- To work effectively, this approach requires a lot of preplanning.
- All materials must be prepared and organized in advance.
- The noise level will be at a maximum.

4.4.3.3

Parallel Teaching In parallel teaching, both the teachers plan jointly but split the classroom in half

165 to teach the same information at the same time. For example, both teachers could be explaining the same math problem-solving lesson in two different parts of the room. If the room had two computers, each teacher could use a computer to model the use of the Internet or a new piece of software to half of the class. Each half of the class could be involved in a literature study group during a text study. Some advantages of this approach are:

- Preplanning provides better teaching.
- It allows teachers to work with smaller groups.
- Each teacher has the comfort level of working separately to teach the same lesson.

Some disadvantages of this approach are:

- Both teachers need to be competent in the content so the students will learn equally.
- The pace of the lesson must be the same so they finish at the same time.
- There must be enough flexible space in the classroom to accommodate two groups.

4.4.3.4 Alternative Teaching In alternative teaching, one teacher manages most of the class while the other teacher works with a small group inside or outside of the classroom. The small group does not have to integrate with the current lesson. For example, a teacher could take an individual student out to catch him/her up on a missed assignment. A teacher could work with an individual or a small group for assessment purposes or to teach social skills. A small group of students could work together for remedial or extended challenge work. Some advantages of this approach are:

- Working with small groups or with individuals helps meet the personal needs of students.
- Both teachers can remain in the classroom so one teacher can informally observe the other modeling good teaching.

Some disadvantages of this approach are:

- Groups must vary with purpose and composition or the students in the group will quickly become labeled (e.g., the “smart” group).

166 • The students might view the teacher working with the larger group as the teacher in control. • Noise level must be controlled if both teachers are working in the classroom.

4.4.3.5

Team Teaching Both teachers are responsible for planning, and they share the instruction of all students. The lessons are taught by both teachers who actively engage in conversation, not lecture, to encourage discussion by students. Both teachers are actively involved in the management of the lesson and discipline. This approach can be very effective with the classroom teacher and a student teacher or two student teachers working together. Some advantages of this approach are:

- Each teacher has an active role.
- Students view both teachers as equals.
- Both teachers are actively involved in classroom organization and management.

Some disadvantages of this approach are:

- Preplanning takes a considerable amount of time.
- Teachers’ roles need to be clearly defined for shared responsibility.

4.5

Differentiated Instruction : Content, Process & Product

4.5.1 Meaning of Differentiated Instruction Differentiated instruction is an instructional theory that allows teachers to face this challenge by taking diverse student factors into account when planning and delivering instruction. Based on this theory, teachers can structure learning environments that address the variety of learning styles, interests, and abilities found within a classroom. Differentiating instruction means creating multiple paths so that students of different abilities, interest or learning needs experience equally appropriate ways to absorb, use, develop and present concepts as a part of the daily learning process. It allows students to take greater responsibility and ownership for their own learning, and provides opportunities for peer teaching and cooperative learning.

167 4.5.2 Four Ways to Differentiate Instruction: Differentiation can occur in the content, process, product or environment in the classroom. 1. Differentiating the Content/Topic Content can be described as the knowledge, skills and attitudes we want children to learn. Differentiating content requires that students are pre-tested so the teacher can identify the students who do not require direct instruction. Students demonstrating understanding of the concept can skip the instruction step and proceed to apply the concepts to the task of solving a problem. This strategy is often referred to as compacting the curriculum. Another way to differentiate content is simply to permit the apt student to accelerate their rate of progress. They can work ahead independently on some projects, i.e. they cover the content faster than their peers. 2. Differentiating the Process/Activities Differentiating the processes means varying learning activities or strategies to provide appropriate methods for students to explore the concepts. It is important to give students alternative paths to manipulate the ideas embedded within the concept. For example students may use graphic organizers, maps, diagrams or charts to display their comprehension of concepts covered. Varying the complexity of the graphic organizer can very effectively facilitate differing levels of cognitive processing for students of differing ability. 3. Differentiating the Product Differentiating the product means varying the complexity of the product that students create to demonstrate mastery of the concepts. Students working below grade level may have reduced performance expectations, while students above grade level may be asked to produce work that requires more complex or more advanced thinking. There are many sources of alternative product ideas available to teachers. However sometimes it is motivating for students to be offered choice of product. 4. Differentiating By Manipulating the Environment or Through Accommodating Individual Learning Styles There has been a great deal of work on learning styles over the last 2 decades. Dunn and Dunn focused on manipulating the school environment at about the same time

168 as Joseph Renzulli recommended varying teaching strategies. Howard Gardner identified individual talents or aptitudes in his Multiple Intelligences theories. It has been concluded that differentiation may be done by manipulating the environment or by accommodating individual learning styles in the learning process. 4.6 Peer Mediated Instruction : Class Wide Peer Tutoring, Peer Assisted Learning Strategies 4.6.1

Meaning and Definition of Peer Mediated Instruction Teachers in general and special education classrooms are continually faced with instructional challenges as the diversity of students in classrooms widens. Researchers and practitioners are interested in implementing best practices that improve educational outcomes for all learners. One solution to overcoming these challenges is the implementation of Peer-Mediated Instruction and Intervention (PMII). Peer-mediated instruction is a widely applied and researched educational intervention in both general and special education settings. Peer-Mediated Instruction and Intervention is an alternative classroom arrangement in which students take an instructional role with classmates or other students. Many approaches have been developed in which students work in pairs (dyads) or small cooperative learning groups. To be most effective, students must be taught roles in the instructional episode; to be systematic, elicit responses, and provide feedback. Research supports the use of these approaches as alternative practice activities, however, does not condone the use of peers for providing instruction in "new" instructional content. Myredden, V, Goodlad and Hirst, 1989 described peer tutoring or peer mediated instruction as "The system of instruction in which learners help each other and learn by teaching." Probably the most succinct definition of peer tutoring comes from Damon and Phelps "Peer tutoring is an approach in which one child instructs another child on material on which the first is an expert and the second is novice. 4.6.2

Advantages of Peer Mediated Instruction Peer mediated instruction has been a favoured practice in inclusive setting due to its potential advantages. Peer mediated instruction benefits children with special needs and all other children. It has the potential to deliver many of the benefits normally associated with expert tutoring by teachers. If teachers organize the contents of the

169 program peer tutors can provide appropriate activities tailored to meet the individual needs of children with special needs. They can ensure a high level of tutee participation in the learning process, and individual guidance and personal care can be provided. Peer mediated instruction normally promotes healthy social relationships between students with special needs and their peer tutors. It also encourages positive interaction between regular class students and those with special needs, and allows individuals to work together in cooperative work environments. Peer mediated instruction encourages close personal relationships, personal interdependence and shared responsibility for learning outcomes. Peer mediated instruction reduces deficiencies in children with special needs and such children are active and participate in many regular class activities.

4.6.3 Types of Peer Mediated Instruction Ryan, Reid, and Epstein (2004), has summarized some peer tutoring formats, which are commonly in practice. These formats are as follows:

4.6.3.1 Class wide Peer Tutoring (CWPT): In this format of peer tutoring entire class participates in tutoring dyads. During each tutoring session students can participate as both Peer Tutor and tutees, or they can participate as only the tutor or the tutee. Class wide Peer Tutoring is a variation of peer-mediated instruction that has been used in elementary, middle school, and high school classrooms. In CWPT students form pairs and take turns in the roles of tutor and student. The CWPT program was originally developed and used with special education students in their mainstream classrooms. It was very evident early on that the procedures were not only effective for the targeted students, but for the entire classroom of students regardless of their ability levels. Thus, CWPT has been researched and proven effective with the following student populations:

- Students with special needs
- Educationally labeled students
- Students at risk of school failure
- Students who are culturally and linguistically diverse
- Students with ADD and ADHD

170

4.6.3.2 Peer Assisted Learning Strategies It is a modified version of CWPT developed by Fuchs et al (1997) where teachers identify the children who require help in specific skills and the most appropriate children to help them learn those skills. Pairs are changed regularly, and over time as student work on a variety of skills all students have the opportunity to be “coaches” and “players”. Pupils are divided into higher ability and lower ability pairings. It’s a version of classwide peer tutoring where teachers evaluate and identify students who need help with specific skills and determine the most appropriate students in the class to assist them with those skills. The students are paired as “coaches” and “players” but rotate roles as activities change and students are required to work on a variety of skills. PALS is designed to complement, not replace, the existing math or reading curriculum by providing opportunities for students to practice what the teacher has taught. Research supports that the use of pairs in the classroom provides more focus on individual student needs rather than a teacher-directed activity that may address the needs of a few students but not be able to meet the needs of all student.

Peer-Assisted Learning Strategies (PALS) is a supplemental peer-tutoring program in which student pairs perform a structured set of activities in reading or math (PALS Reading and PALS Math, respectively) The designation of tutoring pairs and skill assignment is based on teacher judgment of student needs and abilities, and teachers reassign tutoring pairs regularly. Although PALS is for students with diverse academic needs, this intervention report focuses on the use of PALS to improve the reading and mathematics skills of students with learning disabilities.

Some benefits attributed to the PALS program include:

- Actively involves all students in tasks they can perform successfully.
- Increases student opportunity to read and practice basic math skills.
- Motivates students to do better in reading and math.
- Expands instructional resources in the classroom.
- Provides for positive and productive peer interaction.

171

- Creates opportunity for lower functioning students to assume an integral role in a valued activity.
- Allows students with disabilities to spend more time in least restrictive environment and increases their access to the general education curriculum.
- Helps teachers accommodate academic diversity.
- Accelerates student achievement in reading and math.
- Is affordable and easily implemented.
- Is found to be an enjoyable activity by teachers and students.

4.7

ICT for Instructions 4.7.1 Meaning of ICT and its Application in Education. Educational systems around the world are under increasing pressure to use the new information and communication technologies (ICTs) to teach students the knowledge and skills they need in the 21st century. The 1998 UNESCO World Education Report, *Teachers and Teaching in a Changing World*, describes the radical implications the new information and communication technologies have for conventional teaching and learning. It predicts the transformation of the teaching-learning process and the way teachers and learners gain access to knowledge and information. The use of computer based technology has become the need of the day due to different reasons. The technological advancement has brought the use of sophisticated hardware and software like radio, television, tape recorder, films, and transparency in the field of education. The professionals/teachers of today employ numerous information communication technology (ICT) supported methods and materials in the classroom to enhance the teaching-learning process in a more effective way. As we are entering into the era of inclusion and as it has become the fundamental right of each child to be educated, children with disabilities are being enrolled in the regular schools through the centrally sponsored scheme of the Government of India called *Sarva Shiksha Abhiyan*. Since, the professionals/teachers in the regular schools lag in the skills to teach the children with special needs, the knowledge about the ICT supported teaching methods for the disabled children would be of great boon to them to handle the entire class without any discrimination.

172

Inclusive education is a strategy based on human rights and democratic principles that confronts all forms of discrimination.

Inclusive education is concerned with removing all barriers to learning, and with the participation of all learners vulnerable to exclusion and marginalization. It

is a strategic approach designed to facilitate learning success for all children.

Hence, it becomes the duty of a regular teacher to handle children with special needs along with normal children in his/her classroom. So the ICT that he uses should also meet the diverse needs of children with disabilities such as children with learning disabilities, mild intellectual disability, autism, hearing impairment and visual impairment. 4.7.2 ICT in educating children with special needs Educating all students by today's standards and for tomorrow's living most certainly includes the use of technology. Its relationship to providing essential supports for students with disabilities in areas of self-care, education, employment, recreation/leisure, and community living are readily accepted. Additionally, access to technology can provide meaningful learning experiences to develop problem solving and higher order thinking skills and to function in the world beyond the classroom. The appropriate and successful integration of technology into learning environments has the potential to benefit all students. As states and schools work to implement the requirements of educational reform required by the *No Child Left Behind Act, 2001*, they must ensure that all students are included, in particular students with disabilities. Specifically, technology assists students with disabilities to: (a) Maximize independence in academic and employment tasks; (b) Participate in classroom discussion; (c) Gain access to peers, mentors, and role models; (d) Self-advocate; (e) Gain access to the full range of educational options; (f) Participate in experiences not otherwise possible; (g) Succeed in work-based learning experiences; (h) Secure high levels of independent learning;

173 (i) Prepare for transitions to college and careers; (j) Work side-by-side with peers; (k) Master academic tasks that they cannot accomplish otherwise; (l) Enter high-tech career fields; and (m) Participate in community and recreational activities "Inclusive education according to UNESCO means that the school can provide a good education to all pupils irrespective of their varying abilities. All children will be treated with respect and ensured equal opportunities to learn together. Inclusive education is an on-going process. Teachers must work actively and deliberately to reach its goals".

4.7.3 Why Students Prefer ICT Activities Over Conventional Learning? The following is the list of qualities derived by students favoring ICT activities over conventional learning. These student preferences also contribute to our understanding of why ICT enhances achievement, as because ICT; • is infinitely patient • never gets tired • never gets frustrated or angry • allows students to work privately • never forgets to correct or praise • is fun and entertaining • helps individualized learning mode • is self-paced • does not embarrass students who make mistakes • makes it possible to experiment with different options • gives immediate feedback • is more objective than teachers • gives more meaningful contact with students than teachers • is impartial to race or ethnicity

174 • is great motivator • gives a sense of control over learning • is excellent for drill and practice • calls for using sight, hearing, and touch • teaches in small increments • help students improve their spelling • builds proficiency in computer use, which will be valuable later in life • eliminates the drudgery of practices certain learning activities by hand (e.g., drawing graphs) • works rapidly-closer to the rate of human thought. 4.7.4 ICT and Inclusive Education Inclusion should, then, be regarded as a long-lasting process which requires time, effort, competence and strong conviction by all those involved in students' education, first and foremost, by teachers. The key role of teachers in giving birth to and maintaining a truly inclusive classroom is unquestionable (Anderson et al, 2007), but such an important mission also requires that suitable, effective and barrier-free educational means should be employed. From this perspective, ICT resources are promising; there are grounds for maintaining that they help most students overcome barriers to learning, thus increasing their school achievement, together with their autonomy, willingness and self esteem. Indeed, educational research provides strong evidence that: "ICT is both a medium and a powerful tool in supporting inclusive practice. It provides wide-ranging support for communication, assisting many learners to engage with learning, including those who are hard to reach, and helps to break down some of the barriers that lead to under- achievement and educational exclusion" (Becta, 2007). 4.8 Let us Sum Up • The Indian Education Commission (1964-66):

The Indian Education Commission was the first statutory body to suggest that

the

education of handicapped children has to be organized not merely on humanitarian grounds,

but also

on grounds of

175 utility.

The Commission

observed that although the

Indian Constitution had issued specific directives about

compulsory education for all, including children with disabilities, very little

had been done in this regard.

The Commission also emphasized

that the education of children with disabilities should be "an inseparable part of the general education system." •

The

main elements of inclusive education are: ¶ A human rights issue ("Education for all" means all children, not almost all). ¶

Education for all in school for all disabled and non- disabled children learning to live together. ¶ Togetherness "enabling

all to participate together in society from the beginning: contributing to social harmony and stimulating the building of

relationship among individuals groups and nations. ¶ Breaking barriers "familiarity and tolerance for prejudices and

rejection. • The goal of education in the 21st century is not simply the mastery of content knowledge or use of new

technologies. It is the mastery of the learning process. Education should help turn novice learners into expert learners—

individuals who want to learn, who know how to learn strategically, and who, in their own highly individual and flexible

ways, are well prepared for a lifetime of learning. • Co-Teaching Strategies Strategy Definition/Example One Teach, One

Assist One teacher has primary instructional responsibility while the other assists students with their work, monitors

behaviors, or corrects assignments. Station Teaching The co-teaching pair divides the instructional content into parts –

Each teacher instructs one of the groups, groups then rotate or spend a designated amount of time at each station –

often an independent station will be used along with the teacher led stations.

176 Parallel Teaching Each teacher instructs half the students. The two teachers are addressing the same instructional material and presenting the material using the same teaching strategy. The greatest benefit to this approach is the reduction of student to teacher ratio. Alternative (Differentiated) Alternative teaching strategies provide two different approaches to teaching the same information. The learning outcome is the same for all students however the avenue for getting there is different. Team Teaching Well planned, team taught lessons, exhibit an invisible flow of instruction with no prescribed division of authority. Using a team teaching strategy, both teachers are actively involved in the lesson. From a students' perspective, there is no clearly defined leader – as both teachers share the instruction, are free to interject information, and available to assist students and answer questions. • Differentiating instruction means creating multiple paths so that students of different abilities, interest or learning needs experience equally appropriate ways to absorb, use, develop and present concepts as a part of the daily learning process. It allows students to take greater responsibility and ownership for their own learning, and provides opportunities for peer teaching and cooperative learning. • Peer tutoring programs represent a viable means of improving the curricular and social interaction skills of students with autism (Odom et al., 1999). Research reveals that the teaching of specific tutoring strategies facilitates interaction between children with autism and their socially competent peers. Studies indicate that effects of social initiation intervention are immediately evident and substantial (Odom, McConnell, McEvoy, Peterson, Ostrosky, Chandler, et al., 1999).

177 • Peer Mediated Instruction and Intervention o Students taught roles o Students instruct o Teachers monitor/facilitate o Academic and social goals • Class-Wide Peer Tutoring o Teams of dyads within the classroom environment o Highly structured teaching procedures o Daily point earning/public posting of points o Direct practice of academic skills • Peer-Assisted Learning Strategies (PALS) is a class wide peer tutoring program. Teachers carefully partner a student with a classmate. The pair works on various activities that address the academic needs of both students. Pairs change over time. PALS can be used across content areas. The strategy provides direct opportunities for a teacher to circulate in the class, observe students, and offer individual remediation. PALS therefore allows for differentiated instruction via having partners work simultaneously on various teacher-directed activities. • The meaning of technology-based interventions in education is subject to multiple interpretations. Over the last forty years, technology-based intervention introduced into the classroom have included television, the use of film projectors and educational films, videotapes and videodisks, and the use of stand-alone and networked computers and data terminals. For all practical purposes in today's classroom, the term "technology-based interventions" mean the utilization of computers to both deliver instruction and to enable student learning (Ringstaff & Kelley, 2002). • In the 2003 Daniel K. Davis, Michael Wehmeyer and Steven E. Stock in their study on the utilization of Computer Technology to facilitate Money Management by Individuals with Mental Retardation yielded the result which indicated that the use of a money management software programme can be an effective tool to enable people with mental retardation to perform financial management tasks more independently.

178 4.9 "Check Your Progress" 1. What is Universal Design for Learning? Discuss its importance in relevance to inclusive education. 2. Briefly discuss about peer tutoring and its types with examples. 3. How does technology influence education in an inclusive setup? 4. Enumerate the different co teaching methods with examples. 4.10 References and Further Readings 1) Burk, M. (1998). 180 5.1 Introduction

Although the concept of inclusive education has been promoted internationally for more than a decade, multiple barriers remain to the full participation of children with disabilities in education. Lack of information, combined with discriminatory attitudes towards persons with disabilities at all levels of society, contributes to the continued neglect of their right to education. This partly explains the minimal rate of progress that has been made towards the enrolment and participation in the education process of children with disabilities. The factors are complex and extend beyond the boundaries of the school and classroom.

It is conservatively estimated that less than 10 per cent of children with disabilities in developing countries in the Asia-Pacific region are in school.

The

title of the

flagship, the “Right to Education for Persons with Disabilities Towards Inclusion”

reflects the current situation in which there is a movement towards inclusive education throughout the world. All children have the right to education. The equal right for children with disabilities has been clearly mandated but the right is not being comprehensively upheld. The growing trend towards more flexible, relevant and responsive education has been promoted 1990. The Salamanca Statement provided a vision of an inclusive system of education which would play a role beyond the school and would contribute to the building of inclusive and non-discriminatory societies. Inclusive schools would benefit all children as they developed ways of teaching that respond to individual differences and diverse abilities. In addition, they would be cost-effective, removing the need for separate schools systems for children with disabilities. In spite of the clear advantages of inclusive education, the data on the number of children with disabilities not in school suggests that the process is unacceptably slow and many of the most significant barriers that remain are not able to be solved at the level of the individual teacher or the individual school.

Inclusive education aims to provide quality education for all learners. In order to achieve an inclusive school, support is needed from the entire community: from decision-makers to end-users (learners and their families). Collaboration is required at all levels and all stakeholders need a vision of long-term outcomes – the type of young people the school and the community will ‘produce’. Changes in terminology, attitudes and values, reflecting the added value of diversity and equal participation, are needed.

181 In order for teachers and other education professionals to be prepared for inclusion, changes are needed in all training aspects – training programmes, daily practices, recruitment, finances, etc. The next generation of teachers and education professionals must be prepared to be teachers/trainers for all learners; they need to be trained not just in terms of competences but also of ethical values. 5.2

Objectives After going through this unit you will be able to

l discuss about the role of

different stake holders of inclusive education. l explain the importance of advocacy and leadership. l discuss about family and community support in inclusive education. l state about the meaning and importance of resource mobilization. 5.3

Stakeholders of Inclusive Education and their Responsibilities 5.3.1 Who are

the stakeholders of

Inclusive Education? Inclusive education

is

a process of addressing and responding to the diverse needs of all

learners

by

reducing barriers to, and within, the learning environment.

The overall goal of inclusive education, is thus the realization of a school (or any organized educational provision) where all learners are participating and treated equally, and which also proactively seeks and reaches out to any learner who is left behind.' – Salamanca World Conference on Special Needs Education (1994)

To make inclusive education a reality, a number of pieces in the system have to fall in place. It is true that the Government of India has made a significant fund allocation to achieve 'Education for all' through SSA. But to make it happen we need to have the stakeholders suitably prepared and involved. Some of the stakeholders include the regular teachers, special/resource teachers, school administrators, parents of children with special needs and parents of their peers who may not have special needs, children themselves with special needs, and those without special needs. In short, all sections of society who have a stake – directly and indirectly – in children's education.

