the formation of wide 'V shaped Valley (Understanding Procedural)

48 3. Applying : The students will be able to (a) clarify : clarify how sand banks and Braided River are formed. (Applying Factual) (b) Construct : Construct a chart showing the different land form formed in the middle course. (Applying Meta cognitive) 4. Analysing : The students will be able to : (a) Explain : Explain the formation of Flood Plain and Natural Levee (Analysing conceptual) (b) Difference : Difference between Braided river and Meander (Analysing Procedural) 5. Evaluating : The students will be able to (a) Assess : Assess the formation of Ox-bow Lake (Evaluating conceptual). (b) Redefine : Redefine the landforms in the middle course of a river. 6. Creating : The students will be able (a) Imagine : Imagine the different landforms formed in the middle course of river. (Creating Conceptual) (b) Construct : Construct a model representing a landform formed in the middle course. (Creating Metacognitive) 3. Brief summary of the concept : (a) River flowing through a plain land is called the middle course land formed in the middle course. 1. Alluvial Fan or Cone : At the foot of the mountains where the slope of the land is reduced suddenly the velocity of the river is also checked consequently, most of the river load are dropped them and forms a fan shaped or cone- shaped deposit. 2. Wide V shaped Valley : Lateral erosion widens the river valley and it becomes shallow due to deposition. 3. Sand Bank and Braided River : Deposition of stones, pebbles and silts on the river bed forms sand bank over islands in the river. Because of the sand bars and islands, the river divides into branches and rejoin again after going past the obstacle. 4. Flood Plain and Natural Levee : Deposition of silt takes place on both the bank forming an embankment called Natural Levee : In the rainy season, the river floods and deposits the silt carried by it on the banks and forms flood plains. 5. Meander : The meandering course of a river is called Meander.

49 6. Ox-Bow Lake : A meander becomes prominent to form a loop as the river cuts the concave slopes and deposits silts on the concave slope of meander. The river cannot flow straight and leaves its old course which takes the shape of the horse shoe and is called Horse-Shoe or Ox-bow Lake. MAJOR TEACHING STRATEGIES Strategies Teaching Strategy while teaches in the class, she might be followed following techniques which must be associated to upbring the quality of teaching. In that case teacher will demonstrate today's questions Lesson and put some questions in front of the students to recapitulate the interest regarding the day's lesson. Use of Blackboard Teaching Aid Use of Software Technique 1. Observation Method 2. Discussion Method 3. Question Answer Method 4. Demonstration Method Use of Coloured Chalk Use of Charts Use of Model Experiment Power Point Presentation Applicability Teacher will crade some chawks and will show the transportation process by pouring water on the dust. Teacher will discuss the different land forms produced in the Middle course. Teacher will apply Question Answer Method to discuss today's topic more scientifically among the students. To enhance interest among the students, teacher will use various charts to describe the landforms formed. The teacher will use coloured chawks to write the names of the landforms formed. Teacher will use a chart to show some land forms formed in the Middle course. Teacher will perform an experiment to show the process of transportation. No Power Point Presentation will be used to demonstrate the lesson.

50 2.7

Adaptation of unit and lesson plans for children with disabilities:

Inclusion or inclusive education is the most contemporary issue in the field of education now a days. A requirement for inclusionary practices and proper educational facilities for special children has placed greater responsibility and challenge on a classroom teacher. A teacher has to prepare the lesson plan considering the diverse needs of the learners in the classroom. Adaptation of innovative practices or techniques according to the needs of the disabled children is the key for achieving learning objectives. For children with disabilities following things can be incorporated in the plans for teaching: 1. Content should be selected on the basis of the students' needs. 2. Content should be simple and generalised. 3. Principle of individual difference always should be kept in mind. 4. Securing attention and arousing motivational level of the students is very vital for both the teacher and the learners. 5. Learning objectives should be formulated keeping in mind the specific needs of a particular group of learners. Another set of learning objectives may be formulated for other disabled pupils. 6. Teaching strategies should be flexible in nature. 7. Various types of effective teaching aids to be selected very wisely and be used to make the class interesting. 8. Ample opportunities should be there so that the pupils can take part actively in the teaching-learning process. 9. Teacher should deliver the lesson part by part, but not too much content, in a very simple way.

51 2.8 Check Your Progress 1. Discuss the principles for framing history curriculum at the secondary stage at school education.

..... 2. What are the major components of geography at school level?

..... 3. The content of history at different stages should contain a fair mixture of world, history, national history, local history, social economic and cultural history, contemporary history or current affairs why?

..... 4. Mention two practical work in geography curriculum at secondary school.

..... 5. What is instructional planning?

..... 6. Why is it necessary for a teacher to make instructional planning?

52 7. How would you define the term unit plan?

..... 8. Why should every teacher prepare a lesson plan before entering into a classroom?

..... 9. Which principle should be followed by a teacher while preparing a lesson plan?

..... 10. State any two considerations that be taken into consideration while adapting lesson plan for disabled children.

..... 2.9 Let us sum up These principles can help in selecting Social Science curriculum; It should help in achievement of aims of teaching Social Science. It should be appropriate to the age and ability of that group of pupils to whom it is to be taught. The content of study should have functional relationships between them. The curriculum selected should lay emphasis on national and world unity.

53 The curriculum must be wide and comprehensive. For the selection of subject matter for different stages Culture Epoch Theory of Stanley Hall, Biographical Theory and Psychological Theory can be helpful. For the organisation of subject matter Chronological, Concentric, Topical, Regressive, Lines of Development, Patch Method can be used. The unit planning and lesson planning are the two most important things in teaching. While having unit planning a teacher first tries to divide the prescribed syllabus of the subject into some well-defined and meaningful units. These units are then properly sequenced and subjected to planning taken one at a time. Unit planning paves the way for daily lesson planning i.e. the planning for the instructional work on a day to day basis. Careful lesson planning is the foundation of all good teaching from the first day of student teaching to the last day of the month of the retirement years. Proper advance planning will keep the teacher on the track, prevent waste, ensure that the teacher does not forget a pivotal point. Thus the task of daily lesson planning may prove helpful to a subject teacher in a varieties of way. 2.10: References: 1. Basha, S.A.S. and Rao, D.B. 55 Unit - 3 Approaches to Teaching of Social Science Structure 3.1 Introduction 3.2 Objectives 3.3 Curricular Approaches 3.3.1 Coordination 3.3.2 Correlation 3.3.3 Spiral 3.3.4 Integrated 3.4 Methods of Teaching Social Science (i) Lecture Method (ii) Discussion Method (iii) Socialized Recitation (iv) Source Method (v) Project Method 3.4.1 Devices and Techniques of Teaching Social Science (i) Narration (ii) Description (iii) Illustration (iv) Questioning (v) Field Trip (vi) Role Play (vii) Inductive and Deductive thinking. (viii) Concept Mapping (ix) Problem Solving (x) Programmed Learning 56 3.5. Techniques and strategies

required in approaches for teaching children with disabilities. 3.6. Instructional Material for teaching of Social Science 3.6.1 Maps and globes 3.6.2 Different types of boards – smart boards, chalk-boards, brail-boards, 3.6.3 Tape Recorder 3.6.4 Overhead projector and power-point presentation. 3.6.5 Concept and adaptation of inclusive classroom for challenged children. 3.7 Adaptaion of materials for teaching challenged children. 3.8 Check Your Progress 3.9 Let Us Sum Up 3.10 References 3.1 Introduction

The best of the curriculum of social science subject remain ineffective until and unless implemented by the teacher using the right approaches and methods of teaching with the help of the right kind of devices, techniques and instructional materials. In this unit an effort has been made to present how a Social Science teacher can translate a better teaching with various devices, technique and instructional materials.

The Social science teacher's approaches and methods of curriculum transaction will be successful only if he/she can – foster among the pupils curiosity to learn. enable the pupils to develop their personality. Keep the pupils active. 3.2 Objectives After studying this unit the students will be able to :– Explain the different curricular approaches of social science.

57

Explain the different methods of teaching social science. Explain the devices and techniques of teaching social science Explain the concept and adaptations of various instructional materials for teaching social Science. 3.3

Curricular Approaches A curricular approach is the broad direction to show the manner in which a curriculum is to be framed. It can also be explained as the guiding principle on the basis of which the curriculum frame work is to be created. An approach goes hand in hand with methods of teaching as methods of classroom teaching follow the approach based on which a curriculum has been

created. A suitable curricular approach is one that caters to the needs of the learners as well as to those of the classroom teachers who are engaged in the act of facilitating the learning effectively. 3.3.1 Co-ordination : Coordination as a curricular approach means that the various parts of the curriculum of a subject are interrelated with each other. In the curriculum of the subject geography, all the branches

of physical geography, Economic geography, Regional geography, Human geography, etc. must intricately inter-related and coordinated with each other. Descriptions of matters under the different branches of geography should not be treated in water-tight compartments. For an example – while describing the lower reach of an ideal river in physical geography, examples can be cited from Indian rivers with deltas

on their mouth, the main occupations of people living on deltaic regions, their way of living, etc. A coordinated approach of curriculum also means that all the learning objectives like knowledge, Skills and values should get equal weightage while framing the curriculum. A properly coordinated curriculum of geography must put suitable emphasis on aquisition of theoretical knowledge or information, development of desired values or affective qualities of learners as well as practical work, drawing maps, diagrams, graphs etc. for development of the learners practical skill.

58 3.3.2 Correlation : Correlation as a curricular approach is synonymous to the fact the major aim of education is

the unification of knowledge existing in different branches of learning. To achieve such a unification a conscious effort must be made, while framing curriculum, to establish interrelation and curriculum, to establish interrelation and interdependence between various subjects taught in the same class. This is an age of correlation and no subject can be taught in isolation. It is only for convenience of study that we have divided knowledge into different subject areas but actually no subject

is completely independent. Modern educationists have no doubt about the fact that the teaching of a particular subject should be carried out in correlation with other subjects, especially with those subjects that have a common learning. Geography is basically an interdisciplinary subject and is interdependent with such subjects like History, Political Science, Economics, Language and Literature, Fine Arts, Mathematics, Natural Sciences,

etc. Geography is intimately correlated to History and in earlier times, the two subjects were taught together. History emphasizes time while geography emphasizes space. History studies man's life at different times while geography deals with man's life at different places. It is rightly said that geography describes the stage on which human life is enacted while history describes the drama of human life. No history can be complete without reference to space. Similarly no geographical account can be intelligible without reference to development

over time. It is through the study of geography that we come to know

how physical features and phenomena of a region have influenced the course of history of that region.

The teacher of History like a geography teacher must use maps, diagrams etc to show extents of empires, political boundaries, routes of invaders, etc.

Political Science studies the foundations of the state and the principles of government. Difference of political administration from country to country, different traditions, political principles etc are guided by geographical factors.

Rousseau tried to establish relationship between the climatic conditions and the forms of government when he said that warm climates are conducive to despotism, cold climates to barbarism and moderate climates to good polity.

59

In the present age of science and technology, economic forces influence and control human activities more than natural forces. More importance is now paid to economic conditions which modify the influence of natural environment. For this purpose, Economic geography is an important branch of geography. Agriculture, Mining, Industry; Trade, are all influenced by geographical factors. So, Economics, which is called the science of wealth, cannot be properly studied without the knowledge of geography. Language and Literature is much influenced by the geographical factors prevailing in a region.

Description of natural phenomena and cultural conditions of any region can be easily found in the existing literature of the area i.e. prose, poem, drama, etc. Reading, writing and speaking ability through languages is a very essential medium which allows us to express our geographical concepts vividly. Evaluation of students about their geographical knowledge also depends on language usage. Practical geography provides vast relationship with Art and craft. Drawing diagrams, graphs, charts, maps, etc. are important part of geography to make teaching of the subject simple, effective and interesting. This is possible only through art activities. Craft helps in preparing geographical models with clay, plaster of paris etc. On its part geography also provides art and craft with interesting subject matter like rivers, lakes, mountains, waterfalls, forests, etc. These establish the correlation between the two subjects. There are important calculations and problems in geography which cannot be solved without reference to Mathematics.

Geography involves surveys, measurements, calculations specially related to the concepts of time and longitude, latitude etc, distance, width and depth of rivers, oceans, lakes, etc. height and distance of stars, planets, etc. which can be dealt with taking help from Mathematics. Geography also lends its concepts as basis for exercising mathematical calculations. Thus the two subjects are inter-related. Geography is a link subject between social sciences and Natural Sciences. Many facts described in geography are included in the subject matter of Natural Sciences like Physics, Chemistry, Botany, Zoology, Geology, Astronomy, Agriculture etc. cause and effect relationship which is so emphasised in geography is a gift of Science.

Physical geography which studies climate, soil, air pressure and velocity of

wind, rocks, currents, weather, mineral wealth, rotation and revolution of the earth, earthquakes, vulcancity, flora and fauna is very closely

dependent for concepts on subjects of Natural Sciences.

60 3.3.3 Spiral Curriculum

In a spiral curriculum, learning is spread over time rather than being concentrated in shorter periods. In a spiral curriculum, material is revisited repeatedly over months and across grades. Different terms are used to describe such an approach, including a “distributed” and “spaced”. A spiral approach is often contrasted with “blocked” or “massed” approaches. In a massed approach learning is concentrated in continuous blocks. In the design of instructional materials, massing is more common than spacing. The spacing effect - the learning and practice - has been repeatedly found by most researchers to be most effective for more than a century. Findings about distributed learning are among the most robust in learning many sciences and social sciences including geography applying across a wide range of content and for all ages of students from infants to adults. Space learning over time is the first research based recommendation.

3.3.4 Integration We have already studied about how Social Science

subject like geography is correlated with other School subjects. Many concepts of Social Science subjects like History or geography also provide situations where learners can find related learnings of other subjects in a functional setting. Units of the subject geography can provide a natural setting or background for application and use of knowledge and basic skills in solving many problems related to experiences from different spheres of knowledge.

Thus we can rightly say that geographical situations are used as means of integrating various schools subjects and experiences and vice-versa. Integrating Natural Sciences and geography :

Many basic elements related with human needs like food, shelter, clothing, weather and climate, transport and communications are dealt with both Natural Sciences and Social Science like geography. Both geography and Natural Sciences deal with topics like conditions required for various plants, health and hygiene, sanitation, etc. Biology, Astronomy, Mathematics, Geology have many topics to study which are common with geographical topics. The teacher of Geography is required to trace the history of a region while lessons of history also explains the geographical reasons of a historical episode. Integrating with Languages : In any system of education, for teaching learning of any subject, language is of

61 prime importance. Reading, writing and communicating ideas of geography as well as adopting geographical concepts for language learning-teaching is a very common endeavour in everyday school education. Stories and poems about places and travels in language and literature learning in school education easily intergate both the spheres of knowledge. A Student of geography has to communicate his thoughts vividly through reading, writing and speaking using good language skills. Debating, discussing, narrating also enhances the verbal capability of the learner of geography, thus integrating his knowledge of both the subjects of geography and Literature and Language. Integrating with Mathematics : Mathematics, integrated with Social Science like geography, provides accuracy of ideas, and perfection and speed of calculation. Geography is the study of man and his environment and every human being is to be a producer as well as a consumer. Related to the real life situations of human beings, Mathematics integrates in its subject matter, opportunities for acquiring skills, involving income, expenditure, budgeting, calculations of funds, takes measurement of height, weight, time temperature, rainfall and many other

elements related to human life. Integrating Art : Art activities are integrated into social science concepts e.g. while collecting and preparing diagrams, maps, weather charts, graphs, pictures, specimen of rocks, minerals, dresses, cereals etc. pupils automatically apply their aesthetic, artistic aptitude. While learning and collecting a piece of art, students generally tend to explore about its source, geographical location, under what circumstances the artistic material was created or preserved etc., matters which come under the jurisdiction of geography. Thus geographical concepts are embedded in ‘Art’ curriculum while Art is a deeply integrated with geography curriculum. We can easily say that there is very fine integration among subjects and disciplines.

Science, Social Sciences, Languages, Mathematics and Fine Arts are all actually integrated into the world of wholesome knowledge and if learning-teaching of any one of these brings reference from others, the effort will reinforce and strengthen the knowledge of each

one

of these and it will

make knowledge more meaningful and realistic.

62 3.4 Methods of teaching geography as a social Science Subject :

A

method is a procedure which a teacher follows to make learning easy and effective. It is

composed of several important steps which are logically and systematically arranged by the teacher. Many of the steps followed in one particular method may also be used in other methods. It is the duty of the teacher to find out effective ways of guiding pupils to learn and develop properly. Actually,

a method

is the “

Process of planning, guiding, sharing and evaluating learning with a group of students”. It is,

therefore, that method is one of the most fundamental aspects of teaching-learning. After

deciding about the geography syllabus, i.e. ‘What to teach’, the geography teacher must decide about ‘how to teach’ or the method of teaching the particular piece of the geography syllabus for a specific level. Every teacher selects his own method of teaching. A method which is successful in the hands of one teacher may not be effective in the hands of another teacher. Actually, a method of teaching

should always be in accordance with the age and requirements of the students,

their levels of education and the available physical and cultural environment. A method should never be repetitive, it should rather be flexible and workable. The effectiveness of a method is judged by its results in terms of the students, growth and development. Learning that is interesting, easily acquired, functional and long-term is the result of applying good methods of teaching-

learning. A good method, therefore is one which leads to :- Inculcation of the love of work and efficiency. Establishment of organic relationship between the teacher and the taught Development of clear thinking. Expansion of the range of pupils’ interest. Acquisition of knowledge through independent work. Catering to individual differences of needs.

By its very nature, the interdisciplinary subject geography draws its subject matter from various fields of knowledge–

Science and humanities. Therefore, both scientific methods which provide organised and systematic learning situations and activities as well as methods suitable for learning of humanities are applied for teaching of geography. Really

speaking, there is not a single road to success. There are endless varieties of methods. No single method is suitable for successful teaching-learning of all geographical concepts. In fact a successful geography teacher is one who can select the best suitable method at a particular time and place for bringing in the most desired goal

63 depending on

the nature of the subject matter to be taught, the

age and stage of the pupils and the facilities available. (i) Lecture Method Lecture method

is the most commonly used method of teaching geography and history in classroom situations. In lecture method, the teacher in the classroom is the sole speaker and the students are passive listeners. Science students do not actively participate in classroom proceedings, this method can be called a teacher - controlled and information centred method. A lecture is taken as a technique of description, explanation and clarification. In this method, students are provided with readymade knowledge by the teacher and as a result of such spoon-feeding, students gradually lose interest and power of reasoning and observation. This method allows the teacher to go ahead with the subject matter at his own speed. This teacher oriented method in its extreme form does not expect any

questions or response from the students. Advantages of this method : 1. This method

is economical. It is possible to handle a large number of students at a time and no laboratory, equipments, aids, materials are required. 2. By this method, knowledge can

be imported to the students quickly and the prescribed syllabus can be covered in a short time. 3. It is easy to impart factual information. 4. Spoken words are more effective than printed notes. 5. A lecture can be immediately repeated & modified 6. It saves time and energy. 7. It gives pupil good training and experience of learning by hearing. 8.

In this method teacher can easily maintain the logical sequence of the subject by planning his

lecture in advance. It minimises the chances of any gaps or overlapping. When to use this method? 1. At the time of clarifying concepts. 2. Supplementing

the knowledge of pupils. 3. Summing up the findings of pupils. 4. Preparing the students to undertake an assignment, project or an activity.

64 Disadvantages of Lecture Method : 1.

In this method, student participation is negligible and students become passive recipients of information. 2. In this method the teacher can never be

sure whether the students are concentrating and understanding the subject matter being taught to them

by the teacher. 3. It is not a natural way of learning. 4. It cannot be used effectively by all types of teachers. 5. It creates heavy teaching load on teachers. 6. It may become monotonous and uninteresting. 7. It does not cater to individual needs. 8. There is no place of learning by doing. 9. It is an undemocratic and authoritarian method. 10. Its extensive use may lead to harmful effects. (ii) Discussion Method : The present age is an age of discussion. Discussion has presently come to challenge the authoritarian methods through which teaching used to be imparted in older days. Teacher's authority was accepted in these days in all matters in the classroom. But now the scenario has completely changed. Presently, all academic and non-academic activities to be carried on in and outside the classroom are first discussed in a social atmosphere by the teacher and the students and then only these are given practical shapes. Discussion may assume the form of a conference, a symposium or a seminar. Ideas are initiated and exchange of opinion takes place along with a search of its factual basis. All participants are allowed to share their opinions on a fair basis. In a discussion, there is competitive cooperation among the participants and the aim should be towards a collective decision. Essential elements of a discussion are : a) a leader, b) a group, c) a topic, d) a content and e) a session for evaluation and conclusion

Advantages of Discussion Method

- 1) Discussions give scope to participants to come out of the monotony of classroom lectures and think reasonably on a topic, listening to other's deliberations and justifying their own.
- 2) In a discussion session, a lot of information and knowledge along with logical explanation are offered in front of the students.
3. This method helps to inculcate toleration among the students. Discussion may give rise to difference of ideas through arguments and counter-arguments and the participants have scope of practising the exercise of patient listening, justifying their own ideas and accept the conclusive ideas that come out as a result of discussion.
4. It is an intelligent teamwork resting on the principle that pooled knowledge carries greater merit than single individual.
5. It develops team-spirit.
6. It provides training in democratic values.
7. It helps to develop the students' communicative skill, confidence and power of reasoning.
8. It helps the teacher to discover each individual student's talents and potentials.

Disadvantages of Discussion Method :

- 1) It is not suitable for all topics.
- 2) This method demands wide background of knowledge of the teacher about the subject matter.
3. Discussion sessions are likely to be dominated by a few students.
4. Such discussions may sometimes, if not frequently to out of the track resulting in wastage of time.
5. Discussions, if not well-guided, may lead to unpleasant feeling and emotional tensions.

(iii) Socialized Recitation Socialized Recitation is not an invention of modern education. It has existed wherever true education has been given, because the basic principle underlying its use, namely, pupil activity, is the very foundation stone of all education. The true teacher will not attempt to fit the child to a course of study, instead, he will try to help the child to learn by himself. Dewey, in his 'schools of Tomorrow', gives many proofs of the universality of this practice.

66 By Socialized Recitation in Social Science, we mean students discussing and repeating matters learnt in the geography or history class anywhere outside the classroom. A debate may go on among the students in the common room or on playfields, or in the Debate club of the School about geographical phenomena. Quiz sessions may take place, a drama may be enacted by the students on some historical event or idea during cultural programmes. Even at home with the parents and relatives, in the community gathering, the student of geography or history may be proudly expressing his ideas, give a talk or recite some portions of the matters has learnt in the school geography or history class from the teachers. (iv) Source Method Skillful teachers of geography have always realized the educational importance of first hand experience because first-hand experiences are always more profitable than experiences narrated or discussed by others. The study and use of original material from actual sources will provide to the students a much better understanding methods, collecting samples of rocks, minerals, cereals, fibres, flora and fauna, industrial products etc. from different regions, showing these samples to students in a geography class followed by discussion on the regions concerned and natural and man-made products available in those regions will provide a situation where students will learn about the matter in a more effective manner. This is called the source method of teaching-learning of geography. Types of sources are

Natural sources ? examples : rocks, minerals, plant samples, soil, sand, cereals etc. Man-made sources ??examples : dresses, packaged food, metal products, leather products, etc. Printed sources ??examples : books, reference books, journals, periodicals, pictures, maps, etc. e – sources ??examples : matter collected through electronic media like e-mail, internet, etc. Many of these sources are available around or near each school. If properly approached and utilized these can be made to yield the geographical information related with them.

Advantages of Source Method :

1. Sources reveal reliable evidence because using source materials facilitate the realization of the students about the difference between a guess and an assertion.

67 2. It provides a sense of reality. The use of source materials during learning gives the students a sense of reality which a secondary writer cannot. 3. It affords training in reasoning and judgement. It teaches a student to examine carefully before arriving at a decision. 4. It provides functional knowledge. Even the slow and backward children feel interested when they have the opportunity of handling original source materials. Their learning becomes functional because it is gained in the proper context. 5. It arouses the students curiosity, stimulates their creative expression and develops their skill. (v)

Project Method The project Method is a modern contribution to educational theory and practice. It is a result at John Dewey's Philosophy of education

and is a natural extension of the problem solving method. But the credit for initiating this method goes to prof. William H.Kilpatrick who has defined it as

a whole-hearted

purposeful activity, proceeding in a social environment".

Dr. J.A. Stevenson who perfected it as a method of teaching says, "

A project

is

a problematic act carried to completion in its natural setting."

Ballard gives another definition when he says, "

A project is

a

bit of real life that has been important into the school".

Accordingings

to C.V.Good. "A project is a significant unit activity, having educational value and aimed at one or more definite goals of under standing. It involves investigation and solution of problems. It is planned and carried to completion by the pupils and the teacher in a natural life-like manner."

If we analyse the above definitions, we shall find that project method lays great emphasis on actual activity of the students. In this method, the curriculum, content and techniques of teaching are considered from the student's point of view. Basic principles or features of project Method : 1) The principle of purpose. No aimless activity can be taken up in Project method. Activity should be purposeful and interesting. 2) The principle of activity. A child is active by nature. The Project Method provides ample apportunities to people to think and plan things independently and then carry out the project in co- operation with others,

68 3. The principle of experience. The project method enables the child to work in groups. He thus learns to co- operate with others and to share his interest and purposes, 4) The principle of reality In this method, students are provided with opportunities to exercise their power in real life situation. 5) The principle of freedom. In project method, the choice of activity should be spontaneous and no forced imposition is desired, it should be left to the students in an atmosphere on freedom. Students choose their activity according to his own capacity and a felt purpose. 6. The pirnciple of utility.

The knowledge gained through activity must be useful and practical. Experiences gained through projects ensure utility because they are carried out under natural

settings. Students can feel that their effort does not go waste and the activity must end in something concrete from the educational point of view. Steps involved in the projec Method : 1.

Providing a situation. A project is never to be forced upon pupils.

The teacher's job

is to provide a situation according to the interest and aptitude of the pupils which may give them a spontaneous urge to carry it out. 2.

Selecting

a project. After a

situation has been provided, the next step is the selection of a good project.

Only such a project should be selected as may satisfy some real need of the pupils.

The project must be chosen according to the capacities of the pupils. 3. Planning. Once a suitable project has been selected, the next step is to

prepare a plan for its execution. Entire planning is to be done by the pupils under the guidance of the teacher, after a good deal of discussion. Each student should be encouraged to participate in the discussion, and offer his

suggestion. 4. Execution.

When the plan is ready, the teacher should encourage the pupils to go ahead and put the plan

into practice. He should ask the pupils to assign duties and distribute work among themselves according to their

individual capacity and

interest. Pupils should

work in co-operation with one another till the project is complete. 5. Judging and

evaluating. After the project is executed, students should be asked to review their work, they should identify their mistakes if any, and

find out whether they proceeded in the right direction according to plan. 6. Recording. Students should be asked to maintain a project book in which they should put down a complete record of all the activities related with the project.

This record will include the selection of the project, its planning, discussions held, duties assigned, references and books consulted, information gathered,

difficulties felt, experiences gained, guidance sought

etc. Important points for future reference and guidance are also to be noted down.

Advantages of the Project Method : 1) It is based on the laws of learning. It is in accordance with the psychological laws of learning i.e., the law of readiness, the law of exercise and the law of

effect. The law of readiness requires the pupil's mind ready for acquiring knowledge. The planning and selection of the project, prepares the child's mind for the work. The law of exercise requires the child to practise whatever he has learnt.

This method is not only meant for learning by doing but for learning by living. The actual execution of the project gives effective experience. The law of effect requires that learning should be accompanied by satisfaction and purpose. By

actually being involved in the project execution, the student gets pleasure and satisfaction. 2) This method is economical : The students select their own project according to their interest and capacity. So it gives the best results in the shortest

possible time and least wastage of money and energy. 3. It provides training for democratic way of life. Pupils work with each other under this method for a common purpose. Thus they acquire foresight, power of judgement, independence of thought and action, initiative, responsibility, resourcefulness, tolerance, self-respect, etc. All these are useful social habits leading to good training in citizenship and democratic way of life.

70 4. Dignity of labour Since the pupils are required to do all types of work by themselves, it upholds dignity of labour. 5.

Correlation Knowledge is gained through this method in a correlated manner in a natural setting and not in water-tight compartments. 6) No cramming or rote memory. Children learn by doing themselves. No finished product is supplied to them. A problem solving attitude develops within the students and they don't have to memorise matters forcefully in an

abstract form. 7) It imparts education in real life situation. Projects are related to everyday needs and experiences of the child and so knowledge is gained in real, practical situations. 8) Individual skill and interests are aroused. Students having

wide varieties of skills and interests can select projects of their own choice. Very rarely is there any student who finds no challenge in any project whatsoever. 9) Incidental learning. In order to attain fair accuracy and success in the project,

pupils seek answers and solutions to many questions and problems and thus come across a lot of incidental learning.

Limitations of their Method : 1) Knowledge comes in a haphazard way In project Method. systematic arrangement of subject matter is not possible because students proceed initially with a problem related to the subject matter and in the course of solving the problem, knowledge results in a natural, practical setting. 2. It sometimes creates heavy load on the teacher. The teacher has to act as a guide of the project and take leadership in conducting all stages of actions involved in the project like selecting a project, planning, guiding execution, evaluating, recording etc.

71 3) It may result in disorganisation of School schedule. It is not possible to follow any fixed schedule while implementing the project work. Students some times may have to work outside school campus. Thus frequent deviation from normal school time-table takes place. 4) It may involve a lot of expenditure. For successful completion of a project, a lot of materials and fund is required which may not be affordable by all schools. 5) Balanced learning for all students may not be possible. A few bright students may be inclined to take all the responsibility upon themselves as they are more capable than others while weaker students may remain comparatively inactive in a mixed group. Even after having a few limitations, the project method gives ample opportunity to all students to come out of the monotonous classroom lectures, become active and work in a team to solve academic problems in a natural atmosphere.

3.4.1 Devices and Techniques of teaching Social Science

As we have already noted, Social Science is a pivotal subject between Sciences and Humanities and is rightly termed as a Social Science. Its teaching involves a primary analysis of cause and effect relationships, a critical interpretation based on observation and a correlated description of basic information and understanding from almost all sphere of human life and its environment, physical and cultural. This subject requires a broad and rich background of perceptual experiences, as an important basis for good teaching. Hence to enliven the teaching learning of geography, a variety of devices and techniques are to be adopted by the teacher of geography.

(i) **Narration** Narration or story-telling is a technique that can be very effectively utilized in the teaching-learning of Social Science in schools. Such narrator of stories with geographical and history elements in them arouse curiosity and interest among children for acquiring his/her geographical information of different regions, countries, continents, mountainous or riverine areas, islands, travels and excursions, nature and human activities, etc. e.g. the narration about the life of the eskimoes, life of pigmies or life of bedawins against different kinds of environments.

72 Some educationists are of the opinion that narration of stories connected with the life of unknown countries and regions will not create an impact on young minds as they will not be able to visualize them properly and cannot connect such narrations to their real-life situation. However, this technique has proved useful in primary and lower secondary school level, on imaginative minds of story-loving youngsters.

(ii) **Description** The subjects social Science contains many such elements whose pictures have to be visualized by the students as it is not possible for them to go and visit those places personally. Such visualization is possible through vivid description of those matters by the Social Science teacher in a very skillful manner. To make verbal description more interesting and attractive, an attempt should be made to utilize charts, models, pictures, etc. Description may be given of travels to different regions of the world, Physical and cultural characteristics on many regions such as the ice-covered continent of Antarctica, the equatorial rainforest areas of congo or Amazon valley, the extreme climate of the Sahara Desert, etc. Descriptions should be in full detail and they must awaken the imagination of the students. Finally attempt should be made to draw substance so that the students have a thorough knowledge. Teacher should also encourage his students to actively participate in such descriptions and give them enough opportunity to give vent to their feeling. Description must follow simple but attractive language expression. Description can be given about mountains, plateaus, plains, Water-bodies, rivers, glaciers, deserts, forests, islands, agricultural activities, industrial activities, mining operations, ports, cities, life of man in different natural region and their cultural adaptations. etc.

(iii) **Illustration** Narration of geographical and historical stories and description of different elements and past events in different regions of the world should be accompanied with presentation of illustrations to show students examples of various matters included in the description. Illustration may be presented in the form of maps, pictures, photographs, globes, charts, calenders, graphs, drawings, sample pieces, etc. Illustrations will make the narration or description more vivid, meaningful and attractive.

73 iv) Questioning During classroom teaching-learning of Social Science an effort is to be made by the teacher to systematize the previous knowledge of the students and connect the previous knowledge to present lesson. While presenting the current knowledge also the teacher should try to arouse the motivation of the students for actively participating in the lesson development. A Social Science teacher with an orientation of very good art of questioning knows how to engage his students through question answer sessions. Questions can be of different types. Questions asked by the teacher to test the previous knowledge of the students are known as preparatory questions. Through this type of questions the teacher can easily make out the level of entry knowledge of each of the classroom students. Such questions keep the teacher to determine the point from where the day's lesson must start. The teacher of Social Science should take help of very small developing questions on fragmented parts of the content to draw out from the students, their ideas of the matter which is going to be discussed during the class session. These questions arouse interest and motivation in the students and make them actively participate in the development of the day's lesson. After the presentation stage is over, the teacher can make use of recapitulative questions so that by answering such questions, students can consolidate the concepts which they have grasped immediately before that. Evaluative questions are such questions that the teacher uses while testing the students' development of knowledge, affective and skill domains to receive feedback from the students about their achievement of the subject matter. The technique of questioning and its effectiveness depends entirely on the teacher's questioning skill. while using questions as a device, utmost care must be taken by the teacher to keep up the interest of the students. (v) Field Trip or Excursion Social Science teaching should not be confined to the four walls of the classroom. Along with classroom teaching, students should be given good opportunities to go out on short and long field trips or excursions to study geographical facts and historical events in their natural settings and surroundings. Thus excursions must form an essential part of Social Science teaching programme from the very beginning. According to

E.A. Mcnee, "It is essential that the foundations of geographical knowledge shall be laid down in the field. No amount of reading from books can make up for a practical

74 knowledge gained by looking at the earth which the child is studying. It follow that from the very early stages, expeditions should form part of the geography

course." Field trips can be of 3 types e.g. 1) Local trips – Local trips are very short trips to convenient places in the village or city near the school for one or

a few lesson periods. on these occasions the students will study their surroundings and collect first-hand knowledge and information about various geographical phenomena and historical places. Like local agricultural or industrial products, local market, transport system, etc. On the leasis of such knowledge, the geography teacher can give an instructive lesson on local geographical features. The purpose of such trips is neither recreation nor teaching about the locality of the school. The main aim is to give reality to teaching of geography and to make difficult ideas simple by referring to concreat, known ideas, and focus. 2) Communication

or neighbourhood trips – Such trips occupy half or full day's duration and therefore may be arranged either on saturday afternoon or on Sundays or on some other holiday. Such excursions may include a visit to a hilly area or to a riverside, or a factory or mine or port etc. on such trips, students are encouraged to observe, study and investigate the geographical items and Historical places by

themselves and ask as many questions as they may desire to remove their doubts. They will get first-hand knoledge about things like, nature of soil, climate, irrigation facilities, transport, production imports and exports etc. Besides providing useful knowledge such trips also provide recreation. 3) Tours or Excursions – For secondary and higher secondary students, geographical and historical

excursions lasting for several days, may be arranged profitably. Adequate preparation must be taken both by the teacher and the students for excursion. These require careful planning, organization and execution. It is advisable that the teacher himself pays a visit to the place of excursion

before-hand and makes a list of objects to be observed by the students. He should also make necessary arrangements for lodging, boarding and conveyance

to the place to be visited. While on excursion, students should be divided into a few

groups. Each group may be asked to describe a particular aspect of geographical phenomenon. This will enable students to acquire knowledge independently as well as in a group.

75 Advantages 1) It provides direct learning experiences. 2) It satisfies the natural urge of the students. 3) It provides practical social training. 4) It broadens the outlook of the students. 5) It helps to create interest in the subject

Limitations 1) It is time and money consuming. 2) There is a general lack of parents cooperation. 3) Lack of initiative and resourcefulness among many teachers. 4) Lack of proper organisation and guidance. 5) It is not a complete method and

is not applicable for all contents in the syllabus. (vi) Roll Play. Role play is an important teaching method which can be intelligently applied by a geography teacher, but is often under used or only used on special occasions. Role play is especially valuable because it gets students actively involved in their learning and it compels them to engage with the subject matter in a focused way. Some issues to bear in mind about role play are as follows :- 1) Role play should be seamlessly integrated into the lesson and should not be considered as a special treat. 2) Role play can be used when students are arranged in pairs, small groups or working as a whole class. 3) Role play is an ideal way for students to be made aware of the differing views of people on contentious issues. This helps students to come across points of views that they may not usually share and sometimes enables them to change their view when presented with enough reasoning. 4) Role play needs careful setting up and monitoring by the teacher to ensure that students are benefiting from it. Without teacher intervention, it can easily become a chaotic exercise.

76 5) It can be fun, sometimes, to allow students to dress up in appropriate costumes and dramatize the whole matter. 6)

While using the technique of Role play, links can be established with other areas of the curriculum such as language subjects for developing oracy skills or Drama for developing the performance aspect of role play. This technique can be applied through collaborative lessons with teachers of other subjects. 7) Extensive support and preparation should be employed for application of such innovative practices in teaching-learning of Social Science. (vii) Inductive and

Deductive thinking. Inductive thinking Applying the inductive thinking technique We guide the students towards establishing a universal law or definition by showing small examples in case of which the law or formula is true. Through a number of illustrations, an attempt is made to elicit the new theory of knowledge from the students. This technique is psychological as well as logical. Following precautions are to be taken while implementing this technique :- 1) The teacher should make all possible efforts to lead the students towards establishing the general rule, theory or definition. 2) The teacher should encourage the students so as to develop their power of researching. Merits of the technique 1) It helps deep understanding. 2) It is a scientific method & helps to develop scientific attitude. 3) It is a logical technique and develops critical thinking and habit of keen observation. 4) It is also a psychological technique and provides ample scope for students interaction. 5) It is based on actual observations, thinking and experimentation. 6) It keeps the students' interest intact as they move from known to unknown. 7) It reduces the tendency of rote learning. 8) It develops self-confidence. 9) It helps to develop the habit of intelligent hardwork.

77 Limitations 1) It has limited application in Social Science and cannot be used for solving and understanding all areas of Social Science. 2)

The generalization obtained from a few observations are not the complete study of the topic. To retain the matter in the learners' understanding level, a lot of supplementary work and practice is needed. 3)

Inductive reasoning is not absolutely conclusive. generalization is made from the study of a few cases which indicates a certain degree of probability. 4) The use of this technique is to be restricted to early and middle stages of secondary section. 5) Inductive thinking may be proved only when the generalization arrived at is verified through the deductive

process. Deductive thinking Deductive technique is opposite to inductive thinking process. In deductive process the learner proceeds from general to particular, from abstract to concrete. Facts are deduced or analyzed on the basis of already established and declared formula. In this case the learner accepts the formula as an established fact. In this technique the teacher announces the topic of the day and gives the relevant formula or principle with the help of a few examples. The students follow the use or application of the formula or principle by supplying more examples. They memorise the results for future application. Merits of Deductive thinking 1) It is time-saving and is usually liked by teachers or authors. 2) It is a suitable method for all level because is basically explanation-oriented. 3) It glorifies the faculty of memorising because students have to memorize the facts, principles, formula, law, etc. 4) It helps the students for revision work in a more efficient manner. Limitations 1) It is not a scientific or psychological technique. Because the facts or principles are not discovered or established by the students.

78 2) It sometimes causes heavy burden on the learners' brain. 3) Students have very little scope for being active learners. 4) It is not suitable for developing thinkings, reasoning or experimenting power of the students. (viii) Concept Mapping It happens very frequently that visual imagery descriptions help us to understand matters that are difficult to understand through narrative text alone. Visual system diagrams or concept maps are two means of adding value to messages students are sharing. A concept map is a type of diagram which shows various relationships between concepts. The identification, organization and graphic depiction of relationships among concepts in a knowledge domain, the technique employs a node-link formalism in which the main key concepts are circled, bracketed, etc., arranged hierarchically (general to specific), then interconnected by lines labeled with short explanations. Concept mapping have been developed by Joseph D. Novak, Concept map is a network representation of several concepts. Concept maps identify linkages between concepts, consolidate concepts, facilitate long-term memory and cultivate self-learning ability of students. (ix) Problem Solving Problem-solving is the ability to identify and solve problem by applying appropriate skills systematically. In the teaching-learning of Social Science, Problem-solving technique can be used as a learner-centred process or activity in which the student are guided to start with what they know and proceed towards the discovery of what they do not

know. It involves overcoming obstacles by generating hypotheses, examining those predications, and arriving a satisfactory solutions. Problem-solving technique for teaching - learning of geography involves few basic functions :-
1) Seeking and collecting information. 2) Identifying a problem 3) Framing a hypothesis

79 4) Experimenting with probable solutions. 5) Generating new observations and knowledge. 6) Coming to a conclusion. Problem-solving should be an integral part of the curriculum and methodology of teaching-learning of Social Science. It takes into consideration the fact

that students can take on some responsibility on their own learning and can take personal action to solve problems, resolve conflicts, discover alternatives and focus on thinking as a vital element of the curriculum. It provides students with opportunities to use their newly acquired knowledge in meaningful real-life activities and assists them in working at higher levels of thinking.

Some educationists provide the following five-stage formula for application of problem- solving technique for handling many areas of the curriculum as well as real every-day life problem of the students. 1)

Understand the problem. It is primarily important that students understand the nature of a problem and the related goals. Students must be encouraged to frame a problem in their own words. 2) Describe any barriers. Students need to be aware of barriers or constraints that may prevent them from achieving their goals. 3) Identify various probable solutions.

After

understanding

the nature and parameters of a problem, students need to select one or more possible strategies to resolve the problem. For this stage, a few sub-stages may be considered Create visual images – visual imaging or mental imaging of the problem will allow the problem – solver to map out many dimensions of a problem and see it clearly. Guessing – students should be allowed some time to engage in trial - error approach to problem-solving. This is an attempt to gather some preliminary data. Create a table – When students get engaged in creating a table of orderly arrangement of data or information, they become more confident about analysing, grouping and organizing relevant data relative to the problem and proceeding towards a solution becomes easier.

80

Use manipulatives – by moving objects around on a table or desk, students can develop patterns and organize elements of a problem into recognizable and visually satisfying components.

Work backward – The students should go back at the beginning of the problem frequently during his proceeding ahead with a probable line of solution. Look for pattern - A pattern is a regular, systematic repetition may be numerical, visual or behavioural.

Looking for patterns is an important problem-Solving strategy because many problems are similar and fall into predictable patterns. Create a systematic list – Recording data in

a

list form is a process used quite frequently to map out a plan of

attacking the problem and solving the problem. 4) Trying a solution – While working through a single strategy. The students should : Keep accurate and up-to-date records of their thoughts, proceedings etc. Try to work through a selected strategy or combination of more than one until it becomes evident that it is not working. Monitor with great care the steps undertaken as part of a solution. Feel ready and comfortable for putting a strategy aside for a period of time and tackling it at a later time. 5) Evaluate the results It is vitally important that students should have multiple opportunities to assess their own problem-solving skills and the solutions they generate from using those skills.

Frequently, students are dependent on teachers to evaluate their performance in the classroom. The process of self-assessment is not easy. However, it involves risk taking, self-assurance and a certain level of independence. (x)

Programmed Learning. Programmed Learning is the technique of learning by the students themselves on a computer or other types of teaching machines where instructions have been set or programmed by the teacher or instructor on a particular concept of geography before the students start their learning. Programmed Learning is the technique of learning by the students themselves on a

81 computer or other types of teaching machines where instructions have been set or programmed by the teacher or instructor on a particular concept of geography before the students start their learning. Programmed instruction is the method of presenting new subject matter to students in a graded sequence of controlled steps. Students work through the programmed material by themselves at their own speed and after each step test their comprehension of the matter by answering an examination question or filling a diagram, etc. They are then immediately shown the correct answer or given additional information. Computers and other teaching machines are used to present the material although books may also be used for this purpose. Computer-assisted instruction, which tests both students, abilities and evaluates their progress, may supplement classroom activity or helps students to develop ideas and skills independently. The first teaching machine was invented by Sydney. L. Pressey (1934) but it was not until 1950s that practical methods of programming were developed. Programmed instruction was reintroduced by B.F. Skinner of Harvard university and much of the system is based on his theory of the nature of learning. As programming technology developed, so did the range of teaching machines and other programmed instruction materials. Some programmes are linear in concept, allowing advancement only in a particular direction or order as the correct answer is given. Others are branching giving additional information at the appropriate level whether a correct or incorrect answer is given. Although programmed instruction cannot be considered as the sole method of teaching, many educators agree that it can contribute to a very efficient classroom procedure and supplement conventional teaching methods. Teaching machines enable students to work individually, calling for active participation of the learner. 3.5 Techniques and strategies required in approaches for teaching children with disabilities Within the mainstream inclusive classroom environment in a school, there are children with single or multiple disabilities. like children with specially health-care needs, children with sensory impairments like visual or hearing impairments, orthopaedic impairments, borderline or slight mental retardation.

82 Many research results have shown and many continue to show that we can teach students with learning disabilities to “learn how to learn.” We can put them into a position to complete and hold their own. Some intervention practices produce large outcomes like – direct instruction learning strategy instruction, and using a sequential simultaneous structured multi-sensory approach. Teachers who apply these kinds of intervention. a) break learning into small steps, b) administer probes, c) Use diagrams, graphics and pictures to depict what they explain in words, d) Provide ample independent well-designed intensive practice e) Model instructional practices that they want their students to follow. f) Provide prompts of strategies to use g) engage students in giving feedback about the success of the strategies.

Scaffolding is also something that seems to make a real difference. The teacher should start with using heavily mediated instruction or explicit instruction and gradually let the students acquire the skill, moving toward the goal of student-mediated' instruction. Success for the student with learning disability requires a focus on individual achievement, individual progress and individual learning. This requires specific, direct, individualized, intensive remedial instruction for students who are struggling. Whether the student with disability is in the general inclusive classroom or learning in a special classroom setting, the teacher should focus the activities on assessing individual students to monitor their progress through the curriculum. Concerns for the individual must take precedence over concerns for the group or the curriculum or for the organization and management of the general classroom content. As general strategies for teaching and presenting, a geography teacher should : Begin class with a review of the previous lecture.

83 Give an overview of the topics to be covered during the lesson period. At the conclusion of the day's lesson, summarize key points. Highlight major concepts and terminology both orally and visually. Be alert for opportunities to provide information in more than one sensory mode. Emphasize main ideas and key concepts during lecture and highlight them on the blackboard or overhead. Speak directly to the students, use gestures and natural expressions to convey further meaning. Diminish or eliminate auditory and visual distractions. Present new or technical vocabulary on the blackboard or overhead, or use a handout. Use visual aides such as diagrams, charts and graphs, use colour to enhance the message. Give assignments both orally and in written form, be available for clarification Provide adequate opportunities for participation, questions and discussion. Provide time-lines for long-range assignments. Use sequential steps for long-range assignments, e.g. for a lengthy paper– ? select a topic ? write an outline ? Submit a rough draft ? make necessary corrections with approach. ? turn in a final draft Give feedback on early drafts of papers so there is adequate time for clarification, rewrites and refinements. Provide study questions and review sessions to did in mastering material and preparing for exams. Distribute sample test questions, explain what constitutes a good answer and why. Test knowledge of material, phrase test items clearly. Be concise and avoid double negatives.

84 Facilitate the formation of study groups for students who wish to participate. Encourage students to seek assistance during his office hours and to use campus support services. Design collaboration educational services. Interact regularly with families. Manage the physical environment of the classroom & positioning of the disabled students favourably. 3.6. Instructional Material for teaching of Social Science Teaching-learning of Social Science involves a primary analysis of cause and effect relationships, a critical interpretation, based on observation and a correlated description of basic information and understanding. Therefore, good teaching-learning of this subject requires a broad and rich background of perceptual and conceptual experiences. To make geography teaching learning more meaningful, vivid and clear, a variety of instructional materials or learning materials are used to support geography teaching learning in the classroom situation. 3.6.1. Maps and globes A map may be defined as the representation of the earth's surface on a flat sheet of paper for the whole of the world or a part of it, drawn with the help of conventional signs and on a definite scale. Many points in this definition need clarification. We can represent the whole of the world or a part of it on a map. Thus we can represent a village or town, district or state, a country or a continent or the whole world on maps, various features of the earth's surface like hills, rivers, lakes, roads, railways, plains, plateaus etc. can be shown on a map with the help of certain symbols. These signs have been accepted universally by all countries with slight modification here and there. In India, the survey of India have prepared a long list of such conventional signs. A map is always drawn on a definite scale. Without a scale it cannot be called a map, it becomes only a sketch. The scale is always shown at the bottom of every map. Our earth is so vast and presents such a variety of features that it is impossible for any one person to visit the whole world and experience every feature of the earth directly. But if these features are presented on a map, everything will be clear to us even without going to that place and seeing everything with our own eyes. With the help of a map even the unknown and unseen lands may be unfolded before our eyes. Maps are prepared

85 on that sheets of paper and can be easily rolled and taken from one place to another. Separate maps can be prepared for different places and different features. A good map must show at least one of the three things correctly, shape, area and direction, unfortunately no map projection has, so far, been evolved which can show all these three things with great care. But if a map shows two of these things with great care, it may be considered as a good map. Boundary lines shown in the map should be clear. Different types of boundaries are to be shown in types of lines. Right type of colour should be used to show different items. Selection of suitable caption, use of latest names, selection of suitable size of the letters to be used is very important in map preparation. Every good map must show the lines or latitude and longitude correctly. There may be different types of maps like 1) Cadastral maps drawn on very large scales ranging from 10 cm : 1 km to 50 cm : 1 km. These maps show a large number of details and drawn by survey Department after careful survey. 2) Topographical maps : – These maps are also fairly large-scale maps. Scales may vary from 4 cm : 1 km to 1 cm : 1 km. These maps are also prepared by the survey of India and these show a large number of details like hills, valleys, rivers, towns, villages, roads, railways etc. with symbols called conventional signs with suitable colour. 3) Wall maps : – These maps are drawn on a small scale which may vary from 1 cm : 50 km. to 1 cm : 500 km. The world, a continent, a country, a state, district etc. are shown on such maps for use in a classroom. 4) Atlases : Atlases or maps in book form are drawn on very small scales i.e. 1 cm : 500 km to 1 cm : 5000 km. The world or any part of it can be shown on atlas maps. on a very very generalised basis. 1) geological maps, 2) Relief maps, 3) Drainage maps, 4) Soil maps, 5) Weather maps, 6) Climatic maps, 7) vegetation maps 8) Astronomical maps, 9) Population maps, 10) Linguistic maps, 11) Agricultural maps, 12) Mineral maps, 13) Industrial maps, 14) Historic maps, Transport maps, 15) Ethnic maps, 16) Distribution maps, 17) Irrigation maps etc.

86 Globe : The globe is the most accurate representation of the earth that is available in the classroom. It is a combination of a map and a model. It is really a map with a curved surface and is therefore a more accurate representation than a map on a flat surface. The globe provides a simplified small replica of the earth. It gives us a correct idea of many geographical concepts like latitudes, longitudes, the two poles, Arctic & Antarctic circles, equator, the two tropics, the axis of the earth, hemispheres, rotation & revolution of the earth, locational relationships of different lands and oceans of the earth. etc. Globes and maps used together will provide very valuable concepts for the students of geography. Students should be taught to interpret various concepts from the globe in a right manner. The globe should be used to develop fundamental concepts about classes the globe may be used to develop concept of the round shape of the earth, directions, stretches of lands and waters etc. In secondary classes the globe may be used to develop concepts of the formation of day and night, changes of seasons, rotation, revolution, latitude, longitude, etc. 3.6.2. Different types of boards Chalk boards – In place of only black boards, we now use chalk boards for geography teaching. Chalk-boards are not necessarily black but may be black, green, yellow, pink and even white. But chalks are not used on white boards. white board marker pens are used on white boards. All these boards are used for illustrating ideas in various directions, for outlining the topic, for summarising concepts, for drawing diagrams, for developing plans for recording students, achievement in the class etc.? A projector are connected wirelessly or via USB or serial cables. A projector connected to the computer displays the computer image on the interactive white board. The white board accepts touch input from an interactive pen. A smart Board system provides an intelligent white board surface for work and users move within information spaces, exist within information spaces rather than merely gaze at them, and information spaces must be shared with others rather than being private, lived within rather than simply visited. Students can be engaged in active collaboration. The functionality of the technology allows users to work with large amounts of information, 2) it offers an information space that invites active collaboration and 3) the work produced is often dynamic. It has brought a new era in education. Braille Board – This is a light and easy-to-use translator, designed for sign-making, compatible with graphic layout programs such as CASmate, Corel Draw, Flex Sign, Graphix Advantage, Page Maker, Sign Lab, etc. Language support is limited to English. It is a simple but indispensable tool for production of signs. Braille fonts, both regular braille and Sim Braille (with shadow dots) are included.

87 Braille is system of raised dots that can be read with the fingers by people who are blind or who have low vision. Teachers, parents and others who are not visually impaired ordinarily read braille with their own eyes. Braille is itself not a language. Rather it is a code by which many languages may be written and read. Braille is used by thousands of people all over the world on their native languages and provides a means of literacy for all. Blackboard is one of the oldest visual devices for instruction. We may not procure many other aids but a black board is a minimum form of aid in a classroom. If used properly, a chalk board can be of tremendous use. Beside all qualities, a geography teacher must possess illustrative talent in him. He must be in a position to use effectively this basic helpful device as frequently as possible. Drawing and writing freely and correctly on the Chalk-board should be considered as an indispensable requisite of every geography teacher. A lot of maps, charts, diagrams and other ready-made illustrative materials may be brought in the classroom and used but it cannot be denied that the most useful and valuable diagrams, maps and graphs are those drawn in the presence of pupils. It is advisable that the geography teacher should take great care to write legibly and in bold letters, make correct drawings using suitable colours, prevent glaring of the board by adjusting room lights, avoid over-crowding of materials on the boards, plan the use of chalk-board in advance and take care of the student, work simultaneously with boardwork to make the use of this instructional aid most effective. Smart Board – A Smart Board is an interactive white board that uses touch detection for user input in the same way as normal pc input devices. The Smart Board interactive whiteboard operates as part of a system that includes the interactive whiteboard, a computer, a projector and white board software. Braille symbols are formed within units of space known as braille cells. A full braille cell consists of six raised dots arranged in two parallel rows each having three dots. The dot positions are identified by numbers from one through six. Sixty-four combinations are possible using one or more of these six dots. A single cell can be used to represent an alphabet letter, number, punctuation mark, or even a full word.

3.6.3 Tape recorders

A tape-recorder is another useful device at the service of the teacher. It is an instrument which is used to record speeches, songs, music and uses may be played back at any time and any number of times. If some items are not needed after a particular

88 time, it may be erased and the tape can be used for recording some other speech or music. This device may prove especially effective in developing worthwhile standards of correct speech by providing opportunities to the pupils to their own speeches as compared to the speeches of respected and well-known personalities.

3.6.4 Overhead projector and power-point presentation

An overhead Projector is a device that can project a chart, a diagram, a map, a table or anything written on transparent plates, upon a screen or a white wall or white board to supplement discussion in the classroom. This makes teaching illuminative, illustrative and attractive. It also saves a great deal of the teaching time used in writing and drawing. These transparencies can also be preserved by the teacher for future display while taking up the same topic. Transparencies are transparent plates on which materials can be written or drawn with dark ink with a fibre-tipped pen. Matters can also be typed or photocopied on transparencies. Washable colours can also be used on transparencies if matters meant for washing after use.

Power Point Presentation

– Power Point is a slide show presentation programme developed by Microsoft. Power point was officially launched on May 22, 1990 as a part of the Microsoft office suite. Power Point is well known for helping develop the slide based presentation format and is currently one of the most commonly used presentation programmes available. Power Point presentations consist of a number of individual pages or slides. Slides may contain text, graphics, sound, movies and pictures, diagrams, etc, which may be arranged as per the user's wish. The presentation can be displayed live on a computer, printed as handouts or navigated through at the command of the presenter. For large audiences the computer display is often projected using a video projector. Power point presentation is a very strong audio-visual aid for topics of social science. Slides can be prepared for any concept of social science with proper pictures, diagrams, proper explanation in clear and suitable sized letters if required with animation. Special softwares can also produce sound along with pictures. Suitable explanation can be recorded and presented in an effective manner. Popularity of Power Point presentation among teachers depends on its following uses–

- 1) It creates proper atmosphere for teaching-learning of the subject.
- 2) It helps to understand the subject clearly.

89 3) It helps the teacher in repetitive classroom proceedings on the same topic. 4) The teacher can go on improving the power point presentation because it is very easy to add or delete matters and redesign the slides. 5) students can also get a copy of the same and use them whenever they feel to revisit them.

3.7. Adaptation of materials for teaching challenged children

Concept The concept of inclusive education means that students with special needs will be placed in the same classroom environment as other students of their age who do not have special needs. Within inclusive education there are two main branches of thoughts : mainstreaming and full inclusion. Mainstreaming is a process that allow children with special needs to enter certain standard classrooms after they show the ability to keep up with the rest of their peers. Full inclusion puts students with special needs in standard common classroom environments without testing or demonstration of skills. While acceptance of the idea of inclusive education is somewhat mixed, educationists in general at present are of the opinion that children with special needs thrive in standard classroom environments for a variety of different reasons. Inclusive classroom allows children to develop friendships with their peers and feel less that children who are placed in standard common classroom environments generally have higher special classrooms because they have special needs. Children with special needs actually learn more in a regular classroom environments provided they get help and support they need in and out of the classroom when it comes to academic subjects. Children actually need to feel included or belong to a group. Children who are groomed in special schools or special classes develop a kind of self-esteem that would remain with them throughout life and it would make them difficult to feel like they belong to adults. Moreover according to children with Disabilities Act, disabled children have the right to access to the same general curriculum taught to students without disabilities. As educators demand increasingly to include children with disabilities in the regular classrooms, the need for teachers with greater expertise in this field or support from special educators increases as well. Collaborative teaching is fast becoming one of the most popular service delivery in inclusive classroom settings. Co-teaching involves two or more certified professionals to share instructional responsibility

90 A child with disability means a child with :

1. Mental Retardation
2. Hearing Impairments (including Deafness)
3. Speech or Language Impairments.
4. Visual Impairments (including Blindness)
5. Serious Emotional Disturbance
6. Orthopedic Impairments
7. Autism
8. Traumatic Brain Injury
9. Other Health Impairments
10. Specific Learning Disabilities.

Materials that should be adapted for teaching challenged children in an inclusive classroom are :-

1. Thick hard-paper coloured text books with bold writings
- 2) Picture books depicting all geographical concepts.
- 3) Braille books., Braille Boards for visually impaired students.
- 4) Overhead projector, LCD projector for projected materials on a screen with use of coloured writings and diagrams wherever suitable.
- 5) Interactive smart Boards to make the children motivated in participation in the lesson.

91 6) Language Laboratory equipments for the children with speech or language impairments. 7) Hearing Aids (Personal), microphones, good sound system for helping hearing impaired students. 8) For orthopedic imparied children wheel chairs with attached small sized computers and Key-boards may be used for a single group of students in a single classroom for specific content and objectives with mutual ownership, pooled resources and joint accountability. One of the advantages of co-teaching is that more detailed observation of students engaged in the learning process is possible. With this approach, co-teachers can decide in advance about the type of observational information to gather during instruction. Afterwards, the teachers can analyse the informations together. Another approach of co-teaching may be that one teacher would have primary responsibility for teaching while the others provide support in classroom proceedings. 'Parallel teaching' can also be adapted where both teachers cover the same content but they divide the class into two groups and teach simultaneously. In 'Station teaching', both teachers divide the content and each take responsibility for planning and teaching part of it. In this case, the classroom is divided into various teaching centres. Alternative teaching may also be adapted wherin one teacher manages most of the classes while the other teacher works with a small group inside or outside the classroom. In 'Team teaching' both teachers are responsible for planning and sharing the instruction of all students.'

92 3.8 Check Your Progress 1. What is curricular approach ?

.....

94 13. Why is chalk board considered the basic instructional material for a school classroom?

.....
.....

..... 3.9 Let Us Sum Up The teaching of Social Science require a variety of instructional inputs. These instructional inputs are essential to achieve the desired learning outputs. Instructional inputs can broadly be classified into teacher directed and learner directed. In this unit apart from these instructional inputs we have also discussed devices and techniques of teaching Social Science. 3.10

tools and techniques of continuous and comprehensive evaluation (CCE) for

curricular and co-curricular subjects. 4.6 Construction of teacher-made test. 4.7 Diagnostic testing and enrichment techniques for challenged children. 4.8 Check Your Progress 4.9 Let Us Sum Up 4.10

References 4.1 Introduction

In any education system, the teaching-learning process becomes successful if proper curriculum framing is followed by appropriate implementation of methodology and lastly, a scientific evaluation system. Actually the fundamental test of a sound education is its effect on the pupils. An education programme that is unable to bring about desirable changes in the educants, cannot be termed as successful. Keeping in mind, the definite aims of changes in pupil behaviour, teaching-learning experiences are designed and planned. During the course of teaching-learning, teachers have to ascertain very frequently the growth and change, taking place pupils as a result of teaching-learning experiences. This is called evaluation. A good evaluation process rests on

the three pillars of i) educational objectives, 2) learning and behavioural changes, and 3) tools and techniques of evaluation. Evaluation

is a process of determining

the extent to which previously established goals or objectives have been achieved,

the

96 effectiveness of teaching learning experiences provided in the

class-room and the manner in which the aims of

education have been accomplished.

The aims of education have been accomplished. The evaluation process can be represented diagrammatically by means of the following triangle :- Objectives Learning Experiences

Evaluation

Techniques

Objectives are central to both learning experiences and evaluation. Evaluation comes in right at the planning stage when objectives are determined. Similarly, learning experiences are also planned and organised in terms of objectives. At every stage in the learning process, evaluation is needed to discover the extent of the effectiveness of the experiences with a view to bring about the desired changes in pupils behaviour. Evaluation, therefore cannot be postponed till the end of the entire course of instruction. It has to be made at periodical intervals to ascertain effectiveness and change, with a view to improve learning. Thus, evaluation must remain as an integral part of teaching because it is a continuous process and relates to the total learning situation. It indicates an inter relationship among the school, the society, the knowledge body, instruction and social behaviour. Evaluation is a continuous and natural enterprise of all concerned. Evaluation is a holistic process by means of which changes in the behaviour of the students are studied. 'Evaluation' cannot be considered as a synonymous term as 'examination'. Examination measures academic achievement only and it depends for its data on achievement tests to know the level of knowledge acquired by

a student. So, the examination system in earlier days, used to measure only the students' level of achievement it is a 'one-way street' which deprived children of development of varied abilities. On the other hand, evaluation is an integral part of the teaching- learning

97

Evaluation is a process of appraisal, which involves the acceptance of specific values and the use of a variety of instruments of observation, including measurement, as the basis of value Judgement. The basic steps involved in evaluation are :- 1) Formulating objectives, 2) Securing evidence on the achievement of the objectives in selected situations, 3) Summarizing and recording evidence, and 4) Interpreting evidence, and 5) Using interpretations to improve instruction and pupils progress report. 4.2

Objectives After studying this unit the students will be able to : 1) Explain about the meaning and concept of evaluation. 2) Explain the types of evaluation in Social Science. 3) Explain the tools and testing techniques of challenged children. 4.3

Purpose of evaluation in Social Science. Evaluation is more comprehensive than examination. It includes the testing of both tangible and intangible qualities. It is related with the total learning situation. It takes in to account the growth of the Evaluation is both objective and subjective. It is a continuous and developing process and forms an important part of the educational programme. The teacher, if he wishes to succeed in his aims, must ascertain the effectiveness of the text books, audio-visual aids, projects, mehods and devices of teaching and also his relationship with his pupils. Following are the major advantages of evaluation :- 1) Evaluation leads to improvement of instruction

As we have already noticed, there is inter-relatedness between objectives, learning experiences and evaluation. Evaluation is of great importance because it indicates the degree of the attainment of each objective. It also indicates the strength and weekness of different classroom procedure. It also suggests improvements and modifications of those procedures which have not succeed, Thus, evaluation helps in replanning of the work, use of new methods, devices, techniques and aids and the re-evaluation of the whole procedure with a view to improve instruction.

98 2) Evaluation helps in clarifying

objectives : It is evaluation that enables the teacher to judge as to what extent the desired objectives have been realized. Thus, evaluation is

of great help in clarifying objectives and reminding the teacher of his success or failure in the realization of those objectives. 3) Evaluation promotes better learning : The study habits of our pupils depend primarily on the examination methods. Previously class promotion depended only on success in the written examinations. So pupils used to memorize facts and reproduce them at the time of examination. But now evaluation signifies a wider, more comprehensive and continuous process of assessing the progress of the student with the help of different devices.

Therefore, beside

knowledge objective, students tend to develop proper attitudes, skills, habits, appreciations and understanding and better learning

results leading to development of better personality. 4) It provides the basis for guidance : Evaluation helps us in determining the extent and rate of pupil growth along the line of the aims and objectives of education. Diagnosis of the difficulties and weaknesses of individual pupils as well as their potentialities and achievements is possible only with the help of a good mechanism of evaluation.

This information can provide us the basis for guidance in preparing remedial instruction to remove individual weaknesses and difficulties. 5) It leads to curriculum changes : Evaluation is based on educational

objectives which are in turn based on the needs and interests of the children as well as those of the society and also on psychology of learning. Social needs are not static but undergo constant change in the rapidly changing world. So educational objectives are also changing from time to time according to the changing needs of the society. Evaluation which depends on educational objectives, demands similar changes in the curriculum from which some content areas are dropped or modified some other new contents are added

as per reflections of the evaluation to enable the curriculum

to keep pace with the demands of a rapidly changing and amazingly complex world.

The primary purpose of evaluation is to determine whether the desired objectives are being fulfilled in the learning process. So it is the duty of every schools to establish a regular evaluation programme for measuring the growth and development of pupils studying there. Every subject teacher should keep before him the main objectives of 99 evaluation as they relate to the particular subject.

The specific objectives of evaluation in Social Science may be enumerated as below : 1) To help in measuring factual knowledge : A teacher of Social Science evaluates in order to determine the extent and rate of the pupils development as per the aims and objectives of teaching Social Science. Definite knowledge, informations, concepts must be acquired by pupils in order to develop clear thinking and critical judgement. 2) To help in diagnosing weaknesses : Another purpose of evaluating Social Science knowledge is to discover specific weaknesses of individual pupils or the class as a whole so that a Social Science teacher can prepare remedial instruction for removing those weaknesses and deficiencies. 3) To help in predicting future achievements : Another important purpose of evaluation in Social Science is to determine the potentials of the students, discovering their special abilities and attitudes, thereby predicting their future success. 4) To stimulate instruction : Evaluation in Social Science is meant to stimulate both teacher and pupils to work harder with a view to reaching a higher level of attainment and proficiency in Social Science. 5) To meet criticism : A careful and comprehensive evaluation provides evidence that can be used to inform the community and the school authorities about the value of school programmes and its achievements. Thus criticism from parents and public bodies can be met and turned to constructive co-operation. 6) To test the development of skills and attitudes : Evaluation is also meant to test whether right attitudes towards groups and individual persons have been formulated as a result of Social Science instruction. Perfect attitudes will help pupils in their social adjustments, social behaviour, manners, etiquettes, etc. Right attitudes, habits and understanding are essential for producing democratic citizens. Thus, evaluation will help the geography teacher in directing the Social Science intellect and emotions of his pupils in such a manner that they will not possess narrow prejudices, selfish motives intolerance, injustice, jealousy, and other negative traits.

100 4.4 Techniques of evaluating learner achievement in Social Science : Written and oral tests, observation tools, work samples, portfolio. In order to attempt for a comprehensive objective of the present day school curriculum and to obtain an appraisal of the students, achievement several techniques are employed some of which are : written tests, oral tests, observation tools, work samples, portfolio etc. Written Test :– Written tests are those in which tests are taken through paper-pencil work within a specific duration of time and not by means of verbal interviews or online assessment process. Written tests may be of many types : Essay type : In Essay-type written test, examinees are required to write an answer, out of a few alternatives, within a definite duration of time and word limits, which help to test the students, abilities of coherent thinking, analysis of ideas, organization of thoughts in a logical manner, recollection of facts, use of appropriate language, citation of suitable examples, etc. Essay type tests may be descriptive type, comparative type, explanatory type, problematic type, critical analysis type, etc. Merits : It tests the students' capability of sustained thinking and arrangement of them in a systematic manner towards a logical conclusion. It is useful to evaluate the skill of writing on a specific topic requiring assemblage of different facts and may be with critical analysis of them. It can help the evaluator in identification of a student's personal attitude or conviction on certain issues related to a subject or topic. Demerits : Personal biased attitude of the evaluator may hamper the spirit of the test. It takes too much of time and mental stress on the examinee, although full marks are usually not awarded. Much time is spent in evaluating the scripts and thereby publication of results is usually delayed when the number of candidates is large. The students prefer to study only selectively leaving some of the topics unread and thus acquiring a comprehensive knowledge is impossible.

101 Examples and statistics used in the answer vary from candidate to candidate and it may be difficult for the examiner to verify them and compare among the examinees leading to erroneous evaluation process. Short Answer type : Short Answer type test items are meant to judge the students' understanding of a subject or topic within a relatively short time, as the answers are needed to be written within a few words these may be many types like descriptive type, comparative type, explanatory type, problematic type, brief analytical type, etc. Merits : Since answers have to be given very specifically within a few words, they do not vary, very limited personal bias exists among the examiners and time taken for evaluation is relatively less. Language does not play a dominant role as the length of the answer is short. These are useful to understand the students' ability of comprehension, analysis and expression within a short time. Since the weightage of each item is less, questions may be asked covering almost all areas of the syllabus. Demerits : These tests have some extent of subjectivity

and can create adverse effect both on examinee and the examiner. If there are too many items the students are not able to allocate necessary time for each, and in absence of suitable alternatives they are to leave some items resulting in low scoring. Objective type tests :

Test items of objective type demand only a single answer to be given in one word or to be selected from a given set of answers. Objective tests are of many types namely : a) Selectivity type, b) non-selective or retentive type. The non-selective type again may be or sub-types like i) very - short answer type and ii) Filling up or completion type. The selective type again may be classified as-i) Multiple Choice Questions type, ii) True-False or Yes-No type, iii) Matching Test type, iv) Classification or grouping test type,

etc. Merits : Objective type tests have been introduced to avoid the difficulties of essay-type tests. The name of the test suggest that it is suitable for eliminating the faulty assessment due to personal biasness, various types of answers for the same question, and wastage of time for answering as well as evaluation. In this type of test it is possible that questions are framed covering the whole syllabus so that students can learn every portion of the syllabus.

102 As right answers do not vary from candidate to candidate, exact objective measurement of the desired learning outcome is possible. Demerits : This type of test is not suitable for measuring the students' understanding of the cause effect relationship between objects or phenomena and appreciation of different aspects of a concept. More scope for copying from others is generally possible. There is little scope for interpretation of the facts and their correlation.

However limitations of objective tests can be overcome to some extent if proper steps are taken as below :- Time allotted for objective tests should be neither too long nor too short. The instructions should be clearly stated in brief so that time is not wasted in reading instructions. Questions should cover the entire syllabus and must be made compulsory. The scoring key should be prepared with care, beforehand. Oral Test :

Evaluation is also done on the basis of oral test. In this type of test the evaluator can ask a student or a group of students verbal questions in order to make out their level of understanding. Sometimes oral tests are taken as a part of the written test or practical test. For practical evaluation, oral tests are known as viva-voce and are meant to judge the theoretical concepts related with various

practical assignments. Oral tests are also used during teaching learning sessions to test the previous knowledge of the pupils related with present

lesson as well as during the presentation of a lesson for developing a particular concept in the

class, to formulate new generalization or to find out students, contribution to the lesson development, such questions not only keep

the

students alert and attentive but also stimulate their mental activity. The teacher

is also in a position to find out whether his students are learning seriously and at a regular pace. Oral tests serve their real purpose when they are made an integral and essential part of the evaluation programme. All students are not equally able to express their thoughts verbally in a desired manner. Many students are found to be in a better

103 position when they are required to express themselves through written tests. But, beside written tests, all students must be encouraged to express themselves orally as frequently as possible and practice of this ability is a very essential quality for all young citizens of a democratic country like India from the very beginning of their educational endeavour.

Some marks should be set aside for oral testing beside all written tests or whenever evaluation is to take place.

Observation tools :- Development of right attitudes, interests and values

is one of the major aims of teaching Social Science

in schools. Evaluation in this direction is also very essential to ascertain how far we have succeeded in realising our aims.

This is possible through certain techniques one of which is observation. Observation is seeing something with a purpose. It is one of the tools or techniques available to teachers for appraising pupils 'growth and sensing their interests and aptitudes. Observing each pupil, while he or she is engaged in actual classroom activities, is the best way of judging the pupil'

s attitudes, feelings and interests as well as changes in behaviour.

Thorough observation will reveal to the teacher how the pupil shows respect for the ideas and feelings of others, abstains from causing disturbance in the class, takes his proper share in classroom activities, observes rules established by the group, fulfils his responsibilities, tolerates others' comments and enjoys giving help and assistance to others, when needed. It is, however, essential that a properly written record of the data obtained through observation, in case of each pupil, should be maintained by the teacher. Such a record is very helpful in interpreting and reporting progress of pupils to their

parents. Although observation as a tool or technique is mostly subjective, its reliability and validity can be improved by making observation at frequent intervals and also by making observation independently by several observers at a time. Work Samples : –

In Social Science, work samples are usually written materials which include a report, a story, a class-room test or an assignment.

Work samples may also include map-work, illustrative material prepared by pupils, art-work or construction of project. Tape Recorder may also be used for obtaining a sample of the pupils spoken words. Such work samples can provide valuable information and evidence with regard to the desirable growth on the part of the pupils in sharing, cooperating, reviewing and applying his skills in individual and group experiences.

104 Portfolio : – There exist two main types of assessment, namely formative and summative. Formative provides feedback and information during the instruction process, while learning after the learning has been completed and provides feedback that sums up the learning and teaching process at the end of instruction. Portfolio is an evaluation tool used to document student learning through a series of student-developed artifacts. It is considered as an authentic assessment and it offers an alternative or an addition to traditional methods of assessment. Portfolio assessment gives both teachers and students a controlled space to document, review and analyze content learning. A student portfolio is a systematic collection of student work and related materials that depicts a student's activities, accomplishments and achievements in one or more school subjects.

The collection should include evidence of reflection and self-evaluation, guide lines for selecting the portfolio contents and criteria for judging the quality of work. The goal is to help students assemble portfolios that illustrate their talents, request their writing and organizing capabilities and show their status of school achievement. There are two major types of portfolios 'Process Portfolio'

which is more or less equivalent to formative evaluation system and 'Product portfolio' which is close to summative evaluation system. A process portfolio documents the stages of learning and provides a progressive record of student growth. A product portfolio demonstrates the ultimate form of achievement, the mastery of a learning task or a set of learning objectives and contains only the best work.

Teachers normally use process portfolios to help students identify learning goals, document progress over time, and demonstrate

learning mastery. In general, teachers prefer to use process portfolios because they are ideal for documenting the stages that

students go through as they learn and progress. Steps in portfolio Assessment process : 1) First, the teacher along with the students should identify the goals of achievements or learning objectives. 2) Secondly, teacher and students together should decide on selection of portfolio contents or samples of student work, reflections, teacher observations, and

105 conference records. 3) Next, the teacher should develop evaluation procedures for keeping track of the portfolio contents and for grading the portfolio. 4) After conferences, which needs a plan for holding portfolio conferences, which are formal and informal meetings in which students review their work and discuss their progress. Conferences are an essential part of the portfolio assessment because these encourage reflective teaching and learning. Advantages of portfolio assessment : – It promotes the students, self-evaluation, reflection, and critical thinking. It measures performance based on genuine samples of students' work. It provides flexibility in measuring the process adapted by students to accomplish their learning goals. It enables both teachers and students to share the responsibility of setting learning goals and for evaluating progress towards meeting those goals. It gives the students opportunity to have extensive input into the learning process. It facilitates cooperative learning activities, including peer evaluation and tutoring, cooperative learning groups, and peer conferencing It provides a process for structuring learning in stages. It provides opportunities for students and teachers to discuss learning goals and the progress towards those goals in structured and unstructured

conferences. It enables measurement of multiple dimensions of students' progress by including different types of data and materials. Disadvantages of portfolio Assessment :- It requires extra time to plan on assessment system and conduct the assessment. It leads to gathering of all necessary data and work samples which can make portfolio bulky and difficult to manage. Developing a systematic and deliberate management system is difficult and sometimes a portfolio may come out to be a random collection of student work. Scoring portfolios involve subjective evaluation procedure such as rating scales 106 and professional judgement and so it has limited reliability only. Scheduling individual portfolio conferences is difficult and the length of each conference may interfere with other instructional activities. 4.5

Assessment : tools and techniques of continuous and comprehensive evaluation (CCE) for Social Science. Continuous and comprehensive Evaluation (CCE) refers to a system of institutional evaluation of students that covers all aspects of students' development. It is a developmental process of assessment which emphasizes on two-fold objectives. These objectives are continuity in evaluation and assessment of broad-based learning and behavioural outcomes. In this scheme, the term 'continuous' is meant to emphasize that evaluation of identified aspects of students , growth and development' is a continuous process rather than an end event, built into the total teaching learning process and spread over the entire span of academic session. It involves regularity of assessment, frequency of unit testing, diagnosis of learning gaps, use of corrective measures, retesting and feedback of evidence to teachers and students for their self evaluation. The second term comprehensive means that the scheme attempts to cover both the scholastic and the co-scholastic aspects of students' growth and development. Since abilities, attitudes and aptitudes can manifest themselves in forms other than the written word, the term refers to application of variety of tools and techniques (both testing and non-testing) and aims at assessing a learner's development in different areas of learning. The CCE assessment includes both scholastic and co-scholastic assessment. The desirable behaviour related to the learner's knowledge, understanding, application, evaluation, analysis, and creating in various subjects including geography, history and the ability to apply these in new, unfamiliar, situations are some of the objectives in scholastic domain. The desirable behaviour related to learner's life skills, attitudes, interests, values, co-curricular activities, physical health are described as skills to be acquired in co-scholastic domain. Both scholastic or curricular and co-scholastic or co-curricular domains should be assessed in two ways, formative assessment and summative assessment. Formative assessment is carried out during a course of instruction for providing continuous feedback to both the teachers and the learners for taking decisions regarding appropriate 107 modifications in the transactional procedures and learning activities. Summative assessment is carried out at the end of a course of learning. It measures or 'sums-up' how much a student has learned from the course. It is usually a graded test, i.e. it is marked according to a scale or set of grades. The tools for formative assessment in scholastic domain are

oral questions, assignments, conversation skills, projects, quizzes and group work. The tools per summative assessment in scholastic domain are multiple choice questions, short answer type and long answer type descriptive questions at term end. Co-scholastic domain covers the following : values and attitudes towards teachers, students, peers, institutional programmes, environment, Co-curricular activities. Creative and literary activities Aesthetic activities. Clubs and Scientific activities Emotional Skills. Social Skills. Life skills. Thinking skills. Evaluation of Scholastic areas.

Area Technique Tool periodicity Reporting All the Oral Test Oral questions Every day Using direct School Written Test Class Work after completing or indirect Subjects Project work Question Paper a competency grades. Practical Unit Test or a group of Activities Assignment competencies Maintenance Diagnostic Monthly class Test Portfolios Test Unit Test Terminal Test.

108

Evaluation of co-scholastic areas and personal and social qualities

Area Technique Tool periodicity Reporting Health Medical Norms of Once in a Health Status Check-up fitness used year for physical by doctors growth Physical Education Observation Rating scale As per Direct of activities Time Table grading Work Experience Observation Rating scale As per Direct and Art Education at work and Time Table grading activities Maintenance of portfolios Social and Observation, Rating scale, Day-to-day Direct Personal qualities Interview, observations grading Self-Reporting Check-list by the teachers (once in techniques like Anecdotal by determining every month) students' diary. Records criteria for each trait.

The major emphasis on CCE is on the continuous growth of students ensuring their intellectual, emotional, physical, cultural and social development and therefore will not be merely limited to assessment of learner's scholastic attainments. It uses assessment as a means of motivating learners in further programmes to provide information for arranging feedback and follow-up work to improve upon the learning in the classroom and to present a comprehensive picture of a learner's profile. Continuous and comprehensive evaluation helps a classroom teacher in the following ways :-

To identify learning difficulties in mastering certain competencies and the intensity of such learning difficulties. To improve students' learning through diagnosis of their performance.

109 To plan appropriate remedial measures to enable the students who have learning difficulties in mastering the competencies. To strengthen evaluation procedure itself. 4.6 Construction of Teacher-made Test The most frequently used method or technique for measuring and evaluating pupil progress by the classroom teacher is the Teacher-made test. The teachers, therefore, have an obligation to provide their students with best possible evaluation. This type of test may involve many types of objective tests, essay-type tests, etc. Yet it is quite common to find teachers who have had no specific training in the use and construction of these types of tests. Such teachers often design tests on a trial and error basis. Similarly many teachers design such tests with little thought of the relationship between what these tests

measure and the instructional objectives. Determining Instructional/Learning Objectives : The first and most important step in planning

a Teacher-made test

is to define the objectives of instruction. The teacher may have with him, curriculum guides, and knowledge about the taxonomies of instructional objectives developed by Benjamin S. Bloom (1956), Krathwohl (1964) and tests on the development of instructional objectives by Plowman (1971) and Kibler, Barker and Miles (1970), the ultimate responsibility for selecting objectives suitable

for the group of students that he is teaching and stating the objectives

in such a way that they can guide instruction and the evaluation of pupil progress rests with the teacher. Objectives should be stated in terms of student behaviour and not in terms of learning activities or purposes of the teacher.

Objectives should contain an action verb that indicates the behaviour that a student should show in dealing with the content. This format tends to guarantee a focus on the student and what he does.

Objectives should be stated in terms of observable changes in student behaviour. Writing the questions :

Once we have defined the important learning/instructional objectives and have, in the light of those objectives, determined which types of questions and what form of test to use, We can begin the second step in constructing an affective teacher-made achievement test. This step is writing the

questions.

110 General principles of framing questions : While the different types of questions like essay-type, short answer type, very- short-answer type and objective type questions like multiple-choice, fill-in-the-blank, true-false, matching test, etc.

are constructed differently, the following principles apply to constructing questions and tests in general.

Make the instructions for each type of question simple and brief. Use simple and clear language in the questions. If the language is

different, students who understand the material but who do not have strong language skills may find it difficult to demonstrate

their knowledge. If the language is ambiguous, even a student with strong language skills may answer incorrectly if his or her interpretation of the question differs from the instructor's intended meaning. Write items that require

specific understanding of ability developed in that course, not just general intelligence or test-wiseness. Do not suggest the

answer to one question in the body of another question. This makes the test less useful, as the test-wise student will have an advantage over the student who has an equal grasp of the material, but who has less skill at taking tests. Do not write questions in the

negative. If you must use negatives, highlight them, as they may mislead students into answering incorrectly. Specify the units and precision of answers. Principles of constructing Multiple Choice Questions : The most commonly used

type of question is the multiple-choice question multiple-choice questions are more easily and objectively graded than essay-type questions and are more difficult to answer correctly without the required knowledge than true-false, are probably the most difficult type of question to construct. The following are a few guidelines for multiple choice question construction.

State clearly

in the instruction whether you require the correct answer or the best answer to the question. Instead of repeating words in each alternative, include these words in the main body of the question. This will make the question easier to read and the options easier to compare. The structure of the main part of the question, however, must not contain clues to the correct response.

111 Make incorrect alternatives attractive to students who have not achieved the targeted learning objectives. The placement of correct responses

must vary randomly. Make all choices exactly parallel, Less experienced test constructors tend to make the correct answer longer and more carefully worded and

by doing so, may provide a clue to

the correct answer. Never Offer, "all of the above" or "none of the above"

as an alternative in a best-response multiple choice question.

Whether none of the above "is chosen as a better response than one of the other options

may depend on what evidence the student considers rather than how well he or she understands the material. Control the difficulty of a question by making the alternatives more or less similar or by making the main part of the question more or less specific. If the alternatives are more similar, the student will have to make finer distinctions among them. If the main part is more specific, the student will be required to draw on more detailed knowledge.

Four or more options must be provided to minimize guessing. Uniform number of options must be used.

Objective type questions other than Multiple-Choice Type may be :- Simple Recall type and Completion type—in the Recall type category while, Alternative Response type (true-false, plus-minus, right-wrong, yes-no, correct- incorrect, etc) Matching type (With two columns

in which right pairing is required) Rearrangement type (requiring chronological or logical ranking, ordering etc.) Analogy (consisting of a pair of words related to each other like

cause and effect, part-whole, action-object, synonyms, antonyms, degree, place, sequence, numerical, associations, etc). Advantages of objective tests : Easy to score

due to short responses involved. Eliminates subjectivity. Adequate sampling—more items are included where validity and reliability is

112 adequately maintained. High objectivity is possible due to short and a single correction answer in each item. Norms can be established. Time and energy-saving since options are provided. Limitations : Difficult to construct Encourages guessing Expensive because of wide sampling expensive for duplicating facilities. Encourages rote memorization, critical appreciations organization, reasoned expressions are not encourage. Time consuming on the part of the teacher in test construction. Essay type examination.

Essay examination consists of questions where students respond in one or more sentences to a specific question or problem. This type of test is aimed at evaluating knowledge of the subject matter or to measure skills in writing. It also tests the student's ability to express his ideas and think critically within a certain period of time.

According to Monrae and carter : – Essay examination may be of various types like :- Selective recall Evaluating recall Comparison of two ideas. Decision (for or against) Cause and effect Explanation type Summary Analysis Statement of relationship. Illustrations of or examples of principles. Classification of rules or principles in new situations.

113

Discussion Statement of aim Criticism Outline Reorganization of facts Formulation of new questions, problems, etc. New method or procedure.

Advantages of Essay examination : – Easy to construct Economical in terms of producing a huge number of the question papers. It can be even written on the board. Trains the core of organizing, expressing and reasoning power of the students. Minimizes guessing. Develops Critical thinking. Minimizes memorizing. Develops study habits involving comprehension, interpretation, explanation

rather than only memorizing a few items. Limitations of Essay examination : Low

validity because of limited sampling. Low reliability due to its subjectivity in scoring. A given answer by a specific student may or may not be appealing to a specific teacher. Low usability because

it is time consuming both on the part of the student to answer and on the part of the teacher to evaluate. Encourages the students with low ability to go on writing incorrect, half-correct matters using camouflaged judging of words and sentences. Disadvantageous for students with poor penmanship. Some teachers may react unfavourably to responses of students having poor handwriting and unity papers.

114

METHOD SOCIAL SCIENCE WHAT IS PEDAGOGICAL ANALYSIS? Pedagogy is the study of being a teacher. The term generally refers to scientific strategies of instruction, or a style of instruction. Pedagogy is also occasionally referred to as the correct use of instructive strategies. It literally means "to lead the child". The Latin-derived word for pedagogy: child-instruction, is in modern use in English to refer to the whole context of instruction, learning, and the actual operation involved therein, although both words have roughly the same original meaning. In order to analyse a content pedagogically, first of all the content to be taught is to be divided and sub-divided into units and subunits. Then these subunits are to be analysed in accordance with the methodology of subject concern (language, social science, science, music etc.) in order to bring certain behavioural changes among the students. The particular objectives selected to bring about these changes are known as Instructional objectives. So we can say that, "the analysis of a given content material in any subject or any topic carried out well in the spirit of the science of teaching (Pedagogy) is known by the term pedagogical analysis of the contents". Content analysis of the unit into sub-units with time allocation Basic concepts to be imparted Objectives using Revised Bloom's taxonomy Taxonomic table for well balanced unit planning. Teaching strategies including Equipment, probing Questions. learner centred activities, Achievement test of 50 marks based on the taxonomic table.

115

116 Sl.No. SUB-UNITS PERIODS 1 BACKGROUND AND CIVIL RIGHTS 1 MOVEMENT IN SOUTH AFRICA 2 REGIONAL MOVEMENT IN INDIA 1 CHAMPARAN AND KHEDA 3 KHILAFAT MOVEMENT AND 1 ASSUMING FORMAL LEADERSHIP IN THE SUCCEEDING MOVEMENTS 4 REMEDIAL CLASS 1 TOTAL 4 BRIEF CONCEPT- SUB UNIT 1 Mahatma Gandhi's birth and background. Gandhi's field of study and formal degree has to be mentioned which set the background for his involvement in the politics. To plead a case on behalf of Dada Abdullah and Co. he had rushed to South Africa in late 1890s. He observed the exploitation and oppression towards the Negroes by the Whites; and therefore he formed the Natal Indian National Congress. He adopted the idea of Satyagraha from the Book. "kingdom of god" and "unto the last" by Leo Tolstoy and John Ruskin. He formulated his ideas of 'NON VIOLENCE and SATYAGRAHA' which later formed the backbone of Indian Politics and signified the era of 1915- 1947 as the 'Gandhian Era'.

117 BRIEF CONCEPT- SUB UNIT 2 1918- First regional movements in India developed by Gandhi, which brought him closer to the rural mass of India. Oppression and exploitation of the peasants at Champaran and Kheda by the British authorities. The agitation of Indigo planters in Champaran and impoverished peasants in Kheda were channelized by Gandhi in a Non-violent manner to achieve the goal of Satyagraha- search for truth. Gandhi applied his gained experience in South Africa to accommodate these regional causes into the wider realm of Anti Colonial Movement of India. Mention may be made of a similar workers agitation at Ahmedabad. BRIEF CONCEPT- SUB UNIT 3 Cause of the Khilafat Movement in India in 1919 The fall of Caliphate after the first World war provided Gandhi with a cause to unite the Muslim peasants of Malabar coast. Ali Brothers lead the movement with certain demands but Gandhiji, in Calcutta Session of Congress(1920) suggested Khilafat to be united with the National Movements Mahatma Gandhi could pave his way to enter the mainstream Indian politics. Thus, he emerged as a leader of the Hindu-Muslim as well as urban-rural masses with the help of his unique doctrines and slogans. OBJECTIVES 1. FACTUAL 1. REMEMBERING 1.1.1) Students can recall the time and place of Gandhi's birth.

118 1.1.2) Students can recall who were his parents. 1.1.3) Students can recall that he studied barristership from London. 1.1.4) Students can locate where and when did Champaran movement take place. 1.1.5) Students can locate where and when did Kheda movement take place. 1.1.6) Students can recall the time of Khilafat Movement. 1.1.7) Students can memorise the names of the main participants of Khilafat movement. 1.1.8) Students can recall the name of the book from where Gandhiji adopted the ideology of non-violence. 2. UNDERSTANDING 1.2.1) students can explain the cause of Negro agitation in South Africa against the White. 1.2.2) Students can understand the cause of the agitation of Indigo Planters in Champaran against the British Landlords. 1.2.3) Students can explain the issue of peasant agitation in favour of tax relief in post-famine situation of Kheda. 3. APPLY 1.3.1) Students can show some other leaders (political/religious) of the past who followed the path of non-violence to achieve a goal. 1.3.2) Students can point out Gandhi's early movements in the map of India. 4. ANALYSE 1.4.1) Students can compare the causes of uprisings in Champaran and Kheda. 6. CREATE 1.6.1) Students can propose an alternative name to the political organization that Gandhi formed in South Africa to protest against the oppression of the Negroes.

119 OBJECTIVES 2. CONCEPTUAL 1. REMEMBERING 2.1.1) Students can define the term 'Satyagraha'. 2. UNDERSTANDING 2.2.1) Students can relate the two regional movements with the greater pan-Indian movement against Imperialism. 2.2.2) Students can describe the context of Khilafat movement in India. 3. APPLY 2.3.1) student can classify their own activities/interests/likes and dislikes as to whether they are categorically pertaining to what is "national" or reinforcing a veiled colonialism. 4. ANALYSE 2.4.1) Student can analyse the demands of Khilafat Committee. 2.4.2) students can analyze Gandhi's role in merging a Muslim cause of the Khilafat with National schemes of INC. 5. EVALUATE 2.5.1) students can assess the significance of Khilafat as the first All-Indian Movement. 2.5.2) Students can evaluate the notions of non-violence and passive resistance as a tool to defy the colonial hegemony. 6. CREATE 2.6.1) Students can predict Gandhi as the Father of Nation in future.

120 OBJECTIVES 3. PROCEDURAL 1. UNDERSTANDING 3.2.1) Students can discuss the steps of transition of politics. 4. ANALYSE 3.4.1) Students can examine the process by which Gandhi became an All-Indian figure to ensure his role in non-cooperation and civil disobedience movements. 5. EVALUATE 3.5.1) Students can criticize Gandhi's process of protesting to be mild and slow in comparison to the unparalleled damages caused by British authorities in both Champaran and Kheda. OBJECTIVES 4. META COGNITION 5. EVALUATE 4.5.1) Students can critically assess Gandhi as the Father of Nation in their own opinions in the modern context. 6. CREATE 4.6.1) Students can predict Gandhi's role in the later part of the "Gandhian Era" of 20th century. 4.6.2) Students can imagine themselves as Gandhi and suggest a parallel principle which would lead to India's independence.

123 4.7

Diagnostic testing and enrichment techniques for challenged children A diagnostic test is designed to find out whether or not a pupil or a class is performing according to expectations. It furnishes a reliable data about the abilities, interests, difficulties and handicaps of pupils. If the quality of work is not up-to-the mark, the diagnostic test is supposed to disclose its reasons. The word 'diagnosis' has been taken from medical studies which means 'identification of disease by observing or measuring patients' symptoms'. The word diagnosis is used in education to determine the learning difficulties and defficiencies. So a diagnostic test, for educational purposes, is supposed to reveal an individual pupil's weaknesses and strength in the certain case of study. Thus, a diagnostic test is designed to analyse an individuals's performance and provide information about the causes of difficulty. Proper identification of difficulties that hinder the achievement of a learner can provide proper direction to good teaching i.e., effective teaching that will help to overcome such learning difficulties. There is not much difference between a diagnostic test and an achievement test. The only distinction may be that the diagnostic test emphasises individual items meant to measure individual pupil's difficult areas or individual pupil's areas of strength rather than total scores collected from test application. The teacher, moreover, uses the diagnostic test not for purposes of measurement but primarily for discovering faults, weaknesses, difficulties or specific elements of strength. Importance of Diagnostic tests: A diagnostic test can help the teacher to find out the areas of and source of difficulties on the part of the pupils on the basis of which constructive remedial action can be taken and re-teaching is possible to help the pupils overcome their difficulties. It can help to analyze the individual's performance and provide information about causes of difficulties. Diagnostic tests can point out deficiencies in teaching. Dificiencies in learning are also identified, Diagnostic tests help the teacher to monitor the progress of the pupils.

Such tests help to get feedback about the effectiveness of teaching. Diagnostic tests provide feedback to the students about their strength and weakness.

124 Diagnostic test results can lead to positive direction towards the specific type of remedial/

instruction that should be rendered by the teacher to assist the students' understanding of their specific difficulties, more effective learning and attempting to overcome their difficulties. Diagnostic tests may be standardized or teacher-made. Preparation of diagnostic tests require the stages of planning, writing test items, assembling the test items, providing dicertions and preparing the scoring key, making scheme and reviewing the test. The unit on which a diagnostic test is based should be divided into learning points without omitting any of them. A diagnostic test should be prepared by including all types of test items by assembling them in a proper sequence. It should also have proper instructions. After administering a diagnostic test, proper analysis and interpretation of the results on basic concepts, facts and specific skills have to be made. Students' responses (especially wrong ones) have to be analyzed both quantitatively and qualitatively. The frequency of the pattern and level of errors have to be analyzed. Remedial Measures: Remedial measures must be taken after getting feedback from the diagnostic tests about pupils' difficulties, Remedial measures cannot follow a set pattern or path. In some cases it may be a simple matter of review and re-teaching while in other cases it may be an extensive effort to improve metiration, correct emotional difficulties and overcome other learning difficulties. Two students with same learning difficulties may have different causes. So their remedial teaching-learning styles should also differ. Each subject area

also has its own specific remedial programs. Planning of remedial differ from subject to subject as well as from learner to learner. Remediation should be accompanied by strong motivational programs. The purpose of the measures should be related to the needs of the students who should feel convinced about their utility. These measures should be modified to meet

the demands of the situation. Some points to be kept in mind while preparing remedial measures are as follows:

Remedial measures must be based on sound diagnosis. Remedial measures must contain group work as well as individual work. Remedial measures must include procedures with a view to overcome faulty attitudes such as dislikes, rejection, indifference etc. towards the areas of difficulty. Remedial teaching-learning exercises as well as materials must be carefully selected.

125 Sound teaching-tearning procedures must be an integral part of remedial measures. Learning disabilities which can be the source of errors identified by a diagnostic test may be like: Hearing loss and deafness Vision loss and blindness Orthopaedic handicap/ physical disability, Autism Chronic illness. Intellectual disability Memory loss Mental illness. Speech and language disorders, etc.

Also there are gifted children who are not benefited by the educational programs that are extended to other students, gifted educaion programms and strategies are needed for them. Gifted and talented students and those with high abilities require gifted programs that will challenge them in regular classroom settings and enrichment and accelerated programs to enable them towards continuous progress in school, some of the strategies that work well for talented students are: Acceleration which involves the practice of providing optimal learning opportunities to match the abilities and specific talents of talented students. Curriculum compacting which is a strategy of that condenses, modifies or streamlines

regular curriculum to reduce repetition of previously mastered material. Grouping is the practice of placing students with similar abilities

together for instruction. This practice has often shoften shown positive impact on students learning achievements.

Identification is a critical component of effective gifted education program which ensures different strategies for different high potential students. Pull-out programs/specialized programs mean providing special programs or specialized classes to ensurte benefit of the gifted learning.

126

Enrichment programmes are required for gifted students to learn at their level best as well as for students with difficulties to learn at their optimal best. Enrichment program consists of:-

Flexible groups (may change daily or weekly) Choices of students. Content connected. Increased depth, breadth or complexity. Sometimes idenpendent activities, sometimes direct instruction. Cross-curricular-instructions.

Different/differentiated work—not just more work. High-level thinking skills applied to content. Planned and purposeful. Responsive to students needs and achievements.

Enrichment needs to be purposeful, focused, and planned, Enrichment programmes can be successful both for gifted and learning difficult students

if founded on certain criteria like:- Use of

appropriate assessment data to identify students' skill levels. Select texts and materials that provide appropriate level of challenge (skill, maturity, interest). Differentiate small group instruction to offer extension experiences. Adjust pacing to allow for essential skill acceleration. Design units to offer cross-curricular applications. Incorporate problem-solving and enquiry based activities. Faciliate student-led questioning and discustions. Incorporate real-world problem solving activities. Meet diverse learning preferences by allowing students to make choices for how to demonstrate their skill mastery. Foster

critical thinking by weaving media, reading, writing, speaking and listening skills into multifaceted lessons.

127

Stimulate creativity by incorporating graphic, visual, auditory, media and print resources and experiences. At the end we can formulate most of the enrichment strategies by utilizing the basic learning skills like 'think', 'ask', 'analyze', 'discuss', 'plan', 'strategize', 'reflect'. 4.8 Check Your Progress 1. Mention the purpose of evaluation in Social Science.

-
-
- 2. What are the merits and demerits of written test?
-
- 3. Write the importance of work samples.
-
- 4. Mention the steps in Portfolio assessment process.
-
- 5. What is comprehension evaluation?
-

128 6. Write any four Co-scholastic activities of students' growth and development.

-
- 7. Write four principles of framing questions.
-
- 8. Mention the advantages of objectives tests.
-
- 9. Mention the limitations of Essay examination.
-
- 10. What is pedagogical analysis of the contents?
-
- 11. Mention the stages of pedagogical analysis.
-

129 12. What is Diagnostic tests?

-
- 13. Write the importance of Diagnostic test?
-
- 4.9

Let Us Sum Up In this unit, we discussed evaluation in Social Science which is not only for certification but also for improving the instructional process itself. Evaluation is a continuous process which is carried out at the formation stage while developing the concepts and also at the final stage which is called Summative evaluation. Teachers evaluate both cognitive and non cognitive learning outcomes in social science with the help of various evaluation tools construction of achievement tests and diagnostic test when discussed along with the precautions one should take in preparing them. 4.10

Unit 5

Social Science Teacher as a Reflective Practitioner Structure 5.1 Introduction 5.2 Objectives 5.3 Being

a reflective practitioner- use of action research 5.4 Developing an Action Research Plan for solving a problem in teaching- learning of social Science 5.5 Case study- need and importance for a school teacher 5.6 Development of a Professional Portfolio Teaching Journal 5.7 Competencies for teaching social science to children with disabilities 5.8 Check Your Progress 5.9 Let us sum up 5.10 References 5.1 Introduction

A teacher has an important place in the school.

The most powerful, durable and effective agents of educational change are not the policy makers, the curriculum developers or even the education authorities themselves; they are the teachers.

Social science helps the

pupils to understand this complex world in which we live

and prepare them for an intelligent and constructive citizenship. Competencies in social science teacher in the areas of content, performance are also needed.

The quality of the educational changes that teachers have the skills and opportunities to effect will only be as reliable and proficient as the teachers' individual capacities for reflective practice and the development of self knowledge. 5.2

Objectives:

After going through this unit you will be able to Define the concept of

reflective practitioner and need of

using action research

131 Develop an action research plan to solve a problem in teaching-learning of history in the classroom Explain the term case study, its need and importance for a school teacher Develop a Professional Portfolio Teaching Journal Analyse the competencies for teaching social science to children with disabilities 5.3

Being

a reflective practitioner–use of action research Donald Schon in his book 'The Reflective Practitioner' introduced the concept of reflective practice which means the capacity to reflect on action so as to engage in a process of learning. The rationale is that not only experience but deliberate reflection on experience is necessary for learning. Reflective practice is a term strongly associated with learning in professional contexts such as teaching, nursing or social work and can be thought of in a number of ways. It can be described as a learning tool which helps a teacher to synthesize, explain, make sense and learn from our experiences. Action research can help a teacher to perform his/her role as a reflective practitioner to solve any teaching-learning problem inside the classroom.

Action Research Educational research can be classified into three broad categories namely (i) Pure research or Fundamental research (ii) Applied research (iii) Action research Concept of Action research : Action research is

undertaken with a view to find solution for the various practical problems of the educational institutions. Kurt Lewin (1944) first coined the term in his paper "Action Research and Minority Problem".

Stephen M. Corey defines action research

as "the process by which the

practitioners attempt to study their problems scientifically in order to guide, correct and evaluate their decisions and actions is what a number of people called action research." Action research:

According to Picciano, "Action research studies problems at the local level. It usually focuses on

development, implementation and testing of a new product, programme, plan or procedure in a school building".

It is also known as teacher research, practitioner research where teachers or administrators study their own problems or concerns in their own classrooms or schools. Action research is applied in nature and associated with small-scale research projects. It is also known as decision-oriented research since it requires that the researcher is the same person as the practitioner

132 who will make and implement the decision based on the findings of the action research. It is concerned with those practical issues, problems, concerns and needs of teachers or principals, which arise as a routine part of activity in real life situation. It applies the scientific method to the solution of day-to-day school problems.

Objectives of action research The objectives of action research are as follows: To improve the quality of educational or managerial practices and working conditions. To help a teacher or a group of teachers to change or improve a practice or to help them understand issues or problems for themselves. To enable teachers and principals to cope with the challenges and problems posed by the internal and / or external factors and bring about innovations. To enable teachers and principals to develop a more comprehensive view of their situation, to develop action strategies to bring about improvements and to evaluate the outcomes of their efforts. Characteristics of Action Research : 1. It is about action and research : It is action that is intentionally researched, and research that is designed to inform subsequent actions. 2. It is cyclical and evolves The classic action research is cyclical. Each cycle can be short – may be just a few hours, days or weeks. There can be cycles within cycles. Over time, a particular piece of action research may evolve into something quite different from its start.

133 3. Each stage of the cycle is rigorous The cycle doesn't just happen. Accepted and appropriate methods of acting, observing, reflecting and planning are used in each cycle. 4. It is critical Successful action research is based around shared curiosity not individual certainty. Action research works less well if people seek to prove the correctness of their own ideas, people are expected to put their practices, ideas, and assumptions to the test by gathering evidence that could convince them that those practices, ideas and assumptions may be wrong. 5. It tends to be collaborative There is no distinction made between those involved in the "action" and those involved in the "research". Everyone can be involved in both. The aim is to establish self-critical groups or communities participating in all stages of the cycle. 6. It often starts with an engaging question Since action research is both action and research oriented, the inquiry starts best with an initial question that is action oriented. Those involved in a particular piece of action research will have many different perspectives and expectations. In order to engage them, this starting question needs to reflect some common ground between all

those

perspectives and expectations. Other features are: ? It focuses on the immediate problem on a local setting ? Clear vision of goal-solution of the problem ? It is a part of applied research ? Lack of generalization and universal validity ? Small scale intervention ? Contextual in nature ? Enhances teacher pupil interaction ? Both quantitative and qualitative in nature ? Flexible and cyclic in nature

134 Steps of Action Research: Generally the action research involves the following steps like any other researches. Identification of

the problem Defining the problem Listing of probable causes Formation of hypotheses Design for testing hypotheses and data collection Evaluation of result Drawing conclusion

Advantages of Action Research: It ensures quality teaching It helps teachers, supervisors and administrators in making better decisions It gives a professional enrichment It gives a good insight and develops the power of imagination in teachers, supervisors and administrators It leads to innovative teaching strategies Research tools are easily available It is not expensive, it has shorter duration

135 Research Design is flexible based on local need Researcher gets highly motivated Easy to implement the results Any teacher with little insight can undertake action research Limitations of Action Research: The limitations are:

It is hardly noticed by others working in the same field

Lack of time, resource and technical background It requires a lot of imagination and scientific attitude of mind Lack of universal applicability. It is localized in nature. Thus no generalization can be drawn from one action research findings. 5.4

Developing action research plan for solving a problem in teaching, learning of Social Science :

One particular problem in Social Science history may be solved by adopting proper action research plan.

Identification and defining the problem: Poor performance of some students in the first history unit test of class vii.
Formulation of hypotheses: following hypotheses may be drawn Lack of interest in the subject Not properly motivated
Faulty method of instruction Facing some problems at home Neglected the subject over all
Collection of data: Data collection techniques may be the following Questionnaire Interview Observation
136 Data analysis and interpretation of data: After analysing and interpreting the data following conclusions can be reached The students do not get interest in the subject Remain inactive in the class Remedial Steps: Following remedial measures were taken to solve the problem: Teaching strategies were changed. They were inspired to read historical stories. Arrangement of excursion to historical places. They were involved to take part in the teaching-learning process more actively. Extra classes for them twice in a week.

Developing an Action Research Plan for solving a problem in teaching geography: Let us now

take up one particular problem in teaching geography in a particular class of a school and see how the problem can be solved by applying action research.

Identification and defining the Problem: students in class VI have achieved lowest score in map pointing Construction of Hypotheses:

After identification and defining the problems, several probable causes were listed, Based on which the following hypotheses have been postulated.

Anachronistic time table Insufficient use of maps, globe and other TLM Ineffective instruction Lack of clarity in the question Students paid least attention to subject Data collection: Based on the

above hypotheses primary data has been collected and generated by the researcher or the teacher through questionnaire survey.

137 Position of Geography period in different classes were checked Better TLMs were used Teacher selected 10 students at random basis and interviewed them to identify their difficulty in map pointing Teacher identified errors of students to select the common error Analysis and interpretation of data: The already generated data was analyzed using some simple statistical techniques. The following conclusions were drawn on the basis of interpretation. Social Science periods are set at the end of school hour with shorter duration ?

Maps and globes were not visible ? Insufficient interaction with the students ? Ineffective demonstration ? Students did not follow the instruction properly Remedial Measures: Finally, the problem was

resolved by bringing about required changes in Social Science teaching in class VI of the school.

Time table was rescheduled New maps, globes and other TLMs were supplied sufficiently to the students Students were divided into groups for demonstration Students were involved in the demonstration programme Extra classes were arranged for remedial teaching 5.5 Case Study: needs and importance for a School Teacher

Case study

research is descriptive research that involves describing and interpreting events, conditions, circumstances or situations that are occurring in the present. According to Odum, "The case study method is a technique by which individual factor whether it be an institution or just an episode in the life of an individual or a group is analyzed in its relationship to any other in the group". Its distinguishing characteristic is that each respondent is taken as a unit and the unitary nature of individual case is the focus of analysis.

138 Most case studies are usually qualitative in nature. It involves a detailed contextual analysis of a limited number of events or conditions and their relationships. Social scientists have made a wide use of this qualitative research method to examine contemporary real-life situations. However, some case studies can also be quantitative in nature, especially if they deal with

cost-benefit analysis or institutional effectiveness .Many case studies have been done by combining the qualitative

as well as the quantitative approaches in which initially the qualitative approach has been used and data have been collected using interviews and observations followed by the quantitative approach. A case study can precisely focus on a topic or can include a broad view of life and society. A case study can be conducted to explore, to describe, or to explain a phenomenon. Inherently, it is very flexible in nature. covers a wide range of problems posed for analysis, but most types include several key elements, Most cases are either based on real events, or are a construction of events which could reasonably take place. They tell a story, one involving issues or conflicts which need to be resolved- though most case studies do not have one obvious or clear solution. The information contained in a case study might be complex (including charts, graphs, and relevant historical background materials) or simple-a human story that illustrates a difficult situation requiring a decision. Traditional case studies in fields such as economics, public policy, or international affairs can contain detailed historical information/ including statistical data, relevant legal or governmental policy, and the arguments by various agencies for actions to be taken. But case studies are increasingly being written from a more personal perspective, involving real characters in actual situations. Case studies are long being used in business schools, law schools, medical schools and the social sciences, but they can be used in any discipline when instructors want students to explore howl what they have learned applies to real world situations. Cases come in many formats, from a simple "What would you do in this situation?" question to/ a detailed description of a situation with accompanying data to analyze. Whether to use a simple scenario-type case or a complex detailed one depends on your course objectives. Case studies data are strong in reality. Data can be collected over a period of time contextual. It enables the researcher to assess and document not just the empirical data but also how the subject or institution under study interacts with the larger social system.

139 Case study reports are often written in non-technical language and are, therefore, easily understood by lay person. They help in interpreting similar other cases. Most "full-blown" cases have thes common elements: A decision-maker who is grappling with some question or problem that needs to be solved. A description of the problem's context. Supporting data, this can range from data tables to links to URLs, quoted statements or testimony, supporting documents, images,

video, or audio. Need and importance : ? Satisfies varied needs of students: Many students are more inductive than deductive reasoners, which mean that they learn better from examples than from logical development starting with basic principles. The use of case studies can therefore be a very effective classroom technique. ? Reduces the work load: Case assignments can be done individually or in teams so that the students can brainstorm solutions and share the work load. ? Induces self learning: A major advantage of teaching with case studies is that the students are actively engaged in figuring out the principles by abstracting from the examples.

This develops their skills in: ? Problem solving ? Analytical tools, quantitative and/or qualitative, depending on the case ? Decision making in complex situations and ? Coping with ambiguities ? Accompanying Readings:

Case studies can be especially effective if they are paired with a reading assignment that introduces or explains a concept or analytical method that applies to the case. The amount of emphasis placed on the use of the reading during the case discussion depends on the complexity of the concept or method. If it is straightforward, the focus of the discussion can be placed on the use of the analytical results. If the method is more complex, the instructor may need to instruct students through its application and the interpretation of the results.

140 ? Strengthen the value of group activity: In general terms, cases can

assess the application of concepts to complex real world situations, including building analytic skills that distinguish high priority from low priority elements. Working in groups on cases also helps students develop interpersonal skills and the capacity to work in a team-goals that some instructors rate highly and evaluate. ?

Helps to develop principle of correlation: Cases also help students make connections between what they might otherwise consider to be separate disciplines-for example, they see the need to draw upon principles in economics, environmental studies, geography and ethics to solve a problem in urban planning, or the need to use historical, philosophical, and sociological materials to make a decision about carrying out an anthropological project. 5.6

Development of a professional portfolio or teaching journal: A professional portfolio is a collection of carefully selected materials put together in a meaningful way to demonstrate the practice and learning of an educational practitioner

that document the competencies and illustrate the expertise of a teacher as a professional. It is a record of goals, growth, achievement and professional attributes developed over time and provides a way of monitoring professional development of the teacher. A professional portfolio provides a space in which a teacher can plan and reflect in depth on his/her practice, helps to identify strengths and find ways of building on these. A professional portfolio is not a random collection of material and artefacts. The items relate to what the practitioner sees important in the development of his/her practice, may be in a classroom, in a seminar hall or wider educational setting. A professional portfolio documents growth over time. The design and presentation of the portfolio should make sense to the practitioner and other people who will go through it. A teaching portfolio is an essential part of

a teacher's professional development. Purposes of a professional portfolio: To record and display of professional goals, growth and achievement To illustrate achievement To demonstrate ongoing development of thinking and practice To collect evidence To provide a vehicle for reflection

141 Strengths of developing a portfolio: Create a sense of achievement Build self-confidence Provide an in-depth self-evaluation Develop one's own skill of reflection Create a sense of awareness about what did I learn and how can I improve Strengthen understanding of one's development as a practitioner Allows to become more critical and appreciate the success Organisation of a professional portfolio : First, concerning choice and quantity, remember "portfolios are representative not comprehensive". That is, each artefact chosen for inclusion should represent at least one significant aspect of you and/or your teaching. At the same time, bear in mind that teaching is so complex, it is not possible to represent all aspects. In general, the first focus should be on representing goals and growth toward those goals and later, achievements. Second, remember the purpose of the portfolio is self and collaborative assessment and evaluation. This implies a rather limited audience, at least during the initial stages of development. Artifacts chosen for inclusion should be meaningful first of all to the teacher, the primary audience, and second, to others who are involved. The final point to keep in mind is that portfolios are a form of dynamic assessment. In other words, what is put in at any given time may be added to or deleted as is fitting to the teachers' professional development. a portfolio for teacher should contain the following informations: Professional Goals and Attainments statement of beliefs about teaching statement of professional goals portfolio conference records Final practicum reports evidence of:

ability to self evaluates and reflects ability to collaborate with other teachers' ability to set and achieve goals (Example artefacts: Selected log entries, portfolio review records including goal statements, notes or letters from others)

142

Teaching competencies ability to communicate knowledge of instructional strategies A knowledge of assessment and evaluation strategies classroom management abilities organizational and planning skills knowledge of prescribed curriculum (

Example artefacts: Lesson plans for a variety of types of lessons, overview of unit plans, evaluation plans, teacher associate/mentor/faculty comments*, peer observations of teaching, video of teaching, written report to parents, notes to or from students)

Knowledge of child development and learning processes (Example artefacts: Summaries of case studies, observations of students, log entries, lesson plans that employ specific learning processes, individualized learning plans) Content knowledge of one or more subject areas (Example artefacts: Essay, lab report, teaching materials developed that reflect content)

Personal and Professional attributes and experiences that contribute to teaching leadership skills organizational skills fine arts performance co-curricular participation related work experience community involvement Hobbies or sport participation (Example artefacts: Certificates of achievement, letters from previous employers, membership in organizations or teams, concert program with name as performer, picture as team coach, letter acknowledging executive position in professional association, photograph(s) of art showing).

143 5.7 Competencies for teaching social science to children with disabilities: The Kothari Commission

in its report (1964-66) clearly mentioned that,"

Of all

the different factors which

influence the quality of education and its contribution to national development,

the quality of teachers are undoubtedly the most

significant."

Essential qualities that a social science teacher should have to teach the children with disabilities are as follows: Mastery of the subject: Teacher should have a thorough and up to date knowledge of the subject matter. The teacher should be academically well-equipped. Every social science teacher should widen his/her vision by acquiring some basic knowledge of different social Sciences. Mastery of techniques:

The social science teacher should be an expert in various

methods and techniques of teaching social science to the children with disabilities. The teacher should provide a friendly atmosphere in the classroom making learning quicker. A sense of humour is essential. (i)

Thorough knowledge of the subject Like the teacher of any other

subject a social science teacher should have a thorough knowledge of the subject.

For such knowledge the teacher should read various reference books in addition to the prescribed text books.

Such a study would help the teacher to

grasp the spirit of the subject and study it in a proper perspective. A

teacher should always remain a student and his reading should not cease after obtaining his degree. The continuity in

study is also essential to keep the knowledge of the subject up-to-date. It is not essential that a secondary school

teacher be a specialist of his subject but it is essential that he should be able to present the facts of social science in a

psychological manner. For such a presentation the teacher should be aware of the fact

that social sciences are a developing subject. (

ii) Knowledge of Child Psychology For being a successful teacher in any subject knowledge of child psychology is essential and so is the case with a social science teacher. The psychological requirements of child differs from age to age and a teacher must have a thorough knowledge of child psychology if he wants to impart the knowledge of the subject in a proper manner.

The knowledge of child psychology is even more important for teaching the

144 challenged children. The teacher should know about the details of impairment of the students, assess their special

needs to meet their challenges. From the knowledge of child psychology teacher can choose a suitable method for

teaching the students of a particular age and disability group. Thus the knowledge of child psychology and its proper use

can contribute a lot in the teaching of social science. (iii) Special training for challenged children: the teacher

should have the technical training of teaching the challenged children. For example

the teacher

should be able to use and apply Braille and other tactile

equipments for visually impaired students. (iv)

Knowledge of different Methods of Teaching: The knowledge of various teaching methods is essential along with the

knowledge of psychology, it is only then possible to choose a suitable method according to

the requirements of a particular class e.g. a student at the age of 14 is fond of excursions and travels and a good teacher

knowing it can coordinate the two in his teaching method to make the

teaching

successful. (v) Keen Power of Observation A geography teacher should

himself be an observer. Travels and excursion form an integral part of the teaching of geography and only a keen

observer can help his students to make collections etc. during such tours and excursions.

In addition to being a keen observer a teacher of social science must also possess a good power of imagination. A combination of two, observation and imagination, makes a more successful teacher. Life of man is influenced to a large extent by the natural environment and to study it properly the power of observation and imagination are required. We can observe the influence at one place and on the basis of imagination can visualize its effect in other places. Unless the social science teacher possesses a keen power of observation and strong imagination he will not be able to acquaint his students fully with the effects of various factors and will not be able to present the social science of foreign countries before his students in a vivid and attractive way. A teacher having these two qualities can present the subject matter in a better way. Thus these two qualities if present in teacher make him a good and successful teacher.

145 (vi)

A good organiser

and leader: This quality of leadership is essential for a social science teacher like any other good teacher. In the absence of leadership qualities teacher cannot handle his students successfully. In social science

this quality is emphasized in the teacher because he has to exercise a control on his students during tours and excursions which form a part of social science curriculum these days.

For a better control the qualities of leadership and direction are desirable in a social science teacher. A social science teacher is also needed to possess leadership and organisation quality specially to teach the challenged children. For practical and field based activity the teacher should organise activities outside the school. The teacher should be able to manage the permission from school authority as well as parents. He /she should make all the arrangement for successful execution of the activity. (vii)

Knowledge of the syllabus and Curriculum of other subjects and their development A good social science teacher must have knowledge of the curriculum and, syllabus of other subjects and should know about their development and teaching requirement. (

viii)

Knowledge of using and handling of Maps, diagrams, Sketches etc.

for challenged children:

Social Science

puts more emphasis on the study of

cause and effect relationship. Such a relationship is explained with the help of maps, charts, diagrams

Time-line

etc. So these things (charts, models, maps etc.) occupy an important place in teaching of social science.

Maps and charts play a vital role

in secondary classes. (

ix)

Arrangement of curriculum and syllabus according to season

If possible an effort is made to arrange the curricula

on the basis of season and weather to make teaching realistic and interesting. Teaching about rainfall can be taken up by the teacher during rainy season.

It would help to make knowledge more stable and permanent. In the same way the teaching about a particular crop can be taken up during that season in which the crop is actually grown up in the are~

The teaching of Frost, Fog etc. be taken up during winter. Such an arrangement

146 if made properly will make the teaching of geography very interesting.

It would help the teaching of geography and would also help in making full and proper utilization of time available to the teacher for

teaching of geography. (x) Scientific Method of Thinking: It is essential that a teacher of social science

has a scientific way of thinking. Such an attitude on the part of social science teacher is desirable for him to be able to explain the cause and effect relationship which forms the backbone of teaching of

social science. In teachin of social science Heuristic attitude is desirable. Teacher should always impress upon his students not to take anything for granted and to verify facts before accepting them. (

xi) Love for Excursions and Travels: Excursions and Travels form an integral part of the social science curriculum these days. It is therefore obligatory on the part of geography teacher to arrange such tours and excursions for his students. The successful organization of such tours and excursions is possible only if the geography teacher himself is interested in tours and excursions. Such tours and excursions enable the child to acquire the knowledge directly by observing various things and geographical phenomenon themselves.

This direct observation provides the students an easy method of acquiring knowledge and is considered very effective and successful. Direct knowledge is considered better than any other type of knowledge. Such knowledge is ever lasting. Only a teacher who himself is interested in tours and excursions will be able to guide his students in the observation of geographical phenomenon and other things and do justice to his job. (

xii) Interest in collection of things of social science Importance Social Science museum occupies the most important places in the teaching geography and History.

For a good museum we need a good collection of things of geographical and Historical importance. It is only with the help of such collections and exhibits that one can make teaching of social science more interesting and lively. Such a collection is possible only if the social science

teacher has an interest in the collection of things of geographical and

147 Historical importance. In addition to having an interest in collection of things he should also be interested in organizing the museum. It is only by properly arranging the things and presenting them in their real form before the students that a geography teacher can make his, teaching interesting and lively for his students. To provide an insight into the knowledge about soil, rocks etc. they can be arranged in some interesting way in the social science museum and presented to the students in most acceptable way. Similarly maps, charts, sketches etc. be properly arranged. The charts showing the inhabitants of different countries, sea-routes, lands etc. are depicted at some suitable places in the geography room (museum). (

xiii) A Good Story Teller Story telling is an art and it is the most desirable thing to be possessed by a social science teacher. A good social science teacher should be capable of framing stories connected with different social science

aspects and present such stories to his students in an interesting way. (xiv) An Idealistic and Philosophical Out-look Such an outlook is essential for a good social science

teacher like any other subject teacher. The attitude of a teacher should be based on sound philosophical foundations, so as to develop the feeling of world brotherhood and world fraternity in his students. (xv) International Understanding: As it is known that one of the aims of teaching social science is to produce international understanding in the children, It is the purpose of social science teaching to tell the students about various countries, various communities etc. (

xvi) Capacity to Inculcate Interest and Respect for the Subject

To understand a subject the pupil must be interested in that subject and a good teacher is one who can infuse regard for the subject and interest in it. This can be achieved by handling the subject matter in a psychological way. 'Even the personality, behaviour, mode of teaching etc. of a teacher may incite the students to get interested in social science.

Adopt teaching learning materials for challenged children: Some children with measured disabilities will require focused instruction in one-

148 on-one or small- group settings. But other children who need help to keep up with their peers -- especially those with more severe disabilities -- can benefit from machines designed to help them learn! Such "assistive devices" aid

their learning, understanding, and participation in the regular classroom environment. Assistive devices include any device that disabled children (or adults) might use to help them learn and function more effectively. By current estimates, more than 4,000 assistive technologies have been designed for students and

teachers. Those devices include everything from wheelchairs to a wide assortment of high-tech tools, including. Hearing aids and amplification devices that enable hearing-impaired students to hear what's going on in the classroom; Glare-reduction screens, screen magnifiers, and Braille note-taking devices that enable visually impaired students to participate more fully; Voice-recognition software that turns the spoken word into type on a computer screen so students unable to move their limbs can take part; and Technologies that enable severely disabled students to control their computers simply by following letters and commands on the computer screen with their eyes. Visuals (or pictures) are a great tool for seeing and understanding. Visual aids allow children the time they need to process what they are being asked to do. They do not disappear into thin air to be forgotten as spoken words or hand gestures do. Visuals can also be sequenced to breakdown and learn a skill bit by bit. Visuals remain the same and allow for identical rehearsal and consistent memory pathways to be created. With this rehearsal and memory of sequenced activities comes learning and understanding and ultimately increased confidence and self esteem. Visual aids should be used in conjunction with other forms of communication such as speech, signing and tactile experiences. All Children can benefit from using visual aids and especially those who fit into the following categories: Down Syndrome Autism Spectrum Disorder Attention Deficit Hyperactivity Disorder

149 Language Disorders and Delays Hearing Impairment Developmental Delay Oppositional Defiant Disorder English as a Second Language Learning Difficulties Visuals will help children who have difficulties with: listening and attending understanding and responding processing sequenced information motivation and play following instructions and routines anxiety and resistance to change social isolation and shyness challenging behaviour Teaching learning materials for teaching social science to challenged children: Each social science topic presents a challenge for the teacher. There is a question how to present, describe to challenge children specially the blind pupils a certain conception, diagram, picture, graph or table. For partially sighted pupils a magnifying glass or electronic magnifier is used. For the blind no graphical picture means any value. Educational material has to be adapted to the visual perception of an individual pupil. Sometimes this is ordinary material or educational material which pupils use with a magnifying glass or an electronic magnifier. For pupils with severe visual impairment who cannot use ordinary material it has to be adapted to enlarged print, be generalized, be coloured intensively or somehow adapted so that it is suitable to individual perception of a partially sighted pupil. Adaptation of textbooks, teaching sheets and visual material should be made carefully. The solution is to make a tactile picture which means a model or a diagram accessible to tactile perception. Tactile maps, plans and sketches are the most characteristic elements at social science lessons for the blind. ? Didactic tactile devices are the basis for successful lessons. Solution may be

150 simple but it demands some inventiveness. ? Elements of each display have to be clear and adapted to diminished visual perception. ? Display must be made in correct proportion with the thing it presents. Material of composition should resemble the actual object or idea. ? It is right that single parts of display work. Some graphic concepts, pictures, processes or models cannot be simply translated to Braille or adapted into tactile pictures. These have to be made in such a way that they are acceptable to tactile perception or diminished visual perception. ? More exacting conceptions have to be presented as a model. Models can be the starting point for understanding processes and the basis for a wider proceeding of contents. For example, using a model of polder (artificial depression) pupils understand and know the entire image/ concept of the Netherlands as a country of polders. Using this model some words like tide, channel with gates, depression, dyke, windmill, drying ... can be explained easily. ? Tactile threshold, size of note in Braille, adequate graphic perception and elimination of unimportant elements has to be born in mind. Diagrams and graphic sketches can be presented using simple techniques, such as a positive, tyflograph (positive pointed drawing), or exacting thermo-vacuum technique. ? Colourful, attractive, bold charts, diagrams, talking calculators, cassettes, CDs and other audio visual aids,

Braille, typewriter, tape recorder or computer, magnifying glass, electronic magnifier, individual light, or programs for enlargement (computer) should be available. Use of pencil, which makes strong lines and paper which does not reflect the light are very important for visually impaired children. Practical experience confirms these displays adapted to tactile and diminished visual perception are most suitable for gathering new knowledge and understanding different social and geographic factors in the environment.

Organisation of co-curricular activities in school for the challenged children: Mock parliament: Purpose:

To bring provincial parliamentary processes to life To enhance the understanding of how bills become laws

151 To enhance the understanding of the scope and role of provincial ministries To help students understand the term "responsible government". Organisation:

Using the discussion of "characteristics of an effective" leader, students vote for students whom they feel have the qualities that exhibit the best class leader. The student who gets the most votes is the Premier and the second most votes will be

the Leader of the Official Opposition. The class is then divided into Government and

Opposition based on their score on an "ISM" political spectrum

test. The class is

now in their two groups and work to form political parties. The students are to decide a name for their party and what their party platforms will be once they understand where they are on the political spectrum. Drafting Bills: working within their political party, students choose a Ministry and draft a Bill. If in government, their Bill will be introduced in the Mock Parliament. If in Opposition, they will draft a Bill, but it will not be introduced in the Mock Legislative Assembly. (These Opposition Bills will be seen during the Debriefing) Researching Bills: the students should be given time to research their proposed Bills. For example, if they wish to have government pass an Education Bill on class size language, they will first need to research where their party stands on this issue and convince government to pass the bill. Run a mock parliament in the classroom to pass/defeat new Bills over three 55-minute classes. Organisation of quiz: Have the subject area coordinator conduct a meeting for all teachers concerned. Plan about the upcoming school quiz bee. The most important thing for them to do is to make a program outlining the date, venue, time and the different working committees who will be in charge of the said activities. Require the designated subject coordinator give an instruction to the coaches on how to make a

questions which will be used during the quiz bee. Choose a quiz master who will read the guidelines and criteria for quiz bee. Also select tabulators, proctors, a timer, and judges.

152 Organize registration. Registration of participants should be done before the opening program, followed by the reading of the guidelines and criteria for judging and the most important is the presentation of participants, working committees, judges and coaches. Explain the quiz. The quiz master gives the final instruction to all participants and then conducts the quiz bee right away. After conducting it she will announce the winners and giving of certificates and prizes follow. All the winners should then represent the school during

the District Quiz Bee. Organisation of Field trip: 1. Build up your knowledge

Build up your own knowledge and resources relating to the site including: key sites, species, significant features, importance, National parks, agriculture, industry connections and tourism. 2. Approval process Teachers need to gain approval for excursions by following their school policy. In seeking approval from their Principal, teachers should have firsthand knowledge of the field trip sites. Teachers need to be convinced of the educational benefit for the excursion, stating the reason to visit as being pivotal to key learning areas, the field trip as a key motivator for students in active learning, engaging and appropriate to key stage and development requirements. 3. Health and Safety Issues An excursion is a highly valuable firsthand experience for students. However to ensure the safety and well being of students and staff important considerations must be made. Teachers must accept full responsibility for taking their students on excursions and we recommend that each teacher do a site visit and risk assessment for excursion sites before taking students into the field. When endeavouring on an excursion follow your school guidelines. 4. Visit the site It is essential that you visit and investigate your excursion site prior to your excursion. This will enable you to plan your excursion effectively complete a risk assessment and ensure you have a good knowledge of site. No sites should be visited unseen.

153 5. Timing When planning your excursion consider the timing of your excursion. October to March is key time for excursion with more reliable weather that also avoids extreme heat and cold in India. 6. Students needs Individual student considerations will need to be taken into account by the class teacher including dietary, mobility and behavioural factors. If additional support is required this

must be organized well in advance of the excursion day. 7. Parents and permission Provide parents with information along with their permission forms. Information should include excursion location, times, travel, costs, support staff, curriculum links, appropriate clothing and whether food and water is necessary. 8. Costs Consideration must be given to the cost of the excursion. Of primary concern are transport costs. This could include depending upon the site, bus hire, boat, charter or paddle steamer hire. Undertake research as to whether your excursion could be fully or partly subsidized to assist your principal and school families. Funds could be targeted from key learning areas budget such as humanities or science. It may be worthwhile talking with local organizations, the P&C, local industries, and through drought assistance funding provided by the commonwealth government. 9. Student Preparation Ideally before your excursion it is important to build students prior knowledge around the excursion site as well as to explore current issues surrounding that place. 10.

Equipment When planning fieldwork the following materials and equipment should be taken. Binoculars Clip boards Pencils

154 Art materials- crayons, coloured pencils or charcoal Digital cameras for records Tissues First aid kits

Students

medication. Monitoring equipment Charged Mobile Phone Emergency contact list Spare paper for incident recording Class roll with list of students needs

Excursion Risk Assessment Witches hats for laying our boundaries and defining areas Whistle Hats and sunscreen Rain jackets Enclosed shoes

Organisation

of Exhibition Steps to Coordinate and Conduct a School Exhibition /Fair: Choose a chairperson(s) that will oversee the entire Exhibition Solicit volunteers for the committee. At the first planning meeting, set dates and deadlines for the exhibition, including the

date of the exhibition, set up and take down of projects, deadline for student topic / project submission. Decide if you will provide the project board or if the students will need to

use their own. Also, work with the school principal and / or teachers to determine if grades will be involved with the projects, if the projects should be mandatory or voluntary, the format the projects should follow, and the rules. Be sure to consider the venue for the contest

paying careful attention to the amount of display space and the number of 155 tables available.

Allow a table for each project as well as tables for clerical/ administrative needs. Draw a layout plan, and determine the number of volunteers needed to manage each area. Once the layout and rules have been established, create an information sheet to distribute to students and parents about the exhibition stating general information and the project guidelines. Be sure to stipulate any safety related restrictions. Begin to recruit judges at least three months prior to the exhibition. Be sure to keep them updated with

reminders at the beginning of each month, the week before, and week of the judging. It is better to accept

what you feel will be almost too many judges ... schedules do change at the last second and it is always nice to have a back up

judge! It is also considerate to give the judge projects in his / her area of specialty. Ask the judge for any preferences in advance, and then have a list prepared to email beforehand to him / her for review. (This is where a database becomes very helpful!) Establish guidelines for how the students are to submit, set up and represent their projects. Distribute the guidelines as well as a floor plan to the students and their teachers in advance. Order any prizes and establish a method for printing certificates. It may take a couple of weeks for the prizes or certificate paper to arrive. Be sure to generate certificates or letters of appreciation to present to your volunteers. 5.8

Check Your Progress 1. What is reflective practice?

156 2. Give two advantages of action search.

..... 3. State the steps for developing an action research plan.

..... 4. Define case study approach.

..... 5. Mention any two needs of case study method.

..... 6. Mention two necessities of a professional portfolio.

..... 7. What are the components of a professional portfolio for teachers?

157 8. Name two important professional competencies of a social science teacher for challenged children.

..... 9. Discuss the competencies that a history teacher should possess to teach the children with disabilities.

..... 5.9 Let us sum up: Action research stands for relatively a new approach and attitude towards conducting research in the area of the educational researches. In the school situations it concerns itself with the immediate problem faced by the teacher and administrators. In its nature, operation and applicability, action research differs significantly from the traditional researches. It was Stephen M. Corey who tried to provide action research a solid foundation in 1953 through his book "Action Research to Improve School Practices". The main objective for carrying action research is to make the practitioner more conscious about their problems and to seek their immediate solution with their own efforts by engaging in the necessary task of action research.

Case study research is descriptive research that involves describing and interpreting events, conditions, circumstances or situations that are occurring in the present.

It derives much of its philosophical underpinnings and methodology from ethnography and phenomenology. It follows the 'social constructivism' perspective of social sciences.

A case study can be conducted to explore, to describe or to explain a phenomenon.

A professional portfolio is a record of goals, growth, achievement and professional attributes developed over time and in collaboration with others. For teachers, a professional portfolio is a thoughtfully organised collection of artefacts that illustrates

158 professional status, pedagogical expertise, subject matter knowledge, knowledge of learning processes, and professional and personal attributes that contribute to teaching. A professional portfolio has value both as a process of assessment and evaluation and as a product of that process. Artefacts chosen for inclusion in the portfolio should represent at least one vital aspect of teaching. It should be meaningful to those who will go through it. 5.10

Edn.(MR/HI/VI) Programme as prepared and circulated by the Rehabilitation Council of India, New Delhi and adopted by NSOU on and from the 2015-2017 academic session. AREA - A COURSE CODE - A - 5 (PART IV) PEDAGOGY OF TEACHING BENGALI All rights reserved. No part of this work can be reproduced in any form without the written permission from the NSOU authorities. Mohan Kumar Chattopadhyay Registrar

3 Netaji Subhas Open University From the Vice-Chancellor's Desk Dear Students, from this Academic Session (2015-17) the Curriculum and Course Structure of B. Ed.- Special Education have been thoroughly revised as per the stipulations which featured in the Memorandum of Understanding (MoU) between the Rehabilitation Council of India (RCI) and the National Council for Teacher Education (NCTE). The newly designed course structure and syllabus is comprehensive and futuristic has, therefore, been contextualized and adopted by NSOU from the present academic session, following the directives of the aforesaid national statutory authorities. Consequent upon the introduction of new syllabus the revision of Self Instructional Material (SIM) becomes imperative. The new syllabus was circulated by RCI for introduction in the month of June, 2015 while the new session begins in the month of July. So the difficulties of preparing the SIMs within such a short time can easily be understood. However, the School of Education of NSOU took up the challenge and put the best minds together in preparing SIM without compromising the standard and quality of such an academic package. It required many rigorous steps before printing and circulation of the entire academic package to our dear learners. Every intervening step was meticulously and methodically followed for ensuring quality in such a time bound manner. The SIMs are prepared by eminent subject experts and edited by the senior members of the faculty specializing in the discipline concerned. Printing of the SIMs has been done with utmost care and attention. Students are the primary beneficiaries of these materials so developed. Therefore, you must go through the contents seriously and take your queries, if any, to the Counselors during Personal Contact Programs (PCPs) for clarifications. In comparison to F2F mode, the onus is on the learners in the ODL mode. So please change your mind accordingly and shrug off your old mindset of teacher dependence and spoon feeding habits immediately.

I would further urge you to go for other Open Educational Resources (OERs) - available on websites, for better understanding and gaining comprehensive mastery over the subject. From this year NSOU is also providing ICT enabled support services to the students enrolled under this University. So, in addition to the printed SIMs, the e-contents are also provided to the students to facilitate the usage and ensure more flexibility at the user end. The other ICT based support systems will be there for the benefit of the learners. So please make the most of it and do your best in the examinations. However, any suggestion or constructive criticism regarding the SIMs and its improvement is welcome. I must acknowledge the contribution of all the content writers, editors and background minds at the SoE, NSOU for their respective efforts, expertise and hard work in producing the SIMs within a very short time. Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor, NSOU

- 111 (Types of Questions) (Open) (Closed) (Factual) (Alternative) (Broadening) (Justifying) (Hypothetical)
- 112
- 113 By a conscious process of good questioning, an intelligent teacher can lead his educational traveller through unfamiliar regions to a desired destination. The right question is the Psychological basic of all learning. It is certainly the best means of stimulating thought. A teacher's skill can be measured by the way he handles the most important pedagogical instrument. [instruction of Indian Secondary Schools–Ed. E.A. MACNEE] In looking at the skills underlying effective questioning, four key aspects stand out: 1. Quality 2. Targetting 3. Interacting 4. Feedback 1. Quality : Quality of the question itself in terms of clarity and appropriate for meeting its intended function, is clearly of importance.
- 114 2. Targetting : The targetting question refers to the way in which teacher select pupils to answer. 3. Interesting : It refers to the technique used by teachers to ask questions and to respond to pupils. 4. Feedback : The role of feedback concerns the effect on pupils of the teacher's use of questions. [Effective Teaching in Schools :CHIRS KYRIACOW] (Quality) (Targetting) (Interactions) (Feed back)

138 (Learning without burden)

139 (Shift) ? Understanding the learner needs to be given priority. The Learner is seen as an active participant rather than a passive listener in the process of learning and his/her capabilities and potentials are seen not as fixed but as dynamic and capable of being development through direct self experiences. ? View knowledge not as an external reality embedded in textbooks, but as constructed in the shared context of teaching learning and personal experiences. ? View learning as a search for meaning out of personal experience and knowledge generation as a continuously evolving process of reflecting learning.

140 ? ? ? ? ? ? ? ? ? ? (correlation) ? ? ? ? ?

141 ? ? ? ? ? There is a vast range of resources and materials available for use in the classroom, including video tapes, slides, overhead projector transparencies, worksheets and work cards, computer packages and simulation materials. Perhaps the golden rule concerning their use is always to check their quality and appropriateness for the lesson. ? ? ? ? ? ? ? ? ? ? ? ?

3 Netaji Subhas Open University From the Vice-Chancellor's Desk Dear Students, from this Academic Session (2015-17) the Curriculum and Course Structure of B. Ed.- Special Education have been thoroughly revised as per the stipulations which featured in the Memorandum of Understanding (MoU) between the Rehabilitation Council of India (RCI) and the National Council for Teacher Education (NCTE). The newly designed course structure and syllabus is comprehensive and futuristic has, therefore, been contextualized and adopted by NSOU from the present academic session, following the directives of the aforesaid national statutory authorities. Consequent upon the introduction of new syllabus the revision of Self Instructional Material (SIM) becomes imperative. The new syllabus was circulated by RCI for introduction in the month of June, 2015 while the new session begins in the month of July. So the difficulties of preparing the SIMs within such a short time can easily be understood. However, the School of Education of NSOU took up the challenge and put the best minds together in preparing SIM without compromising the standard and quality of such an academic package. It required many rigorous steps before printing and circulation of the entire academic package to our dear learners. Every intervening step was meticulously and methodically followed for ensuring quality in such a time bound manner. The SIMs are prepared by eminent subject experts and edited by the senior members of the faculty specializing in the discipline concerned. Printing of the SIMs has been done with utmost care and attention. Students are the primary beneficiaries of these materials so developed. Therefore, you must go through the contents seriously and take your queries, if any, to the Counselors during Personal Contact Programs (PCPs) for clarifications. In comparison to F2F mode, the onus is on the learners in the ODL mode. So please change your mind accordingly and shrug off your old mindset of teacher dependence and spoon feeding habits immediately.

I would further urge you to go for other Open Educational Resources (OERs) - available on websites, for better understanding and gaining comprehensive mastery over the subject. From this year NSOU is also providing ICT enabled support services to the students enrolled under this University. So, in addition to the printed SIMs, the e-contents are also provided to the students to facilitate the usage and ensure more flexibility at the user end. The other ICT based support systems will be there for the benefit of the learners. So please make the most of it and do your best in the examinations. However, any suggestion or constructive criticism regarding the SIMs and its improvement is welcome. I must acknowledge the contribution of all the content writers, editors and background minds at the SoE, NSOU for their respective efforts, expertise and hard work in producing the SIMs within a very short time. Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor, NSOU

Unit-End Exercises 1.10 References 1.1 Introduction Language is the most essential medium of communication and education. Therefore, promotion and development of Hindi and other 21 languages listed in the eighth schedule of the Constitution of India including Sanskrit and Urdu has been emphasized. Since time immemorial, language has been one of the major issues in India. History intimates that some states have come into existence only based on language. The regional language attains the utmost importance in a region. Along with that, the national language, English and some other foreign languages are also relevant nowadays because of their utility. Teaching and learning of English language has become multifaceted in India. This is in accordance with the issues and debates surrounding the position of English in India. It is accepted at the outer level, but attains undue resistance at the inner levels i.e., the cultural and the psychological levels. Hindrances like the regional language based

10 medium of instruction, staunch ideological opposition from the people all around have made English Language Teaching a difficult job. However, one should understand that, English is a globally accepted common language, a language for higher education and the prerequisite in the modern world. Hence, teaching of English is a necessity nowadays. 1.2 Objectives After going through this unit, you will be able to- Explain the principles of language teaching Describe the

Basic Interpersonal Communication Skills (BICS) and the Cognitive Academic Language Proficiency (CALP)

Illustrate the evolution of English language in the school context Elaborate the recent trends in Modern English literature in the Indian context Justify the position of English as Second Language in Indian Context 1.3 Principles of Language Teaching

English dominated the curriculum in the British Raj. It was the medium of instruction from the lowest to the highest segments of education. This status of English remained even after independence. Still it enjoys a prestigious position in the society. Even if English is a foreign language, it attains an important position in India. Many Indians feel that English is not a foreign language, a language of the British. They have made it very much of their own. Yet a segment of people has been voicing against English as the colonial language and the judicious use of it may restrict us from the hangover of the colonization period. Apart from this ideological stand, English invariably captures all the functional domains such as education, technology, business, international affairs etc. One should have a basic knowledge in English to participate in all these activities. This certainly has a great impact on the agencies of education. Learning a second language is more than learning a mere description of it. It is to develop the ability to use the language fluently and appropriately. This is true of not only second language learning but also of first language learning. Essentially, all language learning involves the processes of listening, speaking, reading and writing. These processes involve both linguistic and psychological aspects. This leads us to the fact that all language learning is based on certain well-defined principles derived from linguistic science as well as

11 psychological science. Principles of Language learning and teaching is a matter of practice. The language teacher can teach the language by choosing any method. But the knowledge and application of certain principles help him to teach the same language effectively. While teaching, the teacher must keep in mind the learner, his capability and capacity to learn and above all his environment of learning. Some teachers knowingly use difficult words of English while teaching. They forget the mental ability-and the grasping capacity of the learners. That type of teaching is not good. Some of the basic principles of Language Learning and Teaching are explained blow: 1.3.1. Linguistic

Principles of Teaching English The modern approach to all language learning and teaching is scientific and is based on sound linguistic principles. The principles discussed below in no way claim finality: they are subject to change in the light of new findings revealed by linguists and language users. These principles are general principles and are applicable to English language. Principle 1. Give Priority to Sounds: The sounds of English should receive priority. Sound should be given its due place in the scheme of teaching. Sounds should not be presented in isolation. They should appear in proper expressions and sentences spoken with the intonation and rhythm that would be used by a native speaker. Principle 2. Present Language in Basic Sentence Patterns: Present, and have the students memorise, basic sentence patterns used in day-to-day conversation. From small utterances, the students can easily pass on to longer sentences. In case of learning mother tongue, the student's memory span can retain much longer sentences than those of a foreign language. Principle 3. Language Patterns as Habits. Real language ability is at the habit level. It does not just mean knowing about the language. Make language patterns as habit through intensive pattern practice in variety of situations. The students must be taught to use language patterns and sentence constructions with

appropriate vocabulary at normal speed for communication. In fact the habitual use of the most frequently used patterns and items of language, should take precedence over the mere accumulation of words. Principle 4. Imitation. Imitation is an important principle of language learning. No learner can ever invent language. Good speech is the result of imitating good models. Imitation followed by intensive practice helps in the mastery of the language system. Principle 5.

Controlled Vocabulary. Vocabulary should be kept under control.

12 Vocabulary should be taught and practised only in the context of real situations. This way, meaning will be clarified and reinforced. Principle 6. Graded Patterns: To teach a language is to impart a new system of complex habits and the

habits are acquired slowly. So, language patterns should be taught gradually, in cumulative graded steps. This means, the teacher should go on adding each new element or pattern to

the

previous ones. New patterns of language should be introduced and practised with vocabulary that students already know. Principle 7. Selection and Gradation: Selection of the language material to be taught is the first requisite of good teaching. Selection should be done in respect of grammatical items, vocabulary, and structures. Selection of language items should involve ? Frequency (how often a certain item or word is used) ? Range (in what different contexts a word or an item can be used) ? Coverage (how many different meanings a word or an item can convey) ? Availability (how far an item is convenient to teach) ? Learnability (how far an item is easy to learn) ? Teachability (how far and item is easy to teach - in the social context) Gradation of the language material means placing the language items in an order. Grading involves grouping and sequence. Grouping concerns (i) the system of language, and (ii) its structures. Grouping the system of language signifies what sounds, words, phrases and meanings are to be taught. Thus, we have: (

i)

Phonetic grouping, i.e. grouping according to sounds. For example, words having the same sound are placed in the one group as, cat, bat, mat, pat, fat, sat; it, bit, fit, hit, kit, it, etc. (ii) Lexical grouping, i.e., grouping according to lexical situations. Example: school, teacher, headmaster, peon, classroom, library. All these words are grouped around "school." (iii) Grammatical grouping, i.e., grouping according to similar patterns as, my book/ his book, (pattern grouping): in the room, in the corner/ in the class/in the garden, etc. (phrase grouping)

13 (iv) Semantic grouping, i.e., grouping according to meaning. Example: school, college, university; bicycle, rickshaw, car, tonga, train, aeroplane, etc.. (v) Structure grouping, i.e., grouping in the structures means how the selected items fit one into the other-the sounds into the words, the words into phrases, the phrases into the clauses and sentences, and the sentences into the context.

Sequence means what comes after what. Sequence should be there in the arrangement of sounds (phonetic sequence), phrases (grammatical sequence) words (lexical sequence) and in meaning (semantic sequence). Sequence of structures implies direction, expansion, variation and length of

the structures. Principle 8. The Oral Way. Many Experts believe that the oral way is the best way to language learning.

Prof. Kittson rightly observes, "

Learning to speak a language is always the shortest road to learning to read and write it."

Prof Palmer also writes, "We should refrain from reading and writing any given material until we have learnt to use its spoken form." Principle 9. Priorities of Language Skills: Listening comprehension, speaking, reading and writing are the four fundamental skills. Listening and speaking are primary skills, while reading and writing are secondary skills. Reading and writing are reinforcement skills. They reinforce what has been learnt through listening comprehension and speaking. In fact, listening comprehension and speaking speed up the reading process. Writing should be introduced after reading.

Principle 10. Multiple Line of Approach: "The term multiple line implies that one is to proceed simultaneously from many different points towards the one and

the same end. We should reject nothing except the useless material and should select judiciously and without prejudice all that is likely to help in our work". In teaching a language, it implies addressing the problem from all fronts. Say, for example, there is a lesson on 'Holidays' in the text book. The teacher can have a number of language activities connected with the topic such as oral drill, reading, sentence writing, composition, grammar, translation, language exercises etc. Principle 11. Language Habit through Language Using: A language is best learnt through use in different contexts and situations. Prof. Eugene A. Nida rightly observes, "Language learning means plunging headlong into a series of completely different experiences. It means exposing oneself to situations where the use of language is required." Another expert expresses a similar opinion by saying: "Learning a language means forming new habits through intensive practice in ?

Since it is a quotation, I could not correct it Author must check with the original and speaking. The emphasis should

14 always be on language in actual use". Principle 12 Spiral Approach. The "spiral" approach to language learning should be followed. Previously taught vocabulary and structures should be reintroduced in subsequent units whenever logical or possible. This is called the "

spiral approach." Principle 13. Use Mother-tongue sparingly. The mother tongue should be sparingly and judiciously used during teaching English. Of course, at the early stage, some explanations will have to be given in pupil's mother tongue. It is important that students do not use their mother tongue in the classroom. 1.3.2.

Psychological Principles of Teaching English It will not be out of place to list down certain principles that have been derived from the science of psychology.

Principle 1. Motivation.

Motivation is an important factor in language learning, particularly in learning a second language. It creates interest as well as the need to learn the target language. If the need for the language we use is felt, it is learnt easily. Pupils' interest can be aroused in a number of ways, and language learning can be made increasingly interesting and attractive. It can be done with the help of pictures, charts, models, flash cards, black board sketches and similar other visual devices. The use of tape-recorder on modern recording devices

can be most effective in the teaching of pronunciation. The aim is to have the students maximally exposed to the target language in variety of contexts and situations, not in isolation. The teacher should prompt connections, feedback and correct errors, if any. The rule is teach, test, re-teach, retest. The teacher should make continual and significant use of language material in class-room situations. Palmer suggests the following six factors which motivate and create interest among the learners : (i) The limitation of bewilderment, that is, minimizing confusion; (ii) The sense of progress achieved; (iii) Competitions; (iv) Game-like exercises; (v) The right relation between teacher and student; and (vi) Variety. Principle 2. Immediate Correction. Corrections make all the difference. They help in improving pupils' responses. But remember, when corrections are made, they should

15 be made immediately. Moreover, the corrections should be made in such a way that will bring about learning and not frustration or demotivation.

Principle 3. Reinforcement Immediate reinforcement is an important principle. It has been experimentally proved that reinforcement of correct responses helps in better learning.

Prompt feedback is also very important.

The student should be told his response is correct immediately after it is given by him. Principle 4. Frequent Review. An important psychological principle is the principle of frequent review. Frequent review and re-entry of the same material is necessary for retention. During the process of reviewing, variations in material should be essentially be introduced and practised. Principle 5. Correct Responses. It is an important psychological principle that classroom activities should strengthen the language skills. The techniques used by the teacher of English should encourage the maximum rate of correct responses. This will give children the feeling of success, achievement and assured progress. Principle 6. Practice in Everyday Situations. A language is best learnt when its need is felt in everyday situations. So, English should be practised in

every day situations with which children can easily identify.

In short, the children, their environment and their experiences, should be the starting point. Let them recall (and, they should be helped, if they fail) something familiar which is related to or contrasts with a new language item to be learnt. These are, then, some of the basic principles of language learning and teaching. Principle 7. Imitation: Learning of any language is based on the principle of imitation. We can see from childhood that language is naturally learnt through imitation. It is especially true in the case of small children. Whatever they see all around them, they imitate those things in the same way. The small children carry on sometimes even the wrong habits of the teacher. If a teacher has poor pronunciation, his students at the early stages of learning the language will pick up the poor pronunciation from him. The bad handwriting of the teacher may also have adverse effect on the learners. So the teacher who is entrusted with the charge of teaching the competent children must be with a model type of pronunciation. His handwriting should be very good. He must possess good linguistic habits. All this will have very good impact on the growing personalities of the small children. It is therefore, very strongly recommended that competent teachers should be recruited for teaching the small children in the schools.

16 Things to Remember, (i) Teach the language, not about the language. (ii) Teach the language, not its written system (at the start). (iii) Teach the language, as it is, not as anyone thinks it to be. (iv) Teach the language, not its literature. (v) Teach the language as it is now, not in term of its history. (vi) Teach the language as a skill, not as an intellectual task. (vii) Teach the language in varied, interesting situations. (viii) Give maximum exposure. (ix) Give vocabulary its due place. (x) Use mother tongue as a tool, not a medium. (xi) Immediately reinforce correct response. (xii) Give prompt feedback
Language is taught so that the learners are able to make use of it in their day-to-day life situations. Different language items, say vocabulary structures etc. should be dealt with in the context or some appropriate situations so that the learner may find them close to life. 1.4.

Language

Proficiency:

Basic Interpersonal Communication Skills (BICS) and Cognitive Academic language Proficiency (CALP)

Basic

Interpersonal Communication Skills (BICS)

are language skills needed in social interactions. It is the day-to-day language needed to interact socially with other people. English language learners (ELLs) employ BIC skills when they are on the playground, in the lunchroom, on the school bus,

at parties, playing sports and talking on the telephone. Social interactions are usually context embedded. They occur in a meaningful social context. They are not very demanding cognitively. The language required is not specialized.

Problems arise when teachers and administrators think that a child is proficient in a language when they demonstrate good social English.

CALP refers to formal academic learning. This includes listening, speaking, reading,

17 and writing about subject area content material. This level of language learning is essential for students to succeed in school. Students need time and support to become proficient in academic areas. This usually takes from five to seven years.

Recent research (Thomas & Collier, 1995) has shown that if a child has no prior schooling or has no support in native language development, it may take seven to ten years for ELLs to catch up to their peers.

Academic language acquisition is not just the understanding of content area vocabulary. It includes skills such as comparing, classifying, synthesizing, evaluating, and inferring. Academic language tasks are context based. Information is read from a textbook or presented by the teacher. As a student gets older, the language becomes cognitively more demanding. New ideas, concepts and language are presented to the students at the same time.

Jim Cummins differentiates between social and academic language acquisition. He also advances the theory that there is a common underlying proficiency (CUP) between two languages. Skills, ideas and concepts students learn in their first language will be transferred to the second languages. These terms are commonly used in discussion of bilingual education and arise from the early work of Cummins (Bilingual Education and Special Education: Issues in Assessment and Pedagogy, 1984) in which he demonstrated his ideas about the two principal lines/directions of second language development in a simple matrix. BICS describes the development of conversational fluency (Basic Interpersonal Communicative Skills) in the second language, whereas CALP describes the use of language in decontextualized academic situations (Cognitive Academic Language Proficiency). According to Baker (2006), "BICS is said to occur when there are contextual supports and props for language delivery. Basic Interpersonal Communication System BICS Cognitive Academic Language CALP Proficiency Cognitively Undemanding BICS Example Face-to-face conversation Example Telephone conversation Context Embedded Context Reduced Example Demonstrations of experiments Example writing a standardized test CALP Cognitively Demanding

18 Face-to-face 'context embedded' situations offer non-verbal support to secure understanding. Actions with eyes and hands, instant feedback, cues and clues support verbal language. CALP, on the other hand, is said to occur in 'context reduced' academic situations. Where higher order thinking skills (e.g. analysis, synthesis, evaluation) are required in the curriculum, language is 'disembedded' from a meaningful, supportive context. Where language is 'disembedded' the situation is often referred to as 'context reduced' (Baker, 2006, p. 174) The horizontal axis of the BICS/CALP matrix represents a continuum from 'context- embedded' to 'context-reduced', ranging from the situation in which the learner uses external clues and information, such as facial gestures, real objects and pictorial representation to enable understanding, to the other extreme where the learner must rely on linguistic cues, and knowledge about language and text to understand meanings. The vertical axis relates to the degree of active cognitive involvement in a task, moving from tasks that are not very demanding to increasing cognitively challenging activities. So, an activity in the upper left corner (cognitively undemanding and context-embedded) such as face to face conversations might be appropriate for a beginner, but tasks in the lower right corner (more cognitively demanding and context-reduced) such as writing a standardized test, would be a task for advanced learners. Cummins' model has proved helpful in identifying and developing appropriate tasks for bilingual pupils. For example, in preparing tasks for a newly arrived second language learner, teachers might start with contextualized tasks and practical activities that are of low cognitive demand, such as naming items or a simple matching exercise. Learners, who are more proficient would require contextual support, but would need more cognitively demanding tasks. This approach to planning and assessing ELL learners was developed and reported by Cline and Frederickson (1996). In conceptualizing bilingual proficiency this way, Cummins and other researchers suggest that it takes learners, on average, approximately two years to achieve a functional, social use of a second language but that it may take five to seven years or longer, for some bilingual learners to achieve a level of academic linguistic proficiency comparable to monolingual English speaking peers. The commonly used acronym BICS describes social, conversational language used for oral communication. Also described as social language, this type of communication offers many cues to the listener and is context-embedded language. Usually it takes about two years for students from different linguistic backgrounds to comprehend context-embedded social language readily. English language learners can comprehend

19 social language by: observing speakers' non-verbal behaviour (gestures, facial expressions and eye actions); observing others' reactions; using voice cues such as phrasing, intonations, and stress; observing pictures, concrete objects, and other contextual cues which are present; and Asking for statements to be repeated, and/ or clarified. CALP is the context-reduced language of the academic classroom. It takes five to seven years for English language learners to become proficient in the language of the classroom because: non-verbal clues are absent; there is less face-to-face interaction; academic language is often abstract; literacy demands are high (narrative and expository text and textbooks are written beyond the language proficiency of the students); and Cultural/linguistic knowledge is often needed for complete comprehension. By using, a matrix with two axes (Context-Embedded language and Context-reduced language), we can see how certain task may be more or less demanding. Context-Embedded Language: Language that is supported by contextual clues in the environment such as objects, props, manipulatives, pictures, graphs, charts and so forth helps the second language learner make meaning from the spoken or written world. Context-embedded language is also a result of students interacting with each other to get interpersonal clues to construct meaning. A "here and now" context is a necessary ingredient if the input is going to be comprehensible. Context-Reduced Language: In decontextualized language there are few if any clues Cognitively Undemanding BICS Example Face-to-face conversation Example Telephone conversation Context Embedded Context Reduced Example Demonstrations of experiments Example writing a standardized test CALP Cognitively Demanding

20 present to support the spoken or written words to help make the language comprehensible. Context-reduced language is abstract and only the author usually knows the context. i.e., textbooks, a novel, a lecture, a CTBS test. Quadrant C and Quadrant D are context- reduced according to Jim Cummin's construct of proficiency. 1.5. English Language in the School Context: An Evolutionary Perspective English dominated the curriculum in the British Raj. It was the medium of instruction from the lowest to the highest segments of education. This esteem status of English remained even after independence. Still it enjoys a prestigious position in the society. Even if English is a foreign language, it attains quite an impressive position in India. Many Indians feel that English is not so far a foreign language, a language of the British- they have made it very much of their own. Yet a segment of people has been voicing against English as the colonial language and the judicious use of it may restrict us from the hangover of the colonization period. Apart from this ideological stand, English invariably captures all Jhe functional domains such as education, technology, business, international affairs etc. and to attend these entire activities one should have a basic knowledge in English. This has certainly a great impact on the agencies of education for an effective teaching learning of English. English reached India with the British. The establishment of East India Company and spreading business across the country sowed the seeds of English in India. There was an urgent need of the Indian people with knowledge in English in their business. Hence, there was a demand for the introduction of English in India. The first initiatives were taken by the Christian missionaries to introduce English. They had the policy to convert Indians to Christianity and in doing so, knowledge in English was regarded as a must. The English Christian missionaries came to India from 1813 and they built schools at primary level for Indians in which the language of instruction was local language. Later on, the missionaries built high schools with English as the language of instruction that obliged the Indians who wanted to study to have a good knowledge of English. The British rulers began building their universities in India from 1857. English became the first language in Indian education. The 'modern' leaders of that era in India also supported English language and claimed it to be the main key towards success. Indians who knew good English were seen as the new elite of India. Many new schools were established in which the language of instruction was English. According to the British laws the language of instruction at university level was English and therefore schools that emphasized

21 English were preferred by ambitious Indians. The East India Company launched English as the language to be used in the administrative purposes. By the 1830s, the Indian middle classes were becoming very demanding. They realized that English was the language required for a secure future in a government job, so why was English not taught in the secondary school? Private schools offering this service were already doing good business, particularly in Calcutta. The state was set for the first 'big moment' in the imperial history of English language teaching. Meanwhile some movements were started by Raja Ram Mohan Roy to introduce western scientific education through English. He wanted to replace traditional Sanskrit and Persian teaching. To take a decision on the issue, a committee was formed. Lord Macaulay was the chairperson of this committee. He advocated English as the medium of instruction in the place of Sanskrit and Persian. Macaulay's "Minutes" (1835) was an epoch making document in the introduction of English language in India. He pleaded for a class of people who could serve as- "... interpreters between us and the millions we govern;

a class of persons,
Indian in blood and colour, but English in taste, in opinions, in morals, and
in intellect" (

cited in Krishnaswamy & Brude, 1998, p. 14). Lord Bentinck, the Governor General of India, accepted his proposal for the establishment of English medium schools. These schools were set up only to meet the emerging administrative needs of the British Raj at that time. In those schools none other than the Englishmen used to teach English from the very first day of schooling and the textbooks of different subjects-science, geography et al. were printed and taught only in English. Because of that and as Macaulay argued, the printing of all Sanskrit and Arabic books was stopped and the prestigious Sanskrit college was closed. Wood's Despatch that has been treated as the Magna Carta of English education in India recommended the number of schools and colleges to be increased in India where English should hold the predominant place. Medium of Instruction should be English for higher branches and Vernacular for lower level. When India attained liberty, its position underwent a massive change. The whole administration of the language policy came into the hands of Indian authorities. The very question regarding the place of English in India became controversial. Some leaders argued that English should be uprooted from the country where as some others favoured the retention of English. In fact, for the first two or three years of independence, so much was said but nothing concrete could be decided in 1950, when the Indian constitution was framed. Hindi, the language spoken in four northern states in India, was made the National language. Article 343(2) of the Indian Constitution specifically stated that English was to be employed for official purposes, both intra and internationally, until 26 th January 1965. After that, Hindi was to replace it and become the sole official language. In a speech delivered on the 7 th day of August 1959, India's first Prime Minister, Pt. Jawaharlal Nehru

declared: "...for an indefinite period- I do not know how long- I would have English as an associate, additional language which can be used, not because of facilities and all that, but because I do not wish people of non-Hindi areas to feel that certain doors of advance are closed to them...