182 The success of inclusion lies in the coordinated and collaborative efforts of all of the stakeholders. 5.3.2

Roles and responsibilities of Stake holders (a) Special Educators

With inclusive education initiated as a major step, a changing role of special educators is seen to be emerging. The educational programmes of special educators approved by the Rehabilitation Council of India (RCI) prepare the special educators to become special teachers to cater to the needs of children with special needs in special schools. SSA has opened doors for them to be resource teachers in the inclusive education settings, where they are expected to visit regular schools periodically and function as partners to the regular educators in meeting the needs of children who have special needs.

A short-term in-service programme may prepare them with updated techniques, which can be offered by the Continuous Rehabilitation Education (CRE) programmes of RCI. (

b) Resource Teachers and Regular Teachers

In inclusive schools, though the responsibility of education of all children lies with the regular teacher, the resource teachers are expected to facilitate inclusive education by supporting the children and the teachers in regular schools. It is essential that both the resource teachers

and regular teachers are prepared suitably to have a smooth, seamless inclusion. (c) Children with Special Needs and their Peers

Children with disabilities and their peer group without special needs are to be prepared for inclusion so that the experience is not overwhelming for either of them. Children with special needs who are used to a protective environment with small class strength of 8 to 10 children may be shocked when placed in a large class of 40 children.

And

those children who have not seen a child with a disability can react to the situation with varied emotional and behavioural responses ranging from pity and sympathy to bullying and making fun of their peers with special needs. (d)

Parents

of children with and without disabilities

Parents also can have apprehensions if not suitably prepared. Parents of a child with disability may prefer the protective special class to the large regular class where their

183 child may not get attention from the teacher. There have been occasions where the parents of a child without any special needs were afraid that their child might 'behave' in an odd manner by being with children with special needs.

These are but a few examples of the many issues related to inclusion that needs to be addressed, so that inclusion is realized in its true sense. (e) School Administrators

The school administrators are another important component to make inclusion a success. Accessibility to classrooms by providing ramps for wheelchair users, having brightly lit and ventilated classrooms so that children who cannot hear can see the teacher clearly when she talks and the children with low vision will be able to see better, having curtains in class so that a child with attention deficit does not get distracted and look outside while the teacher is teaching. All these are the responsibility of the school administrator, so that accessibility and barrier free environment is ensured. More importantly, the attitude of the administrator will impact the other stakeholders. Therefore, by ensuring that the administrators have a positive attitude towards inclusion, a major milestone towards successful inclusion can be achieved. (f) Government of India

and State Governments

The Government of India has taken a major step towards inclusive education. To make it a success, all the stakeholders need to do their best so that inclusive education will be achieved in its true sense. After all, it is the right of the child to get the best education. Let us make it happen and bring out the maximum potential in every child – the future leaders of our nation!

Governments should work in close cooperation with non-governmental organizations which are providing education to children with disabilities and developing strategies to include them in regular community schools, with a view to learning from these processes and including them in the national education system. Governments should consult with organizations

of persons with disabilities and parents of children with disabilities,

in the development of policies and changes to the school system, to ensure that these children are included in regular community schools and that their needs met.

184 (

g)

School and Community Non-governmental organizations should engage with ministry of education officials to ensure that they are aware of, and participating in, the non-government projects on including children with disabilities in education. Disabled peoples' organizations should advocate to ministry of education officials to fulfill the right to the education of children with disabilities by including them in national education policies and schools. Parents should advocate for the inclusion of their children in local community schools within the national education system. 5.4

Advocacy and Leadership for Inclusion in Education 5.4.1 Advocacy for Inclusion in Education

Advocacy by organizations of parents of children with disabilities, and by organizations of people with disabilities is a very important mechanism for changing the education system to make it more willing and more capable of including children with disabilities in schools and making sure that the schools meet their educational needs. In many countries where special schools have been established, they were started by organizations of parents working in partnership with non-governmental organizations. In other countries they have been instrumental in encouraging governments to include children with disabilities in regular pre-schools, primary schools, secondary schools and universities. The Biwako Millennium Framework has identified the strengthening of

self-help organizations of persons with disabilities and related family and parent associations

as the first priority for the second decade of disabled persons. It states that they

are the "most qualified and best equipped to support, inform and advocate for themselves and other persons with disabilities."

This includes children with disabilities. Advocacy for

Inclusion believes that children who have a disability should have an inclusive education of their choosing in the same way that choices are available to students in the broader community. School communities must be inclusive of all children, and openly recognize the unique contributions that children who have a disability make to community life. It is

essential that an inclusive education be supported to maintain and strengthen the personal relationships and social networks of children who have a disability. Each child's support must be individualized and

185 flexible, while remaining relevant to their particular needs at the time. Advocacy involves participation in the policy-making process, and raising public awareness and support to shift the balance of power and bring about change. It is a long-term, cyclical process that: I has measurable, achievable, realistic and time bound goals I addresses the right audience, using appropriate information, and transmits a clear message I builds coalitions and raises local funds. To realize inclusive education, different actors must be addressed, e.g. Government, district authorities, international organizations, community leaders, school boards, teachers, parents, and children.

5.4.2 Leadership for Inclusion in Education

For inclusive education to succeed, administrators must take action to publicly articulate the new vision, build consensus for the vision, and lead all stakeholders to active involvement. Administrators can provide four types of support identified as important by special educators: personal and emotional (for example, being willing to listen to concerns); informational (for example, providing training and technical assistance); instrumental (for example, creating time for teachers to meet); and appraisal (for example, giving constructive feedback related to implementation of new practices) (Littrell, Billingsley, & Cross, 1994). Visionary leaders recognize that changing any organization, including a school, is a complex act. They know that organizational transformation requires ongoing attention to consensus building for the inclusive vision. It also requires skill development on the part of educators and everyone involved in the change; the provision of extra common planning time and fiscal, human, technological, and organizational resources to motivate experimentation with new practices; and the collaborative development and communication of a well-formulated plan of action for transforming the culture and practice of a school (Ambrose, 1987; Villa & Thousand, in press). Inclusion is increasingly understood as an educational reform that responds to the diversity of all learners, challenging the marginalization, exclusion and underachievement which may result from all forms of 'difference'. Leadership for

186 inclusion is conceptualized here as driving a constant struggle to create shared meanings of inclusion and to build collaborative practice, an effort that needs to be rooted in critical practice.

5.5 Family Support and Involvement for Education

5.5.1 Families – The Cornerstone of the Society

The history of progress and of systems change for individuals with disabilities show us that positive changes have come from the work, tenacity and the vision of families. It has been years of struggle, of strong vision or creative thinking and strong social powers that have created the awareness of disability as a human right issue and children with special needs are valued as fellow citizens in the communities in which we live. It is always fascinating to reflect as to how families kept that vision despite horrific histories and practices in almost all countries over the years. Gandhi said that "we must be the change we want to see". Families having children with disabilities play a dual role, we bring up one child to live in a community and we raise the community to welcome our children. Families have a right to be involved in their child's education and to participate with the school in decisions concerning their child and the school community. Extensive research has shown the benefits of parental involvement in education. These benefits include higher achievement, better attendance, more positive attitudes and behaviours and higher graduation rates. Moreover, schools that work well with families show improved teacher morale, and are seen by the community to be performing better than those that do not.

5.5.2 Rationale for Family Support and Involvement

Many reasons can be given for encouraging family involvement in their children's education and intervention program. When we talk about families we usually mean parents. However it is important to consider the needs of other family members in adapting to child with special needs and providing them equal opportunities which a child without disabilities enjoys. I Parents and immediate family members are the major socializing agents for their child, the primary transmitter of cultural values, beliefs and traditions. I Children with disabilities acquire developmental skills more quickly when

187 family members participate in home teaching. | Involvement in intervention program offers parents access to support from other parents and a better perspective on their own child's strengths and needs. | Consistency of adults' expectations can be maintained young children become anxious when adults do not agree on expectations. | Parents know their child better than teachers or clinicians thus parents are a source of unique information. | Family members can help the child transfer learning from school to home and neighborhood. | Only a few hours a day are spending in school, many more hours are spending at home with family. 5.5.3 Examples of Parent Organizations in India | Parivaar-Bengal, part of Parivaar (National Confederation of Parents Organisations) has empowered parents in the districts of West Bengal | Mentaid – Self advocacy for young adults with intellectual and developmental disability 5.6 Community involvement for inclusion 5.6.1 Involving Community for Inclusion Societies respond differently to the provision of services such as education, health, transport, employment, and rehabilitation for persons with disabilities. Accessibility to services by persons with disabilities continues to be a major challenge in all parts of the world, but especially in developing countries. However, many countries have realized the advantages of including persons with disabilities in all development activities. Policies have been adapted to safeguard and improve their lives, and programmes such as Community Based Rehabilitation (CBR) and Inclusive Education (IE) have been put in place. The overall aim of these programmes, is to develop the potential of persons with disabilities and for them to become productive citizens in the community and get equal opportunities. 5.6.2 Utilizing the Community Inclusive education recognizes that the whole community needs to be involved in

188 order to ensure that ALL children receive the education that is their basic human right. This means that we have to think about who is in our communities and how they can support the process of inclusive education. The following are a part of the community: | Parents and family members | Teachers, principals, school boards, school review officers | Local leaders – church, community leaders, women's committees, youth groups, etc. | Local health workers | Local business – shopkeepers, bus drivers | Local sports groups | Local parent groups and disabled people's organizations Schools can use their community to assist by helping with fundraising, providing parent-to-parent support, helping with transport, counseling, being an assistant/helper to the teacher, teaching cultural skills (weaving, cooking), helping identify students not in school, promoting public awareness, and helping with school supplies. Churches can include ALL children in Sunday school and youth groups. Nurses/health workers provide parents with knowledge, and can help find children who do not attend school. Members of disability-related organizations can give talks to schools, raise public awareness and suggest ways to include children 5.7 Resource Mobilisation for Inclusive Education 5.7.1 Resource Mobilization: Importance Inclusive Education requires policy action at both the national and local level. At the national level, the government must implement the passage of new laws mandating inclusive education, while at the local level schools and the community must participate in capacity building, resource mobilization, and generating knowledge. Resource mobilization is imperative for the success of IE. Resources play a significant role in enabling provision of IE services in the country. IE services require specialized human, materials and physical resources. The government is providing required specialized teaching staff. Learners with special needs and disabilities require more and specialized material resources for their education than their non-disabled peers. Material resources are needed at both the

189 individual level and school level. The nature and type of materials required depend on the type and degree of disability. The physical environment where learners with special needs and disabilities operate should be accessible to them and be disability friendly. This calls for adequate allocation of material resources to learning institutions to improve physical structures and provide individual learners with special needs and disabilities with basic learning aids. 5.7.2 Methods of Resource Mobilization Financing and support of educational services for students with special needs is a primary concern for all countries, regardless of available resources. Yet, a growing body of research asserts that Inclusive Education is not only cost-efficient, but also cost-effective and that "equity is the way to excellence" (Skrtic, 1991, OECD, 1999) (a) Governmental Funding Formulas Across countries, the issue of resources appears not so much as an issue of levels of funding, as it is an issue of distribution and allocation of funds. Specifically, fiscal policies and their built-in incentives (or disincentives) for IE "may be as important in affecting program provision as the amounts allocated" (Parrish, 2002). Many parents cannot afford assistive and functional devices needed by learners with special needs and disabilities as they are expensive and out of reach. The government is providing basic learning aids: though provision of assistive/functional devices is still a constraint due to inadequate resources and funding. These will be supplemented by other service providers, which include individuals, faith based organizations, civil society organizations, the corporate sector, bilateral and multilateral agencies. (b) Pupil Bound Budget System Sometimes mainstream schools are eager to have these children (and their budgets) within their walls. However, it is likely that they prefer children (with budgets) who do not cause them too much additional work. Also, parents will always try to get the best for their child and as a result will try to get the highest amounts of special needs funding. This pupil bound budget system is certainly not advisable for children with milder special needs. Criteria for learning disabilities are vague, ambiguous and change over time and this in itself may be a source of debate if budgets are linked to children. In practice, only clear-cut criteria are useful if funds are tied to children. If it is not possible to develop these, pupil bound budgets should not be used.

190 Generally it is desirable that funds are spent on special education itself (in an inclusive setting), instead of on bureaucratic procedures like diagnosis, categorization, appeals and litigation. (c) Decentralized Model Inclusion can be achieved more easily in a decentralized model when compared to a central approach. In a centrally prescribed plan too much emphasis may be put on the organizational characteristics of that specific model without inclusionary practice being realized. Local organizations with some autonomy may be better equipped to change the system. Therefore, a decentralized model is likely to be more cost-effective and provide less opportunity for undesirable forms of strategic behavior. Nevertheless, the central government has to clearly specify which goals must be achieved. Decisions concerning the way in which such goals are to be achieved is then left to local organizations. 5.8 Let us Sum Up 1.

Everyone

has the

right to education. Education shall be free, at least in the elementary and fundamental stages.

Elementary education shall be compulsory.

Education

shall be

directed to the full development of human personality and to

the strengthening of respect for human rights

and fundamental freedoms.

It shall promote understanding, tolerance and friendship among all nations, racial or religious groups, and shall further the

activities of the United Nations for the maintenance of peace." (

art.26 - Universal Declaration of Human Rights) 2. While there are also very important human, economic, social and political reasons for pursuing a policy and approach of inclusive education, it is also a means of bringing about personal development and building relationships among individuals, groups and nations. It is thus imperative that schools and local authorities take the responsibility to ensure that this right is implemented. Concretely this involves: I Initiating debates around how the community understands human rights; I Generating collective thinking and identifying practical solutions such as how human rights can be made part of the local school curriculum;

191 I Linking the Human Rights movement with educational access; I Fostering grassroots action and strengthening its ties to the policy level in order to promote protection; I Encouraging the creation of community and children's councils where issues of access can be discussed; and Developing community-school mechanism to identify children not in school as well as develop activities to ensure that children enroll in school and learn. 3.

Inclusion is seen as a process of addressing and responding to the diversity of needs of all learners through increasing participation in learning, cultures and communities, and reducing exclusion within and from education. It involves changes and modifications in content, approaches, structures and strategies, with a common vision which covers all children of the appropriate age range and a conviction that it is the responsibility of the regular system to educate all children. 4.

An important concern in a decentralized system is the issue of accountability. Clients of the education system and taxpayers in general have a right to know how funds are spent and to what end. Accordingly, some kind of monitoring, inspection and evaluation procedures will be inevitable elements of the funding system. The need for monitoring and evaluation is even greater in a decentralized model compared to more centralized options. Independent evaluation of the quality of education for children with special needs is therefore part of such a model. 5. Inclusion Support Agencies (ISA) are responsible for managing and coordinating access to quality inclusion support that is relevant, appropriate and timely for all eligible education and care services within a defined region. ISAs employ Inclusion Support Facilitators (ISFs) who work directly with educators and staff in education and care services. ISFs provide practical advice and facilitate access to a range of supports designed to strengthen the service's ability to create an inclusive environment for all children. 5.9 "Check Your Progress" 1. Discuss about the different stakeholders in inclusive education and their responsibilities.

3 Netaji Subhas Open University From the Vice-Chancellor's Desk Dear Students, from this Academic Session (2015-17)

the Curriculum and Course Structure of B. Ed.- Special Education have been thoroughly revised as per the stipulations

which featured in the Memorandum of Understanding (MoU) between the Rehabilitation Council of India (RCI) and the

National Council for Teacher Education (NCTE). The newly designed course structure and syllabus is comprehensive and

futuristic has, therefore, been contextualized and adopted by NSOU from the present academic session, following the

directives of the aforesaid national statutory authorities. Consequent upon the introduction of new syllabus the revision of

Self Instructional Material (SIM) becomes imperative. The new syllabus was circulated by RCI for introduction in the

month of June, 2015 while the new session begins in the month of July. So the difficulties of preparing the SIMs within

such a short time can easily be understood. However, the School of Education of NSOU took up the challenge and put

the best minds together in preparing SIM without compromising the standard and quality of such an academic package. It

required many rigorous steps before printing and circulation of the entire academic package to our dear learners. Every

intervening step was meticulously and methodically followed for ensuring quality in such a time bound manner. The SIMs

are prepared by eminent subject experts and edited by the senior members of the faculty specializing in the discipline

concerned. Printing of the SIMs has been done with utmost care and attention. Students are the primary beneficiaries of

these materials so developed. Therefore, you must go through the contents seriously and take your queries, if any, to the

Counselors during Personal Contact Programs (PCPs) for clarifications. In comparison to F2F mode, the onus is on the

learners in the ODL mode. So please change your mind accordingly and shrug off your old mindset of teacher

dependence and spoon feeding habits immediately.

4 I would further urge you to go for other Open Educational Resources (OERs) - available on websites, for better

understanding and gaining comprehensive mastery over the subject. From this year NSOU is also providing ICT enabled

support services to the students enrolled under this University. So, in addition to the printed SIMs, the e-contents are also

provided to the students to facilitate the usage and ensure more flexibility at the user end. The other ICT based support

systems will be there for the benefit of the learners. So please make the most of it and do your best in the examinations.

However, any suggestion or constructive criticism regarding the SIMs and its improvement is welcome. I must

acknowledge the contribution of all the content writers, editors and background minds at the SoE, NSOU for their

respective efforts, expertise and hard work in producing the SIMs within a very short time. Professor (Dr.) Subha Sankar

Sarkar Vice-Chancellor, NSOU

10 1.1.6 Let us Sum up 1.1.7 "Check your progress" 1.1.1 Introduction It is very interesting to know that 90% of the information about the world around us comes from our sight and hearing. We talk to each other, we read our bills, news papers and books, we see T.V., listen to the radio etc. Medically there are four senses, viz., visual, auditory, gustatory and olfactory, which give special information about the environment; hence these are named as special senses. For example, visual sensation not only gives us the sensation of light but we extract much information from the scenery, e.g. soothing or repulsive, hostile or friendly and so on. Every man has to right live independently. But some people live independently with some major impairment. This impairment varies in nature. Some are related to vision; some are auditory; mental and physical impairments are also to be counted in this nature. 1.1.2 Objectives After going through this sub unit, the learners will be able to: lllll understand the meaning of sensory disabilities lllll know about the different aspects of hearing impairment lllll know about the different aspects of visual impairment lllll know about the different aspects of deaf-blindness 1.1.3 What is sensory impairment? Going to details sensory impairment, we must know about two things. (1) The sensory system and (2) Receptors. (1) The sensory system This system is responsible for carrying different sensations resulting from stimulation of the sensory receptors by external or internal stimuli. For the purpose of perception, a 11 sensation is to be carried to the part of CNS (Central Nervous System) called sensorium. (2) Receptors The receptors associated with nervous system are called sensory receptors or neural receptors. A sensory receptor can be defined as a biological transducer which can convert (transduct) various forms of energy in action potential (AP) in the sensory nervous to which they are connected. Medically receptors for special senses are i) Vision : rods and cones, ii) Hearing: hair cells, iii) Taste : tests buds, iv) Smell: olfactory neurones. 1.1.4 Meaning of sensory impairment The sensory impairment means the senses that is

100% MATCHING BLOCK 2/108

sight, hearing, smell, touch, taste and spatial awareness, is no longer normal.

Mainly the term 'sensory impairment' is used here to refer to people with either visual or hearing impairments or both - the extent of those impairments will vary from person to person. As an example, if a man wears glasses then he/ she has

82% MATCHING BLOCK 3/108

SA Sensory impairment resource book.docx (D91330153)

sight impairment, if find it hard to hear or have a hearing aid then call hearing impairment.

100% MATCHING BLOCK 5/108

SA Sensory impairment resource book.docx (D91330153)

A person does not have to have full loss of a sense to be sensory impaired. 1.1.5

Types of Sensory Impairment: Single (Hearing impairment & Visual Impairment) The term sensory impairment encompasses visual loss (including blindness and partial sight), hearing loss (including the whole range) and multisensory impairment (which means having a diagnosed visual and hearing impairment with at least a mild loss in each modality or deaf blindness). In this context it is said that sensory impairment has two types. One is single and another is dual. Hearing impairment & Visual Impairment is under the single sensory impairment and Deaf-blindness is under dual sensory impairment.

12 1.1.5.1 Hearing impairment (HI)

Hearing is the ability to perceive sound.

A person suffering from hearing impairment has difficulty in perceiving or identifying sound clearly due to auditory problems.

So it is said that hearing impairment is hearing loss that prevents a person from totally receiving sounds through the ear. The impairment may be unilateral or bilateral. If the loss is mild, the person has difficulty hearing faint or distant speech. A person with this degree of hearing impairment may use a hearing aid to amplify sounds. Meaning of Hearing Impairment Hearing impairment refers to a defect in or damage to the hearing mechanism. This defect or damage may occur in any part of the ear, outer ear or middle ear or inner ear. Hearing impairment leads to hearing disability or loss of hearing. Hearing disability or loss of hearing may range of severity from mild to moderate to profound. A person may become deaf or hard of hearing depending upon the nature of impairment and the degree of hearing loss. Classification The degree of hearing loss can be classified five levels as listed below: Degree of Hearing Loss Ability to perceive sound Mild Difficult to identify soft sound such as whispering. Moderate Unable to hear clearly what others are saying during conversation. Hearing aids are necessary. Moderately -severe Unable to clearly hear loud noises such as telephone ring. Severe Can only hear very loud noises and sounds such as shouting or vacuum cleaner noise. Profound Difficult to perceive any sound.