So, I would have it as an alternative language as long as people require it" (

cited in Krishnaswamy & Sriraman, 1994, p. 58). However, when a strong Hindi sentiment occurred in the form of riots in different parts of the country in 1963, Parliament passed the Official Language Act to conciliate the non-Hindi states. The act specified that the use of English language remained continued from the appointed day in addition to Hindi for all the official purposes. As a result, English happens to be the Associate Official Language even today. Three states in the North-East- Meghalaya, Nagaland and Mizoram- have given English the status of the sole official State language. Today, there are more teachers, students and Indian English writers than when British left the country. India ranks third in the world after the USA and UK

in proportion to numbers of English speakers. Since achieving Independence, schools that provide free education to all children have been running by the State Governments where the medium of instruction is the local state language and English holds the status of a second or third language. The Indian Government has taken initiatives repeatedly for the betterment of English language education. The Central Advisory Board of Education (CABE) made the first proposal in 1956. The board recommended the study of English as a compulsory language both at the secondary and university stages. It also suggested that English should be introduced in class V and the standard of English be determined by the states individually. Thereafter, the Kothari Commission or the Indian Education Commission (1964-66) advocated the three-language formula in the following way: I. The regional language or the mother tongue of the individual child II.

The official language of the Union or the associate official language so long as it exists and III. A modern Indian or European language not covered under (i) and (ii) and other than that used as the medium of instruction.

23 According to the commission, a working knowledge of English will be treated as an asset even though mother tongue or regional language is the medium of instruction. The National Curriculum Framework followed the track of the Indian Education Commission in successive recommendations i.e., 1975, 1986, 2000 and 2005. The entire educationists even today boast for the retention of the three-language formula as the most effective language policy for India. NCFTE (2009) also asserts the context specific use of language in teaching and learning activity. The Kothari Commission recommended particular units for teaching English language skills instead of focusing more on literature. Here, the shift occurs from grammar translation method to Direct Method. Various English Language Teaching Institutes (ELTIs) and Regional Institute of English (RIEs) were built in different locations of India for providing guidance, models and training to English language teachers. In the 1950s and 60s authorities wanted the help of professionals from London, including British Council, for preparing structural syllabus. Madras English Language Teaching (MELT) invited experts from London School. In addition, an English Language Teaching Institute (ELTI) was established in Allahabad in 1954 with the assistance of British Council. All India Seminar on the Teaching of English in Nagpur in (1957) recommended a revision of the syllabus at schools on a national level and established structural approach as the basis for the new syllabus. Central Institute of English and Foreign Languages (CIEFL) was set up in Hyderabad in 1958. Study groups selected by the Ministry of Education submitted reports in 1967 and 1971 on the 'Study of English in India'. A large number of English medium schools were set up with the prior initiation of the private sector. The Acharya Rammurti commission in 1986 suggested that more emphasis should be given to the hours of study and the level of attainment of the language than the years of study in a school or college. It also suggested that various government educational institutes should jointly design methods for making uniformity in the acquisition of language competency at school level. Curriculum Development Centre (CDC), set up by the University Grants Commission (UGC) in 1989 focussed on the proposed curriculum and suggested shifting of its emphasis from teaching to learning and it should be designed according to the needs and aspirations of the learners. CDC suggested postgraduate courses in British Literature, American Literature, Comparative Literature, Creative Writing in English, Modern English language, English Language Teaching, etc. Several Indian universities have started many of these courses with greater effectiveness to be at par with the large-scale demand for English knowing society. However, English language remained confined on the upward curve in the country. It has only begun the backbone of higher education. Though English entered to the

24 landscape centuries before, it cannot enter into the mindscape of average Indians even today. The continued status of English as the guarantee of upward mobility within a still rigidly stratified society, there has grown to be a segment of the English- knowing middle class which holds the view that English has been 'naturalized' in this country, and hence ought properly to be seen as one of the Indian languages. On the face of it, this must seem too obviously true; about two to three percent of Indians do know some English – the problem resides in the refusal or the unwillingness of such opinion to recognize the collusion between English and various system of dominance, both in relation to the Indian political economy and to culture. Now the aim of English studies in India does not remain merely to develop aesthetic sense and the creative and critical faculty of the students. In this globalized world English has no longer remained a colonial language but a language that various countries and people are using for communicative and commercial purposes. It is now no longer a colonial language of oppression meant to subjugate people but has become a medium of transporting knowledge between countries and people. Therefore, need to review the impact of power on English as second language in India has been felt with immediacy. States, like India and Bihar, which banished English from Primary Education, have reintroduced it. English had been with us for more than two centuries and will dominate once again in the recent future. Today the relevance of English is much more than the colonial India. Circumstances lead to say that English has certainly a great future in India. People use English not due to linguistic barrier only but prefer to express themselves in English. The youngsters favour English most due to their career advancement. Sometimes, it has been treated as a symbol of status due to its predominating role in the world.

1.6. Current Trends in Modern English Literature in Indian Context

Indian English literature commenced as a necessary outcome of the introduction of English education in India under the British colonial rule. In the recent years, it has fascinated widespread interest, both in India and abroad. It is now documented that Indian English literature is not only part of the Commonwealth Literature but has also acquired great significance in the World Literature. Literature is a powerful medium in the hands of creative writers to modulate and modify or change the societal framework. It cannot be created in a vacuum, and has invariably the basis of socio-cultural, political conditions. It might be seen as an individual's perspective on the social, historical, political, economic and cultural patterns of the times. Creative writers have always

25 used literature as a medium to fight against the well established, conventional social norms and traditions, hypocritical reactions, outmoded customs, and so on. Now days a number of Indian writers in English have contributed substantially to the Modern English Literature. Credit goes to Raja Ram Mohan Roy who heralded the Indian Renaissance and Lord Macaulay who initiated English language education in India. Today, it has won for itself international acclaim and distinction. It was sustained to open up fresh avenues of thought and culture, art and literature, science and technology. The introduction of English education and the knowledge of English literature and science through the medium of English language offered a fresh avenue for the growth and expansion of English in India. The expansion of English created a conducive environment for the growth and development of the Indian narrative not only in English, but also in the various Indian languages as well. It directly marks an enriched heritage of different genres of literature-drama, poetry and fiction. The growth of English writing since Independence has taken a new direction.

The Indian English writers perceived India at a post-colonial view. The new ideas nourished but most of the focus was shifted towards the problems like- social, economic, religious, political and familial as bases; which were also enveloped with the feel of National Movement that drew attention of the creative writers.

The partition, the communal riots after partition, the problems of casteism, subjugation of women and the poverty of illiterate masses became the flavour of the day. The outcry is enormous and many up- surging writers have enhanced the view of the Literature with passage of time. This paper will help analyze and understand the development of English writing over the decades beginning from the Post- Independence period till date. It also compares the veterans of writing who posed the realism of fifties in their writing, with the upcoming writers of present who elaborate on the ideas of the past with their modern perspective. It also diverts the readers' attention towards the changing patterns of using language. India had turned Independent in the wake of the middle of a struggling 1947 and this very sudden and gushing change of governmental and administrative policies was sure to create its ill impacts upon the newly renamed 'Indian citizens'. The Partition of India, the consequent 'frozen period' of Indian economy made itself very much perceivable in Indian literatures - a country which was almost thrust into native- native and almost- alien systems after solid 200 years of colonial ruling. This called for reasons enough for genres in Indian literature to become apparent by themselves, a nation plunged into the era of post-colonialism sickness to end, with only sporadic writers and authors taking upon their shoulders the task to be conscious of social norms. Postcolonial Indian literature also gave birth to the Indian diaspora, with clusters failing to identify themselves

26 with the native mode of administration, migrating to the land of once 'white' masters, looking down upon Indians as 'slaves'. Genres of unnaturalness and unimaginable wonders began to crop up every other day in literature from India, with the now emerging tribal literary communities voicing their outcry of protests of helplessness and angst. The postcolonial generation always has perhaps suffered in a void of dichotomy, with two of the most extremities pulling at each other hard for want of importance and lack of it. And this perhaps is most visible in the rather dark genres in Indian literature, with English predominating above every other regional language. Indian English literature has best brought out the pathos and ethos of quintessential Indian literature that was begun during the once-gone Vedic Period. And this very genre of post-colonial genre in Indian English or regional literature, had also given birth to a overwhelming reaction of modernism in Indian literature. Modernism however is not confined to a constricted sense of being omnipresent in the 20th or 21 st centuries only. It also does not define that Indian literature with its touch of modernism is only narrowed down to English authors only. Indian literature of ancient times was also very much adhered and akin to being modernistic in their approach, with Tagore being referred to a man 'much ahead of his times'. The colonial period, which was at first dealt with much subtlety and humour in the literal sense, did take on many momentous and grave proportions due to the British Raj and its cruel domination. In fact, European arrival on Indian soil was one such aspect, which had begun already during the times of Mughal Emperor Jehangir. Yet, British domination, beginning with the East India Company perhaps had surpassed every other literary influence on Indian literature. with 200 years of ruthless reigning. Be it the Company or the later British Empire under the Crown annexation, Indian literature never did remain the same again. Indian regions were turned into provinces and the leading port cities, into Presidency administration. Each of the administrative system was overhauled, which began to gradually make a profound impact upon the mass and the class alike. The cultural ethos, the cultural distinctiveness that India owned, was completely shattered owing to English power and ascendancy. This no doubt was to make its shielding as well as protesting a mark in regional Indian literature, which again was a societal duty for any author. Cultural influence on Indian literature was mostly viewed in the limelight, with writers attempting to at times make headway for nationalists, or, the others, supporting the beneficial cause of the rare to- find kind- hearted Englishman. Whatever was the case, Indian literature was tremendously influenced from its every single angle of advancement. Yet another path breaking aspect was the arrival and permeation of English language was a major means of communication for the class first, and later, the mass. Those kind-hearted Englishmen, who had taken

27 the task upon them to bring natives to justice, had planned to create special position in native heart, by spreading English language and literature into every Indian soul. As such, one of the main influencing factors on Indian literature was the English language. English language thoroughly had influenced the Indian literature. Colonial influence in Indian literature was so much an aspect of everyday basis, that after some time, neither the ruler nor the ruled were very much taken in by it. If India was made a colony under British Empire, it was very much obvious that colonialism would make its everlasting influence upon any kind of literary work from Indian nationals, be it in English, or be it in the regional languages. However, a distinct thin line still remained between these 'ruler-ruled' relationship, in terms of communication, with the latter forever trying effectively to root out the former. And this very element very much became a reality in 1947, with India gaining Independence after 200 years of merciless suppression! The sudden darkness and lack of light that was felt with the Partition of India, intensely had impacted upon any quintessential Indian, mirrored very much in the then- framed 'Indian Diaspora' and its cluster of writers and authors. Post-colonial influence on Indian literature is that very sphere, which can still be viewed in the Indian English literature, not forgetting the sporadic regional literatures or 21st century. The abstract anxiety or helplessness, the angry young man restlessness, or the masked features of any Independent Indian human mind is still perfectly intact in the core of Indian literature, which however has taken towards fresh directions under the gradually arriving globalisation and its influence onto Indian literature. Contemporary Indian Literature that is only one and a half centuries old is marked by amazing variables in both the litterateurs and the regions through which it was produced. Before delving deeply into the exceedingly diversified genre of contemporary Indian literature, it is of tremendous importance to comprehend the fraternal terms of 'modern', 'modernity' and 'modernisation' in the Indian context. These three terms in the modern context are quite significant and highly condensed terms for historical experiences. Keeping in mind the chronological pattern, the twentieth century is considered to be more modern than the nineteenth century, but that does not exclude the 19th century from contemporary literature in India genre. The criterion involved here is not qualitative, but rather simplistic. Furthermore, anything which is fashionable today is considered modern whether it is desirable or not. However, the more significant aspect of modernity is a value-based approach. Particular attitudes and ideas are conceived more progressive and hence it is natural to condition them as modern as opposed to what existed before. The chronological sense is in a way implicit in this concept. The Indian context of contemporary literature bears an essential relation with the social and political history of the country during the mid-19th century, which indeed had marked a breakthrough.

28 English education had gradually disseminated in India during the first half of the 19th century, but its effect is seen manifestly in Indian literary creation only in the second half of the century. A new approach towards literature had emerged in the major languages. There indeed had existed an unambiguous novelty in form and content, mostly in both literatures, as form and content are always cohesively bound together. The distinct Indian flavour was back in the English language and thus the works of the modern Indian writers reflected the Indianised English. Be it Salman Rushdie, Shahshi Tharoor or Amitav Ghosh the deconstruction of the British of English was quite evident. The regional languages were freely used in the prose forms; thus once again breaking, restructuring and adding a new twist and dimension to the traditional narrative patterns .. Hindi, Gujarati, Bengali, Telugu, Tamil, Kannada, Marathi writers adhered to the 'modern' and 'post modern' idiom of writing. For instance, Mulk Raj Anand's work is replete with Hindi and Punjabi words like 'haanaai', 'saalamhuzoorii', 'shabashshabash' (Coolie). Most path breaking is Arundhati Roy's use of untranslated Malayalam words in day to day conversations in her *The God of Small Things* like 'chacko sir vannu', 'she is very beautiful sundarikutty', 'oower, orkunniley, kushambi. As far as poetry was concerned, it did not necessarily rhyme. Rather rhyme was done away with consciously to bring forth the discordance in the life of modern man. Both Indian English and regional poems deliberately distanced themselves from rhythm. Post independence, India was faced with a number of crises including social, political and economic. The society was in a continuous state of flux. This time the writers were no more eulogising their nation. Rather they were bringing to the forefront the reality through their works. Both verse and prose were time and again emphasising on the dominant crises. In order to establish a new narrative, to break away from the colonial mind set, contemporary Indian writers adapted new narrative patterns to put through their notions. Making a move from the 18th or 19th century, that had indeed sowed the budding phase of then referred contemporary Indian literature, writers belonging to contemporary India are additionally very conscious about their own culture and traditions. Hence can be witnessed a massive body of vernacular language and literature flourishing in it. While some of the authors pen in English, most of them continue to write in their colloquial languages. The philosophy and thought behind their works exhibit influences of western thoughts and principles. It is quite laudable that these authors have been successful enough to maintain the unique flavour of their region in their works and tinge it further with a modern dimension. The literary genre of the contemporary Indian literature are

29 manifold. Present Indian readers have novels, plays, short stories, literary criticism, science fiction and poetry to choose from. Besides the Indian English Literature, the regional literature of the subcontinent reflected significant changes as well. For instance, in Marathi literature changes were creeping in after 1800 which was the period of intellectual fervour and reformist didacticism. Many English books were translated in Marathi. Ram Ganesh Gadkari and Prahlad Keshav are also shared the stage with stalwarts like, Mohan Agashe, Sriram Lagoo, Kashinath Ghanekar, Prabhakar Panshikar started playing many immortal characters written by geniuses like Vasant Kanetkar, Kusumagraj, Vijay Tendulkar. This movement in drama was suitably supported by Marathi films which did not become a roaring success. There were pioneers like V. Shantaram and Dadasaheb Phalke and Marathi cinema had a tremendous impact on contemporary film industry. Modern Marathi poetry commenced with the works of Jyotibha Phule but the later poets like Keshuta Lalakavi, Ravi Kiran Mandal wrote poetry inspired by romantic and Victorian English tradition. But the major paradigmatic shift occurred in the mid forties with the poetry of Mardhekar and in the nineties in the hands of Abhidhanantar and Shabadavedh. The Little Magazine movement which became powerful in the fifties because of radical and path breaking writings gained momentum in the nineties too in the hands of Manya Joshi, Hemant Divate and Sachin Ketkar. Similar developments were also witnessed in the South Indian literary circles. In the 19th century the south Indian literature was inspired by European genres but in the end of the century things started to change with the help of modern writers like VVS Aiyar and Subhramania Bharati who started developing new forms. Modern south Indian literature boasts of great stalwarts who have left their imprint on the mind of numerous readers the world around. Contemporary writers like Jhaver Chand Meghani, Dharamvir Bharati, Mulk Raj Anand, Arundhati Roy, Vikram Seth, Jhumpa Lahiri and Amitav Ghosh have won international awards and put India firmly on the world's literary map. The two most famous names are the Mumbai born Salman Rushdie who received a Booker prize for his *Midnight's Children* and the Kerala author Arundhati Roy who also bagged a Booker for her *God of Small Things*. Other important writers are Shashi Deshpande whose *A Matter of Time* revolves around the problems in the middle class household when the husband leaves; Rohinton Mistry's *Family Matters* and *Fine Balance* where he deals with Indian society keeping Mumbai as the background. R.K. Narayan is another renowned south Indian writer who scaled great heights with his works revolving around the south Indian small towns of Malgudi. His chief works are *Swami and his Friends*, *The Financial Expert*, *The Guide*, *Waiting for the Mahatma* and *Malgudi Days*. Kamala Markandaya's *Nector in a Sieve* describes the heart wrenching struggle of a south Indian woman against the ravages of time and the destructive forces of nature.

30 Kaka Saheb Kalelkar is another celebrated writer in pre-independent India. His philosophical writings demonstrate his vast erudition, his commentary on the *Bhagavad Gita*, his essays on culture, his travelogues, his translation of *Gitanjali* had won him applauding appreciation from all quarters. The other eminent personalities that contributed to the literature world redefining contemporary Indian literature during this period comprise: Vempalli Gangadhar, K.K. Munshi, Joy Somnath, Khushwant Singh and many others. Indian contemporary literature is colossal in its scope and encompasses literature of various genres and styles. Contemporary literature in India is influenced considerably in content by the western philosophy and thought. However it knows how exactly to maintain its unique Indian flavour and assorted richness. In the arena of international literature, contemporary Indian literature occupies a position of pride for its sumptuous affluence and originality. Literature of India still bears some of its ingrained colonial impact and present-day writers often base their works in the colonial backdrop. However, this is not something heavily peculiar for a nation under colonial rule for such an extensive period of time. Contemporary Indian writers have taken to writing in English but repeatedly their themes are based upon an Indian backdrop and household.

1.7. Teaching as Second Language in Indian Context:

First language (L1) generally refers to the mother tongue. A child automatically acquires the first language in the process of growing up. It is as natural as mother's breast. It is a habitual action. A child feels comfortable in using his/her mother tongue. A second language (L2) is a language that is different from the vernacular and is learnt for its practical use in different contexts. English enjoys the position of the second language in colonial countries such as India, Bangladesh, Pakistan etc. English is used as the medium of instruction in schools, colleges and universities. Apart from that, English is widely used in the administrative purposes of our country. A third language (L3) is any other language, obviously different from the mother tongue, which is learnt for a specific period of time in schooling but not used as the medium of instruction in schools, colleges or universities. The treatment of English as an associate official language of India for an indefinite period resulted in the three-language formula came into effect. The Central Advisory Board of Education (1956) first suggested it and was accepted by the assembly of the Chief Ministers of different states in 1961. Indian Education Commission (1964) recommended studying English either as a second language (L2) or as a third language (L3). The regional language or the first language (L1) is to be taught from class I to

31 class X. The second language and the third language are to be introduced in class V and class VIII respectively as suggested by the commission. In Hindi speaking areas, the third language should be a modern Indian language other than Hindi. The mother tongue or the regional language should be the medium of instruction at all levels of Education. All the states including West Bengal have accepted the three-language formula with necessary modification to meet local requirements. However, there is a feeling that the Hindi speaking states are not seriously implementing the recommendation relating to the third language in their regions and because of that, the formula seems to be applicable in non-Hindi speaking states only. At the same time, it is also realized that our student will have to learn all the three languages for different purposes to be served by each of them. The expected level of achievement in three languages will however depend on whether the language is learnt as L1, L2 or L3. Different states follow multifarious discretion of introducing English from either class I or class II or class V and whether to treat English as second language or third language. In India, Bengali is the regional language and hence it attains the status of first language where as English and Hindi hold the second and third positions accordingly. There had been a long debate on the position of introducing English, but finally the matter is resolved and it is now introduced from class I in all the govt. or govt. aided schools. If we analyze the history of English language education in West Bengal, we can visualise many experimentation since 1950: I. In the year 1950, English was eliminated from primary section. II. In the year 1964, English was reintroduced from class III and sustained to be taught as second language since 1983. III. In the year 1984, English was again eliminated from Primary section and introduced from class VI instead of class III. IV. In the year 1992, Ashok Mitra Commission recommended launching English from Primary level but our state government paid no heed to this proposal. V. After that, Pabitra Sarkar Committee also suggested to commence English from Primary stage. In the year 1999, this language was launched from class II in West Bengal. VI. Finally, in the year 2004, English was introduced from class I and there is no change henceforward. Though English is a foreign language, it occupies a unique position in our country. The study of English started long ago and dominated the curriculum in the British regime. It played the role in the national integration and in the field of knowledge. Before

32 Independence, English medium schools were set up according to Macaulay's suggestion and at the discretion of Lord William Bentinck. Then English was the- Queen of languages Medium of instruction at different levels After Independence English was- The associate official language One of the languages in the three-language formula Mahatma Gandhi and Pt. Jawaharlal Nehru were in favour of retaining English. the study of English should be introduced as soon as the child has acquired mastery over his mother tongue. It was agreed on all hands that the mother tongue is the best medium of instruction and the Indian Education Commission recommended that no student should be awarded a university degree unless he/she has achieved some proficiency in English. Therefore, English should not be the medium of instruction at school level. It should be the medium of instruction only at higher levels of study where the learners' progress is not hampered because of the medium of instruction. We should keep English as medium of instruction for the time being because it is not an easy task to find equivalents of English especially in the fields of science, technology, medicine etc. Education being the responsibility of states in India, educationists belonging to different states decides things in their own way. That is why English is introduced differently in different states of India. An impartial scrutiny of the result of the modern researches in the field of foreign language learning leads some to the conclusion that the teaching of both Hindi and English should begin from the early days of schooling because by that time a child has acquired proficiency in his mother tongue. In India, English is the medium of instruction at higher levels and a compulsory language in the secondary schools. The study of English is included in the curriculum to keep abreast with world knowledge in science and technology and to make our own contribution to literature. Hence, English should be taught more as a 'language of comprehension' than as 'literature language'. Stress is on developing the four skills at the primary stage; at the secondary stage the ability to handle basic sentences and phrase patterns in speech, reading and writing. Strong emphasis is on the mastery of essential grammatical and lexical items for communication function. There is the essence of a cohesive curricular policy based on the guiding principles for language teaching which allows for a variety of implementations suitable to local needs and resources and which provide illustrative models for use.

English does not stand-

33 alone. It needs to find its place along with other Indian languages and in relation to other subjects. There should be the provision for English across the curriculum. Facilitating English is not the sole responsibility of the English teacher. The entire activities of the school whether it is curricular or co-curricular, should have provision for fostering English. Analysis of the

objectives of teaching English at Secondary Level The objectives of teaching English at the Secondary level are to

developing in the pupils the following skills and knowledge: I. To comprehend English with ease when spoken at normal conversational speed. II. To speak English correctly and fluently III. To read English with comprehension and at reasonable speed so as to use it as library language IV. To write neatly and correctly at reasonable speed V. To acquire knowledge of the elements of English for practical command of the language VI. To enjoy literary pieces in English VII. To translate common English words, phrases and sentences into their mother tongue or vice-versa VIII. To develop interest in extensive reading. The other important aspects that have a bearing on defining the objectives of a language course are- the situations in life where the students will have to use their language skills and the course content, i.e., lexical items, sentence patterns etc. that the students will learn at different stages of the course. In other words, we must define the framework of life-situations and language content within which the language skills are to operate. Such a framework would tell us where exactly we expect our students to use English and what amount of language material should be supplied to them for the purpose. Aims and objectives of teaching English: Aims of Teaching English:

The aims of education are not achieved through the study of a subject or two. Education is a life-long process and it includes the entire spectrum of subjects taught in an educational institution. The study of all the subjects contributes to the achievement of

34 aims of education and therefore in any scheme of teaching a subject, its aims and objectives are of most important. The teacher must know the aims of teaching a particular subject and should strive to do full fairness to it. The teacher who does not know the aims of teaching his subject does not know what he is doing and cannot realize why he is doing the same. Hence, the knowledge of the aims of teaching a subject is of supreme importance for the teacher. He must know what he is trying to accomplish, decide whether the procedure that he follows in the classroom are proper or not. The aim should be decided at the time of beginning a lesson. We may divide the aims of teaching English into two: a. General aims b. Particular/Specific aims The general aims are long-term aims of English teaching. They are at par with the aims of education. Therefore, these are meant to be achieved during the schooling period of the pupils. On the other hand, particular or specific aims are the 'objectives', which the teacher aims to achieve in his day to day teaching. a. General aims: The study of a language has four aspects, viz., the Semantic aspect, the Phonetic aspect, the Graphic Aspect and the Phonetic-cum-graphic aspect. The Semantic aspect means the comprehension of the meaning, the meanings of the words and their relationship used in a sentence.

The Phonetic aspect is the sound aspect and indulges with the spelling and articulation of words. The third, the Graphic aspect, is the writing aspect and deals with the written form of a language. The Phonetic-cum- graphic aspect means the reading aspect.

To these four aspects, some add two more- the literary aspect that leads to the ornamentation of a language and the linguistic aspect that means the working knowledge of language. All these aspects of language work in co-ordination with each other and none of these can work in isolation. Hence, there are four general aims: I. To enable the pupils to hear and understand spoken English II. To help them acquire proficiency in speaking English III. To enable them to understand what they speak in English IV. To enable them to write English At the school or higher secondary stage where English is to be taught as a second

35 language, we should be contented with its linguistic aims. Our chief concern should not be about the technical hitches of pronunciation, expansion of vocabulary, grammar and structure, but with language abilities. b. Specific/Particular Aims: Along with the general aims of teaching English, the teacher should have define, clear- cut aims for each lesson. In other words, these are short-term aims. They are clear, precise pointed and expressive in terms of achievement. The specific aims will vary according to his teaching orientation. It is very necessary for a teacher to specify his objectives of teaching. This helps him to know exactly what he is to do during a particular lesson. The teacher should declare his specific aim to his pupils so that they may know in advance what they are going to learn in that period. This will fix their mind on that specific aim and their energies will not be scattered. With a clear-cut aim both the teacher and the pupils stand on a firm road along which they can walk hand in hand with confidence. Objectives of teaching English: Objectives mean the desired changes in the pupils' behaviour at the end of any particular activity. The objectives are the steps that gradually lead towards the general aims of teaching the subject. The objectives of teaching English as a whole are the followings: I. Motivating students for studying more literature in English language II. Encouraging students

for composing poems and writing essay III. Developing the ability for grasping the theme of a poem or a passage in English IV. Encouraging the students for writing the meaning or theme of a poem or a passage in their own words V. Developing the ability of appreciation of ideas VI. Developing the creativity of the students related to verbal ability and reasoning or fluency of English language VII. Encouraging the ability of understanding of other school subjects VIII. Developing the mastery of English language for expressing his ideas, feelings and experiences IX. Stimulating the ability of evaluation and analysis of language components
36 X. Incorporating the values, moral and character of the students

To attain all these objectives is not an easy task. Hindrances are many, but an efficient teacher should keep in mind that these cannot be achieved overnight but have to keep patience and need to provide constant efforts both manually and by the aid of modern technology. 1.8. Let Us Sum Up Principles of Language Teaching Learning a second language is more than learning a mere description of it. It is to develop the ability to use the language on habit level. This is true not only of second language learning but also of first language learning. Essentially, all language learning involves the processes of listening, speaking, reading and writing. These processes absorb both linguistic and psychological aspects. This leads us to the fact that all language learning is based on certain well-defined principles derived from linguistic science as well as psychological science. Language Proficiency Jim Cummins differentiated between social and academic language acquisition. He also advances the theory that there is a common underlying proficiency (CUP) between two languages. Skills, ideas and concepts students learn in their first language will be transferred to the second language. English Language in the School Context English dominated the curriculum in the British Raj. It was the medium of instruction from the lowest to the highest segments of education. This esteem status of English remained even after independence. Still it enjoys a prestigious position in the society. Even if English is a foreign language, it attains quite an impressive position in India. Many Indians feel that English is not so far a foreign language, a language of the British- they have made it very much of their own. Yet a segment of people has been voicing against English as the colonial language and the judicious use of it may restrict us from the hangover of the colonization period. Apart from this ideological stand, English invariably captures all the functional domains such as education, technology, business, international affairs et al. and to attend these entire activities one should have a basic knowledge in English. This has certainly a great impact on the agencies of education for an effective teaching learning of English.

37

Current Trends in Modern English Literature in Indian Context The growth of English

writing since Independence has taken a new direction.

The

Indian English writers perceived India at a post-colonial view. The new ideas flourished but most of the focus was shifted towards the problems like- social, economic, religious, political and familial as bases; which were also enveloped with the feel of National Movement that drew attention of the creative writers.

The partition, the communal riots after partition, the problems of casteism, subjugation of women and the poverty of illiterate masses became the flavour of the day. The outcry is enormous and many up- surging writers have enhanced the view of the Literature with passage of time. This paper will help analyze and understand the development of English writing over the decades beginning from the Post- Independence period till date. It also compares the veterans of writing who posed the realism of fifties in their writing, with the upcoming writers of present who elaborate on the ideas of the past with their modern perspective. It also diverts the readers' attention towards the changing patterns of using language. Teaching as Second Language in Indian Context The position and status of English in India, the global acceptance of English, modernization, liberalization all these imply that the teaching of English should be consolidated in India. There is an urgent need to compete with the development of the whole planet and not restricted to India only. Hence, the chief aim of teaching language should be to develop the language skills because English is no longer regarded as a knowledge subject but as a skill subject. There is the essence of a cohesive curricular policy based on the guiding principles for language teaching which allows for a variety of implementations suitable to local needs and resources and which provide illustrative models for use.

English does not stand-alone. It needs to find its place along with other Indian languages

and in relation to other subjects. There should be the provision for English across the curriculum. Facilitating English is not the sole responsibility of the English teacher. The entire activities of the school whether it is curricular or co-curricular, should have provision for fostering English. 1.9. Unit-End Exercises 1. What are the different principles of language teaching? 2. Do you find any difference between BICS and CALP? 3. Discuss the evolution of English language education in the school context.

38 4. Show your acquaintance with

the current trends in English literature in Indian context. 5. Explain the role of teaching English as Second language in India. 1.10. References Sanyal, S & Mukherjee. U (2015). 39 Unit - 2

Instructional Planning Structure: 2.1 Introduction 2.2 Objectives 2.3 Aims and objectives of Teaching English at different stages of schooling 2.4 Instructional Planning: Need and Importance 2.5 Unit and lesson plan: Need and Importance 2.6 Procedure of Unit and Lesson Planning 2.7 Let Us Sum Up 2.8 Answer to 'Check Your Progress' 2.9

Unit End Exercises 2.10 References 2.1 Introduction In the arena of teaching, instruction is a new word. It is used to mean systematic delivery of lessons with maximum classroom interaction so as to yield maximum output. Precisely speaking, instruction is an endeavour to make teaching scientific. It is an improved version of teaching where the teaching learning process is controlled and regulated by the maxims of teaching. In instruction, every classroom activity is pre-planned, well- ordered and target specific. Therefore, the word 'instruction' is replacing the word 'teaching' in education.

Instructional planning is an attempt to plan the transaction that would take place in a given classroom in the most objective and specific way. Instructional

plans are formulated more concretely in order to achieve the aims stipulated in the curriculum. They show 'when' and 'what kind of activities' children

need to engage in with the aim of promoting their development. Instructional plans should be formulated so that children can have learning experiences appropriate for their age or stage of

development. Teachers formulate instruction plans by setting objectives so that the curriculum is put into practice, creating an environment that enables children to achieve the objectives and curriculum content and making sure that teachers' support leads the activities in a favourable direction.

40 2.2

Objectives After going through the unit: You will develop a comprehensive idea of the aims and objectives of the teaching unit You can understand the need and importance of instructional planning in English You can develop knowledge about the way unit planning and lesson planning is done You can comprehend the difference between planning of lessons and units for normal and

children with special needs. 2.3 Aims and Objectives of Teaching English at Different Stages of Schooling 2.3.1 Aims of Teaching English

The teacher must know the aims of teaching a particular subject. The teacher who does not know the aims of teaching his/her subject can never do justice to his/her profession.

Hence the knowledge of the aims of teaching a subject is of paramount importance. In teaching of English"

P. Gurrey writes, "It is highly desirable to know exactly what one is hoping to achieve. If this can be clearly seen, then the best way of getting to work usually becomes evident. We ought, therefore, to consider carefully what we are trying to do when we are teaching". English

is a foreign language for Indian students. In most of the states it is accepted as a second language because of its market value and its use as an official link language in a multilingual country like India. English helps the states in official communication with the centre. It was declared as the official Associate Language after Independence. It is a world language and a library language. The principle of three-language formula recommended by the Kothari Commission (1964-66) emphasized the practice of English in Indian schools and colleges. Now it has been adopted by the states and union territories of India. But the performance of our students in English is below satisfaction. There are many hurdles in our way. Many teachers teaching in schools do not know the objectives of teaching the subject. It is, therefore, essential to improve the awareness level of students and teachers about the objectives we are to achieve. The aims and objectives usually are decided upon at the beginning of preparing a lesson.

41

The goal of teaching English in India is to help students to acquire a working knowledge

of English. In other words, it means that students should be able to understand

and speak English, read and write English. The knowledge of the aims of teaching of English will help the teacher to teach effectively. Aims of teaching English can be perceived in two domains. Language development and Literary development.

1] Linguistic Aim : There are four skills of language—Listening, Speaking, Reading and Writing (L.S.R.W.) and four aspects of language—semantics, phonetics, graphics, phonic

cum graphic. The semantics is related to understanding of language (Listening), the phonetic skill deals with sound, spelling and pronunciation (Speaking), the graphic skill is about writing (Writing Skills) while the phonetic cum graphic deals reading of

printed materials (Reading Skill). Every language including English is to be taught based on these four criteria. One's command over a language is to be assessed by the mastery of these four skills. However, for better understanding, things are explained graphically below : Command over Language Passive Active [understanding and reading] [speaking and writing] Receptive Skills Productive/Creative Skills The linguistic mastery of a language (here, English) depends upon the following elements and the way they are used. These are: - grammar - sociolinguistics - tools for interpretation and analysis of language and text - knowledge of texts - text forms/ genres

42 - text linguistics - composition - media and communication with texts 2] Literary aim-

Literature in a language classroom provides enough space for the learners to comment, justify and mirror themselves.

Three main reasons for the teaching of literature have been consistently advanced. Each embraces a particular set of learning objectives for the student. These are: The cultural aspect The language aspect The personal growth aspect The Cultural Aspect Teachers working with a literary aim stress the value of literature in encapsulating the accumulated wisdom, the best that has been thought and felt within a culture. Through literature students get to know the background not only of the particular novel

or prose or poetry

but also, they learn about history, society, and politics of the country. By experiencing this, they open themselves to understanding and appreciating ideologies, mentalities, traditions, feeling, and artistic form

of

the heritage the literature of such cultures endows. The Language Aspect One of the main reasons for a teacher's emphasis upon the linguistic aspects while teaching literature is to give students knowledge with some sense of the subtler and varied creative uses of language. A main purpose of language-centered literature teaching is to help students find ways into a text in a methodical way

in order to probe into the deeper layers of meaning by noting the nature of the use of language in the text. The Personal Growth Aspect Teachers tend to facilitate

the personal growth of the students. Their main goal is to help students achieve an engagement with the reading of literary texts. Helping students to read literature more effectively is helping them to grow and mature as individuals as well as their relationships with the people around them. To encourage personal growth the teacher has to select texts to which students can respond and

with which they can use their ideas and imagination creatively.

43 However, the Specific objectives of teaching English may be summarized in the following manner: 1) To enable to listen to English with proper understanding 2) To enable to speak English correctly. 3) To enable the students to read English correctly and comprehend and interpret the text. 4) To enable the students to write English correctly and meaningfully, for example writing letters, applications, description and accounts of day to day events. 5) To enable the students to acquire knowledge of the elements of English language. 6) To enable the students to develop interest for English. 7) To increase students' ability to use planning, drafting and editing to improve their work. 8) To enable the students to express themselves creatively and imaginatively in the target language, i.e., English. 9) To enable the students to become enthusiastic and reflective readers through contact with challenging texts. 2.3.2 Objectives of Teaching English at Different Stages of Schooling Aims are those targets which are to be achieved in the long run. It may take years to achieve one aim of teaching. But objectives are short-term and are achieved immediately. Let's have a look of the objectives of teaching English at different stages of learning. a. Objectives of Teaching English at

Elementary Level

By the end of the Elementary Stage students should be able to . . . 1. learn the basics of the English language that would form the foundation for its mastery in the future. 2. use the basic structures of English sentences. 3. learn the core vocabulary assigned for this stage. 4. listen to and understand simple English. 5. express themselves orally using simple English. 6. read and understand simple written English materials.

44 7. write simple guided sentences in English. 8. develop an awareness of the importance of the English language as an international mean of communication. 9. develop an awareness of the importance of the English language as an international mean of communication in order to benefit from the achievements of other cultures. b.

Objectives of Teaching English at Secondary Level The following are the main objectives of teaching English at secondary level. 1.

To develop knowledge and understanding of Grammar. 2. To develop abilities to make use of the grammar in own writing English. 3. To understand the meaning of English passage. 4. To develop interest in reading English passages/ literatures. 5. To develop self-study habit. 6. To enhance competencies in writing essays and gist of the passage in own words/ language. 7. To develop their insight and favourable attitude towards English language. 8. To develop the understanding of the rules of grammar and their use. c. Objectives of Teaching English at Higher Secondary Level 1.

Motivate students

for studying English

language. 2. To encourage for composing poems and writing essay. 3. To develop the ability for grasping the theme of poem or English passage. 4. To encourage the students

to write the meaning or theme of

a poem or passage in their own words. 5. To develop the ability of appreciation of ideas and critical thinking. 6. To develop the creativity of the students related to verbal ability and reasoning and fluency of language. 7. To develop the ability of understanding other school subjects. 8. To develop the mastery of language for expressing

one's own

ideas, feelings and experiences. 9. To develop the ability of evaluation and analysis of language components.

45 10. To develop the values, moral and character of the students '

..... 2.4 Instructional Planning : Need and Importance

Teaching has never been easy. Now-a-days another term instruction is used widely. Instruction is scientific, objective and a more controlled process than teaching. It simply means no instruction is successful without a prior planning. An instruction can be successful when it is properly planned and designed.

There are two types of instruction plans - (1) long-term instruction plans: yearly and monthly plans and (2) short-term instruction plans: weekly and daily plans. However, for each kind of plan the following three aspects

are to be taken into consideration. 1. Contents of activities: what the teacher hopes the children will experience. 2. Objectives of curriculum: aspects expected to be developed through the activities.

46 3. Creation of the environment: how to provide an appropriate environment to achieve the objectives of the curriculum. Let's now discuss about the need and importance of instructional planning in detail. i. Creation of an Appropriate Environment Children live and develop through their interaction with the surrounding environment. Key factors of an appropriate environment are 'free from danger', 'appropriate for their development level', 'meeting the interests and curiosity of children' and 'stimulating children to try tasks that teachers want them achieve'. Teachers should try to create an environment that encourages children to voluntarily get involved in their surroundings.

ii. Instructional planning helps to make the process of instruction focussed and objective. iii. It makes the best use of resources iv. Proper justice is given to all activities if instruction is planned properly. 'Check Your Progress' -2 1. How is teaching different from instruction?

.....
.....

47 2.5 Unit and Lesson plan: Need and Importance Planning enables us to think about teaching and its activities in a systematic way before one enters the classroom. The outcome of planning is a coherent framework which contains a logical sequence of tasks to prepare for a more effective teaching and learning. Plans express our intentions. Plans are projects which need to be implemented in a real classroom with real students. 2.5.1 Need and Importance of Unit Planning Unit plans consist of concepts and learning goals that are taught over a period of time and are woven together, often across subject areas. A unit plan lasts two or three weeks (or longer) and includes several standards, skills, and desired outcomes for interconnected learning. It combines subject areas and involves overlapping lessons in the subjects, thus creating longer spans of class time for study and practice. At the secondary level, unit plans contribute to optimal learning When unit plans are done well, learning is maximized through multiple exposures to key learning concepts and goals. In simple terms, a unit plan is simply a more detailed view of your teaching map. Yet in many ways, it has a very similar purpose. Unit planning provides you with a sense of direction and organization that again helps you and the class to achieve significant academic gains within a particular time period. More specifically, a unit plan gives the following benefits: A unit plan forces you to make difficult

decisions about what to teach and how to teach it.

After taking the time to develop a unit plan, you are less likely to be side-tracked by objectives, lessons, or activities that do not advance your ultimate quest for academic achievement. Tempting diversions will look much less appealing if you have your sights set on your students achieving a particular set of goals in a particular four-to-six-week period. A unit plan keeps you on pace to reach your unit (and ultimately long-term) goals. Your unit plan, which should be referred to with almost daily frequency, is your point of reference when you ask yourself, "Given where I want to be in two [or four or six] weeks, am I where I need to be now? Am I spending too much time on certain skills and concepts given the other skills and concepts that must be included in these X weeks, or X days?" Given the limited number of weeks, days, and lessons in a unit, each moment becomes more precious, forcing you to pace yourself appropriately in order to meet your end goals.

48 A unit plan provides an opportunity to stimulate student interest through overarching content that is relevant to students. When you design your unit plan, consider what content will engage your students given their interests and backgrounds. As Jere Brophy indicates in *Tomorrow's Teachers*, "whether in textbooks or in teacher-led instruction, information is easier to learn to the extent that it is coherent (i.e., a sequence of ideas or events makes sense and the relationships among ideas are made apparent). Content is most likely to be organized coherently when it is selected in a principled way, guided by ideas about what students should learn from studying the topic." Your unit plan does precisely that-it creates discrete segments of learning that have a cohesive unity. And, you will help engage your students in learning because each unit will have an overarching idea that is relevant and interesting to students.

2.5.2 Need and Importance of Lesson Planning Lesson planning is a vital component of the teaching-learning process. Proper classroom planning will keep teachers organized and on track while teaching, thus allowing them to teach more, help students reach objectives more easily and manage less. The better prepared the teacher is, the more likely she/he will be able to handle whatever unexpectedly happens in the lesson. The following are the benefits of a lesson planning. Lesson planning: - provides a coherent framework for smooth efficient teaching. - helps the teacher to be more organized. - gives a sense of direction in relation to the syllabus. - helps the teacher to be more confident when delivering the lesson. - provides a useful basis for future planning. - helps the teacher to plan lessons which cater for different students. - Is a proof that the teacher has taken a considerable amount of effort in his/her teaching. 'Check Your Progress' -3 1. Mention two importance of unit planning.

.....

.....

49 2. Write two importance of lesson planning.
.....
.....

..... 2.6 Procedure of Unit and Lesson Planning 2.6.1

Procedure of Unit Planning A unit plan is to be prepared taking the following elements into considerations: i. Outlining the Academic Goal To begin planning a unit, first we need to outline the academic goals of the big vision of the unit. This phase includes deciding what students should know and be able to do at the end of the unit, the number of days or weeks required to maximize learning (great units always require slightly more time than expected), and selecting textbook chapters and stories and other materials to incorporate. ii. Division of units in appropriate time slots Next divide everything according to the available class periods or time slots to determine how to fit the pieces into the unit. Build in extra time for review and enrichment to ensure that all students have learned the material. With each lesson, pinpoint the specific goals and desired outcomes that are to be met to ensure that your students meet the learning goals of the overall unit. iii. Preparation of Overarching Questions for Unit Planning As we plan each unit, these overarching questions need to be asked: What is the big vision for the unit? What is the primary educational intent for this unit? What do students know right now? What should students know and be able to do by the end of each lesson? What should students know and be able to do by the end of the unit? How can instruction be adjusted to meet the needs of all students?

50 What will take place before and during the unit to make sure that all students are successful? What assessments will best ensure that all students have reached the desired outcomes? What happens when students do not know? What materials are available for enrichment activities? What are the cross-curricular connections? Is the time for the unit well justified? iv. Unit Outline Unit plans demand great amounts of time, energy, and planning and each step of the learning ties to the next. The planning outline is useful for completing the specifics of a unit. The outline can be like the following– a. Purpose of the unit: b. Unit title: c. Key concepts: d. Subject area(s): e. Desired outcomes: f. Overarching goals, big ideas: g. Overarching standards to be studied: h. Sectional standards: i. Daily standards: j. Daily big ideas: k. Sectional goals: l. Daily goals: m. Overarching questions (that reflect and highlight the big ideas): n. Sectional questions: o. Daily questions: p. Assessment types to be used:

51 Informal: Formal: q. Methods to monitor and adjust instruction during lesson: r. Methods to determine background knowledge: s. Key vocabulary: Tier 1: students should already know or be familiar with these; fairly easy to teach Tier 2: primarily new terms or the development of deeper understanding of the terms Tier 3: Difficult, problematic terms; specific to domain t. Materials needed: u. Time allotment per day: v. Number of days required to complete the unit: w. Desired outcomes based on previous lessons and student progress: x. Daily plan for lesson phases (include as many days as necessary): Day 1: Day 2: Day 3: y. Methods for connecting all learning: v. Deciding the Type of Unit. Unpack your standards to clearly understand what evidence you will need to see from students in order to know whether they have achieved the unit goal. Then decide among the types of units you might design: goals-based units (which revolve around the learning goals themselves for one content area), thematic units (which use a common theme to draw in various learning goals from different areas), and project-based units (which focus on an end-product, some creation or event that will serve as the vehicle for students' mastery of the learning goals). vi. Create your summative unit assessment. Successful teachers create their end-of-unit assessment tool before they begin teaching the unit. Begin to purposefully choose tasks that will allow students to demonstrate

52 their mastery of the unit goal. This will serve as an initial framework for your assessment that will later feature questions that test each individual objective. After creating your assessment begin to anticipate potential student misunderstandings of your unit content. vii. Translate your learning goals into lesson objectives. You must translate your general learning goals into more specific lesson objectives. These objectives should be student-achievement based, measurable, and rigorous. Consider all of the prerequisite knowledge and skills that a child may need to perform the goals you outline. viii. Sequence your content and scaffold your lesson objectives. Here you need to think critically about how you will order your content and scaffold those objectives over the course of your unit. You need to consider what order will result in the most effective sequencing of the objectives, based on Bloom's Taxonomy and level of rigor. ix. Schedule your objectives on the school calendar. Use a school calendar to plot the lesson objectives, ensuring that you have allotted enough time for the knowledge and skills you wish to teach and recognizing various days or weeks that won't allow for regular instruction. Make sure to plan for remediation, enrichment, and contingencies, and check your unit plan for alignment with other instructional tools. x. Create your beginning-of-unit diagnostic tool. Successful teachers also know where their students are when they begin each unit. To avoid covering material that they already know, develop a diagnostic that assesses prerequisite skills and knowledge of unit objectives at the beginning of each unit. This will also provide you with a benchmark by which to measure future growth. xi. Create a tracking system for your objectives. Once you've determined what you're teaching, you can now begin to create your classroom tracking system, a chart listing your objectives and your students' names that will allow you to record and measure the progress of your class and students on the knowledge and skills you are teaching. xii. Continually adjust your plan. Adjust your plans based on assessment data, including your diagnostic. Interpret your data to determine class strengths and weaknesses and tailor your instructional plans in response to this information. Determine ways to include remediation and review of

53 prerequisite skills into your unit calendar. Also, make sure to recheck your tools for alignment after making appropriate adjustments. 2.6.2 Procedure of Lesson Planning Planning is imagining the lesson before it happens. This involves prediction, anticipation, sequencing, organising and simplifying. When teachers plan a lesson, they have to make different types of decisions which are related to the following items: - the aims to be achieved; - the content to be taught; - the group to be taught: their background, previous knowledge, age, interests, etc. - the lessons in the book to be included or skipped; - the tasks to be presented; - the resources needed, etc. The decisions then depend on the teaching situation, the learners' level, needs, interests and the teacher's understanding of how learners learn best, the time and resources available. Lesson planning involves the following concepts to be taken care of. They are described here one by one. a. Hints for effective lesson planning: When planning, think about your students and your teaching context first. Prepare more than you may need: It is advisable to have an easily presented, light "reserve" activity ready in case of extra time. Similarly, it is important to think in advance which component(s) of the lesson may be skipped. If you find yourself with too little time to do everything you have planned. Keep an eye on your time. Include timing in the plan itself. The smooth running of your lesson depends to some extent on proper timing. Think about transitions (from speaking to writing or from a slow task to a more active one). Include variety if things are not working the way you have planned. Pull the class together at the beginning and at the end.

54 End your lessons on a positive note. b. Basic Elements of a Lesson Plan: 1. Bookkeeping info - stuff like the lesson name, the date, the book you're using and what unit/page you're working with, the age/level of students, the class name or number, etc. None of this really helps with the lesson itself, but it will help you organize your lesson plans and it also will help you easily identify who and what the lesson is for when you look at it later/next year/etc. This also makes lessons much clearer when you share them with others. 2. Target Language - this is the specific language you want to teach in this lesson. This can be a grammatical structure, a list of vocabulary words, a particular sound, etc. If you're planning along with a book, it should be easy to figure out what the target language is - but you still want to include it in your lesson plan because the lesson should be designed around the target language, not the book. (Most lesson plans also include an objective - the goal or aim of the lesson. 98% of the time, my objective is "to teach the target language", so I don't consider this strictly necessary.) 3. Materials - because it is easy to overlook something, you should list the materials you will need for your lesson and then make sure in advance that you will have these ready. This includes books, handouts, flash cards, realia (real-world objects that you use as demonstrations in your lesson), arts and crafts supplies, and anything else you will need for the lesson besides yourself and your students. You might even go so far as to include "chalk" because you can't always take it for granted that classrooms will have some, and you may need to bring your own or make special arrangements to have chalk - rather than waiting for the lesson to start and having to send a kid running down the halls in search of a classroom with extra chalk that you can take some of. 4. A step-by-step, chronological list of things to do in class. This includes taking attendance, the warmer/warmers, your actual presentation of the material, drills with the students, activities the students will do, assessments of student understanding, assignment of homework, etc. If you're teaching with a co-teacher, this list should specify what you should be doing and what your co-teacher should be doing at any given time. Each stage of the lesson should include: - a description of what you will do and what the students should do

55 - a classification: is this presentation, practice, or production? - a time estimate: how long should this stage take? Optionally: - is the class working as a whole, individually, in pairs, or in groups? - does the stage include students talking to each other, talking to the teacher, or not talking at all? 5. Extras: Some lesson plans include lots of other stuff. You can include a list of potential problems with the lesson and some solutions you've come up with in case they occur. You can include advanced exercises for students who get the material quickly, and/or remedial help for students who fall behind. You can specify the background knowledge students will need to complete the lesson. You can include extra activities to do if the lesson finishes early. I don't consider these things integral to a good lesson plan, but they can be helpful. c. Basic Structure of a Lesson: The structure of a lesson plan has two major parts. Lesson Plan Part 1- What to teach (refer to group task in session) Background info (students' age - no of students - time limit) Objectives Language skills Language Content: (structures, vocabulary, functions, etc.) Resources Attitude Lesson Plan Part 2 - Lesson Procedures (how we are going to teach) Warm-up Core lesson: teaching new language, recycling, project work, written and oral production. Tasks (which sequence to follow) Rounding off.

56 d. Steps of a Lesson Plan: The following steps are to be followed for planning a lesson. 1. Review (British English: Revision) - this can be going over homework together, talking about what you did in class the day before, taking questions from students about past material, etc. 2. Warmers/Lead-ins - these are short activities designed to get students ready for the main lesson. Warmers should mentally orient students toward working in English, and lead-ins should point towards or prepare for the content of the lesson. 3. Presentation - this is the part where the target language is first presented to the students. This does not have to mean that the teacher lectures and the students listen silently - the students can and should be actively engaged in the presentation stage. 4. Practice - at this stage the students practice the target language with structured exercises under the guidance of the teacher(s). Practice can include drills - repetitions of specific words, phrases, or sentences - and written exercises such as fill in the blank, multiple choice, matching, etc. 5. Production - production is when students use the target language to communicate. It is less structured than practice, and should involve students producing their own uses of the target language, either written or spoken. 6. Assessment - the students are tested on what they know. Teachers should of course assess students' progress during all stages the lesson but a specific assessment stage can help confirm that all students are on the same page. 'Check Your Progress' -4 1. What kind of background information is required while planning a lesson?

.....
.....
.....
.....

57 2. What does review refer to?

.....
.....

3. What are warmers/lead ins?

.....
.....
.....

2.7 Let Us Sum Up To sum up it can be said that planning is one of the vital parts of teaching. Now-a-days more and more researches have been conducted in this area. These researches have amply proven the fact that for every successful teaching activity there is an efficient planning system. The very word instruction means systematisation of teaching. Instructional planning involves two kinds of planning-unit planning and lesson planning. Unit planning is a comprehensive chalking out of the details of the units to be covered and lesson planning is of the lessons. Both are equally important for successful instructional transaction. The planning we make for the transaction of instructions for normal children will not be applicable for children with special needs. Cares and cautions are to be followed while preparing the unit plans and lesson plans. 'Check Your Progress' -5 1. what is input 'adaptation'?

.....
.....
.....

58 2. what is 'alternate goal' adaptation?

.....
.....

2.8 Answer to 'Check Your Progress' Answer to 'Check Your Progress' -1 1. Instructional planning is an attempt to plan the transaction that would take place in a given classroom in the most objective and specific way. 2. Aims are the targets that are achieved in long run. But objectives are short-term targets and are to be achieved immediately. 3. Speaking and writing Answer to 'Check Your Progress' -2 1. Instruction is a controlled and manipulated version of teaching keeping strict adherence to the objectives of teaching. 2. Weekly plan and daily plan 3. The three basic aspects of a plan are: i. Contents of activities. ii. Objectives of curriculum content. iii. Creation of the environment. Answer to 'Check Your Progress' -3 1. i. unit plans contribute to optimal learning ii. unit plan provides an opportunity to stimulate student interest 2. - provides a coherent framework for smooth efficient teaching. - helps the teacher to be more organized.

59 Answer to 'Check Your Progress' -4 1. students' age, number of students and time limit 2. review means talking about what you did in class the day before, taking questions from students about past material 3. Warmers mentally orient students toward working in English, and lead-ins point towards or prepare for the content of the lesson. Answer to 'Check Your Progress' -5 1. Adapting the way instruction is delivered to the learner 2. Adapting the goals or outcome expectations while using the same materials 2.9

Unit End Exercises 1. Mention the objectives of teaching English at secondary level of teaching. 2. Which of the following aims need to be given more importance at secondary level of teaching and why? i. Language aim ii. Literary aim 3. What does the cultural aspect of language development refer to? 4. Describe the importance of unit planning. 5. State the need of lesson planning for a secondary teacher. 6. In what way can we bring modification in planning a lesson in order to suit the children with special needs? 2.11 References Ahuja N.P. 'Teaching of English'. Anmol Publication Pvt. Ltd. New Delhi.

References: 3.1 Introduction Did we ever have a teacher in a Language Class who forced everyone to learn in the same way? Were all the students equally happy with that class? - Probably not. The chances are that a teacher who showed no flexibility and appreciation of variety in learning style was not very motivating or successful. Diane—Larsen-Freeman (1986) in "Techniques and Principles in Language Teaching" points out that "There is no single acceptable way to go about language teaching today". (p.86). It is realized increasingly that individual learners learn in different ways and any one particular method may not be suitable for all. Against this backdrop, may be concluded that no single approach or method is appropriate for all learning styles. A good lesson will therefore be one in which a wide variety of Activities' should be used taking from a variety of sources. By varying the technique, the students of all types will be given the chance to participate and perform. Each approach has something to offer. The teachers' task is to identify and exploit those elements. But unfortunately if we study the language teaching circumstances of our country, we find, there is a growing notion among the Second Language Teachers that they have to follow one single 'Method in vogue' for classroom instructions. They don't try to get to know their students, or try to sense the 'Pulse' of the class, whether the students are tired or confused or in need of quiet time or particularly interested to learn about the

63 second language. So, there remains a wide gap of communication in the true sense of the term between the teacher and the students. This is against the principles of language teaching as Language itself demands interaction or communication: "Language is a system of oral, written or gestured meaningful signs used consciously or unconsciously to communicate with members of a given society. These signs are regulated by rules which will be different according to each community." Whose quotation? So in Language Teaching itself, to engage the learners in communication, the teachers have to trust their own instincts and abilities to judge when to switch method. This is in tune with the 'Generative' and 'Productive' dimension of language, what the German linguist and philosopher Humboldt states "the infinite use of finite means". If these terms are to be used then they must be clarified. Language is a kind of process that requires hearing, processing, interpreting, organizing and producing. So we need to know specially the four basic skills that are associated with language teaching 'Listening'; 'Speaking'; Reading' and Writing along with different approaches and methods of teaching English. However, before proceeding to discuss the appropriate methodology for Second language teaching, we should clarify, in brief, the concepts of approach or principles, method and technique which are mutually related. Curriculum adaptation is not a separate method for children with disabilities. It is a process of making necessary changes in learning content such as modification, substitution/ replacement, omission as a last resort and compensation etc. without changing the learning purpose. Considering the need for support regarding differential classroom teaching must address variant learner needs in context of Special needs, Teacher education needs to be modified for including students with special needs in educational process. With more and more children from the disadvantaged groups being a part of the mainstream education system, the classroom teacher has to assume greater responsibility in the implementation of inclusive practices.

64 3.2

Objectives After studying this unit, you will be able to: 1.

Compare and contrast Approach, Method and Technique using the actual classroom teaching as point of reference 2. Understand the use of methods among language teachers worldwide in order to provide them food for thought when they make pedagogical decisions in their language classroom. 3. Understand that as different pupils learn differently, so no single method suits all. 4. Find out whether a teacher's preferred approach should be eclectic which uses the best parts of several well-known methods. 5. Learn that over the years, the objective of many teachers has changed from trying to find an ultimate "best method" to identifying compatible approaches and then deciding on strategies for what needs to be done in the classroom. 6. Accommodate in approaches and techniques in teaching children with disabilities.

3.3 Difference between the Approach and the Method A common error among teachers is to use interchangeably terms like approach, method, and technique. Before entertaining such pedagogical weakness we should first try to comprehend these three terms together. They represent, in fact, three levels of analysis and teacher's decision making for teaching and learning English in the classroom. An approach or strategy is the most abstract of all three concepts and refers to the linguistic, psycho- and sociolinguistic principles underlying methods and techniques. Actually, every teacher has some kind of theoretical principles which function as a frame for their ideas of methods

and techniques. Whereas approaches represent language teaching philosophies that can be interpreted and applied in a variety of different ways in the classroom,

methods are held to be fixed teaching systems with prescribed techniques and practices.

A technique is, on the other hand, the narrowest of all three;? Consisting of a wide variety of exercises, activities or devices used in the language classroom for realizing lesson objectives.

65 The diagram below is an attempt to distinguish them: Based on the diagram, it is clearly seen that approach encompasses the whole orientation of teaching. Approach is the broadest of the three, making technique the most specific, and the method determining the techniques. Approach Approach is the way in which you will approach the piece of literature you are teaching. You may centre on the diction, or the theme, or the structure, or the romantic (or modern, etc.) nature of the piece; whatever you choose to teach. Approach is what you are going to teach. Approach is General, it emphasizes on planning strategy Approach is a general guideline on ways of performing a work. It does not identify all the steps involved. Instead it just indicates the direction to proceed in or ways of handling some major or important tasks. Sl. No. 1. 2. 3. Method Method refers to how you are going to teach it: lecture, small-group work, PowerPoint, worksheet, class discussion, etc. Method is Specific, it emphasizes on technique in class Method refers to an overall plan for orderly presentation of language material based upon a Selected approach. Methods for performing different kind of tasks are often formally designed and specified.

66 So, in an Approach, several methods can be used. One must remember that there is no such thing as the best method. Thus, there is no single correct way to teach a class. Instead, there are many good ways of teaching the students. 3.4 Approaches The pedagogical tendencies which have characterized second and foreign language teaching have been profuse and varied. As Stern (1983: 453) phrases it, "The conceptualization of language teaching has a long, fascinating, but rather tortuous history", which Brown (1994: 52) portrays as the "changing winds and shifting sands of language teaching". This history has been formulated mainly in terms of diverse teaching methods, each of which has attempted to find more effective and efficient ways of teaching languages and each of which has been based on different views of what languages are and of how they are best taught. And the aim of this chapter is precisely to review such a methodological history of language teaching; framing recent approaches to language teaching against the backdrop of a general historical overview which evolves from the Grammar-Translation Method to the post-communicative period. 3.4.1 Communicative Language Teaching (CLT) The Communicative Approach emerged in the early 1970

s as a result of the work of the Council of Europe

experts. However, it can be traced to the work of Chomsky in the 1960s, when he advanced the two notions of 'competence' and 'performance' as a reaction against the prevalent audio-lingual method and its views. These two concepts were developed later on by Hymes, into a 'communicative competence' which refers to the psychological, cultural and social rules which discipline the use of speech (Hedge, 2000). CLT advocates avoided prescribing a set of practices through which these principles could best be realized, thus putting CLT clearly on the approach rather than the method end of the spectrum. The assumptions are that (a)

learners learn a language through using it to communicate, (b) authentic and meaningful communication should be the goal of classroom activities, (

c) fluency

is an important dimension of communication, Method is procedural Method is Rigid Approach is an axiomatic Approach is flexible 4. 5.

67 (d)

communication involves the integration of different language skills, and (e)

learning is a process of creative construction and involves trial and error.

Hymes, as a sociolinguist, was concerned with the social and cultural knowledge which speakers need in order to understand and use linguistic forms. His view, therefore, encompassed not only knowledge but also ability to put that knowledge into use in communication. Dimensions of communicative competence which are identified in the literature include: linguistic or grammatical competence, sociolinguistic or pragmatic competence, discourse competence. The theory of language teaching underlying the Communicative Approach is holistic rather than behavioristic. It starts from a theory of language as communication (Richards & Rogers, 1986) which implies knowledge of the grammatical system as well as performance. In other words, such competence includes both the theory and use of the language (Widdowson, 1984).

The centrality of grammar in language teaching and learning was questioned, since it was argued that language ability involved much more than grammatical competence. While grammatical competence was needed to produce grammatically correct sentences, attention shifted to the knowledge and skills needed to use grammar and other aspects of language appropriately for different communicative purposes

such as making requests, giving advice, making suggestions, describing wishes and needs, and so on.

What was needed in order to use language communicatively was communicative competence.

This was a broader concept including knowing what to say and how to say it appropriately based on the situation, the participants, and their roles and intentions. Rather than simply specifying the grammar and vocabulary learners needed to master, it was argued that a syllabus should identify the following aspects of language use in order to be able to develop the learner's communicative competence: i. Consideration of the purposes for which the learner wishes to acquire the target language; for example, using English for business purposes, in the hotel industry, or for travel ii. Some idea of the setting in which they will want to use the target language; for example, in an office, on an airplane, or in a store iii. The socially defined role that the learners will assume in the target language, as well as the role of the interlocutors; for example, as a traveler, as a salesperson talking to clients, or as a student in a school iv. The communicative events in which the learners will participate: everyday situations, professional situations, academic situations, and so on; for example,

68 making telephone calls, engaging in casual conversation, or taking part in a meeting v. The language functions involved in those events, or what the learner will be able to do with or through the language; for example, making introductions, giving explanations, or describing plans vi. The notions or concepts involved, or what the learner will need to be able to talk about; for example, leisure, finance, history, religion vii. The skills involved in the “knitting together” of discourse: discourse and rhetorical skills; for example, storytelling, giving an effective business presentation viii. The lexical content, or vocabulary, that will be needed (van Ek and Alexander, 1980) The main objective of the communicative method is students’ fluency, laying special emphasis on real-life communication. All four skills of language learning are developed: Speaking, Listening, Reading and Writing. Grammar is learned through practice. Classroom Activities or the techniques employed are: ? Role Play ? Language Exchanges ? Interviews ? Surveys ? Information Gap ? Pair Work ? Games ? Learning by teaching The teacher facilitates the students’ learning by organizing class activities and initiating communicative situations. The teacher’s role is to facilitate and manage the students’ activity, and also to be their partner in interaction. Authentic materials are used. The teachers, who teach specialized vocabulary communicatively, can choose materials from journals, films, posters, leaflets, and internet. The teacher initiates interactions among students and sometimes participates with them. The teacher fulfills a variety of functions: controls, assesses, facilitates, participates etc. The students interact a lot with one another and in various ways (group and pair-work is recommended). The emphasis is on developing the students’ motivation for learning. The students must learn by making sense and must perform a number of things into the foreign language. Both individuality and cooperation with other students are encouraged, which have a significant contribution to the creation of a feeling of security in the target-language. Generally speaking, the students’ mother tongue plays no part. This can be used, when possible, for certain explanations, translations and instructions. A lesson based on the communicative method is structured on five parts: i. Introduction (opening) ii. Presentation

69 iii. Practice / Development iv. Application / Comprehension v. Closing Modern CLT does not derive from one particular background, as might have been implied before. According to Savignon (2000: 126) the Communicative Approach has a “multidisciplinary perspective that includes, at least, linguistics, psychology, philosophy, sociology and educational research.” All those disciplines were involved to produce what nowadays is called CLT. The Communicative Approach is seen as an extension of the notional-functional syllabus. Therefore it also places great emphasis on helping students use the target language in a variety of contexts. In the first instance, the focus of CLT is its importance of learning language functions. In this case it is important that the teacher support the learners in creating meaning rather than helping them in creating perfectly grammatical structures or acquire native-like pronunciation. Consequently, learning a foreign language with success is linked to developing communicative competences. According to Nunan CLT is usually characterized as a broad approach to teaching, rather than as a teaching method with a clearly defined set of classroom practices. As such, it is most often defined as a list of general principles or features. One of the most recognized of these lists is David Nunan’s five features of CLT (2004: 6): i. An emphasis on learning to communicate through interaction in the target language. ii. The introduction of authentic texts into the learning situation. iii. The provision of opportunities for learners to focus, not only on the language but also on the learning process itself. iv. An enhancement of the learner’s own personal experiences as important contributing elements to classroom learning. v. An attempt to link classroom language learning with language activation outside the classroom. The principles of communicative exercises imply eight important constituents for grammar activity design: Grammar always derives from a certain context (‘clear and realistic context’), is regarded as communication (‘realistic use/processing of language’), is used to express ideas (‘meaning and meaningfulness of grammar stressed’), is a means of encoding experience (‘linkage to own knowledge, ideas, experience, wishes’), is seen as constituent of a creative processes (‘open ended exercises’), is only one aspect of language (‘integrated skills’) and finally is enjoyable (‘motivation’)

70 An example is given below : Name and type of activity Look at the pictures. Complete the sentences Teacher input The teacher (book) provides a text with sentences where some information is missing. Pictures (on the top of the exercise) are also given. Learner input Vocabulary; L2 knowledge and knowledge of prepositions which should already be known by the pupils Procedure Pupils have to complete the sentences. Beside the sentences there are pictures, which show what is going to happen. Pupils have to look at the pictures and then they have to complete the sentences. Communicative principles Task based, clear context, integrated skills: vocabulary and prepositions Pedagogical principles Practising or testing and also revision of prepositions which should already be stored in the minds of the children.

71 Criticism One of the most famous attacks on communicative language teaching was offered by Michael Swan in the English Language Teaching Journal in 1985. The communicative approach focuses on the use of language in everyday situations, or the functional aspects of language, and less on the formal structures. However, critics believe that there needs to be some sort of "bridge" between the two in order for effective language learning. 1. The approach relies extensively on the functional-notational syllabus which places heavy demands on the learners. 1. The various categories of language functions are overlapping and not systematically graded like the structures of the language. 2. A major premise underlying this approach is its emphasis on learners' needs and interests. This implies that every teacher should modify the syllabus to correspond with the needs of the learners. 3. The approach gives priority to meanings and rules of use rather than to grammar and rules of structure. The latter are taught by means of functions and notions. Such concentration on language behaviour may result in negative consequences in the sense that important structures and rules would be left out. 4. The requirements are difficult: availability of a classroom that can allow for group work activities and for teaching aids and materials. 5. Too much emphasis has been given -particularly in its early stages- to speaking and listening, to the detriment of reading and writing. 3.4.2 Cooperative (Collaborative) Learning An approach credited to Olsen and Kagan. It is a part of the collaborative approach. Co-operative learning is an instructional strategy that simultaneously addresses academic and social skill learning by students. In co-operative learning, students receive training in small group social skills and usually activities are structured with each student having a specific role. Neil Davidson & Peter Hawkes (1945) explain that, in co-operative learning, the teacher usually observes and listens, intervening in a group only when necessary. Students usually submit their work and are often urged to assess individual as well as group performance. Co-operative Learning is a part of Collaborative approach.

72 Collaborative Learnings, on the other hand, usually assumes that the learners already possess the necessary social skills and will build on the existing skills to achieve their goals. The students in Collaborative learning, are urged to organize and negotiate efforts themselves, with the activity not strictly monitored by the instructor. The teacher guides the students with the information needed when such input is solicited. The learners usually retain draft of their work to develop and complete further work. Both Collaborative and Co-operative learning emphasize the importance of active learning and the teaching learning experiences are shared by both the teachers and the taught. Both enhance higher order cognitive skills and promote diversity, social as well as than building skills of the learners. The instructional approach which is currently shaping the teaching of modern languages is in fact not new to education. The principles of cooperative learning were outlined by Quintilian in the first century and subsequently by Comenius in the seventh (Olsen and Kagan, 1992). Rousseau's ideas in the eighteenth century and Piaget and Vygotsky's developmental theories are also sources from which this approach draws. More recently, it is Dewey and Lewin in the early twentieth century who are considered important promoters of the idea of cooperation and interdependence among group members.

Cooperative learning is an approach whereby students work together in structured groups to reach common goals. It aims to foster cooperation rather than competition – each person's success is linked with every other member's success – and to develop critical thinking skills. The learners are thus direct and active participants in the learning process, must work collaboratively with other group members on tasks assigned, and must learn to monitor and evaluate their own learning. Teacher roles also change drastically from traditional - speaks less, acts as facilitator of learning and is responsible for the creation of a highly structured and well-organised teaching environment which promotes successful group-based learning. There are, five main principles which underlie their work and which could be considered key elements in ensuring the success of this approach (Richards and Rodgers, 2001; Naughton, 2004): i. Positive interdependence: it occurs when the success or failure of each group member is linked to the success or failure of the entire group. ii. Individual accountability: it refers to a situation in which both the group assumes

73 responsibility for achieving set goals and each individual member assumes responsibility for his/her part of the task. iii. Interpersonal and social skills: they determine the way in which learners interact with each other in order to attain their objectives and are usually taught explicitly to guarantee successful interaction. iv. Group formation or group processing: it involves making decisions as regards the size, make-up, or roles of and within the group and evaluating its success or limitations. v. Structuring and structures: it alludes to the different ways in which student interaction can be organised. In fact, there is an enormous variety of possible cooperative learning structures or methods, as Chafe (1998: 2) terms them. Richards and Rodgers (2001), and Naughton (2004), refer to three of the most frequently cited CL techniques that are summarized in the table below: Table 12: Cooperative learning techniques Academic material is broken down into sections, each of which is assigned to a team member. They then meet up in expert groups to discuss their sections, subsequently returning to their original teams in order to teach their group members about their section. The teacher presents a lesson and students in heterogeneous groups of four work within their teams to master the lesson. Individual quizzes are then taken and success is based on improvement. This more flexible framework structures a cooperative learning lesson into five categories: a. Objective setting b. Decision-making c. Task communication d. Monitoring and intervening e. Evaluating and processing JIGSAW (Aronson, 1978): STUDENT TEAMS ACHIEVEMENT DIVISIONS (STAD) (Slavin, 1982): LEARNING TOGETHER / LEARNING CIRCLES (Johnson, Johnson, and Holubec, 1994):

74 Perhaps more than any other recent language teaching proposal, cooperative learning has been extensively evaluated. And research results have generally been supportive of this approach. It has been found to correlate positively with achievement; to lead to improved social interrelations among students; to bear a positive relationship with the affective state of the learner; and to generate higher quality cognitive reasoning strategies. All in all, it has been evinced to be an effective method for increasing L2 acquisition, something which has led authors like Kagan (1995: 3) to conclude: "Cooperative learning and the ESL classroom – a natural marriage". Thus, it is not surprising that numerous assets have been associated to this approach, the most notable of which are summarized below (Hirst and Slavik, 1990; Kagan, 1995; Chafe, 1998; Naughton, 2004): i. In the cooperative classroom, input is more comprehensible, developmentally appropriate, and redundant; output is more functional, communicative, frequent, redundant, and consistent with the identity of the speaker; and the context is more supportive, motivating, communicative, referential, developmentally appropriate, and feedback rich, all critical variables that, according to Kagan (1995), foster language acquisition. ii. Motivation, positive attitudes, and higher levels of self-esteem are promoted by CL situations. iii. It can be used for a wide range of tasks and types of syllabus material. iv. It increases learner autonomy and allows students to act as resources for each other. v. It develops critical thinking skills, encourages cognitive strategy use, and fosters metacognitive awareness. vi. It helps to develop cross-cultural understanding. Nonetheless, CL has also been found to present problems in its implementation (Chafe, 1998; Richards and Rodgers, 2001; Troncale, 2002; Naughton, 2004): 1. Teachers may use it inadequately and thus need to be properly inserviced on cooperative learning theory and practice. 2. They may also feel excessively burdened in adapting to the new demands it places on them and to the novel roles they are required to assume.

75 3. Students themselves may feel reluctant to cooperate. 4. They may tend to resort excessively to their L1. 5. The input they receive may well also be too limited, something which can lead to fossilization if more advanced input is not provided. 6. Cooperative learning has been found to be less effective in promoting problem-solving skills than whole class instruction. 7. Higher achievers may obtain

3.4.3 Bilingualism:
The bilingual method of foreign language teaching was developed by C.J. Dodson (1967) as a counterpart of the audiovisual method. .

As the name suggests, the method makes use of two languages- the mothertongue and the target language. Hence, this can be considered as a combination of the direct method and the grammar-translation method The

architecture of the bilingual method is best understood as a traditional three-phase structure of presentation – practice – production. A lesson cycle starts out with the reproduction of a dialogue, moves on to the oral variation and recombination of the basic sentences, and ends up with an extended application stage characterized by previous a free, communicative exploitation of the work. Well-ordered activities are used to take the students upto a conversational level in the shortest possible time. It focuses on the development of oral skills. According to Lam (2001:93), bilingualism “refers to the phenomenon of competence and communication in two languages”. However, it is difficult to determine what constitutes competence in two or more languages. What seems clear nowadays is that the task of learning two linguistic systems gives them a neurological advantage in verbal aspects. Traditionally, bilinguals were only those individuals who had one or two parents speaking a language different from that of the community, or who lived or had moved to a country with a language different from his/her L1 and that of his/her parents. In order to provide for those communities with special language needs, several types of educational programs were developed hinging on two main issues: whether the non-dominant language should be used as a medium of instruction, and whether that language ought to be valued as a cultural asset worth acquiring for itself. Nunan and Lam (1998) provide four examples. a. Submersion models, in which ‘children’ just enter into the current educational

76 programs of the L2 country, without any kind of provision for their L1. b. Transitional bilingualism, in which the L1 is temporarily used but not respected as a target language. c. Heritage language programs, in which the L1 of immigrant learners is valued as a target language but not used for instruction. d. The language exposure time model, in which the L1 is valued and used for some subjects. The advocates of this method believe that it is the wastage of time for recreating a situation while teaching a foreign language. They think that teaching-learning method is useful when mother tongue equivalents are given to the pupil without duplicating the situation. It differs from translation method in two respects. In the first case it is the teacher only who uses the mother-tongue to explain meaning. Furthermore, pupils are given a lot of practice in the drill of sentence patterns.