According to impairment the two main types of hearing loss are: Conductive hearing loss, which is the most common type and results from interference in the conduction pathways through which sound reaches the inner ear. This hearing loss usually affects the volume of sound reaching the inner ear. People

13 with conductive hearing loss may benefit from the surgical insertion of grommets or from hearing aids. It is commonly a temporary hearing loss. Sensorineural hearing loss, which is caused by

64%

MATCHING BLOCK 4/108

W

damage to the hair cells lining the inner ear, or the nerves that supply them. This hearing loss can range from mild to profound,

and affects certain frequencies more than others. Consequently, people with sensorineural hearing loss need high quality hearing aids or cochlear implants to gain access to the spoken word and sound in the environment. It is also possible to have a mixed hearing loss, which arises from both the above. Symptoms of Hearing Impairment

The symptoms of children with hearing impairment are: During infancy: 1-3 months old No response to sudden sound such as banging of door or ringing of doorbell. 4-6 months old Unable to locate the sound source. 7-9 months old Do not look at the person being mentioned, e.g. "Where is Papa?" 10-12 months old No response to their names being called or frequently used words or phrases, e.g. "come", "go". During Childhood lllll Delayed response to sound. lllll Can not hear clearly what others are saying lllll Show difficulty in locating the sound source lllll Pay more than usual attention to speakers' facial expression and lip movement while listening lllll Give irrelevant answers or misinterpret instructions lllll Request for repetition during conversation lllll Show poorer ability to understand speech in a noisy environment lllll Tend to turn up the sound volume of television

14 lllll Incorrect pronunciation lllll Delayed language development lllll Poor attention in class lllll Frequent use of gestures to express themselves, e.g. pointing to what they want lllll Easily irritated as a result of communication difficulty

Parents should be alert to the possibility of hearing impairment if their child shows the above signs, and seek medical advice as soon as possible. Causes of Hearing Impairment Two factors are involved in various causes of hearing impairment. These are Congenital factors and Acquired factors. Congenital factors mean those factors which are innate by birth. Such as Ø Heredity Ø Viral infection during pregnancy, e.g. rubella infection Ø Congenital defects such as anomalies of the ear, nose or throat Ø Premature birth, birth asphyxia, excessive bilirubin etc. Acquired factors mean those factors which are acquired after birth. Such as Ø Excessive ear wax Ø Eardrum perforation Ø Middle ear effusion or infection Ø Otitis media or ear ossicle dislocation Ø Sequel of childhood disease such as meningitis Ø Head or ear trauma Ø Prolonged exposure to loud noise Ø Medication that may lead to hearing damage Ø Accident. Above causes of hearing impairment are affecting the children's development in different side. Mainly problem arises in language development. Except this problem

15 Emotion and behaviour problem, lack of self-confidence, problems of social interaction, academic performance etc. People who are profoundly deaf can hear nothing at all. In order to communicate spontaneously and rapidly with people, they are totally reliant on lip reading and/or sign language. People who are born deaf and lip-reading much harder to learn compared to those who became hearing impaired after they had learnt to communicate orally (with sounds).

87%

MATCHING BLOCK 7/108

SA

.SREEJA DEAFNESS.docx (D70342501)

Some diseases or circumstances can cause deafness, including: Chicken Pox Cytomegalovirus Mumps Meningitis Sickle cell disease

AIDS- Offspring of mothers who had aids during pregnancy have a much higher risk of being deaf by the age of 16 years. Syphilis Lyme disease Diabetes- Studies have shown that upto 40% of diabetes patients suffer from some kind of hearing loss. Tuberculosis (TB)-Expert believe that the medication, streptomycin, used to treat TB may be the key risk factor Hypothyroidism and underactive thyroid gland Arthritis Some Cancers Second hand smoke exposure can increase hearing loss in teenagers Many people globally have untreated hearing loss The impact of hearing impairment on the child is determined by a variety of factors. Generally speaking, early treatment and training can help to minimize the developmental problems caused by hearing impairment.

16 1.1.5.2 Visual impairment (VI) This term covers varying degrees of vision loss including those who are registered severely sight impaired (blind). Even the latter may have some vision, such as being able to tell the difference between light and dark. There are many conditions that cause different kinds of vision loss; the main distinction between conditions is whether the impairment is ocular (eye) or cerebral (brain). Visual impairment is considered as the most severe and traumatic physical handicap. Since more impressions are conveyed to the brain through the eyes, the visual anomalies may influence the life of the individual in physical, mental, social, vocational and educational aspects. Visual impairment (VI) refers to a significant functional loss of vision that cannot be corrected by medication, surgical operation, or ordinary optical lenses such as spectacles. Meaning of Visual Impairment

It is an interesting phenomenon that visual impairment tends to evoke more awkwardness from us than any other disability.

Why are we so uncomfortable about of blindness?

For one thing blindness is visible. The blind person is usually not one who can easily weave himself into the fabric of a crowd. Unlike any other exceptional people he stands out.

We often don't realize a person has impaired hearing until we talk to him. There are two prevailing ways of describing visual impairment-the legal definition and the educational definition. Legal definition of visually impaired—the legal definition involves assessment of visual acuity and field of vision.

The American Medical Association (AMA) proposed the definition. This definition is now accepted by the American Foundation for the Blind (AFB) and other Blind Association in different countries. "

A legally blind person is said to be one (1) who has visual acuity 20/200 or less in the better eye even with correction, (ii) whose field of vision is so restricted that it subtends an angle of 20° or less in the better eye after correction." Visually impaired are those who suffer from either of the following conditions (Ministry of Social Welfare 1987) - a)

77%

MATCHING BLOCK 6/108

W

Total absence of sight, 17 b) Visual acuity not exceeding 6/60 or 20/200(Snellen) in the better eye correction lenses, c) Limitation of the field of visual subtending an angle of 20 degree or worse.

Within this broad definition, visually impaired children are differentiated into two categories, the blind and the partially seeing or low-visioned. Educational definition of visually impaired- educationally defined, the blind child is defined as one whose visual loss indicates that he/she should be educated chiefly through the use of Braille and other tactile and auditory materials. The partially seeing child is defined as one who has some remaining useful vision and can use print and other visual materials as part of the educational programme. Sensory Training and Mobility In a visually impaired individual, the loss of sight is compensated by sense of touch and hearing. Sense of touch enables the persons to determine his position and direction. Hearing play a dominant role in mobility. Explorations of an object through touch determine the definiteness of the object and help the individual to form a neat conception of them. Sense of touch also has a lot to do with reading. During his travel the smell of a gutter, the smell of smoke of a chemical industry (like paper factory, sugar factory etc.), smell of kitchen products etc. are source of information for the person to locate where he is, this leads to a greater level of confidence in mobility. Daily living skills These are also called as 'survival skills'. These build up confidence specially among visually impaired children. These are necessary for day to day living. Some of the common daily living skills are eating manners using toilet, dressing body hygiene, cleanliness, taking bath, washing cloth, handling money, shopping, shaving, proper use of electrical appliances, food preparation, cleaning of place, using medicine etc. learning daily living skills of a visually impaired child are means of his proper social development also. These skills are difficult but not impossible to learn.

18 Classification The degree of visual impairment can be classified into three levels: Mild llll Can read relatively larger characters. llll No difficulty in identifying shapes ,colours and brightness contrast Moderate llll Can tell shapes and colours of objects and can distinguish between brightness and darkness llll Can only read characters with larger size and broader strokes Severe llll Can only distinguish more obvious changes in brightness and darkness llll May not see anything(completely blind) The visually impaired children have been classified medically which are shown in the following table: Category/ Level Better Eye Worse Eye Percentage of Impairment Level D 6/9-6/18 6/24-6/36 20% Category I 6/18-6/36 6/60-nil 40% Category II 6/60-4/60 3/60-nil 75% or Field of Vision 100-20 3/60-1/60 F.C. at 1 ft. To 100% Category III or nil Field of Vision 100 Category IV F.C. at 1 ft. To nil Field of or Vision 100 Field of Vision 100 There are two major categories of visually impaired children : (i) The partially sighted are those who require large print or magnified print materials. Their visual acuity is very low (20/70 in the better eye).this means that the child sees at 20ft when a normal child sees at 70 ft. Their eyesight may be weak

19 due to short sightedness, long sightedness, Such astigmatism need , glaucoma or muscle detachment. (ii) The blind are those who need to be taught through Braille or through aural methods their visual acuity may fall to 2/200.Such children must be prepared in preacademic skills like braille reading and use of cane for mobility before integration. Symptoms of Visual Impairment The symptoms of children with visual impairment are: During infancy: llll Lack of eye contact llll Blinking to bright light llll Do not look at his /her hands llll Do not visually follow moving objects in front of his /her face llll Slow response to voiceless toys or parents' faces; respond only to sound llll No imitation of others' expressions and actions llll Do not actively reach out for his /her favourite toys llll Fear of gross motor activities ,such as crawling During early childhood llll Often keep his/her head down; lack eye contact with others llll Limited facial expression and body language llll Tend to hold objects very close to the eyes when looking at them llll Abnormal responses to bright to light (gazing at light excessively or trying to avoid it) llll Often bump into objects or fall over , and get confused with directions llll Search for his/her way using hands llll May press on eyeballs with fingers llll Jerky movements of the eyeballs

20 Causes of Visual Impairment Loss of vision or impairment of vision is caused due to many reasons. Injury to the eye, inherited conditions, infections etc. are the main common causes that lead to vision loss or visual impairment. Generally causes of Visually Impairment are divided into two parts. One depends on systematic conditions and another is specific eye conditions. SYSTEMIC CONDITIONS lllll Diabetes lllll Hypertension (high blood pressure) lllll Cerebrovascular (brain blood vessel) disease or stroke lllll Atherosclerotic disease (cholesterol deposits in blood vessels, including those of the eye) lllll Human immunodeficiency virus (HIV) usually due to infection with cytomegalovirus, a virus that affects the eye lllll Vitamin A deficiency lllll Infections involving the eyes Some eye infections, including those caused by parasites, are more common in developing countries. Infections in a pregnant woman can affect the foetus. This type of vision loss, present from birth, is called congenital blindness. SPECIFIC EYE CONDITIONS lllll Macular degeneration-deterioration of the central part of the retina lllll Cataracts-clouding of the lens of the eye lllll Glaucoma-damage to the nerve connecting the eye to the brain caused by increased pressure inside the eye lllll Eye injuries lllll Tumours involving the eye or surrounding structures in the head and neck Now some causes of visual impairment are discussed briefly Injury to the eyes · Eye injury may happen while playing or at work or due to accidents which may result in vision loss and impairment.

21 lllll The commonest cause of vision loss is injuries to the cornea. Inherited conditions of blindness and vision impairment lllll The most common cause of inherited blindness is retinitis pigmentosa. Infections of the eyes lllll The baby may be born with blindness or visual impairment if the mother has had a viral infection like German measles that is transmitted from the mother to the developing foetus during pregnancy. lllll Trachoma of the eyes caused by contagious microorganism called Chlamydia trachomatis may also damage eye sight. This is seen in the developing and underdeveloped countries with poor water and sanitation facilities. Amblyopia lllll Generally Amblyopia means impaired vision in one eye due to lack of its use in early childhood. lllll It is seen in squint or "lazy eye" since both the eyes project differently and send in different messages to the brain the brain may then turn off or suppress images from the weaker eye. This stops development of the weaker eye leading to amblyopia in that eye. Cataract lllll Cataract means clouding of part or the entire lens of the eye. lllll Normally, the lens is clear to let in the light that focuses on the retina. Cataracts prevent light from easily passing through the lens, and this causes loss of vision. lllll Due to cataract cloudy or blurry vision, difficulty in seeing in dimly lit areas and bright lights, colours appear faded, double vision etc. happen. This condition usually affects the elderly. lllll Cataract is the leading cause of blindness in the world compared to other eye disorders. Diabetic retinopathy lllll The small blood vessels in the retina are affected due to diabetes for which impairment of vision is caused.

22 lllll This is the commonest cause of blindness and visual impairment in the United States. Glaucoma lllll Raised pressure within the eyes is caused due to Glaucoma. The increased pressure impairs vision by damaging the optic nerve. lllll This may be seen in older adults and in some babies as well who are born with the condition. Age related Macular Degeneration lllll The progressive loss of the visual acuity due to damage to the macula that is the most sensitive part of the retina is called Age related Macular Degeneration or AMD. lllll Due to AMD the center of the visual field appears blurry or opaque. The patient is unable to focus clearly. This mainly occurs in the elderly. lllll Those who are exposed to excess sunlight and those who smoke excessively may suffer from AMD. AIDS related visual impairment lllll Viral infections of the eyes called Cytomegalovirus or CMV retinitis may cause AIDS related visual impairment. Cancer of the eyes lllll The most common eye cancer of children is called Retinoblastoma. 1.1.5.3 Dual Sensory Impairment (Deaf-Blindness) Meaning of

100% MATCHING BLOCK 8/108

SA Sensory impairment resource book.docx (D91330153)

dual sensory impairment It is the combination of both hearing and sight impairment. It is not necessarily a total loss of both senses - indeed the majority of dual sensory impaired people do have some degree of sight and/or hearing. Those with a less severe degree of both sight and hearing impairment may also be referred to as having a dual sensory impairment or loss. The words dual sensory impaired and deaf-blind are generally accepted as inter- changeable words. 23 When a person has difficulties seeing and hearing then the person can be termed

deaf-blind.

100%

MATCHING BLOCK 9/108

SA

Sensory impairment resource book.docx (D91330153)

Although it is more common to refer to someone as being deaf-blind if their combined sight and hearing loss causes difficulties for them with communication, mobility and access to information. The combination of the two sensory impairments intensify the impact of each other, which usually means that a deaf-blind person will have difficulty, or find it impossible, to utilise and benefit fully from services for deaf people or services for blind people. Meeting the needs of

deaf-blind people therefore requires a separate approach. Deaf-blindness is a unique and extremely complex disability that often requires specialist communication methods and systems being introduced to the person and those around them to enable communication to take place. Deaf-blindness has adverse effects on all areas of development, in particular the language acquisition process, conceptual development, motor development, behaviour and personality of a person. People who are deaf-blind can generally be separated into two groups: Congenital Deaf-blindness - People who were born with a hearing and vision impairment. This category may also include individuals who are born hearing-sighted, but who become deaf-blind through accident or illness within the first months of their lives. The important factor being that they become deaf-blind before they had the opportunity to gain formal language skills. Acquired Deaf-blindness - People who develop deaf-blindness later in life. Three combinations are possible : a) Individuals who are born blind and later develop a hearing impairment. b) Individuals who are born deaf and later develop vision impairment. c) Individuals who are born sighted and hearing, but later develop a vision and hearing impairment. Every deaf-blind person is an individual and may not fit neatly into any of the above categories, or use the suggested means of communication. Their situation may be complicated by the existence of other factors such as physical and/or learning disabilities etc.

24 Symptoms of deafblindness Levels of hearing and sight loss vary between individuals who are deafblind. Hearing loss In deafblindness, hearing loss can occur from birth or may develop later after an infection or injury. In other cases, a person's hearing may gradually deteriorate over time. Someone with impaired hearing may find that speech and other noises sound muffled and indistinct and they may not be able to follow and understand conversations, particularly when there's background noise. A person with a hearing problem may also need

100%

MATCHING BLOCK 11/108

SA

Sensory impairment resource book.docx (D91330153)

to turn up the volume on the television or radio

and ask others to speak loudly, slowly and more clearly. Sight loss A person who is deafblind may have developed a condition that gradually causes their vision to deteriorate. For example, they may have an eye condition such as: lllll cataracts - cloudy patches that form on the eye's lens lllll glaucoma - pressure changes inside the eye that damage the optic nerve (the nerve that transmits images from the eye to the brain) lllll retinopathy - a number of eye disorders that damage the blood vessels of the retina (light-sensitive tissue at the back of the eye) and can lead to vision loss Common symptoms of conditions that cause progressive sight loss include: lllll eye pain lllll blurred vision lllll halos around light sources lllll reduced night vision lllll difficulty seeing in bright sunlight or well-lit rooms Causes of Deaf-Blindness There are many causes of deaf-blindness. Those that are present or occur around the time a child is born include prematurity, childbirth complications, and numerous congenital syndromes, many of which are quite rare. Deaf-blindness may also occur

25 later in childhood or during adulthood due to causes such as meningitis, brain injury, or inherited conditions. Congenital deafblindness is when people are born deafblind. Some people become deafblind later in life and this is called acquired deafblindness. Many people who are deafblind have rare and varied causes of their sight and hearing loss. They may experience other disabilities and health conditions, meaning that diagnosis and the identification of sight and hearing loss are difficult. Causes of deafblindness include: llll Infections during pregnancy llll Prematurity llll Rare syndromes, such as Usher and CHARGE llll Illness and accidents llll Sensory loss in old age Many children with profound and multiple learning disabilities will experience limited communication skills and impairments of vision and hearing. Congenital rubella syndrome is no longer a significant cause of deafblindness, but other infections during pregnancy are a factor, for example cytomegalovirus and toxoplasmosis. One in ten babies born prematurely will develop a permanent disability such as cerebral palsy, blindness, deafness or lung disease, or a combination of these. Illness and accidents can lead to sensory loss in children and adults, and a number of conditions lead to a loss of sight and / or hearing over time. Sensory loss is just one more effect of old age. A hearing and vision loss may have crept up slowly on a person, so they only gradually realise something is wrong. As a result the everyday difficulties a person describes are not just to do with ageing but are the typical effects of deafblindness. Below is a list of potential causes of deafblindness with links to websites containing additional information. Please note that the information on these pages is for information purposes only. It should never be used for diagnostic or treatment purposes.

26 If you have questions regarding a medical condition, always seek the advice of your general practitioner or other qualified health professional. Rubella Rubella is a mild and preventable disease caused by a virus. If you catch it you may feel unwell, with

100% MATCHING BLOCK 10/108

W

swollen glands, a slight temperature, or a sore throat and

rash. But some people have no symptoms at all and so are unaware that they may be infectious and may be passing on the disease. Rubella is very serious if a pregnant woman catches it in the early stages of her pregnancy because it can profoundly damage the development of her unborn child. It can result in deafblindness or raise the possibility of a termination. Ensuring that children are routinely vaccinated helps to protect pregnant women and their babies. Congenital rubella syndrome A baby born affected by rubella is said to have congenital rubella syndrome (CRS). Many will have hearing loss, cataracts, other eye conditions, and heart problems that require significant hospital treatment and will affect the child throughout their life. A baby's brain can also be affected. The risk of congenital rubella syndrome affecting the baby and the extent of the birth impairments it causes depends on how early in the pregnancy the mother is infected. The earlier in the pregnancy the greater the risks. German measles is a common term used to describe rubella. 1.1.6 Let us sum up 90% of the information about the world around us comes from sight and hearing. Medically there are four senses, viz. visual, auditory, gustatory and olfactory, which give special information about the environment; hence these are named as special senses. Some people live with some major impairment which is related to vision, auditory, mental & physical. Sensory impairment has two types- Single & Dual. Hearing and visual impairment is under single sensory impairment and deaf-blindness is under dual

27 sensory impairment.

A person suffering from hearing impairment has difficulty in perceiving or identifying sound clearly due to auditory problems

which prevent a person from receiving sounds through ear. Visual impairment is considered as the most severe and traumatic physical handicap and it may influence the life of an individual in physical, mental, social, vocational and educational aspects.

29 1.2 p Importance of hearing Structure 1.2.1 Introduction 1.2.2 Objectives 1.2.3 Why hearing is important 1.2.4 What are the consequences of hearing loss? 1.2.5 Effect of hearing in living 1.2.6 How hearing loss can affect in everyday situations 1.2.7 How hearing works 1.2.8 Anatomy of the Ear 1.2.9 Hearing Loss Impacts 1.2.10 Tips for parents 1.2.11 "Check your progress" 1.2.1 Introduction "Blindness separates people from things. Deafness separates people from people." There is no better way to describe why hearing is of such great importance in our lives than the words of the philosopher Immanuel Kant. Hearing helps us to establish contact with other people, holding an intimate conversation or simply laughing together - hearing means communication and is an irreplaceable component of our social lives. An unborn child already picks up sounds, voices, and even music. Hearing is used round the clock. It is key to communication and hence to social interaction. The ear is man's most efficient but also most sensitive sensory organ. However, proper importance is not given to it by our modern, visually-oriented world. Considering the importance of hearing to one's career, interpersonal relationships, achievement, and safety, it is not surprising to find that the costs of hearing loss are widespread and grave. Readiness is disrupted by noise-induced hearing loss and result in decreased efficiency. For service member, hearing is considered as the most important survival sense. Sound is often the first source of information a warrior has before direct contact with the enemy. As such, hearing is vital for both lethality and survivability. In the military, hearing is fundamental to the instruction, teamwork and reporting skills that are necessary for mission accomplishment. Moreover, hearing is essential for forging relationships and connections with friends and family, fully participating in team and community activities, and experiencing life events. 1.2.2

Objectives After going through this subunit the learners will be able to ● know about the importance of hearing ● understand the effect of hearing in living ● know about the process of hearing ● know about the impacts of hearing loss 1.2.3 Why is hearing important? Hearing empowers us and enriches our lives. Hearing enables us to socialise, work, interact, communicate and even relax. Good hearing also helps to keep us safe, warning us of potential danger or alerting us to someone else's distress. Hearing is very much important for us to be able to live and participate in life more effectively. Hearing problems may lead to feelings of isolation and even depression. Our hearing provides us with an enormous source of information, which forms the bridge between the worlds and how we interact with it. The ability to hear is an integral part of our lives. The importance of good hearing and the consequences of hearing loss are still underestimated. Due to the demographic aging of our society and the growing noise pollution in our environment, the number of people affected by hearing loss continues to rise.

31 1.2.4 What are the consequences of hearing loss? Serious consequences are often faced by the people with untreated hearing loss. These range from disadvantages at work, relationship problems and social isolation, which may even lead to depression. Since the development of speech and language of children is fundamentally dependent on the sense of hearing, the consequences are severe for the children with an untreated hearing loss. 1.2.5 Effect of Hearing in living Every part of our life is influenced by hearing. Hearing accompanies us throughout our life. Hearing enables us to communicate with others. Sounds are there with us in our daily life - some relax us, others cause stress. Much of what we hear we enjoy. There are everyday sounds we no longer even notice, and other noises we would rather just avoid. Our ears help us to communicate with other people, to listen to music or make music ourselves. Our hearing is partly responsible for how well we sleep at night. The quality of our hearing also affects our personal relationships and happiness in our partnerships. Two important things of hearing in living The first important thing is that so many areas of our everyday life are influenced by hearing. that improved hearing has one benefit above all others: enhanced quality of life. Better hearing means better communication - in our relationships with our partners, as well as toward friends and family. Good hearing is not merely of benefit to ourselves : its positive effects are also directly measurable among family, relatives and partners. The second important thing is that we are able to experience life in a more active, healthier way, and with fewer restrictions with better hearing. Stress is reduced, or may be avoided in the first place, concentration is improved, and relaxation is easier. Moreover good hearing also contributes to enhanced personal wellbeing and general health. Healthy hearing allows us to communicate. to socialize with friends, to alert us trouble and work more effectively. Healthy hearing even helps us to relax. So when our hearing declines which happens for most people at some point -it can feel like much of our life is going downhill. The fact is, hearing loss doesn't just affect us physically. It can impact our emotional and social health, too.

32 Left untreated, hearing loss is often related to: lllll Negative attitudes, anger and irritability lllll Stress, fatigue and tension lllll Depression lllll Loneliness lllll Desire to avoid social scenes lllll Unsafe situations due to decreased alertness lllll Lower job performance lllll Trouble remembering things or following directions Many people chalk these symptoms up to old age. But in truth, hearing loss occurs in every age group. It's especially important to catch hearing loss in children since hearing is so essential to language development and hearing skills. But adults young and old also need to watch for signs of hearing loss so that they can make the most of their quality of life. Hearing helps us to lead our everyday lives without limitations. 1.2.6 Everyday situations that can be affected by hearing loss Hearing is important... ... at work lllll Participating in group meetings. lllll Talking on the telephone. lllll Following a conversation in a busy office. ... at social occasions lllll Chatting to friends. lllll Participating in dinner conversation at a restaurant. lllll Interacting with grandchildren. lllll Talking on the telephone. lllll Watching TV together with others.

33 ... for our own safety lllll When walking near busy roads. lllll To be able to hear sounds that alert us to danger like sirens and other traffic signals. lllll So we can be alert to a cry for help. ... when we learn lllll Allowing us to maintain a high level of concentration with little effort. lllll So we are able to communicate with instructors. lllll So we are able to register information accurately. 1.2.7 How hearing works The ear, despite its small size, is a highly complex organ. Acting as sound filter, the ear transforms every sound audible to us into accurate information the brain can prioritise. Each ear consists of delicate and highly complex mechanisms. In "the inner" ear, a sea of tiny sensory cells and nerve fibres pick up sound vibrations and transform them into electrical impulses for the brain to process. The sensory cells and fibres can become damaged if the ear is exposed to strong vibrations over time. If these are unable to heal or be replaced, this can lead to permanent hearing loss. Hearing works in six steps. These are 1. Sound funnels into the ear canal and causes the eardrum to move. 2. The eardrum vibrates with sound. 3. Sound vibrations move through the ossicles to the cochlea. 4. Sound vibrations cause the fluid in the cochlea to move. 5. Fluid movement causes the hair cells to bend. Hair cells create neural signals which are picked up by the auditory nerve. Hair cells at one end of the cochlea send low pitch sound information and hair cells at the other end send high pitch sound information. 6. The auditory nerve sends signals to the brain where they are interpreted as sounds.

34 1.2.8 Anatomy of the ear The ear is made up of three parts: lllll the outer ear (the external ear and the ear canal) lllll the middle ear (the ear drum and three very small bones) lllll the inner ear (the cochlea and auditory nerve) lllll Sound travels through the air in waves resulting in a series of vibrations within the ear. The brain then interprets those signals into meaningful sounds such as speech. Our ears are small but highly complex amplifiers. OUTER EAR At the end of the ear canal, the sound waves hit the ear drum. The ear drum is a thin membrane between the outer ear and middle ear. MIDDLE EAR The ear drum is connected directly to the hammer. The three tiny bones - hammer, anvil and stapes-are the smallest bones in human body, and transmit the mechanical vibrations of the ear drum into the inner ear. INNER EAR The stapes transmits the vibrations via the oval window to the inner ear. In this way, the sound waves arrive in the cochlea, which is filled with fluid. 1.2.9 Hearing Loss Impacts: Health: Hearing loss has been linked to feelings of social isolation, depression, and chronic disease. Safety: Hearing loss can cause threat so far as safety of our service members is considered since it diminishes their ability to send, receive, and respond to commands and warning signals and can result in the misinterpretation, or miscommunication, of critical information.

35 Quality of Life : Hearing helps us to enjoy our life fully which helps to shape the quality of our life. The impact of hearing loss for our military personnel is not only significant on the battlefield but also at home and in their interpersonal lives. It still impedes one's ability to participate in and experience many of life's cherished moments, such as hearing a loved one's voice or laughter, participating in meaningful conversations with friends and family, hearing birds chirping or waves crashing on the beach, or enjoying one's favorite shows or sports on TV. Mission accomplishment : For effective operational planning and execution communication is a must. Hearing loss can disrupt communication and therefore substantially impede a service member's ability to carry out his or her mission. Miscommunication or misinterpretation of a command/order/ instruction, may happen due to hearing loss which can have dire consequences for the service member and the unit at large. Hearing loss also contributes to a hefty economic toll. In addition to the indirect and direct costs associated with veteran compensation for hearing loss and related injuries, which accounts for billions of dollars annually, these injuries also result in expenses in the form of decreased productivity, loss of qualified service members, and recruitment and retraining costs. 1.2.10 Tips for parents Of babies with hearing loss lllll Above all, babies with hearing loss need exactly the same as all children: the love, patience and attention of their parents. lllll Even when their baby is still an infant, parents should try to maintain eye contact when speaking to them. Their facial expressions and gestures should match what they are saying. lllll Hearing loss in your baby should not be a taboo subject: if it is spoken about openly from early on, it is easier for the parents, and later also the child, to treat it as something natural. When children learn to speak lllll Parents should treat their children as normally as possible.

36 lllll Parents should speak as clearly as possible, maintain eye contact with their child when speaking, and teach their child to always look at the person talking to them. If the child does not understand everything they say, they should repeat what they said using different words. lllll Even at a very young age, children should be encouraged to ask if there is anything they have not understood correctly. lllll Parents should make sure that background noise is kept to a minimum when speaking to their child. lllll If parents read picture books to young children, they should bring the pictures to life with sounds as well as reading the text provided (e.g., imitating animal noises). This will enable children to imitate sounds and learn from an early stage how to participate verbally in communal reading. How to successfully master school life lllll Parents should get to the bottom of unusual behaviour at school or concentration difficulties as soon as possible: hearing loss could be the cause. lllll If opting for a mainstream school, a few points should first be clarified with the classroom teacher: the student in question should sit as close to the front as possible (for better comprehension / lip reading where applicable) and the teacher should use an FM/Roger system. lllll Speech or music therapy can also provide additional support for the child. As well as enhancing the child's verbal and communication skills, this can also promote reading and writing skills. 1.2.11 Let us Sum up Blindness separates people from things and deafness separates people from people. Hearing means communication & is an important component of our social lives. The ear is man's most efficient & sensitive sensory organ. If we consider the importance of one's career, interpersonal relationships, achievement & safety, it is not surprising to find the costs of hearing loss are widespread & grave. Operational effectiveness is decreased due to Noise Induced Hearing Loss. Sound is often the source of information a warrior has before direct contact with enemy. As such, hearing is very vital for lethality & survivability. Hearing enables us to socialise, work, interact, communicate & even relax. Safety of an individual as well as other depends on good hearing capacity. Problems

37 of hearing may lead to feeling of isolation & even depression. If treatment is not done for hearing loss, people may face with serious consequences like disadvantages at work, relationship problem, social problem which may lead to depression. There are two important things of hearing in living. Firstly, better hearing means better communication effects in relationship with partners, friends and family. Secondly, better hearing helps us to reduce stress, improve concentration and easy relaxation. On the other hand, effect of hearing loss is observed in our emotional & social life. Hearing helps us lead our everyday life without limitations. Impact of hearing loss is observed at work, at social occasions, safety on road & workplace and in learning practices. Our ear consists of three parts - Outer ear, Middle ear & Inner ear. Sound travels through the air in waves resulting in a sense of vibration within the ear. The brain then interprets those signals into meaningful sounds such as speech. Care is required to be taken for the children having hearing loss problem since the development of speech and language of children is fundamentally dependent on sense of hearing.

Types of hearing loss 1.3.4.1 On age of onset 1.3.4.2 On the location of the problem 1.3.4.3 Nature of hearing impairment 1.3.4.4 Degree of hearing impairment 1.3.4.5			

On the basis of cause 1.3.5 Impediment caused by different types of hearing loss 1.3.6 "Check Your Progress" 1.3.1. Introduction Hearing comes first and then speaking. Learning process of most students starts with

40 their hearing. One of the earliest link infants develop is between what they hear and what they see. Our speaking vocabularies depend on our hearing vocabularies (the words we understand). Hearing enables us to know more than we can say. Language acquisition and the knowledge of the world that comes with it are naturally occurring process for all students. Deaf or hearing impaired students experience their world in a markedly different way than do their hearing peers. Without early and special help they may not acquire spoken language. For effective education and socialization speech and language are critical avenues in our society. Hearing impaired students may be cut off this processes and become isolated unless early identification is done and helped to compensate for their hearing loss by undergoing corrective medical treatment or learning to use amplification, normal ways of receiving and expressing language, or various types of assistive devices. So, it is very much important to know the process of hearing, types of hearing loss and its impediments leading to different types of hearing loss if we want to know regarding hearing impairment. 1.3.2

Objectives After going through this subunit the learners will be able to

llll know about the Process of hearing llll know the different parts of the Ear llll state the functions of the Ear llll know about the types of hearing loss 1.3.3 Process of Hearing Through our organ- Ear, we are able to acquire hearing, auditory perception, or audition to perceive sound by detecting vibrations, changes in the pressure of the surrounding medium through time, we may hear sound through solid, liquid, or gaseous matter. It is one of the traditional five senses; partial or total inability to hear is called hearing loss. For humans and other vertebrates, hearing is performed primarily by the auditory system. Vibrations (mechanical waves,) are detected by the ear and transduced into

41 nerve impulses which are perceived by the brain (primarily in the temporal lobe). Like touch, audition requires sensitivity to the movement of molecules in the world outside the organism. Both hearing and touch are types of mechanosensation. During hearing, sound waves enter the auditory canal and strike the eardrum, causing it to vibrate.

The sound waves are concentrated by passing from a relatively large area (the eardrum) through the ossicles to a relatively small opening leading to the inner ear. Fig 1 For knowing the hearing process it is necessary to know about the anatomy of the Ear. Anatomy of the Ear To understand properly about the hearing loss, it is necessary to first understand the anatomy of the ear. The ear has three main parts: the outer ear, the middle ear and the inner ear External Ear llll Pinna (auricle) - collects and funnels sound into the ear canal llll Ear canal (external auditory meatus) - directs sound into the ear

42 Middle Ear llll Eardrum (tympanic membrane) - changes sound into vibrations llll Ossicles or Hammer, anvil and stirrup (malleus, incus and stapes) - this chain of three small bones (ossicles) transfers vibrations to the inner ear Inner Ear llll Inner ear (cochlea) - contains fluid and highly sensitive "hair" cells. These tiny hair-like structures move when stimulated by sound vibrations llll Vestibular system - contains cells that control balance llll Auditory nerve - leads from the cochlea to the brain

an elastic cartilaginous structure and it has no bones. The pinna remains live and active due to the blood and nerve supply. Ear canal (external auditory meatus) The external auditory Canal/Meatus is "S" shaped

tube that opens at the pinna but closed inside by the tympanic membrane or eardrum. The length of an adult auditory canal is about 25 to 40 mm and has a volume of about 2 cc. The outer two third portion of the ear canal is cartilaginous one while the inner one third portions is bony i.e., has bony base. The entire canal is lined with skin and epithelial cells. The outer portion of the ear canal also has hair follicles on the skin. A pair of glands namely cerumenous and sebaceous glands is present on the both sides of the external auditory Canal/Meatus. The ear canal carries out its functions in smooth and appropriate manner due to the blood and nerve supply. Middle Ear The middle ear is a small air filled cavity of about 2cc. It is located between

8 UNIT-I (FUNDAMENTALS OF HEARING).docx
(D162037136)

very thin membrane and its thickness is about 1/10th mm. The normal tympanic membrane is pinkish in colour. It is roundish oval in shape. It is also concave. It has an area of about 85 to 90 sq.mm. The

conical shape of the tympanic membrane transmits maximul sounds into the middle ear. Ossicles or Hammer, anvil and stirrup (malleus, incus and stapes) The middle ear has three small bones known as the ossicles. These three bones are the smallest bones in human body, which are joined to one another and thus form a chain. The chain is commonly known as ossicular not only transmits sound waves from the middle ear to inner ear but also helps to amplify sound. Malleus: It is a hammer shaped bone which has two handle, its

It is an anvil shaped bone 44 with the head and two handle like structures. The head of the malleus is attached to the head of the incus. The long handle of the incus is attached to the third ossicle called Stapes, while the short handle is free. Stapes: This is the smallest bone not only in the middle ear but also in the whole body. It is a stirrup shaped bone with a small head and an oval shapped footplate.

93%

MATCHING BLOCK 21/108

SA

8 UNIT-I (FUNDAMENTALS OF HEARING).docx
(D162037136)

Among all three ossicles, stapes plays very vital role in both transmission and amplification of sound waves from middle ear to inner ear.

Inner Ear Inner ear is also known as an internal ear. It is also referred to as Bony Labyrinth as it consists of a set of complicated tubes in it. It is also called as vestibule since it has a passage to the other portions of the auditory system and brain. Both the organs of hearing as well as the organ of the balance are situated in the inner ear. The main three parts of the inner ear are Cochlea, Vestibular system and Auditory nerve. Cochlea: Cochlea, the organ of hearing is a snail shaped bony structure. It is made up of a twisting bony shell, which is about 1cc wide and 5 mm broad from base to apex. The cochlea is divided into three fluid-filled parts. Two canals are for the transmission of pressure and the third one is the sensitive organ of Corti, which detects pressure impulses and responds with electrical impulses which travel along the auditory nerve to the brain. It is divided lengthwise by the organ of Corti, which is the main organ of mechanical to neural transduction. Inside the organ of Corti is the basilar membrane, a structure that vibrates when waves from the middle ear propagate through the cochlear fluid - endolymph. The basilar membrane is tonotopic, so that each frequency has a characteristic place of resonance along it. Characteristic frequencies are high at the basal entrance to the cochlea, and low at the apex. Basilar membrane motion causes depolarization of the hair cells, specialized auditory receptors located within the organ of Corti.[5] While the hair cells do not produce action potentials themselves, they release neurotransmitter at synapses with the fibers of the auditory nerve, which does produce action potentials. In this way, the patterns of oscillations on the basilar membrane are converted to spatiotemporal patterns of firings which transmit information about the sound to the brainstem Vestibular system In most mammals, the vestibular system, is the sensory system that provides the leading contribution about the sense of balance and spatial orientation for the purpose of coordinating movement with balance. Together with the cochlea, a part of the auditory system, it constitutes the labyrinth of the inner ear in most mammals, situated in the vestibulum in the inner ear (Figure 1). Since movements consist of rotations and translations, the vestibular system comprises two components: the semicircular canal system, which indicates rotational movements; and the otoliths, which indicates linear accelerations. The vestibular system sends signals primarily to the neural structures that control eye movements, and to the muscles that keep an animal upright. The projections to the former provide the anatomical basis of the vestibulo-ocular reflex, which is required for clear vision; and the projections to the muscles that control posture are necessary to keep an animal upright. The brain uses information from the vestibular system in the head and from proprioception throughout the body to understand the body's dynamics and kinematics (including its position and acceleration) from moment to moment. Auditory nerve The cochlear nucleus in the brainstem receives the sound information from the cochlea which travels via the auditory nerve . From there, the signals are projected to the inferior colliculus in the midbrain tectum. The inferior colliculus integrates auditory input with limited input from other parts of the brain and is involved in subconscious reflexes such as the auditory startle response. The inferior colliculus in turn projects to the medial geniculate nucleus, a part of the thalamus where sound information is relayed to the primary auditory cortex in the temporal lobe. Sound is believed to first become consciously experienced at the primary auditory cortex. Around the primary auditory cortex lies Wernickes area, a cortical area involved in interpreting sounds that is necessary to understand spoken words. Hearing problems may be caused due to the disturbances (such as stroke or trauma) at any of these levels, especially if the disturbance is bilateral. Auditory hallucinations or more complex difficulties in perceiving sound may also occur for the same in some instances. 1.3.4 Types of hearing loss Hearing loss have been classified under various subgroups from various angles. Some categories are as follow: 1.3.4.1 Age of onset Hearing impairment may occur since birth or it may be acquired at any age in life. 46 Thus depending

69%

MATCHING BLOCK 22/108

SA

SED-14 Final.docx (D93662759)

on the age of onset we have two groups of hearing loss such as- (A) Congenital hearing loss (B) Adventitious hearing loss (A) Congenital hearing loss It refers to any hearing loss occurring prior to birth or at the time of birth. It may be hereditary or may develop during prenatal or natal period. (B) Adventitious hearing loss

It means that who is born with normal hearing and has acquired speech but later lost hearing ability due to infection, disease or some damage to the hearing mechanism. Another two types of hearing loss can be mentioned here. These are: i)

100%

MATCHING BLOCK 23/108

8 UNIT-I (FUNDAMENTALS OF HEARING).docx
(D162037136)

Pre-lingual hearing loss- The term pre-lingual hearing loss refers to that hearing loss

developed prior or before the language

77%

MATCHING BLOCK 24/108

SA

8 UNIT-I (FUNDAMENTALS OF HEARING).docx
(D162037136)

development or language acquisition or language age. The hearing loss developed during the first three years of life is considered as pre-lingual. ii) Post-lingual hearing loss- The term post-lingual hearing loss refers to that hearing loss developed after the language had developed significantly. Post-lingual hearing loss can be sudden or progressive in nature. The person with post-lingual hearing loss finds it more difficult to adjust and adapt to deafness as compared to pre-lingual deafened persons. 1.3.4.2

On the location of the problem Hearing loss is also classified into three types depending upon the location of the hearing problem or defect. There are three types of problems- (A) Conductive hearing loss (B) Sensorineural hearing loss and (C) Mixed hearing loss (A) Conductive hearing loss Hearing problems when are located in the outer ear and middle ear it is called Conductive hearing loss. Conductive loss of hearing is curable. (B) Sensorineural hearing loss and Sensorineural hearing loss takes place when hearing problems arise out of the defects in the inner ear.

47 (C) Mixed hearing loss Combination of conductive loss and sensorineural loss is called Mixed

81%

MATCHING BLOCK 25/108

SED-14 Final.docx (D93662759)

hearing loss. 1.3.4.3 Nature of hearing impairment On the basis of nature, hearing impairment can be classified as: A) Gradual hearing impairment B) Sudden hearing impairment A) Gradual hearing impairment- Gradual hearing impairment is also termed as "progressive hearing loss". This refers to a slow deterioration of hearing sensitivity with time. This may be due to any infection or hereditary disorder or aging. Conductive or mixed or sensori-neural hearing impairment can be gradual or progressive in nature. B) Sudden hearing impairment In Sudden hearing impairment, the patient

over night

97%

MATCHING BLOCK 26/108

SA

SED-14 Final.docx (D93662759)

may suffer partial or complete hearing loss in either one or both ears. This hearing loss results due to onetime insult to the auditory system. Usually the damage to the auditory system results in a permanent hearing loss. Sudden hearing impairment is usually always of sensori-neural type. 1.3.4.4 Degree of hearing impairment An important consideration of any hearing loss is the degree of impairment. On the basis of

degree hearing impairment

classified into the following sub-groups. Hearing loss or hearing sensitivity is measured in decibels (dB). Normal hearing sensitivity is -10 dB to 25 dB. Degree of Hearing Loss as per the Ministry of Welfare (Govt. of India), Notification No.4283HW, dt. 6.9.86 are given in the following table:

48 Level Types of Impairment dB Levels Speech Percentage of Impairment discrimination Impairment I. Mild dB 26 to 40 100% in better Less than 40% Hearing dB in better ear Impairment ear II. Moderate 41 to 55 dB 50% to 80% in 40% -50% Hearing in better ear better ear Impairment III. Severe 50 to 70 dB 40 % to 50 % 50 % -75% Hearing hearing Impairment impairment in better ear IV. (a) Total No hearing no 100% deafness discrimination (b) Near 91 dB & total above in - do- 100% deafness better ear 75%-100% (c) Profound 71 to 90 dB Less than 40% hearing Loss in better ear Decibel (dB) means a unit of relative loudness of a sound. Zero decibels (0 dB) designate the point at which people with normal hearing can detect even the faintest sound. Each succeeding number of dB indicates a certain degree of hearing loss. 1.3.4.5 On the basis of

87%

MATCHING BLOCK 27/108

SA

SED-14 Final.docx (D93662759)

cause Hearing loss can be classified as Exogenous Hearing Impairment, Endogenous Hearing Impairment and Idiopathic hearing impairment. (a) Exogenous Hearing Impairment This refers to hearing loss caused by all factors other than heredity. These factors include: • Prenatal causes (Cause before birth) • Natal causes (Causes at the time of birth) • Post natal causes (Causes after birth) • Infections 49 • Noise • Aging (b) Endogenous Hearing Impairment This includes only "heredity" as the causative factor for hearing loss. Hereditary hearing loss may be transmitted as a dominant or recessive characteristic. (c) Idiopathic Hearing Impairment This refers to hearing loss of an unknown pathology or cause i.e., the causes of hearing loss is unknown. 1.3.5

Impediment caused by different types of hearing loss Due to different types of hearing loss, an individual faces various types of profound consequences life which are restricted below- 1. Socially handicapped 2. Problems in Personal & Social Development 3. Personality Problems 4. Psychological Problems 5. Linguistic Problems 6. Abnormal Emotional Behaviour

1. Socially handicapped Hearing impaired children find it very difficult to adjust with the environment of the society. They suffer from personality disorders & slow temperament, withdrawl or submissiveness etc. They very often fail to understand what other people say due to which they face communication difficulties. 2. Problems in Personal & Social Development Personal & social development problem is very common with the hearing impaired children. The main barrier for them for communicating with other is language-which affects the socialisation process and plays a vital role in their personal & social development. The most significant aspect of these children is their increased dependence on others which causes sense of inferiority. 50 3. Personality Problems Studies show that hearing impaired children face some personality problems. Partial hearing children face more problem than the totally deaf children since partially deaf child gets more frustrated as he tries to reach the level of normals. 4. Psychological Problems Hearing impaired children suffer from behavioural problems. They suffer from inferiority complex since they find themselves helpless in adapting to circumstances that require verbal communication. They compare themselves with their peers and also judge the attitude of society towards them. They feel that they are different from the normal children which hampers the growth and development of their personality. 5. Linguistic Problems The deaf children face difficulty for acquisition of language since language is an auditory vocal process which leads to very slow linguistics development in them. These children have to receive visually while the normal children receive orally. They differ significantly from the normal children so far as language development is considered. These children have a limited vocabulary; they lack comprehension of complex word and words with multiple meaning and concept. Moreover, they are faced with difficulty in understanding complex structure of language and sometimes they have no language exposure. 6. Abnormal Emotional Behaviour Young hearing impaired children very often show abnormal emotional behaviour like throwing something to attract to attention to them. Lack of comprehension may invite tension and resistance in them. They get irritated when they cannot make them understood.