Such practice is not provided in the translation method. The Bilingual method was the reaction against the direct method. Dodson vehemently attacks the direct method in the following words: “It is one of the tragedies at present being enacted in some emergent countries, where a major world language is being taught as a second language to young children by the direct method, that if this type of teaching were successful, which by all account it is not, the vernacular would disappear within a few generations. It is only possible to teach a second language by direct method techniques at the expense of the first language, and it is sheer hypocrisy to claim that the final aim of such teaching philosophies is bilingualism. Every aspect of the direct method teaching is directed towards keeping the two languages as far apart as possible, thus destroying the bridge which the learner must continuously cross to and fro if he wishes to be truly bilingual.” Dodson, thus, makes it clear that the excessive use of the direct method would result in disappearance of the vernacular in future. He was of the view that the direct method, operated at the expense of the first language, could not make the learner truly bilingual. This method is not an independent new method with new concepts and models. It is, in fact, a happy synthesis of the best principles and features present in the other methods. It has modified the principles of other methods to overcome the objections and criticisms and to suit the objectives of the second language learning today. This idea was expressed by Carrol in the following words:

77 “But, then, in these highly advanced times it could hardly be expected that a new method would represent anything more than a new combination of procedures.” Principles of Bilingual Method (a) The understanding of words and sentences in foreign languages can be made easier by the use of mother tongue. (b) There is no need to create artificial situations for explaining the meaning of words and sentences of the target language. (c) Use the target language for part or the whole school syllabus, including the evaluation process (d) Employ highly linguistically competent and specialized teachers (e) Foster exchanges with the target language community (f) Develop or maintain a positive attitude towards both the target language and the mother tongue (g) Start early (h) Students become functional bilinguals (i) The aims of this method as stated by Yardi are – to make the pupil fluent and accurate in the spoken and written words and to prepare the pupil in such a manner that he can achieve true bilingualism. (j) The main principles of the bilingual method as stated by Dr. Sharada Bhat

are: Controlled use of the students’ mother-tongue, the introduction of reading and writing early in the course of language learning and integration of writing and reading skills

Advantages of Bilingual Method According to this method acquisition of the mother tongue is very important for language learning process. When the mother tongue is firmly established in the minds of the students by the age of 7 or 8, it becomes easy to learn difficult words and grammar. Thus this method helps to save time by not creating artificial situations unnecessarily to explain or convey meanings in English. Give importance to other languages: In this method, importance is given to the mother tongue and its culture. Thus it does not lead to substitution of one means of communication for another.

78 Accessibility: This method of language learning ensures accessibility. When students start learning a language using this method, they find a level of familiarity. Through the use of the mother tongue, the teacher ensures that the learning is happening. Efficiency: Many new English language teachers face the difficulty to handle the students and make them feel as comfortable as with the local teacher. Learning the local language is considered as the sure way to improve behaviour management skills. It also helps in delivering the instructions related to lesson activities. If the concepts are explained in students' L1, then the new learners to English language will be able to grasp more knowledge about grammar and vocabulary. Thus it helps the students to be more efficient and faster. It's the teacher's tool: In the bilingual method, as the native language is used in the classroom, it is important to note that it's predominantly the teacher who makes use of L1. The Bilingual Method promotes both fluency and accuracy. It promotes theory as it lays emphasis on speech and pattern practice. It promotes accuracy as the meanings of new words are given in the mother tongue of the learner. It does not require any teaching aids and is suited to all kinds of school-rural and urban. Unlike the Direct Method, which ignores the linguistic habits already acquired by the learner in the process of learning the first language, the Bilingual Method makes use of them. The important contribution of this method is that it had made possible for the students to get both quantitative and qualitative acquisition of language skills. Disadvantages of Bilingual Method 1.

If the teacher fails to carry out this method properly, then it can degenerate into pure translation method. 2.

This

method can confuse the learner while contrasting the features of two languages. 3.

The teacher must be fluent in both the languages in order to make the concepts clear. 4. Students may develop dependency on their mother tongue. 5. Slows down

learning process and takes longer time to learn and be proficient in the target language.

79

Nonetheless, becoming bilingual in a monolingual community in which the L2 is not used at all is no easy feat. A program of this type should fulfill a number of conditions: There are many factors affecting the process of becoming a bilingual, including the quality and quantity of the input received, the interactional style, the attitudes developed towards each language and the socio-cultural context. code-switching and diglossia are phenomena with important socio-cultural implications in a bilingual community. Code-switching involves the intentional or unintentional use of both linguistic codes at the same time. Diglossia is a social phenomenon which entails, rather than code-switch, language switch. Each linguistic variety is always associated to a different domain in a society. For instance, one linguistic variety is used for administrative matters and the other one in the street. Bilingual developmental sequences study the stages children go through in their acquisition process. First, they use a single lexical system in which they include items from both languages. Then, they distinguish the words belonging to each variety, but use one single grammar. In a third stage, they differentiate lexicon and syntax, and last, they become aware of the two languages (de Vega and Cuetos, 1999). 'Selection', 'Gradation', 'Presentation', and 'Repetition' are the sequences to learn. The equipment necessary for the Bilingual method in Yardi's opinion are: a printed text of the situation to be learnt. This text ought not to be exceeding thirty sentences in length at the secondary level. The text has to be linguistically graded and made interesting to the learner. Each situation in the text should have a picture strip, not just one composite picture as in the usual textbook, representing the development of the content in the text- lesson. The intention in using the picture strip is not to help the learner acquire the sentence meaning but to retain it. To conclude, this method is simple from the point of view of teaching and learning. That is why we see majority of teachers in Indian schools following this method. The method increases the rate and amount of learning in the classroom and it creates better attitudes in the minds of students towards learning English. It also establishes rapport between the teacher and the taught. 3.4.4 Task-based language teaching Task-based language teaching (TBLT) was said to be a logical development of communicative language teaching (Willis, 1996). It uses real communication activities to carry out meaningful tasks, and stresses the importance of targeting these tasks to the individual student as much as possible.

80 TBLT develops and perfects the communicative language teaching approach. The first person who has applied TBLT to teaching programs and practice is Prabhu. It was in Bangalore of southern India in 1979 that Prabhu began his bold experiments to put his theories into practice which seemed radical at that time. He thought that students may learn more effectively when their minds are focused on the task, rather than on the language they are using. Therefore, Prabhu is thought to be the originator of TBLT. The theoretical basis of TBLT dates back to cognitive psychology that has deeply affected the elementary education. As early as the year of 1977, a famous English linguist Dick Allwright said, "If the language activities involve the learners in solving communicative problems in the target language, language learning will take care of itself."

Task-Based Language Teaching refers to an approach based on the use of tasks as the core unit of planning and instruction in language teaching.

Although definitions of task vary in TBLT, there is a commonsensical understanding that a task is an activity or goal that is carried out using language.

For Prabhu, a task is 'an activity which requires learners to arrive at an outcome from given information through some process of thought, and which allows teachers to control and regulate that process' (Prabhu 1987:17).

While

Crookes defined a task as "a piece of work or an activity, usually with a specified objective, undertaken as part of an educational course, at work, or used to elicit data for research" (Crookes 1986:1).

Accordingly to Richards & Rogers (2001)—"Tasks are believed to foster a process

of negotiation, modification, rephrasing and experimentation that are at the heart of second language learning." (

p. 228) A Task-Based syllabus may be organised in terms of two syllabuses: Communication Tasks (the actual tasks a person undertakes when communicating) and related Enabling Tasks that facilitate a learner's participation in the former (tasks which explicitly focus upon the rules and conventions of the language system, the interpersonal knowledge and meaning). Task-Based models, on the one hand, organise learning in terms of how a learner applies his or her communicative competence to undertake a selection of tasks. The roots of Task-Based models can be found in several sources: the Situational Approach, the use of project-based materials, and the use of problem-solving activities. Let us look at some of the attractive features of task based learning. 1. More student centred learning where learners are encouraged to use language creatively and spontaneously through the tasks given. 2. Utilizing more authentic experiences and materials as well as principles of constructivism compared to top down teaching.

81 3. More of a sense of personal and active accomplishment including developing a greater sense of language ownership. 4. Increased student participation when tasks are well planned and implemented according to learners' learning style, learning and communicative strategies, personalities, multiple intelligences and the overall local contexts. 5. Making specific lesson goals more evident through movement towards success of task completion. Tasks, well-chosen and developed have also the potential to lessen the need for test cramming and excessive reliance on a result / test oriented syllabi – as described by Poole (2003) in the Asian EFL Journal. In 1989, Nunan published *Designing Tasks for the Communicative Classroom*. Some consider this book as a milestone of task-based approach to language teaching. In his book, he proposed a framework for analyzing communicative tasks, and that tasks are analyzed or categorized according to their goals, input data, activities, settings and roles. Researchers have proved that task difficulty has great influences on the effect of tasks? namely the accuracy, complexity and fluency of the learners' language outcomes. So, proper choice of difficulty in different stage of a TBLT class is of great importance. Tasks can be used as the central component of a three-part framework: "Pre-task", "Task cycle", and Post-Task, also called the "Language focus" stage.

82 Pre-task Pre task phase introduces the class to the topic and the task, activating topic related words and phrases. Here, the teacher roles as instructor.

The teacher introduces the topic and gives the students clear instructions on what they will have to do at the task stage and might help the students to recall some language that may be useful for the task.

Then instruct the students to do the task and make sure that all the students understand task instruction. Task cycle Task: The task cycle offers learners the chance to use whatever language they already know in order to carry out the task, and then to improve that language under teacher guidance, while planning their report of the task. Feedback from the teacher comes when they want it most, at the planning stage, and after the report. Exposure to language in use can be provided at the different points, depending on the task type of

the task. The students complete a task in pairs or groups using the language resources that they have as the teacher monitors and offers encouragement. Planning: Students prepare a short oral or written report to tell the class what happened during their task, how they did the task and what they decided or discovered. Then, they practice what they are going to say in their groups. Teachers must ensure that the purpose of the report is clear. Besides, the teacher is available for the students to ask for advice to clear up any language questions they may have. Clearly, the teacher acts as linguistic adviser and giving feedback; helping students to correct, rephrase or rehearse oral report and organize or draft written report. Report: Students then present their spoken reports to the class orally or read the written reports. The teacher chooses which group of students will present their reports and may give them some quick feedback on the content and form. At this stage the teacher acts as chairperson and may play a recording of others doing the same task for the students to compare. Post-Task Phase : This has also been called the Language Focus phase by Dave & Jare Willis of Aston University, UK. The language focus phase allows a closer study of some of the specific features naturally occurring in the language used during the task cycle. By this point, the learners will have already worked with the language and processed it for meaning, so they are ready to focus on the specific language forms that carry the meaning.

83

Analysis: The teacher then highlights relevant parts from the text of the recording for the students to analyze. They may ask students to notice interesting features within this text or bring other useful words, phrases and patterns to improve students' attention. The teacher can also highlight the language that the students used during the report phase for analysis. Meanwhile the students examine and discuss specific features of the text or transcript of the recording. Practice: Finally, the teacher conducts practice activities. It begins with selecting language areas to practice based upon the needs of the students and what emerged from the task and report phases. The students then do practice activities to increase their confidence and make a note of useful language. On the other hand, the students can practice other features occurring in the task text or report stage. The selection of activities or tasks should be based on the students' need in order to motivate students, engage their attention, improve intellectual and linguistic challenge and promote their language development. Nunan (1989) suggest that a syllabus might specify two types of task: (1) Real-world task, which designed to practice tasks that important in a needs analysis and useful in the real life. (2) Pedagogical tasks, which have psycholinguistic basis in SLA theory and research but do not necessarily reflect real life tasks.

In the Bangalore Project, both tasks were used, as is seen from the following list: Task type Example 1. Diagrams and information Naming parts of a diagram with numbers and letters of the alphabet as instructed. 2. Drawing geometrical figures/ formations from sets of verbal instructions 3. Clock faces Positioning hands on a clock to show a given time 4. Monthly calendar Calculating duration in days and weeks in the context of travel, leave, and so on School timetables Constructing timetables for teachers of particular subjects 5. Age and year of birth Working out year of birth from age Willis proposes six tasks types based on traditional knowledge hierarchies as follows; Listing, Ordering and sorting, Comparing, Problem solving, Sharing personal experience, Creative task. While Pica, Kagany, and Falodun (1993) classify tasks according to the type of interaction that occurs in tasks accomplishment and give the following classification: 84 1. Jigsaw tasks: These involve learners combining different pieces of interaction to form a whole. 2.

Information-gap tasks: One student or group of students has one set of information and another student or group has a complementary set of information. They must negotiate and find out what the other party's information is in order to complete an activity. 3. Problem-solving tasks: Students are given a problem and a set of information. They must arrive at a solution to the problem. There is generally a single resolution of the outcome. 4. Decision-making tasks: Students are given a problem for which there are a number of possible outcomes and they must choose one through negotiation and discussion. 5. Opinion exchange tasks: Learners engage in discussion and exchange of ideas. They do not need to reach agreement.

General principles and characteristics of TBLT Task-based learning is based on

the use of tasks as the core unit of planning and instruction in language teaching.

Tasks that involve real communication are essential for language learning.

Learners learn language by interacting communicatively and purposefully while engaged in the activities and tasks.

The focus is on process rather than product.

Language that is meaningful to the learner supports the learning process.

Activities and tasks of a task-based syllabus are sequenced according to difficulty. The difficulty of a task depends on a range of factors including the previous experience of the learner, the complexity of the task, the language required to undertake the task, and the degree of support available (

Richards and Rodgers 2001). The Advantages and Disadvantages of TBLT: A Task-based approach can be defined as "how a learner applies his or her communicative competence to undertake a selection of tasks". Task-based Language Teaching has some clear advantages:

85 TBLT is a student-centred

approach. The students are free of language control. In all three stages they must use all their language resources rather than just practicing one pre-selected item.

During the task the learners are allowed to use whatever language they want, freeing them to focus entirely on the meaning of their message. This makes it closer to real-life communicative situation, which is a way of bringing the real world into classroom (Krahnke 1987).

A natural context is developed from the students' experiences with the language that is personalized and relevant to them.

The students will have a much more varied exposure to language with TBLT. They will be exposed to a whole range of lexical phrases, collocations and patterns as well as language forms. The language explored arises from the students' needs. This need dictates what will be covered in the lesson rather than a decision made by the teacher or the course book. It is a strong communicative approach where students spend a lot of time communicating. Just watch how much time the students spend communicating during a task-based lesson. It is enjoyable and motivating.

Motivation is provided mainly by the need to achieve the objectives of the task and to report back on it. Success in doing this can increase longer term motivation. Task-based learning is widely applicable as it is suitable for learners of all ages and backgrounds. Tasks provide a natural opportunity for revision and recycling and give teachers the opportunity to assess learners' progress. TBL provides clear objectives in terms of what participants will gain from the tasks. That is, each task has a clearly defined set of objectives, stating

what the participants

will be able to do at the end of the

task. TBL provides cooperative support. Classroom work is to be carried out on a cooperative basis involving a lot of participants' initiation right from the start. This should enable a supportive, non-threatening environment for participants to invest personally in the learning effort (Frost)

86 Beside those advantages, TBLT also has some disadvantages: The weaknesses of task-based learning lay not so much in the potential effectiveness of this type of instructional content but in problems of implementing the instruction.

Task-based learning requires a high level of creativity and initiative on the part of the teacher. If the teachers are limited to more traditional roles or do not have time and resources to implement task-based teaching; this type of teaching may be impossible. Task-based learning requires resources beyond the textbooks and related materials usually found in language classrooms.

Task-based instruction is not teacher-centred; instead, it requires individual and group responsibility and commitment on the part of students. If students are notably lacking in these qualities, task-based instruction may indeed be difficult to implement (Krahne 1987). Some learners revert to mother tongue when things get difficult or if the group feels impatient. Some individuals develop excellent communication strategies, e.g. miming and using gestures, but get by using just odd words and phrases and let others supply the more challenging language they need. This may make those individuals fossilize before advancing very far in the syntax of the target language. Some learners tend to get caught up in trying to find the right word, and do not worry over much about how it fits into the discourse. There is naturally more concern for use of lexis and lexical chunks than for grammar and grammatical accuracy (Willis 1996: 55). There is a risk for learners to achieve fluency at the expense of accuracy.

Pressure of time will force learners to make use of language that can be readily accessed rather than to attempt to create language in real time. There may be a minimal concern with accuracy and no incentive for learners to extend their existing language system (Skehan 1996). Evaluation of task-based learning can be difficult. The nature of task-based learning prevents it from being measurable by some of the more restricted and traditional tests (Krahne 1987). However, more recently the alleged demise of methods and the concept of post-

87 methodology have come into question (Larsen-Freeman 2001; Bell 2003). As Kumaravadivelu (1994: 28) has also pointed out, "as long as we are caught up in the web of method, we will continue to get entangled in an unending search for an unavailable solution, ... a search [which] drives us to continually recycle the same old ideas".
3.4.5 Eclecticism It initially takes a great deal of courage for critics to openly express their reservations as regards the Communicative Approach. As Ur (1996: 6) explains, this is because "'communicativity' was becoming axiomatic rather than a means to an end, treated as synonymous with 'good language teaching'". Perhaps one of the best-known methodologists who is among the first to voice his dissent is Swan (1985a, 1985b). While acknowledging the valuable contributions of CLT to the field of language teaching, he straightforwardly maintains that "A dogma remains a dogma, and in this respect the 'communicative revolution' is little different from its predecessors in the language teaching field". At this point, we are thus living in a "post-communicative" (Ur 1996: 7) period, or perhaps it is a post-methodological one, as Ur (1996: 7) also points out, since it is now believed that no single method is optimally effective for teaching languages. It seems we have learned enough from past experiences and research so as to practice a cautious eclecticism or integrated approach, where, as Swan (1985b: 87) puts it, we both try out new techniques and hold on to useful older ones. We have come to realize, in Stern's (1983: 474) words, that "language teaching cannot be satisfactorily conceptualized in terms of teaching method alone". And the majority of language specialists considers eclecticism a legitimate solution to the lack of universal solutions offered by any single method or, as Rodgers (2001: 4) terms it, "method synergistics" or a "disciplined eclecticism".

The eclectic theory of language was advocated during the year 1990's and because important for the educational theory of language learning.

Multiple tasks, high interaction, lively learning, objective correlative, and fast results are the salient features of this method.

The eclectic approach is the label given to a teacher's use of techniques and activities from a range of language teaching approaches and methodologies. The teacher decides what methodology or approach to use depending on the aims of the lesson and the learners in the group.

88

In teaching practice, many have to come to favour of eclecticism, which generally holds that although no single ELT method can meet all teaching and learning needs, thus teachers need a set of principles to adapt their teaching procedure to the specific circumstances. When linguists thought to improve the quality of language learning they often did so by referring to general principles and theories concerning how languages are learned and

how knowledge of language is presented and organized in memory or how language itself structured.

There is a call nowadays to move towards eclecticism in language learning especially at the primary stage since it is the first stage in foreign language learning. Eclecticism has given a variety of names: effective or successful eclecticism, enlighten eclecticism, integrative eclecticism, new eclecticism, etc. The fact that it had many names testifies to the influence and popularity of this theory. The main principles of the eclectic method are: 1. Giving teachers a chance to choose different kinds of teaching techniques in each class period to reach the aims of the lesson. 2. Flexibility in choosing any aspect or method that teachers think suitable for teaching inside the classroom. 3. Giving a chance to pupils to see different kinds of teaching techniques that break monotony and dull on one hand and ensure better understanding for the material on the other hand. 4. Solving difficulties concerning presenting the language material in the pupil's textbook. 5. Using different kinds of teaching aids which leads to better understanding, and 6. Saving a lot of time and effort in presenting language activities.

The use of eclecticism does not mean to mix up different approaches randomly. There must have some philosophical backgrounds and some systematic relation among different activities. Usually it is recommended to mix structural approaches with communicative use of language.

Execution or Implementation In this approach teacher decides the method of teaching himself. He is free to employ any relevant techniques for his lesson and learners. Several different teaching methods

89 are borrowed and adapted to needs and abilities of learners. Learner's strength and learning style is always kept in mind. Wide range of resources is used to match the curriculum. It is flexible and elastic technique which keeps the needs of learners in mind. In the Eclectic method learners are believed to be the unique individuals and appropriate technique is applied for every single learner. This technique requires curriculum that is creative, innovative, and imaginative. It provides every student an opportunity to grow and develop in quite natural environment. This approach is heterogeneous and breaks monotony with variety of learning materials, methods and techniques An example of material chosen for different subjects may clarify the eclectic technique. Textbook is better for teaching mathematics, short stories or novels of supreme quality are good for teaching reading, and a workbook is used for teaching spelling. Eclectic approach keeps the learner busy all along the day. **Advantages**

Firstly, with this theory, it becomes easier and more possible for the learners to understand the language of the text with the context of culture.. Secondly, it blends the practices of listening, speaking, reading and writing into an organic whole.

Weakness Brown .D (1994:74) gives some of the weak points of eclecticism as follows: 1. Teaching English by eclecticism urged that practical eclecticism does not meet the criterion of efficiency. 2. Theoretical eclecticism is suspicious on logical and theoretical grounds. 3. The fault of eclecticism in language teaching lies in that attempts to make a kind of all-purpose language teaching out of existing methods and to persuade that eclecticism is the only right idea in foreign language teaching methodology. 4. Without principles eclecticism is likely to fall into a state of arbitrariness. **Conclusion:**

One of the major premise

of eclecticism is that teaching should serve pupils not methods. Thus teachers should feel free in choosing techniques and procedures inside the classroom. There is no ideal approach in language learning. Each one has its merits and demerits. There is no loyalty to certain methods. Teachers should know that they have the right to choose the best methods and techniques in any method according to pupils

90 needs and learning situation. Teachers can adopt a flexible method and technique so as to achieve their goals. They may choose whatever works best at a particular time in a particular situation. 3.4.6

Language Across Curriculum Language is central to the whole curriculum. Oral and written language are both essential to the thinking process which must take place in all areas of the curriculum According to Fillion (1991): "Language across the curriculum stresses concern for how people learn to use language, how they use language to achieve understanding and appreciation of their experiences (including the curriculum content introduced in schools) and how language use influences cognitive development." Language across the curriculum is primarily concerned with pupils' ability to use reading, writing and talk for an increasing range Origin LAC is a concept has been around for some time in academic and pedagogic theoretical discourse, but less so in school practice. It was developed in the late 70s / early 80s of the last century. It originated in Great Britain, where the idea of linking LAC with School Language policies as a whole received formal recognition in the so-called Bullock Report (entitled A Language for Life) Each school should have an organised policy for language across the curriculum, establishing every teacher's involvement in language and reading development throughout the years of schooling (DES 1975:514) A decade later this was underlined in the Swann Report (Education for ALL): Unless there is a school language and learning policy across the curriculum there will be wastage of effort and often confusion. (DES 1985: 419) The ideas of LAC itself, which had received real impetus in that report, have somewhat changed over time. Nevertheless, the basic tenets on which LAC rests, have stayed the same: they focus on the importance of language in and for school education, for all subject-matter learning, across the whole curriculum (Corson 1990:74). The principal features of LAC are— 1. Language develops mainly through its purposeful use (domains to be broadened) 2. Learning (often) involves talking, writing, shaping and moving (normally in reaction to perceptions) 91 3. Learning often occurs through speaking or writing as much as through shaping and moving 4. Language use contributes to / is a pre-requisite for cognitive development 5. Language is the medium for reflecting learning, for improving it, for becoming autonomous Language across the curriculum relates to thinking different forms and aspects of language education within the school, particularly emphasising the role of language in all subject-matter learning. LAC has two meanings: in the narrow sense it is a concept suggesting the importance of language work and language training in all non-linguistic subjects. In the wider sense, it is a concept demanding a comprehensive model of language education as the basis of a whole school language policy. The later includes linking all languages as subjects (mother tongue education, foreign language education, second (or third) language education and the language dimension in all other subjects. It certainly does not mean that each subject teacher must take responsibility for teaching sentence structure, grammar and composition skills in the subject areas. Rather, language across the curriculum is "verbalization as the fulfilment of understanding within each subject area". (Thaiss, 1984). The concept of LAC also claims that language and learning as well as language and thinking are deeply linked. Therefore, wishing to acknowledge and further develop children's existing mental and linguistic capacities, LAC focuses on active, constructive, potentially autonomous learning :

Language plays a central role in learning. No matter what the subject area, students assimilate new concepts largely through language, that is, when they listen to and talk, read and write about what they are learning and relate this to what they already know. Though speaking and writing, language is linked to the thinking process and is a manifestation of the thinking that is taking place. Thus, by explaining and expressing personal interpretations of new learnings in the various subject students clarify and increase both their knowledge of the concepts in those fields and their understanding of the ways in which language is used in each." (Ontario Ministry of Education, 1984; quoted in Corson, 1990, p. 75) The goals of LAC are – simply speaking – to support language development in each and every child, in all domains of language use, in each learning activity in school. John Carrol (1974), states that: "The various forms of pictorial expressions are almost always accompanied by language and require language to make them intelligible". Even highly abstract processes in Mathematics and psychomotor activities use the medium

92 not only in describing the techniques and processes but also in evoking responses. The student who is articulate in oral and written language, who can use words to manipulate ideas, to shape thoughts and to understand key concepts, has an indispensable tool for all school learning because the ability to communicate through language is a necessary skill in all subject areas. This involves such factors as: Students (in all subject areas) Using writing to order and classify thoughts Learning the language appropriate to the subject using the increasing precision the vocabulary of their subject Teachers (in all subject areas) Modelling the language of their subject Attending to the conventions of written language Becoming sensitive to the role and varieties of language learning The following learning skills which are traditionally regarded as the purview of the language teacher are shared by all subjects in the curriculum. i. Locating information - using encyclopedias and reference books and gathering facts from field trips and interviews. ii. Organising information - outlining and categorising iii. Acquiring information - using strategies such as skimming through reading and scanning and understanding the importance of pre-reading strategies. iv. Acquiring information - setting purpose for listening and through listening and observing. v. Communicating orally - speaking with accuracy and pose, and in writing with clarity and exactness, using the writing process. vi. Interpreting pictures - constructing simple graphs, tables charts, graphs, tables, charts and other pictorial pictures material cartoons including cartoons. vii. Evaluating and applying - applying problem-solving and information critical thinking skills. Each subject area has its special needs although there are many held in common across

93 the curriculum. The subject teacher needs to be aware of this and should provide learning situations which will foster the development and use of appropriate language. Example: English across the curriculum Art and architecture Explore art while learning the language of art. These resources help students to describe art and express their opinions on it while simultaneously learning more about art history. Business and tourism Worksheets for budding entrepreneurs to practise their skills. These worksheets tackle social issues in the business world and provide plenty of opportunities for students to build their confidence and hone their speaking skills. Culture Speaking and reading activities that encourage cross-cultural learning. These reading and speaking activities help students to understand more about how people live and their social customs in different parts of the world. Geography and the environment Activities on climate change, global warming, and key cities and countries around the world. These thought-provoking reading and speaking activities get students to engage with timely environmental issues while practicing reading and speaking skills. Information technology Key terminology and information on computing, past and present. Students learn IT terminology and the history of computing in these useful resources. Mathematics Worksheets for students learning key mathematical concepts and vocabulary. This section is devoted to resources for students tackling mathematics in English. Science and nature From Darwin's theories to cloning and how the brain works; a fascinating range of illustrated activities covering areas of science and the natural world. These resources give students the knowledge, vocabulary and key phrases to understand more about different spheres within science. Sports From the first Olympic Games to the modern day, fun language activities to help students

94 learn about sport. Activities help students learn about the language, history and culture of sport as well as modern day practices and health benefits. Cross-curricular webquests Webquest worksheets and projects for use in class or for homework. This developing section includes resources to keep your students glued to the computer screen for hours! Historical topics Reading, speaking and vocabulary activities that introduce EFL students to the past. Take your students on a journey into the past while learning English at the same time! Topic-based listening lessons These topic-based listening lessons on an eclectic range of subjects are designed to introduce content-based learning into the EFL classroom. LAC is a concept and a policy. As a concept it acknowledges the fact that language education in school does not only take place in specific language education, second language education etc. but also in each and every other subject, in each and every activity in school, across the whole curriculum. LAC leads to new forms of language use of L1 or LS (language of the School), to new types of discourse behaviour, to extended linguistic competences, the bases of which are already laid, mainly through early childhood socialisation and through L1/LS education in school. 3.4.7 Constructivism: Constructivist Teaching and Learning is a summary of a Master's thesis by Audrey Gray, University of Saskatchewan, entitled "The Road to Knowledge is Always Under Construction: A Life History Journey to Constructivist Teaching".

Constructivist teaching is based on the belief

that learning occurs as learners are actively involved in a process of meaning and knowledge construction rather than passively receiving information. Learners are the makers of meaning and knowledge.

Constructivist teaching

fosters critical thinking and creates motivated and independent learners. Constructivism holds that the primary responsibility of the teacher is to create and maintain a collaborative problem-solving environment where students are allowed to construct their own knowledge, and the teacher acts as a facilitator and guide. Constructivism (Li, 2005) holds that learning is an active process in which learners construct their own knowledge and understanding. They do not simply mirror and reflect what they are taught or what they read. Learners look for meaning and will try to find 95 regularity and order in the events of the world, even in the absence of full or complete information. Constructivist teaching theory (Li, 2005) holds that the students should be the center of teaching, although we should not neglect the importance of the teacher's guidance. We should use multi-media and Internet, construct real environments, carry on cooperative teaching and lead the students to self-constructed knowledge.

Constructivism draws on the developmental work of Piaget (1977) and Kelly (1991). Twomey Fosnot (1989) defines constructivism by reference to four principles: learning, in an important way, depends on what we already know; new ideas occur as we adapt and change our old ideas; learning involves inventing ideas rather than mechanically accumulating facts; meaningful learning occurs through rethinking old ideas and coming to new conclusions about new ideas which conflict with our old ideas. A productive, constructivist classroom, then, consists of learner-centered, active instruction. In such a classroom, the teacher provides students with experiences that allow them to hypothesize, predict, manipulate objects, pose questions, research, investigate, imagine, and invent. The teacher's role is to facilitate this process. Piaget (1977) asserts that learning occurs by

an active construction of meaning, rather than by passive recipience. He explains that when we, as learners, encounter an experience or a situation that conflicts with our current way of thinking, a state of disequilibrium or imbalance is created. We must then alter our thinking to restore equilibrium or balance. To do this, we make sense of the new information by associating it with what we already know, that is, by attempting to assimilate it into our existing knowledge. When we are unable to do this, we accommodate the new information to our old way of thinking by restructuring our present knowledge to a higher level of thinking.

Constructivist beliefs have recently been applied to teaching and learning in the classroom.

Why Is Constructivism Important?

Educational curricula and teaching methods are changing. One component of the current redevelopment of all subject area curricula is the change in focus of instruction from the transmission curriculum to a transactional curriculum. In a traditional curriculum, a teacher transmits information to students who passively listen and acquire facts. In a transactional curriculum, students are actively involved in their learning to reach new understandings. Constructivist teaching fosters critical thinking and creates active and motivated learners. Zemelman, Daniels, and Hyde (1993) tell us that learning in all subject areas involves inventing and constructing new ideas. Twomey Fosnot (1989) recommends that a

96 constructivist approach be used to create learners who are autonomous, inquisitive thinkers who question, investigate, and reason. The Constructivist Classroom A constructivist teacher and a constructivist classroom exhibit a number of discernable qualities markedly different from a traditional or direct instruction classroom. A constructivist teacher is able to flexibly and creatively incorporate ongoing experiences in the classroom into the negotiation and construction of lessons with small groups and individuals. The environment is democratic, the activities are interactive and student centered, and the students are empowered by a teacher who operates as a facilitator/ consultant. Constructivist classrooms are structured so that learners are immersed in experiences within which they may engage in meaning-making inquiry, action, imagination, invention, interaction, hypothesizing and personal reflection. Teachers need to recognize how people use their own experiences, prior knowledge and perceptions, as well as their physical and interpersonal environments to construct knowledge and meaning. This perspective of learning presents an alternative view of what is regarded as knowledge, suggesting that there may be many ways of interpreting or understanding the world. No longer is the teacher seen as an expert, who knows the answers to the questions she or he has constructed, while the students are asked to identify their teacher's constructions rather than to construct their own meanings. In a constructivist classroom, students are encouraged to use prior experiences to help them form and reform interpretations. This may be illustrated by reference to a personal response approach to literature, a constructivist strategy first articulated by Rosenblatt (1938). Rosenblatt (1978) argues for a personal and constructive response to literature whereby students' own experiences and perceptions are brought to the reading task so that in transacting with that text, the realities and interpretations which the students construct are their own. A Constructivist Classroom is Student-Centred

From a constructivist perspective, where the student is perceived as meaning-maker, teacher-centered, text-centered and skills-oriented approaches to literature instruction are replaced by more student-centered approaches where processes of understanding are emphasized. In a discussion of language arts instruction based on constructivist theories of language use and language development, Applebee (1993) suggests that rather than treating the subject of English as subject matter to be memorized, a

97 constructivist approach treats it as a body of knowledge, skills, and strategies that must be constructed by the learner out of experiences and interactions within the social context of the classroom. In such a tradition, understanding a work of literature does not mean memorizing someone else's interpretations, but constructing and elaborating upon one's own within the constraints of the text and the conventions of the classroom discourse community. A constructivist student-centered approach places more focus on students learning than on teachers teaching. A traditional perspective focuses more on teaching. From a constructivist view, knowing occurs by a process of construction by the knower. Lindfors (1984) advises that how we teach should originate from how students learn.

Students and Teachers are Interactive in a Constructivist Classroom Another quality of a constructivist class is its interactive nature. Authentic student- student and student-teacher dialogue is very important in a constructivist classroom. Belenky, Clinchy, Goldberger, and Tarule (1986) inform us that constructivists distinguish didactic talk, when participants report experiences but no new understanding occurs, from real talk where careful listening creates an environment within which emerging ideas can grow. Perhaps this defines the difference between teacher talk in a direct instruction classroom, and purposeful talk by students in a student-centered constructivist classroom where meaningful discussion occurs and meanings emerge. Belenky et al (1986) explain that in "real talk", domination is absent, while reciprocity, cooperation, and collaborative involvement are prominent. Consequently, constructivist activities in the classroom that focus on speaking and listening promote not only constructivist thought but also important connections between teacher and students. Organization and Management of a Constructivist Classroom are Democratic The organization and management of a class contribute appreciably to the creation of a classroom environment that promotes constructivist learning. A democratic classroom environment emphasizes shared responsibility and decision-making. A democratic classroom is self-regulating. Indeed, since student empowerment and autonomy are major goals in constructivist teaching, changing the power structure in the classroom is a desired course of action. Characteristics and Roles in a Constructivist Classroom There are many specific aspects of constructivism when relating it to the classroom and the learner, at whatever age. As mentioned before, the social aspect of constructivism is

98 important in the classroom. The socialization and interaction are an essential part of the classroom. It is in a constructivism classroom where a child can use his or her social activity to be influenced or influence other students' beliefs and values. The socialization can assist in "problem solving and conflict resolution" techniques. There is never a classroom that is free of problems. Helping to solve these problems as a group and letting the students resolve the conflicts is a vital feature of the constructivism classroom (Bloom; Perlmutter & Burrell, 1999). When the learner is a child, the constructivism approach teaches the child to be responsible for themselves. Also, the students can create a sense of belonging, and high self-esteem, for themselves and others in the environment of the classroom. One process that Bloom, Perlmutter, and Burrell (1999) mention is the "Peacekeepers". The Peacekeepers have rituals where they meet in groups, say a pledge, have symbols to give permission to speak and voice their cares and concerns within the classroom. Also, each student has a "basket of acceptance" where they bring an item that is special to them and they share it with the rest of the class. The Peacekeepers represents the belonging aspect in a constructivist classroom (Bloom; Perlmutter & Burrell, 1999). Another example is cohesiveness that is, brought on by the constructivism classroom. An example of cohesiveness is the students can develop rules, and mission and goal statements for their classroom. The teacher may assist by providing parameters and suggestions, but it is the students who learn self-management techniques and unity with others. Their contributions to the classroom shows that they have interest and care for themselves and others (Bloom; Perlmutter & Burrell, 1999). Open-ended assignments are another feature of a constructivism classroom. A student may have a different method in figuring out a math problem than what the teacher has in the book. The student can feel comfortable sharing the method with peers (Bloom; Perlmutter & Burrell, 1999). Relevance and creativity is another characteristic of constructivism in the classroom. Learning is based on the students' creativity from their prior knowledge and experiences (Bloom; Perlmutter & Burrell, 1999). Spigner-Littles & Anderson, (1999) also explain that to reach the creative side the teacher needs to assist in bringing about some new skills to coincide with the prior skills, "challenge their pre-conceived notions and beliefs, and possibly re-examine their worldly outlook. Windschitl (1999) mentions that an integrated curriculum is the way to go in a constructivist classroom. In this kind of classroom the teacher can create themes incorporating all subjects. The students can use their creativity and relevance to create a new or deeper understanding of several

99 subjects with a variety of learning activities that they can share with their peers. Also, student do not need to do the traditional paper and pencil tasks in a constructivist setting. They can write in journals, create and act out plays, create model, and other works of art. The students can be creative in their own unique way, and objectives and standards can still be observed. What is

instructional practice in constructivist classrooms? Values prior knowledge Is context embedded Integrates cooperative group work Multidimensional assessment Integrates language, content, and process

Example: Vocabulary Use objects EXAMPLE: Canvas –integrate with picture induction model and context embed it. Show pictures whenever possible. Use picture vocabulary dictionaries. Provide graphic organizers, which help students build associations Integrate as much as possible through thematic units Integrate reading and writing and work toward expressive vocabulary. In a traditional classroom, an invisible and imposing, at times, impenetrable, barrier between student and teacher exists through power and practice. In a constructivist classroom, by contrast, the teacher and the student share responsibility and decision making and demonstrate mutual respect. The democratic and interactive process of a constructivist classroom allows students to be active and autonomous learners. Using constructivist strategies, teachers are more effective. They are able to promote communication and create flexibility so that the needs of all students can be met. The learning relationship in a constructivist classroom is mutually beneficial to both students and teachers. Challenges of Constructivism There defiantly are some challenges when it comes to constructivism). Concern is constructivism does not just have a single meaning or approach (Airasian & Walsh,

100 1997). Some teachers are not sure as to which methods of teaching are appropriate to use in the classroom. For example, lecture, discussion, and cooperative groups can all be used, but when and with which students? Also, some students don't "like" to work in a group atmosphere, and they may cause problems with the groups. The teachers need to be competent in a variety of areas to help maintain a learning environment for every student (Windschitl, 1999). The next concern is time and management, which pertains to the students and the teachers. As mentioned before, the teachers need time to learn how to manage a constructivist classroom. The teacher has to adjust to letting the students making more decisions and interpret the information to how they understand it. In constructivism there is not necessarily one right answer. The role of the teacher is to guide the student, and the students have to get used to this, as well. The students will have to initiate more, and express their idea, instead of waiting for the teacher to say the "right ideas". Also, the actual time that the students are physically with the teacher can be an issue. When teaching in a high school setting, where the student change classes, the fifty minute time frame is clearly not enough time cover a theme that incorporates all of the subjects. The next concern of constructivism is the variety of learners and teachers. Previously mentioned, learners and teachers have different social and cultural background. In the constructivist view, race, gender, previous schooling, and individual contacts can all influence a person's learning. These contrasts can sometimes cause chaos. "Too many" meanings and can make for confusion, if not handled properly. Once again, the cooperation of parents, and community working with the school can help in the student's learning. The last concern is evaluation. If we are looking at each individual learner, then does there have to be a separate rubric for each student? And, if the student is involved in each process in the constructivist view then he or she needs to take part in determining the evaluation and standards. Again, a balance needs to be established to fit everyone's need, which can be complex. In conclusion, constructivism is a belief that the learner can use their previous and current beliefs, ideas, and knowledge to form and connect incoming information and eventually reach conclusions in subject matter. Learners and teachers need to be aware that we live in a world with a variety of perspectives and opinions. The diversity of cultures and issues can be some of the many challenges in a constructivist setting. With the use of instructional technology and open communication, the constructivism approach

101 can be successful and enriched learning can take place, in all types of learners (Rice & Wilson, 1999). 3.5 Methods In case of

English language teaching in India, there are some milestones in the development of this tradition.

According to D. Kanta Rao and J.M.Kanthi Thilakha: "If language teachers teach as they taught earlier, then one may not achieve the required goals of teaching English in the present global scenario." So, there could be as many ways of learning languages as there are people learning them. The way one learnt English is not exactly the way one is teaching it. Again, the way one acquired one's mother-tongue may be quite different from the way one learnt English. The following observation by V. Saraswathi is very important to quote in this connection. She says: "There is no best method. The history of language teaching presents a fascinating variety of methods. If there is such a variety of methods, which one are we to choose? There is no definite answer to this question, what works with one learner may not work with another. One may be a wizard in grammar but another may just hate it. Others might enjoy memorizing sentences." She further adds: "Different methods may be appropriate to different contexts. If we start searching for the perfect method or the ideal single solution to the problem of language learning, we bound to fail" Like V. Saraswathi, Diane-Larsen-Freeman's remark on language teaching methodology sums up a major trend away from unity to diversity in the following words. They comment: "There is no single acceptable way to go about teaching language today." The statements quoted above make it clear that no single approach or method is appropriate for all learning styles. A good lesson will, therefore, be one in which the teachers use a sort of board of activities taken from a variety of sources. By varying our techniques, we will give students of all styles the chance to shine some of the time. So we have to know some of the prominent methods that have been used in English...some are listed below:

102 3.5.1 Direct Method Made popular by Berlitz in the 1950s, it allows only the second language, uses everyday vocabulary, and stresses pronunciation. This was developed, as Rao has pointed out, "as a reaction against the grammar-translation method". Again this method is a logical extension of the Natural method. It is also an offshoot of the Behaviourist school of psychology. It insists that the key to all language learning lies in association. It stresses the need for direct association between experience and expression in the foreign language. The aim is to enable the learner to think in foreign language and to cultivate an unerring language sense. It recognises that language sense has its roots in the spoken language and lays stress on the oral approach. In the opinion of Diller this method has one basic rule: "no translation is allowed". In fact, this method receives its name from the fact that meaning is to be

conveyed directly in the target language through the use of demonstration and visual aids, with no recourse to the students' native language.

For example, in a reading lesson to class V, a new word 'watch' occurs. If we associate it with its intermediate in the vernacular, i.e. 'Gharee', we are teaching the meaning indirectly; but if on the other hand, we associate the word with an actual 'watch' or with the picture of a watch, we are teaching the meaning directly.

If such a direct association is not possible, the teacher can explain the meaning of new words by giving synonyms, definitions, explanations, or by inference from the context. The same technique with a few modifications here and there, can be followed in teaching compositions - oral or written. Many new words can be added to the vocabulary of the learner without the intervention of the mother tongue. According to Bhatia and Bhatia, the main aim of teaching English by this method is to enable the learner: "to think in English and to discourage the practice of inwardly thinking in one's vernacular and then overtly translating the thought into the foreign language. He should be able to grasp what he hears or reads in English and should be able to express his thoughts and wishes directly and fluently so that in due course of time he obtains a real command over the language". It was based on the involvement of the learner in speaking and listening to the FL in realistic situations. This method seeks to establish a direct bond between thought and expression, experience and language. Learners were encouraged to think in their Target Language (TL) and translation was forbidden. Formal grammatical rules were avoided. It was not an easy method to use in the artificial setting of a classroom. This method was also known for its tolerance towards errors. Berlitz was one of its scholars.

103 In its purest form, the practice of the direct method often created feelings of tension and exhaustion in both students and teachers. This was partly because of their mutual knowledge that their own first 3.5.2 Grammar Translation Most popular before the 1940s - It started to be slowly replaced by the Direct Method from the early 1900s. It is still popular, however, in countries where reading is more important than communicating. Problems learners expected to express themselves in TL too soon with too little structural knowledge inaccuracy and vagueness in learner TL performance need to learn by induction suits some students more than others Objectives to recreate L1 learning conditions, where understanding comes mainly through listening, speaking to encourage direct association of TL words and sentences with objects, notions and actions without the mediating use of L1 to provide practice in aural-oral skills before reading and writing to facilitate learning of grammar through practice and inference rather than explanation to ensure learners can function in the TL early, orally and in writing Sample classroom activities Teacher (T.) addresses students in TL and expects them to reply in it T. talks in TL, about classroom objects, asking questions, giving orders; students obey orders and tell class in TL what they are/ have been doing T. uses pictures to describe activities and events in TL T. demonstrates meanings of new action or relational words by miming students repeat new words and phrases in TL students asked to form own TL sentences according to what they have heard students read aloud passage of related content after the teacher, chorally then individually T. asks questions about passage in TL, students reply in TL. difficulties of vocabulary or structure explained in TL students make TL notes, write in TL, mainly on what has been covered in listening and speaking activities

104 The grammar-translation approach to the teaching of a second language is often called the classical approach, influenced as it is by "the formal teaching of Latin and Greek in Europe for many centuries" (Rivers 1968: 14). Given that the method was still applied in the mid-twentieth century to the teaching of non-current languages, its objectives would, it might be assumed, differ from those of the teaching of modern languages. Howatt (1984: 131) explains that the grammar-translation method was originally an attempt to adapt the scholastic study of foreign languages for a reading knowledge of their culture and history "to the circumstances and requirements" of school students. Hence, he suggests, the emphasis on sentence-level usage. Howatt claims that the first grammar-translation course for the teaching of English was written by Johann Flick, in Germany, in 1793. Yet many modern language-teaching classrooms of the nineteen- ?fties bore the typical characteristics of this approach, summarized here: to inculcate an understanding of the grammar of a language training in the translation and accurate writing of the language following strict grammar rules to provide students with a wide literary vocabulary to use language- learning as an intellectual discipline Students learn target language vocabulary lists (with L1 equivalents) from their textbook Teacher (T.) and/or students read textbook passage in target language (TL) aloud Students translate sentence by sentence T. explains rules of grammatical usage featured in the passage Students copy grammar rules, paradigms examples, exceptions in their notebooks, and can expect their knowledge of the rules to be tested Students do written practice exercises, e.g. ?lling in blanks in grammatical phrase or sentence- level exercises, or translate into TL specially selected phrases or sentences containing the grammatical usage concerned Students regularly do "proses", i.e. passages for translation to or from the TL Little interest in TL pronunciation, intonation TL not generally seen as a means of expressing one's own meanings, in writing or in speaking The language most used in the classroom is the mother tongue rather than the language being learnt The texts serves mainly as supports to the analysis of grammar & may often not be selected to suit the learners' level of ability, age & interests Problems Objectives Sample classroom activities

105 As Krashen (1987:128) mentions, "It can be claimed that grammar translation provides scraps of comprehensible input. The model sentences are usually understandable, but the focus is entirely on the form, and not on meaning ... students are forced to read word by word, and consequently rarely focus completely on the message. The sentences use in the exercises may be comprehensible, but here again, as in the model sentences; they are designed to focus the students on form." 3.5.3 The Structural Approach: Introduction

This approach as Kripa K. Gautam states "is based on the belief that language consists of 'structures' and that the mastery of these structures is more important than the acquisition of vocabulary. These structures are carefully graded in terms of both meaning and form.

Since structure is what is important and unique about a language, early practice should focus on mastery of phonological and grammatical structures rather than on mastery of vocabulary"

This approach, according to Kulkarni 'emphasizes the teaching and learning of the basic items or materials that constitute the framework of a language'. Hence, in structural approach students are taught to master the pattern of sentences. This approach employs techniques of the direct method of teaching. Speech is mainly stressed but reading and writing is not neglected. The structural approach

is not a method in the strict sense of the term. It

is an approach, a technique, a device which can be used to put into practice any method successfully. The term 'structural' according to Kripa K. Gautam "is referred to the following

characteristics: a) Elements in a language are linearly produced in a rule governed way. b) Language samples can be exhaustively described at any structural level of description (phonemic, morphological and syntactic). c) Linguistic levels are thought of as a system within systems. These sub-systems are pyramidally structured-phonemic systems leading to morphemic systems, and those in turn lead to be higher level systems of phrases, clauses and sentences. The two essential features of this approach are careful grading of structures, and vocabulary control. J.B. Bruton in a working paper presented at the Nagpur Seminar in 1958 summarises the basic assumptions regarding the nature of language and the methods best suited for the presentation of linguistic items. He says:

106 1.

Language is primarily a spoken thing and...therefore, our approach to a foreign

language should in a first instance be through its spoken forms 2. ...

Mastery over the signalling system of a language is more important than detailed knowledge of the forms of the language

3. ...this mastery is best acquired by repetition of the various components of

the

system in varied forms 4. ... since language arises from situation, the teacher's task is to create meaningful situations from which language will arise easily and naturally 5. ... mastery over a given range of structures and confidence in their use are best imparted by concentrating on the teaching of one item at a time 6. ... each item must be firmly established orally before

pupils encounter it in their textbooks. Yardi defines the term 'structures' as an "internal ordering of linguistic items", and further adds that

structures may be defined as "devices that we use to make signals, to convey meanings,

and indicate relationship." Thus the structural approach is based on structures which have been carefully selected and graded. According to Dr. (Mrs) Sharada V. Bhat: "selection of structure is made on four principles: usefulness, productivity, simplicity, and teachability". She further adds that: "the

structural approach distinguishes two types of structures, productive structures and other structures". Productive structures, as Dr. Bhat opines, are those with which other structures can be built. Naturally

the productive structures are given more importance, since after the mastery of those structures the student can build other structures by themselves. Some structures can be taught easily with demonstration. Every structure must be encountered and practised in a context of situation".

Objectives According to Menon and Patel the objectives of the new structural approach are as follows: - 1.

To lay the foundation of English by establishing through drill and repetition about 275 graded structures. 2. To enable the children to attain mastery over an essential vocabulary of about 3000 root words for active use. 3. To correlate the teaching of grammar and composition with the reading lesson.

107 4. To teach the

four fundamental skills, namely understanding, speaking, reading and writing in the order names. 5. To lay proper emphasis on

the

aural- oral approach, activity methods and the condemnation of formal grammar for its own sake.

Main features of structural approach

The structural approach makes use of the following features for teaching the language: Word order - Word order or the pattern of form is very important in Language for e.g: a) Jo broke his toy b) The toy broke Jo

The

sentence a) Jo broke his toy - makes proper sense. it shows the arrangement or pattern of words. The presence of function words:

Function words help in modifying meaning considered the following sentence - for e.g: a) I ate an ice cream. b) I'm eating an ice cream. c) I will eat an ice cream. In the above given example, we can see the modified meaning. The use of few

Inflections: By adding an affix, the base form of the word can be altered. e.g: a) In verbs: I play; he plays; I am playing ; I played b) In nouns; One boy; two boys; one man c) In adjective and adverb: Great - Greater - Greatest Principles of the

structural approach Prof. F.G. French has entitled the following principles underlying the structural approach: a)

Importance of Framing Language Habits - The structural approach lays stress on the importance of forming language habit, particularly the habit of forming words in English. b)

Importance of Speech - The structural approach is based on the principle of

108 effective use of speech. c) Importance pupil's activity - The

structural approach is based on the principles of the pupils' activity. The

importance of pupil's activity rather than the activity of the teacher

is the sure way to learning English. d) The principle of oral work - Oral work is the sheet anchor of the structural approach.

Oral work is the basis and all the rest are built up from it.

e)

Each language has its own grammar - Instead of teaching grammar of the target language, its structures are to be taught.

How should a teacher select the structure to teach the learner. The following principles should be kept in mind while selecting structures: i. Usefulness - the structures, which are more frequent in use should be introduced first ii. Productivity - some if the structures are productive, other structures can be built upon. for e.g: we have two sentence pattern- a) Mr. Roy is here b) Here is Mr.Roy. The former pattern is productive because we can frame many sentences on the same pattern like - He is there etc. iii. Simplicity - The simplicity of the structure depends upon the form and the meaning. iv. Teach-ability - Items easy from teaching point of view v. Frequency - The structures must be selected with a high frequency of occurrence. vi. Range - to know, in how many contexts it is applicable vii. Coverage - A word covering a number of meanings For e.g: Meals viii. Learnability- teacher should focus on the items that are easy for students to learn should be taken first. Gradation of Structure Structural approach upholds the teaching of English as a foreign language through the teaching of the structures of the language. The questions which structural approach attempts to answer primarily are: (1) should the structural items and sentence patterns to be graded? (2) how shall they be graded? and (3) what should be the fundamental principles of grading the structural items? through gradation of structure, we can get answers for the following Questions. Gradation means grouping synonyms. In structural approach, gradation of structure can

109 be taught by using the following patterns that should be taught at early stages: ? Grouping: i. Phonetic grouping - group according to sound. for example: cat, rat, mat etc. ii. Lexical grouping - grouping according to words used in same situation. iii. Grammatical grouping - pattern of sentences similar should be taught together. iv. Semantic grouping - Words having similar meaning grouped together. v. Structure Grouping - selecting items that are fit for each other. ? Sequencing: i. Grammatical sequencing - it will tell that it follows which structure. e.g.: I was watching a movie. I was watching a movie with my friend. ii. Semantic sequencing - A word having different meanings e.g.: The ball is there, under the bed. There are many balls in the bag. iii. Lexical sequencing - It Tells which word follows which e.g.: sit-stand, come-go, high-low ? Types of patterns of sentences:there are different patterns of sentence. as follows below: i. Two-part patterns like She goes (she / goes) ii. Three-part patterns e.g: He is reading (He / is / reading) iii. Four-part patterns e.g: Geetha went to school (Geetha/went/to/school) iv. Patterns beginning with 'there', 'wh' type question e.g: There are five baskets in the rack. What is your name? v. Patterns of Command and Request e.g: come here, sit down , stand up etc. vi. Formal pattern - like Good Morning, Thank You etc. ? Sentence Patterns: The structures may have the following pattern like: i. Statement of Fact - mention simple facts e.g: Pinky gets up at 6 a.m. She takes bath. she eats her breakfast. she goes to school. (subject-verb-object pattern) ii. Imperative sentence - Question form verb-subject-object pattern e.g: Did Pinky come to school today? has she taken her breakfast ? iii. Imperative sentence (imply compliance) subject remains hidden. e.g.: (Pinky) Come here , Close the door , Bring your book etc.

110 ? Phrase Patterns: Sentence using phrases are called Phrase pattern. e.g: That book is 'on the table' to develop listening and speaking skills as the foundation for reading and writing skills to use grammar as a means to an end, not an end in itself (inductive analogy rather than deductive explanation) to enable learners to communicate in TL students repeat sentences in TL in chorus, imitating the pronunciation and intonation of T., then in groups, then individually (almost like a mimicry) contexts, usually dialogues, perhaps with A/V support, based on everyday incidents in life of student in TL country students act out conversational interchanges in pairs students practise reading together after the teacher what they have just been repeating students repeat several times after the teacher pattern sentences containing key structure students repeat other sentences of identical structure but with minimal changes of vocabulary on cue words from T., students construct slightly different sentences on same structural pattern T. gives cues to small groups, then individuals, to make sure that all have assimilated the uses of the structure being drilled students asked to write out drill they have been repeating aloud, adding lexical variants of their own choosing emphasis on drilling structural patterns which is mechanical and non- individual Use of TL artificial and restricted reading and writing skills delayed Vocabulary is strictly limited to context learned Problems Objectives Sample classroom activities

111 Limitations of the Approach: i. The structural approach has limited application. It is best suited for the early stage of teaching English. ii. The structural approach ever emphasizes oral work and speech manipulation. There is blind repetition of structural items during oral teaching. Intensive drilling makes it mechanical. iii. The approach ignores reading and writing children fail to expand their language acquisition. iv. This approach fails to exploit children's mother tongue. v. The proper working out of the structural approach requires efficient teachers. There is acute dearth of such teachers. vi. It is not practicable in Indian schools. vii. It will not help cover the syllabus. Yardi finds out one main inadequacy with this approach that "they don't help to develop 'communicative competence", and he further states that "the structural approach may help in making correct sentences, it fails in helping the learner to make correct utterances" The Audio-Lingual Method The 1960s saw a transitional trend, rather than a clear-cut switch, from the Grammar- Translation and Direct Methods of the 1940s and 1950s to what soon became known as the audio-lingual (or "aural-oral") method. This method, in Howatt's words, "was derived from the structural approach developed by Fries at Michigan". Audio-lingual and structuralist approaches emerged, Wilga Rivers suggests, under the influences of behavioural psychology (notably Skinner, 1957). Also, it came under the influence of the American structural linguists (e.g. Bloomfield 1933, Fries 1945, Harris 1951) and anthropologists (e.g. Pike 1947), who analyzed, described and explained the structures and systems of languages from listening to them in native-speaker use. The emphasis was laid mainly on every-day language – the model structure (pattern- sentences) and on structural exercises (structure-drills). Audio-lingualism is summarized by Moulton (1961: 86) as being based on these slogans: "

Language is speech not writing.

A language is a set of habits. Teach the language, not about the language.

A language is what its native - speakers say, not what someone thinks they ought to say. Languages are different."

112 3.5.4

Situational Language

Teaching The overlap between language approaches may again be illustrated here. The late 1950s and early 1960s saw the British tradition of English language teaching influenced by A. S. Hornby's: Progressive English for Adult Learners (1954–56), which he referred to as situational. This meant, for Hornby, "that each new pattern or lexical item should be introduced to the class in advance of the work with the text" (Howatt 1984: 263), a principle central to the audio-lingual approach. The 1960s also saw the kind of situational approach represented by the audio-visual courses which related film-strips and recorded dialogues. The situational method tended to organize its language syllabus according to relevant physical and social situations, but then used techniques from direct and audio- lingual methods to pursue syllabus objectives.

The Oral Approach or Situational Language Teaching is based on a structural view of language. Speech, structure and a focus on a set of basic vocabulary are seen as the basis of language teaching. This was a view similar to American structuralists, such as Fries. However, what distinguishes The Situational Language Teaching approach is its emphasis on the presentation of structures in situations.

Teacher role: context setter and error corrector. Student role: memorizer and imitator. This approach, popularly known as the S-O-S approach, came into being as an alternative to the direct method. It is an outcome of the experiments carried out in the army camps during world War II. It is the presentation and practice of carefully selected and graded grammatical structures of English in effective, meaningful situations, initially through speech and later through reading and writing.

Language is viewed as structurally related elements forencoding of meaning, the elements being phonemes, morphemes, words, structures and sentence types.

According to Rao the theory underlying this approach is that language exists in situations; it cannot be used in vacuum. Language is used according to the needs of the situation. In view of this Rao suggests presenting a new language item in meaningful situations. It would make the input comprehensible for the learner. Situational use of English is aimed at in this approach. Prominent names associated with this approach are Charles Fries, Harold Palmer and A.S. Hornby. Harold Palmer points out that there are three processes in learning a language- receiving the knowledge or materials, fixing it in the memory by repetition, and using it in actual practice until it becomes a personal skill. By using meaningful situations, according to Geetha Nagraj, the use of mother-tongue

113 can be avoided. In view of this GeethaNagraj suggests that these language items should be given in meaningful situations, the learners can deduce the meaning and the context from the situation in which it is used. The characteristics of this approach: 1.

Focus on vocabulary and reading is one of the most salient traits of SLT. In fact, mastery of a set of high frequency vocabulary items is believed to lead to good reading skills. 2. An analysis of English and a classification of its prominent grammatical structures into sentence patterns, also called situational tables, is believed to help learners internalize grammatical rules. 3.

Speech is the basis of language teaching - new language items and vocabulary items are presented orally before they are presented in the written form. 4. The language items which are commonly used by native speakers in their day-to-day language are selected for teaching. 5. The items are also graded according to their usefulness, frequency and teachability. 6. The language items thus selected are presented and practised in meaningful situations. Vocabulary items are selected with reference to the general service list. 7. Reading and writing are based on items which have already been introduced and practised orally.

Behaviouristic background The behavioristic view of language learning constitutes the cornerstone of Situation Language Teaching. The approach gives primacy to the processes over the conditions of learning. The following processes are noted in this approach: 1. The act of receiving knowledge or material 2. Repetition to fix that knowledge or material in memory. 3.

The use of the knowledge or material in actual practice until it becomes a personal skill. The behaviorist theory of learning is based on the principle of habit formation. Mistakes are banned so as to avoid bad habit formation. Following the premises of behaviorism, a teacher presents language orally then in written form.

114 SLT objectives 1. The objectives of Situational Language Teaching involve accurate use of vocabulary items and grammar rules in order to achieve a practical mastery of the four basic skills. 2. Learners must be able to produce accurate pronunciation and use of grammar. The ultimate aim is to be able to respond quickly and accurately in speech situations with an automatic control of basic structures and sentence patterns. 3.

Teaching involves situational presentation of new sentence patterns and drills to practice the patterns. The teacher moves from controlled to freer practice of structures and from oral use of sentence patterns to their automatic use in speech, reading and writing. According to Situational Language Teaching, a lesson starts with stress and intonation practice followed by a revision and a presentation of new material (mainly structures or vocabulary). The teacher then proceeds to oral practice and drilling of the elements presented. Finally, the lesson ends with reading activity or written exercises.

According to the Situational Approach, and to insure that the language that is being taught is realistic, all the words and sentences must grow out of some real situation or imagined real situation. Thus, the meaning of words are tied up with the situations in which they are used. The learners know the meaning of the word "blackboard", not because they have looked it up in a dictionary, but because they have learned the word in situations; by hearing commands such as: "Look at the blackboard!"; "Clean the blackboard!"; "Write on the blackboard!". This example stresses the association between the word "blackboard" and the action of "looking at it", "cleaning it", or "writing on it. Even if the classroom environment is limited, the teacher's inventiveness should be put into practice in the pretence of a situation picked up from outside the classroom. Since the purpose of teaching a foreign

language is to enable the learners to use it, then it must be

heard, spoken, read, and written in suitable realistic situations. Neither translation nor mechanical drills can help if they are not connected to practical life. Drilling words and structures or making a maximum of sentences out of substitution tables would, inevitably, lead to the unreality, boredom, and remoteness of the language process. The difference between American structuralists, such as Fries and the British applied linguists such as Firth and Halliday, lies in the fact that structures must be presented in situations in which they could be used. The situational environment should be presented in such a way that even the slowest

115 learner gets involved in what the teacher or the other learners do and say in the classroom. The idea of making the learners cooperate with one another underlines the social touch of this approach. Learners are always eager to take part in make-believe situations, especially when they assume roles and enact a situation before the rest of the class.

Disadvantages ? Though this approach got well established by 1975 but soon then some doubts were also raised on its efficiency. In Prabhu's words 'the S-O-S principles were increasingly being questioned, mainly on the grounds that learners practice situation didn't ensure that they could make sentences correctly in other context. ? The other charges were that the teachers were required to do a lot of preparatory work. ? The structures soon become over generalized and mechanical. ? Less attention was paid to the reading skill ?

Chomsky (1957) showed that the structural and the behavioristic approaches to language are simply incorrect as they do not explain the fundamental feature of language learning: the ability to create novel and unique sentences. Children do not acquire their mother tongue through repetition and habit formation. There must be, however, an innate predisposition that lead them to a certain kind of linguistic competence. 3.6

Language Skill 3.6.1 Introduction Languages are generally taught and assessed in terms of the 'four skills':

listening, speaking, reading, and writing.

Listening and reading are known as 'receptive' skills while speaking and writing are

known as 'productive' skills. They are communication skills that are important in all subject areas in the curriculum.

Hence, literacy of all these skills should have a central position in the curriculum. All language learners will need to develop their skills in each of these areas, and language classes should incorporate activities related to all these skills. If pupils are given the opportunity to make choices and decisions about what they do, they will be more motivated to engage with learning activities. A pupil's language proficiency can vary from class to class in accordance with the type of task and the learning context. In school and in life, students face a diversity of circumstances that require language 116 skills. For this reason, experience with a variety of reading, writing and speaking activities in school can help learners acquire the skills they need to be successful. 3.6.2 How are the four skills used in the language classroom? Through daily

activities, teachers provide learners with opportunities to develop each skill: students listen (to the teacher use the target language, to a song, to one another in a pair activity), speak (pronunciation practice, greetings, dialogue creation or recitation, songs, substitution drills, oral speed reading, role play), read (instructions, written grammar drills, cards for playing games, flashcards) and write (fill-in-the-blank sheets, sentences that describe a feeling, sight or experience, a dialogue script, a journal entry). 3.6.3 The basics in developing the Language skills Speaking :

Learners need to know how speakers differ from one another and how particular circumstances call for different forms of speech. They can learn how speaking styles affect listeners. Thus, the rate at which they speak, the volume and the precision of pronunciation may differ substantially from one situation to another. It is useful for students to know that speech should differ in formality, such as when speaking to a judge, a teacher, a parent or a playmate. They may also benefit from learning about the differences among various dialects. The subjects in the curriculum and examples from the media may provide occasions for different forms of speech. Oral presentations can be derived from poems, stories, newspaper and magazine articles, as well as scientific reports. Dramatic acting and watching skits and plays may provide the richest opportunity to see how character and circumstance affect speech. Listening: Listening skills are essential for learning since they enable students to acquire insights and information, and to achieve success in communicating with others. Poor listening can lead to unnecessary arguments and problems. So, Students' listening skills has to be enhanced with practice. Reading: "Learning to read is no longer sufficient for preparing students for a knowledge- based and life-

long learning society. They have to be equipped with the skills of 'Reading to Learn'. Reading helps to develop thinking skills, enriches knowledge, enhances language proficiency and broadens life experience. Emphasis has to be placed on motivating learners and providing them with proper guidance and opportunity to enhance their

117 learning capacity through reading. Writing: Skill in writing develops only through regular experience of all types of writing. Writing is a complex process and teachers have a vital role in helping children, as they work through the challenges that allow them to become competent and confident writers (Pinnell and Fountas, 2000). Through effective teaching of the writing process, children have the potential of becoming writers who: ? understand both the constraints and possibilities of written language conventions can organize and structure various kinds of texts understand that texts have multiple purposes and a range of audiences. 3.6.4 Objectives (Speaking): to engage critically and constructively in the exchange of ideas, particularly during class discussions and conference with instructors; to conceive and develop ideas about a topic for the purpose of speaking to a group; to choose and organize related ideas; to present them clearly in standard English; and to evaluate similar presentations by others; to vary one's use of spoken language to suit different situations explain concepts/ideas in organized manner using examples or details use a variety of sentence patterns, new vocabulary, and high-frequency idioms in spontaneous conversation 3.6.5 Objectives (listening): to recall significant details; to comprehend main ideas; to draw inferences about information; to make judgments concerning the speaker (e.g., attitude, intent); to make judgments about the information (e.g. , type of evidence, logic of arguments). 3.6.6 Objectives (Reading): Understanding the basic conventions of written English

118 Constructing meaning from texts Locating information and ideas. Knowledge of the use of written symbols Knowledge of letter-sound relationships Skills of word recognition Grammar knowledge Skills in contextual understanding. 3.6.6 Objectives (Writing): Write complex sentences in paragraphs Demonstrate the correct use of capitalization, punctuation and spelling (e.g., using reference materials to edit and revise) Use pre-writing skills to organize and develop a paragraph Write a detailed paragraph with topic sentence, supporting details, and conclusion Describe a detailed procedure in writing Summarize articles on familiar topics Identify parts of a composition – outlining content/sequence of paragraphs 3.6.7 How to develop Speaking Skills: To develop the Speaking Skill the pupil should have: Control over vocabulary Grammatical accuracy Control over phonology Developing vocabulary 1. Move from concrete to abstract concepts 2. Focus on vocabulary in clear contexts 3. Use word lists, diagrams, labels and other visual displays that remain on the wall to provide ongoing support and consolidation

119 4. Get the pupils to provide their own words as much as possible 5. Make sure that pupils (whose peers are literate) are constantly developing their own personal dictionaries Developing structural accuracy 1. As early communicative ability develops the pupil will move from nods/gestures to single words then incorrect forms. 2. At this stage, encourage communication particularly by promoting small-group activities Developing phonological accuracy 1. This should never be ignored as bad pronunciation and intonation patterns can impede comprehension and contribute to serious spelling problems The teacher should also ensure the following strategies and classroom talk that include: Repetition of key words Paraphrase Miming and gesture to support spoken words Modelling Checking for understanding Summarizing Modelling grammatical accuracy without constantly 'correcting' the pupil Making use of classroom routines that quickly become familiar to the pupil – circle time, roll call, tidy up, passing on objects etc. – to encourage oral participation Encouraging the use of complete sentences as appropriate Listening to individual pupils but provide feedback to all Using minimal responses Language learners who lack confidence in their ability to participate successfully in oral interaction often listen in silence while others do the talking. One way to encourage such learners to begin to participate is to help them build up a stock of minimal responses

120 that they can use in different types of exchanges. Such responses can be especially useful for beginners. Minimal responses are predictable, often idiomatic phrases that conversation participants use to indicate understanding, agreement, doubt, and other responses to what another speaker is saying. Having a stock of such responses enables a learner to focus on what the other participant is saying, without having to simultaneously plan a response. Recognizing scripts Some communication situations are associated with a predictable set of spoken exchanges - a script. Greetings, apologies, compliments, invitations, and other functions that are influenced by social and cultural norms often follow patterns or scripts. So do the transactional exchanges involved in activities such as obtaining information and making a purchase. In these scripts, the relationship between a speaker's turn and the one that follows it can often be anticipated. Instructors can help students develop speaking ability by making them aware of the scripts for different situations so that they can predict what they will hear and what they will need to say in response. Through interactive activities, instructors can give students practice in managing and varying the language that different scripts contain. Using language to talk about language Language learners are often too embarrassed or shy to say anything when they do not understand another speaker or when they realize that a conversation partner has not understood them. Instructors can help students overcome this reticence by assuring them that misunderstanding and the need for clarification can occur in any type of interaction, whatever the participants' language skill levels. Instructors can also give students strategies and phrases to use for clarification and comprehension check. By encouraging students to use clarification phrases in class when misunderstanding occurs, and by responding positively when they do, instructors can create an authentic practice environment within the classroom itself. As they develop control of various clarification strategies, students will gain confidence in their ability to manage the various communication situations that they may encounter outside the classroom. 3.6.8 How to develop Listening Skills: We Spend a lot of Time Listening - Adults spend an average of 70% of their time engaged in some sort of communication, of this an average of 45% is spent listening compared to 30% speaking, 16% reading and 9% writing. (Adler, R. et al. 2001).

121 Listening strategies are techniques or actions that provide directly to the comprehension and recall of listening input. Effective language instructors show students how they can adjust their listening behavior to deal of listening strategies and match appropriate strategies to each listening situation. Have inviting body language - Inviting body language means positioning yourself in a way that makes it inviting and easier for people to come talk to you. This means facing the person who is speaking to you and standing with an open posture. Moving slightly closer toward the person speaking to you. Smiling and laughing when it is appropriate. Tilting your head when hearing new or interesting information. Nodding your head if you agree or understand what someone is saying Listen without distraction - An important part of listening is being able to zone out background noise, thoughts, and conversations so you focus on the conversation in front of you. Being distracted by other things takes your attention away from the speaker and lessen your ability to fully listen. Turning off communication devices like cell phones is a polite and easy way to get rid of further distractions. Listening Actively Take note of the speaker's body language. Someone's body language can communicate a lot more than the actual words they are saying. For example, if your partner keeps

122 looking down at the floor, that might be an indication that they are shy, embarrassed, or sad. Since words only convey a fraction of the message, "listening" to body language cues can help you further understand what the speaker is trying to communicate besides what their words convey. Listen with the intent to learn. Some people focus on how they are going to reply when someone is talking to them, rather than absorbing and understanding what their partner is trying to communicate. That isn't a habit of someone who is a good listener. Instead of thinking of your response, try to fully absorb what your partner is trying to say to you, and view every conversation you have as a learning opportunity. You might not be knowledgeable or fascinated with every topic of discussion, but listening with the intent to learn offers other points of view different from your own, and a chance for you to grow as a listener. Be open-minded. A basic rule of listening is to judge only after you've heard and evaluated what someone has to say. You must wait to form your opinions, because once you deem someone to be ignorant, ill-informed, or shallow, you immediately shut them out and stop listening to what they have to say. You might disagree with someone, but you will never find out until you listen to their ideas and opinions. Try to empathize. Empathizing is trying to feel yourself, what the speaker is feeling at that moment. Identifying with the speaker in this way allows for better understanding of what they are trying to communicate, and where their feelings are coming from. Remember to use an active-listening attitude. Using an active-listening attitude can help reinforce positive listening practices and encourage respectful listening tendencies. Exercising an active-listening attitude means: Acknowledging that listening is just as important as speaking in a conversation. Hearing what somebody has to say to is equally important as voicing your opinion to them. Being aware that listening is necessary for productive exchanges of information. Those who remember to prioritize listening create less confusion in a conversation, cause fewer misunderstandings, and misspeak less frequently. Understanding that listening to others is not only necessary, but all around beneficial for the betterment of the conversation. Always try to absorb some piece of new information when you encounter and interact with new people.

123 Responding Appropriately Use top-down listening strategies to prepare your response. Using a top-down strategy means you, as a listener, calling on information you already know (about the subject you and your partner are discussing, your partner, the context of your conversation, and the specific language being used to create the conversation), in order to plan what you will say next. Some other components of this strategy involve: Anticipating. Paraphrasing. Differentiating fact from opinion. Interpreting tone. Drawing conclusions. Use bottom-up listening strategies to gather further information and prepare a response. Using a bottom-up strategy means using specific linguistic signifiers to draw meaning from what the speaker you're listening to is saying. These signifiers include the actual language the speaker uses to express themselves, the grammar used to create their message, and the sounds used to create the message. Some other components of this strategy include: Picking out individual words. Noting words of similar origin. Identifying placement patterns of words. "Identifying prefixes, roots, and suffixes". The listener taps into background knowledge of the topic, the situation or context, the type of text, and the language. This background information activates a set of expectations that assist the listener to interpret what he has heard and anticipate what

he will hear next. These are listener based Listening for the major idea: Predicting Drawing assumptions Cutting The listener depends on the language in the message, that is, the arrangement of words, sound, and Interacting strategies:

124 Listening for specific information Recognizing cognates Recognizing word-order patterns Listening for Meaning They encourage students to evaluate their comprehension and their strategy use immediately after completing an assignment. They build comprehension checks into in-class and out-of-class listening assignments, and periodically review how and when to use particular strategies.

By raising students' awareness of listening as a skill that requires active engagement, and by explicitly teaching listening

strategies, instructors help their students develop both the ability and the confidence to handle communication situations they may encounter beyond the classroom. In this way they give their students the foundation for communicative competence in the new language.

Genuine materials and situations prepare students for the types of listening they will need to do when using the language outside the classroom. Radio and television programs Public address announcements (airports, train/bus stations, stores) Speeches and lectures Telephone customer service recordings Use paper, tin sheet, aluminum foil, or any substance that comes in sheets; produce sounds in various ways: by crinkling, rubbing, tearing, waving, shredding, wrapping, scratching, etc. One child does the action, the rest with eyes closed; have to guess how the sound was made. Practice the vocabulary beforehand. Students sit in a circle and share a conversation with the others and the teacher. They also share journals, diaries, stories, and maths and science experiences. The teacher starts telling the story while the students act out the different actions that appear in it. There are no further instructions given. It is left to the students to listen carefully and to imagine how and to do it.

3.6.9 How to develop reading skills “Successful integration of reading skills into the English Language curriculum will

125 help young learners develop a positive attitude towards learning to read and reading to learn” (ELCG, 2004, p.A27). The underlined Reading Strategies will help the students to develop the reading skill: Reading Aloud involves the teacher reading aloud a text and demonstrating a positive attitude to reading, reading behaviour and book orientation. Students are provided with opportunities to enjoy a variety of texts and to engage with the text afterwards through activities, such as discussion and mime. Storytelling involves the teacher telling a story with the use of pictures or real objects, e.g. puppets or storyboards, to support the students’ understanding of the content. Students are provided with opportunities to participate in the story and develop some listening and basic reading skills. After Storytelling activities can include retelling the story or role-play. Shared Reading involves teachers modelling, instructing and explaining reading skills and strategies through sharing the reading process with students. They read and reread the text, e.g. a big book or picture book, involving the students more and more with the reading. Students are provided with opportunities to learn and develop the skills, strategies and confidence needed to participate in Guided and Independent Reading as well as the Home Reading Programme. They complete After Reading activities either as a whole class, in groups or individually. Guided Reading involves teachers working with individual students or small groups of students with similar learning needs. Teachers provide opportunities for students to practise effective strategies they have been taught in Shared Reading sessions. Students read books at their Instructional Reading Level. Independent Reading involves teachers providing uninterrupted time for students to practise and integrate skills and strategies they have learned in Shared and Guided Reading sessions as well as enjoy the reading experience. The students read books at their Independent Reading Level. Home Reading involves teachers selecting books to be read at home with the guidance and encouragement of parents or guardians. The students will practise the strategies and skills they have learned during Shared and Guided Reading. The letter books revisit and consolidate the sounds taught in class while the small books revisit and consolidate the taught language structures. Following strategies are also needful in the process:

126 Semantic strategies – finding out about meanings, e.g. word meanings, common expressions, picture cues Syntactic strategies – finding out about language structures, e.g. sentence structure, word order, text organisation Graphophonic strategies – finding out about: ? the sounds of language, e.g. rhyme, alliteration, onset and rime, individual sounds ? the relationships between sounds and letters and about combining sounds (blending), e.g. differences between letter sounds and letter names, alphabetic principle, analogy and letter clusters ? language in print, e.g. letter and word shapes, letter clusters, sight words, punctuation, layout After the reading activities, also the students should be given opportunities to finally strengthen their reading skills by: rereading the text while, e.g. asking questions, asking students to point out focus language and structures and matching word cards to text in the book completing activities, e.g. games, work sheets, writing activities, drawing pictures, completing cross-curricular activities (collage, learning a song, creating a drama performance) and role play and finally realizing: ? the purpose of a text (the text type) ? how it has been written (structural and language features) ? what it means ? how they could use it ? what the author meant by writing it.

3.6.10 How to develop Writing Skills: Four Stages provide opportunities for students to learn and develop their writing skills. These are: Copying is necessary to help students to acquire and apply concepts about basic conventions in writing and put language into use at an early stage of learning. Copying activities help students reinforce the language that they have come across for a communicative purpose. It need not be a mechanical and boring exercise.

127 Controlled Writing In controlled writing, students are given a limited choice in what language to use, and few errors are likely to occur. Students can have some initial writing practice within a safe setting. Guided Writing provides explicit teaching through lessons focused on the specific needs of individuals and conferring with individuals within a small group. Students are encouraged to use the language they know and to write for a range of purposes and audiences with substantial assistance from the teacher. Independent Writing helps students activate their linguistic knowledge in new contexts. They make use of their creativity and express personal ideas and feelings. They need to be assisted in getting started and in organising their ideas. Guidance and language preparation are required for independent and free writing. Other strategies are also there to develop writing skills: ? Brainstorming and expanding Teacher introduces the topic by using a concrete example or resource such as a set of pictures Teacher prompts pupils to provide more words for items. Then prompts further description Example : It was raining cats and dogs. I was coming home from school with my friend. I stood under a tree for some time. I saw an old beggar lying unconscious a few yards away. My friend advised me to ignore him. I walked up to the beggar and found he was feverish. I called the local people to the spot. The local people made arrangements for him to be taken to the hospital. I got drenched but felt happy. When I got home I told my parents about the incident. They were proud of me. It was

128 I was returning from ----- with ----- . We stood ----- when I saw ----- . I walked up to ----- . I called ----- and then ----- . I got ----- . When I got home

----- . ? Word poems Making poems from single words is an excellent way of getting pupils to use all the language that they know in an imaginative way. The result is a great sense of achievement, particularly for those whose level of English is still low. Method: 1. Write a single word on the board. It could be a word that the pupils have recently learnt or the name of a member of the class. 2. Brainstorm all the words that the pupils know that start with the letters in the name, and write these under the original word. 3. Then, working in pairs, pupils make a short poem using, as a basis, some of the words/ideas they have collected. ? Newspaper Many pupils become familiar with the idea of 'News' in both the mainstream and the language support class. A project for pupils who have developed basic literacy is the compilation of a 'class newspaper'. Method: 1. Teacher shows a newspaper to the class and brainstorms/discusses what is in a paper. 2. Pupils look back through the work that they have done and talk about what they could put in a newspaper

129 3. Class is organised in pairs and each pair must discuss and decide what they will contribute to the paper. Contributions could include text, pictures, wordsearch or crosswords, etc. 4. Pupils work on their contributions over several sessions 5. Teacher brings the work together in a scrap book, or other form, and it is shown to all classes. Use of Technology or ICT Overall, there are a set of necessary but not sufficient conditions which must be met for inclusive education to become a meaningful model for meeting special educational needs. These are: An opportunity for pupil participation in decision-making processes A positive attitude about the learning abilities of all pupils Teacher knowledge about learning difficulties Skilled use of specific teaching methods Parent and teacher support Our conclusion is that this process of making accommodations does not constitute pedagogy but is an element of it. Our view is that questions about a separate special education pedagogy are unhelpful given the current policy context, and that the more important agenda is about how to develop a pedagogy that is inclusive of all learners. 134 4.3.1 Concept of Instructional Material Instructional Materials as the name suggests, are materials of visual, audio and audio - visual category that helps to make concepts, abstracts and ideas concrete in the teaching/ learning process. These are also materials which the teacher uses in supplementing his teachings. Instructional Materials include materials used to facilitate learning for better results. Likewise, it is the use of the chalkboard, charts, models, overhead projectors, films, television and computers in teaching process. Broadly speaking, it is not just the use of tools of technology alone but a systematic, integrated organization of machines, hard wares and soft wares and human potential for the solution of problems in education. In order to ensure an effective teaching learning process, it is important for the teacher to be thoroughly acquainted with the teaching resources and services available to him. The components of instructional materials available to teachers and students are in large numbers and also vary according to the functions of each of them. Examples of instructional materials are charts, maps, diagrams, comics, models, globes, slides, film strips, television, radio cassettes, video, recorders, cinema, public address system, laboratories and museums, flash Cards, flannel boards, card boards, Calendar, Computers, etc.