1.3.6 Let us sum up In our society, speech and language are critical avenues for effective education and socialization. To know about Hearing Impairment, it is very much essential to know the process of hearing, types of hearing loss and causes leading to different types of hearing loss.

51 Through our organ- Ear, we are able to acquire hearing, auditory perception, or audition to perceive sound by detecting vibrations, changes in the pressure of the surrounding medium through time, we may hear sound through solid, liquid, or gaseous matter. It is one of the traditional five senses; partial or total inability to hear is called hearing loss. To understand properly about the hearing loss, it is necessary to first understand the anatomy of the ear. The ear has three main parts: the outer ear, the middle ear and the inner ear. To understand properly about the hearing loss, it is necessary to first understand the anatomy of the ear. The ear has three main parts: the outer ear, the middle ear and the inner

SA SED-14 Final.docx (D93662759)

Hearing is the main sensory pathway through which speech and verbal communication develop. A child is likely to speak incorrectly

if he/she hears imperfectly. Hearing also influences learning and other aspects of maturation. So it is important for us to know about the normal hearing sensitivity .A normal hearing sensitivity means the person has no known pathology or known history of infection or any kind of disorder and without any kind of significant difficulties, is able to hear even the softest sound or whisper. Generally a normal hearing sensitivity level is -10 dB HL to 25 dB HL. the implications of an auditory impairment change due to change of situation and person. Different types of terms are used to describe the persons who are suffering from hearing problem. Speech and hearing experts generally use these terms interchangeably. This is not correct, because meaning of each term is different. So it is essential for us to know the meaning of these terminologies 1.4.2

Objectives After going through this subunit the learners will be able to •
know the definition of

hearing loss • know about the different terminologies of hearing impairment • know the steps involved in hearing process 54 1.4.3 Definition of hearing loss Any degree of impairment of the ability to apprehend sound is called

74% MATCHING BLOCK 31/108

hearing loss. Hearing loss, also known as hearing impairment, is a partial or total inability to hear. It may occur in one or both ears .

Hearing impaired are those in whom the sense of hearing is non functional for ordinary purposes of life. They do not hear/understand sound at all even with amplifier. Hearing loss exists when there is diminished sensitivity to the sounds normally heard. The people who have relative insensitivity to sound in the speech frequencies come under the terms hearing impairment or hard of hearing. According to the increase in volume above the usual level necessary before the listener can detect it the severity of a hearing loss is categorized.

100% MATCHING BLOCK 32/108

SA .SREEJA DEAFNESS.docx (D70342501)

Deafness is defined as a degree of loss such that a person is unable to understand speech even in the presence of amplification.

95% MATCHING BLOCK 33/108

SA .SREEJA DEAFNESS.docx (D70342501)

In profound deafness, even the loudest sounds produced by an audiometer (an instrument used to measure hearing by producing pure tone sounds through a range of frequencies) may not be detected. In total deafness, no sounds at all, regardless of amplification or method of production, are heard.

Description Sound can be measured accurately. The term decibel (dB) refers to an amount of energy moving sound from its source to our ears or to a microphone. A drop of more than 10 dB in the level of sound a person can hear is significant. Sound travels through a medium like air or water as waves of compression and rarefaction. These waves are collected by the external ear and cause the tympanic membrane (ear drum) to vibrate. The chain of ossicles connected to the ear drum, the incus, malleus, and stapes carries the vibration to the oval window, increasing its amplitude 20 times on the way. There the energy causes a standing wave in the watery liquid (endolymph) inside the organ of Corti. (A standing wave is one that does not move. A vibrating cup of coffee will demonstrate standing waves.) The configuration of the standing wave is determined by the frequency of the sound. Many thousands of tiny nerve fibers detect the highs and lows of the standing wave and transmit their findings to the brain, which interprets the signals as sound. To summarize, sound energy passes through the air of the external ear, the bones of the middle ear and the liquid of the inner ear. It is then translated into nerve impulses, sent to the brain through nerves and understood there as sound. It follows that there are five steps in the hearing process:

55 • air conduction through the external ear to the ear drum • bone conduction through the middle ear to the inner ear • water conduction to the Organ of Corti • nerve conduction into the brain • interpretation by the brain. If any problems arise in the ear in these steps due to anatomy and physiology of the ear or any problems in brain then comes hearing loss. Hearing can be interrupted in several ways at each of the five steps. Ear wax, foreign objects, infection, and tumors can block the external ear canal. Overgrowth of the bone, a condition that occurs when the ear canal has been flushed with cold water repeatedly for years, can also narrow the passage way, making blockage and infection more likely. The ear drum is so thin a physician can see through it into the middle ear. Sharp objects, pressure from an infection in the middle ear, even a firm cuffing or slapping of the ear, can rupture it. It is also susceptible to pressure changes during scuba diving. Several conditions can diminish the mobility of the ossicles (small bones) in the middle ear. Otitis media (an infection in the middle ear) occurs when fluid cannot escape into the throat because of blockage of the eustachian tube. The fluid that accumulates, whether it be pus or just mucus and dampens the motion of the ossicles. A disease called otosclerosis can bind the stapes in the oval window and thereby cause deafness. All the conditions mentioned so far, that occur in the external and middle ear, are causes of conductive hearing loss. The second category, sensory hearing loss, refers to damage to the Organ of Corti and the acoustic nerve. The leading cause of sensory hearing loss is prolonged exposure to loud noise. A million people have this condition, many identified during the military draft and rejected as being unfit for duty. The cause is often believed to be prolonged exposure to rock music. The other leading cause of noise induced hearing loss (NIHL) is occupational noise exposure and is ample reason for wearing ear protection on the job. A third group of people over 65 have sensory hearing loss due to aging. Both NIHL and presbycusis are primarily high frequency losses. In most language, it is the high frequency sounds that define speech, so these people hear plenty of noise, they just cannot easily make out what it means. They have particular trouble selecting out speech

56 from background noise. Brain infections like meningitis, drugs such as the aminoglycoside antibiotics (streptomycin, gentamycin, kanamycin, tobramycin), and Meniere's disease also cause permanent sensory hearing loss. Meniere's disease combines attacks of hearing loss with attacks of vertigo. The symptoms may occur together or separately. High doses of salicylates like aspirin and quinine can cause a temporary high frequency loss. Prolonged high doses can lead to permanent deafness. There is a hereditary form of sensory deafness and a congenital form most often caused by rubella (German measles). Sudden hearing loss—at least 30dB in less than three days is most commonly caused by cochleitis, a mysterious viral infection. The final category of hearing loss is neural. Damage to the acoustic nerve and the parts of the brain that perform hearing are the most likely to produce permanent hearing loss. Strokes, multiple sclerosis, and acoustic neuromas are all possible causes of neural hearing loss. Hearing can also be diminished by extra sounds generated by the ear, most of them from the same kinds of disorders that cause diminished hearing. These sounds are referred to as tinnitus and can be ringing, blowing, clicking, or anything else that no one but the patient hears. 1.4.4 Deferent terminologies used in hearing impaired

8 UNIT-I (FUNDAMENTALS OF HEARING).docx
(D162037136)

usually outside the range of normal .It generally includes a broad range of hearing disability, which ranges in severity from mildly hearing impaired to profoundly deaf.

There is often confusion over the terms "hearing impaired," "hard of hearing," "deaf," and "deafened," both in definition and appropriateness of use. 'Hearing impairment', 'hearing disability' and 'hearing handicap' are not synonymous term. The term "hearing impaired" is often used to describe people with any degree of hearing loss, from mild to profound, including those who are deaf and those who are hard of hearing. Many individuals who are deaf or hard of hearing prefer the terms "deaf" and "hard of hearing," because they consider them to be more positive than the 57 term "hearing impaired," which implies a deficit or that something is wrong that makes a person less than whole. "Deaf" usually refers to a hearing loss so severe that there is very little or no functional hearing. "Hard of hearing" refers to a hearing loss where there may be enough residual hearing that an auditory device, such as a hearing aid or FM system, provides adequate assistance to process speech. "Deafened" usually refers to a person who becomes deaf as an adult and, therefore, faces different challenges than those of a person who became deaf at birth or as a child. Deaf, deafened, and hard of hearing individuals may choose to use hearing aids, cochlear implants, and/or other assistive listening devices to boost available hearing. Alternatively, or in addition, they may read lips, use sign language, sign language interpreters, and/or captioning. People who are deaf or hard of hearing may have speech that is difficult to understand due to the inability to hear their own voice. The term "Deafness" refers to hearing disabilities that preclude successful processing of linguistic information through audition, with or without a hearing aid.

98%

MATCHING BLOCK 37/108

8 UNIT-I (FUNDAMENTALS OF HEARING).docx
(D162037136)

The term "hearing handicap" refers to the effect of the hearing impairment on the person's everyday situations and the disadvantages imposed by the impairment sufficient enough to affect one's personal efficiency in the activities of daily living. Thus in other words, the influence of the hearing impairment is the hearing handicap. According to the definition adopted by Ministry of Social Justice and Empowerment, Govt. of India and Persons with Disability Act (P.W.D. - 1995-96), "hearing handicap" refers to hearing loss of 60dB HL or more on the better ear. 1.4.5

Let us sum up Hearing is the main source of development of speech and verbal communication. So it requires perfect hearing to develop a child properly. Normal hearing sensitivity means a person has no infection or disorder and is able to hear properly. Its level is -10dB HL to 25dB HL. Auditory impairment varies due to change of situation and person. Hearing loss means any degree of impairment. Hearing impaired person does not hear at all with the amplified speech. The severity of the hearing loss is categorized according to the increase in volume above normal level. Profound deafness means unable to detect the

58 loudest sounds and total deafness means no sounds at all. Unit of sound is decibel (dB). Sound energy passes through the air of the external ear, the bones of the middle ear and liquid of the inner ear. It is then translated into the nerve impulses which are sent to the brain through nerve. If any problem comes in the ear, hearing loss arises. The external ear canal can be blocked with ear wax, foreign objects, infections and tumor. Several conditions like Otitis media or otosclerosis can diminish the mobility of the ossicles in the middle ear and can cause deafness. Conductive hearing loss is caused due to all above conditions. Sensory hearing loss refers to damage to the organ of Corti and acoustic nerve which is caused due to prolonged exposure to loud noise, aging, brain infection like meningitis, drugs like aminoglycoside, Meniere's disease, High doses of salicylate like aspirin and quinine etc. Neural hearing loss is caused due to strokes, multiple sclerosis and acoustic neuromas. Depending upon the hearing loss, different terms are – (i) hearing impaired, (ii) hard of hearing, (iii) deaf, (iv) deafened, (v) deafness and (vi) hearing handicap.

The cause can be genetic and hereditary, caused by issues during pregnancy or caused from an issue during the birthing process.

93% **MATCHING BLOCK 41/108** **W**

The causes of hearing loss and deafness can be divided into congenital causes and acquired causes. 1.5.3.1 Congenital causes Congenital causes may lead to hearing loss being present at or acquired soon after birth. Hearing loss can be caused by hereditary and non-hereditary genetic factors or by certain complications during pregnancy and childbirth, including: • maternal rubella, syphilis or certain other infections during pregnancy; • low birth weight; • birth asphyxia (a lack of oxygen at the time of birth); • inappropriate use of particular drugs during pregnancy, such as aminoglycosides, cytotoxic drugs, antimalarial drugs and diuretics; • severe jaundice in the neonatal period, which can damage the hearing nerve in a newborn infant.

Hearing loss may occur if any part of the ear is defected. It may be before birth or after birth. If it is shown in birth time then it is called congenital hearing loss. There is a range of congenital ear, nose and throat problems - some occurring alone and others as part of a syndrome. The underlying causes are varied but, as with any congenital disorder, they can be broadly divided into chromosomal abnormalities (mutations and inherited problems), diseases associated with prenatal infection, maternal drug abuse, environmental factors, iatrogenic causes and abnormalities of unknown aetiology.

62 1.5.3.2 Types of Congenital causes An abnormality of the External Ear, Middle Ear & Inner Ear may lead to congenital hearing loss. Various types of abnormality are shown in these types. Such as: Anotia/microtia Anotia is the total absence of the auricle, most often with narrowing or absence of the external auditory meatus. Strictly speaking, in microtia, there is some degree of malformation of the external ear (\pm narrowing or absence of the external auditory meatus) in contrast to a 'small ear' which is normally formed, as seen in Down's syndrome. These conditions may be unilateral or bilateral - the latter is less common. Macrotia This is a large but normally formed auricle, not usually associated with functional abnormality. It is defined as an ear which is two or more standard deviations from the mean. True macrotia is rare but may be seen in association with vascular malformations, hemihypertrophy, neurofibromatosis and secondary to haemangioma. It is more conspicuous if the ear is prominent too. Surgical correction can be carried out. The Antia-Buch technique, which involves freeing the helical flap and repositioning it, is the most commonly used procedure. External auditory meatus atresia Congenital atresia of the external auditory canal is caused by a failure of canalisation of the epithelial plug portion of the first branchial cleft. This results in the formation of a membranous or bony (or both) plate at the level of the tympanic membrane. There may be associated ossicular malformations. Abnormalities of the middle ear In the absence of other problems, hearing loss associated with these abnormalities is often picked up during the course of routine infant and childhood audiological assessments. More specialist assessment and management is carried out in the ENT department. Tympanic membrane abnormalities The tympanic membrane may be small (eg, congenital rubella syndrome), distorted (eg, VATER syndrome [Vertebral anomalies, Anal atresia, Tracheo-oesophageal fistula, (o) Esophageal atresia and Renal anomalies and radial dysplasia]) or replaced by fibrous tissue or a bony plate.

63 Ossicular abnormalities • There are a number of different ossicular abnormalities, which may affect one or more of the ossicles. • There may be absence of part or all of these bones and there can also be varying degrees of fusion. • The associated intratympanic muscles are often affected and there can be an aberrant course of the facial nerve. • Surgery can go some way towards correcting this. Abnormalities of the tympanic cavity Congenital cholesteatoma (2-3% of all cholesteatomas) It is usually unilateral, may be bilateral, and presents as conductive hearing loss. The tympanic membrane is intact and overlies a white mass (this varies from a small pearl size to filling the entire middle ear) which can act as a source of infection. CT scanning to assess the lesion is advisable as this will dictate the surgical approach. Vascular abnormalities These include the presence in the middle-ear cavity of internal carotid artery aneurysms, jugular bulb abnormalities and very rare cases of an anomalous internal carotid artery. These vascular abnormalities tend to present with limited functional problems but a pulsatile red, smooth mass may be seen behind the tympanic membrane on examination. Their presence should be confirmed in a specialist unit, as it will have implications in considering any future intervention in. Congenital perilymph fistula This may occur, linking the perilymphatic space of the inner ear to the middle-ear cavity. There are often associated deformities. Children present with fluctuating and progressive sensorineural hearing loss \pm tinnitus, vertigo and, occasionally, recurring meningitis. Diagnosis is confirmed on CT scanning and surgical correction can be carried out. Abnormalities of the inner ear The inner ear is the collection of structures within the bony labyrinth: the semicircular canals, the vestibule and the cochlea. Congenital abnormalities here are rare and will result in deafness in addition to possible dizziness, and account for up to 20% of children with sensorineural hearing loss.

64 People with abnormalities of the inner ear are at increased risk of developing recurrent meningitis or a perilymphatic fistula. Middle-ear infections should therefore be treated aggressively. There is also increased risk of developing cerebrospinal fluid leaks after minor head injuries and therefore it is advisable to avoid contact sports. These deformities are typically classified according to embryonic developmental stages. Any of the structures can be involved.

Cochleosaccular dysplasia is probably the most common form of inner-ear congenital deformity and is characterised by a collapse of the cochlear duct and saccule. 1.5.4 Acquired hearing loss Acquired hearing loss is a hearing loss that appears after birth. The hearing loss can occur at any time in one's life due to illness or injury. The problems may occur in any part of the ear. Following are examples of conditions that can cause acquired hearing loss in children: 1.5.4.1 Acquired causes Following are the

63% MATCHING BLOCK 42/108

W

acquired causes which may lead to hearing loss at any age : • infectious diseases such as meningitis, measles and mumps, Encephalitis, • Chicken pox, Flu; • chronic ear infections; • collection of fluid in the ear (otitis media); • use of particular drugs, such as

some antibiotic and antimalarial medicines; •

76% MATCHING BLOCK 43/108

W

injury to the head or ear; • excessive noise, including occupational noise such as that from machinery and explosions, and recreational noise such as that from personal audio devices,

94% MATCHING BLOCK 44/108

W

concerts, nightclubs, bars and sporting events; • ageing, in particular due to degeneration of sensory cells; • wax or foreign bodies blocking the ear canal. Chronic otitis media is

the leading cause of hearing loss among children, In the previous unit it is known that on the location of the problem, hearing loss is also classified into three types. These are • Conductive loss
65 • Sensorineural hearing loss and • Mixed hearing loss These three types of hearing losses are common for congenital hearing loss and acquired hearing loss. It can vary in degrees of severity and occur in all age groups; however, the elderly are most commonly the hearing impaired. Hearing is broken up into two different parts: • The conduction of the sound and • The nerve processing of the sound. On the basis of anatomy and the place of problem the distinction is made. • Conductive Loss: Problems with sound waves travelling to the cochlear (the external and middle ear) • Sensorineural Loss: Nerve related problems involving the cochlear and the inner ear • Mixed hearing loss: Is a combination of both conductive and sensorineural hearing loss at the same time. Both the middle and inner ear are involved. 1.5.5 Challenges Hearing and speech are essential tools of learning, playing and developing social skills for a child. Children learn to communicate by imitating the sounds they hear. If they have a hearing loss which is undetected and untreated, they can miss much of the speech and language around them. This results in delayed speech/language development, social problems and academic difficulties. These children score a relatively low score on IQ testing. In general their performance in academic subjects of the school is also poor. They face difficulty in personal-social adjustment. 1.5.5.1 Impact of hearing loss Functional impact Individual's poor ability to communicate with others is

70% MATCHING BLOCK 45/108

W

one of the main impacts of hearing loss. Spoken language development is often delayed in children with

deafness. On the academic performance of children

100% MATCHING BLOCK 46/108

W

hearing loss and ear diseases such as otitis media can have a significantly adverse effect.

However, when opportunities are provided for people with hearing loss to communicate, they can participate on an equal basis

66 with others. The communication may be through spoken/-written language or through sign language. Social and emotional impact Limited access to services and

100% MATCHING BLOCK 47/108

W

exclusion from communication can have a significant impact on everyday life, causing feelings of loneliness, isolation and frustration, particularly among older people with hearing loss.

If a person with congenital deafness has not been given the opportunity to learn sign language as a child, he or she may feel excluded from social interaction. Economic impact

100% MATCHING BLOCK 48/108

W

Children with hearing loss and deafness rarely receive any schooling

in developing countries.

W

among those who are employed, are in the lower grades of employment compared with the general workforce. Unemployment rates among this group will decrease by improving access to education and vocational rehabilitation services, and raising awareness especially among employers about the needs of people with hearing loss.

Hearing loss substantially affects social and economic development in communities and countries also in addition to the economic impact of hearing loss at an individual level. 1.5.5.2 Challenges arising due to congenital hearing loss In congenital hearing loss child has not acquired the basic language and speech patterns which are required in intellectual functioning, academic success and social adjustment. Congenital hearing loss is associated with certain behavioural problems. In adapting to circumstances that requires verbal communication the H.I (hearing impaired) children feel invariable inferior and helpless. They have a poor self concept which damages the development of personality (Loeb and Saregiani, 1986). Language development of the congenitally deaf children differs markedly from that of the normal. In fact, the normal child learns the language, but the HI child is taught language. They process language and linguistic utterances visually. In congenital hearing loss cognitive functioning also does not develop. They face difficulty in understanding abstracts concepts. They possess poor comprehension ability because of limited vocabulary. 67 In case of congenital hearing loss of mild or moderate level, child can achieve his/her goal with the help of proper guidance, treatment and use of proper devices. But in case of severe or profound level child cannot progress according to his/her goals. In case of congenital sensori-neural hearing loss, child faces many problems in various areas such as academic, social etc. 1.5.5.3 Challenges arising due to acquired hearing loss In addition to the challenges discussed in the case of congenital hearing loss, acquired hearing loss children may face following challenges. Acquired hearing loss is of two types- (i) Pre-lingual and (ii) Post-lingual. If a child suffers from hearing loss before he/she has achieved basic competency in his or her primary language (i.e. occurring before age 3 years (Schein, 1987) then it is called Pre lingual hearing loss. Whereas post lingual hearing loss is that which occurs after the basic acquisition of language i.e.in later childhood or adulthood (Vernon and Andrews, 1990). At the age of one year or a little more, a child with normal hearing begins to speak and he or she acquires many pre-verbal skills (skills that are learned by the child before acquiring speech and language). Also develops a significant amount of receptive language (understanding of language) in the first year of life. A child with hearing impairment does not get a chance to learn many of the pre-verbal skills (for e.g. imitation of voice) since the development of these skill is related to hearing and thus begins to lag behind average children of the same age. As the development of many of the pre-verbal skills (for e.g. imitation of voice) is related to hearing ,a child with hearing impairment does not get a chance to learn these skills and thus begins to lag behind average children of the same age. After the stage of learning basic language if a child develops a hearing loss he or she would have an advantage over a child who has had hearing loss pre-lingually. However, children with post –lingual hearing loss is at risk for losing language and speech skills that they have acquired if proper care is not taken for him in advance. 1.5.6 Let us sum up Speech and verbal communication of a child is developed on the basis of hearing capacity. Effect of poor hearing may affect his speaking, learning and performance. Congenital hearing loss is any hearing loss being present or acquired soon after the birth due to

68 genetic factors or by certain complication during pregnancy and child birth. An abnormality of the external ear, middle ear and inner ear may lead to congenital hearing loss. Acquired hearing loss is a hearing loss that appears after birth which may occur at any time in any part of the ear due to illness or injury. Hearing loss is classified into three types – (i) Conductive loss, (ii) Sensorineural loss and (iii) Mixed hearing loss. If a child is having any hearing loss problem which is not detected and treated, then there may be great impact which may result in delayed speech/ language development, social problems and academic difficulties. He may face personal – social adjustment. Moreover, there may be functional impact, emotional impact as well as economic impact on his life due to this. In addition to different impacts of hearing loss at an individual level, hearing loss substantially affects the social and economic development in communities and countries. In congenital hearing loss, child does not acquire language and speech patterns which are required in intellectual functioning, academic success and social adjustment. Due to this he/she suffers from inferiority complex and feels helpless which affects his/ her day to day life. Acquired hearing loss is of two types – (i) Pre- lingual and (ii) Post- lingual. Pre- lingual hearing loss is that which occurs before the child has achieved basic competency in his/ her primary language. Post- lingual hearing loss is that which occurs after the basic acquisition of language. Apart from speaking at the age of one year, a normal hearing child acquire many pre- verbal skills which is not possible for a child with hearing loss and thus lag behind the average child of his age. However, child with post –lingual hearing loss is at risk for losing language and speech skills that acquired if proper care is not taken for him in time.

1.5.6 “Check your progress” 1. What do you mean by congenital hearing loss?

A person suffering from hearing impairment has difficulty in perceiving or identifying sound clearly due to auditory problems. The impairment may be unilateral or bilateral ears. Due to this problem child can face problem in verbal communication skill and It can affect several development areas personal-social, cognitive and academic. Unit : 2 ppppp Impact of Hearing Loss

71 2.1.2

Objective: lllll To understand symptom of hearing loss during infancy and child hood. lllll To understand characteristics of learners having hearing loss. lllll To understand different degrees and communication of hearing loss. lllll To understand, and address the challenge in educating student with hearing loss. lllll To understand different terminology in hearing loss.

2.1.3 What are the symptoms of children with hearing impairment? During infancy: lllll 1-3 months old no response to sudden sound such as banging of door or ringing of doorbell. lllll 4-6 months old unable to locate the sound source. lllll 7-9 months old do not look at the person being mentioned, e.g. "Where is Uncle Joy?" lllll 10-12 months old no response to their names being called or frequently used words or phrases. During childhood: lllll Delayed response to sound lllll Cannot hear clearly what others are saying lllll Show difficulty in locating the sound source lllll Pay more than usual attention to speaker's facial expression and lip movement while listening. lllll Give irrelevant answers or misinterpret instructions lllll Request for repetition during conversation lllll Show poorer ability to understand speech in a noisy environment lllll Tend to turn up the sound volume of television lllll Incorrect pronunciation

72 lllll Delayed language development lllll Poor attention in class lllll Frequent use of gestures to express themselves, e.g. pointing to what they want lllll Easily irritated as a result of communication difficulty. 2.1.4 Characteristics of learners with hearing loss lllll Deaf/Deafness refers to a person who has a profound hearing loss and uses sign language. lllll Hard of hearing refers to a person with a hearing loss who relies on residual hearing to communicate through speaking and lip-reading. lllll Hearing impaired is a general term used to describe any deviation from normal hearing, whether permanent or fluctuating, and ranging from mild hearing loss to profound deafness. lllll Residual hearing refers to the hearing that remains after a person has experienced a hearing loss. It is suggested that greater the hearing loss, the lesser the residual hearing. 2.1.5

Characteristics of learners: lllll Language and speech- The ability to learn language and speech is the most severely affected area of development of hearing impairment. lllll Intellectual ability- Thinking process of normal and deaf children are found to be similar. Also cognitive abilities of deaf children are essentially unimpaired expect in those cases which involve language experience. But deaf children are retarded in intellectual task which requires verbal skill and highly performance in non- verbal intelligence. lllll Academic Performance- Hearing impaired children are frequently handicapped in various degree of hearing loss and it effect on educational performance and particularly and particular handicapped in reading which relies heavily upon language skill. lllll Adjustment of social interaction Our social interaction, depends upon communication. So deaf children have communication problems that's why they have problem of social interaction such children live in a world of isolation and

73 from a group of their own an association of the deaf for their common interest and interaction. lllll Behavioral problem- Deaf learners feel invariably inferior and helpless in adapting to circumstances that require verbal communication. So regard non-verbal communication absence of verbal/they have poor self concept which damages the development of personality. lllll Socially handicapped - Learners with hearing loss can not adjust with society because they suffer from communication difficulty and fail to understand what others hearing people say. lllll Problem in personal and social development- Language becomes a barrier for deaf learner for purpose of communication with others so this affects the socialization process and plays a vital role in the personal and social development of hearing loss learner. lllll Personality problem- Hearing difficulty may create more personality problem because a deaf learner is more frustrated as he/she tries to reach the level of the normal and a totally deaf child seems reconciled to his take. 2.1.5.1 "Check your progress" - 1 l) During infancy what are the symptoms of children with hearing impairment?

characteristics of learners with hearing loss?

.....

..... 2.1.6 Impact of different degree of hearing impairment on communication.

Hearing impairment results from a number of causes and is usually characterized by the type and degree of hearing loss. Type of hearing loss is related to the site of the disorder within the auditory system, and degree of loss is related to the extent that the disorder is infringing on normal function. Defining both the type and degree of hearing loss is a cornerstone of audiology. 2.1.6.1. Importance of Hearing: The sense of hearing is essential as: lllll It is the foundation for development of verbal language lllll It helps the person to live effectively in the environment lllll It helps in better communication even over long distances. 2.1.6.2 The process of hearing: lllll The physical processing of hearing occurs in three groups of structures, commonly known as the outer, middle, and inner ears.

75 The outer ear has three main components: the auricle, the ear canal or meatus, and the outer layer of the eardrum or tympanic membrane. The outer ear serves to collect and resonate sound, assist in sound localization, and function as a protective mechanism for the middle ear. The middle ear is an air-filled space located within the temporal bone of the skull. It contains the ossicular chain, which consists of three contiguous bones suspended in space, linking the tympanic membrane to the oval window of the cochlea. The middle ear structures act as an impedance matching device, providing a bridge between the airborne pressure waves striking the tympanic membrane and the fluid-borne traveling waves of the cochlea. The inner ear contains the cochlea, which is the sensory end organ of hearing. The cochlea consists of fluid-filled membranous channels within a spiral canal that encircles a bony central core. The sound waves, transformed into mechanical energy by the middle ear, set the fluid of the cochlea into motion in a manner consistent with their intensity and frequency. Waves of fluid motion impinge on the membranous labyrinth and set off a chain of events that result in neural impulses being generated at the VIIIth cranial nerve which is perceived by the auditory cortex in the temporal lobe in the brain. Impediment to sound across any of the three structures can result in loss in hearing acuity called as hearing loss.

2.1.6.3 Types of hearing loss: According to anatomical origin, hearing loss are of three major types :

- Conductive hearing loss - pertaining to the outer and middle ear
- Sensorineural hearing loss - pertaining to the inner ear only.
- Mixed hearing loss -pertaining to the outer/middle and inner ear.

According to the perceived loudness, hearing loss can be categorized as :

- Hearing sensitivity loss
- Suprathreshold hearing disorders
- Functional hearing loss

Hearing sensitivity loss is the most common form of hearing disorder. It is characterized by a reduction in the sensitivity of the auditory mechanism so that sounds need to be of higher intensity than normal before they are perceived by the listener. Suprathreshold disorders are less common, may or may not include hearing sensitivity loss, and often result in reduced ability to perceive speech properly.

76 Functional hearing loss is the exaggeration or fabrication of a hearing loss. In addition to type of loss, a hearing disorder can be described in terms of time of onset, time course, and whether one or both ears is involved. A hearing disorder can be described by the time of onset:

- Congenital: present at birth
- Acquired: obtained after birth
- Adventitious: not congenital; acquired after birth; coming by chance/accidental

Hearing disorder can also be described by its time course:

- Acute: of sudden onset and short duration
- Chronic: of long duration
- Sudden: having a rapid onset
- Gradual: occurring in small degrees
- Temporary: of limited duration
- Permanent: irreversible
- Progressive: advancing in degree
- Fluctuating: aperiodic change in degree

In addition, hearing disorder can be described by the number of ears involved:

- Unilateral: pertaining to one ear only
- Bilateral: pertaining to both ears

Sensitivity Loss Degree of hearing sensitivity loss is commonly defined on the basis of the audiogram. Normal sensitivity ranges from -10 to +25dBHL. All other classifications are based on generally accepted terminology. These terms might be used to describe the pure-tone thresholds at specific frequencies, or they might be used to describe the puretone average or threshold for speech recognition. Pure-tone average is the mean of thresholds at 500, 1000, and 2000 Hz.

General guideline for describing degree of hearing loss

Degree of loss Range (in dB HL) Normal -10 to 25 Mild 26 to 40 Moderate 41 to 55 Moderately severe 56 to 70 Severe 71 to 90 Profound >90

77

Communication Speech is normal and normal pattern of development with good auditory perceptive skills. Speech and language developments are within normal limits. May exhibit occasional auditory perception problems some educational retardation likely. Language development and speech are mildly affected. Difficulty with rarely used words, minor differences in meaning of words and idioms, defective articulation but still intelligible speech loss quality and inflection almost normal. Reading and writing delayed. Vocabulary training, reading and writing to be special attended train addition to schooling. Grammar, vocabulary, articulation and voice are affected understand in loud speech .Early speech is unintelligible. Even with hearing aids show difficulty in understanding. Reading and writing need special assistance. Speech and language donot developments spontaneously. Sound produced very loudly at a distance of 1ft. and near of the ear. The voice will be high-pitched and articulation distorted. They donot rely on hearing for their communication. Language and speech develop only by training and they are educationally deaf. Communicate mostly through gestures, voice, inflection, articulation greatly affected. Required regular speech and language training regarding subject's expert. Type of Impairment Ability to perceive Speech dB level sound discrimination 0 to 25 dB HL Normal Hearing Normal Normal 26-40 dB HL Mild Hearing Loss Difficult to identify 100% better ear soft sound such as whispering and others. "41-55 dBHL Moderate Hearing Loss Unable to hear clearly 50% to 80% what others are saying better ear during conversation. Hearing aids are necessary. 56-70 dB HL Moderatey-Severe Hearing Unable to clearly hear 40% to 50% loud noises such as better ear telephone ring Severe 71-90 dBHL Severe Hearing Loss Can only hear very No loud noises and discrimination sounds such as shouting or vacuum cleaner noise. &t;90 dB HL Profound Hearing Loss Difficult to perceive No any sound discrimination

78 2.1.7

Let us Sum Up lllll

Hearing ability suffer it leads from hearing difficulty. lllll Problem will be unilateral and bilateral. lllll Symptom of hearing loss infancy or it will be childhood. lllll It will be several characterstics hearing loss and also learner activities lllll It will be impact in different egree of hearing loss and it affected communication of speech and language. 2.1.7.1 "

Check Your Progress" - 2 l) What is the difference between normal hearing communication and profound hearing loss communication?

..... 2) What is the meaning of Unilateral and Bilateral hearing loss?

..... 3) According to anatomical origin how many type of hearing loss are there?

..... 4) Mention the type of physical processing of hearing?

79 5) Where is the Ossicular chain situated?

..... 6) What is the name of VIIIth crenial nerve in brain?

..... 7) Write the full form of the P.T.A.

..... 2.1.8

Answer to Check Your Check Progress "Check Your Check Progress" - 1 1) 1-3 months old No response to sudden sound such as banging of door or ringing of doorbell. 4-6 months old Unable to locate the sound source. 7-9 months old do not look at the person being mentioned, e.g. "Where is Uncle Joy?" 10-12 months old No response to their names being called or frequently used words or phrases, e.g. "No". 2)

Hard of hearing refers to a person with a hearing loss who relies on residual hearing to communicate through speaking and lip-reading. 3)

Deaf/

Deafness refers to a person who has a profound hearing loss and uses sign language. 4)

Residual hearing refers to the hearing that remains after a person has experienced a hearing loss. It is suggested that greater the hearing loss, the lesser the residual hearing. 5)

Hearing impaired is a general term used to describe any deviation from normal hearing, whether permanent or fluctuating, and ranging from mild hearing loss to profound deafness.

80 6)

Academic Performance- Hearing impaired children are frequently handicapped in various degree of hearing loss and it effect on educational performance and particularly and particular handicapped in reading which relies heavily upon language skill. Adjustment of social- Our social inter action depend upon communication so deaf children have communication problems that's why it should have problem of social inter action such children live in a world of isolation and from a group of their own ,an association of the deaf for their common interest and interaction. Behavioral problem- Deaf learners feel invariable inferior and helpless in adapting to circumstances that require verbal communication. So regard non-verbal communication absence of verbal they have poor self poor concept which damages the development of personality. "Check Your Progress" - 2 1) In normal hearing communication speech is normal and normal pattern of development with good auditory perceptive skills. In profound hearing loss donot rely on hearing for their communication. Language and speech develop only by training and they are educationally deaf. Communicate mostly through gestures, voice, inflection, articulation greatly affected. Required regular speech and language training regarding subject's expert. 2) Unilateral means pertaining to one ear only and Bilateral means pertaining to both ears. 3) There are of three major types of hearing loss. These are lllll Conductive hearing loss - pertaining to the outer and middle ear lllll Sensorineural hearing loss - pertaining to the inner ear only. lllll Mixed hearing loss - pertaining to the outer/middle and inner ear. 4) There are three physical processing of hearing.Outer Ear,Middle Ear and Inner Ear. 5) Middle Ear. 6) Auditory nerve is VIIIth cranial nerve in brain. 7) Pure Tone Audiometry.

81 2.1.9 Unit End Exercises 1. Discuss the details about characteristics with of learner/ksf hearing loss 2. Discuss the details about different type of hearing impairmet and their communication.

82 Unit : 2.2 ppppp Language and

communication issues attributable to hearing loss and need for early Intervention Structure 2.2.1 Introduction: 2.2.2 Objective: 2.2.3 Language issues attributable to hearing loss. 2.2.3.1 "Check your progress" - 1 2.2.3.2 Deafness creates language issues attributable to hearing loss. 2.2.3.3 Different degree of hearing loss and Language issues attributable 2 2.3.4 "Check your progress" - 2 2.3.5 Different degree of hearing loss and on communication issues attributable 2 2.3.6 "Check your progress" - 3 2.2.4 Early intervention 2.2.4.1 Early Intervention for the Identified Population 2.2.4.2 "Check Your Progress" - 4 2.2.5 Let us Sum Up 2.2.6 Answer to Check Your Progress 2.2.7 Unit End Exercise 2.2.1 Introduction Man is a social animal, without society human just being is like animal. So human interaction with society with the help of verbal interaction and that involves speech, language and communication. Speech, language and communication depend upon our

83 hearing ability which is to perceive the sound about nature. But if suffering from hearing ability it has difficulty to perceiv the sound about nature and it affects verbal interaction and also affects speech, language and communication. Due to this problem child can face problems in several development areas these are personal-social, cognitive and academic. You will realize that language and communication are the two of such concepts and also including speech which are core issue in the special education. Hence a clear and descriptive idea of language and communication issues attributable to hearing loss and need for early intervention is necessary to know it in a better way as a teacher trainee and also as a human being. 2.2.2 Objective lllll To understand meaning of communication lllll To know about different communication system, language and communication lllll To know about different degrees of hearing loss and type. lllll To understand to given in formation while language issue of hearing loss lllll To understand able to given in formation while communication issue of hearing loss lllll To understand the need for early intervention of hearing loss 2.2.3 Language issues attributable to hearing loss. Language is a part of human life. It gives words to our thought, voice to our idea and expression to our feelings. It is a rich and varied human ability one we can use without a thought that children seems to acquire automatically and that linguists have discovered to be complex yet describe. According to Chomsky, Language is a set of(finite or infinite) sentences, each finite in length and constructed out of a finite set of elements.

84 LANGUAGE COMPONENTS 2.2.3.1 “Check your progress” - 1 What is Language? Mention the component of language?

.....
.....

..... 2.2.3.2 To see how deafness creates language issues attributable to hearing loss. Speech is an oral manifestation of language. Speech refers to the actual production of sounds making words. These sounds are produced by the coordination of facial muscles and the flow of air through the human voice box (larynx). Language refers to our complex system of symbol used to communicate. Man is the talkative animal that lives in language as a fish lives in water. Speaking is natural activity for a human being. Moreover, the spoken word is the foundation of, all languages. While comparing the various aspects of language, one can conclude that ear language (spoken/oral aspect) and another is

of Thought

85

eye language (writing language). Ear language (spoken aspect) or oral language is the means of communication among people and it is used in daily life because it is the medium for conversation. Deaf student cannot perceive the sound about nature with the help of ear that’s why they are already delayed to ear language which is oral language in spoken aspect. The hearing-loss-children do not learn to listen immediate. After they are provided with the amplification and exposure to speech and language training and with best possible amplification language learning for the hearing-loss-child is possible. This is the major concern of hearing impairment. The system to process speech and language is in place but required raw material for it to enable any processing is inadequate. How to revive the broken link between hearing and speaking? This question may be answered predominantly in two ways: 1) One way to restore the link between hearing and speaking (and language) is to provide the child with ACE (Appropriate Continuous and Early) amplification with training. 2) Another answer is to bypass the link between speaking and hearing by providing the child with ENR (Early Natural Rich) exposure to sign language. The issue of these two answers and their mid points is complex, multi-faceted and challenging. 2.2.3.3

Different degree of hearing loss and Language issues attributable Language issues attributable Normal Misses 50% of class discussions, has problems in suppressing background noise. Articulation deficit, limited vocabulary, learning dysfunction. Delayed language syntax, atonal voice, reduced speech intelligi- bility Speech not developed or deteriorates, learning deficits Speech not developed or deteriorates, learning deficits Missed Sounds Normal 25% - 40% speech signal, distant sounds, unvoiced consonants, plurals and tenses. 50% - 80% speech signal 100% of speech information Ail speech sounds, can hear loud environmental noises All speech sounds, only feels vibrations Hearing Level Degree of Type (dB) Hearing Loss 0-25 Normal Normal 26-40 Mild Conductive Sensorineural 41 -55 Moderate Conductive/ Sensorineural 56-70 Moderately Sensorineural Severe Mixed 71 -90 Severe Sensorineural Mixed <90 Profound Sensorineural Mixed

86 2.2.3.4 “Check your progress” - 2 1) What is the meaning of Ear language?

.....
.....

..... 2) What is the meaning of Eye language?

.....
.....

..... 3) What is the difference between children with mild hearing loss and those with profound hearing loss on language issues?

.....
.....

..... 2.2.3.5 Different degree of hearing loss and communication issues We use the word communication very commonly and casually. What does it mean?

Communication is an intentional two way complex process of sending message from one end to the other via a channel. Have a look at the following examples : 1. Bulti writes a letter to Rishl. 2. Runa is unfolding the story of Shrikrishna through her Bharatnatyam. 3. Ananya saw red light at the signal and stopped her car. 4. Ashoke waves ‘bye’ to Prabir. 5. Saikat says, “Kishore please go to the bank”. 6. Triptesh opens the door when the bell rings. 7. Mita teaches her students the ‘Properties of Air’ using the Indian Sign Language. 8. Sujata listens to the radio.