4.3.2 Classification of Instructional Materials The Instructional Materials could best be classified in to three forms: audio, visual and audio-visual aids. The audio (deal with sound only) the visual (as in sight) and audio- visual (a combination of audio and visual i.e. sound and vision) for instance: AUDIO: These include such things as radio, record players, cassettes, gramophone etc. These aid teaching through the sense of hearing. They can be used in teaching of songs, poems, rhymes and at the sametime different content matters can be melodiously presented via them. These materials help us develop listening and pronunciation skills. Side by side, students get training in the subtle skills of language like, stress, intonation and pause. VISUAL: This category consists of maps, film strips, specimen, pictures, charts, blackboard, posters etc. Usually it appeals to the pupils through the sense of sight. Until facts are presented in the form of visual aid, pupils may not readily grasp the meaning of ideas, concepts and facts. English has many topics and concepts that demand concretization of concepts through visual presentation. Here, the utility of visual aids is more of a necessity. Sometimes to introduce a topic or a poem we need the visual objects. Moreover, poets and writers can be introduced through visual presentation of facts.

135 AUDIO-VISUAL: As have said already, this group consists of a combination of both audio and visual materials. Television, films and projector etc. come under this category. In today's education these materials are in heavy demand, because they satisfy both the auditory and visual passion of learners. Moreover, the use of more than one sense stimulus makes the process interesting and comprehensive. Language subject like English can greatly benefit from this. Specially, these materials help in listening and speech practice.

4.3.3 Factors Guiding the Selection of Instructional Materials The teacher who wants to use instructional materials should consider the following variables to guide him in the selection of the types to be used in the teaching learning exercise.

1. Availability The teacher should ensure that the instructional materials to be used are easily available for use before the date of use. It means that the materials should be in store and the teachers should look at it and test it before the starting of the lesson. If the teacher has to prepare it himself, he should do so at least a day before the lesson. Instructional materials that are not available or not easy to prepare should be negated by the teacher in his lesson plan.
2. Accessibility It is the duty of the teacher to ensure that the materials to be used as instructional materials are not only available but also accessible to him. They should be within the reach of the teacher on the date and time of use. There should be no excuse that the materials are readily available but locked up in the store because the store-keeper is nowhere to be found or the keys to the store have been misplaced.
3. Affordability The instructional materials to be used should not be expensive. The cost should be such that either the teacher or the school can afford. It is no use to say that something is available but not affordable due to high cost. The cost should not be outrageous. It should be within the budget of the school.
4. Suitability The teacher using the instructional materials should ensure the appropriateness of the materials for his intended learners. The materials should be suitable for their age, experience and intelligence. The legal, safety and ethical aspects of the materials to be used should equally be considered. The materials should not portray any anti-social attitude. They should also be free from

136 any bias, distortion or prejudice. If the materials would need electric power then an alternative should be sought to avoid disappointment from electricity. 5. Simplicity The instructional materials to be used should be simple to operate or manipulate. The teacher should test the materials and ensure their workability before the actual date of use. There should not be any technical problem and where electricity is to be used provision should be made for an alternative power. No teacher should use electric failure as an excuse for nonperformance. In a situation where an instrument demands the hands of a technician, he (the technician) should be in hand and the teacher should have an insight into the operation of the instructional materials. 6. Quality The instructional materials selected for teaching by the teacher should be of good quality. Teachers should avoid the idea of "managing" with poor quality materials because he might not achieve the desired aim. 7. Recency The instructional materials should be the best or nearest to the best. It should not be out of date. The instructional materials should reflect current and original thought. 4.3.4 Importance of Instructional Materials The instructional materials help

improve students' knowledge, abilities and skills, monitor their assimilation of information, sustain students interest for longer period, provide opportunity to all students to share experience necessary for new learning and bring more permanency in learning. This is for the fact that such materials enhance, facilitate and make teaching/learning easy, lively and concrete. Books, journals, archives, newspapers, reports, internet are some of the widely used instructional materials. Instructional materials allow the instructor to engage learners by supporting concepts through the use of multimedia, including sound clips, video, images, hands-on experience and interactive games. Materials offer learners the opportunity to practice concepts and develop a product that demonstrates their level of understanding. Consequently, those products are then used to evaluate learners' knowledge. Instructional materials allow the instructor to support learners with varying levels of ability and foundational skills by providing additional support. Many educationists agree that instructional materials bring about improvement in the 137 teaching/learning process as well as permit teachers and students to interact in a controlled environment. Also, most educators generally agree that the creative use of variety of instructional materials will increase the probability that students would learn more, retain better and acquire requisite skills. Instructional materials help the teacher with the means for extending the learners' horizon of experience and provide the teacher with rich sources of communicative materials which could be produced jointly by the teacher and the students. Several studies have been conducted to test the value of Instructional materials and other sensory devices. These researches have proved that Instructional materials when properly used in teaching learning situations can accomplish a lot of complex tasks. The instructional materials also offer real experiences in giving the teacher basis for thinking and understanding. They provide concrete basis for conceptual thinking and therefore reduce meaningless responses of students. At the same time, they overcome the limitations of time, space and size by helping the students to understand things that are too small or too big, or too slow or too fast. Therefore, instructional materials can provide members of a group with a common or joint experience. They also break language barriers and ease difficulties and in the end make the lesson more meaningful. They save time and thus enable students grasp ideals more effectively and quickly. Likewise, they help to simplify and emphasize facts and clarify difficulties. They reinforce other teaching methods and materials. They improve the efficiency of other method and effectiveness of the teaching process. Instructional media usage in practice teaching can make instruction to be much more interesting and enjoyable. The changing images and use of special effects, among others, can reduce boredom of the learners and enhance classroom interaction. Media can also promote student-student interaction, student-teacher interaction, and teacher-student interaction, if pre-instructional planning incorporates principles such as stimulus variation, feedback, reinforcement, learner' participation, and so on. Media also saves teaching time as if requires short-time to present large information. Media can be used to reveal needs and stimulate students' question. Thus learners' interest can be aroused, maintained, and stimulated to promote their imaginative power. On the whole, media ensures the application of classroom-oriented communication techniques. 4.3.5 Effective Use of Instructional Materials It is wrong to bring into the class those instructional materials that cannot be easily used to convey facts, ideas and concepts to the pupils. This means instructional materials are not just selected on the basis of their attractiveness but on the basis of certain criteria that will ensure their effectiveness in the teaching and learning processes. In order to

138 make the best use of instructional materials, the following criteria should be considered: (a) Reliability: As much as possible, teachers should make sure that the instructional materials are so selected that they can be used to achieve the objective of a particular lesson. The instructional materials must be relied upon to achieve the objective of the lesson. (b) Relevance: Care must be taken to ensure that only instructional materials that relate to the topic are used while teaching. (c) Cost: The instructional materials should be within the reach of the teacher or the school. The cost of the instructional materials will determine whether it can be bought and used or not; otherwise the teacher selects only those instructional materials that cost less. Beside the above criteria, to ensure the best and maximum use of instructional material the following suggestions may be considered. i. Workshops and seminars should be organized from time to time for teachers where they would be taught not only how to produce instructional material but also how to use them effectively for the achievement of educational goals. ii. Resources centers should be established at strategic locations and be well equipped with instructional materials where teachers could loan from. To this end, the resource centers should be brought near teachers, suffice is to say the centers should be developed in all educational institutions. iii. The availability of reference texts and instructional materials are very vital for high academic performance, while, teachers should make efforts to improvise some of these materials, the educational authority should play their own role by making these materials available in schools. iv. Government should provide assistance in the area of book publishing so that cheaper and more qualitative useful text books can be produced in English. v. Storage is an important factor that influences positive or negative use of instructional materials. Storage facilities should be provided where they could be stored for use at a later date. vi. Parents should be enlightened on the significance of the study of English for their children in order to benefit fully from the new education system.

139 Check Your Progress-1 Q1. Why is a television more approachable by the students than a radio?

.....
.....

..... Q2. Instructional materials are the real teachers in an open and distance learning system, why?

..... Q3. Mention the three criteria to be taken into consideration while selecting instructional media.

..... 4.4 The Use of Instructional Material for ELT (English Language Teaching) There are several inherent advantages in the use of media by the teachers. First, effectively used media is vital for encouraging and facilitating students' learning. Second, through the use of media, subject content can be more carefully selected and organized. Thus, the quality of instruction delivered by teachers can be improved as subject content can be delivered in a well-organized, consistent, specific, and clearly defined manner. Third, the delivery of instruction can be much more standardized as learners with varying abilities can receive the same message and their individual differences catered to using media. Let's discuss about some instructional materials that can be used by the teacher of English to make the teaching learning transaction effective. 4.4.1 Smart Board A SMART Board is a brand of interactive white board. It is a large touch-sensitive whiteboard that uses a sensor for detecting user input (e.g. scrolling interaction) that are equivalent to normal PC input devices, such as mice or keyboards. A projector is used 140 to display a computer's video output onto the whiteboard, which then acts as a huge touch-screen. The SMART Board usually comes with four digital writing utensils that use digital ink replacing the traditional whiteboard markers. The digital ink works by using an active digitizer that controls the PC input information for writing capabilities such as drawing or handwriting. Older versions of the SMART Board only worked with one point of contact on the board, so multiple people could not be touching the board at the same time. The newer models are equipped with multi-touch technology, which allow up to four students to collaborate using the board by responding to multiple touches at the same time. This means two students could be solving a math problem at the same time on the board or label a diagram together easily. A wireless keyboard and mouse can be used with it, so also a write-on tablet which allows interacting with the tablet and having everything appear on the projected screen. Both the wireless mouse and the write-on tablet are great tools because they allow the teacher to circulate the room, which is essential for good classroom management, while still interacting with the screen at the front of the classroom. Older SMART Boards used clickers, wireless handheld devices that can be connected to it so students can answer quiz questions and Polls.

There are several advantages of bringing in a SMART interactive whiteboard into a classroom setting. Here are some of the advantages of SMART board for English Language Teaching.

1. Provides Flexibility: Interactive whiteboards allow many different forms of media – including photos, illustrations, maps, graphs, games, and video, to be displayed. These tools not only enrich the classroom experience but also help to expand the nature of content that can be used in learning. In addition, SMART Boards makes learning to be more dynamic owing to the different forms of presenting information.
2. Enhances teaching/learning experience: SMART Boards provide new ways for teachers to teach, and students to learn. These tools support a wide variety of learning styles. For instance, visual learners can watch as their tutors use the whiteboards to project visual elements, whereas audio learners can listen and have discussions. On the other hand, the Boards come with touchscreen capabilities that allow tactile learners to touch and interact with the board.
3. Interactive and Sharing: The interactive nature of SMART boards offers learners an opportunity to share and participate in the instructional process. Interactivity provides a platform for students to demonstrate their grasp of the subject through touching, drawing, and writing. Every learner has an opportunity to participate or contribute to the presentation and/or discussion via notebooks and tablets. In addition, the boards provide for rapid assessment whereby learners can receive immediate feedback. Teachers and students are able to identify individual strengths and weaknesses in various subject areas and isolate areas/topics that need more focus or review.
4. Low-Maintenance: SMART Boards are neat and easy to use. There are no hassles in cleaning or maintaining whiteboards. The data on the screen can be modified using a specialized highlighting tool or pen. There is no need for using unhygienic chalk or marker pens.
5. Access to Online Information & Tools: SMART boards allow learners to easily access a rich database of online resources. Teachers can use the wide variety of online information sources such as knowledge databases, online video and news items to reinforce their lessons. Learners can also quickly access the wide range of powerful tools and resources to conduct research and supplement their usual study material.
6. Going Green: Interactive boards are also environmentally friendly. They offer teachers an entirely different way of presenting information to students, which eliminates the need for writing, printing or photocopying. Which, contribute to eliminate waste and pollution, from over-utilization of paper and ink.
7. Technology Integration: SMART boards allows for integration of various technologies in order to improve the learning experience. For instance, it is possible to attach tools such as microscopes, document cameras, cameras or video cameras to a whiteboard to aid in instruction. It is also possible to integrate the interactive learning tools with a wide range of software applications.
8. Communication: Interactive whiteboards allow for connectivity in different locations; making ideal collaboration and distance learning environments. When using SMART boards, student show to increase student-to-student collaboration and increase overall participation in the lesson.

4.4.2 Chalk Board

A Chalk Board is used to present instructional content and for delineating ideas. When integrated with other media, it can give full explanation. However, most teachers do not use chalk. But the teacher of English must use it to explain concepts, write difficult words, draw diagrams and provide useful descriptions. Neatness of the chalkboard must be ensured through the use of guidelines, templates, compasses and straight-edged rulers. Chalkboard should be divided into sections. Lettering should follow the occidental form of lettering, that is, from the left sector of the chalkboard to the right. Or use of only the middle portion of the chalkboard can be used. Chalks to be used for teaching must be in the form of wedges and cones so as to give uniform thickness of line. Coloured chalks may be used when it is appropriate to show distinction among parts of drawings and for emphasis of teaching points.

4.4.3 Flannel Board

It is basically a story-telling board covered in a flannel or felt material that teachers can use with young learners to tell visual stories with pictures, and a variety of other manipulatives that are made from felt cut-outs. Flannel boards can come in a variety of sizes and can be mounted on a wall or be a smaller table-top style with an easel that easily folds up to be put away.

Flannel board sets are soft, colorful felt cutouts of shapes, alphabets (upper and lower case) colors, numbers or story characters and props. Commercial sets can be found for fairy tales, nursery rhymes, popular literature, safety lessons, maps, the seasons, calendars, animals (zoo, jungle, farm, pets, etc.), special holidays, dinosaurs, multi-cultural ideas, Bible characters, games, transportation and many more early childhood themes. They can be purchased, pre-cut or teachers and caregivers on a budget can make their own designs from felt.

Encouraging a child to re-tell a story or a number sequence or identify colors and shapes is a great independent activity as well as

fun. Re-telling reinforces learning and abstract concepts. Young learners will gravitate toward this anyway if the materials are left on the board for their use. They will also make up their own creative stories using the flannel board shapes in a free-play setting. Children enjoy touching and feeling the soft manipulative shapes.

Below given are a number of pictures of different kinds of flannel board.

144

145 4.4.4 Picture and Picture Cut-outs Pictures and cut-outs are required for the young learners to understand the concept better. Pictures give concrete shape to our understanding of things and characters. They also give knowledge of the context. A picture is a useful instrument for the teacher of English to teach language to the young learners. There is a popular saying that says, "a picture is better than thousand words". Pictures are helpful in presenting abstract things in a concrete manner. As pictures are attractive, they hold the attention of learners easily. Moreover, illustration through pictures saves time and energy. Pictures are easily available everywhere. Relevant pictures can be found in newspapers, magazines, calendars and posters. The size of the picture must vary according to class size. However, the teacher must take the following factors into consideration while using pictures: i. Pictures should be hanged in such a place so that all students can follow ii. Pictures should be used at a particular point of discussion and then must be kept aside Picture cut-out is a special kind of picture cropped from the original picture in order to highlight a part of the picture under discussion. Generally a cut-out is highlighted by different colours or marked special by lines or boxes. Sometimes a cut-out is completely cropped up from the original picture and pasted on board for showcase. The importance of cut-out is that it emphasizes certain aspect of the picture that is more important than the other. "Cut out" photography is a way to manipulate an image with the purpose to distinguish one or more items at the picture as if it was coming in or out of that very same photo. This is done to provide extra-focus to the matter of concern. This is done when we explain a particular part of the prose or poetry. For example, a cut-out picture of a valley can be pasted in a book or in a paper-board while explaining 'vale profound' of 'The Solitary Reaper'. A cut out photo creates a "visual assumption" and tangible impression of the matter under discussion. A teacher can use the cut-out picture of a grasshopper while explain John Keats poem the Grasshopper and the Cricket. Given below is the picture of a cut-out.

146 4.4.5 Charts When information is presented graphically, it is known as chart. Generally, charts are used when it is essential to present a large quantity of information or to present the relationship between parts of information. For the purposes of clarity, it is desirable to consider charts as a means of visualization with certain attributes. It may be defined 'as combinations of graphic and pictorial media designed for orderly and logical visualizing of relationships between key facts or ideas'. Edgare Dale defines chart as a visual symbol summarizing or comparing or contrasting or performing other helpful services in explaining subject matter. The main function of the chart is always to show relationships such as comparisons, relative amounts, developments, processes, classification and organizations. A chart can be in the form of a tree or in the form of a flow-chart or of a table chart. A teacher of English can use chart to motivate students, to show relationship between facts and figures and to provide abstract ideas in visual form. The following are some of the benefits of chart-

147 i. Charts help the learners to understand the difficult matter easily ii. Charts empower the skill of observation among the learners iii. New words in a lesson can be listed in a chart and displayed However, while using a chart a teacher of English should take the following into considerations: i. Charts should be visible to all learners at the same time; ii. Charts should be hanged in such a place that all students can follow iii. Charts should be used at a particular point of discussion, not for the whole time; after discussion it should be kept aside

4.4.6 Tape-records Tape-records are wonderful instruments for educating children. These are very useful particularly for language subjects. The students can have good listening and speech practices through this. A tape-record can be played, replayed as many times as one desires. This facilitates learning of content matter easily. Students can record their own practice of speaking and get feedback immediately. This instrument also helps to build up vocabulary knowledge among learners. A tape record has the following advantage: i. Facilitate Diverse Learning Objectives ii. Contribute to self-learning activities iii. They motivate learners psychologically iv. Involvement of learners v. Increases student's concentration vi. Accommodate individual needs vii. Help learning monitor the information input Tape-records are useful device for teaching listening and pronunciation skill. This is found in conventional language laboratory along with audio cassettes for the linguistic training of the students. Tape-record can be used to monitor the progress of language learners. Students can record their performance and can have self-feedback. Besides, a teacher of English can use it to support his/her teaching during the classes.

148 4.4.7 Radio Instructional radio allows educators a very economical means of information dissemination, and, permits them to reach a large numbers of students in a particular time. This medium is considered by many to have great potential in educational programming. In 1979–80, the AIR (All India Radio) conceived and implemented an experiment to use radio broadcast for language teaching. The experiment was conducted in collaboration with the department of education, Government of Rajasthan. Under this experiment an attempt was made to teach Hindi as a first language to school going children. The experiment was a success. Radio as an instrument has the following advantage: 1) Immediacy Books tell us about events that may have occurred long ago. Because they are not revised each other, may often be five or ten years out of date. But radio can be as upto date as the latest broadcast. 2) Realism An announcer who tells radio listeners what he sees as he sees it may be more impressive than a newspaper reporter dealing with identical matter. The broadcaster is on the scene, and tones of his voice communicate shades of meaning that the newspaper story, hours or days after the event, cannot convey. We may hear not only broadcaster's voice but also the background. We should bring the world to the school and school to the world, which a radio can do very effectively. But radio's realism lacks the pictorial quality provided by television & motion pictures. 3) Solves the problem of space and time Through on-the-spot broadcasts radio can actually overcome the barriers of space and time. 4) Emotional impact Radio brings dramatic feelings into the classroom. It has the warmth of drama; the personal feeling of actor's presence- it can carry to the listener all the emotional overtones of the broadcast materials. Human voice can be heard and its feeling and attitude conveyed even through one has closed his eyes. Sound alone can convey deep emotional experience with great poignancy. 5) Authenticity: Radio has been often used to bring two classrooms the first kind of expertness, authority in subject matter. Expertness in methods is also provided by radio.

149 6) Inexpensiveness: Radio can be used inexpensively when there is need to emphasize local problem or conditions of one kind or another because it reaches many people, its per capita cost is small. English as a language can have all these advantage to its credit. Radio is a powerful device for the learners of English. Students learn new vocabulary, their contextual use by listening to it. Radio also gives wide exposure of different subject matter relating to a target language. Because it has a variety of programmes students get the facility to know a wide variety of contents. Radio can also be used as a supplement to the class teaching. The teacher of English can select relevant programmes broadcast by different stations and made the students listen. We have a radio channel which is purely meant for educational purpose. This is known as GYANVANI. This is spearheaded by IGNOU. Now NSOU also joins hand with it. Besides this channel there are other channels where relevant programmes are broadcast for the learners. The teacher must make the learners aware of all these channels and initiate them to listen to these channels. It is said that more the listening the better the speaking. Radio provides that platform of listening to the potential learners. 4.4.8 Television Television is now considered the best medium of learning and entertainment for the learners. It now has a significant role in educating children through its various programme broadcasts. Information transferred through television is different from traditional education methods. Explanations related to the subject and examples can be presented visually, so the learner gets motivated, his/her desire for learning increases, and therefore learning and remembering become easier. Allowing thousands of people spread over a large and distance geographic regions to receive the same program at the synchronous time, television broadcast helps overcome the problem of inequality and imbalance among the regions by providing equality in opportunities. Television may grant positive motivation such as attracting the learner's attention to a certain point or arousing attention with the movements of the camera's coming close, going away, and reflecting details. Invisible or virtual objects, today, can be animated with different expression methods such as cartoon films. It enables distinguished instructors to reach a large mass of students at the same time. The most distinctive specialty of television is its ability to present information to the student which other tools cannot. Television is an effective tool in expressing abstract concepts or ideas. Abstract concepts are usually produced and conveyed with words. Besides this, in making an abstract concept concrete, the role of animation and visual experimentation is very important. The limitation here is how to combine the text, which is involving information, with moving views, animation, concrete ideas, utterance and objects like pictures. Television in the learning process could be helpful in understanding abstract ideas directly.

150 The teacher of English can suggest students to watch news channels and programmes which can benefit their knowledge of English. Students learn many more concepts, theories and contents through television. This is a popular medium because it uses both auditory and visual stimuli simultaneously. Different educational agencies like the SIETs use television for educational purposes. They telecast programmes for various classes and in all subjects during the school hour. The teacher of English can use this as a medium of learning for the students. Besides, we have a programme called GYAN DARSHAN telecast by IGNOU. This can hugely benefit students. The additive property of television is that it provides visual stimuli to the learners which they like most. It catches the very attention and psyche of the learners. So students learn easily and quickly through this medium.

4.4.9 Films and Film Strips Films are the most popular media now-a-days. The most attractive part of a film is its movability. Film projectors and videotape projectors are used to project motion pictures, when motion is a significant factor of a subject. Educational films are in black and white, and colour. There are also sound and silent motion pictures. Videotape availability has further widened the possibilities for the use of motion pictures, as they can be shown through monitor, that is, cathode ray tube, or projected using video projector or through the digital projector, for group use. Motion pictures are relevant for all subject disciplines, but much more helpful for students of literature subjects like English. Motion pictures when accompanied by sound may constitute a very effective way of emphasizing distinctive features for the tasks, which needs distinguishing the visual aspects of simulation. Motion pictures are also very good for ensuring students' positive attitude toward the subject of instruction. They can also be used to modify students' attitude. Filmstrip projectors project images contained in filmstrips, which are series of small slides photographed in permanent sequence on a 35mm or 16mm film either in colour, or black and white. Some filmstrip can also be used to project slides. Teachers can use filmstrips and slides to enrich their instruction. They are less expensive, easily handled and stored for future use. They are adaptable for use in every subject area, and the rate of presentation for classroom use can be controlled by teachers using remote, reverse, and advance mechanisms.

4.4.10 Overhead Projector From the name of the equipment itself, it would be evident that in overhead transparency projector, the projected image is obtained behind and over the head of the instructor. The OHP reflects images coming from a powerful light that shines through a transparency on a screen by means of tilted, highly polished mirror and lens assembly. The image is

151 bright enough to be seen even in a lighted room. The projector area ranges from 3"x3" to 10"x10". Normally overhead projectors are compared to a projection lamp, to act as a source of light, condensing lenses to concentrate all the light into usable beam, a polished mirror and lens assembly and a blower for cooling the system. Using the overhead projector, transparent materials are projected so that a group can see. It is simple to operate, and it is a versatile media for teachers to use. A teacher can maintain eye-to-eye contact with students while projecting transparencies in a lighted room. The following are some of the advantages of overhead projectors.

- A large image in a minimum projection distance is obtainable
- Permits the instructor to face the class as he writes or indicates points of importance on the transparency
- Projected images obtained could be seen even in a lighted room
- Simple and convenient to operate the equipment
- Low cost, home-made materials could be used in minimum time.

Below given is the examples of overhead projector.

152 4.4.11 Language Laboratory Language laboratory is an audio-visual mechanism used in modern teaching methods to learn the target language, which here is English. It provides an extensive platform to the learners to learn the target language. English being a foreign language demands better practice and exposure. Language laboratory provides that opportunity to the learners. Basically, language laboratory is a room having equipment and infrastructures of linguistic nature in order to promote language proficiency of the learners. There are different kinds of language laboratories. Let's deal all these in nutshell. i. Conventional Laboratory: this is the most traditional type laboratory among all. The laboratory has a few audio cassettes and a tape-recorder of the target language. This laboratory is useful for teaching pronunciation to the students. ii. Lingua Phone Laboratory: This is an improvised version of the conventional laboratory where the learners are provided with a headset to listen to audio cassettes being played. iii. Web Assisted Language Laboratory: it uses computer with an internet connection to teach language. The language course materials are easily available on computer and are collected on the demand of the learners. iv. Multi-Media Hi-tech Language Laboratory: this laboratory uses softwares available in the market for language learning. The lab has all kinds of equipment necessary for language teaching. Advantages of Language Laboratory: i. The lab provides a controlled atmosphere where it is easy to monitor the student and their practice of language. ii. The students can evaluate their own performance and can have self-feedback. iii. The lab also adds on understanding of the subject matter as it makes use of different media simultaneously.

4.4.12 Language Games Psychologists believe that learning should be a pleasurable and rewarding experience. Children tend to learn more when they are tension-free. They can and do learn a lot of things through games. Language games have both fun and excitement for the learners

153 with an additive pedagogical purpose. It must be noted that language games would fail in their purpose if they are not planned in advance and used methodically and carefully. According to Peter Hubbard et.al, "Games are often wrongly regarded as an end-of- term activity or something to fill in the last five minutes of a lesson. In fact, they can be used at all stages of practice from controlled to free". Language games can be of four kinds: Listening games, speaking games, reading games and Writing games. The idea of play-way method of teaching English was proposed in the late 19th century as it was brought that interesting games, if included in the teaching activity, could increase the motivation of the learners; learning will take place in an atmosphere of freedom and enjoyment. This idea has been incorporated in all the late methods of teaching English in the form of language games. Language games can introduce a healthy competition among the learners in English classes. They are useful for improving the learner's knowledge of vocabulary, grammar, and his language skill. Young learners learn better and faster if learning involves fun and excitement. Language game is such a technique that makes the learning attractive and lively. Generally a language game is introduced as a preliminary activity to communicative teaching lesson. It can also be used for vocabulary and grammar teaching. The effectiveness of games depend on various issues such as class size, division of students into groups, nature of the game, attitude of the learner towards the game etc. Games ignite thinking ability of the learners and bring maximum involvement of learners. Here are some guidelines for making the games attractive– i. The class should be divided into several groups of equal size; ii. Students of various capabilities are to be there in a group; iii. Games are to be presented in the form of a puzzle or problem; iv. Newer games are to be attempted always. Repetition brings monotony. Types of Language Games 1. Jumbled Words: Through this type of game the students are able to develop the skill of construction of a sentence and also sequence of words in. 2. Expanding the text: This type of expanding the text game is used to develop the skill of formation of sentences, to improve their grammatical knowledge and to improve the skill of concept and creativity. 3. Reading Aloud: This type of game is used to develop the skill of listening ability and also the questioning ability. 4. Word Card: Word card game is used for construction of sentences and to develop creative thinking coherence and continuity of writing skills.

154 5. Three Picture Story: It helps to develop the skill like creativity in speech, imagination, pronunciation and sentence formation. Role of Language Games in Language Teaching A language is learnt by using it and this means by using it in situations and communicatively. Disembodied sounds, words, phrases and sentences, however wrapped about with rules, do not carry language remove such elements and look at them closely, much as them to the intermingling streams of discourse. The situations which bring a foreign language to life in the classroom are provided by gestures, by handling and touching things, by incidents and activities, by pictures, by dramatization, by interesting stories spoken or in print and not least by certain contests and games. In these the language is linked with action and is no longer a disembodied thing. Games therefore should not be regarded as a marginal activity, filling in odd moments when the teacher and class have nothing better to do.

Language learning itself is complex and many sided as a matter of four communicative skills. One more introductory point is that the game brings teachers and learners into a more agreeable and more intimate relationship, and that too helps to ease and process of learning and teaching. Language games, if organized well with care and interest, help the learners, especially the young ones acquire a lot of language, because while playing a game learners have opportunities to learn without stress and anxiety, which is good for learning. The teacher uses a lot of language without conscious attention on it and this language is useful for acquisition. These serve as a valuable input for language acquisition in a tension-free situation.

4.4.13 Reading Cards

Reading cards are otherwise known as flash cards. Flashcards are small cards with a picture or symbol on them used both in teaching and in development work. In the classroom, flashcards are commonly used to teach reading. A picture, for example, of an elephant may be drawn or stuck on a card and the word 'elephant' written underneath it or on a different card. The students are encouraged to associate the pictures and the words through various 'look and say' activities and games, for example, Kim's game, Pairs, and so on. In teaching and development work, flashcards may have pictures, symbols drawn or painted on them. They are particularly useful for stimulating discussion in small groups, as well as for sharing information and reminding people of a recommended process with posters, research the local situation and pre-test them. To use flashcards in a classroom situation, such as learning to read, show the picture and the word together. Ask students to look at the picture and say the word. Then they look at the word and say it again. After presenting a number of words with pictures that the students already know, ask for volunteers to come out and match pictures and words. When the students have learnt to read the words, you can divide them into teams and play reading games using the flashcards. Below here given an example of a reading card.

Animal Cards : Lucy, in her blog Bakei my smile, refers to 'Animal Cards' to teach firstgrade kids about different reading strategies. She cards were called—Chunky Monkey, Stretchy Snake, Eagle Eye, Flip Flop Froggy, Lips the Fish, Turtte Talk and so on. Each brightly coloured picture card signified some activity like— (a) Chunky Monkey—break the word into smaller chunks. (b) Stretchy Snake—Identify the Sounds in the Words. (c) Eagle Eye—Look at the words and pictures carefully. (d) Hip Hop Froggy—Try using short and long vowel sounds to see which one sounds right. (e) Lips the Fish—Make the initial Sound with the lips. By holding up each card, the learners were basically shown some writter instructions which they read and were urged to perform accordingly.

4.4.14 Worksheets

Worksheet commonly refers to a sheet of paper with questions for students and places to record answers. A worksheet lists questions or activities for students to work through. Pre-prepared worksheets can be used successfully with groups with differing abilities or language skills because each person can work at their own pace. Worksheets can be used for homework or a revision programme, or they can include further details to be studied for the next lesson. Worksheets provide flexibility in the classroom as well as in the workshop, because they can be used individually, in pairs, or in small groups to facilitate teamwork skills. Through worksheets children learn in different ways by engaging themselves in various activities like colouring, drawing, solving exercises and puzzles. Below given the example of a worksheet where a learner has to complete the information about himself/herself.

4.4.15 Handouts

Reading handouts give students activities to complete or questions to answer whilst reading. The handout contains key points which will be the same for all students.

It spares student tedious note-making and thereby help them in the greater concentration

on the lecture. But the information it provides is partial and relies on the students completing the information either from the lecture itself, or from further reading thus removing the passive element in a situation where all the information is provided.

Given below is an example of handout for your better understanding.

4.4.16 Power Point Presentation

Power point involves combinations of visual and/auditory materials. It is a learning resource package, which can be effective when several media are used concurrently for specific instructional purposes. Power point is a multi-media approach of education where there is the use of many medium simultaneously. Using multimedia or multi-image, a large amount of information can be passed across to students, and high interest can be created in students. Furthermore, different media can be tailored towards different objectives outlined for the lesson.

Power Point has become very popular in teaching

because it's easy to learn and widely available. It provides the ability to equip a teacher's

presentations with different types of media - including images, sounds, animations, and much more. This enhances the students' abilities to retain what they're being taught, especially those who are visual learners. Teachers can focus on the class and interacting with the students instead of writing on a board, because the text and the entire presentation are already there in the form of a

Power Point file. PowerPoint helps structure the content and processing of a lesson or lecture. Aiding note-taking (and thus facilitating study) is another purported advantage of using PowerPoint. Students like the lecture outline and graphs on the screen, and it has a positive influence on students. PowerPoint enhances instruction and motivates students to learn. PowerPoint encourages and supports teaching learning process by facilitating the material presentation. The template provided is designed to default to good presentation criteria such as the number of lines of information in each slide and appropriate font sizes. The use of the default templates can improve the clarity and the arrangement of a presentation. It helps the teacher avoid the common use of excessive text often found on OHV (Over Head Projector). PowerPoint is able to perform a variety of manipulations, such as editing text before printing it out, and the teacher can add new slides for adding new materials. PowerPoint is also fun to be applied and fun to watch. It is not hard to learn in one hour. It allows the users to reflect on a lesson and correct any changes, and they can create the perfect lessons and are being able to print them out.

159 Using Power Point improve the students' learning motivation, increasing authentic materials for study, encouraging interaction between the teacher and the students. Many concepts of grammar and other linguistic items can be best taught through power point presentation. Check Your Progress-2 Q1. Construction of Teacher Made Test for English Proficiency

Teacher-made test is the major basis for evaluating the progress or performance of the students in the classroom. English as a foreign language needs a comprehensive process of evaluation by the teacher. Moreover, it is a skill based subject. The four skills of listening, speaking, reading and writing need elaborate testing so that learners' proficiency can be easily deciphered. Let us discuss about the construction of a teacher-made test. Steps in Constructing Teacher-Made Test 1. Planning the Test. In planning the test the following areas are to be taken into consideration:

the objectives of English Language Teaching,

the purpose for which the test is administered, the availability of facilities and equipments, the nature of the testee, the provision for review and the length of the test.

A thorough planning makes a test comprehensive and valid. 2.

Preparing the Test. The process of writing good test items is not simple – it requires time and effort. It also requires certain skills and proficiencies on the part of the writer. Therefore, a test writer must master the subject matter he/she teaches, must understand his testee, must be skillful in expression and be familiar with various types of tests. 3.

Reproducing the Test. In reproducing test, the duplicating machine and who will facilitate in typing and mimeographing be considered. 4. Administering the Test. Test should be administered in an environment familiar to the students, sitting arrangements is observed, corrections are made before the start of the test, distribution and collection of papers are planned, and time should be written on the board. 5.

Scoring the Test. The best procedure in scoring objective test is to give one point of credit for each correct answer. In case of a test with only two or three options to each item, the correction formula should be applied. Example: for two option, score equals right minus wrong ($S = R - W$). For three options, score equals right minus one-half wrong ($S = R - 1/2 W$ or $S = R - W/2$). Correction formula is not applied to four or more options. If correction formula is employed students should be informed beforehand. 6.

Evaluating the Test. The test is evaluated to know

the quality of the student's responses and the quality of the test itself. Index difficulty and discrimination

161 index of the test item is considered. Fifty (50) per cent difficulty is better. Item which are 100 per cent answered and zero (0) per cent answered by students is

valueless in a test of general achievement. 7. Interpreting Test Results. Standardized achievement tests are interpreted based on norm tables. Table of norm are not applicable to teacher-made test.

As our concern is on teacher-made test, let's delimit our discussion to it. Norm is not essential for it.

Types of Teacher Made Test I. Essay Examination Essay examination consists of questions where students respond in one or more sentences to a specific question or problem. It is a test to evaluate knowledge of the subject matter or to measure skills in writing. It also tests students' ability to express ideas accurately and to think critically within a certain period of time. Essay examination maybe evaluated in terms of content and form. In order to write good essay test, it must be planned and constructed in advance. The questions must show major aspect of the lesson and a representative samples. Optional questions

are to be avoided and large number of questions with short answer are to be preferred

rather than short question with very long answer. According to Monroe and Carter there are twenty types of essay examination as cited by Calmorin, 1994.

These are as follows:

a. Selective recall. The basis is given. Example – Name the four types of skills in ELT and their function in the classroom.

b. Evaluating recall. The basis is also given here. Example – Name five strategies by which one can be a good reader of English.

c. Comparison of two things (specific). There is one single designated basis. Example – compare the type of mother tongue influence that is found in grammar translation method and that of direct method. d.

Comparison of two things (general). Here comparison is made between two things in general. Example – compare grammar translation method with direct method.

e. Decision (for or against). Example – In which in your opinion, can you do better, an oral or a written examination? Why? 162 f. Cause or Effect. Example – Why is

listening a pre-requisite for better speaking?

g. Explanation of the use of exact meaning of some phrases or statement in a passage. Example – What does 'melancholy song' signify in the poem "The Solitary Reaper"?

h. Summary of some unit of the test or some articles read. Example – Summarize the first two paragraphs of the poem "The Solitary Reaper". i.

Analysis. (The word itself is seldom used in the question). Example – What are the characteristics of active listening by which you can differentiate it with passive listening?

j. Statement of relationship. Example – Why is the knowledge of grammar an essential for better writing? k. Illustrations and examples of principles of construction in language, etc. Example – From your own experience give three examples of the use of adverbs in your daily life. l. Classification. Example – To

which skill of language does 'debate' belong to?

m. Application of the rules or principles in new situations. Example – Why should

the mechanics of writing be taught before the students are taught free writing?

n. Discussion. Example – Explain briefly the four skills of ELT. o. Statement of aim. Example – State the principles of better writing. p. Criticism. As to the adequacy, correctness, or relevance of a pointed statement or student's answer to a question on the lesson. Example – What is wrong with the statement "Practice makes perfect". q. Outline. Example – Outline the rules in constructing matching type test in English. r.

Reorganization of facts. (a good example of review-question to give training in organization). Example – Discuss how functional communicative approach can be used in Indian classroom. Does it require any modification? s.

Formulation of new questions, problems and questions raised. Example – What else must be known in order to understand the

skill of reading better other than the matter under consideration? t. New method or procedure. Example – Formulate a conversation between two strangers on the topic of 'giving information for a nearby fair'.

163

Advantages of an Essay Examination: a.

Easy to construct. In terms of preparation, essay examination is easier to construct. Thus it saves time and energy. b.

Economical. Economical when it comes to reproduction of materials. It can be written on the board. c. Trains the core of organizing, expressing and reasoning power. Encourage students to think critically and express their ideas. d. Minimizes guessing. Guessing is minimized because it requires one or more sentences. e. Develops critical thinking. Essay type questions call

for comparison,

analysis, organization of facts, for criticism, for defense of opinion, for decision and other mental activity. f. Minimizes cheating and memorizing. Essay test minimizes cheating and memorizing because essay tests are evaluated in terms of content and form and that an answer to question is composed of one or more sentences. g. Develops good study habits. It can develop good study habits in the sense that students study their lesson with comprehension rather than rote

memory. Disadvantages of Essay Examination:

a.

Low validity. It has low validity for it has limited sampling. b. Low reliability. This may occur due to its subjectivity in scoring. The tendency of the teachers to react unfavorably to answers of students whom he consider weak and give favorable impressions to answers of bright students

affects the reliability. c. Low usability. This kind of test is

time consuming to both teacher and students wherein much time and energy are wasted. d. Encourage bluffing. It encourages bluffing on the part of the testee. The tendency of the students who does not know the answer is to bluff his answers just to cover up his lack of information. If bluffing becomes satisfactory on an easy examination, inaccuracy of the measuring instrument may occur and evaluation of the students' achievement may not be valid and reliable.

e.

Difficult to correct or score. Difficulty on the part of the teacher to correct or score occurs as the

answer consists of one or more sentences.

164 f.

Disadvantages for students with poor penmanship. Some teachers

react unfavorable to responses of students having poor handwriting and untidy papers. Scoring an Essay Examination:

a. Brush up the answers before scoring. b.

Check the students' answer against the prepared model. c. Quickly read the papers on the basis of your opinion of their worthiness and sort them into five groups: 1) very superior, 2) superior, 3) average, 4) inferior, and 5) very inferior.

d.

Read the responses of the same item simultaneously. e. Re-read the papers in each group and shift any that you feel have been misplaced. f. Avoid looking at the names of the paper you are scoring. II. Objective Examination The two main

types of objective tests are the recall and the recognition. The recall type is categorized as to: a. Simple recall b.

Completion The recognition type is categorized as: a. Alternative response b. Multiple choice c. Matching type d.

Rearrangement type e. Analogy

Recall Type 1. Simple recall type. This test is one of the easiest tests to construct among the objective types where the item appears as a direct question, a stimulus word or phrase, or a specific direction. The response requires the subject to recall previously learned materials and the answers are usually short.

Example– Name the part of speech which is used to join two sentences.

165 2.

Completion test. This test consists of a series of items which requires the subject to fill a word or phrase on the blanks. An item may contain one or more blanks. Indefinite and overmutilated statements, keywords and statements directly taken from the book should be avoided.

Example: Mr. Mitra died --snake bite.(Use correct preposition in the blank).

Recognition Type 1. Alternative Response Test. This test consists of a series of items where it admits only one correct answer in each item. This is commonly used in classroom testing.

Some of the dichotomous alternative are true-false, right-wrong, yes-no, correct-incorrect, etc. Example: adverb qualifies a noun. (

true/false)

Suggestion for the Construction of Alternative Response Type: a. Items must be arranged in group of five and each group must be separated by two single spaces. b. Responses must be simple as TF, XY, etc. and if possible be placed in one column at the right. c. Avoid lifting similar statement from the test. d. Language to use must be within the level of students. Flowery words must be avoided. e. Specific determiners like all, always, none, never, not, nothing, no, are more likely to be false and so must be avoided. Moreover, determiners as may, some, seldom, sometimes, usually, and often are more likely to be true, hence, these should

also

be avoided. f. Qualitative terms as few, many, great, frequent, and large are vague and indefinite and so they must be avoided. g. Partly right and partly wrong statement must be avoided. Consider statement that represents either true or false. h. Ambiguous and double negative statements must be avoided. 2. Multiple Choice Type. This consists of items

having three or more plausible options. It is regarded as one of the best tests. This is widely used due to its flexibility and objectivity in scoring. In teacher-made test, it is applicable for

166 testing vocabulary, reading comprehension, relationship, and drawing inferences from a set of data.

Example: Bibhas --- for Benaras to offer puja to lord Shiva. (Carries out, Sets out, goes out)

Rules and suggestion for the Construction of Multiple Choice Items: a. The main stem of the test item may be constructed in question, completion or direction form.

b. Questions that tap only rote learning and memory should be

avoided. c. Use unfamiliar phrasing to test students' comprehension, thus avoid lifting words from the

text. d. Four or more options must be provided to minimize guessing. e. Uniform number of options must be used. f.

Arrangement of correct answers should not follow patterns. g. Articles "a" and "an" are avoided as last word in an incomplete sentence. This word gives clues. h. Alternative should be arranged according to length. Varieties of Multiple Choice Type items: a. Stem-and-options variety. This is commonly used in the classroom and other standardized test.

The stem serves as the problem and is followed by four or more options. b. Setting-and-options variety. The optional responses are dependent upon a setting or foundation which includes graphical representation, a sentence, paragraph, pictures, equation, or some forms of representation. c. Group-term variety. Consists of group or words or items in which one does not belong to the group. d. Structured-response variety. This makes use of structure response which is commonly used in testing natural science subjects. This test on how good the students are to judge statements which are closely related. e. Contained-option variety. This variety is designated to identify errors in a word, phrase, sentence or paragraph. 3.

Matching Type. This type consists of two columns in which proper pairing

167 relationship of two things is strictly observed. Column A is to be matched with column B. It has two forms: balanced and unbalanced, the latter being preferred. In balanced type the number item is equal to the number of option. In unbalanced type, if there are 5 items in column A there are 7 items in column B. Remember, the ideal number for matching type is 5 to 10 and maximum of 15. In constructing matching type, avoid using heterogeneous materials. Do not mix dates and terms, events and person and many others. the question item should be placed on the left and the option on the right. option column should be in alphabetical order and dates in chronological order.

Example: 1. _____ apples A. Yellow 2. _____ oranges B. Red 3. _____ bananas C. Purple 4. _____ plums D. Orange E. Blue 4.

Rearrangement Type. This type consists of a multiple-option item where it requires a chronological, logical, rank, etc., order.

Example: rearrange the following in their order to make a meaningful paragraph. (A) While doing so, we may also correct any distortions that we may discern (B) With all our experience and insight, we should be able to visualize them well in advance (C) The celebration of the 50th anniversary of the country's independence is a historic moment (D) Also, it is a time to consolidate on the gains that we have made (E) But, most of all, it is a time to gear up for the opportunities and challenges that lie ahead. (F) It is a time to introspect and evaluate what we have achieved in the last five decades

168 5. Analogy Type:

This type is made of items consisting of a pair of words which are related to each other. It is designated to measure the ability of students to observe the pair relationship of the first group to the second. The kinds of relationship may be: according to purpose, cause and effect, part-whole, part-part, action to object, synonym, antonym, place, degree, characteristics, sequence, grammatical, numerical and associations.

Example: a whale lives in the ocean, like wise find out answer for the rest using the same analogy and make sentences. car snake tiger

Advantages of Objective Type Test: a. Easy to score. It is easier to correct due to short responses involve. b. Eliminates subjectivity. This is due also to short responses. c. Adequate sampling. More items can be included where validity and reliability of the test can be adequately observed.

d. Objectivity in scoring. Due to short and one correct answer in each item. e. Eliminates bluffing. Since the students only choose the correct answer. f. Norms can be established. Due to adequate sampling of test. g. Save time and energy in answering questions. Since the options are provided, time and energy may be utilized properly. Limitations of Objective

Test: a. Difficult to construct b. Encourages cheating and guessing. c. Expensive. Due to adequate sampling, it is expensive in terms of duplicating facilities. Questions cannot be written on the board. d. Encourages rote memorization. It encourages rote memorization rather than memorizing logically because an answer may consist only of a single word or a phrase. A student's ability to think critically, express, organize and reason out his ideas is not developed. e. Time consuming on the part of the teacher.

..... Q3. What is an analogy type test item?

.....

..... 4.6 Teaching Portfolio

The Teaching Portfolio is a documented statement of a teacher's teaching responsibilities, philosophy, goals and accomplishments as a teacher. It is a flexible document, and can be used in a number of ways, depending upon the needs and interests of the faculty member.

Pat Hutchings, (1993) defines teaching portfolio as "a coherent set of materials, including work samples and reflective commentary on them, compiled by a faculty member to inquire into and represent his or her teaching practice as related to student learning and development." A teaching portfolio is a collection of documents that together provide a record of: The ideas and objectives of teaching The courses to be taught The methods to be used

170 One's effectiveness as a teacher How one assesses and improves his/her teaching

A good teaching portfolio is one that has clear statements of teaching responsibilities and goals, and solid evidence showing how those goals have been reached. A teaching portfolio is a dynamic document, and must be updated continuously. It becomes a lifetime record of a faculty member and his/her scholarly achievement as a teacher.

There are three major parts in a

portfolio: 1. Teaching responsibilities This section is typically a list with a brief explanation of the faculty member's teaching responsibilities. In essence it describes "What one does as a teacher"

with supportive narrative as to the content, level, size, special circumstances, or other relevant details about the courses. For example, the faculty member would list courses taught by title, term it was taught, number of students enrolled, whether a lecture or a seminar, etc. Also, any independent study courses, honors courses, or dissertation mentoring would be included here. 2. Teaching philosophy and goals Secondly, the teacher states his or her philosophy and goals for teaching. Here the focus is "Why one did it."

The following questions may be appropriate for this:

Given my responsibilities, what goals did I attempt to reach through my teaching? Why did I choose to teach in the manner I used? What was I trying to achieve as a teacher? What did I expect my students to gain from my course: mastery of content, critical thinking skills, etc? For example, an instructor may state that he or she wants the

students to develop critical thinking skills. Then the instructor explains that this goal lead to a different style of teaching beyond the content-based lecture to include cooperative learning activities and out of class research assignments. 3.

Evidence of effective teaching Finally, a collection of data and documents present a record showing how well the teacher met his or her teaching goals. This

concerns itself with the phrase "How one did it" and

includes a review and interpretation of the results of students, survey ratings,

171 peer review, alumni letters, teaching awards and classroom assessments of student learning. As in the example above in (2), if an instructor states as a goal that students should develop critical thinking skill, then evidence to show how this goal has been accomplished should be presented, e.g., results from exams, assignments and classroom assessments that show progress towards critical thinking skills, results from students' evaluations, etc.

Key Functions of a Teaching Portfolio is to: Collect evidence of teaching ability Contextualize the process of teaching

Summary data must be in a simple, readable format Focus on quality, not on quantity Organized and its various sections

relate to each other Allows for self-reflection Provide an opportunity to show one's personal style of teaching

Importance of a Portfolio for a Teacher of English? The teaching portfolio can serve many purposes for a teacher of

English. Some of these are: It reflects the teacher's goals as a language trainer It helps in assessing one's teaching

strengths and areas which need improvement It documenting one's progress as a teacher It generates ideas for future

teaching/course development It helps in identifying one's personal teaching style It helps to find out new ways of

gathering student feedback It helps the teacher in collecting multiple sources of evidence that document the

implementation of one's teaching goals and their success Check Your Progress-4

172 Q1. Mention three major part of a teaching portfolio?

..... Q2. What help can a teacher of English get from portfolio?

..... Q3. How can a portfolio be a part of continuous and comprehensive evaluation?

..... 4.7 Let Us Sum Up Instructional Materials, when carefully selected and integrated, can ensure that student develop the right attitude toward-instructional content. Furthermore, classroom interaction between the teacher and students can be enhanced through its proper use. The use of it would also promote teachers' efficiency in the design, production and handling of classroom transaction. With its judicious use teachers can make students' attitude more positive, encourage their self-motivation, demonstrate associated factors and ideas, highlight specific topics and concepts, encourage relevance and credibility, and enhance understanding. The teachers can also deliver their lessons with much more vigour. Teacher-made tests play important role in the evaluation of student's performance. These can be essay type or objective type. Essay type tests are essential for the measurement of higher order learning skills whereas objective type tests are useful in measuring the

173 factual and conceptual knowledge of the learners. The exceptional children are exceptional in all matters. They cannot get the benefit from the teaching learning material designed for normal children. Hence different kind of adaptations are essential for them to get the maximum benefit. There are some general provisions and also some specific provisions by which we can adapt the teaching learning material to yield the maximum benefit. 4.8 Answer to "Check Your Progress" Check Your Progress-1 Q1. Because a television satisfies both the auditory and visual thirst of the learners Q2. As teachers are not there in open and distance learning, the learners have a direct emotional attachment with the teaching learning materials. Q3. Reliability, relevance and cost are three criteria of selection of teaching learning material. Check Your Progress-2 Q1. Story-telling board, graphic board, sorting board, game board, creativity board and collection board are different kinds of flannel boards used in teaching English to the young learners. Q2. A picture cut-out is used to emphasize a particular part of subject matter under our discussion. By over emphasizing the concept we draw the attention of students as desired. Q3. A language game is a joyful and fun based activity through which learners are exposed to different kinds of linguistic items meant for developing their linguistic efficiency. Q4. Worksheets provide a package of linguistic items to the learners on any given concept or subject matter. It aims at developing mastery on that very subject matter. Check Your Progress-3 Q1. A teacher-made test is a technique of evaluation where the items are prepared by

174 the concerned subject teachers of the school in order to test the learning progress of students. Q2. In a recall type question the learner has to retrieve information purely from his/ her mind. But in a recognition type question the learner has the privilege to get the options for it. Q3. An analogy type test item is an item where questions are asked to find out relationship between two concepts. Check Your Progress-4 Q1. The three parts of a portfolio are teaching responsibility, teaching philosophies and goal, and evidence of effective teaching. Q2. The teacher of English can get the following helps from a portfolio. it documenting one's progress as a teacher it generates ideas for future teaching/course development it helps in identifying one's personal teaching style it helps to find out new ways of gathering student feedback Q3. A portfolio gives a comprehensive information about the teaching learning process in a given academic year. It is also a living record which means it is constantly updated. So it is both comprehensive and continuous. Check Your Progress-5 Q1. As these students are not normal and they have deficiencies to overcome, these learners need extra help in their learning. material adaptation will help them learn better. Q2.

Break tasks into smaller subtasks. Provide additional practice to ensure mastery.

Q3. If a disabled child is found Is reluctant talkers during group activities then give the child a turn to talk after another child who is particularly talkative. This gives the reluctant child ideas about what to say.

175

Has difficulty staying focused during small group activities, then have him sit in such a way that distractions are minimized, such as away from the window or door or next to quieter children. 4.9

Unit End Exercises Q1. Describe the role of instructional material in ELT. Q2. How are charts useful in ELT? Q3. Briefly explain different types of objective test items used frequently for testing English proficiency. Q4. How are adaptation in TLM helpful for the disabled learners. 4.10 References Association for Educational Communication and Technology (AECT) (1977). The definition of educational technology. Unit End Exercises 5.11 References 5.12 Webliography 5.1 Introduction It is a well-known fact that any teaching is
preceded by, collaborated with and succeeded by evaluation of different kinds without which the act of teaching would
lose much of its vitality. Any decision taken in the field of education is directly or indirectly associated with the system of
evaluation. English, being a foreign language needs quite a good attention in this regard. Evaluation helps the teacher
know his/her effectiveness as a teacher. It also helps him/her and the concerned authorities to take right kind of
academic decisions on the basis of assessment results. It helps in the promotion of the learners to the next higher course
of instruction. There are many more functions of evaluation. Let's study evaluation in the context of ELT (English
Language Teaching).

180 5.2 Objectives After having gone through the unit, the students will be able to: ? Know the concept and varieties of evaluation Know different language skills and how they are tested Know different evaluation tools in English and how best they could be adapted to suit the CWSN Understand the essentialities of individual assessment for disabled children Know the concept of error analysis and diagnostic test and will understand their needs in ELT 5.3 Evaluation - Concept and Need 5.3.1 Concept and Types of Evaluation Evaluation is a comprehensive term that includes the assessment of learners' ability, attitude and knowledge with the help of tools and instruments in order to take academic decisions about the learners. The terms which have association with evaluation are assessment, measurement, examination and test. Though these terms have different meanings but they are used in the context of evaluation. The meaning of the term assessment is closer to that of evaluation, which means judging the efficacy of a course of instruction or learners with the help of some measuring instruments with respect to certain pre-fixed standards. Measurement is the quantification of students' performance in a given test after instruction is carried out for a stipulated period. Examination is the process through which students' academic capacity is measured. Test is a tool or instrument through which examinations are carried out. Evaluation is 'formative' when it is carried out during the course of instruction in order to bring improvements in the proficiency level of learners. The teacher uses varieties of means to judge the performance of students during the course of instruction. This evaluation also helps the teacher know his/her skill in the teaching learning transaction. The example of a formative test can be class test after a chapter is over, periodical spelling test, periodical reading test etc. Evaluation is 'summative' when it is taken at the end of a course. It is used for promotional purpose. The students' performances are summarised and decisions are taken whether to promote them to the next higher class or not. The example of a summative test can be

181 the session-end test of class ix after which the decision of promoting the students to class x will be taken. Evaluation is 'diagnostic' when it tries to find out the inherent learning difficulties of learners. In course of their learning, some learners may not have satisfactory progress. This may happen due to various causes relating to the learner. Diagnostic test intends to find it out. For example, if two students of a particular class commit spelling errors then a diagnostic test relating to spelling may be conducted in order to know the causes of spelling errors. Evaluation is 'placement based' when it intends to select students for a required course of instruction. For example, if we want the best speaker in a school should be the secretary of debate club then we must select the best student-speaker from the existing talent pool. Evaluation is continuous when it happens all the time through numerous interactions of the teacher with the students. There is no specific time or place for it. An evaluation is said to be comprehensive when it tests the students in all three domains– cognitive, affective and psychomotor. 5.3.2 Need and Importance of Evaluation We now have an idea about the essentialities of evaluation in educational practice. Let us discuss it specifically. i. Evaluation helps in deciding the effectiveness of a course of instruction ii. Evaluation helps the teacher to know his ability and makes him/her aware of the academic loopholes iii. Evaluation helps to take important academic decisions iv. Evaluation gives feedback to the students about their performance and ability in any subject of discussion v. Evaluation promotes students into next higher classes vi. Evaluation screens students and selects the fittest candidate for right course of instruction vii. Evaluation brings motivation among the learners to learn new things Check Your Progress-1 Q1. How is formative evaluation different from summative evaluation?

.....
.....
.....

182 Q.2 When can be an evaluation comprehensive?

.....
.....
..... Q.3 Briefly state the importance of evaluation in educational process.
.....
.....

..... 5.4
Testing Language Skills and Language Elements (Vocabulary, Grammar and Phonology)

At all levels but the most elementary, it is generally advisable to include test items which measure the ability to communicate in the target language. How important, for example, is the ability to discriminate between the phonemes /i:/ and /I/? Even if they are confused by a testee and he or she says look at that sheep sailing slowly out of the harbour, it is unlikely that misunderstanding will result because the context provides other clues to the meaning. All languages contain numerous so-called 'redundancies' which help to overcome problems of this nature. Furthermore, no student can be described as being proficient in a language simply because he or she is able to discriminate between two sounds or has mastered a number of structures of the language. Successful communication in situations which stimulate real life is the best test of mastery of a language. It can thus be argued that fluency in English—a person's ability to express facts, ideas, feelings and attitudes clearly and with ease, in speech or in writing, and the ability to understand what he or she hears and reads—can best be measured by tests which evaluate performance in the language skills. Listening and reading comprehension tests, oral interviews and letter-writing assess performance in those language skills used in real life.

5.4.1 Vocabulary as a Language Element

One of the areas in which the first and second language speakers differ substantially is the use of vocabulary. The handling of vocabulary in both the cases is quite different. While it is expected that the native speakers are well aware of the common vocabulary 'use-patterns' the second language learners may not have that level of awareness. In case of English the same principle holds true.

183 The second language learners are very often economical with their use of words. This is because of the dearth of stock words and phrases they want to use. Hence they start pulling the near-meaning words or breaking the conversation and writing into segments that convey the meaning without using the correct word. For example, if a second language student wants to use the word 'sailor' but if he/she does not know the word or failed to remember it, s/he can express it saying the 'boat-man' or 'the person who goes deep into the sea'. This of course depends on the frequency of the word heard or read by the target learner. The lower the frequency of words, the lower is the probability of being used. Another factor that determines the knowledge of vocabulary is the learner's culture and personal linguistic world. The more the learner can relate words and phrases into his own world the more s/he learns. Not only that, very often the learners own mother tongue or first language intrudes upon the territory of the second language. Code-switching and code mixing are the examples of this. This happens due to the lack of exposure for the target language. In most cases the learners who are English- disadvantaged are because of their limited exposure of the target language and preponderance of first language upon the later. Any second language learner of English must know at least 2000 most commonly used words in order to prove him/her as a good communicator. Learners face more difficulty in using functional words and chunk words, such as get a job, make coffee than the so called common words.

Testing Vocabulary

A test of vocabulary measures students' knowledge of the meaning of certain words as well as the patterns and collocations in which they occur. Such a test may test their active vocabulary (the words they should be able to use in speaking and in writing) or their passive vocabulary (the words they should be able to recognize and understand when they are listening to someone or when they are reading). Obviously, in this kind of test the method used to select the vocabulary items (=sampling) is the utmost importance. While testing a student's vocabulary the first task here is to determine the degree to which we want to concentrate on testing the students' active or passive vocabulary. The next task is to decide whether lexical items in the test should be taken from the spoken or the written language. Vocabulary as a language element pervades in all the four skills of language—listening, speaking, reading and writing. We can test knowledge of vocabulary through all these elements. Let's discuss one by one.

1. Test of Vocabulary through Listening Comprehension

Here the learner is to be exposed of an audio programme for a period of 15 minutes to 30 minutes. Then s/he is to be asked to describe the theme of the audio matter within

184 five best words. Or the learner may be asked to give a title for the audio talk s/he has listened. The time limit and word limit may vary according to the maturity of the students. A marking scheme is to be built on the theme of the audio programme and it is to be clearly decided about how much number is to be given for what kind of words and phrases. Here, a possible list of words and phrases are to be prepared in advance to make the evaluation ease.

2. Test of Vocabulary through Oral Production Tests Conversational exchanges At first a class is to be divided into pairs. The teacher must arrange the pairs in such a way that meaningful conversation can take place. A theme or concept is to be given to each of the pair to make conversation. The time limit and word limit may vary according to the maturity of students. The teacher will prepare a rating scale on the theme/s and will assign marks to the students. The best use of vocabulary will get the highest mark. Using pictures for assessing oral production Some pictures are to be selected as per the maturity of the students. Then they are asked to describe the pictures. Here, with the usage coherence and cohesion are also to be judged. For this a comprehensive marking scheme is to be prepared. The short talk Learners are asked to give a short talk of 5-10 minutes based on a theme or concept. The list of potential vocabulary is to be framed. Learners are awarded marks as per the use of vocabulary. Group discussion and role playing Learners are given topics on which group discussions can be carried out. The flow and fit of vocabulary is measured for each learner by an expert or by the teacher. The same can be done with role-playing.

3. Test of Vocabulary through Reading Test Matching tests (word matching, sentence matching) Matching is a linguistic game which can be used to promote knowledge of vocabulary among young learners. The learners are asked to match column 'A' with column 'B' finding appropriate resemblance for each other. Below given are the examples of two different kinds of word matching, one is relationship-based and the other picture-based. Both are helpful in building up vocabulary talent among learners.

185 Similarly, sentence matching test can be given to learners of higher grade. Below given are the examples. rain no neck coat car ring night glasses out gown over fit sun coat under bag hand wear

186 Completion items This is another way to test learners' vocabulary talent. Here a sentence is given to the taste and somewhere in between there lies a blank space to be filled by the learner with correct word or phrase. Here is an example for your better understanding. There are some people who think that only the poor and less educated people use slang, but this idea is _____. (A) accurate (B) popular (C) erroneous (D) widespread (E) ineffectual

Rearrangement items Rearrangement items are a bit developed form of testing vocabulary talent of young learners. These tests are for higher grade learners and for the students who at least read English for four to five years. This type of item not only tests the knowledge of vocabulary but also the higher order cognitive skills like analysis, synthesis and evaluation. Let's take an example. In this example the learner is given six sentences of which the first and sixth are in order. s/he has to rearrange the rest four in their perfect order in order to make the theme meaningful. (1) Even though he had prepared well P. in the examination hall Q. and could not do R. for the examination S. he got nervous (6) as well as he had hoped to do

Cloze Test A test in which one is asked to supply words that have been removed from a passage in order to measure one's ability to comprehend text. Cloze tests provide evidence of how easy a text is to read and understand for a specified target audience.

Cloze

reading tests are used by teachers to measure how well a student comprehends a reading

passage. Cloze reading exercises are short passages or paragraphs where you supply the missing words which have been removed from the test's passage.

187 A Cloze Reading Test can be referred to as a "deletion test", as key words in the passage are left blank or deleted for you to fill in. Close Test activity or procedure is also referred to as an English exercise or assessment quiz. Cloze tests are great vocabulary builders and are indicative of your level of English comprehension. Cloze reading test can be multiple choice, where you may be required to choose from a list of words to "fill in" the blanks, or be required to select the best word to complete the sentence based on your vocabulary skills. In the latter, the students' answers may vary but are required to make grammatical sense.

Below given is an example of cloze test.

Cloze Practice Paragraph Can we see (1) the earth is a globe? Yes, we can, when we watch a ship that sails out to sea. If we watch closely, we see that the ship begins (2) The bottom of the ship disappears first, and then the ship seems to sink lower and lower, (3) we can only see the top of the ship, and then we see nothing at all. What is hiding the ship from us? It is the earth. Stick a pin most of the way into an orange, and (4) turn the orange away from you. You will see the pin disappear, (5) a ship does on the earth. 1. A. if B. where C. that D. whether E. when 2. A. being disappeared B. to be disappeared C. to have disappeared D. to disappear E. having disappeared 3. A. until 188 B. since C. after D. by the time E. unless 4. A. reluctantly B. accidentally C. slowly D. passionately E. carefully 5. A. the same B. alike C. just as D. by the way E. similar to

4. Test of Vocabulary through Writing The knowledge of vocabulary is best tested through writing skill. But for it the learner must be prepared enough and must have mastered the other skills. Let's discuss some of the means through which we can test the vocabulary talent of learners. Testing composition writing A composition is a piece of writing formed by putting together the ideas you have on a subject. This suggests two important points about writing a composition. The first is that you must have some ideas on the subject about which you are going to write. The second is that you must be able to put these ideas together in such a way that they will form an effective whole. For this along with other skills one primary need to write better composition is having a good stock of vocabularies. A composition can be controlled or free. For young learners controlled and guided composition is better. When the learner develops maturity in writing then only free composition can be introduced to test him/her.

189 5.4.2 Grammar as a Language Element Grammar is the study of how words come together to form sentences categorized by meaning, form, and function, English words fall into various parts of speech: nouns, pronouns, verbs, adjectives, adverbs, prepositions, conjunctions, articles, and interjections. One can communicate more clearly if s/he understands how each of these parts of speech operates in a sentence. The ultimate goal of teaching grammar is to provide the students with knowledge of the way language is constructed so that when they listen, speak, read and write, they have no trouble applying the language that they are learning. Language teachers are, therefore, challenged to use creative and innovative attempts to teach grammar so that such a goal can successfully be achieved. In other words, whatever exercises are given, the most crucial thing is that the teachers provide the students with an opportunity to be able to produce the grammatical item making use of syntactically and semantically correct examples of sentences comprised of appropriate and relevant vocabulary. However, the knowledge of grammar of a second language learner in India (which is English here) has the following three features.

is accurate and follows the rules of English is influenced by the learner's first language conforms to a typical pattern of language development which does not reflect English or the first language

These above features say us about two kinds of knowledge that a learner usually possesses—explicit and implicit. Explicit knowledge is generally accessible through controlled processing. In short, it is conscious knowledge of grammatical rules learned through formal classroom instruction. In this respect, a person with explicit knowledge knows about language and the ability to articulate those facts in some way (Brown, 2000). For instance, Ramesh knows every rule about present tense, but he frequently makes mistakes in speaking and writing. Explicit knowledge is also obtained through the practice of error correction, which is thought to help learners come to the correct mental representation of a rule. the speaker is concerned with the correctness of her/his speech/written production; and s/ he knows the correct rules (Krashen, 1987). Implicit knowledge is automatic and easily accessed and provides a great contribution to building communicative skills. Implicit knowledge is unconscious, internalized knowledge of language that is easily accessed during spontaneous language tasks, written

190 or spoken (Brown, 2000). Implicit knowledge is gained in the natural language learning process. It means that a person applies a certain grammatical rule in the same way as a child who acquires her/his first language (for example, mother tongue). According to Brown (2000), the child implicitly learns aspects of language (for example, phonological, syntactical, semantic, pragmatic rules for language), but does not have access to an explanation of those rules explicitly. As an example, Rohit speaks and writes English with good use of present tense, although he has no idea about the grammatical rule behind it. To sum up, implicit knowledge is gained through a sub-conscious learning process. That is why native speakers of a language do not always "know" (consciously) the rules of their language. Now, let's come to the question of teaching. Teaching of grammar, all through the world, is dominated by two methods/approaches—deductive approach and inductive approach. A deductive approach is derived from the notion that deductive reasoning works from the general to the specific. In this case, rules, principles, concepts, or theories are presented first, and then their applications are treated. In conclusion, when we use deduction, we reason from general to specific principles. Dealing with the teaching of grammar, the deductive approach can also be called ruledriven learning. In such an approach, a grammar rule is explicitly presented to students and followed by practice applying the rule. The deductive approach maintains that a teacher teaches grammar by presenting grammatical rules, and then examples of sentences are presented. Once learners understand rules, they are told to apply the rules given to various examples of sentences. Giving the grammatical rules means no more than directing learners' attention to the problem discussed. To sum up, the deductive approach commences with the presentation of a rule taught and then is followed by examples in which the rule is applied.

In this regard, learners are expected to engage with it through the study and manipulation of examples. An inductive approach comes from inductive reasoning which says that a reasoning proceeds from particulars (that is, observations, measurements, or data) to generalities (for example, rules, laws, concepts or theories). In short, when we use induction, we observe a number of specific instances and from them infer a general principle or concept. In the case of pedagogical grammar, most experts argue that the inductive approach can also be called rule-discovery learning. It suggests that a teacher teach grammar starting with presenting some examples of sentences. In this sense, learners understand grammatical rules from the examples. The presentation of grammatical rules can be spoken or written. 191 Besides these two approaches a third approach of teaching grammar is gaining currency and is considered to be the best approach in teaching grammar to the young learners. This is called situational or contextual approach. The approach says that

if learners are to achieve a functional command of a second language, they will need to be able to understand and produce not just isolated sentences, but whole texts in that language. Language is context-sensitive; which is to say that an utterance becomes fully intelligible only when it is placed in its context.

This means language is to be taught in a real situation or creating a near-real situation through simulated activities. Grammar can be taught through text, through stories, through songs and rhymes that largely resembles the real situation. Testing the Knowledge

of Grammar The following are some of the common types of objective items used to test awareness of the grammatical features of the language.

They are as follows: 1. Multiple-choice items To test English grammar mastery, the multiple choice test must be used due to its merit of guaranteeing the fulfilment of the content validity of achievement tests.

The most common type of multiple choice grammatical item is one in which the test maker gives the testee a sentence with a blank and four or five choices of a word or phrase which completes the sentence correctly. An example is given below for better understanding. The boy stepped on a piece of ice and flat on his face a. fell b. fall c. felled d. fallen 2. Error-recognition items

Error correction items are also useful for testing grammar. An error correction item is one in which the testee is given a sentence with an error. Four words or phrases in the sentence marked with letters, and the testee needs to decide which of the words or phrases has the error.

This is one of the popular items of testing knowledge of grammar from young learners up to the adult learners.

Generally, an incorrect sentence is given; the students are asked to correct the sentence and rewrite it or are asked simply to find out the error and mention it separately or underline it.

192 Example: I have no difficulty to study the art of management. (find the error from the words underlined and correct the sentence) 3.

Items to Test Knowledge of Word/Sentence Order Items can be prepared to test testees' knowledge of word order. The traditional way is to present the testee with four alternative word orders. For example, I wonder how she knows a) how it costs much. b) how much it costs. c) it costs how much. d) it how much costs.

Understanding of appropriate sentence order can also be tested in a similar way by giving testees several sentences and asking them to put them in order. This type of test tests knowledge of references, cohesive devices, etc. 4.

Rearrangement items

Here the given elements have to be arranged in the correct order to form a phrase or a sentence. These items check grammar and reading. For example, '

Won't I need a coat?' 'Well, you know how.....' A. warm is it today B. today is it warm C. is it warm today D. warm it is today E. today is it warm 5.

Completion items Completion items are items in which the testees are asked to fill in blanks in sentences. For example, Give the book to----- woman in the blue dress. (

supply correct article to the blank space mentioned here. 6.

Transformation items Another type of grammar item makes use of transformations. In this type of item, testees

193 are given a sentence and the first few words of another sentence to change the original sentence without changing the meaning. For example, Jim hasn't been home in a long time. It's been a long time-----

7.

Word Changing Items Another type of item is one in which the testees are given a sentence and a word which they need to fit into the sentence by changing the form of the word. For example, I have never to Australia. (be) 8. '

Broken sentence' items These items consist of sets of phrases which have to be put together in a sentence by adding the necessary prepositions, articles, etc. to the given phrases.

This type of item tests the student's ability to write full sentences from a series of words and phrases, and thus not allow the test writer to concentrate exclusively on testing those particular grammatical features which may have just been practiced in class. It is nevertheless a useful device for testing grammar provided that the tester is aware that several other areas of the language are being tested in addition to those on which he or she wishes to focus attention. In this type of test item, students should be instructed to make whatever changes are necessary to form good sentences, adding articles, prepositions, etc. where required and putting verbs in their correct tense. Take / drug and stimulants / keep awake / while revise examination / often be very harmful / it be far better / lead / balanced life / and get enough sleep / every night. / There / be / limit / degree and span / concentration / which you be capable/ exert. / Brain / need rest / as much body. / Indeed, / it be quality / than quantity work / that be important. 9. Pairing and Matching Items

the aim in these items is to choose two words or phrases out of a whole set and to match them according to similar grammatical features, meaning etc. These items check grammar and vocabulary. 10. Combination Items

Sentence combining exercises can play a part in testing grammar as well as its more traditional use as part of composition testing and training. For example, testees might be instructed to combine the following sentences using a relative pronoun. I met a man. The man went to the same high school I did.

194 (I met a man who went to the same high school I did.) 11.

Addition Items Students are instructed to insert the word in capitals in the most appropriate place in each sentence. (a) Have you answered all the questions? (

YET) (

b) Some students had not mastered the correct techniques for answering examination questions. (STILL) (c) There may be little choice of questions. (

OCCASIONALLY) 12. Gap Fills or Close Tests These items look a lot like completion items but unlike the latter where the missing words have been erased subjectively by the teacher (only grammatical forms or only vocabulary) in cloze the erasing is systematic (every nth word is erased, usually every 5th, 6th or 7th irrespective of its function in the sentence). 13. True-false Statements These items are a variation of multiple-choice. Here you have to read or listen to a text and based on the reading or the listening, you have to consider whether certain sentences are true or false.

5.4.3 Phonology as a Language Element

Phonetics is concerned with how sounds are produced, transmitted and perceived. Phonology is concerned with how sounds function in relation to each other in a language. In other words, phonetics is about sounds of language, phonology about sound systems of language. Phonetics is a descriptive tool necessary to the study of the phonological aspects of a language. Whereas syntax is about sentence formation, and semantics about sentence interpretation, phonetics and phonology cover the field of sentence utterance. As phonetics and phonology both deal with sounds, and as English spelling and English pronunciation are two very different things, it is important to keep in mind that we are not interested in letters here, but in sounds. For instance, English has not 5 or 6 but 20 different vowels, even if all these vowels are written by different combinations of 6 different letters, "a, e, i, o, u, y". For example, take a word "please" and its phonetic transcription is [pli:z]. Thus the word please consists of three consonants, [p,l,z], and one vowel, [i:]. And sounds considered from the phonological point of view are put between slashes. Among these twenty vowel some are pure vowels and some are diphthongs. Let's know the soundsystem of English language with their phonetic transcriptions. This is given below.

195 In any language system phonology is an important component, so also in English. It constitutes the basics of any language system. The following are some of the causes for which phonology must be an important part of English language teaching and evaluation.

- Phonology brings reality in language teaching. Without it language teaching becomes prosaic and monotonous
- Pronunciation is an important part of communication and therefore, importance should be given to listening aspects to understand the message
- Phonology is an important component of metalinguistic awareness. The communication between teacher and taught is based on that. Hence, in any language teaching the basic matters, so in the case of phonology. But our concern here is not to discuss the pros and cons of it, but to discuss how this as a linguistic element can be best evaluated. But before that let us discuss some of the common problems faced by the second language learners in India and then we will move to the process of evaluation.

196 The first problem that Indian students face in learning English pronunciation is relating to articulation. The beginner starts articulating all the letters and thus giving a new dimension to speech. For example, in the word 'psychology' the letters 'p' is silent, but is pronounced by a beginner who comes across the word for the first time. Another problem is how to pronounce. Taking the same example, we can see that there is high probability that learners pronounce 'cho' in psychology as cho not ko. Learners are unaware of the disagreement between spelling and pronunciation of the sound. They try to infer the pronunciation through the spelling of words. The word 'think' can be pronounced as 'tink'. Thirdly, the students are unaware of the allophones of sound. For example, the sound / p/ will have three different sounds depending upon these contexts: pen, spool and cap. The first 'p' in 'pen' is pronounced as an aspirated sound, the second in 'spool' is unaspirated and the third in 'cap' is unexploded. The fourth problem for Indian English learner is its prosodic aspect. English has a different pattern of stress and rhyme, so also intonation. Rhyme and intonations are created by the alteration of stressed and unstressed syllables. The Indian learner has a different set of stress pattern in his/her mother-tongue. Not only that, English has different levels of stress—high-primary, medium-secondary, and tertiary. The Indian English learners are not aware about this fact most of the times.

Phonological Awareness Skill Test

Like other skills the teacher of English must test the knowledge of phonology among his/her learners. Test items designed to test phonology attempt to assess the following sub-skills:

- ability to recognize and pronounce the significant sound contrasts of a language,
- ability to recognize and use the stress patterns of a language,
- and ability to hear and produce the melody or patterns of the tunes of a language (i.e. the rise and fall of the voice).

Having good phonological awareness skills means that a child is able to manipulate sounds and words, or "play" with sounds and words. For example, a teacher asks a child to break the word "cat" into individual sounds: "c-a-t." The following activities can be undertaken to test phonological awareness skill among the learners: Recognizing when words rhyme (e.g., "Do 'cat' and 'shoe' rhyme?") and coming up with a word that rhymes (e.g., "What rhymes with 'key'?")

197 Segmentation of words in sentences (e.g., "Clap for each word you hear in the sentence 'The dog is furry.'") Blending syllables (e.g., "I am going to say parts of a word. Tell me what the word is. 'Pan-da.'") Segmentation of syllables (e.g., "Clap for each syllable you hear in the word 'refrigerator.'") Deletion of syllables (e.g., "Say the word 'strawberry.' Now say it without saying 'straw.'") Identifying sounds in words (e.g., "What sound do you hear at the end of 'tulip?") Blending sounds (e.g., "Put these sounds together to make a word. 'D-oo-r.'") Segmentation of sounds (e.g., "Tell me each sound you hear in the word 'cat?") Deletion of sounds (e.g., "Say 'chair.' Now say it without the 'ch.'") Addition of sounds (e.g., "Say 'cook.' Now say it with an 'e' at the end.") Manipulation of sounds (e.g., "Change the 's' in 'sad' to 'd' and say the new word.")

5.5 Error Analysis, Diagnostic Tests and Enrichment

Measures 5.5.1 The Concept of Error Analysis Every learner has a mechanism of acquiring language. Noam Chomsky, the famous grammarian calls it Language Acquisition Device (LAD). It is so designed that when a learner learns another language the mechanism of the first language affects the process of learning the second language. Let us call the first language which is generally the mother tongue of the learner as L 1 and the target language, which is English as L 2 . The learning of L 2 is affected by the way L 1 is learnt. In the process of learning L 2 learners commit a lot of mistakes, which are called errors in English language learning. In order to make the process of learning English 'error-free' we need to analyse why these errors occur. Then we can find out the relevant solution for the same. This process of analysing the causes of errors, classifying them into different categories and finding out the ways to deal these errors is known as error analysis. An error is a form in learner's language that is inaccurate, meaning it is different from the forms used by competent speakers of the target language.

Error analysis

is a method that documents the errors that appear in learner language, determine whether those errors are systematic, and (if possible) explain what caused them.

While native speakers make unsystematic 'performance' errors (like slips of the tongue) from time to time, second language learners make more errors, and often ones that no native speaker ever makes. An error analysis focuses on errors that are systematic violations of patterns in the input to which the learners have been exposed. Such errors tell us something about

199 the learner's inter-language, or underlying knowledge of the rules of the language being learned (Corder, 1981, p. 10). Bose (2005) mentioned that one of the reasons for learner's

errors is the interference of his mother tongue, which is described as the negative and positive transfer between the mother tongue and the target language. The negative transfer happens when the forms of the target language and those of the learner's mother tongue are different from each other whereas, the positive transfer between the mother tongue and the target language is similar. He added that a teacher can plan remedial teaching after he corrects the written compositions of his learners and collects their common errors in a note book. Ferguson (1965) pointed out that one of the major problems in the learning of a second language is the interference caused by the structural differences between the native language of the learner and the second language.

Error analysis theory first distinguishes an error from a lapse or a mistake. It is thought that an error appears when a learner is ignorant of a certain language rules and makes errors in usage, but a lapse or mistake appears when a learner is so careless that he/she does not use the language rules he/she has mastered. Then causes for errors are divided into three parts roughly: (1) inter-lingual errors: The learners bring the habits of mother tongue into target language, which leads to negative language transfer; (2) intra-lingual errors: This kind of errors are caused by the learners' wrong understanding about the rules of target language or by incomplete learning; and (3) other errors: errors in improper teaching or learning materials; in cultural habits of target language; in pronunciation and words; and in usage, expressions, and style. This shows language acquisition is a creative process of constantly making errors. Students will make progress in language by making errors and correcting them. 5.5.2 Need of Error Analysis Firstly, learners accept large amount of language input, then process and digest the new information, and finally change parts of the knowledge into their own skills. During the learning, it is inevitable and natural for learners to make errors for it is these errors that show they are working hard and try to put what they have learned into practice. Gaies (1983) thought that in the past years, errors were regarded as a window of language acquisition and a reflection of language internalization. Secondly, through analyzing and studying the learners' errors during their learning, teachers will obtain helpful information, focus on the weak points in teaching, improve

200 teaching methods, get the best teaching results. Error analysis changes people's attitude to errors and helps people understand the process and the nature of Second Language Acquisition (SLA). For students, errors do not mean failure, but are necessary parts for students to master language rules correctly and develop language ability. Students learn through making errors, realizing them, and correcting them. 5.5.3 Causes for Errors LIN Shan-ling (2012) has generalised three broad causes for all the errors that second language learners commit. These are as follows: Inter-lingual Errors Inter-lingual error occurs when learners bring their mother-tongue and its cultural habits into the learning and practice of target language. This kind of errors is regarded as negative language transfer, and is influenced by the interference of their mother tongue. For Bengali students, the interference of Bengali causes different vocabulary and grammatical errors in English. Since learners know little about the culture and customs of target language, they tend to imitate the cultural habits of their mother tongue when practicing the target language, which leads to language errors. Intra-lingual Errors In human language learning process, learners try to generalize the language materials they have learned and discover the language rules. Intra-lingual errors result from the learners' incomplete or wrong understanding of the target language rules. Since the students' English knowledge is limited, when they try to generalize some language rules too much or too little, they are usually affected by intra-lingual interference and make errors. For example, students have learned the past forms of some verbs ("work", "play", "want") are to add "-ed" after the verbs("worked", "played", "wanted"). By generalization, they think that the past forms of all verbs' follow the same rules.They start writing "goed" for "go", "haved" for "have" and "buyed" for "buy". Other Errors In practice, learners will make errors in speaking, writing, or expressing because of their concentration, fatigue, attitude, or nervousness. For example, some learners will make such error in oral practice just because of nervousness: "He is my sister". On the

201 other hand, improper teaching or excessive emphasis on certain grammar rule will give students a wrong impression and then result in errors. For example, when explaining the passive voice, the teacher gives many example sentences: "I was asked to stand up", "She is given a gift", and "The tree was cut down". Then the students will be under the illusion that all English verbs can be used in passive voice. So in their writings, there will be the errors: "An accident was happened yesterday", and "The soup is tasted delicious".

5.5.4 Types of Error

Different Types of Language Errors exist in English. Let's bring some common denominations for error classification. For your ease in understanding the errors are divided into two broad categories—typical errors and skill-specific errors. Let's find these out.

Typical Errors

a) Performance errors and competence errors
Performance errors usually result from learners' tension, carelessness, fatigue, and distraction, which are called a slip of tongue or a slip of the pen. They do not put what they have mastered into practice correctly. This kind of errors is occasional and has no rules. The learners can find the errors and correct them by themselves. Competence errors appear, because the learners have no command of the system and rules of target language. This kind of errors will appear again and again in their learning and practice. The errors cannot be found and corrected by the students themselves and teachers should help them in right time lest these could be fossilized.

b) Global errors and local errors.
Global errors refer to the errors that break the sentence structure and interfere with the understanding of the sentence, for example: the wrong use or omission of conjunctions, reverse sentence order, and so on. Local errors refer to the errors which will affect the understanding of a clause or part of a sentence, for example: the wrong use of the ending change of a verb or a noun, and the abuse of articles or auxiliaries. But local errors do not interfere with the normal communicative behaviour.

Skill-Specific Errors

a) Errors in vocabulary
Vocabulary is the basis of English writing. Since students' vocabulary is quite limited, they cannot express themselves as a native speaker does and use limited words for 202 different purposes. They usually make errors in spelling, preposition, collocation, word choice, part of speech, and so on. Let's take some examples for this.

Example: Incorrect sentence: It only spends us 15 minutes to go to the market from our school.
Correct sentence: It only takes us 15 minutes to go to the market from our school. It is an error in word choice: different word with different sentence structure.

Example: Incorrect sentence: If we are told we can't recovery, we can choose the way of death—euthanasia.
Correct sentence: If we are told we can't recover, we can choose the way of death—euthanasia. It is an error in part of speech: "Recovery" is a noun but "recover" is a verb.

b) Errors in collocation
Collocation is the way words combine in English language to produce natural-sounding speech and writing. In English, some expressions like "receive the telephone", "open a check", "open TV", and "crowded traffic" are not proper. Instead the standard expressions should be "answer the telephone", "write out make out a check", "turn on TV", and "busy/heavy traffic". Because of the different cultural background, proper English collocation usage is a key obstacle to Indian students in their writings.

Example: Incorrect sentence: I am afraid that the price of the food is a little expensive.
Correct sentence: I am afraid that the price of the food is a little high. I am afraid that the food is a little expensive.

203 It is an inter-lingual error. When a price is talked about, the habitual expressions are "cheap" or "expensive". But in English, the words "high" or "low" are used to make a collocation with "price", and "cheap" or "expensive" usually makes a collocation with commodities.

c) Errors in grammar
The students' errors in grammar have something to do with the wrong usage of articles, tense, subject-verb agreement, singular and plural forms of nouns, non-predicate verbs, and so on.

Example: Incorrect Sentence: It was very interesting journey.
Correct Sentence: It was a very interesting journey. It is an article error: "journey" is a countable noun.

Example: Incorrect Sentence: Sandy is a pretty girl who loves music very much.
Correct Sentences: Sandy is a pretty girl who loves music very much. It is a subject-verb agreement error.

Example: Incorrect Sentence: I'll brush my tooth after eating my breakfast.
Correct sentence: I'll brush my teeth after eating my breakfast. It is a singular and plural form of noun error. When a noun is changed from a singular form to a plural form, some rules should be followed: Usually "-s" is added to a noun, which is called regular change; sometimes the spelling of the singular noun should be changed: "child—children", "foot—feet", and "tooth—teeth".

204 d) Errors in syntax Syntax errors are frequently found in Indian English. Here the mother tongue interferes with the learners' learning of English and makes their expression improper. Example: Incorrect Sentence: Because my English is very poor so I am very nervous in class. Correct Sentence: Because my English is very poor, I am very nervous in class. In Bengali, "because" and "so" can appear in one sentence, which is not a proper sentence structure in English. It is an error of conjunction repetition. Example: Incorrect Sentences: Some people are afraid of stress; others overcome it and succeed at last. Correct Sentences: Some people are afraid of stress; others overcome it and succeed at last. Some people are afraid of stress while others overcome it and succeed at last. It is an error in comma splice/run-on sentence, in which two or several independent sentences are separated with commas. e) Errors in Discourse A good writing is composed of some sentences with relevant meanings which are logically put together into a semantic unity by link words (transition words). Errors are committed by the second language learners in the following aspects: (1) improper or wrong use of link words; (2) too many simple sentences; (3) close similarity and monotony in sentence structure; (4) the sentences in the writing do not serve the topic; and (5) unclear writing structure. Example: Most of the students agree that watching TV is helpful for us—but the others don't agree that watching TV is helpful for us. (close similarity in sentence structure and lack

205 of flexibility) Example: In recent time, I was ill. I went to see a doctor. He gave me an examination. He told me that I must be in hospital for a month. (Too many simple sentences—monotony in sentence structure; lack of continuity between sentences) Example: Though our teacher should criticise us when we did not finish our homework, she was unkind to us most of the times. After these errors are classified, it is clear to find students' error mechanism. The purpose for finding, classifying, and analyzing the errors is to offer possible explanations why students make the errors and try to find the causes. With the explanations and causes, effective measures can be taken to put them right in order to meet the goal—improving students' language ability. 5.5.2 Diagnostic Test 5.5.2.1 Concept of Diagnostic Test Diagnostic testing is a form of assessment that is used to diagnose strengths and areas of need in the students. A diagnostic test is a test designed to locate specific learning deficiencies in case of specific individuals at a specific stage of learning so that specific efforts could be made to overcome those deficiencies. It helps the teacher in identifying the status of the learner at the end of a particular lesson, unit or course of learning as to what specific teaching or learning points have been properly grasped by the learner. If such a deficiency is located in several students, it becomes obvious to the teacher to reflect upon whether something went wrong with his method of teaching. After administering a diagnostic test or battery test to students, a teacher takes remedial measures to overcome the deficiencies thus discovered. Diagnostic assessment involves the gathering and careful evaluation of detailed data using students' knowledge and skills in a given learning area. The tests are not graded. The tests can determine if differentiated instruction is needed, and discover strengths, weaknesses, and misconceptions. In English Language Teaching, diagnostic test is a

206 test that helps the teacher and learners identify problems that they have with the language. For example, at the start of the course, a teacher can administer a diagnostic test to see what areas of language need to be in the syllabus. During the course also a teacher can make use of diagnostic test. Progress tests given during the course can also act as diagnostic tests as they help the teacher and learners identify what areas will be looked at next on the course. According to Wormeli (2006) when creating diagnostic tests, instructors should consider the following questions: What skills are to be assessed, Whether the assessment allows students to demonstrate mastery of those skills, If every component of the skills accounted for in the assessment, If students can respond in a different way than expected and still show mastery of the concepts, and If the assessment is a test of the process or the content. Diagnostic testing must be aligned with predetermined learning objectives and should be built into the regular classroom routine. The assessments should be relatively short, valid, and free from bias. In order to accurately use diagnostic testing, instructors must be willing to modify course content and their teaching methods based on the information they receive from the assessments. This could mean covering subjects and concepts assumed to be already mastered, or not covering concepts that were originally planned if the skills and concepts have already been mastered. Instructors should also take care to assure. Diagnostic test differs markedly from achievement test though every achievement test has some diagnostic value and vice versa. The main difference is in the way items are sampled. In an achievement test, sampling of questions is not so exhaustive to cover each and every learning point as the content is generally a large portion; whereas in a diagnostic test each learning point has several items, each cluster of such items forming a subtest. The diagnostic value of the test is obtained from the total score which is the sum of the scores on these subjects. The coverage of Subject matter is more detailed, though based on a smaller area than an achievement test. A diagnostic test thus requires a very careful analysis of the content and a detailed study of the common errors made by the students.

207 5.7.2.2 Need and Importance of Diagnostic Test The purpose of a diagnostic test in education is to assess the current state of a student's progress or ability in a particular area. Some diagnostic tests determine if a student qualifies for special education services on the basis of everything from dyslexia to speech delays or even attention deficit disorder while others indicate specific competencies on the scope and sequence for a course in which students have either demonstrated mastery or need remediation. Diagnostic testing can be a very useful tool for instructors, because it can tell them where their students are with respect to what they are planning to teach them. If diagnostic testing shows that the entire class has already mastered a concept, then the instructor modifies the lesson plan to begin with a new concept. If diagnostic testing shows that half the class has mastered the concepts and half has not, then the instructor may decide to implement differentiated instruction. Conversely, if the instructor is planning on beginning instruction with a concept but diagnostic testing shows that students have not mastered the previous topic, the instructor should begin there. By beginning instruction with where students are, additional instruction time is gained which can be used to go over concepts the class has not mastered more slowly or cover more concepts than originally anticipated. A diagnostic assessment can be used to profile students' interests and help determine their preferred learning styles of mastering language, particularly English. Diagnostic testing can also help instructors plan their instruction and develop curriculum by helping to determine whether or not classroom instruction is closely aligned with state or central high-stakes tests. Since these assessments are intended for diagnostic or predictive purposes the test here must have resemblance with these tests. Diagnostic tests should not be too large or complex and should only look to assess specific skills and concepts. For example, instructors could have their students a few spelling test or that of testing a few vocabulary item that represent what will be taught.

5.5.2.3 Types of Diagnostic Test a. Formal and informal Diagnostic Test Diagnostic testing can be both formal and informal. Formal diagnostic testing includes standardized tests that can be used to assess particular skills, giving objective data on skill levels. However, the validity of such tests can be debated, and there is some concern

208 about test bias. Additionally, standardized tests may assess more or fewer skills than those that will occur during instruction. The formal approach to diagnostic testing can be implemented within a classroom, a department, or within a school. It can also occur within a school district, state, or nation. Informal diagnostic testing approaches can provide more flexibility, such as one-on-one questioning or small-group testing; but they still must follow the principles of diagnostic testing, meaning that they must assess only what is selected to be taught in the classroom and cover all concepts and skills.

b. Conceptual(discipline-specific) and Stage-specific Diagnostic Test Discipline-specific conceptual diagnostic tests actually aim to "trick" students, or rather to reveal whether they hold common misconceptions about a subject. Indeed, answer choices on these multiple-choice exams are designed to trigger common misconceptions about the discipline, thus ensuring the student has a clear understanding of the concept. Not only do conceptual diagnostic tests identify weak areas of key understanding, they aim to neutralize the effect of good test-taking skills — meaning knowledge of a topic, not test taking, is being assessed. The Stage-specific Diagnostic Test aims at discovering the stage or grade level backwardness of students and finding a solution for it. In English take an example of reading test. Diagnostic tests for reading provide specific information about reading skills. Such tests are designed to pinpoint at what grade level children are reading based on their mastery of phonics, blending, word recognition and text comprehension. Ideally, a child entering a grade should display reading skills typical of that grade, meaning a fifth grader isn't using sound-out techniques like a first grader. When teachers discover students are reading below grade level, they typically implement interventions designed to bolster the missing skills.

5.5.2.4 Steps of a Diagnostic Test The essential steps in educational diagnosis are: (i) Identification of students who are having learning difficulties (ii) Locating the errors of learning difficulties (iii) Discovering causal factors.

5.5.2.5 Functions of

Diagnostic Test Cook (1951) suggested the following functions. (1) To direct curriculum emphasis by:

209 (i) Focusing attention on as many of the important ultimate objectives of education as possible (ii) Clarifying of educational objectives to teachers and pupils (iii) Determining elements of strength and weaknesses in the instructional programme of the school (iv) Discovering inadequacies in curriculum, content, and organisation. (2) To provide for educational guidance of pupil by: (i) Providing a basis for the preliminary grouping of pupils in each learning area (ii) Serving a basis for the preliminary grouping of pupils in each learning area (iii) Discovering special aptitude and disabilities (iv) Determining the difficulty of material pupil can read with Profit (v) Determining the level of problem solving ability in various areas (3) To stimulate the learning activities of pupils by: (i) Enabling pupils to think of their achievements in objective terms (ii) Giving pupils satisfaction for the progress they make, rather than for the relative level of achievement they made (iii) Enabling pupils to compete with their past performance record (iv) Measuring achievement objectively in terms of accepted educational standards, rather than by the subjective appraisal of the teachers (4) To direct and motivate administrative and supervisory efforts by: (i) Enabling teachers to discover the areas in which they need supervisory aid (ii) Affording the administrative and supervisory staff an over-all measure of the effectiveness of the school organization and supervisory policies. 5.5.2.6 Administration of Diagnostic Test The following points need to be kept in view: (i) The first task of the teacher is to win the confidence of the students and reassure them that test is to help them in the improvement of their learning rather than for declaring pass or fail.

210 (ii) It should be administered in a relaxed environment. (iii) Students should be seated comfortably. (iv) Students should be asked not to consult each other while taking (v) If any student is not able to follow something, he should be allowed to seek clarification from the teacher. (vi) The teacher may ensure that the students taking the test attempt all questions. (vii) Time schedule should not be enforced strictly. If any student takes a little more time, he should be allowed to do so. 5.5.2.7 Use of Diagnostic Tests The important uses of diagnostic tests are: (i) Items, units or skills, which are understood by a majority of students, can be located and teaching can be adjusted to the situation (ii) Items, units or skills which are not understood by a majority of pupil's can be located and there by special emphasis in these aspects can be attempted (iii) The causes for the difficulty in certain items can be found out, for which remedial measures can be taken (iv) Individual weakness can be found out which would serve as the baseline for individual correction work and personal guidance (v) Diagnostic test may be used for prognosis. It helps to predict the possible success in certain type of courses or vocation and therefore it helps in providing guidance and counselling (vi) Diagnostic tests can be made the basis of individualized instruction. Differentiated teaching methods, ability grouping, individual drill. Differentiated assignments etc. can be attempted on the basis of the results of diagnostic tests (vii) Diagnostic test measures 'real understanding' as opposed to superficial mastery of subject areas measured by achievement of pupils in subject areas (viii) Diagnostic tests can assist the pupil in locating one's weakness and so they can be corrected with maximum ease and economy (ix) Diagnostic: tests can indicate the effectiveness of specific methods of teaching in dealing with specific teaching situations

211 (x) Diagnosis of pupils' weakness and self-discovery can lead to motivation and interest can generate co-operation in future teaching learning situation 5.5.3 Enrichment Measures After the difficulties are diagnosed it is now essential to arrange suitable measures to sort the problems out. Let's see how it can be done. Methods and Strategy for Correcting Errors When it comes to the methods and strategy on correcting errors, three points should be paid attention to. (1) Teachers correct the errors: When teachers try to correct the errors, they should not only be aware of difference among students, but also take different strategy according to students' different English level. During the error correction, teachers should create an atmosphere of equality and pleasure in order to reduce or eliminate students' emotion barriers and stress and at the same time to protect students' self-respect (self-confidence). Teachers have to make their correction shorter so as to avoid breaking the flow of teaching in class. (2) Students correct the errors themselves: When students make errors, it is unnecessary for teachers to correct them right away. It is a proper way to give students some time to think and find the wrong points with the help of teachers' guidance so that the students can finish self-correction without hurting their self-confidence. By self-correction, it is helpful for students to have a good command of what they have learned. (3) Students correct the errors each other: It is an effective way for students to correct the errors each other, which provides students with opportunities to think and listen to and communicate with others. They begin to learn from each other. Students usually make errors in vocabulary, grammar, and discourse. Through analyzing the students' common errors with error analysis, some important suggestions can be provided. (4) Changing Attitude towards Error In traditional English teaching, there is a tendency that when a learner makes errors in putting the target language into practice, teachers will immediately point them out and correct them. In fact, it is important to treat the nature of errors differently. Teachers should encourage students to put the target language into use actively and make students not afraid of errors. Also teachers should try to avoid excessive correction to those errors that do not arouse misunderstanding and break communicative process in order to protect students' learning enthusiasm.

212 (5) Putting Different Emphasis to Different Kinds of Errors Global errors—common errors in second language acquisition and a big interference with communication—should be taken seriously. And local errors will be solved naturally with development of language learning. Other Measures Preparation of Remedial Material Preparation of remedial materials for a child is a crucial aspect of corrective instruction. Remedial materials prepared should meet the following criteria: (i) The difficulty level of the remedial material should be geared to the child's readiness and maturity in the subject or skill to be improved. A set of remedial materials should provide a wide range of difficulty, covering several grades (ii) The remedial measures should be designed to correct the pupils' individual difficulties. Through the use of observation, interview and diagnostic testing materials, the teacher would have analysed the work of the backward children in order to locate the specific retaining needs. An adequate amount of remedial materials must be provided which is designed to correct the specific difficulties identified (iii) The remedial materials should be self-directive. Children may differ widely as to the instructional materials needed to correct their difficulties (iv) The remedial measures must permit individual rates of progress (v) A method should be provided for recording individual progress. When the child has an opportunity to record his/her successes on a progress record, he/she is given an additional incentive to achieve. Corrective Instruction Corrective instruction should begin by analyzing with the child the specific strengths and needs, and showing how the instructional materials are designed to correct his / her deficiencies. Making the child aware of his/her problem and providing a method of solving them, based on individual effort, helps to establish a powerful motivating force. Instruction should begin at or slightly the learner's present level of achievement. Short term goals should be established which the learner considers reasonable and possible to attain. By means of progress charts, praise and social recognition the child's feeling of successful accomplishment should be reinforced. Corrective procedures must be modified for children of relatively inferior or superior mental ability.

213 The results of corrective instruction should be evaluated. Comparable forms of a standardized test should be administered before and after a period of concentrated instruction. The effectiveness of the programme must be evaluated for each child than in terms of class averages. Putting Emphasis on the Teaching of Basic Knowledge: We have been aware of the error mechanism in students' writings by error analysis. Teachers should attach much importance to the teaching of essential English knowledge. Vocabulary and grammar are two key factors and also main route to thinking and communicating. In order to develop students' language ability and effectively vocabulary and grammar should be the focuses in English teaching. Improving Writing Skills by Reading English: Reading is helpful to writing. A piece of good writing expresses the thoughts and emotions by means of vocabulary, grammar, and rhetoric. Proper expressions in writing are based on large information of language knowledge which can be acquired by extensive reading. On the other hand, reading will broaden students' horizons, accumulate knowledge, enhance the accuracy of language expression, and reduce, even eliminate, the influence of negative language transfer of mother tongue so as to avoid Indian English expressions in writing. Paying Attention to Western Cultures: Learning a foreign language means not only a sound grasp of pronunciation, vocabulary, and grammar, but also the understanding of its cultural background information. The difference between Indian culture and Western culture is a potential factor which will have an effect on writing. In English teaching, teachers should bring culture teaching into language teaching, and try to cultivate students' awareness of cultures, and help students sense the difference of thinking mode and cultures. At last, according to Featherstone, the following are to be kept in mind if the teacher of English wants his pupil learns best: i. Shorter units of instruction ii. More concrete association - to see, hear, feel etc iii. More motivated drill or review iv. More specific direction, purpose v. More illustration and audiovisual aids vi. More supervising and guidance vii. More time to complex work

214 viii. Personalization of experience ix. Emotional involvement in the activity as in dramatics, dancing and art x. Greater variety of pupil response in a given area of learning xi. Praise for work that shows any indication of work xii. Great variety of stimulation and material

..... 5.6 Let Us Sum Up Evaluation is a comprehensive term that includes the assessment of learners' ability, attitude and knowledge with the help of tools and instruments in order to take academic decisions about the learners. Evaluation is 'formative' when it is carried out during the course of instruction in order to bring improvements in the proficiency level of learners. And evaluation is 'summative' when it is taken at the end of a course. It is used for promotional purpose. Evaluation is 'diagnostic' when it tries to find out the inherent

215 learning difficulties of learners. And it becomes 'placement based' when it intends to select students for a required course of instruction. Evaluation is continuous when it happens all the time through numerous interactions of the teacher with the students. There is no specific time or place for it. An evaluation is said to be comprehensive when it tests the students in all three domains—cognitive, affective and psychomotor. Evaluation does a good number of services to all—students, teachers, parents and other community members. It is an essential part of teaching learning process. English is both a second language and foreign language in India. Teaching Indian students English needs a comprehensive ground work. At least three elements matter much to master this language in particular and any language in general. These are phonology, vocabulary and grammar. Testing the learners in these areas would decide their mastery level. A test of vocabulary measures students' knowledge of the meaning of certain words as well as the patterns and collocations in which they occur. Such a test may test their active vocabulary (the words they should be able to use in speaking and in writing) or their passive vocabulary (the words they should be able to recognize and understand when they are listening to someone or when they are reading). The ultimate goal of teaching grammar is to provide the students with knowledge of the way language is constructed so that when they listen, speak, read and write, they have no trouble applying the language that they are learning. Grammar is taught both deductively and inductively. Various types of test items are used to know the mastery grammar. Some of the popular items are error-recognition items, rearrangement items, transformation items, pairing and matching items, addition items and cloze test. Phonetics is concerned with how sounds are produced, transmitted and perceived. Phonology is concerned with how sounds function in relation to each other in a language. In other words, phonetics is about sounds of language, phonology about sound systems of language. To test the phonological awareness skill the teacher can use techniques like sound addition, sound deletion, sound manipulations, sound segmentations, recognition of words through rhyme etc. Most of the evaluation tools are designed to test the normal students. Many of these tools are not suitable to test learners having some sorts of disability. Hence these tools need adaptations and modifications. These adaptation ranges from adaptive furniture and locations to writing tools and amplification materials. The tools can be adapted specifically for specific type of disability. Error analysis is an important part of applied linguistics and an essential means of

216 foreign language teaching. How to put the theory into practice is quite significant to language teaching. The improvement of language teaching depends on learners' awareness to learning process. The process of making errors is the process of foreign language acquisition. And error analysis tries to discover and sum up some rules in language learning by analyzing learners' errors. The theory of error analysis, on the one hand, helps teachers understand the students' difficulties in learning, study the causes of their errors, and take effective measures to correct the errors. On the other hand, the theory will press teachers to adjust teaching strategy, teaching means, and develop teaching level wholly. A diagnostic test is a test designed to locate specific learning deficiencies in case of specific individuals at a specific stage of learning so that specific efforts could be made to overcome those deficiencies. After administering a diagnostic test or battery test to students, a teacher takes enrichment measures to overcome the deficiencies thus discovered. 5.7 Answer to "Check Your Progress" Check Your Progress-1 Q.1 Formative evaluation is carried out when the instruction is in progress but summative evaluation is carried out at the end of instructional process. Q.2 When an evaluation tests the three domains of learning namely, cognitive, affective and psychomotor, it is said to be comprehensive. Q.3 Evaluation helps the educational process to start, to progress and to end as per the destined goal. Check Your Progress-2 Q.1 A test in which one is asked to supply words that have been removed from a passage in order to measure one's ability to comprehend text.

Q.2 Active vocabulary is the words the students are able to use in speaking and in writing) and passive vocabulary is the words they can recognize and understand when they are listening to someone or when they are reading. Q.3 When the teaching of grammar proceeds from particular example to rules of grammar it is known as inductive teaching.

217 Q.4 Phonetics is concerned with how sounds are produced, transmitted and perceived. Phonology is concerned with how sounds function in relation to each other in a language. In other words, phonetics is about sounds of language, phonology about sound systems of language. Check Your Progress-3 Q.1

A scribe is a skilled person who has been trained to write down what a student dictates by an assistive communication device, pointing, sign language, or speech.

Q.2 Braille is a device used to help the blind learners read and write materials through a raised surface. Q.3 A sign language is a technique to teach the dumb students. The learners are taught to express themselves through scientific method of signs. Check Your Progress-4 Q.1 Sometimes due to their inability they fail to benefit from group situation. And sometimes their disability needs personal attention for taste taking. Q.2. An alternate location is essential when a student is easily distracted by other students. Q.3 The blinds and low vision students need individual reader in order to grasp the content as per their ability. Q.4

Test security involves maintaining the confidentiality of test questions and answers; it is critical in ensuring the integrity and validity of a test.

Check Your Progress-5 Q.1

An error is a form in learner's language that is inaccurate, which means it is different from the forms used by competent speakers of the target language.

Q.2 The learner brings the habits of mother tongue into target language, which is here English and thus commits a lot of mistakes known as inter-lingual errors. Q.3 A diagnostic test is designed to locate specific learning deficiencies in case of specific individuals at a specific stage of learning so that specific efforts could be made to overcome those deficiencies. Without diagnostic test the problems of learners cannot be determined. Q.4 i. Shorter units of instruction ii.

Personalization of experience

218 5.8 Unit End Exercises Q.1 Discuss the importance of evaluation for ELT. Q.2 Explain some of the major problems of learning the phonological aspect of English. Q.3 Briefly explain how the tools of evaluation can be made individualised for some target learners. Q.4 Discuss different kinds of errors committed by the second language learners in English. Q.5 Briefly explain the functions of diagnostic test. Q.6 State different strategies for correcting errors in ELT. 5.9 References Assessing Special Education Students (ASES) and

3 Netaji Subhas Open University From the Vice-Chancellor's Desk Dear Students, from this Academic Session (2015-17) the Curriculum and Course Structure of B. Ed.- Special Education have been thoroughly revised as per the stipulations which featured in the Memorandum of Understanding (MoU) between the Rehabilitation Council of India (RCI) and the National Council for Teacher Education (NCTE). The newly designed course structure and syllabus is comprehensive and futuristic has, therefore, been contextualized and adopted by NSOU from the present academic session, following the directives of the aforesaid national statutory authorities. Consequent upon the introduction of new syllabus the revision of Self Instructional Material (SIM) becomes imperative. The new syllabus was circulated by RCI for introduction in the month of June, 2015 while the new session begins in the month of July. So the difficulties of preparing the SIMs within such a short time can easily be understood. However, the School of Education of NSOU took up the challenge and put the best minds together in preparing SIM without compromising the standard and quality of such an academic package. It required many rigorous steps before printing and circulation of the entire academic package to our dear learners. Every intervening step was meticulously and methodically followed for ensuring quality in such a time bound manner. The SIMs are prepared by eminent subject experts and edited by the senior members of the faculty specializing in the discipline concerned. Printing of the SIMs has been done with utmost care and attention. Students are the primary beneficiaries of these materials so developed. Therefore, you must go through the contents seriously and take your queries, if any, to the Counselors during Personal Contact Programs (PCPs) for clarifications. In comparison to F2F mode, the onus is on the learners in the ODL mode. So please change your mind accordingly and shrug off your old mindset of teacher dependence and spoon feeding habits immediately.

4 I would further urge you to go for other Open Educational Resources (OERs) - available on websites, for better understanding and gaining comprehensive mastery over the subject. From this year NSOU is also providing ICT enabled support services to the students enrolled under this University. So, in addition to the printed SIMs, the e-contents are also provided to the students to facilitate the usage and ensure more flexibility at the user end. The other ICT based support systems will be there for the benefit of the learners. So please make the most of it and do your best in the examinations. However, any suggestion or constructive criticism regarding the SIMs and its improvement is welcome. I must acknowledge the contribution of all the content writers, editors and background minds at the SoE, NSOU for their respective efforts, expertise and hard work in producing the SIMs within a very short time. Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor, NSOU

Attitudinal 1.7.1.2 Physical 1.7.1.3 Instructional 1.8 "Check Your Progress" 1 - 5 1.9 Let us Sum Up 1.10 References 1.1
 Introduction Disability is seen as a prominent developmental issue in any country, as the disabled group in a society is often become marginalized due to exclusion from the mainstream society leading to poverty. Inclusive Education approach doesn't only provide the provision of basic human rights to education but also the dignity of human being which is often being linked with the socio-economic status in the community. It is seen as a device for both access and equity in education which are also the fundamental aspirations of Education for All programme (UNESCO, 1990) and Millennium Development Goal Action Frameworks (Millennium Summit of the United Nations, 2000). Through inclusive education the learners may get a chance for not only getting into the system but also a support to complete it successfully. Inclusive education results in improved social development and academic outcomes for all learners as it provides opportunity to get exposed to the real world which leads to the development of social skills and better social interactions. It also provides platform to the non-disabled peers to adopt positive attitudes, tolerance. An important prerequisite for inclusive education is to have respect for differences, respect for different learning styles, variations in methods, open and flexible curricula and welcoming each and every learner into the common platform. Thus, the perspectives of seeing the disabled learner has been changed to differently-abled or special need learner.

11 Success of any learner is dependent on both the school and community, but, both of them may possess barriers in implementing the inclusive education policy. These barriers are both external and internal in nature. In order to facilitate inclusive education, there has to have a modification in the environmental conditions which includes the physical changes for barrier free environment in each of the school buildings with adequate facilities. Apart from that very importantly, there is a need to change the negative attitudes of the common people and to develop their sense of responsibility towards the child with special needs (CWSN). There is a need to provide proper training to the teachers dealing with the diverse needs of the learners, applying appropriate individualized pedagogy and assessment system. Barriers to access and success can be viewed in physical as well as structural sense. But more than that, it is the curriculum, the pedagogy, the examination and the schooling approach, which may also create barriers. Unless these unseen barriers are taken care of, access to all children with diverse needs would remain a far cry. The inclusive education movement, combined with technological development has come at this crucial juncture in our country. Choosing a holistic Inclusive approach to access and success in education is more likely to succeed in reaching education for all. 1.2 Objectives ●●●●●

To understand the concepts of marginalization and Inclusion: ●●●●● To understand the changing practices in education of children with disabilities in respect to segregation, integration and inclusion; ●●●●● To understand the Diversity in classroom in the context of learning Styles, linguistic and socio-cultural multiplicity; ●●●●● To understand the basic principles of inclusive education; ●●●●● To acquire knowledge about primary Barriers to Inclusive Education. 1.3 Marginalization vs. Inclusion : Meaning and Definition 1.3.1 Marginalization : Meaning and Definition 'Marginalization' is social disadvantage and relegation to the fringe of society.

12 The term has been used first in France and then widely in Europe. Academically, it is now used across the disciplines of social sciences including philosophy, education, sociology, psychology, political science and economics. Marginalization as the social exclusion is a process in which individuals or entire communities of people are systematically blocked from or denied full access to various rights, opportunities and resources that are naturally and normally available to members of a different group, and which are fundamental to social integration within that particular group (e.g., housing, employment, healthcare, civic engagement, democratic participation, and due process). The outcome of social exclusion is that affected individuals or communities are prevented from participating fully in the economic, social, and political life of the society in which they live. Definition: Marginalization is a process whereby something or someone is pushed to the edge of a social group and accorded lesser importance. This is predominantly a social phenomenon by which a minority or sub-group is excluded, and their needs or desires ignored.

Thus, marginalization leads to social exclusion. Social exclusion is a multidimensional process of progressive social rupture, detaching groups and individuals from social relations and institutions and preventing them from full participation in the normal; normatively prescribed activities of the society in which they live. It reflects the inability of our society to keep all groups and individuals within the reach of a society or to realise their full potential. 1.3.2 Inclusion: Meaning and Definition

The right of every child

to education is proclaimed in the Universal Declaration of Human Rights (1948) as well as in the UN Convention on the Rights of the Child (1990), and reaffirmed in the World Declaration on Education for All (1990).

Each Child is different with different learning needs, learning speeds and programming for education. Among these learners, some have more specialized needs than others, but the commitment to ensure their education too has been enshrined in Salamanca Conference (1994). 'Inclusive Education' is an approach that aims to realize the goals stated in these conventions, as an approach that involves homes, schools communities, employers and governments in ensuring that each and every child, regardless of his/ her individual needs or social circumstances, has equal opportunity to get a mainstream

13 education together with the children of other community. As the name implies, inclusive education seeks to ensure that no child is excluded, marginalised or segregated, that school is such a community to which everyone belongs, and that each child is learning what she is expected to learn. Definition: "

Inclusion is seen

as

a process of addressing and responding to the diversity of needs of all learners through increasing participation in learning, cultures and communities, and reducing exclusion within and from education" (

Booth, quoted in UNESCO 2001). "Inclusive

Education

involves

changes and modifications

in content, approaches, structures and strategies, with

a common vision which covers all children

of

the

appropriate age range

and a conviction that it is the responsibility of the regular system to educate all

children" (

UNESCO, 1994). "

Inclusion,

when the position of

children with disabilities is considered as physically being in the same place and doing the same things as other students,

social acceptance, and a right to individually relevant learning"(Norwich, 1999). 1.3.3 Marginalization vs. Inclusion

Marginalization theoretically emerges at the individual or group level on four correlated dimensions–(i) insufficient

access to social rights, (ii) material deprivation, (iii) limited social participation and (iv) lack of normative integration. It is

then regarded as the combined result of personal risk factors (age, gender, race etc.), macro-societal changes

(demographic, economic and labour market developments, technological innovation, evolution of social norms etc.),

government legislation and social policy, and the actual behaviour of businesses, administrative organisations and fellow

citizens. On the other hand, inclusion is a system in which all children from a given community learn together in the

same local school setting including the children with learning difficulties, special needs or disabilities with certain

changes in the education systems. Traditional systems of education tend to increase the gap between advantaged

included students with disadvantaged excluded children. Middle and upper class children, who start out with more (in

terms of opportunity, materials), are also given more in the traditional system, thus widening the gap in education and

society between the haves and have not's. As for example, the marginalised children,

14 who start with less, are generally provided less in terms of equal educational opportunities propagating the vicious cycle of poverty and lack of opportunities. International Journal of Inclusive Education (vo1.16, Issue 12, 2012) focuses on the importance of engaging with children's voices in school settings in order to understand and deal with marginalization. Engaging with the views of children and young people is an essential part of the process of developing inclusion. It can be viewed as an approach to inclusive education, which predominantly places emphasis on the views of the learners, rather than on other organisational aspects within a school context. 1.4 Changing Practice in Education of Children with Disabilities : Segregation, integration and inclusion 1.4.1 Changing Practice in Education of Children with special needs Introduction of education of children with disabilities, in India, can be traced back to the dawn of 19th century. Special school services in the country were initiated mostly by foreign missionaries. The concept of inclusion has been finding its reference in many documents of nationalist education movements in the post independent period. The provision of better services to person with disabilities has been included in the Article 45 of the Indian Constitution. The Indian, Education Commission Report (1964-66), had recommended placement of the disabled child as far as possible in ordinary schools. The National Policy on Education (NPE, 1986) included a full chapter on Education of the handicapped and formulated guidelines for action. The NPE strongly emphasised the need for the expansion of 'integrated' education

programme. The centrally sponsored scheme of Integrated Education for Disabled Children (IEDC) was introduced in 1974

and later it was emphasised in the National Policy of Education (1986) as well as in the Programme of Action (1991). Therefore, efforts for inclusion were persistently made. Though these national documents emphasised the need for services for persons with disabilities, the actual implementation of activities for the disabled was not satisfactory in the past. 1.4.2 Segregation of Children with Special Needs 'Segregation' indicates that disabled children will only be treated separately. Some scholars believe that segregation is the best way to educate special child.

15 Segregated programs are designed and staffed by professionals that are trained to work with Child with Special Need (CWSN), which typically means they are better trained to teach special Child. Therapists are usually an integrated part of the system. However, there are downsides to segregation. Children that are segregated do not always have the challenge of learning with their peers, which can sometimes facilitate better learning and skills. Also, children that are segregated are not learning how to function in the community in hopes of becoming integrated into society. There are many educational environments that do not offer 'pure' segregated special education classes. There are programs that combine inclusion and segregation, where the child might spend part of the day in a segregated program and the other part of the day in an inclusion program or s/he might spend the day in an inclusion program and receive remedial assistance and therapy. There may be different combinations of inclusive education. 1.4.3 Integration of Children with Special Needs 'Integration' is the beginning of inclusive education. No specific year could be cited for the Introduction of inclusive vis-a-vis integrated education in India. Special schools were adopting partial integration for disabled children at the secondary level in the beginning of 20 th century itself. However, full-fledged integrated education programmes emerged only in the beginning of 1980s. Since 1980, the field has witnessed a phenomenal growth of integrated education. Integrated education emerged out of compulsion rather than as an option in India.

In the process of bringing more disabled children under the umbrella of educational services, integration was considered as the cost-effective

approach and therefore, the general education system started accepting CWSN in general schools. The implementation of integrated education programme also addressed the needs of the high risk children who were suspected to be potential dropouts and therefore, retention of such children became high. With the success of integration in the past two decades, the country is now becoming ready for inclusive education. Inclusion aims at reinforcing better educational practices in the general school system which addresses the educational needs of all children. Current Status of Integrated Education in India: The centrally sponsored scheme of integrated education, initiated in 1974, had been implemented in all the States and Union Territories of the country. More number

16 of Government, institutions was intensively involved in integrated education in both the government and non-government organisations. According to Mukhopadhyay and Mani (2000), "Across the disabilities, orthopedically disabled children are better identified than other disabilities at all levels of education. This factor also needs attention as the identification and assessment procedures yet to be developed to shift the focus on the actually deserving disabled children." The share of disabled children in general schools is still much lower than the estimated number. The present coverage in integrated education is expected to be approximately 80,000 disabled children in over 18,000 schools. Integrated education concept has come to stay in the educational system in India and its full potential is yet to be explored.

1.4.4 Inclusion of Children with Special Needs

The country has been striving hard to provide education for all children since 2002. The direct and simple approach to answer the question whether children with special needs are being adequately covered and have benefitted from Education for All (EFA) would be to match the number of children in the related age group with that of children enrolled in schools including special schools, non-formal centres and / or open learning systems. Unfortunately, the data and information are neither collected in this manner nor the services made available presently at par with other children (Mukhopadhyay and Mani, 2000). Some of the related major acts and policies are discussed below:

Inclusion through the PWD Act, 1995:

The issue of the services for children with disabilities is treated as human resources development with

the introduction

of

the Person

with Disability (Equal Opportunities, Protection of Rights and Full Participation) Act, 1995.

As a

result, the service for children with disabilities

is no more considered a welfare activity; rather it is treated as the right of the disabled child. The main purpose of the PWD Act is to define responsibilities of the Central, State and Local Governments with regard to service for disabled persons. The Act also ensured coverage of total life to disabled individuals so as to make full contribution in accordance with their disability conditions.

Blindness, Low Vision, Leprosy-Cured, Hearing Impairment; Loco motor Disability, Mental Illness, and Mental

Retardation are the seven disability conditions covered under the Act. As per the Act, the

17 Governments shall ensure that suitable education should be provided till their age of 18. It also indicates that integrated education and special schools will have to be set up to meet the educational needs of the children with acute disabilities. Introduction of non-formal education, functional literacy schemes, provision of aids and appliances, education through open schools and universities etc., are also stressed in the Act. It also indicates that the Government should create adequate teacher training facilities to prepare teachers for special and integrated schools. Development of research on assistive devices is also envisaged in the Act. Many schemes are being evolved at the national and state levels to implement this Act. Therefore, the PWD Act 1995 is strongly encouraging inclusive education concepts wherever possible. Role of the Rehabilitation Council of India (RCI) in Inclusion: In 1932., the RCI Act was enacted in the Parliament. The Act was created by the then

Ministry of Welfare (presently known as the Ministry of Social Justice and Empowerment)

to regulate the manpower development programmes in the field of education of CWSN. Though RCI does not deal directly with the promotion of services at the school level, it has projected the need for massive manpower development for facilitating education for all disabled children, The major responsibilities of the RCI are: ●●●●● To bring standardisation of training courses for rehabilitation

professionals/ personnel dealing with people with disabilities; ●●●●● To prescribe minimum standards of education and training

institutions in the field of rehabilitation uniformity throughout the country; ●●●●●

To regulate these standards in all training institutions uniformly throughout the country; ●●●●● To recognise institutions running degree/ diploma/ certificate courses in the field of rehabilitation of

the disabled and to withdraw recognition, whenever facilities are not satisfactory; ●●●●● To recognise foreign degree/ diploma/ certificate in the field of rehabilitation awarded by institutions on reciprocal basis; ●●●●● To maintain a Central

Rehabilitation Register of persons possessing the recognised rehabilitation qualification; ●●●●●

To collect information on regular basis, on education and training in the field

18 of rehabilitation of people with disabilities from institutions in India and abroad; ●●●● To encourage continuing rehabilitation education by way of collaboration with organisations working in the field of rehabilitation of persons with disabilities. Role of Special Schools and Inclusion: Special school concept is still an accepted model of education for children with disabilities in India and it will continue to be so in the years to come. Presently there are about 3000 special schools addressing persons with different disabilities. It is estimated that there are 900 schools for hearing impaired, 400 schools for visually impaired, 1000 schools for mentally retarded and 700 for physically challenged children (by UNISED Report 1999). The exact number of special schools is not fully known as there are many NGOs who run those schools and are not yet included in the lists available. However, the responsibilities of special schools are likely to change in the future. Some of the desired changes are: i. They are expected to become resource centre to facilitate inclusive education. ii. They are in a better position to serve children with multiple disabilities. In the growing concept of inclusion the special schools have a vital role to play. Through inclusion is open to everyone, experiences in India reveal that some children may not cope with the inclusive setting. Children with additional disabilities, orphans etc., need some alternative settings and special schools may help equip themselves to serve these children.

1.5 Diversity in Classroom : Learning Styles, Linguistic and Socio-Cultural Multiplicity.

1.5.1 Diversity in Normal Classroom

Now-a-days the increasing number of learners from diverse backgrounds entering into the elementary classrooms has reinforced the importance of making our schools more inclusive. With a greater variation in the talents, and social, cultural, economic and political backgrounds of the learners the elementary class-room in India has been facing a challenge to use this diversity constructively in order to democratize the teaching-learning processes and practices, and achieve the larger goals of social justice. In this context, the agenda of 'inclusive education' has gained importance. There has been a further impetus with the enactment of the Right of Children to Free and Compulsory Education (RTE) Act, 2009. The implementation of this Act will be considered successful only if it addresses the issue of making the children of marginalized communities 'visible' within the four walls of the classroom. Many of these children, across the country come from socially disadvantaged backgrounds, such as Scheduled Caste and Scheduled Tribe communities; ethnic and religious minorities, economically weaker sections, children of these communities are enrolled in school, they face the danger of dropping out. Many of them live in extremely vulnerable socio-economic conditions and face a serious threat to their universal rights, such as a school education. Inclusive schools are designed with a vision and principles that believe in the culture of rights, social justice and equity. It believes that all children are not the same, and accepts the diversity as strength rather than a problem. It believes in certain basic pedagogy that children learn in different ways, and relates success more with the learning of life and social skills than scoring high marks in examinations. The admission policy of such schools should accept children from a diverse community rather than reject on the ground of admission test scores or other physical, social and economic factors. Inclusive schools might follow flexible curricula that would respond to these diverse needs of children. The UNESCO Framework has again highlighted the need of child-centred pedagogy for addressing the educational needs of the disadvantaged and the disabled: "The challenge confronting the inclusive school is that of developing a child-centred pedagogy capable of successfully educating all children, including those who have serious disadvantages and disabilities".

1.5.2 Diversity in Learners' Learning Style

Educators do not believe that all learners are the same. Yet, too often, educators continue to treat all learners alike while paying lip service to the principle of diversity. Teachers know that students learn in different ways; the experience in the classroom confirms this every day. In addition, well-accepted theories and extensive research illustrate and document learning differences. Most educators can talk about learning differences, whether by the name of learning styles, cognitive styles, psychological type, or multiple intelligences. Learners bring their own individual approach, talents and interests to the learning situation. The target of new inclusive schools is not that they are capable of providing

20 quality education to all children; their establishment is a crucial step in helping to change discriminatory attitudes, in creating welcoming communities and in developing an inclusive society according to their respective ability and learning style (Framework for Action on Special Needs Education; UNESCO, 1994). Traditional schools mostly offer scope for the use of only two types of intelligences - linguistic and logical- mathematical. This approach itself, creates learning barriers for a large number of children particularly those belonging to the first generation learners, the disadvantaged and the disabled. Gardner (1993), on the other hand, has identified seven types of intelligences - (i) Linguistic or Verbal, (ii) Logical Mathematical, (iii) Spatial or Visual, (iv) Musical, (v) Kinaesthetic, (vi) Interpersonal and (vii) Intra-personal. Schools encouraging the identification and application of these intelligences would be able to remove unseen and internal barriers that child learning face in traditional schools. Inclusive schools use variety of innovative practices to get children involved and participating in diverged learning processes. Some of the inclusive strategies are: ●●●● Whole class inclusive teaching; ●●●● Group/cooperative/collaborative learning; ●●●● Peer tutoring/child-to-child learning; ●●●● Activity based learning; ●●●● Team approach/problem solving; ●●●● Equity in assessment/examinations. Inclusion in Education and its evolution in school system as a process-for removing barriers to access and success is a growing phenomenon. The strategies suggested above have been tried out in many schools across the countries and have, also conceptual and pedagogical backing. However, it is yet to be shaped into a reform movement or as a replacement of the traditional school system.

1.5.3 Diversity in Learners' Linguistic ability

Language is not merely a means of communication. Language, thinking and learning are inextricably linked. When children are forced to study through a language they cannot fully understand, especially in the school level, they face a serious learning disadvantage that can stunt their cognitive development and adversely affect their self-esteem and self-confidence for life. This is especially severe in marginalised

21 socio-economic situations where there is little exposure to the school language, outside the school. This gets further exacerbated when the children's culture, along with their language, is completely excluded from the classrooms. India is pluri-lingual and pluri-ethnic country. The language situations in India are like a mosaic with a bewildering variety of speech patterns that get woven together in an 'organic pluralism'. It is usually difficult to attach language labels to the varied speech patterns that differ from place to place. There is little agreement on which languages be called 'languages' and which ones be categorised as 'dialects' and why. A significant proportion of the Indian population is multilingual- even if their repertoire of the other languages is limited; different languages are used in different domains of life; there are many 'contact' languages that are used in inter- group communication, which are often hybrids of other languages; there are constant language shifts that are taking place; in most parts of the country. Language assimilation is taking place resulting in increased homogenisation, especially in many tribal areas: there are several diglossic patterns among many communities, for example, parents using the regional language when speaking with their children, while using their ancestral language with their elders. Thus, like several other countries in South Asia, language use patterns are complex and difficult to capture and any attempt at documenting speech patterns is a complex exercise. The education system in India has not been able to respond so far to the complex cultural and linguistic diversity in the country. language-in-education policies have attempted to provide some standardised solutions, though it needs further exploration in the Indian context.

1.5.4 Diversity in Learners' Socio-Cultural Multiplicity

Another, dimension of inclusive society is tolerance for and appreciation of cultural diversity. This includes societies that celebrate multiplicity and diverse expressions of identities. In the process of celebrating diversity there is a scope for recognition and affirmation of the differences between and among members of a society, which enables the society to move away from labelling, categorizing, and classifying people, towards more inclusive policies. Also, enabling a diversity of opinions provides the checks and balances crucial for the development of a society, while allowing for the greatest amount of diverse opinions to enter into every discourse. We also know that an individual learner's culture, family background, and socio-

22 economic level affect her/his learning. The context in which someone grows and develops has an important impact on learning. These beliefs, principles and theories have an important impact on the opportunities for success for every student in our schools. The cultural clash often causes students to struggle in school, and yet their individual strengths, if valued, respected, and promoted, would bring them success and increase their self-confidence. We know that culture and learning are connected in important ways. Early life experiences and the values of a person's culture affect both the expectations and the processes of learning. This is important because we need all the information we can get to help every learner succeed in school, and because a deep understanding of the learning process should provide a framework for curriculum and instructional decisions. Education plays a critical role in this area, as it can provide opportunities to learn the history and culture of one's own and others, which might cultivate the understanding and appreciation of other communities, cultures and religions. Particularly for young people, education provides the opportunity to instil such values of respect and appreciation of socio-cultural multiplicity in achieving the broader goal of democracy. 1.6

Principles of Inclusive Education: Access, Equity, Relevance, Participation and Empowerment 1.6.1

Concept of Inclusive Education

Inclusion is seen as

a process of addressing and

responding to the

diversity of needs of all learners through increasing participation in learning,

cultures and communities,

and reducing exclusion within and from education.

It involves changes and modifications in content, approaches, structures and strategies, with

a common vision which covers all children of

the

appropriate age range

and a conviction that it is the responsibility of the regular system to educate all

children.

Inclusion

education

is concerned with providing appropriate responses to the broad spectrum of learning needs in formal, informal and non-formal educational settings, rather than being a marginal issue on how some learners can be integrated in mainstream education. It is an approach that looks into how to transform education systems and other learning environments in order to respond to the diversity of learners. It aims towards enabling teachers and learners both to feel comfortable with 23 diversity and to see it as a challenge and enrichment of the learning environment, rather than a problem.

Inclusion emphasizes providing opportunities for equal participation of persons with disabilities (physical, social and/ or emotional) whenever possible into general education, but leaves open the possibility of personal choice and options for special assistance and facilities for those who need it. In particular, four key elements have tended to feature strongly in the conceptualisation of inclusion

in education. Those

are as follows: i. Inclusion is a 'process'. That is to say, inclusion

in education

has to be seen as a never-ending search to find better ways of responding to diversity. It is

about learning how to live with difference and learning how to learn from difference. In this way differences come to be seen more positively as a stimulus for fostering learning, amongst

all children and adults. ii. It

is concerned with the 'identification and removal of barriers'. Consequently, it involves collecting, collating and

evaluating information from a wide variety of sources in order to plan for improvements in policy and practice. It is about using evidence of various kinds to stimulate creativity and problem-solving

of all learners. iii. It

is about the presence, participation and achievement of 'all students'.

Here 'presence' is concerned with where children are educated, and how reliably and punctually they attend;

'participation' relates to the quality of their experiences whilst they are there and, therefore, must incorporate the views of the learners themselves;

and '

achievement' is about the outcomes of learning across the curriculum, not merely test or examination results.

iv. It

involves a particular emphasis on those groups of learners who may be at risk of marginalization, exclusion or underachievement'.

This indicates the moral responsibility to ensure that those groups that are statistically most 'at risk' are carefully monitored, and that,

where

necessary, steps are taken to ensure their presence, participation and achievement in the education system. 1.6.2

Principles of Inclusive Education The Social Good Summit (UN Foundations, 2014) defined that the aim of social integration is to create an inclusive society, in which every individual, each with rights and responsibilities, has an active role to play. But what makes some societies

24 more inclusive than others? What are the critical elements for creating and maintaining an inclusive society in practical terms? An inclusive society is based on the fundamental value

of human rights. If All human beings are born free and equal in dignity and

rights. They are endowed with reason and conscience and should act towards one another in a spirit of brotherhood." It

is a society in which all members, regardless of their backgrounds, are able to motivate and to participate in civic, social, economic and political activities. For this to happen, legal, regulatory and policy frameworks must be inclusive, and uphold and promote just and inclusive processes in all areas of implementation, so that equal access to basic education, public space, facilities and information are ensured, and diversity and cultural pluralism are respected and

accommodated. As the pre-requisite, respect for all human rights, freedoms, and the rule of law, both at national and international levels, are fundamental. Every member of a society, no matter what his/her economic resources, political

status, or social standing, must be treated equally under the law. Legal instruments ensure the guiding principles that will guarantee equity, justice and equal opportunities for all citizens. Violators of human rights should be brought to justice.

The judiciary which serves to protect just societies must be impartial, accountable and inclusive. Maintaining the security of all individuals and their living environment is paramount in creating a feeling of inclusion and an atmosphere of

participation in society. The major principles of Inclusive Education are given below: 1.6.2.1 Access: In order to encourage all-inclusive participation, there must be universal access to public infrastructure and facilities (such as,

education, community centres, recreational facilities, public libraries, resource centres, with internet facilities, well maintained public schools, clinics, water supplies, health and sanitations). These are the basic services which will create, when partly or fully put into place, conditions for people to have a sense of belonging by not suffering the painful consequence of being unable to afford them. As long as both the advantaged and disadvantaged have equal access to or benefit from these public facilities and services, they will all feel less burdened by their differences in socio-economic status, thus alleviating a possible sense of exclusion or frustration. It is important to note though, that access alone does not necessarily ensure use of public facilities, as unequal relations within communities and households may inhibit the use of facilities by vulnerable groups.

25 Addressing the unequal power relations is therefore a necessary step to increase participation. Similarly, equal access to public information plays an important role in creating an inclusive society, as it will make popular participation possible with well-informed members of society. Information that pertains to the society, such as what a community owns, generates or benefits from, should be made available to all. Collective participation, through accepted representations of all classes and backgrounds, in the planning, implementation and evaluation of community activities should be sought after. Publication or information sharing and increasing the accessibility of the community's activities will eliminate doubts and suspicions which could otherwise create a sense of exclusion. The mass media can be used as an effective tool to educate and enlighten members of society.

1.6.2.2 Equity: Equity in the distribution of wealth and resources is another critical element of inclusive society. How the resources are allocated and utilized will significantly affect the orientation of a society, either towards a more integrated, inclusive society, or an exclusive, polarized, and disintegrated one. Therefore, socio-economic policies should be geared up towards managing equitable distribution and equal opportunities. Inclusive policies, instructions and programs that are sensitive to and cater to the less advantaged and vulnerable need to be put in place in all areas/ sectors, including public health, and effectively implemented. There is a need for a strong monitoring and evaluation tools to demonstrate whether inclusiveness was actually achieved, as well as highlighted the areas for improvement.

1.6.2.3 Relevance: Inclusion in education is concerned with the quality of education of all learners. Hence, its relevance should be in terms of:

- Learners should have a voice in decisions that affect them;
- In assessment - choosing different ways of showing what they know, understand and can do, being involved in discussions about assessment information and how it can support future learning;

26 ●●●●● In the learning process -having different ways of accessing information, making it meaningful and expressing themselves; ●●●●● In planning their learning, taking personal factors into account; ●●●●● In the provision of support to overcome barriers to learning that does not stigmatise them or separate them from their peers; ●●●●● In curriculum - having a say in relevant, meaningful, personalised outcomes; ●●●●● In evaluating the learning outcomes to ensure educational achievement and well-being. ●●●●● All learners are entitled to be active participants in the life of the school and community; ●●●●● All learners should have a sense of belonging and feel secure in the school environment; ●●●●● Learners should have opportunities for collaboration and co-operative learning, with flexible peer groups to develop social and communication skills; ●●●●● Learners should take a full part in extracurricular and out-of-school activities; In an inclusive set up, all teachers should have positive attitudes and towards learners of diverged ability and socio-cultural backgrounds. They should see diversity as strength and stimulus for their own learning.

1.6.2.4 Participation: Social participation is understood as the act of engaging in society's activities. It refers to the possibility to influence decisions and have access to decision-making processes. Social participation creates mutual trust among individuals, which forms the basis for shared responsibilities towards the community and society. Participation is most significant as it denotes an active involvement in the process, not merely having access to society's activities, but engaging in them, and building and maintaining a social network. Participation also creates a sense of responsibility towards others, a community or an institution, and influences decisions or enables individuals to have access to the decision-making processes. Therefore, resources to fully participate in all aspects of societal activities are the ultimate step for successful social inclusion. It is not only because of lack of

27 financial resources that people are unable to participate, or stop participating, but also because of conditions, such as insufficient time or energy, spatial distance, lack of recognition, lack of respect, physical conditions or constraints. These elements all need to be taken into consideration.

1.6.2.5 Empowerment: According to a recent report for the World Bank Disability Group (2011), "Education is widely seen as a means to develop human capital, to improve economic performance and to enhance individual capabilities and,

chokes in order to enjoy freedoms of citizenship." Within this context, therefore, empowerment refers - "Acquiring the awareness and skills necessary to take charge of one's own life chances. It is about facilitating the ability of individuals (and groups) to make their own decisions and, to a greater extent than hitherto, to shape their own destinies." Some educational theorists tie the concept to Freire's (1970) notion of "the collective struggle for a life without oppression and exploitation" and the expression of students' and teachers' 'voices' which can be emancipatory in different levels. This is the understanding of empowerment embedded in these guidelines. Social transformation requires self-formation. Curriculum can play an instrumental role in fostering tolerance and promoting human rights. It is the means by which respect for the dignity of persons and awareness of responsibilities as national and global citizens are instilled in children. Such knowledge can be a powerful tool for transcending cultural, religious and other diversities and empowering teachers, students and all members of society. Furthermore, education is an important vehicle through which economically and socially marginalized adults and children can be empowered to change their life chances, and obtain the means to participate more fully in their communities. According to the World Bank, "programs that expand the access of excluded groups to education have led to important shifts in mind-set among community members and government leaders regarding the contributions that those groups can make to society." This is where change processes and empowerment go hand in hand to move towards inclusion for all learners.

28 Traditional Approach vs. Inclusive Approach: A comparison between the traditional and inclusive approaches in education is given below:

Traditional Approach	Inclusive Approach
1. Education for some	1. Education for all
2. Static	2. Flexible
3. Collective teaching	3. Individualistic teaching
4. learning in segregated areas	4. learning in integrated areas
5. Emphasis on subject-oriented teaching	5. Emphasis on child-centred learning
6. Diagnostic/ prescriptive	6. holistic
7. Opportunities limited by exclusion	7. Equalisation of opportunities for all
8. Disability View	8. Curricular view
9. Labels children disability wise	9. Planning is made on ability levels and opposes all kinds of labelling of children.

Barriers to Inclusive Education: Attitudinal, Physical and Instructional 1.7.1 Barriers to Inclusive Education

The discussion on inclusive education started with proposition of the 'social model of disability', which proposes systemic barriers, negative attitudes and exclusion by society (deliberately or inadvertently) as the ultimate factors defining disability. This shift in the idea came when it was realized that children in special schools were seen as geographically and socially segregated from their peers and failure of meaningfully integrating students in mainstream schools (integration). Inclusive education is not only limited to mainstreaming the learners with special needs but also concerned with identifying and overcoming all barriers to effective/continuous and quality participation in education. While we cannot neglect the importance of inclusive education, it remains unanswered why the practice of inclusive education is presenting some problems. It appears that it is both at the level of Government policy, but rather at the level of implementation. While the policy states that all children should go to school - and

29 Governments are enforcing this rule - in many cases quality learning is not taking place, which is contradictory to the ethos of inclusive education. The reasons for the non-implementation of the inclusive education in India, is because of various barriers which according to Johan (2002) are both external and as well as internal. The external barriers are confronted before coming to and getting enrolled in schools, which includes physical location of schools, non-availability of school, social stigmatization or economic conditions of the learners. The internal barriers are mostly psychological barriers like self-concept, confidence etc. which are sometimes imposed by the external factors and first step to remove the internal barriers is to remove the external barriers. The following are some of the external barriers:

1.7.1.1 Attitudinal: It has been noted that disabled students suffer from physical bullying, or emotional bullying. These negative attitudes results in social discrimination and thus, leads to isolation, which produces barriers to inclusion. Regarding disabled children some regions still maintain established beliefs that educating the disabled is pointless. It is sad to note here that these barriers are caused by our society, which is more serious to any particular medical impairment. The isolation which results from exclusion closes the doors of real learning. The negative attitudes often develop due to lack of knowledge. Along with information about disability or condition, their requirements must be provided to peers, school staff and teachers as well. Increasing interactions between learners with special needs and community through organization of fairs, meetings, discussions etc. can play very important role to counsel the parents of these learners, especially in rural areas about the importance of providing education for developing self-reliant individuals. There is also a need to shift in perspectives and values so that diversity is appreciated and teachers are 'given skills to provide all children, including those with different learning needs with quality education. Also, at the policy level, it should be mandatory for all to educate about disability, so that a responsive individuals who respects disability could be developed.

1.7.1.2 Physical : Along with the attitudinal barriers which are faced by the learners on the daily basis, another important barrier, is the physical barriers, which includes school buildings, playgrounds, washrooms, library, laboratory etc. Apart from this, the majority of schools are physically inaccessible to many learners because of poor buildings, particularly in, rural areas. Since most schools are not equipped to respond to special needs poses blockage for learners in physically getting into school, many of the students require a personal assistant for such basic activities as taking personal care or remedial education efforts. Most school buildings don't respond to the requirement of these learners properly. For example, if there is a ramp, sometimes it is too steep, often the doors were too heavy for the student to open unaided which impedes the access. Hence, it is important for implementing the inclusive education in schools, it is important to overcome such physical barriers. Along with basic changes in the architectural designs such as widening doorways, removing unnecessary doors, installing proper ramps, technology could be used in the form of motion sensors to open doors, flush toilets and automatic door buttons for easier access through doors. Voice recognition technology can also used for activating many of the above-mentioned barriers. Since, there is an inadequacy of resources available to meet the basic needs in education, it is estimated that for achieving the inclusive education goal will require additional financial support from the Governments.

1.7.1.3 Instructional : The instructional barriers refer to the inadequacy of teaching and administrative practices carried out in ordinary schools that were chosen or are being chosen to become inclusive. The instructional barriers can be addressed by practicing the following principles: (i) Singularity - each student is unique; in this sense, the school needs to set individualized goals along with the student and/or her/his family; (ii) Multiple Intelligences - the teacher, when teaching the content of their respective discipline, needs to stimulate and use each student's entire brain; (iii) Learning style - the teacher, when planning their lessons, needs to focus on each student's learning peculiarities; (iv) learning evaluation the school needs to adopt the system based on selfhood (to compare the assessment of each student with other assessments of the same student, not of other students), on continuity (all-classes serve as evidence of learning) and on inclusiveness (assessments should help to include and not to exclude the student); (v) Coherence - the whole school needs to adopt inclusive attitudes: teachers and staff must undergo periodic training on inclusive education.

36 1.9 Let us Sum Up For Implementing the inclusive education successfully, it is important that teachers must have positive. attitudes towards learners with diverged needs. But, because of lack of knowledge, education, uderstanding, or effort the teachers give inapropriate substitute work to the learners, which eventually leads to learners dissatisfaction and poor quality of learning. Another important feature of the schools is high teacher- student ratios (average 1:45) and where it is expected that learners of diverse abilities have to be taught together. At the first place, there is a scarcity of trained teachers to deal with the diversity and secondly, it is very wrong to assume to deal with 45 learners with diversity. Hence, it is important to reduce the teacher-learner's ratio in the classroom, which is only possible if we have more schools with trained teachers to deal with the diversity of learners. At present, training to teachers is fragmented, uncoordinated and inadequate taking place in a segregated manner, i.e. one for special children and another for students with general capabilities; both of them are preparing teachers for the segregated schools. However, there is also an effort by SCERT, DIETs in providing ongoing training programme, which are not adequate because of various reasons.

Therefore, it is important that an inclusive teacher education programme must be designed which can foster proper skills among teachers. 1.10 References Booth, Tony (1996). in 1995 with the beginning of the UN Decade for Human Rights Education. In 1953 with the UNESCO Associated Schools

Program served as an "initial attempt to teach human rights in formal school settings". The first formal request for the

need to educate students about human rights came about in UNESCO's 1974 article Recommendation. It was

concerning about Education for International Understanding, Cooperation and Peace, and Education Relating to Human

Rights and Fundamental Freedoms. The participants of the International Congress on the Teaching of Human Rights

eventually met in 1978 to form a specific definition of what would be required application of the education in formal

curricula. The aims at which the Congress agreed upon including the encouragement of tolerant attitudes with focus on

respect, providing knowledge of human rights in the context of national and international dimensions as well as their

implementations finally the develop the awareness of human the congress wanted to rights translating into reality

whether social or political on national and international levels.

40 Human Rights Education became an official central concern internationally after the World Conference on Human

Rights in 1993. This conference brought the issue of formal education to the top of many countries priority lists which

was brought to the attention of the United Nations. It was two years later that the United Nations approved the Decade

for Human Rights Education, which reformed the aims of application once again. Since the development of the UN

Decade, the incorporation of human rights education into formal school curricula has been developed and diversified

with the assistance of nongovernmental organizations, intergovernmental organizations, and individuals dedicated to

spreading the topic through formal education. Today the most influential document has been used to determine what

qualifies as human rights and how to implement these ideas and rights into everyday's life in the Universal Declaration.

This declaration was adopted by the General Assembly in 1948, making December 10th annual Human Rights Day ever

since. To this day the 30 article compilation is seen

as "a common standard of achievement for all peoples and all nations" 2.2

Universal Declaration of Human Rights The Universal Declaration of Human Rights (1948)

was drafted by

the

UN Commission on Human Rights in 1947 and 1948.

The Declaration was adopted by the United Nations General Assembly on 10th December 1948.

41

Amongst other human rights, this declaration enunciates certain fundamental human rights of every human being which are of special interest in the study of the ethics of circumcision. They are the rights to security of person, to freedom from torture and other cruel and unusual treatment, and to privacy. Motherhood and childhood have a right to special protection. Preamble Whereas

recognition

of the inherent dignity and of the equal and unalienable rights of all members of the human family is the foundation of freedom, justice and peace in the world.

Whereas disregard and contempt for human rights have resulted in barbarous acts which have outraged the conscience of mankind, and the advent of a world in which human beings shall enjoy freedom of speech and belief and freedom from fear and want has been proclaimed as the highest aspiration of the common people, Whereas it is essential, if a man is not to be compelled to have recourse, as a last resort, to rebellion against tyranny and oppression, that human rights should be protected by the rule of law, Whereas it is essential to promote the development of friendly relations between nations, Whereas

the peoples of the United Nations have in the Charter reaffirmed their faith in fundamental human rights, in the dignity and worth of the human being and

in the equal rights of men and women

and have determined to promote social progress and better standards of life in larger freedom,

Whereas Member States have pledged themselves to achieve, in cooperation with the United Nations, the promotion of universal respect for and observance of human rights and fundamental freedoms,

Whereas a common understanding of these rights and freedoms is of the greatest importance for the full realization of this pledge, Now, therefore, The General Assembly proclaims this Universal Declaration of Human Rights as a common standard of achievement for all peoples and all nations.

The every individual and every organ of society should keep this Declaration constantly in mind. The teaching and education promote the respect for these rights and freedoms by progressive measures in national and international to secure their universal and

42 effective recognition and observance. Both among the peoples of Member States themselves and among the peoples of territories are under the jurisdiction. Article 1 All human beings are born free and equal in dignity and rights. They are endowed with reason and conscience and should act towards one another in a spirit of brotherhood. Article 2

Everyone is entitled to all the

rights and freedoms set forth

in this Declaration,

without distinction of any kind,

such as

race, colour, sex, language, religion, political or other opinion, national or social origin, property, birth or other status.

Furthermore, no distinction shall be made on the basis of the political, jurisdictional or international status of the country or territory to which a person belongs, whether it be independent, trust, non-self-governing or under any /other limitation of sovereignty. Article 3 Everyone has the right to life, liberty and security of person.

Article 5

No one shall be subjected to torture or to cruel, inhuman or degrading treatment or punishment.

Article 6 Everyone has the right to

recognition everywhere as a person before the law. Article 7 All are equal before the law and are entitled without any discrimination to equal protection of the law. All are entitled to equal protection against any discrimination in violation of this Declaration and against any incitement to such discrimination. Article 8 Everyone has the right to an effective remedy by the competent national tribunals for acts violating the fundamental rights granted him by the constitution or by law.

Article 12 No one shall be subjected to arbitrary interference with his privacy, family,

43 home or correspondence, nor to attacks upon his honour and reputation. Everyone has the right to the protection of the law against such interference or attacks.

Article 18 Everyone has the right to freedom of thought, conscience and religion; this right includes freedom to change his religion or belief, and freedom, either alone or in community with others and in public or private, to manifest his religion or belief in teaching, practice, worship and observance. Article 25 2. Motherhood and childhood are entitled to special care and assistance. All children, whether born in or out of wedlock, shall enjoy the same social protection. Article

28 Everyone is entitled to a social and international order in which the rights and freedoms set forth in this Declaration can be fully realized. Article 29 2. In the exercise of his rights and freedoms, everyone shall be subject only to such limitations as are determined by law solely for the purpose of securing due recognition and respect for the rights and freedoms of others and of meeting the just requirements of morality, public order and the general welfare in a democratic society. 3. These rights and freedoms may in no case be exercised contrary to the purposes and principles of the United Nations. Article 30 Nothing in this Declaration may be interpreted as implying for any State, group or person any right to engage in any activity or to perform any act aimed at the destruction of any of the rights and freedoms set forth herein.

2.3.2 Word Declaration for Education for All (1990) Over sixty years ago education was declared as a basic human right for every person, and enshrined

in the Universal Declaration on Human Rights in 1948. Since then, it has been reaffirmed in

the International Covenant on Economic, Social and Cultural Rights (1966),

the Conventional

on the Elimination of

Discrimination Against Women (1979) and the Convention on the Rights of the Child (1989)

among many other international human rights instruments.

44 In 1990, over 150 governments adopted the World Declaration on Education for All at Jomtien, Thailand to boost the efforts towards delivering the right to education. Ten years later, the World Education Forum in Dakar, Senegal reaffirmed this commitment and adopted the six goals of Education For All (EFA) that run to 2015: Goal 1:

Expanding and improving comprehensive early childhood care and education, especially for the most disadvantaged and vulnerable children. Goal 2: All children, particularly girls, children in difficult circumstances and those belonging to ethnic minorities have access to free, quality and compulsory primary education by 2015. Goal 3: Ensuring the learning needs of all young people and adults

who

are met through equitable access to appropriate learning and life skills programmes Goal 4: Achieving a 50 per cent improvement in levels of adult literacy by 2015, especially for women, and equitable access to basic and continuing education for all adults. Goal 5: Eliminating gender disparities in primary and secondary education by 2005, and

achieving gender equality in education by 2015, with a focus on ensuring girls' full and equal access to and achievement in basic education of good quality Goal 6: Improving every aspect of the quality of education, and ensuring their

excellence so that recognised and measurable learning outcomes are achieved by all, especially in literacy, numeracy and essential life skills 180

countries signed up to make these goals happen, committing to putting legal frameworks, policies and finance .

Everyone has a right to get education in four corner that are available, accessible, acceptable and adaptable. The richest countries pledged to help make Education for All a reality by committing to principles of international cooperation towards those countries with fewer financial resources. Commitment towards the right to education was also reflected in the UN Millennium Development Goals, set in 2000 with a deadline for achievement by 2015. There are eight Millennium Development Goals (MDGs) of which two are focussed on education: Ensure that all boys and girls complete primary schooling by 2015 Eliminate gender disparities in primary education by 2005 and at all levels by 2015 But the progress has been painfully slow. In the period immediately after the

45 setting of both the MDGs and the six EFA goals, investments were made by governments committed to achieving these goals. Education budgets, both foreign and domestic increased, enabling the abolition of tuition fees for primary school in several countries and the development of improved national educational plans. Averagely 8.9% of domestic budget is going to education in low income countries - rising to an average of over 10% in sub-Saharan Africa - States are still falling behind. ●●●●● Enrolment in primary school may have increased since 2000, but this has slowed towards the end of the 2000-2010 periods; worse, completion rates remain low, with 10 million children dropping out of primary school every year in sub-Saharan Africa alone. ●●●●● Millions of children who complete the education of primary schools do so with poor performance than expected levels of reading, writing and numeracy they receive poor quality of education when they are in schools and - where pupil-teacher ratio is quite unnatural in the very poorest areas. ●●●●● Women and girls remain at a huge disadvantage: although gender parity in primary enrolment is within reach, girls are still less likely to progress to secondary education - in the vast majority of African countries, this chance is less than 50% - and women make up almost two-thirds of the 796 million adults without basic skills. ●●●●● Another 1.8 million teachers are needed to achieve universal primary education by 2015. 2.4 International Conventions: 2.4.1 Convention against Discrimination (1990) The General Conference of the United Nations Educational, Scientific and Cultural Organization, meeting in Paris from 14th November to 15th December 1960, at its eleventh session, Recalling that the Universal Declaration

of Human Rights asserts the principle of non-discrimination and proclaims that every person has the right to education, Considering that discrimination in education is a violation of rights enunciated in that Declaration, Considering that, under the terms of its Constitution, the United Nations Educational, Scientific and Cultural Organization has the purpose 46 of instituting collaboration among the nations with a view to furthering for all universal respect for human rights and equality of educational opportunity. Recognizing that, consequently, the United Nations Educational, Scientific and Cultural Organization, while respecting the diversity of national educational systems, has the duty not only to prescribe any form of discrimination in education but also to promote equality of opportunity and treatment for all in education, Having before It proposals concerning the different aspects of discrimination in education, constituting item 17.1.4 of the agenda of the session, Having decided at its tenth session that this question should be made the subject of an international convention as well as of recommendations to Member States, Adopts this Convention on the fourteenth day of December 1960. Article 1 1. For the purposes of this Convention, the term 'discrimination' includes any distinction, exclusion, limitation or preference which, being based on

race, colour, sex, language, religion, political or other opinion, national or social origin, economic condition or birth,

has the

purpose or effect of nullifying or impairing equality of treatment in education

and in particular: (a) Of depriving any person or group of persons of access to education of any type or at any level; (b) Of limiting any person or group of persons to education of an inferior standard; (c) Subject to the provisions of Article 2 of this Convention, of establishing or maintaining separate educational systems or institutions for persons or groups of persons; or (d) Of inflicting on any person or group of persons conditions which are in- compatible with the dignity of man. 2. For the purposes of this Convention, the term 'education' refers to all types and levels of education, and includes access to education, the standard and quality of education, and the conditions under which it is given. Article 2 When permitted in a State, the following situations shall not be deemed to constitute discrimination, within the meaning of Article 1 of this Convention:

47 (a)

The establishment or maintenance of separate educational systems or institutions for pupils of the two sexes offering equivalent access to education,

provide a teaching staff with qualifications of the same standard as well as school premises and equipment of the same quality, and afford the opportunity to take the same or equivalent courses of study; (b) The establishment or maintenance, for religious or linguistic reasons, of separate educational systems or institutions offering an education

which is in keeping with the wishes of the pupil's parents or legal guardians, if participation in such systems or attendance at such institutions is optional and if the education provide to make like such standards as may be laid down or approved by the competent authorities, in particular for education of the same level; (c)

The establishment or maintenance of private educational institutions, if the object of the institutions is not to

secure the exclusion of any group but to provide educational facilities in addition to those provided by the public authorities, if the institutions are conducted in accordance with that object, and if the education provided conforms with such standards as may be laid down or approved by the competent authorities, in particular for education of the same level. Article 3 In order to eliminate and prevent discrimination within the meaning of this Convention, the States Parties thereto undertake: (a) To abrogate any statutory provisions and any administrative instructions and to discontinue any administrative practices which involve discrimination in education; (b) To ensure, by legislation where necessary, that there is no discrimination in the admission of pupils to educational institutions; (c) Not to allow any differences of treatment by the public authorities between nationals, except on the basis of merit or need, in the matter of school fees and the grant of scholarships or other forms of assistance to pupils and necessary permits and facilities for the pursuit of studies in foreign countries ; (d) Not to allow, in any form of assistance granted by the public authorities to educational institutions, any restrictions or preference based solely on the ground that pupils belong to a particular group; 48 (e) To give foreign nationals resident within their territory the same access to education as that given to their own nationals. Article 4 The States Parties to this Convention undertake furthermore to formulate, develop and apply a national policy which, by methods appropriate to the circumstances and to national usage, will tend to promote equality of opportunity and of treatment in the matter of education and in particular: (a) To make primary education free and compulsory; make secondary education in its different forms generally available and accessible to all; make higher education equally accessible to all on the basis of individual capacity; assure compliance by all with the obligation to attend school prescribed by law; (b) To ensure that the standards of education are equivalent in all public educational institutions of the same level, and that the conditions relating to the quality of the education provided are also equivalent; (c) To encourage and intensify by appropriate methods the education of persons who have not received any primary education or who have not completed the entire primary education course and the continuation of their education on the basis of individual capacity; (d) To provide training for the teaching profession without discrimination. Article 5 1. The States Parties to this Convention agree that: (a) Education shall be directed to the full development of the human personality and to the strengthening of respect for human rights and fundamental freedoms; it shall promote understanding, tolerance and friendship among all nations, racial or religious groups, and shall further the activities of the United Nations for the maintenance of peace; (b) It is essential to respect the liberty of parents and, where applicable, of legal guardians, firstly to choose for their children institutions other than those maintained by the public authorities but conforming to such minimum educational standards as may be laid down or approved by the competent authorities and, secondly, to ensure in a manner consistent with the procedures followed in the State for the application of its legislation, the religious and moral education of the children in conformity with their own convictions; and

49 no person or group of persons should be compelled to receive religious instruction inconsistent with his or their convictions; (c) It is essential to recognize the right of members of national minorities to carry on their own educational activities, including the maintenance of schools and, depending on the educational policy of each State, the use or the teaching of their own language, provided however: (i) That this right is not exercised in a manner which prevents the members of these minorities from understanding the culture and language of the community as a whole and from participating in its activities, or which prejudices national sovereignty; (ii) That the standard of education is not lower than the general standard laid down or approved by the competent authorities; and (iii) That attendance at such schools is optional. 2. The States Parties to this Convention undertake to take all necessary measures to ensure the application of the principles enunciated in paragraph 1 of this Article. Article 6 In the application of this Convention, the States Parties to it undertake to pay the greatest attention to any recommendations hereafter adopted by the General Conference of the United Nations Educational, Scientific and Cultural Organization defining the measures to be taken against the different forms of discrimination in education and for the purpose of ensuring equality of opportunity and treatment in education. Article 7 The States Parties to this Convention shall in their periodic reports submitted to the General Conference of the United Nations Educational, Scientific and Cultural Organization on dates and in a manner to be determined by it, give information on the legislative and administrative provisions which they have adopted and other action which they have taken for the application of this Convention, including that taken for the formulation and the development of the national policy defined in Article 4 as well as the results achieved and the obstacles encountered in the application of that policy. 50 Article 8 Any dispute which may arise between any two or more States Parties to this Convention concerning the interpretation or application of this Convention, which is not settled by negotiation shall at the request of the parties to the dispute be referred, failing other means of settling the dispute, to the International Court of Justice for decision. Article 9 Reservations to this Convention shall not be permitted. Article 10 This Convention shall not have the effect of diminishing the rights which individuals or groups may enjoy by virtue of agreements concluded between two or more States, where such rights are not contrary to the letter or spirit of this Convention. Article 11 This Convention is drawn up in English, French, Russian and Spanish, the four texts being equally authoritative. Article 12 1. This Convention shall be subject to ratification or acceptance by States Members of the United Nations Educational, Scientific and Cultural Organization in accordance with their respective constitutional procedures. 2. The instruments of ratification or acceptance shall be deposited with the Director-General of the United Nations Educational, Scientific and Cultural Organization. Article 13 1. This Convention shall be open to accession by all States not Members of the United Nations Educational, Scientific and Cultural Organization which are invited to do so by the Executive Board of the Organization. 2. Accession shall be effected by the deposit of an instrument of accession with the Director-General of the United Nations Educational, Scientific and Cultural Organization. Article 14 This Convention shall enter into force, three months after the date of the deposit of the third instrument of ratification, acceptance or accession, but only with respect to

51 those States which have deposited their respective instruments on or before that date. It shall enter into force with respect to any other State three months after the deposit of its instrument of ratification, acceptance or accession. Article 15 The States Parties to this Convention recognize that the Convention is applicable not only to their metropolitan territory but also to all non-self-governing, trust, colonial and other territories for the international relations of which they are responsible; they undertake to consult, if necessary, the governments or other competent authorities of these territories on or before ratification, acceptance or accession with a view to securing the application of the Convention to those territories, and to notify the Director-General of the United Nations Educational, Scientific and Cultural Organization of the territories to which it is accordingly applied, the notification to take effect three months after the date of its receipt. Article 16 1. Each State Party to this Convention may denounce the Convention on its own behalf or on behalf of any territory for whose international relations it is responsible. 2. The denunciation shall be notified by an instrument in writing, deposited with the Director-General of the United Nations Educational, Scientific and Cultural Organization. 3. The denunciation shall take effect twelve months after the receipt of the instrument of denunciation. Article 17 The Director-General of the United Nations Educational, Scientific and Cultural Organization shall inform the States Members of the Organization, the States not members of the Organization which are referred to in Article 13, as well as the United Nations, of the deposit of all the instruments of ratification, acceptance and accession provided for in Articles 12 and 13, and of the notifications and denunciations provided for in Articles 15 and 16 respectively. Article 18 1. This Convention may be revised by the General Conference of the United Nations Educational, Scientific and Cultural Organization. Any such revision

52 shall, however, bind only the States which shall become Parties to the revising convention. 2. If the General Conference should adopt a new convention revising this Convention in whole or in part, then, unless the new convention otherwise provides, this Convention shall cease to be open to ratification, acceptance or accession as from the date on which the new revising convention enters into force. Article 19 In conformity with Article 102 of the Charter of the United Nations, this Convention shall be registered with the Secretariat of the United Nations at the request of the Director-General of the United Nations Educational, Scientific and Cultural Organization. Done in Paris, this fifteenth day of December 1960, in two authentic copies bearing the signatures of the President of the eleventh session of the General Conference and of the Director-General of the United Nations Educational, Scientific and Cultural Organization, which shall be deposited in the archives of the United Nations Educational, Scientific and Cultural Organization, and certified true copies of which shall be delivered to all the States referred to in Articles 12 and 13 as well as to the United Nations.