87 Which of these are examples of communicative events? Yes, all the 8 are examples of communication. So Communication is a two way process of transfer of a message from one end to the other through a channel. What happens in these 8 events, do fit into our definition of communication? Now let us try to identify whether all events can be called language? You are very sure of 1, 5, and 8 for being examples of language. What about 7? Indian Sign Language, (as suggested by its name) is a language and hence communication example number 7 must be categorized along with 1, 5, 8. What about other examples 1, 2, 3, 4, 6 are communicative events but not examples of language. Linguistic communication can take place through following three modes of communication: 1) Aural / Oral (listening / speaking) 2) Visual / Graphical (Reading / Writing) 3) Visual / Manual (Sign Language) Again have a look at the list and point out the examples where speech is involved. Yes, 5 and are examples of speech. While comparing the various aspects of language, one can conclude that ear language (spoken/oral aspect) and another is eye language (writing language) Oral language is the means of communication. So communication is a complex two ways and intentional process of passing the message from one end to the other using a channel Encoder Message Decoder Channel Communication development and behavioral skills are influenced by a child's ability to hear. When hearing loss goes undetected or is detected late (after 6 months of age), language and speech development can be delayed. This delay can affect a child's social interactions, emotional development and academic performance.

88 2.2.3.6 "Check your progress" - 3 l) What is communication, speech and language?

.....
.....

..... Communication issues attributable Speech and language normal and normal pattern of development with good auditory perceptive skills. Speech and language developments are within normal limits. May exhibit occasional auditory perception problems some educational retardation likely. Language development and speech are mildly affected. Difficulty with rarely used words, minor differences in meaning of words and idioms, defective articulation but still intelligible speech loss quality and inflection almost normal. Reading and writing delayed. Vocabulary training, reading and writing to be special attended train addition to schooling. Grammar, vocabulary, articulation and voice are affected understand in loud speech .Early speech is unintelligible. Even with hearing aids show difficulty in understanding. Reading and writing need special assistance. Speech and language do not develop spontaneously. Sound produced very loudly at a distance of 1ft. and near the ear. The voice will be high-pitched and articulation distorted. They do not rely on hearing for their communication. Language and speech develop only by training and they are educationally deaf. Communicate mostly through gestures, voice, inflection, articulation greatly affected. Required regular speech and language training regarding subject's expert. Type of Impairment

Normal Hearing

Mild Hearing Loss Moderate Hearing Loss Moderately-Severe Hearing Severe Hearing Loss Profound Hearing Loss

.....

..... 3) What is the difference between children with normal hearing and those with profound hearing loss on communication Issue?

.....
.....

..... 2.2.4 Early intervention

Many services and programmes will be available to you soon after your child's hearing loss is found. When a child's hearing loss is identified soon after birth, families and professionals can make sure the child gets intervention services at an early age. Here, the term intervention services include any programme; service, help or information given to families whose children have a hearing loss.Such intervention services will help children with hearing loss to

develop communication and language skills. There are many types of intervention services to consider. We will talk about early intervention and about communication and language. Some of the services provided to children with hearing loss and their families focus on these topics.

So early intervention services and choices it means communication and languages available for you and your child. "Early intervention" means getting started as early as possible to address the individual needs of a child with disabilities. This is done to enhance the infant or toddler's development, to minimize the potential for developmental delay, and to enhance the family's capacity to meet the child's needs. Early intervention is a system of services established by the states through grants from the federal government to help eligible children from birth until their third birthday. If your child was born with a hearing loss or has developed one before turning three, you may want to get in touch with personnel in the early intervention system in your area. The hospital staff may have already connected you with these services. If not, you may wish to ask your child's doctor.

90 Early intervention may be of help to your child and your family in many ways, including learning to communicate with each other. Early intervention programme will be assigned a service coordinator to help you understand the intervention system and make sure that your child gets the services to which he or she is entitled. Valuable service systems available to you and your family are: lllll State services such as early intervention (for eligible children up to the third birthday) and special education and related services (for eligible preschoolers and school-aged children). lllll Organizations specializing in hearing loss and deafness that provide information and support. lllll Resource and information centers that can offer information about national and state resources and education rights. lllll Parent groups in which you can talk with other parents who also have children with hearing impairments or deafness. 2.2.4.1-Early Intervention for the Identified Population The services/facilities available for early intervention in the country are covered under the following: lllll Medical intervention lllll Aids, appliances and cochlear implant. lllll Auditory and speech-language training. i) Medical intervention- There

are two conditions that require medical intervention in school children. 1)

Remove the wax. 2) Otitis media. Otolaryn go legists

being available only at the hospitals, the doctor manages the ear/ conductive hearing problem at the primary center.

Anganwadi workers and other grass root level health workers are trained to handle acute ear pain, foreign body in the ear canal, etc. There are about 600 district hospitals in the country but not all may have ENT specialists

or

infrastructure for audiological assessment. The scenario is expected to improve as made budgetary provisions to meet the deficiencies and a 'medical kit' for grass root workers to attend to the ear problems.

91

ii)

Aids, appliances and cochlear implant- Fitting appropriate hearing aids are a crucial step in initiating successful intervention especially in children with pre-lingual hearing impairment. The status of availability of 'state-of-art 'hearing aids of all styles, makes and models (digital and analog) in the Indian market have improved to a great extent with the liberalization of the import policies. It is estimated that about 1.85 lakh hearing aids are distributed/sold annually. Of these, about 1.25 lakh body level aids are distributed under the ADIP scheme. The rest are either assembled or imported for sale in the country. The Scheme of Assistance to Disabled Persons (ADIP) of Ministry of Social Justice and Empowerment. Government of India, provides Rs. 8,000 per aid per ear for the beneficiary. Binaural aids are provided to school- going children which may be replaced with new hearing aids every two years. Income for eligibility for fully and partially subsidized aids currently is Rs.6, 500 p.m. and Rs.6, 501 to Rs.10, 000 p.m. respectively. Solar battery chargers with two AA rechargeable batteries are also included for the beneficiaries.

The cost of hearing aids is reimbursed for employees under ESI and CGHS schemes. Some of the State Governments have also made provision for distribution of free/subsidized hearing aids.

Cochlear implant is not an option by choice, but in terms of candidacy and cost (varying from Rs.5 lakhs to Rs.10 lakhs). Among the elite hearing impaired, cochlear implant is picking up well, especially in the prelingually deaf. Marketing strategies and the outcome of cochlear implant in the implanted children seem to have contributed to the popularity. Three popular brands of cochlear implant (Nucleus, Medel and Clarion) are marketed in the country.

INS Ashwini Hospital, Mumbai have made provision for free cochlear implant for their beneficiaries. Certain corporate houses also have donated funds to some private hospitals to help the economically weaker section. The outcome of cochlear implant is good (especially with the pediatric population) wherever a team of professionals is involved. The network of hearing aid dealers of the major hearing aid manufacturers in the country have provision to supply the spares for the hearing aids (such as cords for body level aids, prebent tubes for BTE aids) as well the repair of the hearing aid. Repair facilities are available at the major training institutes, some NGOs and private practitioners. Directory of Services published by AYJNIHH. Mumbai provides more information on this issue. The ear mould is the final link between the hearing aid and the ear. Custom made ear moulds are prepared only at institutions in cities and by some NGOs and private

92 practitioners. District Disability Rehabilitation Centers (DDRC) of Ministry of Social Justice and Empowerment has facilities for custom ear mould (website: www.socialjustice.nic.in). Facilities to make soft ear molds are available at some centers and with the hearing aid manufacturers/distributors. (iii) Auditory and speech-language training- Available services are comparatively more in the urban than the rural sector; the caregivers from the latter sector can avail of demonstration therapy, with the objective of facilitating home training. Several early intervention centers run by parent groups continue to offer quality services. Special educators are also involved in auditory/speech language training though it remains the domain of the speech-language pathologists/audiologists. Recognizing the importance of auditory/speech-language training for the cochlear implant recipients, the team approach has had a positive impact on the caregivers. An increasing number of special educators and caregivers have benefited from the workshops/training programmes in auditory/ verbal therapy organized by the manufacturers/ distributors of cochlear implants. A certificate course for the caregivers (of children with developmental disabilities) has been launched by AISH, Mysore in collaboration with the RCI. To meet the special needs of the age group 0 to 5 years, orientation programmes of one-month duration aimed at manpower development are conducted at seven centers across the country by AYJNIHH, Mumbai in collaboration with Balavidyalaya, Chennai. Availability of affordable educational material such as picture story books, puzzles, audio/video tapes, educational toys, attractive stationery items has improved due to the access, through internet, to pictures/material. Indigenously developed software and websites are also available for auditory training and speech-language training. 2.2.4.2 "

Check your progress" - 4 l) What is Early Identification?

.....
.....

.....

..... 2.2.5 Let us Sum Up lllll Human interaction with the help of verbal interaction and it involves speech, language and communication. lllll These systems depend upon our hearing ability which perceives the sound about nature. lllll Language is a part of human life and it three stages Form, Content, Use. lllll Student with hearing loss cannot perceive the sound about the nature with the help of ear that's why delay ear language. lllll With the help of best amplification system language learning may be provided children with hearing loss. But it depends on different degrees of hearing loss. So it is the. issue of language attributable. lllll This language issue impact of communication issues of children with hearing loss and it also depends on type of hearing impairment. lllll Early identification means hearing loss identified soon after birth in valuable service system. lllll Early identification of hearing loss services are lllll Medical intervention lllll Aids, appliances and cochlear implant. lllll Auditory and speech-language training

94 2.2.6 Answer to “Check Your Progress” “Check your progress” - 1 1. Acc to Chomsky, Language is a set of (finite or infinite) sentences, each finite in length and constructed out of a finite set of elements. There are three components of language form, content and use. “Check your progress” - 2 1) Ear language means spoken oral language 2) Eye language means written languages 3) In case of mild hearing Loss 50% of class discussions is missed on language issues. They have problems suppressing background noise and is missed 25% - 40% speech signal, distant sounds, unvoiced consonants, plurals and tenses. In profound loss causes only is felt a vibration speech is not developed or learners face learning deficits. “Check your progress” - 3 1) Communication is an intentional two way complex process of sending message from one end to the other via a channel. Speech is an oral and verbal manifestation of language. Language is a set of (finite or infinite) sentences, each finite in length and constructed out of a finite set of elements. There are three component of language form, content and use. 2) Linguistic communication can take place through three modes these are I Aural / Oral (listening / speaking) II Visual / Graphical (Reading / Writing) III Visual / Manual (Sign Language) 3) In normal hearing causes communication issues like speech and language are normal and pattern of development is normal good auditory perceptive skills while in case of profound hearing loss they do not rely on hearing for their communication. Language and speech develop only by training and they are educationally deaf. They communicate mostly through gestures. Voice, inflection, articulation are greatly affected. Regular speech and language training are required with the help of subject’s expert.

95 “Check your progress” - 4 1) Early intervention means getting started as early as possible to address the individual needs of a child with disabilities. 2) There are many valuable service of early intervention. These are I State services such as early intervention for eligible children and also up special education and related services for eligible preschoolers and school- aged children. II Organizations specializing in hearing loss and deafness that provide information and support. III Resource and information centers that can offer information about national and state resources and education rights. IV Parent groups, in which one can talk with other parents who also have children with hearing impairments or deafness. 3) The facilities available for early intervention in the country are covered under the following: (i) Medical intervention (ii) Aids, appliances and cochlear implant, (iii) Auditory and speech-language training. 4) D.D.R.C.-District Disability Rehabilitation Centers A.I.I.S.H.-A11 India Institute of Speech and Hearing. R.C.I.-Rehabilitation Council of India A.Y.J.N.I.H.H.-Ali Yavar Jung National Institute for Hearing Handicapped 2.2.7 Unit End Exercise. 1. Discuss the details about language attributable of hearing loss student. 2. Discuss the details about communication attributable of hearing loss student. 3. What is early intervention? Who are the service provides of early intervention Explain in details. 4. What is language? Discuss the details of language components.

96 Unit: 2.3 ppppp Communication options, preferences and facilitators of individuals with hearing loss. Structure 2.3.1 Introduction 2.3.2 Objective 2.3.3 Communication System 2.3.3.1 “Check Your Progress” - 1 2.3.4 Communication Option. 2.3.4.1 Communication Options Available for Use by Children with Hearing Loss 2.3.4.2 “Check your progress” - 2 2.3.5 Communication Preferences of individual of hearing loss. 2.3.5.1 “Check your Progress” - 3 2.3.6 Communication facilitators of individual of hearing loss. 2.3.6.1 “Check your progress”-4 2.3.7

Let us Sum-up 2.3.8 Answer to

Check Your Progress 2.3.9 Unit End Exercises 2.3.1 Introduction Communication is the process of exchanging and sharing information through idea and opinions. Most often this exchange is via language. Language consists of symbol ordered in particular sequences for the purpose of conveying information. The symbol of language mainly consisting of used communication can be carried out in different ways. The term communication is often used to include only the spoken word that is speech and hearing.

A communication option, mode, modality, or method is the means by which the child and family receive and express language. The choice of a communication modality that facilitates language development and allows the child who is hard of hearing or deaf to readily engage in communication interchanges with

97 family and caregivers is a primary issue throughout childhood.

So in this unit we know about the communication options, preferences and facilitators of individual of hearing loss. 2.3.2 Objective The Student-Teacher will be able to understand I the meaning of communication option II the different communication system-modes and method. III the communication option available for children with hearing impairment. IV the communication preferences available for children with hearing impairment, V the communication facilitators available for children with hearing impairment, 2.3.3 Communication System SPEECH LANGUAGE COMMUNICATION

98 Modes (Four modes) Methods (Three methods) 1 Aural/Oral(Listening/Speaking) 1 Oralism 2 Visual/Graphical(Reading /Writing) 2 Total Communication 3 Visual/Manual(Sign Language) 3 Education Bilingualism 4 Speech reading Modes : There are four modes of linguistic communication. These are Aural/Oral (Listening/Speaking) mode is the common mode used for communication by hearing population. It develops automatically and naturally in the non-impaired and it is acquired in early years in life and its basic purpose is for routine communication. Visual/Graphical (Reading/Writing) mode is the mode secondary mode because it is a learnt skill as against the acquired skill of aural/oral mode. It is learnt, formally and is command is acquired in later years of life and its purpose is official/educational. Visual/Manual (Sign Language) used by people with hearing impaired and is not a mere collection of signs but a rule governed language with its own grammar. Speech reading is fourth mode and play supportive roles to the earlier modes. It does not have the potential to carry the message in totally, hence cannot function on its own independently. Methods: There are three methods of linguistic communication. These are One mode (out of the two) and one type of language (out of two) can be selected and the combination of these two is called the methods of communication. There are three methods of communication possible. Oralism- Oralism is philosophy which desires to develop verbal language through aural/oral mode. Modern oralists believe that that attempts should be made to break through the barrier to communication caused by deafness. Total communication- Total communication in simple words means the use of sign as well as speech in order to develop spoken language of the deaf children. Garretson (1976) defines total communication in the following way a philosophy incorporating appropriate aural, manual and oral modes of communication in order to ensure effective communication with and among hearing impaired persons. Education Bilingualism- Education Bilingualism is generally considered to be a reaction against oralism as well as total communication. Bilingualism with total communication that oralism can never work with profound deaf students but it is equally critical of total communication that combining sign with verbal language will bring speech to child. So fundamentally the bilingual approach is that the first language of all deaf children could be the sign language which belongs to deaf community of the concerned

99 2.3.3.1 "Check your progress" - 1 1. Mention any two modes of linguistic communication?

.....
..... 2. Mention any two methods of linguistic communication?

..... 3. What is total communication?

.....

..... 2.3.4 Communication Option

100 2.3.4.1 Communication Options Available for Use by Children with Hearing Loss Option/Feature Auditory-Verbal Maximizes use of residual hearing to develop spoken language. Auditory channel is primary input mode exclusively during language learning experiences and therapeutic intervention. The stricts use of visual cues, speech reading and signs. Provides only auditory training Auditory-Oral Maximizes use of residual hearing and speech reading to develop spoken language. Use of both auditory and speech reading encouraged during language learning and therapeutic experiences. Provides both auditory and speech reading training Familial Role Serve as spoken language models Provide abundant opportunities for spoken language learning through Auditory- Verbal techniques in the home environment. Seek professionals support from those knowledgeable in AV approach. Ensure appropriate audiologist management. Monitor rigorously the performance of amplification/cochlear implant technology. Desire mainstream educational setting & inclusion in hearing community as primary goal. Serve as spoken language models Provide abundant opportunities for spoken language learning using auditory and speech reading input in the home environment. Arrange for appropriate Auditory -Oral programs/professionals. Ensure appropriate audiology management. Monitor rigorously the performance of amplification/ cochlear implant technology. Desire mainstream educational setting & inclusion in hearing community as primary goal. Amplification Provide early amplification Provide maximum audibility across the speech -frequency range Promote consistent use of hearing aids. FM systems and/or Cochlear Implant Provide early amplification Provide maximum audibility across the speech-frequency range Promote consistent use of hearing aids, FM systems and/or Cochlear Implant.

101 Cued Speech Makes spoken language visible through use of specific hand shapes, positions and lip reading (i.e., cues). Manually Coded English (MCE) Uses sign system and finger spelling to represent spoken English. Often used in conjunction with Total Communication and Simultaneous Communication. Total Communication Uses multiple methods simultaneously (manual, oral, auditory) Uses MCE system Simultaneous Communication Use sign system and finger spelling and speech. Does not require use of audition. Learn and become fluent in Cued Speech Provide abundant opportunities for spoken language learning cueing all communication interactions with the child in the home environment. Support use of Cued Speech by early intervention personnel, teachers and all others communicating regularly with child. Arrange for appropriate educational settings or Cued Speech transl iterator Determine desire for child to use amplification or cochlear implant technology. Learn and become fluent in manual sign system (MCE). Arrange for appropriate educational settings. Professionals who are fluent users of MCE system used by the child or interpreter. Learn and become fluent in manual sign system (MCE). Encourage speech reading and use of audition in combination with sign (MCE). Arrange for appropriate educational setting/TC professionals who are fluent in TC and support use of sign, speech reading and audition. Ensure appropriate audiologist management. Learn and become fluent in manual sign system. Encourage speech and sign. Arrange for appropriate educational setting; may be the same as TC. Ensure appropriate audiology management when required. Amplification not necessary for spoken language acquisition Provide maximum audibility across the speech-frequency range when family desires child to use amplification or cochlear implant Amplification not necessary Provide maximum audibility across the speech-frequency range when family desires child to use amplification or cochlear implant Provide amplification early amplification Provide maximum audibility across the speech-frequency range Promote consistent use of hearing aids, FM systems and/or Cochlear implant. Amplification not generally used for communication as part of approach.

102 2.3.4.2 "Check your progress" - 2 1. Mention any two communication options available children with hearing impairment?

..... 2. What is cuae speech?

.....

..... 3. What is full from of A.V.T.?

.....

..... 2.3.5 Communication Preferences of individual of hearing loss. Hearing—Listening capability of our hearing system. So speech, language and communication these systems depend upon our hearing ability which perceives the sound about nature. But if suffering from hearing disability it has difficulty to perceive the sound about nature and it affects verbal interaction and also affects speech, language and communication. Due to this problem child can face problem in several development areas. These are personal-social, cognitive and academic. Conversation – The use of speech and/or sign for informal exchange of views, ideas or information. Alphabetic Principle – The use of letters and letter combinations to represent phonemes and/or signs in a system of writing. Bilingual-Bicultural (Bi-Bi) Philosophy of language learning: first ASL, second spoken language (e.g., English) Combines ASL and form of spoken language (MCE, Cued Speech) Opportunities for experiences in Deaf and hearing communities. Learn and become fluent in ASL Ensure regular interaction with members of Deaf and hearing culture/community Arrange for appropriate educational setting in program supporting Bi-Bi philosophy. Amplification not required for visual language learning. Amplification/CI may be used for alerting, warning, awareness of environmental sounds and for support of spoken language development

103 Vocabulary – The words we must know to communicate effectively. Fluency – The ability to read a text quickly and accurately with ease and expression. Comprehension – The process of constructing meaning from print. Writing – Communicating through the use of written symbols. Gesture – It is the meaning of a movement of parts of the body especially a hand or the head to express an idea or meaning. Singing- It is a large body literature and also composes hand shapes, locations and motions. Addition facial expression and also classifier is a specific hand shapes that can represent a particular person and project. Facial expression- It is facial literature use to non-verbal communication to facial express.

Unit End Exercises. 2.4.1 Introduction: Literacy skills are essential for succeeding in our today's society. Everyday examples include accessing the Internet or messages via e-mail; reading instructional manuals for the workplace, for computers, for cars, directions at work, for travel, or for taking

108 medications; and for leisure activities such as reading the newspaper or enjoying a magazine or a book. Literacy is also the key to functioning effectively in school. For most individuals the foundation for reading proficiency begins in infancy, advances with formal reading instruction in school, and continues to increase as the result of quality educational, social and recreational experiences throughout one's lifetime but without well-developed literacy skills students cannot participate fully in classroom learning. Students are at much greater risk for school failure and lifelong problems with employment, social adjustment, and personal autonomy so literacy skills are vital at a national level. But the problems are galore for administrators, educators, and families who work or live with students who are deaf or hard of hearing for the purpose of methods of instruction.

Hearing loss has nothing to do directly with literacy development and functioning; in most of the cases of deafness, literacy does get negatively impacted. This is due to basic inadequacies of language and communication. In this part we are going to see what

are the

issues & measures in literacy development and scholastic achievement of students with hearing loss. 2.4.2

Objective The student and teacher will be able to- • understand issue of literacy development of students with hearing loss. • understand issue of literacy development in reading writing steps in hearing impaired student. • under stand measures for literacy development of students with hearing loss. • understand scholastic achievement of students with hearing loss. 2.4.3 Literacy development of students with hearing loss. The development of literacy hearing impairment children is not a multifaceted issue. It is possible to find a good number of parallels to literacy development in their hearing peers. Current millennium still reports that children with hearing loss are often severely delayed when compared to hearing children, especially in earlier development. Adolescents with hearing loss are still seen to have multifaceted problems involving literacy (reading and writing) and language that can influence their attitude to their ability to access and use academic information. This also has implications for how they regard academic information and whether they are willing to apply it. If adolescents with hearing loss are able to access and use academic information sufficiently, they

109 will be able to fulfil a more significant role in society, as well as 01 to study and work well. The acquisition of academic information will enable adolescents with hearing loss to function in such a way that they will be able to maintain their independence and improve their knowledge base throughout their education years. According to Briggles (2005) some class activities that are beneficial to hearing impaired or deaf children includes: 1) Time to explore writing, drawing, books and environmental print 2) Story time translated in to sign 3) Journal writing using invented spelling. Like hearing peers, hearing impaired or deaf children should have the opportunity to participate in literacy events. They should also use written language in many ways that are typical to their hearing peers. According to Briggles (2005) and Williams (1994) the teacher should provide them with the opportunity of demonstrating the following uses of languages in signed or spoken form: 1) To interact socially with peers and adults while writing. 2) To provide information about written text. 3) To label written creations. 4) To monitor the construction of text. 5) To request assistance with writing tasks from adults and peers, 6) To challenge others' knowledge of literacy, and 7) To evaluate literary works. 2.4.3.1 "Check your progress" - 1.1. What is the multifaceted problem children with hearing impairment?

.....
.....
.....

110 2.4.4. Issue of literacy development of students with hearing loss. Children with hearing loss now compete favourably with hearing peers in some issues. The following areas are 1) Children with hearing loss who evidence language delays also demonstrate significant delays in development of theory of mind. So theory of mind development is dependent on a child's opportunity for social interaction auditory comprehension, verbal communication and play. 2) Oral language acquisition remains a challenge for children with hearing loss and also affects in reading. (Easterbrooks & Baker, 2002). Reading outcomes are well below average for 96% of children with hearing loss, most reaching only fourth to sixth grade proficiency (Karchmer, M.A. & Mitchell, R.E. 2003). The 19th International Congress on Education of the Deaf (ICED) brought together 1,067 teachers, administrators, and researchers from 46 countries to address topics in education. The publication resulting from the conference noted that while academic outcomes improve with more hearing peers, social language use and the ability to make friends with hearing peers remain as problems for children with hearing loss in mainstream educational settings (Leigh, G & Power, D 2004). 3) Sensory-motor concerns are related about literacy development of students with hearing loss. Children with sensory neural hearing loss appear to experience higher rate difficulty with vestibular processing when compared with their typically developing peers, resulting in delays and/or compensatory strategies in their development, motor skills, such as balance, coordination, and body and spatial awareness (Suarez et al 2007). 4) Kluwin, T.M. Stinson, M.S. and Colarossi, G.M. (2002) identified four main areas of concern for children with hearing loss when compared with hearing peers. They are: a. Social skills, b. Interaction/participation, c. Sociometric status/acceptance, d. Affective functioning.

111 5) Another and most important issue differences between normal and children with hearing loss. Children with hearing loss have been consistently documented areas of balance, complex motor sequencing, sensory, and vestibular processing. 6) Children with hearing loss are more likely to experience co-morbid diagnoses, such as apraxia and attention disorders and also auditory deprivation may lead development of specific motor and language skills that share common cortical processes. 7) Literacy (reading and writing) issue is traditionally regarded as the most important skill area needed to obtain academic information and also involved in the communication of thoughts and process of learning through conversation, reading, writing and the conceptualization of the reading process. 8) The educational outcomes for hearing impairment in secondary schools in normal mainstreaming after leave the school prepared to live and function independently should be able to independent living skills, employment readiness, and a set of 'learning how to learn' skills. 2.4.4.1 "Check your progress" - 2.1. What do/mean by vestibular processing?

.....

..... 2. Mention any two issues of literacy development of students with hearing loss?

..... 2.4.5. Measures for literacy development of students with hearing loss.

Language based reception / expression of ideas and thoughts achieved by the medium of a shared script, which reflect shared language, context and the world knowledge. This means, reading / writing is

not mere understanding and creation of script. Reading / writing is not conversion of spoken thoughts into a graphical thought. It is understanding and creation of independent thoughts. Sharing the script in itself is extremely essential but is not the only essential prerequisite in the process of writing

112 (and reading). Writing is much more than penning down a set of alphabets on paper. For example, read the following sentence: Ich bin Lehrerin Van Beruf This sentence uses Roman (English) script, which you already know. Could you understand the meaning? No, because sharing a script with the writer is not enough for you as a reader. You do not share German language with the writer and hence meaning is inaccessible for you. If a sentence is: I am a teacher by profession You will be able to read (understand) the sentence because you not only know the script but also share the language. Thus reading and writing is not possible without the adequate, age appropriate knowledge of the language for which the script is used. Hearing loss impacts language development and language functioning. As a result, very often the student with hearing loss

has inadequate language. This inadequacy of language in turn impacts the literacy skills of the student with hearing loss. 2.4.5.1. Tips to develop Measures for

literacy Skills in Students with Hearing Impairment Literacy means independent reading (comprehension and not mere loud pronunciation of the text) and independent writing (expression of thought and not mere copying or penning down memorized lines).

Student with hearing impairment

have to be taken from guided / assisted literacy skills to independent literacy skills. Languages in the first point are true with literacy and

literacy is experience and context bound. If it is developed through pleasurable activities / games / exercises students / with hearing impairment learn it more readily. The best method to develop reading / writing in student with hearing loss is

to expose them to written material which is graded as per their levels.

This

material should be able to take them one step ahead in complexity. Reading / writing material may include readymade and custom-made materials like: • Text books (of all the school end examination boards); • Story books / comic books; • News paper, magazines; • Personalized notes to teachers / parents / classmates; • Captioned movies; • Greeting cards; 113 • Advertisements • Manuals of phones, ovens, washing machines etc; • SMS text messages; • Rules of games; • Road maps; • Recipes; • Railway / airplane / bus tickets; • Matter on packed food / grocery; • Menu card • Joke books; • Encyclopedia; • Bill boards / banners / hoardings; • Instruction boards at gardens, theatres etc.; • Telephone / electricity bills; • Purchase receipts; • Registers and records; • Specially created albums with written material; • Specially created scrap books / experience books; • Specially created vocal books; • Daily diary etc.

Although reading and writing are closely linked but these cues are separate process. 2.4.5.2.

Reading activity: Step-1 (Unseen/ in experienced passage) • Sit with the student. • Read a particular number of lines as per the level of the students

and

either read together silently or let the student read after you. • Discuss the matter and encourage him / her to ask, answer, describe, comment, agree / disagree etc. on the matter

and it will be produced on total communication system.

114 • Explain new concepts with the help of real object and dramatization. • Show similar and smaller examples of sentence types. • Ask questions to ensure he / she has not missed the details. • Link the information with previous knowledge. • Repeat the steps with next few lines. 2.4.5.3-Reading activity Step- II In step I we made the student with hearing impairment read the lines first and then explained the content. In step II the teacher first develops the context by telling what the lines are about

in.

Explain a few concepts discuss with the child and then let him / her read the lines. Both step I and step I and step II are good tools of learning and

both have strengths and hence students should be exposed to both. 2.4.5.4. Dos and Don'ts for better reading activities: • Reading material should not restrict to word level, it should be in sentence form and

key word could be highlighted with underline, colouring etc. • Never work on vocabulary lists without context. • Never over-do speech correction while the focus of the activity is reading. • Be tolerant of mistakes.

When students hesitate going on to complex level. •

Reading does not always mean understanding every bit of the written matter. Overall understanding too helps many times. •

In pre-school level Children should be encouraged

the habit of scanning picture books, flipping comic books, sitting together to read magazines etc. This builds readiness before the child starts learning the actual reading. • Link reading activities with school subjects. Reading activities can be used in both the ways to reinforce learnt knowledge or to build readiness for the knowledge to be learnt. This is important for

student/with hearing loss

since it helps him/her in understanding school subjects and also in developing reading. 2.4.5.5-

Writing: (1) To provide ample opportunity to the child to write his/her own thought.

115 (2) Link development of writing with reading, listening - speaking (or signing), context and experiences. Teachers always want to make tasks simpler for students and simplest way to make tasks simpler is to link it with meaning and context. Teaching writing for that matter, teaching anything without context or pragmatic background cannot have good results in the long run. (3) In order to facilitate learning use of feedback is an essential factor. This in turn needs to be responded with feedback comprising • Clear • In detail • Indicative of higher expectation • Appropriate • Immediate • In writing • Consistent • Objective • Pro-active (4) Writing should be enjoyable and communication oriented rather than task-oriented. (5) Develop the habit of self-editing. Many times, looking at the writings of the children one can hardly know his / her current level of language competency. The teacher is confused about whether an error committed by the student is an error of accident or is an outcome of incorrect knowledge of language. If the children are made to edit their own writing, correcting their inner language structures becomes possible. Initially teachers can mark the sentences, parts where modification is required. This can work as a clue to help him/her edit the overall write up. (6) Carry out assessment of writing. Separate writing assessment needs to be carried out by the teachers on regular basis. Assessment of language or assessment of language text book cannot be considered as writing assessment. There is a difference between assessment of language through writing and assessment of writing. Like any other ideal assessment, writing assessment too has to be carried out systematically, consistently and objectively.

116 (7) Involve parents in the process of writing development. As said earlier, writing needs to be developed in connection with context and real life situations. Home environment is rich from this point of view. Providing training to parents on follow up activities on development of writing is highly recommended. 2.4.5.5.1 "Check your progress" - 3 1. Mention the steps of reading activity for students with hearing impairment?

.....

.....

..... 2. What is literacy?

.....

.....

..... 3. Name two ways for developing reading skill of children with hearing impairment?

.....

..... 2.4.6 Scholastic achievement of students with Hearing Loss. The scholastic achievement of students with hearing loss is one of the most important determinants of recipient's quality of life after schooling. The scholastic achievement of students with hearing loss attending the mainstream schools and to compare their scholastic performance to their normal hearing peers. So scholastic performance in mainstream school is a most important factor. The factors are: • Language and speech- The ability to learn language and speech is the highest development of children hearing impaired. • Intellectual ability- Process of thinking of deaf children and that normal peers are found to be (& similar also cognitive abilities and develop verbal intelligence. • Academic Performance- Hearing impaired children are frequently handicapped in various degree of hearing loss and it affects educational performance and particularly reading which relies heavily upon language skill. So after scholastic achievement hearing loss student can develop the academic performance.

117 • Adjustment of social Our social inter action depends upon communication. So deaf children have communication problems. That's why it should have problem of social inter action. Such children live in a world of isolation and form a group of their own, an association of the deaf for their common interest and interaction. So after scholastic achievement student with hearing loss can develop on adjustment in social inter-action. • Behavioural problem- Deaf learners feel invariably inferior and helpless in adapting to circumstances that require verbal communication. So regard non- verbal communication absence of verbal they have poor self poor concept which damages the development of personality but with the help of mainstream education which is scholastic achievement they develop the personality and is reduced the problem behaviour regard various social academic aspect. • Socially handicapped - Learners with hearing loss cannot adjust with society because they suffer from communication difficulty and fail to understand what others hearing people say. But after scholastic achievement with the help of mainstream they develop communication skill and mixing the oral social which is social of communication and reduced of socially handicapped. • Problem in personal and social development- Language becomes a barrier for deaf learner for purpose of communication with others. So this affects the socialization process and plays a vital role in the personal and social development of hearing loss learner. So with the help of scholastic achievement in mainstream in regular class room it develops the normal peer acceptance and reduces the problem in personal. • Personality problem- Hearing difficulty may create personality problem. A becomes deaf learners more frustrated as he/she tries to reach the level of the normal and a totally deaf child seems reconciled to his fate But given well provided adequate facility of language and communication regard literacy development in regular school they develop their personal adjustment and well developed scholastic achievement in hearing impaired studens. • Provided in natural and social environment-For a child with hearing loss to scholastic achieve developmental synchrony even development across the developmental domains programs need to provide a richer, more natural social environment and consistent exposure to hearing peers who can model age- appropriate language and social development.

118 • Mainstream Placement- Another choice commonly made for children with hearing loss is mainstream placement. The term mainstreaming is used to refer to the placement of regular education classes based on their skill level. Mainstream education does seek to educate the "whole child" and provide exposure to many preschool programmes. However, many schools turn to more directive teaching models by kindergarten wherein children sit at desks, teachers instruct, and children acquire facts, skills, and concepts through drill and practice. 2.4.6.1 "Check your progress"-4 1. Mention any two issue scholastic achievement of students with Hearing Loss?

.....
.....
..... 2.4.7

Let us Sum Up •

Hearing loss is a disability which affects literacy and it is a multifaceted issue. • Literacy issue is the most important skill area to obtain academic information of hearing impaired studens. • Literacy issue depends on communication and communication is the most significant process. • After literacy development students with hearing loss should achieve in the respected of different formal area in mainstream placement. 2.4.8 Answer to "Check Your Progress" "Check your Progress" - 1 1. The multifaceted problem children with hearing impairment involvement literacy issue which are reading, writing and also language that can influence their attitude to their ability to access and use academic information. "Check your progress" - 2 1. Vestibular processing means the areas of balance motor coordination, complex motor sequencing. 119 2. Children with hearing loss who evidence language delays also demonstrate significant delays in development of theory of mind so theory of mind development is dependent on a child's opportunity for social interaction auditory comprehension, verbal communication and play. Sensory motor concerns are also related about issue literacy development of students with hearing loss. Children with sensor neural hearing loss appear to experience higher rates of difficulty with vestibular processing when compared with their typically developing peers, resulting in delays and/or compensatory strategies in their development of gross motor skills, such as balance, coordination, and body and spatial awareness. "Check your progress" - 3 1. Class room situation and teachers should develop the contents of text books. 2. Literacy means independent reading (comprehension and not mere loud pronunciation of the text) and 3. • Discuss the matter and encourage him / her to ask, answer, describe, comment, agree / disagree etc. on the matter

and it will be produced on total communication system. • Explain new concepts with the help of real object and dramatization. • Show similar and smaller examples of sentence types. "Check your progress" - 4 1. Language and speech- The ability to learn language and speech is the mostly development of the hearing impairment. Academic Performance- Hearing impaired children are frequently handicapped in various degree of hearing loss and its effect on educational performance and particularly and particular handicapped in reading which relies heavily upon language skill so after scholastic achievement hearing loss student can develop the academic performance. 2.4.9 Unit End Exercises. 1. Describe the details about issue of literacy development and scholastic achievement of students with hearing loss.

2.5.9 Unit End Exercises 2.5.10 References 2.5.1. Introduction The modern world presents many challenges of very different types. Our senses are constantly being assailed with new sensations, environments, and experiences. We have to develop coping strategies that allow us to move with confidence and deal with these challenges without becoming overwhelmed. For many of us, that is a significant task. For others, particularly those with a disability, it is a monumental challenge. Deafness is often described as 'the silent disability' because it is not noticed, not visible and not discussed, yet it is a condition growing in importance and prevalence. People who are hearing impaired and hard of hearing face many challenging hearing environments every day. They face obstacles in most areas of their lives. These are education settings, the workplace and social situations. • In education settings, miscommunication can result in poor grades. Educators can be unaware that students have not heard the correct instructions, and mislabel children with hearing loss as 'lazy' or 'stupid.' • In the workplace, people with hearing loss have more difficulty in finding employment and struggle with certain practical aspects, such as attending group meetings or answering the telephone. • In social situations, hearing people cannot see that a person with hearing loss has difficulty hearing others, and also forget that hearing aids and cochlear implants are only aids. They need to be constantly reminded to consider the hearing difficulty, which can be tiring, frustrating and embarrassing. It can become easier

122 for a person with hearing loss to withdraw from social events and isolate themselves. 2.5.2. Objective: The student -teacher able will be able to understand- • Restoring techniques using human (interpreter). • Restoring techniques using Technological Support (Hearing Device). • Auditory training. 2.5.3. Student who are hard of hearing face obstacles in most areas of their lives Deafness refers to the inability to hear, either totally or partially. Symptoms may be mild, moderate, severe or profound. Deafness may occur at birth or may be acquired due to various diseases, infections and or ageing. There are various strategies to enable these people to compensate for their deafness so that they can communicate with human interpreter such as lip-reading, sign language and use hearing devices such as hearing aids and also cochlear implant. When they use lip-reading, sign language and use hearing devices that means loss of normal hearing (normal hearing is restored) and using the restoring technique (human interpreter) & technological support (hearing device) and also auditory training. So restoring techniques are (1) Human interpreter (lip-reading, sign language, communication worker) (2) Technical support (hearing device/amplification option) (3) Auditory training. 2.5.4. Restoring Techniques Using Human Support: Ø Attract the student's attention before speaking and make sure you are facing him/ her. Ø Speak clearly; but avoid speaking artificially slowly, exaggerating your lips, or shouting as this affects the natural rhythm of speech. Ø Make use of natural gesture and facial expression as a clue to meaning.

123 Ø Make sure that there is adequate light on your face. Do not stand with your back to windows. Ø Position the student so that he/she can lip-read you easily and see the projector or board and as much of the class as possible if there is to be a group discussion. Ø Make use of visual material, i.e. handouts, key vocabulary, diagrams, written instructions. Ø Indicate when you are changing the subject. Ø Check comprehension; encourage and direct questions. Ø Keep background noise to a minimum. Ø Write important new words on the board to fix their form. Ø If using DVD/video for teaching purposes, be aware that the student will not be able to follow the soundtrack and will need to borrow the DVD/video or have access to subtitles or a transcript. Ø Direct the student towards any relevant course materials on Blackboard. Ø Ensure that members of the group raise their hand before speaking, so that the deaf student is alerted to a change of speaker. Ø Do not allow more than one person to speak at a time. Ø Be aware that a deaf person cannot read or take notes at the same time as lip-reading-allow time for a student to look at the relevant section of a handout, then make sure you have his or her attention before you comment on it. Lip speakers are useful for those who do not use sign language but who find a tutor or lecturer difficult to lip-read. A lip speaker repeats the words of the speaker without voice. They produce clearly the shape of words, the flow, rhythm and phrasing of natural speech and repeat the stress as used by the speaker. The lip speaker also uses facial expression, natural gesture and finger spelling (if requested) to aid the lip reader's understanding. Lip speakers are used by people who use lip-reading extensively and who have a good command of English language. Interpreters are used by students who prefer to communicate through British Sign Language (BSL) or Sign Supported English. The interpreter will translate what is said by the lecturer or tutor into sign and will provide a voice over for the deaf student's own signed contribution if required. It is helpful to employ an interpreter who has some knowledge of the subject matter, especially if the vocabulary is highly specialized.

124 Communication Support Workers provide an interpreting service and may also provide a lip speaking or note-taking service and a voice-over for the deaf student's contributions, but will not yet have reached interpreter level (They will usually be qualified to Level I/II Certificate in BSL). 2.5.4.1 "Check your progress" - 1 1. Mention any four restoring techniques using humans support?

..... 2. Write the full form of BSL?
.....

..... 2.5.4.2. Description And Facts A student with hearing impairment may be hard to recognize in the classroom. Some students use hearing aids and have learned to lip-read or sign. A person with no hearing is deaf. "Hard of hearing" defines a hearing impairment in which the sense of hearing, although diminished, is functional. The following list describes some facts about individuals with hearing impairment: • Not all people with hearing impairment are good lip readers. Lip reading skill has no correlation to a person's intelligence. • Not all people with hearing impairment know how to sign. Not all students with hearing impairment use interpreters. Some prefer to communicate through lip reading and some prefer sign language. • A hearing aid does not correct hearing loss like glasses correct vision problems. Most persons with hearing impairment have sensory neural hearing losses and the clarity of speech is affected. The hearing aid does not make speech more clear; it merely amplifies the sound. • Many people with hearing impairments are easily understood. Others cannot monitor the volume and tone of their speech and may be initially hard to understand. • Students who have hearing impairment, just like students who do not have hearing impairment, vary to some degree in their communication skills. 2.5.4.3. Possible Barriers: • Lack of interpreters or people who understand sign language • Decreased awareness of auditory cues in communication

125 2.5.4.4. Interaction with An Individual with Hearing Impairment : Each and every student is functionally different. So interactions with an individual with hearing impairment following suggestion are that: • Get the individual's attention before speaking. • Look at the individual when you speak. • Do not block the area around your mouth as it may inhibit lip reading. • Speak naturally and clearly. Slowing down slightly may help. Do not exaggerate lip movement and do not shout. • Try to avoid standing in front of windows or other light sources. The glare from behind makes it difficult to read lips and other facial expressions. • Do not hesitate to ask the student to repeat if you do not understand. If repeating does not work, use a pen and paper. Communication is the goal; the method is unimportant. • If a student is using an interpreter, speak directly to the student, not the interpreter. • Short sentences are easier to understand than longer sentences with several clauses. • If the student does not understand, try repeating, and if the student still does not understand, rephrase a thought or use a different word order rather than repeating the same words. • It is impossible to lip-read a word that the student has never seen before. If time permits, it helps to write the word and then let him or her see how it looks on the lips. • Facial expressions, gestures and other body language help convey the message. • If a sign language interpreter is present, request him or her to interpret - even for social and non-academic conversations. 2.5.4.5 "Check your progress" - 2 1. Mention any two facts of hearing loss?

126 2. Mention any five ways of interactions with an individual having hearing impairment?
.....
.....

..... 2.5.5. Restoring Techniques Using Technological Support (

Hearing Device) If you think you might have hearing loss and could