2.4.2 Convention on Rights of Child (1989) The General Assembly, Recalling its previous resolutions, especially resolutions 33/166 of 20th December 1978 and 43/112 of 8th December 1988, and those of the Commission on Human Rights and the Economic and Social Council related to the question of a convention on the rights of the child, Taking note, in particular, of Commission on Human Rights resolution 1989/57 of 8th March 1989, by which the Commission decided to transmit the draft convention on the rights of the child, through the Economic and Social Council, to the General Assembly, and Economic and Social Council resolution 1989/79 of 24th May 1989, Reaffirming that children's rights require special protection and call for continuous improvement of the situation of children all over the world, as well as for their development and education in conditions of peace and security, Profoundly concerned that the situation of children in many parts of the world remains critical as a result of inadequate social conditions, natural disasters, armed 53 conflicts, exploitation, illiteracy, hunger and disability, and convinced that urgent and effective national and international action is called for, Mindful of the important role of the United Nations Children's Fund and of that of the United Nations in promoting the well-being of children and their development, Convinced that an international convention on the rights of the child, as a standard-setting accomplishment of the United Nations in the field of human rights, would make a positive contribution to protecting children's rights and ensuring their well-being, Bearing in mind that 1989 marks the thirtieth anniversary of

the Declaration of the Rights of the Child and the tenth anniversary of the International Year of the Child, 1.

Expresses its appreciation to the Commission on Human Rights for having concluded the elaboration

of

the draft convention on the rights of the child; 2. Adopts and opens for signature, ratification and accession the Convention on the Rights of the Child contained in

the annex to the present resolution; 3. Calls upon all Member States to consider signing and ratifying or acceding to the Convention as a matter of priority and expresses the hope that it will come into force at an early date; 4. Requests the Secretary-General to provide all the facilities and assistance necessary for dissemination of information on the Convention; 5. Invites United Nations agencies and organizations, as well as intergovernmental and non-governmental organizations, to intensify their efforts with a view to disseminating information on the Convention and to promoting its understanding; 6. Requests the Secretary-General to submit to the General Assembly at its forty-fifth session a report on the status of the Convention on the Rights of the Child; 7.

Decides to consider the report of the Secretary-General at its forty-fifth session under an item entitled "

Implementation

of

the

Convention

on the Rights

of the Child".

54 2.4.3

United Nations Convention

of

Rights

of

Persons

with Disabilities (

UNCRPD) 2006

The

Convention on the Rights of

Persons with

Disabilities

is

an international

human rightstreaty of

the United Nations intended

to protect the rights and dignity of persons with disabilities.

Parties to the

Convention

are required

to

promote, protect, and ensure the full enjoyment of human rights by persons with disabilities and

ensure that they enjoy full equality under the law. The Convention has served as the major catalyst in the global

movement

from viewing

persons

with disabilities as objects of charity, medical treatment and social protection towards viewing them as full and equal

members of society,

with human rights.

It is also the only UN human rights instrument with an explicit sustainable development dimension. The Convention was the first human rights treaty of the third millennium.

The text was adopted by the United Nations General Assembly on 13 December 2006,

and

opened for signature on 30 March 2007.

Following ratification by the 20th party, it came into force on 3 May 2008. As of February 2016, it has 160 signatories and 162 parties, including 161 states and the European Union (which ratified it on 23 December 2010 to the extent responsibilities of the member states were transferred to the European Union). In December 2012, a vote in the United States Senate fell six votes short of the two-thirds majority required for ratification.[4] The Convention is monitored by the Committee on the Rights of Persons with Disabilities.

History 1981 to 1992 was the UN "Decade of Disabled Persons". In 1987, a global meeting of experts to review progress recommended that the UN General Assembly should draft an international convention on the elimination of discrimination against persons with disabilities. Draft convention outlines were proposed by Italy and subsequently Sweden, but no consensus was reached. Many government representatives argued that existing human rights documents were sufficient. Instead, non-compulsory "Standard Rules on the Equalization of Opportunities for Persons with Disabilities" were adopted by the General Assembly in 1993. In 2000, leaders of five international disability NGOs issued a declaration, calling on all governments to support a Convention. In 2001, the General Assembly, following a proposal by Mexico, established an Ad Hoc Committee to consider proposals for a comprehensive and integral convention to promote and protect the rights and dignity of persons with disabilities, based on a holistic approach.[5]

Disability rights organizations, including the International Disability Alliance as coordinator of an ad hoc International Disability 55 Caucus, participated actively in the drafting process, in particular seeking a role for disabled people and their organizations in the implementation and monitoring of what became the Convention. Mexico initiated negotiations, with active support from GRULAC (the Latin American regional group). When support for a Convention was foundering in 2002 due to WEOG opposition, New Zealand played a pivotal role in achieving cross- regional momentum. Acting as facilitator from 2002-03, New Zealand eventually assumed the formal role of Chair of Ad Hoc Committee and led negotiations to a consensus agreement in August 2006, working closely with other Bureau members Jordan, Costa Rica, the Czech Republic, and South Africa, as well as Korea and Mexico.

The Convention became one of the most quickly supported human rights instruments in history, with strong support from all regional groups. 160

States have signed the Convention upon its opening in 2007 and 126 States ratified the Convention within its first five years. In recognition of its role in creating the Convention, as well as the quality of New Zealand's landmark national Disability Strategy, Governor- General of New Zealand Anand Satyanand received the 2008 World Disability Award on behalf of the nation. Summary

The Convention follows the civil law tradition, with a preamble, in which the principle that "all human rights are universal, indivisible, interdependent and interrelated" of Vienna Declaration and Programme of Action is cited, followed by 50 articles. Unlike many UN covenants and conventions, it is not formally divided into parts. Article 1 defines the purpose of the Convention:

to promote, protect and ensure the full and equal enjoyment of all human rights and fundamental freedoms by all persons with disabilities, and to promote respect for their inherent dignity

Articles 2 and 3 provide definitions and general principles including communication, reasonable accommodation and universal design. Articles 4-32 define the rights of persons with disabilities and the obligations of states parties towards them. Many of these mirror rights affirmed in other UN conventions such as the International Covenant on Civil and Political Rights, International Covenant on Economic, Social and Cultural Rights or the Convention Against Torture, but with specific obligations ensuring that they can be fully realised

56 by persons with disabilities. Rights specific to this convention include the rights to accessibility including the information technology, the rights to live independently and be included in the community (Article 19), to personal mobility (article 20), habilitation and rehabilitation (Article 26), and to participation in political and public life, and cultural life, recreation and sport (Articles 29 and 30). In addition, parties to the Convention must raise awareness of the human rights of persons with disabilities (Article 8), and ensure access to roads, buildings, and information (Article 9). Articles 33-39 govern reporting and monitoring of the convention by national human rights institutions (Article 33) and Committee on the Rights of Persons with Disabilities (Article 34). Articles 40-50 govern ratification, entry into force, and amendment of the Convention. Article 49 also requires that the Convention be available in accessible formats.

Core provisions Guiding principles of the Convention

There are eight guiding principles that underlie the Convention: 1.

Respect for inherent dignity, individual autonomy including the freedom to make one's own choices, and independence of persons 2.

Non-discrimination 3.

Full and

effective participation and inclusion in society 4.

Respect for difference and acceptance of

persons with

disabilities

as part of human diversity and humanity 5. Equality of opportunity 6. Accessibility 7. Equality between men and women 8.

Respect for

the

evolving capacities of children with disabilities

and respect for the right of children with disabilities to preserve their

identities

Definition of disability The Convention

adopts a social model of disability, and defines disability

as

57

including

those who have

long-term physical, mental, intellectual or sensory impairments which in interaction with

various

barriers may hinder their

full and effective participation in society on an equal basis

with

others.

Principle of "reasonable accommodation" The Convention defines "reasonable accommodation" to be "

necessary and appropriate modification and adjustments not imposing a disproportionate or undue burden, where

needed in a particular case, to ensure to persons with disabilities

the enjoyment or exercise

on an equal basis with others of all human rights and fundamental freedoms"

at the

Article 2 and demands this all aspects of life including inclusive education. Prevention of discrimination The Article 8 of

Convention stresses the awareness raising to foster respect for the rights and dignity against discrimination: 1.

To raise awareness throughout society, including at the family level, regarding persons with disabilities, and to foster

respect for the rights and dignity of persons with disabilities. 2. To combat stereotypes, prejudices and harmful practices

relating to persons with disabilities, including those based on sex and age, in all areas of life. 3. To promote awareness of

the capacities and contributions of persons with disabilities. 4.

Initiating and maintaining effective public awareness campaigns designed: (i) to nurture receptiveness to the rights of persons with disabilities. (ii) to promote positive perceptions and greater social awareness towards persons with disabilities. (iii) to promote recognition of the skills, merits and abilities of persons with disabilities, and of their contributions to workplace and the labour market. 5. Encouraging all organs of the mass media to portray persons with disabilities in a manner consistent with the purpose of the present Convention. 6. Promoting awareness-training programmes regarding persons with disabilities and the rights of persons with disabilities. Accessibility The Convention stresses that persons with disabilities should be able to live independently and participate fully in all aspects of life. To this end, States Parties should take appropriate measures to ensure that persons with disabilities have access, to the physical environment, to transportation, to information and communications technology, and to other facilities and services open or provided to the public. accessibility can be grouped into three main groups. 1. physical accessibility 2. service accessibility 3. accessibility to communication and information. Situations of risk and humanitarian emergency Article 11 of the Convention affirms that States Parties shall take, in accordance with their obligations under international law, including international humanitarian law and international human rights law, all necessary measures to ensure the protection and safety of persons with disabilities in situations of armed conflict, humanitarian emergencies and the occurrence of natural disaster. Recognition before the law and legal capacity Article 12 of the Convention affirms the equal recognition before law and legal capacity of the persons with disabilities. States Parties should: 1. reaffirm that persons with disabilities have the right to recognition everywhere as a person before the law. 2. recognize that persons with disabilities enjoy legal capacity on an equal basis with others in all aspects of life. 3. take appropriate measures to provide access by persons with disabilities to the support they may require in exercising their legal capacity. 4. ensure that all measures that relate to the exercise of legal capacity provide for appropriate and effective safeguards to prevent abuse in accordance with international human rights law. Such safeguards shall ensure that measures relating to the exercise of legal capacity respect the rights, will and preferences of the person, are free of conflict of interest and undue influence, are proportional and tailored to the person's circumstance, apply for the shortest time possible and are subject to regular review by a competent, independent and impartial authority or judicial body. The safeguards shall be proportional to the degree to which such measures affect the person's rights and interests. 59 Access to justice Article 13 of the Convention affirms the effective access to justice for persons with disabilities, stating that: 1. States parties shall ensure effective access to justice for persons with disabilities on an equal basis with others, including through the provision of procedural and age-appropriate accommodations, in order to facilitate their effective role as a direct and indirect participants, including as witnesses, in all legal proceeding, including at investigative and other preliminary stages. 2. In order to help to ensure effective access to justice for persons with disabilities, states Parties shall promote appropriate training for those working in the field of administration of justice, including police and prison staff. This Article together with the Article 12 are cited by the "Handbook on prisoners with special needs"[7] by United Nations Office on Drugs and Crime. Right to education The Convention states that persons with disabilities should be guaranteed the right to inclusive education at all levels, regardless of age, without discrimination and on the basis of equal opportunity. States Parties should ensure that: 1. children with disabilities are not excluded from free and compulsory primary education, or from secondary education; 2. adults with disabilities have access to general tertiary education, vocational training, adult education and lifelong learning; 3. persons with disabilities receive the necessary support, within the general education system, to facilitate their effective education;

and 4. effective individualized support measures are put in place to maximize academic and social development. States Parties should take appropriate measures, such as: 1. endorsing the learning of Braille, alternative script, augmentative and alternative modes, means and formats of communication and orientation and mobility skills, and facilitating peer support and mentoring; 2. supporting the learning of sign language and promoting the linguistic identity of the deaf community; 3. advocating that education of persons, particularly children, who are blind or deaf, is delivered in the most appropriate languages and means of communication for the individual; and 4. employing teachers, including teachers with disabilities, who are qualified in sign language and/or Braille, and to train education professionals and staff about disability awareness, use of augmentative and alternative modes and formats of communication, and educational techniques and materials to support persons with disabilities. Right to health Article 25 specifies that "persons with disabilities have the right to the enjoyment of the highest attainable standard of health without discrimination on the basis of disability." [8]

Protecting the integrity of the person Article 17 of the Convention states that every person with disabilities has a right to respect for his or her physical and mental integrity on an equal basis with others. Respect for the family Article 23 of the Convention prohibits compulsory sterilization of disabled persons [9] and guarantees their right to adopt children. Habilitation and rehabilitation Article 26 of the Convention affirms that "States Parties shall take effective and appropriate measures, including through peer support, to enable persons with disabilities to attain and maintain maximum independence, full physical, mental, social and vocational ability, and full inclusion and participation in all aspects of life. To that end, States Parties shall organize, strengthen and extend comprehensive habilitation and rehabilitation services and programmes, particularly in the areas of health, employment, education and social services, in such a way that these services and programmes: 1. Begin at the earliest possible stage, and are based on the multidisciplinary assessment of individual needs and strengths; 2. Support participation and inclusion in the community and all aspects of society, 61 are voluntary, and are available to persons with disabilities as close as possible to their own communities, including in rural areas. 3. States Parties shall promote the development of initial and continuing training for professionals and staff working in habilitation and rehabilitation service. 4. States Parties shall promote the availability, knowledge and use of assistive devices and technologies, designed for persons with disabilities, as they relate to habilitation and rehabilitation.

Participation rights
The Convention on the Right of Persons with Disabilities recognised that "that disability results from the interaction between persons with impairments and attitudinal and environmental barriers that hinders their full and effective participation in

society on an equal basis with others"

and that "persons with disabilities

continue to face barriers in their participation as equal members of society." The Convention makes participation of the disabled one of its principles, stating "The principles of the present Convention shall be:...

Full and effective participation and inclusion in society", subsequently enshrining the right of disabled to participate fully and equally in the community,

education, all aspect of life (in the context of habilitation and rehabilitation), political and public life, cultural life, leisure and sports.[10] States Parties should take appropriate measure such as: 1. To enables persons with disabilities to have the opportunity to develop and utilize their creative, artistic and intellectual potential, not only for their own benefit, but also for the enrichment of society. 2. In accordance with international law, to ensure that law protecting intellectual property rights do not constitute an unreasonable or discriminatory barrier to access by persons with disabilities to cultural materials. 3. So that persons with disabilities should be entitled, on an equal basis with others, to recognition and support of their specific cultural and linguistic identity, including sign languages and deaf culture. Work and employment Article 27 requires

that

States Parties recognize

the right of persons with disabilities to

work, on an equal basis

of

others; this includes the right to the opportunity to gain a living by

work freely chosen or accepted in a labour market and work

62 environment that is open, inclusive and accessible to persons with disabilities.

And that

States Parties shall safeguard and promote the realization of the right to work,

including for those who acquire a disability during the course of employment,

by taking appropriate steps, including through legislation, to inter alia: 1. Prohibit discrimination on the basis of disability with regard to all matters concerning all forms of employment, continuance of employment, career advancement and safe and healthy working conditions; 2. Protect the rights of

persons with disabilities, on an equal basis with others, to

just and favourable conditions of work, including equal opportunities and equal remuneration for work of equal value,

safe and healthy working conditions, including protection from harassment, and the redress of grievances; 3. Ensure that

persons with disabilities are able to exercise their labour and trade union rights on an equal basis with others; 4. Enable

persons with disabilities to have effective access to general technical and vocational guidance programmes, placement

services and vocational and continuing training; 5. Promote employment opportunities and career advancement for

persons with disabilities in the labour market, as well as assistance in finding, obtaining, maintaining and returning to

employment; 6. Promote opportunities for self-employment, entrepreneurship, the development of cooperative and

starting one's own business. 7.

Ensure that reasonable accommodation is provided to persons with disabilities

in the workplace. 8. Promote

the acquisition by persons with disabilities of work experience in the open labour market. 9.

Promote vocational and professional rehabilitation, job retention and return- to-work programmes

for

persons with disabilities. States Parties shall ensure that persons with disabilities are

not held in slavery or in servitude, and are protected, on an equal basis with others, from forces or compulsory labour.

Adequate standard of living and social protection Article 28 requires

that

States Parties recognize the right of persons with

63 disabilities to

an adequate standard of living for themselves and their families, including adequate food, clothing and housing, and to

the continuous improvement of living conditions, and shall take appropriate steps to safeguard and promote the

realization of this rights without discrimination

on the basis of disability.

States

Parties recognize the right of persons with disabilities to

social protection and to the enjoyment of that rights without discrimination on the basis of

disability, and shall take appropriate steps to safeguard and promote the realization of the rights, including measures; 1.

To ensure equal access by persons with disabilities to clean water service, and

to ensure access to appropriate and affordable service, device and other assistance for disability-related

needs. 2. To ensure access by

persons with disabilities, in particular women and girls with disabilities

and older persons with disabilities, to social protection programmes and poverty reduction programmes. 3. To ensure

access by persons with disabilities and their families living in situations of poverty to assistance from the State with

disability-related expenses, including adequate training, counselling, financial assistance and respite care. 4. To ensure

access by persons with disabilities to public housing programmes. 5. To ensure equal access by persons with disabilities

to retirement benefits and programmes. Right to vote Article 29 requires that all Contracting States protect "the right of

persons with disabilities to vote by secret ballot in elections and public referendums". According to this provision, each

Contracting State should provide for voting equipment which would enable disabled voters to vote independently and

secretly. Some democracies, e.g., the US, Japan, Netherlands, Slovenia, Albania or India allow disabled voters to use

electronic voting machines or electronic aides which help disabled voters to fill the paper ballot. In others, among them

Azerbaijan, Kosovo, Canada, Ghana, United Kingdom, and most of African and Asian countries, visually impaired voters

can use ballots in Braille or paper ballot templates. Many of these and also some other democracies, Chile for example,

use adjustable desks so that voters on wheelchairs can approach them. Some democracies only allow another person to

cast a ballot for

64 the blind or disabled voter. Such arrangement, however, does not assure secrecy of the ballot. Article 29 also requires

that Contracting States ensure "that voting procedures, facilities and materials are appropriate, accessible and easy to

understand and use." In some democracies, i.e. Sweden and the US, all the polling places already are fully accessible for

disabled voters. Reservations A number of parties have made reservations and interpretative declarations to their

application of the Convention. Australia does not consider itself bound to stop forcibly medicating those labeled mentally

ill when it is considered a last resort. El Salvador accepts the Convention to the extent that it is compatible with its

constitution. Malta interprets the right to health in Article 25 of the Convention as not implying any right to abortion. It

also reserves the right to continue to apply its own election laws around accessibility and assistance. Mauritius does not

consider itself bound by the Article 11 obligation to take all necessary measures to protect people with disabilities during

natural disasters, armed conflict or humanitarian emergencies, unless permitted by domestic legislation. The Netherlands

interprets the right to life in Article 10 within the framework of its domestic laws. It also interprets Article 25(f), which bars

the discriminatory denial of health care, as permitting a person to refuse medical treatment, including food or fluids.

Poland interprets Articles 23 and 25 as not conferring any right to abortion. The United Kingdom has reservations relating

to the right to education, immigration, service in the armed forces and an aspect of social security law. 2.5 International

Framework: 2.5.1

Salamanca framework More than 300 participants representing 92 governments and 25 international organizations met

in Salamanca in 1994 to further

the objective of Education for All

65 by considering

the fundamental policy shifts required to promote

the approach of inclusive education, namely enabling schools to

serve all children, particularly those with special educational needs.

Organized by the Government of Spain

in co-operation with UNESCO,

the Conference brought together senior education officials, administrators, policy-makers and specialists, as well as

representatives of the United Nations and the Specialized Agencies, other international governmental organizations,

non-governmental organizations and donor agencies.

The Conference adopted

the Salamanca Statement on Principles, Policy and Practice in Special Needs Education and a Framework for Action.

These documents are informed by the principle of inclusion, by recognition of the need to work towards "schools for all" - institutions which include everybody, celebrate differences, support learning, and respond to individual needs. As such, they constitute an important contribution to the agenda for achieving Education for All and for making schools educationally more effective. This

Framework

for Action on Special Needs Education was adopted by

the World Conference on Special Needs Education

organized by the Government of Spain in co-operation with UNESCO

and held in Salamanca from 7 to 10 June 1994. Its purpose is to inform policy and guide action by governments,

international organizations, national aid agencies, nongovernmental organizations and other bodies

in implementing

the Salamanca Statement on Principles, Policy and Practice in Special Needs Education.

The Framework draws extensively upon the national experience of the participating countries as well as upon

resolutions, recommendations and publications of the United Nations system and other intergovernmental

organizations, especially

the

Standard Rules on the Equalization of Opportunities for Persons with Disabilities'.

It also takes account of the proposals, guidelines and recommendations arising from the five regional seminars held to prepare the World

Conference.

The right of every child to an education is proclaimed in

the Universal Declaration of Human Rights and was forcefully

reaffirmed by the World Declaration on Education for All.

Every person with a disability has a right to express their wishes with regard to their education, as far as this can be

ascertained. Parents have an inherent right to be consulted on the form of education best suited to the needs,

circumstances and aspiration so far their children. The guiding principle that informs this Framework is that

Schools should

accommodate all children regardless of their physical, intellectual, social, emotional, linguistic or other conditions. This should

include disabled and gifted children, street and working children, children

from

remote or nomadic populations,

children from

66 linguistic, ethnic or cultural minorities and children from other disadvantaged or marginalized areas or groups.

These conditions create a range of different challenges to school systems. In the context of this Framework,

the term 'special educational needs' refers to all those children and youth whose needs arise from

disabilities or learning difficulties. Many children experience learning difficulties and thus have special educational needs at

some time during their schooling. Schools have to find ways of successfully educating all children, including those who

have serious disadvantages and disabilities. There is an emerging consensus that children and youth with special

educational needs should be included in the educational arrangements for the majority of children. This has led to the

concept of the inclusive school. The challenge confronting the inclusive school is that of developing a child-centered pedagogy capable of successfully educating all children, including those who have serious disadvantages and disabilities.

The merit of such schools is not only that they are capable of providing quality education to all children; their

establishments a crucial step in helping to change discriminatory attitudes, in creating welcoming communities and in

developing an inclusive society. A change in social perspective is imperative. For far too long, the problems of people with

disabilities have been compounded by a disabling society that has focused upon their impairments rather than their potential.

Special needs education incorporates the proven principles of sound pedagogy from which all children may benefit. It must accordingly

be adapted to the needs of the child rather than the child fitted to

preordained assumptions regarding the pace and nature of the learning process. A child-centred pedagogy is beneficial to all students and, as a consequence, society as a whole. Experience has demonstrated that it can substantially reduce the drop-out and repetition that are so much a part of many education systems while ensuring higher average levels of achievement. A child-centred pedagogy can help to avoid the waste of resources and the shattering of hope that is all too frequently a consequence of poor quality instruction and a 'one size fits all' mentality towards education. Child-centred schools are, moreover, the training ground for a people-oriented society that respects both the differences and the dignity of all human beings.

This Framework for Action comprises the following sections: I. New thinking in special needs education II. Guidelines for action at the national level A. Policy and organization B. School factors

67 C. Recruitment and training of educational personnel D. External support services E. Priority areas F. Community perspectives G. Resource requirements III. Guidelines for action at the regional and international level. 2.5.2

Biwako Millennium Framework of Action 2002 In May 2002, ESCAP adopted the resolution "

Promoting

an inclusive, barrier-free and rights-based society for people with disabilities

in

the Asian and Pacific

regions in

the 21st century". The resolution also proclaimed

the extension of the Asian and Pacific Decade of Disabled Persons 1993-2002,

for another decade, 2003- 2012. In October 2002, Governments

at the

High-level Intergovernmental Meeting to Conclude

the Asian and Pacific Decade of Disabled Persons 1993-2002,

adopted

the "

Biwako Millennium

Framework for Action

towards

an Inclusive, Barrier-free and Rights-based Society for Persons with Disabilities

in

Asia and the Pacific"

as the

regional policy guideline for

the new decade. The "Biwako Millennium Framework" outlines issues, action plans and strategies

towards an inclusive, barrier-free and rights-based society for persons with disabilities.

To achieve the goal, the

framework identifies seven priority areas

for action, in which critical issues, targets with specific timeframe and actions

are specified. In all, 21 targets and 17 strategies supporting the achievement of all the targets are identified.

The new decade (2003-2012) will ensure the paradigm

shift from a charity-based approach to a rights-based approach

to protect the

civil, cultural, economic, political and social rights of persons with disabilities.

To pursue the targets and strategies, consultations with and involvement of civil societies, inter alia, self-help

organizations and concerned NGOs are essential. The following summarizes the seven priority areas for action, the

targets, strategies, timeframe and supporting/monitoring mechanisms. (1)

Self-help organizations of persons with disabilities and related family and parent associations. (2)

Women with disabilities. (3) Early detection, early intervention and education.

68 (4) Training and employment, including self-employment. (5) Access to build environment and public transport. (6)

Access to information and communications,

including information, communication and assertive technologies. (7) Poverty alleviation through social security and livelihood programmes. (8)

Highlights of item (5): Access to built environment and public transport.

Inaccessibility to the built environment, including public transport systems, is still the major barrier for persons with disabilities.

This problem will only be exacerbated, as the number of older people with disabilities increases in the region. Universal design approaches benefit all people in society, including older persons, pregnant women and parents with young children. Its economic benefits have been legitimized, yet substantive initiatives at policy level have not been taken. Three targets are set to improve the situation: The Government should

adopt and enforce accessibility standards for planning of public facilities, infrastructure and transport, including those in rural/ agricultural contexts. Existing public transport systems and all new

and renovated public transport systems should be made accessible as soon as practicable. All international and regional funding agencies for infrastructure development should include universal and inclusive design concepts in their loan/grant award criteria. 2.6

National Commissions & Policies 2.6.1.

Kothari Commission (1964) Indian Education Commission (1964-1966), popularly known as Kothari Commission, was an ad hoc commission set up by the Government of India to examine all aspects of the educational sector in India, to evolve a general pattern of education and to advise guidelines and policies for the development of education in India.

It was formed

on 14 July 1964 under the chairmanship of Daulat Singh Kothari, then chairman of the University Grants Commission. The terms of reference of the commission was to formulate the general principles and guidelines for the development of education from primary level to the highest and advise the government on a standardized national pattern of education in India. However, the medical and legal studies were excluded from the purview of the commission. The tenure of the

commission was from 1964 to 1966 and the report was submitted by the commission on 29 June 1966. The four main themes of the commission were: 1. Increase in Productivity 2. Promoting social and National Integration 3.

Education and Modernization 4. Developing social, moral and spiritual values Main recommendations One of the main recommendations of the commission was the standardization of educational system on 10+2+3 pattern, across the country. It advised that the pre-primary education which had different names such as kindergarten, Montessori and pre-basic should be renamed as pre-primary and the primary education (renamed as lower primary) to be up to the 4th standard. It further classified the schooling as upper primary or higher primary and high school (up to standard X). The undergraduate education was identified as XI and XII standards under the name, higher secondary or pre university. The graduate studies were recommended to be standardized as a three-year course. The educational system up to master's degree was categorized as first (primary education), second (secondary education up to XII) and third levels of education (higher studies). The commission recommended that a common public education system should be introduced and the it should be vocationalized in general and special streams by introducing work experience as a part of education. It further stressed on the need to make work experience and social/national service as an integral part of education.

Specializations of subjects were advised to be started from higher secondary levels. The days of instruction were recommended to be increased to 234 for schools and 216 for colleges and the working hours to be fixed at not less than 1000 hours per academic year, preferably higher at 1100 or 1200 hours. It also advised for reduction of national holidays. Linking of colleges to a number of schools in the neighbourhood, utilization of school facilities 8 hours a day all through the year, establishment of book banks, identification of talents and provision of scholarships, setting up of day study and residential facilities and opportunities for students to earn while studying were some of the other recommendations of the commission. It also emphasized on free education up to and including lower secondary level of education.

70 Commission laid stress on women education and advised setting up of state and central level committees for overseeing women education. It suggested establishing schools and hostels for women and urged to identify ways to find job opportunities for women in the educational sector.[9] Focusing on equalization of opportunities to all irrespective of caste, religion and gender and to achieve social and national integration, the schools were advised to provide education to backward classes on a priority basis and the minimum level of enrolment at a secondary school were advised to be not less than 360 every year. Two sets of curricula were prescribed, one at state level and one at the national level and the schools were recommended to experiment with the curriculum. It also proposed that three or four text books to be prescribed for each subject and moral and religious education be made a part of the curriculum. The curriculum prescribed by the commission was: Lower primary level (1 to 4) ●●●●● One language (regional) ●●●●● Mathematical studies ●●●●● Environmental studies ●●●●● Creative studies ●●●●● Health studies ●●●●● Work experience Higher primary level (5 to 8) ●●●●● Two languages (one regional and one national) and preferably a third language ●●●●● Mathematical studies ●●●●● Science studies ●●●●● Social studies ●●●●● Art ●●●●● Physical education ●●●●● Work experience ●●●●● Moral studies Lower secondary level (IX and X) ●●●●● Three languages ●●●●● Mathematical studies

71 ●●●●● Science studies ●●●●● Social studies ●●●●● Art ●●●●● Physical education ●●●●● Work experience ●●●●● Moral studies Higher secondary level (XI and XII) ●●●●● Two languages (one modern Indian language and one classical or foreign language) ●●●●● Any three subjects from (a) one additional language, (b) History (c) Economics (d) Logic (e) geography (f) psychology (g) sociology (h) art (i) physics (j) chemistry (k) mathematics (l) biology (m) geology (n) home science ●●●●● Art ●●●●● Physical education ●●●●● Work experience ●●●●● Moral studies It also recommended the establishment of guidance and counselling centres and a new approach in the evaluation of student performances. The commission suggested the neighbourhood school system without social or religious segregation and a school complex system integrating primary and secondary levels of education. It put forward the suggestion that state and national boards of examination be set up and state level evaluation machinery be put in place. The commission recommended the establishment of Indian Education Service, along the lines of Indian Administrative Service, to bring in professional management to education sector. It proposed standardization and revision of the pay scales of the teaching, non-teaching and administrative staff and prescribed minimum pay levels based on their locations. It also advised standardization of pay scales working under different managements such as government, private and local bodies. The minimum scale was suggested to be in the ratio of 1:2:3 for teachers in the primary, secondary and higher levels of educational sector. Another proposal was for the establishment of a machinery for continuous on job training of the teaching staff and for efforts to raise the status of the teachers to attract talents into the profession. It urged laws to 72 be passed to legalize the educational standards and the educational expenditure to be raised from the then level of 2.9 percent of the GDP to 6 percent, to be achieved by the fiscal year, 1985-86. A significant suggestion was the issuance of a National Policy on Education by the Government of India which should serve as a guideline for the state and local bodies in the design and implementation of their educational plans. 2.6.2

National Education Policy 1968 The National Policy on Education (NPE) is a policy formulated by the Government of India to promote education amongst India's people. The policy covers elementary education to colleges in both rural and urban India. The first NPE was promulgated in 1968 by the government of Prime Minister Indira Gandhi, and the second by Prime Minister Rajiv Gandhi in 1986.

Since the nation's independence in 1947, the Indian government sponsored a variety of programmes to address the problems of illiteracy in both rural and urban India. Maulana Abul Kalam Azad, India's first Minister of Education, envisaged strong central government control over education throughout the country, with a uniform educational system. The Union government established the University Education Commission (1948-1949) and the Secondary Education Commission (1952-1953) to develop proposals to modernize India's education system. The Resolution on Scientific Policy was adopted by the government of Jawaharlal Nehru, India's first Prime Minister. The Nehru government sponsored the development of high-quality scientific education institutions such as the Indian Institutes of Technology. In 1961, the Union government formed the National Council of Educational Research and Training (NCERT) as an autonomous organisation that would advise both the Union and state governments on formulating and implementing education policies. Based on the report and recommendations of the Education Commission (1964- 1966), the government of Prime Minister Indira Gandhi announced the first National Policy on Education in 1968, which called for a "radical restructuring" and equalize educational opportunities in order to achieve national integration and greater cultural and economic development. The policy called for fulfilling

compulsory education for all children up to the age of 14, as stipulated by the Constitution of India, and the better training and qualification of teachers. The policy called for focus on learning of regional languages, outlining the "three language formula" to be implemented in secondary education - the instruction of the English language, the official language of the state where the school was based, and Hindi, the national language.

Language education was seen as essential to reduce the gulf between the intelligentsia and the masses. Although the decision to adopt Hindi as the national language had proven controversial, the policy called for use and learning of Hindi to be encouraged uniformly to promote a common language for all Indians. The policy also encouraged the teaching of the ancient Sanskrit language, which was considered an essential part of India's culture and heritage. The NPE of 1968 called for education spending to increase to six percent of the national income.

As of 2013, the NPE 1968 has moved location on the national website. 2.6.3 National Policy on Education 1986 Having announced that a new policy was in development in January, 1985, the government of Prime Minister Rajiv Gandhi introduced a new National Policy on Education in May, 1986. The new policy called for "special emphasis on the removal of disparities and to equalise educational opportunity," especially for Indian women, Scheduled Tribes (ST) and the Scheduled Caste (SC) communities. To achieve these, the policy called for expanding scholarships, adult education, recruiting more teachers from the SCs, incentives for poor families to send their children to school regularly, development of new institutions and providing housing and services. The NPE called for a "child-centred approach" in primary education, and launched "Operation Blackboard" to improve primary schools nationwide. The policy expanded the Open University system with the Indira Gandhi National Open University, which had been created in 1985. The policy also called for the creation of the "rural university" model, based on the philosophy of Indian leader Mahatma Gandhi, to promote economic and social development at the grassroots level in rural India. 2.6.4

Revised National Policy on Education 1992 The 1986 National Policy on Education was modified in 1992 by the P.V. NarasimhaRao government. In 2005, Prime Minister Manmohan Singh adopted a new policy based on the "Common Minimum Programme" of his United Progressive Alliance (UPA) government. Programme of Action (PoA), 1992 under the National Policy on Education (NPE), 1986 envisaged conduct of a common entrance examination on all India basis for admission to professional and technical programmes in the country. For admission to Engineering and Architecture/Planning programmes, Government of India vide Resolution dated 18 October 2001 has laid down a Three - Exam Scheme (JEE and AIEEE at the National Level and the State Level Engineering Entrance Examinations (SLEEE) for State Level Institutions - with an option to join AIEEE). This takes care of varying admission standards in these programmes and

74 helps in maintenance of professional standards. This also solves problems of overlaps and reduces physical, mental and financial burden on students and their parents due to multiplicity of entrance examinations.

The National

Policy on Education-1986 was modified in 1992. It is a comprehensive frame work to guide the development of education in the country. The principles included in the NPE-1968 are also included in the new policy with some modifications. Modifications and Additions ●●●● The new education policy will give emphasis on retention of children in the schools at primary level. The cause of the drop out of the children from the school should be strategically handled by making plans. The network of Non- Formal education in the country to be introduced and also the education should be made compulsory up to the age of 14. ●●●● Greater attention should be given to the backward classes, physically challenged and minority child for their development in education. ●●●● Major emphasis will be laid on women's education to overcome the poor rate of illiteracy among female. They will be given priority in various educational institutes and special provisions will be made available for them in vocational, technical and professional education. ●●●● Institutions will be provided with resources like infrastructure, computers, libraries. Accommodation for students will be made available especially for girls students. Teachers will have the rights to teach, learn and research. ●●●● The Central Advisory Board of Education will play an important role in reviewing educational development and also to determine the changes required to improve the education in the country. ●●●● State government may establish State Advisory Board of Education to look after the state's progress in education. ●●●● Non-government organizations will be encouraged to facilitate the education in the country. At the same time steps will be taken to prevent establishment of institutions for commercialization of education. 2.6.5

National Curriculum Framework 2005 The National Curriculum Framework (NCF 2005) is one of four National Curriculum Frameworks published in 1975, 1988, 2000 and 2005 by the National Council of Educational Research and Training

NCERT

in India.

75 The Framework

provides the framework for making syllabi, textbooks and teaching practices within the school education programmes in India.

The NCF 2005 document draws its policy basis from earlier government reports on education as Learning Without Burden and

National Policy of Education 1986-1992 and focus group discussion. After wide ranging deliberations 21 National Focus Group Position Papers have been developed under the aegis of NCF-2005. The state of art position papers provided inputs for formulation of NCF-2005. The document and its offshoot textbooks have come under different forms of reviews in the press. Its draft document came under the criticism from the Central Advisory Board of Education (CABE). In February 2008 the director Krishna Kumar in an interview also discussed the challenges that

are faced by the document. The approach and recommendations of NCF-2005 are for the entire educational system. A number of its recommendations, for example, focus on rural schools. The syllabus and textbooks based on it are being used by all the CBSE schools, but NCF-based material is also being used in many State schools.

NCF 2005 has been translated into 22 languages and has influenced the syllabi in 17 States. The NCERT gave a grant of Rs.10 lakh

to each State to promote NCF in the language of the State and to compare its current syllabus with the syllabus proposed,

so that

a plan for future reforms could be made.

Several States have taken up this challenge. This exercise is being carried out with the involvement of State Councils for Educational Research and Training [SCERT] and District Institutes of Education and Training [DIET].

Main Features of the NCF 2005 The document is divided into 5 areas: Perspective of NCF The NCF was framed considering the articulated ideas in the past such as ●●●●● To shift learning from rote method. ●●●●● To ensure overall development of children. ●●●●● To integrate examination into classroom learning and make it more flexible. ●●●●● to nurture identify of caring concerns within the democratic policy of India. ●●●●● nurturing an over-riding identity informed by caring concerns within the democratic polity of the country.

76 NCF focused on ●●●● Learning without burden to make learning a joyful experience and move away from textbooks to be a basis for examination and to remove stress from children. It recommended major changes in the design of syllabus. ●●●● To develop a sense of self-reliance and dignity of the individual this would form the basis of social relationship and would develop a sense of nonviolence and oneness across the society. ●●●● To develop a child centered approach and to promote universal enrolment and retention up to the age of 14. ●●●● To inculcate the feeling of oneness, democracy and unity in the students the curriculum is enabled to strengthen our national identity and to enable the new generation reevaluate. ●●●● J. P. Naik has described equality, quality and quantity as the exclusive triangle for Indian education. ●●●● With respect to social context NCF 2005 has ensured that irrespective of caste, creed, religion and sex all are provided with a standard curriculum. Learning and knowledge Learning should be an enjoyable act where children should feel that they are valued and their voices are heard. The curriculum structure and school should be designed to make school a satisfactory place for students to feel secure and valued. The curriculum should focus on holistic development of the students to enhance physical and mental development in individuals and as well as with the peer interactions. In order to bring about the overall development of the students, adequate nutrition, physical exercise and other psychosocial needs are addressed hence participation in yoga and sports in required. Learning should be made enjoyable and should relate to real life experiences learning should involve concepts and deeper understanding. Adolescence is a vulnerable age for students and the curriculum should prepare the students and provide support for social and emotional support that will inculcate positive behavior and provide skills essential to cope with situations that they encounter in their lives, peers pressure and gender stereotype. Inclusive education to be given priority and flexibility to follow a curriculum to suit the needs of every student irrespective of students having disabilities. Constructive learning has to be part of the curriculum. Situations and opportunities 77 have to be created for students to provide students with challenges, encourage creativity and active participation for students. Students have to be encouraged to interact with peers, teachers and older people which would open up many more rich learning opportunities. The foundation should be laid strong and firm. primary, upper primary and middle school should provide the space for children to explore and develop rational thinking that they would imbibe in them and have sufficient knowledge on concepts, language, knowledge, investigation and validation procedures. Curricular area, School stages and assessment Language - Three language formula system to be followed. medium of communication should be the home language. [10] The First language to be studied must be the mother tongue or the regional language. The Second language - In Hindi speaking States, the second language will be some other modern Indian language or English, and - In non-Hindi speaking States, the second language will be Hindi or English. The Third language - In Hindi speaking States, the third language will be English or a modern Indian language not studied as the second language, and - In non-Hindi speaking States, the third language will be English or a modern Indian language not studied as the second language. Mathematics - The emphasis for learning mathematics is that all students can learn and need to learn mathematics. Pedagogy and learning environment have to be made favourable for students to develop interest in basic skills and include variety of mathematics models by pedagogy which devotes a greater percentage of instructional time to problem solving and active learning. Computers - Introduction of computers in schools is to move from a predetermined set of outcomes and skill sets to one that enables students to develop 16 explanatory reasoning and other higher-order skills. o Enable students to access sources of knowledge, interpret them, and create knowledge rather than be passive users. o Promote flexible models of curriculum transaction. o Promote individual learning styles. o Encourage use of flexible curriculum content, at least in primary education, and flexible models of evaluation. Science - Pedagogy of learning sciences should be designed to address the aims of learning science is to learn the facts and principles of science and its applications, consistent with the stage of cognitive development. To acquire skills and understand the methods and processes that lead to generation and validation of scientific knowledge. To develop a historical and developmental perspective of science and to

78 enable her to view science as a social enterprise. To relate to the, local as well as global, and appreciate the issues at the interface of science, technology and society. To acquire the requisite theoretical knowledge and practical technological skills to enter the world of work. To nurture the natural curiosity, aesthetic sense and creativity in science and technology. To imbibe the values of honesty, integrity, cooperation, concern for life and preservation of environment and to cultivate 'scientific temper'- objectivity, critical thinking and freedom from fear and prejudice. Social Sciences - Social science a subject is included in schools to assist students to explore their interests and aptitudes in order to choose appropriate university courses and/or careers. To encourage them to explore higher levels of knowledge in different disciplines. To promote problem-solving abilities and creative thinking in the citizens of tomorrow, to introduce students to different ways of collecting and processing data and information in specific disciplines, and help them arrive at conclusions, and to generate new insights and knowledge in the process. Art education - The objectives of including art education in schools is to bring about the complete development of the students personality and mental health, to appreciate cultural heritage and develop respect for each other's work and connect to environment. Health and Physical education - To provide theoretical and practical inputs to provide an integrated and holistic understanding of health, disease, accidents and physical fitness among children. To provide skills for dealing with psycho-social issues in the school, home and the community. To help children grow as responsible citizens by inculcating in them certain social and moral values through games, sports, N.C.C., Red Cross, Scouts & Guides, etc. Study of Peace - Skills that are developed as part of curriculum activity such as to listening with patience and endurance, purity of mind to develop concentration, aptitude for cooperation and teamwork, to reach out to get answers (curiosity and rational inquiry), acceptance of discipline, and a positive attitude to study/work are the trademarks of a good student which in turn are also the skills of a peace-oriented person. Thus the curriculum also inculcates peace and democracy into students. Work and Education - Work related education is made as an integral component of the school curriculum, in the form of - work experience, work education, SUPW, craft education, life oriented education, pre vocational education and generic education. Work based education aims at involving children in a variety of production or service oriented activities, to develop skills, positive attitudes and values through work and also to develop work related competencies.

79 School and Classroom Environment Physical environment has to be maintained favorable to students in terms of infrastructure, adequate light and ventilation, student teacher ratio, hygiene and safe environment. Schools should also treat students with equality, justice respect, dignity and right of the students. Give equal opportunities for all students to participate in all activities without any bias. Policy of inclusion has to be part of the school where differently abled and children from marginalized section get equal opportunities. The schools should also be well equipped with libraries, laboratories and educational technology laboratories. Systemic Reforms The NCF has aimed at bringing about reforms in the education system to bring about a curriculum that is learner centric, has a flexible process, provide learner autonomy, teacher plays a role of a facilitator, supports and encourages learning, involves active participation of learners, develops multidisciplinary curriculum, focuses on education, brings about multiple and divergent exposure, multifarious, continuous appraisal in educational system. 2.6.6

National Policy for Persons with Disabilities (2006) The Government of India formulated the National Policy for Persons with Disabilities in February 2006 which deals with Physical, Educational & Economic Rehabilitation of persons with disabilities. In addition the policy also focuses upon rehabilitation of women and children with disabilities, barrier free environment, social security, research etc.

The

National Policy recognizes

that Persons with Disabilities are valuable human resource for the country and seeks to create an environment that provides those equal opportunities, protection of their rights and full participation in society. Focus of the policy

The focus of the policy is on

the following 1. Prevention of Disabilities - Since disability, in a large number of cases, is preventable; the policy lays a strong emphasis on prevention of disabilities. It calls for programme for prevention of diseases, which result in disability and the creation of awareness regarding measures to be taken for prevention of disabilities during the period of pregnancy and thereafter to be intensified and their coverage expanded. 2. Rehabilitation Measures - Rehabilitation measures can be classified into

80 three distinct groups: i. Physical rehabilitation, which includes early detection and intervention, counseling & medical interventions and provision of aids & appliances. It will also include the development of rehabilitation professionals. ii.

Educational rehabilitation including vocational education and

iii. Economic rehabilitation for a dignified life in society. 2.7

National Acts & Programmes: 2.7.1. IEDC 1974 Integrated Education for Disabled Children (IEDC), In the 1970s, the government launched the Centrally Sponsored Scheme of

IEDC. The

scheme aimed

to provide educational opportunities to learners with disability in regular schools and to facilitate their achievement and retention. Under the scheme,

hundred

percent financial assistance is

provided for setting up resource centres, surveys and assessment of

children with disability, purchase and production of instruction materials and training and orientation of teachers. The scheme is currently being revised to reflect the paradigm shift towards inclusive education.

The right of every child to an education is proclaimed in the Universal Declaration of Human Rights and was strongly reaffirmed by the World Declaration on Education for All. 2.7.2.

RCI Act (1992) The Rehabilitation Council of India (RCI) is the apex government body, set up under

an Act of Parliament, to regulate training programmes and courses targeted at disabled, disadvantaged, and special education requirement communities. It is the only statutory council in India that is required to maintain the Central

Rehabilitation Register which mainly documents details of all qualified professionals who operate and deliver training and educational programmes for the targeted communities. In the year 2000, the

Rehabilitation Council of India (Amendment) Act, 2000, was introduced and notified consequently by the government of India. The amendment brought definitions and discussions provided within the earlier Rehabilitation Council of India Act,

1992, under the ambit of a larger act, namely,

An Act to provide for the

constitution of Rehabilitation Council of India

for

81 regulating the training of rehabilitation professionals and the maintenance of a Central Rehabilitation Register and for matters connected therewith or incidental thereto. 2.7.3

The

Persons with Disabilities Act, 1995 (Equal Opportunities, Protection of Rights and Full Participation)

Act, 1995.

This is

an act to give

effect to the proclamation

and equality of the people with disability in the Asian & Pacific region.

Disability: - means a) Blindness b) Low vision c) Leprosy cured d) Hearing impairment e) Locomotor disability f) Mental

Retardation g) Mental illness (j) "employer" means, - (i) In relation to a Government, the authority notified by the Head of the Department in this behalf or where no such authority is notified, the Head of the Department; and (ii) in relation to an

establishment, the Chief Executive Officer of that establishment; (k) "establishment" means a corporation established by or under a Central, Provincial or State Act, or an authority or

a body owned or controlled or aided by the Government

or a local authority or a Government company as defined in section 617 of the Companies Act, 1956 (1 of 1956) and

includes Departments of a Government; (l) "

hearing impairment" means loss of sixty decibels or more in the better ear in the conversational range of frequencies; (

m) "institution for persons with disabilities" means an institution for the reception,

82 care, protection, education, training, rehabilitation or any other service of persons with disabilities; (n) "

leprosy cured person" means any person who has been cured of leprosy but is suffering from- (i) loss of sensation in hands or feet as well as loss of sensation and paresis in the eye and eye-lid but with no manifest deformity; (ii) manifest deformity and paresis but having sufficient mobility in their hands and feet to enable them to engage in normal economic activity; (

iii)

Extreme physical deformity as well as advanced age which prevents him from undertaking any gainful occupation, and the expression "leprosy cured" shall be construed accordingly; (

o) "loco motor disability" means disability of the bones, joints or muscles leading to substantial restriction of the movement of the limbs or any form of cerebral palsy; (

p) "medical authority" means any hospital or institution specified for the purposes of this Act by notification by the appropriate Government; (q) "

mental illness" means any mental disorder other than mental retardation; (r) "

mental retardation" means

a condition of arrested or incomplete development of mind of a person which is specially characterized by sub normality of intelligence; (

s) "

notification" means a notification published in the Official Gazette; (t) "person with disability" means a person suffering from

not less than forty per cent of any disability as certified by a medical authority; (u) "

person with low vision" means a person with impairment of visual functioning even after treatment or standard refractive correction but who uses or is potentially capable of using vision for the planning or execution of a task with appropriate assistive device; (

v) "prescribed" means prescribed by rules made under this Act; (w) "

rehabilitation" refers to a process aimed at enabling persons with disabilities to reach and maintain their optimal physical, sensory, intellectual, psychiatric or social functional levels;

83 (

x) "Special Employment Exchange" means any office or place established and maintained by the Government for the collection and furnishing of information, either by keeping of registers or otherwise, respecting- (i) persons who seek to engage employees from amongst the persons suffering from disabilities; (ii) persons with disability who seek employment; (iii) vacancies to which person with disability seeking employment may be appointed; (y) "State Co-ordination Committee" means the State Co-ordination Committee constituted under sub-section (1) of section 13; (z) "State Executive Committee" means the State Executive Committee constituted under sub-section (l) of section 19.

CHAPTER II The Central Co-ordination Committee 3. Central Co-ordination Committee. - (1) The Central Government shall by notification constitute a body to be known as the Central Co-ordination Committee to exercise the powers conferred on, and to perform the functions assigned to it, under this Act. CHAPTER III The State Co-ordination Committee 13. State Co-ordination Committee. - (1) Every State Government shall, by notification, constitute a body to be known as the State Co-ordination Committee to exercise the powers conferred on, and to perform the function assigned to it, under this Act. CHAPTER IV Prevention And Early Detection Of Disabilities 25. Appropriate Governments and local authorities to take certain steps for the prevention of occurrence of disabilities. - Within the limits of their economic capacity and development, the appropriate Governments and the

84 local authorities, with a view to preventing the occurrence of disabilities, shall- (a) undertake or cause to be undertaken surveys, investigations and research concerning the cause of occurrence of disabilities; (b) promote various methods of preventing disabilities; (c) screen all the children at least once in a year for the purpose of identifying "at-risk" cases; (d) provide

facilities for training to the staff at the primary health

centres; (e) sponsor or cause to be sponsored awareness campaigns and disseminate or cause to be disseminated information for general hygiene, health and sanitation; (f) take measures for pre-natal, parental and post-natal care of mother and child; (g) educate the public through the pre-schools, schools, primary health centres, village level workers and anganwadi workers; (h) create awareness amongst the masses through television, radio and other mass media on the causes of disabilities and the preventive measures to be adopted. CHAPTER V Education 26. Appropriate Governments and local authorities to provide children with disabilities free education, etc. - The appropriate Governments and the local authorities shall- (a)

ensure

that every child

with a disability has access to free education in an appropriate environment till he attains the age of eighteen years; (

b) endeavor

to promote the integration of students with disabilities in

the

normal schools; (

c)

promote

setting up of special schools in Government and private

sector for those in need of special education,

in such a manner

that children with disabilities living in any part of the country have access to such schools;

85 (

d) endeavor to equip the special schools for children with disabilities with vocational training facilities. 27.

Appropriate Governments and local authorities to make schemes and programmes for non-formal education, etc. (a)

Conducting part-time classes in respect of children with disabilities who having completed education up to class fifth and could not continue their studies on a whole-time basis; (

b)

Conducting special part-time classes for providing functional literacy for children in the age group of sixteen and above;

(c) Imparting non-formal education by utilizing the available manpower in rural areas after giving them appropriate orientation; (

d)

Imparting education through open schools or open universities; (e) Conducting class and discussions through interactive electronic or other media; (f) Providing every child with disability free of cost special books and equipment needed for his education. 28.

The appropriate Governments shall initiate or cause to be initiated research by official and nongovernmental agencies for the purpose of designing and developing new assistive devices, teaching aids, special teaching materials or such other items as are necessary to give a child with disability equal opportunities in education. 29. The appropriate Governments shall set up adequate number of teachers' training institutions and assist the national institutes and other voluntary organizations to develop teachers' training programmes specializing in disabilities so that requisite trained manpower is available for special schools and integrated schools for children with disabilities. 30. Without prejudice to the foregoing provisions, (be appropriate Governments shall by notification prepare a comprehensive education scheme which shall make Provision for- (a)

Transport facilities to the children with disabilities or in the

alternative financial incentives to parents or guardians to enable their

children

with disabilities to attend schools.

86 (

b)

The removal of architectural barriers from schools, colleges or other institution, imparting vocational and professional training; (

c)

The

supply of books, uniforms and other materials to children with disabilities attending school. (

d) The

grant of scholarship to

students with disabilities. (e)

Setting up of appropriate fora for the redressal of grievances of parent, regarding the placement of their children with disabilities; (f) Suitable modification in the examination system

to eliminate purely mathematical questions for the benefit of blind students and students with low vision; (

g) Restructuring of curriculum for the benefit of children with disabilities; (h) restructuring the curriculum for benefit of students with hearing impairment to facilitate them to take only one language as part of their curriculum. 31.

All educational institutions shall provide or cause to be provided a manuaensis to blind students and students with or low

vision. CHAPTER VI: Employment 32. Appropriate Governments shall-- (a) Identify posts, in the establishments, which can be reserved for the persons with disability; (b) At periodical intervals not exceeding three years, review the list of

posts identified and up-date the list taking into consideration the developments in technology. 33. Every appropriate

Government shall appoint in every establishment such percentage of vacancies not less than three per cent. for persons or class of persons with disability of which one per cent. Each shall be reserved for persons suffering from-

(i) Blindness or low vision; (ii) Bearing impairment;

87 (iii) Loco motor disability or cerebral palsy, in the posts identified for each disability: Provided that the appropriate

Government may, having regard to the type of work carried on in any department or establishment, by notification subject to such conditions, if any, as may be specified in such notification, exempt any establishment from the provisions

of this section. 34. (1) The appropriate Government may, by notification. Require that from such date as May he specified.

By notification. The employer in every establishment shall furnish such information or return as may be prescribed in relation to vacancies appointed for person, with disability that have occurred or are about to occur in that establishment

to such Special Employment Exchange as may be prescribed and the establishment shall thereupon comply with such requisition. (2) The form in which and the intervals of time for which information or returns shall be furnished and the

particulars, they shall contain shall be such as may be prescribed. 35. Any person authorized by the Special Employment Exchange in writing, shall have access to any relevant record or document in the possession of any establishment, and

may enter at any reasonable time and premises where he believes such record or document to be, and inspect or take copies of relevant records or documents or ask any question necessary for obtaining any information. 36. Where in any

recruitment year any vacancy under section 33, cannot be filled up due to non-availability of a suitable person with disability or, for any other sufficient reason, such vacancy shall be carried forward in the succeeding recruitment year and

if ;r the succeeding recruitment year also suitable person with disability is not available, it may first be filled by interchange among the three categories and only when there is no person with disability available for the post in that Year,

the employer shall fill up the vacancy by appointment of a person, other than a person with disability: Provided that if the nature of vacancies in an establishment is such that a given category of person cannot be employed, the vacancies may

be interchanged among the three categories with the prior approval of the appropriate Government.

88 37. (1) Every employer shall maintain such record in relation to the person. With disability employed in his

establishment in such form and in such manner as may be prescribed by the appropriate Government. (2) The records maintained under sub-section (1) shall be open to inspection at all reasonable hours by such persons as may be

authorized in this behalf by general or special order by the appropriate Government. 38. (1) The appropriate Governments and local authorities shall by notification formulate schemes for ensuring employment of persons with

disabilities, and such schemes may provide for- (a) The training and welfare of persons with disabilities; (b) The relaxation of upper age limit; (c) Regulating the employment; (d)

Health and safety measures and creation of a non-handicapping environment in places where persons with disabilities are employed; (

e) The manner in which and the person by whom the cost of operating the schemes is to be defrayed; and (f)

Constituting the authority responsible for the administration of the scheme. 39.

All Government educational institutions and other educational institutions receiving aid from the Government, shall reserve not less than three per cent seat for persons with disabilities. 40.

The appropriate Governments and local authorities shall reserve not less than three per cent. in all poverty alleviation schemes for the benefit

of persons with disabilities. 41. The appropriate Governments and the local authorities shall, within the limits of their economic capacity and development, provide incentives to employers both in public and private sectors to ensure that at least five per cent. of their work force is composed of persons with disabilities. CHAPTER VII: Affirmative Action 42. The appropriate Governments shall by notification make schemes to provide aids and appliances to persons with disabilities. 43. The appropriate Governments and local authorities shall by notification frame 89 schemes in favor of persons with disabilities, for the preferential allotment of land at concession] rates for- (a) House; (b) Setting up business; (c) Setting up of special recreation centers; (d) Establishment of special schools; (e) Establishment of research centers; (f) Establishment of factories by entrepreneurs with disabilities CHAPTER VIII: Non-discrimination 44. Establishments in the transport sector shall, within the limits of their economic capacity and development for the benefit of persons with disabilities. 45. The appropriate Governments and the local authorities shall, within the limits of their economic capacity and development. 46. The appropriate Governments and the local authorities shall, within the limits of their economic capacity and development. 47. (1) No establishment shall dispense with or reduce in rank, an employee who acquires a disability during his service. (2) No promotion shall be denied to a person merely on the ground of his disability: CHAPTER IX: Research And Manpower Development 48. The appropriate Governments and local authorities shall promote and sponsor research, inter alia, in the following areas- (a) Prevention of disability; (b) Rehabilitation including community based rehabilitation; (c) Development of assistive devices including their psychosocial aspects; (d) Job identification; (e) On site modifications in offices and factories. 90 49. The appropriate Governments shall provide financial assistance to universities, other institutions of higher learning, professional bodies and non-governmental research-. units or institutions, for undertaking research for special education. rehabilitation and manpower development. CHAPTER X: Recognition of Institutions For Persons with Disabilities 50. The State Government shall appoint any authority, as it deems fit to be a competent authority for the purposes of this Act. 51. Save as otherwise provided under this Act, no person shall establish or maintain any institution for persons with disabilities except under and in accordance with a certificate of registration issued in this behalf by the competent authority: 52. (1) Every application for a certificate of registration shall be made to the competent authority in such form and in such manner as may be prescribed by the State Government. (2) On receipt of an application under sub-section (1), the competent authority shall make such enquiries as it may deem fit and where it is satisfied that the applicant has complied with the requirements of this Act and the rules made thereunder it shall grant a certificate of registration to the applicant and where it is not so satisfied the competent authority shall. by order. refuse to grant the certificate applied for: Provided that before making any order refusing to grant a certificate the competent authority shall give to the applicant a reasonable opportunity of being heard and every order of refusal to grant a certificate shall be communicated to the applicant in such manner as may be prescribed by the State Government. (3) No certificate of registration shall be granted under sub-section (2) unless the institution with respect to which an application has been made is in a position to provide such facilities and maintain such standards as may be prescribed by the State Government. (4) A certificate of registration granted under this section, -

91 (a) Shall, unless revoked under section 53, remain in force for such period as may, be prescribed by, the State Government. (b) May be renewed from time to time for a like period; and (c) Shall be in such form and shall be subject to such conditions as may be Prescribed by the State Government (5) An application for renewal of a certificate of registration shall be made not less than sixty days before the period of validity. (6) The certificate of registration shall be displayed by the institution in a conspicuous place. 53. (1) the competent authority may, if it has reasonable cause to believe that the Holder of the certificate of registration granted under sub-section (2) of section 52 has - (a) Made a statement in relation to any application for the issue of renewal of the certificate which is incorrect or false in material particulars; or (b) Committed or has caused to be committed any breach of rules or any conditions subject to which the certificate was granted, it may after making such inquiry, as it deems fit, by order, revoke the certificate: Provided that no such order shall be made until an opportunity is given to the holder of the certificate to show cause as to why the certificate should not be revoked. (2) Where a certificate in respect of an institution has been revoked under sub-section (1), such institution shall cease to function from the date of such revocation. Provided that where an appeal lies under section 54 against the order of revocation, such institution shall cease to function- (a) Where no appeal has been preferred immediately on the expiry of the period prescribed for the filing of such appeal, or (b) Where such appeal has been preferred, but the order of revocation has been upheld, from the date of the order of appeal. (3) On the revocation of a certificate in respect of an institution, the competent authority may direct that any person with disability who is an inmate of such institution on the date of such revocation, shall be-

92 (a) Restored to the custody of her or his parent, spouse or lawful guardian, as the case may be, or (b) Transferred to any other institution specified by the competent authority. (4) Every institution, which holds a certificate of registration, which is revoked, under this section shall, immediately after such revocation. Surrender such certificate to the Competent authority. 54. (1) Any person aggrieved by the order of the competent authority, refusing to grant a certificate or revoking a certificate may, within such period as may be prescribed by the State Government, prefer an appeal to that Government against such refusal or revocation. (2) The order of the State Government on such appeal shall be final. 55. Nothing contained in this Chapter shall apply, to an institution for persons with disabilities established or maintained by the Central Government or State Government. CHAPTER XI: Institution For Persons With Severe Disabilities 56. The appropriate Government may establish and maintain institutions for persons with severe disabilities at such places as it thinks fit. (2) Where, the appropriate Government is of opinion that any institution other than an institution. Established under sub-section (1), is fit for the rehabilitation of the persons with severe disabilities, the Government may recognize such institution as an institution for persons with severe disabilities for the purposes of this Act: Provided that no institution shall be recognized under this section unless such institution has complied with the requirements of this Act and the rules made there under. (3) Every institution established under sub-section (1) shall be maintained in such manner and satisfy such conditions as may be prescribed b), the appropriate Government. (4) For the purposes of this section "person with severe disability" means a person with eighty percent. or more of one or more disabilities.

93 CHAPTER XII: The Chief Commissioner And Commissioners For Persons WITH DISABILITIES 57. (1) The Central Government may, by notification appoint a Chief Commissioner for persons with disabilities for the purposes of this Act. (2) A person shall not be qualified for appointment as the Chief Commissioner unless he has special knowledge or practical experience in respect of matters relating to rehabilitation. (3)

The salary and allowances payable to and other terms and conditions of service (including pension, gratuity and other retirement benefits of the Chief Commissioner shall be such as may be prescribed by the Central Government. (4) The Central Government shall determine the nature and categories of officers and other employees required to assist the Chief Commissioner in the discharge of his functions and provide the Chief Commissioner with such officers and other employees as it thinks fit. (5) The officers and employees provided to the Chief Commissioner shall discharge their functions under the general superintendence of the Chief Commissioner. (6) The salaries and allowances and other conditions of service of officers and employees provided to the Chief Commissioner shall be such as may be prescribed by the Central Government. 58. The Chief commissioner shall --- (a) Coordinate the work of the Commissioners; (b) Monitor the utilization of funds disbursed by the Central Government; (c) Take steps to safeguard the rights and facilities made available to Persons with disabilities; (d) Submit reports to the Central Government on the implementation of the Act at such intervals as that Government may prescribe. 59. Without prejudice to the provisions of section 58 the Chief Commissioner

94 may of his own motion or on the application of any aggrieved person or otherwise look into complaints with respect to matters relating to - (a) Deprivation of rights of persons with Disabilities. (b) Non-implementation of laws, rules, byelaws, regulations. Executive orders, guidelines or instructions made or issued by the appropriate Governments and the local authorities for the welfare and protection of rights of persons with disabilities. And take up the matter with the appropriate authorities. 60. (1) Every State Government may, by notification appoint a Commissioner for persons with disabilities for the purpose of this Act. (2) A person shall not be qualified for appointment as a Commissioner unless he has special knowledge or practical experience in respect of matters relating to rehabilitation. (3) The salary and allowances payable to and other terms and conditions of service (including pension gratuity and other retirement benefits) of the Commissioner shall be such as may be prescribed by the State Government. (4) The State Government shall determine the nature and categories of officers and other employees required to assist the Commissioner in the discharge of his functions and provide the Commissioner with such officers and other employees as it thinks fit. (5) The officers and employees provided to the Commissioner shall discharge their functions under the general superintendence of the Commissioner. (6) The salaries and allowances and other conditions of service of officers and employees provided to the Commissioner shall be such as may be prescribed by the State Government. 61. The Commissioner within the State shall- (a) Coordinate with the departments of the State Government for the programmes and schemes, for the benefit of persons with disabilities; (b) Monitor the utilization of funds disbursed by the State Government; (c) Take steps to safeguard the rights and facilities made available to persons with disabilities. (d) Submit reports to the State Government on the implementation of the Act 95 at such intervals as that Government may prescribe and forward a copy thereof to the Chief Commissioner. 62. Without prejudice to the provisions of section 61 the Commissioner may of his own motion or on the application of any aggrieved person or otherwise look into complaints with respect to matters relating to— (a) Deprivation of rights of persons with disabilities; (b) Non-implementation of laws, rules, bye-laws, regulations, executive orders, guidelines or instructions made or issued by the appropriate Governments and the local authorities for the welfare and protection of rights of persons with disabilities, and take up the matter with the appropriate authorities. 63. The Chief Commissioner and the Commissioners shall, for the purpose of discharging their functions under this Act, have the same powers as are vested in a court under the Code of Civil Procedure, 1908 while trying a suit, in respect of the following matters, namely: - (a) Summoning and enforcing the attendance of witnesses; (b) Requiring the discovery and production of any documents; (c) Requisitioning any public record or copy thereof from any court or office; (d) Receiving evidence on affidavits; and (e) Issuing commissions for the examination of witnesses or documents. 62. Without prejudice to the provisions of section 61 the Commissioner may of his own motion or on the application of any aggrieved person or otherwise look into complaints with respect to matters relating to--- (a) Deprivation of rights of persons with disabilities; (b) Non-implementation of laws, rules, bye-laws, regulations, executive orders, guidelines or instructions made or issued by the appropriate Governments and the local authorities for the welfare and protection of rights of persons with disabilities, and take up the matter with the appropriate authorities. 63. The Chief Commissioner and the Commissioners shall, for the purpose of discharging their functions under this Act, have the same powers as are vested in a court under the Code of Civil Procedure, 1908 while trying a suit, in respect of the following matters, namely: - 96 (a) Summoning and enforcing the attendance of witnesses; (b) Requiring the discovery and production of any documents; (c) Requisitioning any public record or copy thereof from any court or office; (d) Receiving evidence on affidavits; and (e) Issuing commissions for the examination of witnesses or documents. (2) Every proceeding before the Chief Commissioner and Commissioners shall be a judicial proceeding within the meaning directions 193 and 228 of the Indian Penal Code and the Chief Commissioner, the Commissioner, the competent authority, shall be deemed to be a civil court for the purposes of section 195 and Chapter XXVI of the Code of Criminal Procedure, 1973. 64. (1) The Chief Commissioner shall prepare in such form and at such time for each financial year as may be prescribed by the Central Government an annual report giving a full account of his activities during the previous financial year and forward a copy thereof to the Central Government. (2) The Central Government shall cause the annual report to be laid before each House of

Parliament along with the recommendations explaining the action taken or proposed to be taken on the recommendation made therein in so far as they relate to the Central Government and the reasons for non-acceptance, if any, of any such recommendation or part. 65. (1) The Commissioner shall prepare in such form and at such time for each financial year as may be prescribed by the State Government an annual report giving a full account of his activities during the previous financial year and forward a copy thereof to the State Government. The State Government shall cause the annual report to be laid before each State Legislature along with the recommendations explaining the action taken or proposed to be taken on the recommendation made therein in so far as they relate to the State Government and the reasons for non-acceptance, if any, of any such recommendation or part.

97 CHAPTER XIII: Social Security 66. The appropriate Governments and the local authorities shall within the limits of their economic capacity and development undertake or cause to be undertaken rehabilitation of all persons with disabilities. 67. The appropriate Government shall by notification frame an insurance scheme for the benefit of its employees with disabilities. 68. The appropriate Governments shall within the limits of their economic capacity and development shall by notification frame a scheme for payment of an unemployment allowance to persons with disabilities registered with the Special Employment Exchange for more than two years and who could not be placed in any gainful occupation. CHAPTER XIV: Miscellaneous 69. Whoever fraudulently avails or attempts to avail, any benefit meant for persons with disabilities, shall be punishable with imprisonment for a term which may extend to two years or with fine which may extend to twenty thousand rupees or with both. 70.

The Chief Commissioner, the Commissioners and other officers and staff provided to them shall be deemed to be public servants within the meaning of section 21 of the Indian Penal Code. 71.

No suit, prosecution or other legal proceeding shall lie against the Central Government, the State Governments or the local authority or any officer of the

Government in respect of anything which is done in good faith or intended to be done in pursuance of this Act and any rules or orders made thereunder. 72. The provisions of this Act, or the rules made there under shall be in addition to, and not in derogation of any other law for the time being in force or any rules, order or any instructions issued there under, enacted or issued for the benefit of persons with disabilities. 73. The appropriate Government may, by notification, make rules for carrying out the provisions of this Act. Conclusion - The main purpose of this act is to define responsibilities of 98 Central Governments and State Governments with regard to services for disabled persons. It recommends making changes in assessment and curriculum and removing architecture barriers to support inclusion. It also recommends providing free books, uniform, etc. (Source from K. L. MOHANPURIA., Secy. to the Govt. of India) 2.7.4. The National Trust Act, (1999)

An Act to provide for the constitution of a body at the national level for the Welfare of Persons with Autism, Cerebral Palsy, Mental Retardation and Multiple Disabilities and for matters connected therewith or incidental thereto.

Be it enacted by Parliament in the Fiftieth Year of the Republic of India as follows: CHAPTER 1 Preliminary 1. This Act may be called

the

National Trust for Welfare of Persons with Autism, Cerebral Palsy, Mental Retardation and Multiple Disabilities

Act, 1999 2.

It extends to the whole of India except the State of Jammu and Kashmir. In this Act, unless the context otherwise requires, - a. "

autism" means a condition of uneven skill development primarily affecting the communication and social abilities of a person, marked by repetitive and ritualistic

"Regulation" means the regulations made by the Board under this Act; o. "

Severe disability" means disability with eighty percent or more of one or more of multiple disabilities;

p. "

Trust" means

the

National Trust for Welfare of Persons with Autism, Cerebral Palsy Mental Retardation and Multiple Disability

constituted under sub section (1) of section 3. CHAPTER 2

The

National Trust For Welfare of Persons with Autism, Cerebral Palsy, Mental Retardation and Multiple Disability

With effect from such date as the Central Government may, by notification, appointment, there shall be constituted, for the purpose of this Act, a body by

the name

of

the

National Trust for Welfare of persons with Autism, Cerebral Palsy, Mental Retardation and Multiple Disabilities

which shall be a body corporate by the name aforesaid, having perpetual succession and a common seal, with power, subject

100 to the provision of this Act, to acquire, hold and dispose of property, both movable and immovable, and both movable and immovable, and contract, and shall, by the said name, sue or be sued. CHAPTER 3 Objects

of the Trusts

The objects of the trust

shall

be: ●●●●●

to enable and empower persons with disability to live as independently and as fully as possible within and as close to the community to which they belong;

a.

to strengthen facilities to provide support

to persons with disability to live within their own families; b. to extend support to registered organization to provide need based services

during

the

period of crises in the family of persons with disability ; c. to deal with problems of persons with disability who do not have family support; d. to promote measures for the care and protraction of persons with disability in the event of death of their parent or guardian; e. to evolve procedure for the

appointment of guardians and trustees for persons with disability requiring such protection; f.

to facilitate

the realization of equal opportunities, protection of right and full participation of persons with disability; and

g.

to do any other act

which is incidental to the

aforesaid

object. CHAPTER 4 Powers and Duties of The Board shall:- ●●●● receive from the Central Government a one-time contribution of rupees one hundred crores for a corpus, the income where of

shall be utilized to provide for adequate standard of living for persons with disability; a. receive bequest of movable property any person for the benefit of the person with disability in general and for furtherance of the objectives of the Trust in particular:

101 Provide that it shall be obligatory on the part of the Board to make arrangement for adequate standard of living for the beneficiary named in the bequest, if any and to utilize the property bequeathed for any other purpose for which the bequest has been made: Provide further that the Board shall not be under any obligation to utilize the entire amount mentioned in the bequest for the exclusive benefit of the persons with disability named as beneficiary in the bequest; b. receive from the Central Government such sums as may be considered necessary in each financial year for providing financial assistance to registered organization for carrying out any approved Programme. For the purpose of sub-section (1), the expression "approved Programme" means

c.

any Programme which promote independent living in the community for persons with disability by creating a conducive environment in the community; ii. counseling and training of family members of persons with disability; iii. setting up of adult training units, individual and group homes; d. any programme which promotes respite care, foster family care or day care service for persons with disability; e. Setting up residential hostels and residential homes for persons with disability; f. Development of self-help group persons with disability to pursue the realization of their rights; g. setting up of local committee to grant approval for guardianship and h. such other programmes which promote the objective of the Trust. While earmarking funds for the purpose of clause (c) of sub-section (2), preference shall be given to woman with disability or to persons with severe disability and to senior citizen with disability. Explanation:- For the purpose of this sub-section, the expression;- "Persons with severe disability" shall have the same meaning as is assigned to it under sub-section (4)

of section 56

of

the

persons with Disabilities (Equal Opportunities, Protection of Right and Full Participation) Act, 1995;"

Senior citizen' means a person

who is above the age of sixty-five years or more.

102 CHAPTER 5 Procedure for Registration 0. Any association of person with disability, or any association of parents of persons with disability or a voluntary organization whose main object is promotion of welfare of persons with disability may make an application for registration to the Board. 1. An application for registration shall be made in such form and manner and at such place as the Board may by regulation provide and shall contain such particulars and accompanied with such documents and such fees may be provided in the regulation. 2.

On receipt of application for registration, the Board may make such inquiries as it thinks fit in respect of genuineness of the application and correctness of any particulars thereon. 3. Upon receipt of such application the Board shall either grant registration to the applicant or reject such application for reasons to be recorded in writing Provided that where registration has been refused to the application,

the said applicant may again make an application for registration after removing defects, if any in its previous application.

CHAPTER 6 Local level Committees 0. The Board shall constitute a local level committee for such area as may be specified by it from time to time. 1. A local committee shall consist of an officer of the civil service of the Union or of the State, not below the rank of a District Magistrate or a District Commissioner of a district; a. a representative of a registered organization; and

b.
a person with
disability as defined in clause (t)
of section 2

of

the

persons

with disabilities (Equal Opportunities, Protection of rights and Full Participation) Act, 1995

103 2.

A local level committee shall continue to work for a period of three years from the date of its constitution or till such time it is reconstituted by the Board 3. A local level committee shall meet at least once in every three months or at such interval as may be necessary. 0. A parent of a person with disability or his relative may make

as

application to the local level committee for appointment of any person of his choice to act as a guardian of the persons with disability. 1. Any registered organization may make an application in the prescribed form to the local level committee for appointment of a guardian for a person with disability: Provide that no such application shall be entertained by the local level committee, unless the consent of the guardian of the disabled person is also obtained. 2. While considering the application for appointment of a guardian, the local level committee shall consider: - whether the person with disability needs a guardian; the purpose for which the guardianship is required for person with disability. 3. The local level committee shall receive, process and decide applications received under sub-section (1)

and (2), in such manner as may be determined by regulation: Provide that while making recommendation for the appointment of a guardian, the local level committee shall provide for the obligation which are to be fulfilled by the guardian. 4. The local committee shall send to the Board the particulars received by it and orders passed there on

at such interval as may be determined by regulations. Every person appointed as a guardian of a person with disability under this chapter shall, wherever required, either have the care of such person of disability and his property or be responsible for the maintenance of the person with disability. 0. Every person appointed as a guardian under section 14 shall, within a period of six months from the date of his appointment, deliver to the authority which appointed him, an inventory of immovable property belonging to the person with disability and all assets and other movable property received on behalf of the person with disability, together with a statement of all claims due to and all debts and liabilities due by such person with disability.

104 1. Every guardian shall also furnish to the said appointing authority within a period of three months at the close of every financial year, an account of the property and assets in his charge, the sums received and disbursed on account of the person with disability and the balance remaining with him. 0. Whenever a parent or a relative of a person with disability or a registered organization find that the guardian is :- abusing or neglecting a person with disability; or a misappropriating or neglecting the property, it may in accordance with the prescribed procedure apply to the committee for the removal of such guardian. 1. Upon receiving such application the committee may, if it is satisfied that there is a ground for removal and for reasons to be recorded in writing, remove such guardian and appoint a new guardian in his place or if such a guardian is not available make such other arrangement as may be necessary for the care and protection of person with disability. 2. Any person removed under sub-section (2) shall be bound to deliver the charge of all property of the person with disability to the new guardian, and to account for all moneys received or disbursed by him. Explanation,- For the Purpose of this chapter, the expression "relative" includes any person related to the person with disability by blood, marriage or adoption. CHAPTER 7 Accountability and Monitoring 0. The books and documents in the possession of the Board shall be open to inspection by any registered organization 1. Any registered organization can submit a written requisition to the Board for the access of any book or document maintained by the Board. 2. The Board shall frame such regulations as it thinks necessary for allowing the access of any books or document to a registered organization. The Board shall determine by regulations the procedure for evaluating the pre-funding status of registered organizations seeking financial assistance from it and such regulations may also provide for the guidelines for monitoring and evaluating the activities of the registered organizations who are receiving financial assistance from the Trust.

105 0. The Board shall in each year hold an annual general meeting of registered organizations, and not more than six months shall elapse between the date of one annual general meeting and that of the next. 1. A notice of the annual general meeting along with a statement of accounts and records of its activities during the preceding year shall be sent by the Board to every registered organization at such time as may be determined by regulations. 2. The quorum for such meeting shall be such number of persons of the registered organization as may be determined by regulation. CHAPTER 8 Finance, Accounts and Audit The Central Government may, after due appropriation made by Parliament by law in his behalf, make to the Trust a one-time contribution of rupees one hundred crores or a corpus, the income whereof may be utilized for the objects of the Trust under this Act. There shall be constituted a fund to be called the

National Trust for Welfare of persons with Autism, Cerebral Palsy, Mental Retardation and Multiple disabilities

Fund and there shall be credited thereto- all money received from the Central Government;

- a. all moneys received by the trust by way of grants, gifts, donation, benefaction, bequests or transfers;
- b. all moneys received by the Trust in any other manner or from any other source. 1. All moneys belonging to the fund shall be deposited in such banks or invested in such manner as the Board may, subject to approval of the Central Government, decide. 2. The funds shall be applied towards meeting the administrative and other expenses of the Trust including expenses incurred in the exercise of its powers and performance of duties by the Board in relation to any of its activities under section 10 or for any thing relating thereto.

The Board shall prepare, in such form and at such time in each financial year as may be prescribed, the budget for the next financial year showing the estimated receipt and expenditure of the Trust and shall forward the same to the Central Government,

106 0. The Board shall maintain proper accounts and other relevant records and prepare an annual statement of accounts of the Trust including the income and expenditure accounts in such form as the Central Government may prescribe and in accordance with such general direction as may be issued by that Government in constitution with the Comptroller and Auditor-General of India. 1. The accounts of the Trust shall be audited by the Comptroller and Auditor General of India at such intervals as may be specified by him and any expenditure incurred by him in connection with such audit shall be payable by the Board of the Comptroller and Auditor-General of India. 2. The Comptroller and Auditor-General of India and by other person appointed by him in connection with the audit of the accounts of the Trust shall have the same rights, privileges and authority in connection with such audit as the Comptroller and Auditor-General of India generally has in connection with the audit of the Government accounts, and in particular, shall have the right to demand

and

production of books of accounts, connected vouchers and other documents and papers and to inspect any of the offices of the Trust. 3. The accounts of the Trust as certified by the Comptroller, and Auditor-General of India or any other person appointed by him in this behalf, together with the audit report thereon, shall be forwarded annually to the Central Government, and that Government shall cause the same to be laid before each House of Parliament. The Board shall prepare every year, in such form within such time as may be prescribed an annual report giving a true and full accounts of its activities during the previous year and copies thereof shall be forward to the Central Government and that Government shall cause the same to be laid before each House of Parliament. All orders and decisions of the Board and instrument issued in the name of the Trust shall be authenticated by the signature of the Chairperson, the Chief Executive Officer or any other officer authorized by the Chairperson, in this behalf. The Board shall furnish to the Central Government such reports, returns and other information as that Government may require time to time. CHAPTER 9

Miscellaneous 0. Without prejudice to the foregoing provisions of this Act, the Board shall, in exercise of its power or the performance of its duties under this Act, be bound

107 by such direction on questions of policy as the Central Government may give in writing it from time to time: Provided that the Board shall, as far as practicable, be given an opportunity to express its views before any direction is given under this sub-section. 1. The decision of the Central Government whether a question is one of policy or not shall be final. If the Central Government on the complaint of a registered organization or otherwise has reason to believe that the Board is unable to perform or has persistently made default in the performance of the duties imposed on it, the Central Government may issue notice to the Board asking why it should not be superseded: Provide that no order superseding the Board shall be made by the Central Government, unless a notice affording reasonable opportunity to the Board has been given in writing that why it should not be superseded. 1. The Central Government after recording reasons in writing and by issuing a notification in the Official Gazette supersede the Board for a period of not more than six months: provided that on the expiration of the period of super session Central Government may reconstitute the Board, in accordance with section 3. 2. Upon the publication of the notification under sub-section (2), all the members of the Board shall, notwithstanding that their term of office had not expired as on the date of supersession, vacate their office as such members;

a. all the powers and duties which may, by or under the provision of this Act, be exercised or performed by or on behalf of the trust shall, during the period of supersession, be exercised and performed by such person as the Central Government may direct. 3. On the expiration of the period of super session specified in the notification issued under sub-section (2), the Central Government may extend the period of super session for such further period as it may consider necessary so that the total period of supersession does not exceed more than six months; or a. reconstitute the Board in the manner provided in section 3. Notwithstanding anything contained in the Income-tax Act, 1961, or any other law for the time being in force relating to tax on income. profit organs, the Trust shall not be liable to pay income-tax or any other tax in respect of its income, profits or gains derived. No suit, prosecution or other legal proceeding shall lie against the Central Government or the Trust or any member of the Board or Chief

108 Executive officer or any officer or other employee of the Trust or any other person authorized by the Board to perform duties under this. Act for any loss or damage caused or likely to be caused by anything which is done in good faith. Explanation:- For the purpose of this section, the expression "good faith" shall have the same meaning as is assigned to it in the Indian Penal Code.

All Members, Chief Executive Officer, other officers and employees of the Trust shall be deemed, when acting or purporting to act in pursuance of any of the provisions of this Act, to be public servant within the meaning of section 21 of the Indian Penal Code. The Board may, by general or special order in writing, delegate to the Chairperson or any members or any officer of the Trust or any other person subject to such conditions and limitations, if any, as may be specified in the order such of its powers under this Act, (except the power to make regulations under section 35) as it may deem necessary. The Central Government may, by notification in the Official Gazette, make rules for carrying out the provisions of this Act. 1. In particular, and without prejudice to the generality of the foregoing powers, such rules may provide for all or any of the following matters, namely:- the procedure in accordance with which the person representing registered organization shall be elected under clause (b) of sub-section (4) of section 3; a. the condition of service of the Chairperson and Members under sub-section (2) of section 4; b. the rules procedure in the transaction of business at meeting of the Board under sub-section (2) of section 14; c. the powers and duties of Chief Executive Officer under subsection (1) of section 8; d. the form in which an application for guardianship may be made by a registered organization under sub-section (2) of section 23; e. the procedure in accordance with which a guardian may be removed under section 17; f. the form in which, and the time within which, the budget of the trust shall be forwarded to the Central Government under section 23; g. the form in which the annual statement of accounts shall be maintained under sub-section (1) of section 24; h. the form in which, and the time within which, the annual reports shall be prepared and forwarded under section 25; i. any other matter which is required to be, or may be, prescribed. The Board may, with the previous approval of the

Central Government, by notification in the Official Gazette, make regulations consistent with this Act and rules generally to carry out the purpose of this Act. In particular, and without prejudice to the generality of the foregoing power, such regulation may provide for all or any of the following matters, namely:- ●●●● the manner and purpose for which a person may be associated under sub-section (5) of section 3; a. the time and place at which the Board shall meet under subsection (6) of section 4; b. the terms and conditions of service of, Chief Executive Officer, other officer and employees of the Trust under sub-section (3) of section 8; c. the form manner in which the application shall be made for registration under sub-section (2) of section 12 and the particulars which such application shall contain under that sub-section; d. the manner in which application for guardianship shall be received, proceed and decided by the local level committee under sub-section (4) of section 114; e. the particulars of application and orders passed thereon by the local level committee under sub-section (5) of section 14; f. the procedure for evaluating the pre-funding status of the registered organization and framing of guidelines for monitoring and evaluating the activities of such registered organization under section 19; g. the time within which notice for annual general meeting shall be sent and quorum for such meeting under sub-section (2) and (3)

of section 20; and h.

any other matter which is required to be, or may be provided by

regulation. 2.7.5. The Sarva Shiksha Mission 2000 It pledges that the "SSM

will ensure

that every child with special needs irrespective of the kind, categories and degree of disability

is

provided

education in appropriate environment."

Sarva Shiksha Abhiyan or

SSA, is an Indian Government programme

aimed at the universalisation of elementary education "in a time bound manner",

as mandated by the 86th Amendment to the Constitution of India making free and compulsory education to children

between the ages of 6 to 14 (

estimated to be 205 million

110 children in 2001) a fundamental right. The programme was pioneered by former Indian Prime Minister Atal Bihari Vajpayee. History As an intervention programme, SSA has been operational since 2000-2001. However, its roots go back to 1993-1994, when the District Primary Education Programme (DPEP) was launched, with an aim of achieving the objective of universal primary education. DPEP, over several phases, covered 272 districts in 18 states of the country. The expenditure on the programme was shared by the Central Government (85%) and the State Governments. The Central share was funded by a number of external agencies, including the World Bank, DFID and UNICEF. By 2001, more than US\$1500 million had been committed to the programme, and 50 million children covered in its ambit. In an impact assessment of Phase I of DPEP, the authors concluded that its net impact on minority children was impressive, while there was little evidence of any impact on the enrolment of girls. Nevertheless, they concluded that the investment in DPEP was not a waste, because it introduced a new approach to primary school interventions in India. The Right to Education Act (RTE) came into force on 1 April 2010. Some educationists and policy makers believe that, with the passing of this act, SSA has acquired the necessary legal force for its implementation. Features Sarva Shiksha Abhiyan (SSA) is a programme for Universal Elementary Education. This programme is also an attempt to provide an opportunity for improving human capabilities to all children through provision of community -owned quality education in a mission mode.

It is

a response to the demand for quality basic education all over the country.

Main

features 1.

Programme with a clear time frame for universal elementary education. 2. A

response

to the demand for quality basic education all over the country. 3.

An opportunity for promoting social justice through

basic education. 4.

A

expression of political will for universal elementary education across the country. 5.

A partnership between the central, state and

the local government.

111 6. An opportunity for states to develop their own vision of

elementary education. 7. An effort at effective involving the Panchyati Raj Institutions, school management Committees, village and urban slum

level Education Committees,

parent'

s

Teachers' Associations, Mother-Teacher Associations, Tribal Autonomous councils and other grassroots level structures in the management of elementary schools.

Aims 1.

To provide useful and elementary education for all children in the 6-14 age group. 2. To bridge social, regional and gender gaps with the active participation of community in the management of schools. 3.

To allow children to learn about and master their natural environment in order to develop their potential both spiritually and materially. 4. To inculcate value-based learning

this

allows children an opportunity to work for each other's well being rather than to permit mere selfish pursuits. 5. To

realize the importance of Early Childhood Care and education and looks at the 0-14 age as a continuum.

Objectives 1.

All children in school. Education Guarantee Centre, Alternate School, 'Back- to-School' camp by 2003. 2. All children complete five years of primary schooling by 2007. 3. All children complete of elementary schooling by 2010. 4. Focus on elementary education of satisfactory quality with emphasis on education for life. 5. Bridge all gender and social category gaps at primary stage by 2007 and at elementary education level by 2010. 6. Universal retention by 2010.

Aspects 1. It provides a wide convergent frame work for implementation of Elementary Education schemes.

112 2. It is also a programme with budget provision for strengthening vital areas to achieve universalisation of elementary education. 2.7.6 Right to

Education Act (2006) Right to Education

Act

Every child between the ages of 6 to 14 years has the right to free and compulsory education.

This is stated as per the 86th Constitution Amendment Act via Article 21A. The Right to Education Act seeks to give effect to this amendment. The government schools shall provide free education to all the children and the schools will be managed by School Management Committees (SMC). Private schools shall admit at least 25% of the children in their schools without any fee. The National Commission for Elementary Education shall be constituted to monitor all aspects of elementary education including quality.

Main Features of Right to Education (RTE) Act, 2009 ●●●●●

Free and compulsory education to all children of India in the 6 to 14 age group. ●●●●● No child shall be held back, expelled or required to pass a board examination until the completion of elementary education. ●●●●●

If a child above 6 years of age has not been admitted in any school or could not complete his or her elementary education, then he or she shall be admitted in a class appropriate to his or her age. However, if a case may be where a child is directly admitted in the class appropriate to his or her age, then, in order to be at par with others, he or she shall have a right to receive special training within such time limits as may be prescribed. Provided further that a child so admitted to elementary education shall be entitled to free education till the completion of elementary education even after 14 years. ●●●●● Proof of age for admission: For the purpose of admission to elementary education, the age of a child shall be determined on the basis of the birth certificate issued in accordance with the Provisions of Birth, Deaths and Marriages Registration Act 1856, or on the basis of such other document as may be prescribed. No child shall be denied admission in a school for lack of age proof

113 ●●●●● A child who completes elementary education shall be awarded a certificate. ●●●●● Call need to be taken for a fixed student-teacher ratio. ●●●●● Twenty-five per cent reservation for economically disadvantaged communities in admission to Class I in all private schools is to be done. ●●●●● Improvement in the quality of education is important. ●●●●● School teachers will need adequate professional degree within five years or else will lose job. ●●●●● School infrastructure (where there is a problem) need to be improved in every 3 years, else recognition will be cancelled. ●●●●● Financial burden will be shared between the state and the central government. '

Free and Compulsory Elementary Education' All children

between the ages of 6 and 14 shall have the right to free and compulsory elementary education at a neighbourhood school.

There is

no direct (school fees) or indirect cost (uniforms, textbooks, mid-day meals, transportation) to

be borne by the child or the parents to obtain elementary education.

The government will provide schooling free-of-cost until a child's elementary education is completed.

The role envisaged for the community and parents to ensure

RTE

The

Right of Children to Free and Compulsory Education (

RTE) Act 2009

insists upon schools to constitute School Management Committees (SMCs) comprising local authority officials, parents, guardians and teachers. The SMCs shall form School Development Plans and monitor the utilization of government grants and the whole school environment. RTE also mandates the inclusion of 50 per cent women and parents of children from disadvantaged groups in SMCs. Such community participation will be crucial to ensuring a child friendly "whole school" environment through separate toilet facilities for girls and boys and adequate attention to health, water, sanitation and hygiene issues. RTE promote Child-Friendly Schools All schools must comply with infrastructure and teacher norms for an effective

114 learning environment. Two trained teachers will be provided for every sixty students at the primary level. Teachers are required to attend school regularly and punctually, complete curriculum instruction, assess learning abilities and hold regular parent-teacher meetings. The number of teachers shall be based on the number of students rather than by grade. The state shall ensure adequate support to teachers leading to improved learning outcomes of children. The community and civil society will have an important role to play in collaboration with the SMCs to ensure school quality with equity. The state will provide the policy framework and create an enabling environment to ensure RTE becomes a reality for every child. RTE be financed and implemented in India Central and state governments shall share financial responsibility for RTE. The central government shall prepare estimates of expenditures. State governments will be provided a percentage of these costs.

RTE provides a ripe platform to reach the unreached, with specific provisions for disadvantaged groups, such as child labourers, migrant children, children with special needs, or those who have a "disadvantage owing to social, cultural economical, geographical, linguistic, gender or such other factor." RTE focuses on the quality of teaching and learning, which requires accelerated efforts and substantial reforms: 1. Creative and sustained initiatives are crucial to train more than one million new and untrained teachers within the next five years and to reinforce the skills of in-service teachers to ensure child-friendly education. 2. Families and communities also have a large role to play to ensure child-friendly education for each and every one of the estimated 190 million girls and boys in India who should be in elementary school today. 3. Disparities must be eliminated to assure quality with equity. Investing in preschool is a key strategy in meeting goals. 4. Bringing eight million out-of-school children into classes at the age appropriate level with the support to stay in school and succeed poses a major challenge necessitating flexible, innovative approaches.

115 Right to Education Bill In 2002, education was made a fundamental right in the 86th amendment to the Constitution. Six years after an amendment was made in the Indian Constitution, the union cabinet cleared the Right to Education Bill. Key provisions of the Bill include: 25% reservation in private schools for disadvantaged children from the neighbourhood, at the entry level. The government will reimburse expenditure incurred by schools; no donation or capitation fee on admission; and no interviewing the child or parents as part of the screening process. The Bill also prohibits physical punishment, expulsion or detention of a child and deployment of teachers for non-educational purposes other than census or election duty and disaster relief. Running a school without recognition will attract penal action. The Right to Education Bill is the enabling legislation to notify the 86th constitutional amendment that gives every child between the age of six and 14 the right to free and compulsory education. 25%

quota for poor The Supreme Court upheld the constitutional validity of Right of Children to Free and Compulsory Education Act, 2009, on April 12, 2012 and directed every school, including privately-run ones, to give immediately free education to students from socially and economically backward classes from class-I till they reach the age of 14 years. The court threw out the challenge by private unaided schools to Section 12(1)(c) of the Act that says every recognized school imparting elementary education, even if it is an unaided school not receiving any kind of aid or grant to meet its expenses, is obliged to admit disadvantaged boys and girls from their neighbourhood. School Admissions According to RTE Norms A series of measures have been taken by the NCPCR to ensure that school admission procedures all over the country are in accordance with

the

Right of Children to Free and Compulsory Education (RTE) Act, 2009.

This was necessitated by the

fact that schools in some states were carrying out a screening procedure for admission of children in the elementary stage of education prohibited by the Act. In April, the NCPCR wrote to the chief secretaries of all the states asking them to issue Government Orders to ensure that school admission procedures were in accordance with the RTE

116 Act. This was prompted by the Directorate of Education, Government of National Capital Territory of Delhi (GNCTD), issuing a notice in March inviting applications for admission to Class VI in the RajkiyaPratibhaVikasVidyalayas run by the Directorate. The NCPCR's intervention in April came in response to an admission notice that had been issued by the GNCTD's Directorate of Education in all leading newspapers as well as in the Directorate's website, inviting students to purchase application forms costing Rs 25 each and thereafter sit for an entrance exam. Since the RTE Act prohibits any kind of screening procedure and permits admissions into any school through random selection only, the notice was clearly in contravention of the Act. As the nodal body monitoring the implementation of the RTE Act, the Commission wrote to the Principal Secretary, Education, GNCTD, asking the admission notice be withdrawn and a notice in Conformity with the provisions of the RTE be issued instead. It also requested that Government Orders (GO) be issued to all schools in the GNCTD within a week regarding the provisions of the Act so that the schools made the required changes in their procedures and modes of functioning. As the Directorate did not comply with this request, it was summoned by the Commission in June and given time till July to re-conduct the admission in accordance with RTE procedures. To ensure that the RTE Act was not similarly contravened in other states, the NCPCR has in its letter to the chief secretaries said that the GO they issue to schools on the matter must specify that: 1. Admission procedures be made in accordance with the RTE Act 2. 25 per cent reservation is ensured for weaker sections in all 'specified category' schools and private unaided schools, and reservation norms for government aided schools are to be followed Further, private schools recognized by the government must also be mapped out and issued notice regarding provisions in the Act as well as the procedures by which children in the neighbourhood could claim admission to the schools. Also, the task of finalizing State Rules on the RTE Act must be completed at the earliest. In response to queries regarding Navodaya Schools which have been designated as 'specified category' schools in the RTE Act, the NCPCR clarified that the provisions of Section 13 of RTE Act applied to all schools without exception.

117 The relevant provision of Section 13 of the Act is: No school or person shall, while admitting a child, collect any capitation fee and subject the child or his or her parents or guardians to any screening procedure. Any school or person, if in contravention of the provisions of sub-section (1): 1. Receives capitation fee, shall be punishable with fine which may extend to ten times the capitation fee charged 2. Subjects a child to screening procedure shall be punishable with fine which may extend to Rs 25,000 for the first contravention and Rs 50,000 for each subsequent contravention. No Screening for Admission to Navodaya Schools

The National Commission for Protection of Child Rights (NCPCR) has written to the

commissioner, Navodaya Schools, as well as the state education secretaries against any kind of screening for admission of children to elementary education (Classes 1 to eight). The NCPCR intervened to check violation of RTE provisions after it got reports of Navodaya schools screening students in Delhi and other states.

Quoting Section 13 of the RTE Act 2009, the NCPCR has pointed out that while admitting a child to school, the Act prohibits schools or persons from collecting capitation fees or subjecting the child or the parents and guardians to any screening procedure.

Any school or person receiving capitation fees, it has pointed out, could be punished with a fine which could be ten times the capitation fee charged. Subjecting a child to screening could lead to a fine of Rs 25,000 for the first contravention and Rs 50,000 for each subsequent contravention. Section 13 applies to all schools even the Navodaya schools which have been designated special category schools in the RTE Act. Screening procedures being conducted by Navodaya Schools are a violation of the RTE Act, it clarified. NCPCR has also requested state governments to issue orders to all schools regarding the provisions of the Act so that the required changes in their procedures and modes of functioning are made within a week. Eligibility for Teachers The following persons shall be eligible for appearing in the TET: 1. A person who has acquired the academic and professional qualifications specified in the NCTE Notification dated 23rd August 2010. 2. A person who is pursuing any of the teacher education courses (recognized

118 by the NCTE or the RCI, as the case may be) specified in the NCTE Notification dated 23rd August 2010. 3. The eligibility condition for appearing in TET may be relaxed in respect of a State/UT which has been granted relaxation under sub-section (2) of section 23 of the RTE Act. The relaxation will be specified in the Notification issued by the Central Government under that sub-section. Each child to get free uniform, books under RTE Each child from class I to class VIII in the country will be provided free textbooks and uniforms, if a roadmap prepared by the Centre to implement the Right To Education Act (RTE) is accepted by the states. 2.7.7. Rashtriya Madhyamik Shiksha Abhiyan (RMSA)2009 Rashtriya Madhyamik Shiksha Abhiyan (

RMSA) (English: "National Mission for Secondary Education")

is a centrally sponsored scheme of the Ministry of Human Resource Development, Government of India, for the development of secondary education in public schools throughout India. It was launched in March 2009. The implementation of

the scheme has started from 2009-2010 to provide conditions for an efficient growth, development and equity for all. The scheme includes a multidimensional research, technical consulting, various implementations and funding support. The principal objectives are to enhance quality of secondary education and increase the total enrollment rate from 52% (as of 2005-2006) to 75% in five years, i.e. from 2009-2014. It aims to provide universal education for all children between 15-16 years of age.

The funding from the central ministry is provided through state governments, which establish separate implementing agencies.

Objectives

The objectives of Rashtriya Madhyamik Shiksha Abhiyan

can be summarised as follows:[3] 1. To improve

quality of education imparted at secondary level through making all secondary schools conform to prescribed norms. 2.

To remove gender, socio-economic and disability barriers. 3. Universal access to secondary level education by 2017,

i.e., by the end of the XII Five Year Plan. 4. Universal retention

by 2020.

119 Action plans RMSA is planned to promote secondary education by establishing in every target school the following infrastructure: 1.

Additional class rooms 2. Laboratories 3. Libraries 4. Art and crafts room 5. Toilet blocks 6. Drinking water provisions 7.

Residential hostels for teachers in remote areas

In addition it aims to provide additional teachers to reduce student-teacher to 30:1, focus on science, mathematics and English education, in-service training of teachers, science laboratories, ICT-enabled education, curriculum reforms, and teaching-learning reforms.

Planning for secondary education Background ●●●●●

Since the initiation of the National Policy on Education (NPE), 1986, there has been no major changes in the structure and organization of the secondary and higher secondary school systems under the Ninth Plan period. ●●●●●

The focus in this plan was on minimising the various disparities, to renew the curricula giving importance to vocationalisation and employment-oriented courses. It also give importance to expanding and diversifying the open learning system, teacher training and ICT. Free education and hostel facilities for girls and integrated education for the disabled children was also brought into highlight, etc. Participation of private sector ●●●●●

There was an increased participation of the private sector including non- governmental organisations (NGOs). Currently, these private sectors manage around 51% of the secondary schools and 58% of the higher secondary schools. ●●●●● Opportunities were provided for those children who were not able to enroll themselves in formal education systems through national and state open schools by utilising contact-centres and multi-media packages.

120 ●●●●● It highly emphasized on the content, process and the quality of education especially the environment education, science, mathematics and computer literacy with the financial help from the central government. ●●●●● After the revised NPE policy, 1992, new initiatives like revision of curriculum, resource centres for value education and National Centre for Computer-aided Education etc. have been taken up. ●●●●● The appeal lacks in the vocationalisation of education due to the lack of manpower demand and academic restraints etc. Hence, by 2000, only 10% of the students opt for the vocational streams against 25%.

Planning for children with special needs (CWSN) ●●●●● With the enactment of the Persons with Disabilities Act, 1995, the education for the CWSN received an impetus. This act entrusts certain governments and authorities for the provision of free access for these children towards education, allotted lands for certain purposes, non-discrimination in transports, financial incentive for them to undertake research etc. ●●●●● This scheme has also taken up programmes for the attitudinal changes and capacity building among teachers for the sake of these children.[7]

Four major heads ●●●●●

Quality improvement: In school, there was promotion of the science laboratories, environmental education, promotion of yoga, as well as centrally sponsored schemes of population education project, international mathematics and science olympiads. The state governments provide in-service training for the teachers and provide infrastructure and research inputs. ●●●● Information communication technologies (ICT): ICT comprises the centrally sponsored schemes like computer education and literacy in schools (CLASS) and educational technology (ET) which familiarizes the student with Information technology (IT). Due to the rise in IT demand in today's world, a major importance is given on it.

Components of a merged scheme ICT in school include a) funding support towards computer education plans; b) strengthening and reorientation of the staffs of SIETS - state institutes of education and training; c) there is digitalisation of SIETs audio and video cassettes with the partnership of NGOs; and d) management of internet-based education by SIETs.

121 ●●●●

Access and equity: RMSA not only emphasizes on providing secondary education for the special focus groups that include scheduled tribe and scheduled caste groups, minority girls and CWSN children, but it also give importance on removing the existing disparities in socio-economic and gender background in the secondary level of education. They are termed as the vulnerable/ disadvantaged group. Certain strategies were implemented to provide free access towards secondary education and they are given as following steps: 1.

Identification of the disadvantaged groups: For this purpose, educational indicators like gross enrollment ratio (GER), net enrollment ratio (NER), drop-out rate, retention rate, gender parity index (GPI), gender gap, etc. were analysed. 2. Need assessment: This is the critical step to prepare for the equity plan where the factors affecting the education of this group of children were evaluated with the involvement of the community members, teachers, civil society, etc. 3. Strategising for the addressing gaps: Since there are multiple interwoven factors that cause the un-equitable condition in this scenario, the strategy was called to have a set of multi-dimensional activities. 4. Project-based proposal: Development of a project-based strategy enables the RMSA to call for an evidence-based and outcome-oriented strategy. ●●●●

Integrated education for disabled children (IEDC): Inclusive education have been highlighted to bring about expansion in terms of meeting/catering to the needs of the mentally and physically disadvantaged children. This schemes continues to be a separate centrally sponsored scheme. It includes several components for convergence with integrated child development services for early interventions, Sarva Shiksha Abhiyan (SSA) for the particular group at the elementary level, and special schools.

Funding method The Ministry of

Human Resource Development directly provides funds to the state governments. Each state government then release the funds to the approved implementing agencies or institutions. During the XI Five Year Plan the central government provided 75% of the total fund for each state, while 25% was borne by

122 the state as matching share. However, in the remote northeastern states and Sikkim the matching share was waived to 10%. [6][9]

Achievements The major achievements of RMSA as of 2015-2016 report are: 1. New school: 11,577 new secondary schools were approved out of which, 10082 are functional. 2. Strengthening of schools: 337,731 have been approved in terms of infrastructure development under this scheme. The details is as follows: ●●●● Additional classroom: Out of 52750 approved, 20,839 were completed and 16,774 are under progress. ●●●● Science laboratory: Out of 25,948 approved, 10,107 were completed and 8532 are under progress. ●●●● Computer room: Out of 21,864 approved, 6920 were completed and 6297 are under progress. ●●●● Library room: Out of 27,428 approved, 10,133 were completed and 8929 are under progress. ●●●● Art/Craft room: Out of 31,453 approved, 12,062 were completed and 9686 are under progress. ●●●● Drinking water: Out of 12,327 approved, 7096 were completed and 2507 are under progress. ●●●● Teacher quarters: Out of 5408 approved, 623 were completed and 509 are under progress. ●●●● Major repair: Out of 2975 approved, 1313 were completed and 271 are under progress.

Rise of RMSA Due to the impact of the programmes undertaken for the universalisation of elementary education, there is a rise in the demand of education at the secondary level. Despite the increase in the number of secondary schools, the spread of the secondary education throughout the country remains uneven. There are regional disparities, differences in the socio-economic background and in Union Territories. There was narrowing of this significant gender gaps in existing condition. In the

123 Tenth Plan, the key was focussed on a quality education at all levels and to pursuit excellence accordingly. 2.7.8.

Inclusive Education for Disabled at Secondary stage (

IEDSS) 2013

The Scheme of Inclusive Education for Disabled at Secondary Stage (IEDSS)

has been launched from the year 2009-10.

This Scheme

replaces the earlier scheme of Integrated Education for Disabled Children (IEDC)

and

provides

assistance for the inclusive education of the disabled children in classes IX-XII. This scheme now subsumed under RashtriyaMadhyamikShikshaAbhiyan (RMSA) from 2013. The

States/ UTs are also in the process of subsuming under RMSA as RMSA subsumed Scheme.

Aims To enabled all students with disabilities,

to pursue further four years of secondary schooling after completing eight years of elementary schooling in an inclusive and enabling environment. Objectives The scheme covers all children studying at the secondary stage

in Government, local body and Government-aided schools, with one or more disabilities as defined under the Persons with Disabilities Act (1995) and the National Trust Act (1999)

in the class IX to XII, namely

blindness, low vision, leprosy cured, hearing impairment, locomotory disabilities,

mental retardation, mental illness, autism,

and cerebral palsy and may eventually cover speech impairment, learning disabilities, etc.

Girls with

the disabilities receive special focus to help them gain access to secondary schools, as also to information and guidance for developing their potential. Setting up of Model inclusive schools in every State is envisaged under the scheme.

Components ●●●●● Student-oriented components, such as medical and educational assessment, books and stationery, uniforms, transport allowance, reader allowance, stipend for girls, support services, assistive devices, boarding the

lodging facility, therapeutic services, teaching learning materials, etc. ●●●●●

Other components include appointment of special education teachers, allowances for general teachers

for teaching such children, teacher training, orientation of school administrators, establishment of resource room, providing barrier free environment, etc.

124 Implementing Agency The School Education Department of the State Governments/Union Territory (UT) Administrations are the implementing agencies. They may

involve NGOs having experience in the field of education of the disabled in the

implementation of the scheme. Financial Assistance Central assistance for all items covered in the scheme is on 100 percent basis.

The State governments are only required to make provisions for scholarship of Rs. 600/- per disabled child per annum. 2.8

Let us Sum Up International Level 1.

Universal Declaration of Human Rights (1948):

It proclaimed the right of every child to and education. 2.

UN Convention on the Rights of the Child (1989):

It states that education is the right of every child. 3.

UN Declaration on Education for all (Jometien Declaration) - 1990:

It emphasizes education for all including children with disabilities. It states, "

the learning needs of the

disabled demand special attention, steps need to be taken to provide equal access to education to every category of disabled person as an integrated part of education

systems. 4.

UN Declaration Standard Rules on equalization of opportunities for person with disabilities - 1993: It is important resolution

for improving the education condition for person with disabilities.

It states, "State should recognize the principal of equal, primary, secondary and tertiary educational opportunities for children, youth and adults with disabilities, in integrated setting. They should ensure that education of person with disabilities is on integrated part of the education system. 5.

The Salamanca Declaration (1994):

It endorsed inclusive education and stated that inclusion and participation are essential to human rights. National Level The basic structure of the constitution of India, as reflected in the preamble ensures social, economic and political justice as well as equality of status and equal opportunity to all citizens of India. It is thus constitutional obligation of equality of

125 all citizens including persons with disabilities and other marginalized groups of people. Article 45 requires the state to make provision within 10 years

for free and compulsory education for all children until they complete the age of 14 years.

The Constitution (86th Amendment Act ,2002)) has substituted a new article for article 45 which provides, "

The state shall endeavour to provide early childhood care and education for all children until they complete the age of six years." In 1964,

the Kothari Commission (1964-66) recommended placement of the disabled child, as far as possible in ordinary schools. The Integrated Education for Disabled Children (IEDC) - 1974

The centrally sponsored scheme IEDC launched in 1974 to admit children with disabilities in regular schools.

The District Primary Education Programme (DPEP) - 1985. It acknowledges the fact that universalization of education is possible only if it includes children with disabilities. The National Policy on Education (NPE) - 1985

It included a full chapter on "Education of the Handicapped and formulated guidelines for action. The NPE (1986) strongly emphasized the need for the expansion of integrated education programmes.

The Project Integrated Education for Disabled (PIED) - 1987 It was launched in 1987, which encourages all schools in a neighbourhood to enroll children with disabilities.

The Rehabilitation Council of India (RCI) Act - 1992 In 1992, ` the RCI act was passed in the parliament to regulate the manpower development and funding research programme

in the field of education of children with special needs.

The Person with Disabilities (Equal Opportunities Protection of Rights and Full Participation) Act 1995

The main purpose of this act is to define responsibilities of Central Governments and State Governments with regard to services for disabled persons. It recommends making changes in assessment and curriculum and removing architecture barriers to support inclusion. It also recommends providing free books, uniform, etc.

126

The National Trust Act It recommends promotion of children with autism, cerebral palsy, mental retardation and multiple disabilities.

It runs many programmes, which promote independent living community for people with disabilities by creating conducive environment in the community. The Sarva Sikhsha Mission It pledges that the "SSM

will ensure
that every child with special needs irrespective of the kind, categories and degree of disability
is
provided
education in appropriate environment."

The Amendment of
the Constitution in 2001 It makes education a fundamental right for those in the age 6-14 age group
which covers children with disabilities. The National policy for Persons with Disabilities It has a section on education,
stating, "

There is a need for mainstreaming of the person with disabilities in the general education system through inclusive
education.

It also mentions that children learns but in the company of their peers. Right to Education The Constitution (Eighty-sixth Amendment) Act, 2002 inserted Article 21-A in the Constitution of India to provide
free and compulsory education

of all children in
the
age group of six to fourteen
years

as a Fundamental Right
in such a manner as the State may, by law, determine.

The
Right of Children to Free and Compulsory Education (RTE) Act, 2009,
which represents the consequential legislation envisaged under Article 21-A, means that every child has
a right to full time elementary education of satisfactory and equitable quality in
a formal school which satisfies certain essential norms and standards. RMSA 2009 This scheme was launched in March,
2009 with the objective to enhance access to secondary education and to improve its quality. The implementation of the
scheme started from 2009-10.

The other objectives include
improving
quality of education
127 imparted at secondary level through making all secondary schools conform to prescribed norms, removing gender,
socio-economic and disability barriers,
providing universal access to secondary level education by 2017,
i.e., by the end of 12th Five Year Plan

and achieving universal retention by 2020. A Comprehensive Plan of Action for Children and youth with Disabilities It was
also presented by the minister for Human Resource Development, Arjun Singh in March 2005. This Action Plan
advocated inclusive education and envisages making all schools "disabled friendly" by 2020. 2.9 "Check your progress" 1.

Accommodations and modifications serve as two separate kinds of curricular adaptations.

132 Before defining into the differences between accommodations and modifications, let's take a step back and focus on the concept of curricular adaptations. Accommodations accomplish this objective without modifying the curriculum. Adaptations, accommodations, and modifications need to be individualized for students, based upon their needs and their personal learning styles and interests. It is not always obvious what adaptations, accommodations, or modifications would be beneficial for a particular student, or how changes to the curriculum, its presentation, the classroom setting, or student evaluation might be made.

3.2 Objectives

- To Learn Adaptations in inclusion
- To Learn Accommodations in Inclusive Education.
- To Learn Modification in inclusion.
- To learn specifics for children with sensory Disabilities.
- To learn specifics for Children with Motor and Multiple Disabilities.
- To learn about gifted Children.

3.3 Meaning, Difference, Need & Steps

Adaptations, accommodations, and modifications need to be individualized for students, based upon their needs and their personal learning styles and interests. It is not always obvious what adaptations, accommodations, or modifications would be beneficial for a particular student, or how changes to the curriculum, its presentation, the classroom setting, or student evaluation might be made. This page is intended to help teachers and others find information that can guide them in making appropriate changes in the classroom based on what their students need. Some of the major issues that general education teachers may have with creating instructional accommodations and adaptations in the classroom may include the need for a starting point with examples of how to modify lesson plans for students with special needs in addition to looking at what different types of adaptations there are. Even though most pre-service teachers are taught to create lesson plans for the general education setting, it is also necessary for these teachers to be aware of how to modify

133 lesson plans for students with individual needs. All children do not learn the same way, therefore general education teachers need to be aware of methods they can use to alter lesson plans to benefit students with special needs. Being aware of different types of accommodations and adaptations is another important part of being a general education teacher, as these specific areas of adaptations will help teachers focus on what exactly they can change in their lesson plans to meet the specific needs of learners. According to the Council for Exceptional Children, there are several methods that teachers can consider when creating instructional accommodations and adaptations to meet the needs of diverse learners (Council for Exceptional Children, 2011):

-

Altering existing materials: Teachers can re-write, reorganize, add to, or re-cast the information so that the student can access the regular curriculum material independently. For example, teachers could prepare a study guide and audiotape for students.

- Mediating existing materials: Teachers can provide additional instructional support, guidance, and direction to the student in the use of the materials. Teachers can instruction to mediate the barriers presented by the materials so that one may directly lead the student to interact with the materials in different ways. For example, one might have students survey the reading material, collaboratively preview the text, and create an outline of the material to use as a study guide.
- Selecting alternate materials: Teachers might select new materials that are more sensitive to the needs of students with disabilities or are inherently designed to compensate for learning problems. For example, use an interactive computer program that cues critical ideas, reads text, inserts graphic organizers, defines and illustrates words, presents and reinforces learning in smaller increments, and provides more opportunities for practice and cumulative review. The New Jersey Council on Developmental Disabilities lists nine different types of adaptations that teachers might use when addressing the needs of different learners (Curriculum modifications, n.d.):

1. Input: Adapting the way the instruction is delivered to the learner (such as using different visual aids).
2. Output: Adapting how the learner might respond to instruction (such as allowing a verbal instead of written response).

134 3. Time: Adapting the time allotted for learning, task completion, or testing (such as increasing or decreasing time given for tasks). 4. Difficulty: Adapting the skill level, problem type, or rules on how the learner might do the work (such as simplifying directions). 5. Level of Support: Increase the amount of personal assistance for a specific learner (such as assigning peer tutors). 6. Size: Adapting the number of items that the student will complete (such as reducing the number of answers on a multiple choice test). 7. Degree of Participation: Adapting how much the student will be involved in an activity (such as having the student write answers on the board). 8. Alternate Goals: Adapting the goals or outcomes expectations while using the same materials (such as asking the student to be able to recall book titles instead of recalling both book and author names). 9. Substitute Curriculum: Providing different instruction and materials to meet a learner's individual goals (such as asking a student to read the graphic novel version of a text instead of the entire novel).

3.4 Specifics for Children with Sensory Disabilities The concept of sensorial disability embraces persons with sensory, visually , and hearing impaired; and they are so important for humans, because those are the receptors that perceive information about the world around us. The concept of visual impairment refers to both, the blindness and other conditions of vision that do not reach it. According to the timing of deficiency, we can find blindness and visual impairment from birth and acquired, early or late; having great importance, when all this happens; because it would depend all the visual experiences, that may have been acquired before the injury. Within this category, we found visual impairment and hearing impairment. 3.4.1 Visual Impairment Visual impairment is the lack, deficiency, or decreased vision. For many people the word blind means total lack of vision, visual impairment but is divided into total blindness or amaurosis, blindness.

135 Classification Partial blindness, when the vision of the person is low or there is insufficient capacity and need to wear glasses to improve it. Macular degeneration: loss of peripheral vision and central vision is weak or a black hole. Cataracts occur when the eye's lens becomes cloudy; it is the most common cause of low vision in old age. Tubular or tunnel vision: it is caused by glaucoma. Damage to the optic nerve at the back of the eye leads to a gradual loss of nerve function and can cause loss of peripheral vision. Diabetic retinopathy is a common source of low vision in middle age. Diabetes can damage blood vessels in the eye. Blindness: means there is difficulty distinguishing between colors, especially reds and greens. Cortical blindness is caused by brain damage in the primary visual area of the occipital lobe although the visual organs are in good condition. The vision of the person is vague to light or movement. Blindness may be caused due to same diseases like Trachoma, Glaucoma, Xerophthalmia etc. or it may cause due to some accidents or some genetic defects/chromosomal aberrations. Some systemic disease like diarrhoea, blood sugar and hypertension also may cause blindness. Lenses Staff: used to acquire information about the road in front of the user is not detected unbalanced on hanging objects, Guide dogs, blind people can be transported with the help of a dog which has to be trained for several weeks, is very useful if you need to walk long distances. These dogs are not pets but companions; they should not pet him or take him by the collar without the permission of the owner. Audio books Braille: A system of touch reading and writing in which letters, words, numbers, etc. Are points that stick out of the paper. The system has 18 abbreviations, contractions calls to save space and speed up the reading or writing. 3.4.2 Children with visual in Inclusive Education Students with visual impairments have unique educational needs which are most

136 effectively met using a team approach of professionals, parents and students. In order to meet their unique needs, students must have specialized services, books and materials in appropriate media (including braille), as well as specialized equipment and technology to assure equal access to the core and specialized curricula, and to enable them to most effectively compete with their peers in school and ultimately in society. There must be a full range of program options and support services so that the Individualized Education Program (IEP) team can select the most appropriate placement in the least restrictive environment for each individual student with a visual impairment. There must be adequate personnel preparation programs to train staff to provide specialized services which address the unique academic and non-academic curriculum needs of students with visual impairments. There must also be ongoing specialized personnel development opportunities for all staff working with these students as well as specialized parent education. Providing equal access to all individuals with disabilities is the key element of the Rehabilitation Act of 1973 and the Americans with Disabilities Act of 1992. Access involves much more than providing ramps. Access is also the key element of inclusion, which involves much more than placement in a particular setting. The relationship of access and inclusion may not be obvious to individuals who are not familiar with the educational and social impact of a vision loss. Placing a student with a visual impairment in a regular classroom does not, necessarily, provide access and the student is not, necessarily, included. A student with a visual impairment who does not have access to social and physical information because of the visual impairment, is not included, regardless of the physical setting. Students with visual impairments will not be included unless their unique educational needs for access are addressed by specially trained personnel in appropriate environments and unless these students are provided with equal access to core and specialized curricula through appropriate specialized books, materials and equipment.

3.4.3 Hearing impairment or deafness.

It refers to the individual's inability to detect or receive at least some sound frequencies which can usually be heard by members of their species, hearing loss can be classified as mild, moderate to profound. A deaf person uses vision as the primary mode for learning and communication.

137 Causes of hearing loss and deafness If one or both parents have greater risk of hearing loss the child is born deaf. Hearing impairment is often caused by problems during pregnancy and childbirth. Premature birth during labor conditions in which a baby does not have enough oxygen to breathe. Rubella, syphilis or some other infections in a woman during pregnancy. Inappropriate use of toxic drugs (a group of over 130 drugs, such as the antibiotic gentamicin) during pregnancy. Jaundice, which can damage the auditory nerve in a newborn baby. Other causes include infections such as meningitis, measles, mumps and chronic ear infections can lead to hearing impairment. Wax or foreign bodies blocking the ear canal can cause hearing loss at any age. Excessive noise, including working with noisy machinery, exposure to loud music or other noises such as gunfire or explosions can damage the inner ear and weak hearing. As people age, accumulated exposure to noise and other factors can lead to deafness or hearing loss. Sensori neural hearing loss can be prevented by:

- Meningitis, immunize children against childhood diseases like measles, meningitis, rubella and mumps.
- Immunize women of childbearing age against rubella before pregnancy.
- Detection and treatment of syphilis and certain other infections in pregnant women;
- Improved prenatal and perinatal care.

3.4.4 Hearing Impaired with Inclusive Education

Inclusive Education for Hearing-impaired Children, teachers learn how to support the hearing-impaired child in a mainstream school, addressing specific needs of the hearing- impaired child including academic, social, amplification and physical needs. Teachers also gain specialised knowledge about language and listening and how they form the basis for the development of literacy and academic learning. Music forms an important part of the curriculum and the necessary information is provided to any teacher who

138 wishes to use music as a way to aid the language, listening and reading development in children. •••• The model of inclusive education on which this programme is based, aims at including hearing-impaired learners in a mainstream school through the early identification of hearing loss and ongoing audiological management, parent guidance, speech-language therapy, development of listening skills and educational support. •••• This programme is directed at mainstream educators and is also suitable for speech- language therapists, audiologists, educational psychologists, and occupational therapists with previous training in education in their undergraduate studies. •••• Qualifying students are provided with applied competence in the effective inclusion of the hearing-impaired child in mainstream education. The student is equipped with knowledge of the principles and practicalities of inclusive education to optimise the education of the hearing-impaired child. •••• A module is dedicated to the guidance of parents with a hearing-impaired child. KNOWLEDGE AND PRACTICAL KNOW-HOW ARE •••• the principles of inclusion and how it differs from specialised schooling and integration; •••• how the ear and hearing works and the amplification technology available for hearing-impaired children; •••• the application of these technologies, and trouble-shooting and assisting the hearing-impaired child in the classroom; •••• language and communication development and how they lay the foundation for literacy development and academic achievement. The student is able to develop a language-development programme to enhance and encourage literacy and numeracy development. evaluating and addressing the individual needs of each child (including the hearing-impaired child) in order to support the child holistically to reach her/ his full academic potential; •••• differentiated teaching methods in order to ensure full participation of the hearing- impaired learner in the school;

139 •••• working as part of an interdisciplinary team along with other team members (of which the parents form an integral part); •••• the importance of parental and family involvement in the education of the hearing- impaired child. The students are equipped to guide and support and actively involve the parent in the education of the hearing-impaired child and in understanding him/her ; •••• the role of the parent as part of the interdisciplinary team. The students are able to understand the need for parental involvement and also how to accommodate specific needs of each child and each family in education, the role of music in the development of language, listening and literacy skills, and are able to incorporate music and movement as part of the curriculum

1 Inclusion: Fundamentals In this module students learn to understand the rationale for inclusion of the hearing-impaired child in a mainstream school. Relevancy in today's education as well as considerations based on ethical and financial implications are discussed. Students acquire knowledge on global developments in the area of inclusion and deliberate global trends in inclusion.

2 The Ear and Hearing Students are provided with information in order to understand the ear in terms of the anatomy, diseases of the ear and treatment of ear pathologies. Students are made aware of the importance of hearing in the classroom and levels of impairment.

3 Amplification Technology Understanding the importance and use of amplification technologies for children with hearing impairment in and out of the classroom are discussed. The module offers an in-depth knowledge of the technologies available and the working of these devices.

4 Listening, Language and Communication Development Listening and language are interlinked and listening affects language development. Students learn about the effects that language development have on both literacy and numeracy development. The required interdisciplinary

140 teamwork to address these issues with the hearing-impaired child is discussed. 5 Educational Practices for inclusion The impact of hearing impairment in classroom practice and aligning the learning environment to support the hearing-impaired child to achieve his/her potential, are covered. Evaluating the child's needs holistically in order to support the hearing-impaired child and adapting the curriculum, teaching methods and assessments to the hearing-impaired child's specific needs, are included. 6 Parent and Family Guidance and Support The aim of this module is to guide and support the parent and family in all aspects of hearing impairment of their child as well as addressing the educational needs of the child. The importance of the parent or guardian as part of the interdisciplinary team working with the hearing-impaired child is stressed. 7 Music in the Development of Language and Literacy The importance of music in speech, language and listening development and its effects on academic performance are clarified. The role of music in overall academic performance is explained. The effect of music in the holistic development of the child is discussed. 3.5 Specifies for Children with Neuro-Developmental Disabilities Neurodevelopmental disorders are impairments of the growth and development of the brain or central nervous system. A narrower use of the term refers to a disorder of brain function that affects emotion, learning ability, self-control and memory and that unfolds as the individual grows. The term is sometimes erroneously used as an exclusive synonym for autism and autism spectrum disorders. Disorders considered neurodevelopmental in origin, or that have neurodevelopmental consequences when they occur in infancy and childhood, include: •••• Intellectual disability (ID) or intellectual and developmental disability (IDD) •••• Autism and autism spectrum disorders such as Asperger syndrome •••• Fetal alcohol spectrum disorder 141 •••• Motor disorders including developmental coordination disorder, stereotypic movement disorder and the tic disorders including Tourette syndrome. •••• Traumatic brain injury (including congenital injuries such as those that cause cerebral palsy) •••• Communication, speech and language disorders •••• Genetic disorders, such as fragile-X syndrome •••• Down syndrome •••• Attention deficit hyperactivity disorder •••• Mendelsohnn's syndrome •••• Schizophrenia •••• Schizotypal disorder •••• HIV •••• Malaria Neurodevelopmental disorders are associated with widely varying degrees of difficulty which may have significant mental, emotional, physical, and economic consequences for individuals, and in turn their families and society in general. Causes The development of the brain is orchestrated, tightly regulated, and genetically encoded process with clear influence from the environment. This suggests that any deviation from this program early in life can result in neuro-developmental disorders and, depending on specific timing, might lead to distinct pathology later in life. Because of that, there are many causes of neuro-developmental disorder, which can range from deprivation, genetic and metabolic diseases, immune disorders, infectious diseases, nutritional factors, physical trauma, and toxic and environmental factors. Some neuro-developmental disorders-such as autism and other pervasive developmental disorders-are considered multifactorial syndromes (with many causes but more specific neurodevelopmental manifestation) Deprivation Behavioral retardation, as in the reactive attachment disorders, has been observed in emotionally deprived children living with their families. However, prominent modern

142 thought attributes other causative mechanisms to autism and autistic spectrum disorders. However, nurture is not the only cause of deprivation that leads to neuro-developmental sequelae. A common example of sensory deprivation due to biologic factors is blindness. Blind infants are at risk for poor developmental outcomes that if left untreated can lead to severe, autistic-like behaviors. Despite its biologic basis, caregivers can ameliorate blindness-related sensory deprivation. This can lead to positive neurodevelopmental outcome, as in the cases of author Helen Keller, who was trained in the use of tactile sign language, and musicians such as Arthel "Doc" Watson and Ray Charles who remained emotionally connected to others via their sense of hearing. Genetic disorders A prominent example of a genetically determined neuro-developmental disorder is Trisomy 21, also known as Down syndrome. This disorder usually results from an extra chromosome 21, although in uncommon instances it is related to other chromosomal abnormalities such as translocation of the genetic material. It is characterized by short stature, epicanthal (eyelid) folds, abnormal fingerprints, and palm prints, heart defects, poor muscle tone (delay of neurological development) and mental retardation (delay of intellectual development). Less commonly known genetically determined neurodevelopmental disorders include Fragile X syndrome, Rett syndrome, and Williams syndrome. Fragile X syndrome was first described in 1943 by J.P. Martin and J. Bell, studying persons with family history of sex-linked "mental defects". Rett syndrome, another X-linked disorder, produces severe functional limitations. Williams syndrome is caused by small deletions of genetic material from chromosome 7. Immune dysfunction Immune reactions during pregnancy, both maternal and of the developing child, may produce neuro-developmental disorders. One typical immune reaction in infants and children is PANDAS, or Pediatric Autoimmune Neuropsychiatric Disorders Associated with Streptococcal infection. Another disorder is Sydenham's chorea, which results in more abnormal movements of the body and fewer psychological sequelae. Both are immune reactions against brain tissue that follow infection by Streptococcus bacteria. Susceptibility to these immune diseases may be genetically determined, so sometimes several family members may suffer from one or both of them following an epidemic of Strep infection.

143 Infectious diseases number of infectious diseases can be transmitted either congenitally or in early childhood, and can cause serious neurodevelopmental disorders, such as schizophrenia. Congenital toxoplasmosis may result in formation of cysts in the brain and other organs, causing a variety of neurological deficits. Congenital syphilis may progress to neurosyphilis if it remains untreated. Measles can progress to sub acute sclerosing panencephalitis. Congenital rubella syndrome can produce schizophrenia in addition to multiple other symptoms. Metabolic disorders Metabolic disorders, present in either the mother or the child, can cause neurodevelopmental disorders. Two examples are diabetes mellitus (a multifactorial disorder) and phenylketonuria (an inborn error of metabolism). Many such inherited diseases may directly affect the child's metabolism and neural development but less commonly they can indirectly affect the child during gestation. (See also teratology). In a child, type 1 diabetes can produce neurodevelopmental damage by the effects of excess or insufficient glucose. The problems continue and may worsen throughout childhood if the diabetes is not well controlled. Type 2 diabetes may be preceded in its onset by impaired cognitive functioning. However a non-diabetic fetus can also be subjected to glucose effects if its mother has undetected gestational diabetes. Maternal diabetes causes excessive birth size, making it harder for the infant to pass through the birth canal without injury or it can directly produce early neurodevelopmental deficits. Usually the neurodevelopmental symptoms will decrease in later childhood. Phenylketonuria, also known as PKU, is an inborn error of metabolism that can induce neurodevelopmental disorders in children. Children with PKU require a strict diet to prevent mental retardation and other disorders. In the maternal form of PKU, excessive maternal phenylalanine can be absorbed by the fetus even if the fetus has not inherited the disease. This can produce mental retardation and other disorders. Nutrition Nutritional deficits may cause neurodevelopmental disorders, such as spina bifida, which is common, and anencephaly, which is rare. Both disorders are neural tube defects with malformation and dysfunction of the nervous system and its supporting structures, leading to serious physical disability as well as its emotional sequelae. The most common

144 nutritional cause of neural tube defects is maternal deficiency of folic acid, a B vitamin usually found in fruits, vegetables, whole grains, and milk products. (Neural tube defects are also caused by medications and other environmental causes, many of which interfere with folate metabolism, thus they are considered to have multifactorial causes.) Another deficiency, iodine deficiency, produces a spectrum of neuro- developmental disorders ranging from mild emotional disturbance to severe mental retardation. Excesses in both maternal and infant diets may cause disorders as well, with foods or food supplements proving toxic in large amounts. For instance in 1973 K.L. Jones and D.W. Smith of the University of Washington Medical School in Seattle found a pattern of "craniofacial, limb, and cardiovascular defects associated with prenatal onset growth deficiency and developmental delay" in children of alcoholic mothers. This disorder, now called fetal alcohol syndrome, has significant symptom overlap with several other entirely unrelated neurodevelopmental disorders. It has been discovered that iron supplementation in baby formula is linked to lowered I.Q. and other neurodevelopmental delays. Trauma Brain trauma in the developing human is a common cause (over 400,000 injuries per year in the US alone, without clear information as to how many produce developmental sequelae) of neurodevelopmental syndromes. It may be subdivided into two major categories, congenital injury (including injury resulting from otherwise uncomplicated premature birth) and injury occurring in infancy or childhood. Common causes of congenital injury are asphyxia (obstruction of the trachea), hypoxia (lack of oxygen to the brain) and the mechanical trauma of the birth process itself.

3.5.1 ASD or other neurodevelopment disorder

Students in Mainstream Classrooms For children who present at the high-functioning end of the spectrum, the classic "Asperger's kids," inclusion in a mainstream classroom is a good option. Special accommodations for children with ASD or other neurodevelopment disorder may include modifying homework and classroom assignments, providing extra time for assignments, and working with a special education specialist to devise lesson plans. Children with ASD may be taught in classrooms with a mainstream teacher who is also certified in special education.

145 Many students with autism or other neurodevelopment students , however, will not be able to succeed in a mainstream classroom setting. These children may have significant cognitive impairment, an extreme learning disability, or a physical disability in addition to ASD. In some cases the disorder may be so severe that the child has never learned to communicate verbally. For such children a special education classroom or institutional setting may be the only option. Whatever early intervention therapy or teaching method is used to assist a child with ASD or others neurodevelopmental students , clear communication among parents, teachers and therapists is essential. Students on the autism spectrum lack the ability to understand how their lack of social and communication skills affects their relationship with others, and careful examination of such students' progress is necessary to make sure they are not being bullied or taken advantage of in peer interactions. Every opportunity must be made to help a child with ASD have a positive experience on which they can lay a foundation for future developmental growth.

3.6 Specifies for children with Loco-Motor & Multiple Disabilities

3.6.1 Locomotor disability:

Means a person's inability to execute distinctive activities associated with moving, both himself/herself and objects, from place to place, and such inability resulting from affliction of either bones, joints, muscles or nerves. Main Causes Locomotor disability may arise from the following conditions

- Cerebral Palsy
- Polio
- Amputation
- Paralysis
- Congenital Deformities

Categories of Locomotor Disability for Evaluation

Assessment of Permanent Physical Impairment of Upper Limb

The estimation is purely a measurement of functional impairment and is not expression

146 of personal opinion. The estimation and measurement should be made when the clinical condition has reached the stage of maximum improvement from the medical treatment. Normally the time period is to be decided by the medical doctor who is evaluating the case for issuing the PPI Certificate as per standard format of the certificate.

1. The upper limb is divided into two component parts; the arm component and the hand component.
2. Measurement of the loss of function of arm component consists of measuring the loss of motion, muscle strength and co-coordinated activities.
3. Measurement of loss of function of hand component consists of determining the prehension, sensation and strength. For estimation of prehension opposition, lateral pinch cylindrical grasp, spherical grasp and hook grasp have to be assessed as shown in Hand Component of Form A Assessment Proforma for upper extremity.
4. The impairment of the entire extremity depends on the combination of the functional impairments of both components. Arm Component Total value of arm component is 90%

Principles of evaluation of range of motion (ROM) of joints

1. The value of maximum ROM in the arm component is 90%
2. Each of the three joints of the arm is weighed equally (30%)

3.6.2 Multiple Disabilities "

Multiple disabilities" means concomitant impairments (such as mental retardation blindness, mental retardation-orthopedic impairment, etc.), the combination of which causes such severe educational needs that they cannot be accommodated in special education programs solely for one of the impairments.

Multiple disabilities is a term for a person with several disabilities, such as a sensory disability associated with a motor disability. Depending on the definition, a severe intellectual disability may be included in the term "multiple disabilities". Individual usually has more than one significant disability, such as movement difficulties, sensory loss, and/or a behavior or emotional disorder.

147 Characteristics People with severe or multiple disabilities may exhibit a wide range of characteristics, depending on the combination and severity of disabilities, and the person's age. There are, however, some traits they may share, including: Psychological •••• May Feel ostracized •••• Tendency to Withdraw from society •••• Students with multiple disabilities may become fearful, angry, and upset in the face of forced or unexpected changes. •••• May execute self-injurious behavior Behavioral •••• May display an immature behavior inconsistent with chronological age •••• May exhibit an impulsive behavior and low frustration level •••• May have difficulty forming interpersonal relationships •••• May have limited self-care skills and independent community living skills Physical/health •••• A variety of medical problems may accompany severe disabilities. Examples include seizures, sensory loss, hydrocephalus, and scoliosis. •••• May be physically clumsy and awkward •••• May be unsuccessful in games involving motor skills Challenges Families •••• A variety of medical problems may accompany severe disabilities. Examples include seizures, sensory loss, hydrocephalus, and scoliosis. Time is needed to ensure their safety at home in times of condition like seizures. •••• Financially, the medical/transport fees may place burdens on the family. •••• The effort needed to ensure safety of the person will require family members to take turns to look after that person.

148 •••• Individuals have only limited speech or communication •••• Requires a lot of patience with individuals with multiple disabilities Individuals •••• Difficulty in basic physical mobility •••• May experience fine-motor deficits that can cause penmanship problems •••• May have slow clerical speed. •••• May tend to forget skills through disuse •••• May have trouble generalizing skills from one situation to another •••• May lack high level thinking and comprehension skills •••• May have poor problem-solving skills •••• Ability to engage in abstract thinking is limited •••• May be poor test taker due to limiting factors of the disabilities •••• May have difficulty locating the direction of sound •••• May have speech that is characterized by substitution, omissions •••• May have difficulty learning about objects and object relationships •••• May lack maturity in establishing career goals •••• May face problems in socializing with peers Accommodations/strategies •••• A multi-disciplinary team consisting of the student's parents, educational specialists, and medical specialists in the areas in which the individual demonstrates problems should work together to plan and coordinate necessary services. •••• Involvement of the appropriate professionals (E.g. occupational therapists, speech/language therapist etc.) •••• The arrangement of places school and homes must be easily accessible. •••• Have a buddy system that ensures their needs are heard and that they get aid when needed. •••• Give Simple and Specific and Systematic instructions to what you exactly want the person to do.

149 •••• Use visual aids when communicating with the child. •••• Engage the child regularly in oral language activity. 3.7 Engaging Gifted / Talented Children The term "gifted and talented," when used with respect to students, children, or youth, means students, children, or youth who give evidence of high achievement capability in such areas as intellectual, creative, artistic, or leadership capacity, or in specific academic fields, and who need services There are a number of characteristics that can signal to a professional that a young child might be gifted. There are behaviours that can be observed that indicate when a child's thinking or learning is advanced. Examples include: •••• early development of language •••• abstract thinking •••• strong memory •••• a capacity to focus and concentrate on tasks of interest •••• intellectual curiosity •••• a strong motivation to learn. Although development may be rapid in some areas, young gifted children have the same learning to master as all children. How they manage this learning and when these behaviours appear can be different because their cognitive development can be advanced in particular ways. For instance young gifted children may start talking earlier, or may begin at much the same age as other children but then their language development can be more rapid and they quickly become very articulate. Young gifted children can also behave in a more sophisticated way than their peers. This can have different outcomes. For instance it could result in them taking on the role of the leader in play, or it may put them out of step with other children, making social interaction more difficult. In many cases, where professionals and families have recognised a child's advanced development or learning and are responding in an appropriate way, it may not be useful to seek a formal identification of giftedness through assessments such as IQ tests. Formal

150 assessment of giftedness may be more appropriate later on, when the child is older, about to transition to school or is attending school. If the child and their family are receiving appropriate support, formal testing may not be required, particularly in the early years. On the other hand, there are situations when formal testing is appropriate, such as when very high levels of giftedness or a learning difficulty are suspected, or if such testing is required for entry to specific programs. Myth: Gifted and talented children are not found in disadvantaged areas, they are products of upper, middle class or professional families. Fact: Gifted children occur in the same numbers in all socio-economic and cultural groups. The challenge for early childhood professionals is to be aware and know how to identify children who are gifted and talented. Considerations in identification In identifying giftedness and/or talent in young children, professionals should consider a number of factors that can affect the process. •••• Individual assessments and observations are 'snapshots' only, and provide information about what the child can do at this time. To really identify a young gifted and/or talented child requires a collection of evidence over time. •••• For various reasons, young children may not perform 'on demand', and thus not demonstrate their full potential. •••• The development of young gifted and talented children can be very uneven, with peaks and troughs, stops and starts. Multiple assessments and observations over time are necessary to identify advanced development or learning. •••• Where gifted and talented children also have disabilities (dual exceptionality), the disability can hide or mask the giftedness or talent. Educators should be aware that gifted and talented children can show learning that may not fit within conventional ideas about achievement.

151 •••• Cultural and other biases can interfere with a professional's ability to identify giftedness and talent in young children. Families' different cultural backgrounds can lead to a diversity of expressions of giftedness and talent, and may not fit narrow or pre-determined ideas. In some cultures, children may be discouraged from displaying their abilities. •••• Stereotypes about giftedness and talent can lead to failure to identify young gifted children, particularly where the signs of giftedness are subtle. Young gifted children are not 'geniuses'. Not all gifted children are early readers or good at maths. •••• Young gifted children may lack opportunity or support to demonstrate their gifted potential, or develop this potential into talent, and thus not be identified. In the world of education, a gifted and talented child is defined as someone who has exceptional aptitude or talent in one or more areas. While some gifted children are separated from their peers and educated in special gifted and talented classrooms, others are served by getting involved in special enrichment classes and activities, either during or after school. Recognizing a student's giftedness by pulling a student out of the general education classroom can often have negative side effects. Keeping gifted students in the classroom through a full-inclusion program, however, can negate some of those side effects. In a full-inclusion classroom, gifted students stay in the classroom with students of all abilities and the classroom instruction is differentiated, allowing gifting students to receive instruction at their level while still interacting with their peers. Celebrating Areas of Giftedness One of the benefits of teaching gifted children in a full-inclusion classroom is the ability to focus on their specific areas of giftedness. While some students are gifted in multiple areas, many students may only be gifted in one or two key areas. Unfortunately, when students are identified as gifted, they are often treated as if they are gifted in every area and therefore receive high-level instruction in every area, even if they are not ready for it. In a full-inclusion classroom, instruction in every subject is differentiated, allowing gifted students to work at higher-levels in areas where they are gifted and work at other levels in areas where they are not. Positive Interaction with Peers Being gifted is not easy. Often when gifted children are pulled out of the general education

152 classroom they face ridicule from their peers. While teaching gifted children in full- inclusion classrooms does not guarantee they will never be called a "nerd" or made fun of for their giftedness, it does not make their giftedness as obvious to their peers. They have the opportunity to socialize with other students their age and learn to work and interact with students of all different ability levels. In the full-inclusion classroom, every child has his/her own strengths and weaknesses. Enhancing the Curriculum When done effectively, full-inclusion programs have the potential to enhance the curriculum for all students, not just gifted students. Special classes and pull-out programs for gifted students typically follow a set curriculum and just work at a higher level than general education classrooms, but they do not always meet the needs of gifted students. Full-inclusion classrooms operate with differentiated instruction, allowing teachers to focus on adapting the curriculum to meet the needs of individual gifted children and all students in the classroom, thereby enhancing the curriculum and improving the instruction all students receive. Full Inclusion Done Right For teachers, a full-inclusion classroom full of students with learning disabilities, gifted students and those who are just average can be overwhelming. In order for full-inclusion classes to become overwhelming for gifted students, teachers must be committed to teaching gifted children and all children at their levels through differentiated instruction. 3.8 Let us Sum Up

Adaptation: all students should have equitable access to learning, opportunities for achievement and the pursuit of excellence in all aspects of their educational programs. Adaptations are teaching and assessment strategies especially designed to accommodate a student's needs so he or she can achieve the learning outcomes of the subject or course and to demonstrate mastery of concepts. Essentially, adaptations are "best practice" in teaching. A student working on learning outcomes of any grade or course level may be supported through use of adaptations. Accommodations can help kids learn the same material and meet the same expectations as their classmates. If a student has reading issues, for example, she might listen to an audio recording of a text. There are different

types of classroom accommodations, including presentation (like listening to an audio recording of a text) and setting (like

153 where a student sits). Modification: Kids who are far behind their peers may need changes, or modifications,

to the curriculum. For example, a student could be assigned shorter or easier reading assignments. Kids who receive modifications are not expected to learn the same material as their classmates.

In this three parts are very much important in inclusive education . 3.9 "Check your Progress" Q. Discuss about Adaptation , Accommodations and Modifications

.....
.....

..... 1. What is Sensory Disabilities?

Inclusive Academic Instructions Structure 4.1 Introduction 4.2 Objectives 4.3 Universal Design for Learning : Multiple Means of Access, Expression, Engagement & Assessment 4.3.1 Meaning and Definition. 4.3.2 Universal Design in Education. 4.3.3 Features of Universal Design for Learning. 4.3.4 Principles of Universal Design for Learning. 4.4 Co-Teaching Methods : One Teach One Assistant, Station-Teaching, Parallel Teaching, Alternate Teaching & Team Teaching. 4.4.1 Meaning of Co-Teaching. 4.4.2 Benefits of Co-Teaching. 4.4.3 Co-Teaching Methods. 4.4.3.1 One Teach One Assist 4.4.3.2 Station Teaching 4.4.3.3 Parallel Teaching 4.4.3.4 Alternative Teaching 4.4.3.5 Team Teaching 4.5 Differentiated Instructions : Content, Process & Product 4.5.1 Meaning of Differentiated Instruction. 4.5.2 Four Ways to Differentiate Instruction 4.6 Peer Mediated Instruction : Class Wide Peer Tutoring, Peer Assisted learning Strategies. 157 4.6.1 Meaning and Definition of Peer Mediated Instruction. 4.6.2 Advantages of Peer Mediated Instruction. 4.6.3 Types of Peer Mediated Instruction. 4.6.3 1 Class Wide Peer Tutoring 4.6.3 1 Peer Assisted Learning Strategies. 4.7 ICT for Instructions 4.7.1

Meaning of ICT and its application in Education. 4.7.2 ICT in Educating Children with Special Needs. 4.7.3 Why Students Prefer ICT activities over Conventional Learning? 4.7.4 ICT and Inclusive Education. 4.8 Let us Sum Up 4.9 “Check your Progress” 4.10 References 4.1 Introduction According to

Loreman and Deepeler, (2001), Inclusion means full inclusion of children with diverse abilities in all aspects of schooling that other children are able to access and enjoy. It involves regular schools and classrooms genuinely adapting and changing to meet the needs of all children, as well as celebrating and valuing differences.

This definition of inclusion does not imply that children with diverse abilities will not receive specialized assistance or teaching outside of the classroom when required, but rather that this is just one of many options that are available to, and in fact required of, all children. The history of education for persons with disabilities is a progression from segregation to integration and now to inclusion. Inclusion refers to the opportunity for persons with a disability to participate fully in all of the educational employment, consumer, recreational, community and domestic activities that typify every society (ILSMH 1994)

158

Inclusive education is concerned with removing all barriers to learning, and with the participation of all learners vulnerable to exclusion and marginalization. It

is a strategic approach designed to facilitate learning success for all children.

It addresses

the common goals of decreasing and overcoming all exclusion from the human right to education, at least at the elementary level and enhancing access, participation and learning success in quality basic education for all 2000

Bulletin, UNESCO NO.32, 1998. An ideal inclusive education concept aims at facilitating total integration of the child in the community. The upcoming inclusive education programs in India are avoiding separation of children with disabilities from their families for the purpose of education. In India many schools are implementing the inclusive education, which also aims towards universalization of primary education of both disabled and non-disabled students. Inclusion requires a climate of acceptance. As stated earlier, the ideal inclusive education in India would be possible only when all general education teachers are capable of serving students with special needs. In addressing the challenges of educating these children, the schools become effective schools and the teachers become effective teachers. Attitude is the basic and pervasive aspects for determining the effectiveness of inclusive education. All the research evidence point towards a considerable potential for a greater amount of cooperative work between teachers and students. 4.2

Objectives After going through this unit you will be able to • define universal design for learning and its implication in inclusive set up. • explain the different co-teaching methods along with its advantages and disadvantages. • discuss about differentiated instruction. • state about peer mediated instructions and its types. • explain the importance of ICT for instruction.

159 4.3

Universal design for learning : Multiple Means of Access, Expression, Engagement & Assessment 4.3.1

Meaning and Definition of Universal Design for learning Universal Design for Learning is a much-touted approach to providing appropriate and accessible education to all students, including those with disabilities, in the context of the demands of the 21st Century educational environment. UDL provides a blueprint (framework) for creating flexible goals, methods, materials, and assessments that accommodate learner differences (Cast, 2002). Universal design for learning is an approach to ensure that educational programs serve all students. UDL definition “the proactive design of curricula (including learning goals, instructional methods and materials, and assessments) that are accessible and usable by all students with little or no need for additional accommodations and are compatible with available assistive technology” in Forum, June 2008 4.3.2 Universal Design in Education The goal of education in the 21st century is not simply the mastery of content knowledge or use of new technologies. It is the mastery of the learning process. Education should help turn novice learners into expert learners—individuals who want to learn, who know how to learn strategically, and who, in their own highly individual and flexible ways, are well prepared for a lifetime of learning. Universal Design for Learning (UDL) helps educators meet this goal by providing a framework for understanding how to create curricula that meets the needs of all learners from the start. 4.3.3 Features of Universal Design for Learning • UDL assumes a continuum of learning differences in the classroom. • UDL relies on curriculum being presented in a flexible, engaging and challenging manner.

160 • UDL maintains high expectations for all students. • UDL design for those in the margins, works better for everyone • UDL is inclusive by design. Inclusive Education “The new challenge of inclusion is to create schools in which our day-to-day efforts no longer assume that a particular text, activity, or teaching mode will “work” to support any particular students’ learning” Ferguson, 1995 Universal Design for Learning • Is what? A scientifically valid framework that • Does what? Provides multiple means of access, assessment, and engagement and removes barriers in instruction • For what? To achieve academic and behavioral success for all 4.3.4 Principle of Universal Design for Learning Universal Design for Learning calls for • Multiple means of access or representation, to give learners various ways of acquiring information and knowledge. • Multiple means of action and expression, to provide learners alternatives for demonstrating what they know, • Multiple means of engagement and assessment, to tap into learners’ interests, offer appropriate challenges, and increase motivation.

161 Principle I: Provide Multiple Means of Representation (the “what” of learning) Learners differ in the ways that they perceive and comprehend information that is presented to them. For example, those with sensory disabilities (e.g., blindness or deafness); learning disabilities (e.g., dyslexia); language or cultural differences, and so forth may all require different ways of approaching content. Others may simply grasp information quicker or more efficiently through visual or auditory means rather than printed text. Learning, and transfer of learning, occurs when multiple representations are used, because it allows students to make connections within, as well as between, concepts. In short, there is not one means of representation that will be optimal for all learners; providing options for representation is essential. Principle II: Provide Multiple Means of Action and Expression (the “how” of learning) Learners differ in the ways that they can navigate a learning environment and express what they know. For example, individuals with significant movement impairments (e.g., cerebral palsy), those who struggle with strategic and organizational abilities (executive function disorders), those who have language barriers, and so forth approach learning tasks very differently. Some may be able to express themselves well in written text but not speech, and vice versa. It should also be recognized that action and expression require a great deal of strategy, practice, and organization, and this is another area in which learners can differ. In reality, there is not one means of action and expression that will be optimal for all learners; providing options for action and expression is essential. Principle III: Provide Multiple Means of Engagement / Assessment (the “why” of learning) Affect represents a crucial element to learning, and learners differ markedly in the ways in which they can be engaged or motivated to learn. There are a variety of sources that can influence individual variation in affect including neurology, culture, personal relevance, subjectivity, and background knowledge, along with a variety of other factors. Some learners are highly engaged by spontaneity and novelty while other are disengaged, even frightened, by those aspects, preferring strict routine. Some learners might like to work alone, while others prefer to work with their peers. In reality, there is not one means of engagement that will be optimal for all learners in all contexts; providing multiple options for engagement is essential. In UDL we are seeking to create expert learners, individuals who- whatever the particular strengths and weaknesses, know themselves, and know how to learn. 4.4

Co-Teaching Methods : One Teach One Assist, Station- Teaching, Parallel Teaching, Alternate Teaching & Team Teaching 4.4.1

Meaning of Co-Teaching When a general education teacher and a special education teacher work together to plan and deliver instruction to a diverse population in a general education setting. It involves the distribution of responsibility among people for planning, instruction, and evaluation for a classroom of students. Another way of saying this is that co-teaching is a fun way for students to learn from two or more people who may have different ways of thinking or teaching. Some people say that co-teaching is a creative way to connect with and support others to help all children learn. Others say that co-teaching is a way to make schools more effective. A common example of co-teaching today is played out in many inclusive classrooms where a General Education teacher and a Special Education teacher share responsibility for classroom management and instruction. Co-teaching may be defined as two or more people who agree to

1. Coordinate their work to achieve at least one common, publicly agreed-on goal.
2. Share a belief system that each of the co-teaching team members has unique and needed expertise.
3. Demonstrate parity by alternatively engaging in the dual roles of teacher and learner, expert and novice, giver and recipient of knowledge or skills.
4. Use a distributed functions theory of leadership in which the task and relationship functions of the traditional lone teacher are distributed among all co-teaching group members.
5. Use a cooperative process that includes face-to-face interaction, positive interdependence, performance, as well as monitoring and processing of interpersonal skills, and individual accountability.

163 4.4.2 Benefits of Co-Teaching The benefits of co-teaching for Teachers are:

- It is easier to monitor students' behavior
- It builds relationships and opportunities for professional and/or personal growth
- It provides more support during instructional activities
- It gives support to provide students' accommodations
- It helps to receive feedback from each other
- It provides more flexible grouping
- It covers content more effectively to support mastery learning

The benefits of Co-Teaching for Students:

- It gives access to the general education curriculum
- It provides more instructional support
- It enhances learning from peers
- It provides more opportunities for social interactions
- It increase respect and understanding for all students

4.4.3. Co-Teaching Methods Marilyn Friend and Lynne Cook (1996a) have presented different methods of co-teaching that provide ways for two teachers to work together in a classroom. They include:

4.4.3.1

One teach One Assist 4.4.3.2 Station Teaching 4.4.3.3 Parallel Teaching 4.4.3.4 Alternative Teaching 4.4.3.5 Team

teaching 4.4.3.1
One teach One Assist With this model one teacher has the primary responsibility for planning and teaching, while the other teacher moves around the classroom helping individuals and observing particular behaviors. For example, one teacher could present the lesson while the other

164 walks around or one teacher presents the lesson while the other distributes materials. Some advantages of this approach are:

- Students receive individual help in a timely manner
- It'

s
easier to keep students on task because of the proximity of the teacher. • It saves time when distributing materials. Some disadvantages of this approach are:

- Through the eyes of the students, one teacher has more control than the other.
- Students often relate to one person as the teacher and the other as a teacher's aide.
- Having a teacher walk around during the lesson may be distracting to some students.

4.4.3.2

Station Teaching Both teachers divide the instructional content, and each takes responsibility for planning and teaching part of it. In station teaching, the classroom is divided into various teaching centers. Both the teachers are at particular stations; the other stations are run independently by the students or by a teacher's aide. For example, three or more science stations, each containing a different experiment, could be organized with both the teachers

working with the two stations that need the most supervision. It is also possible to use an aide or parent volunteer or trainee teacher

to supervise stations. Some advantages of this approach are:

- Each teacher has a clear teaching responsibility.
- Students have the benefit of working in small groups.
- Teachers can cover more material in a shorter period of time.

Some disadvantages of this approach are:
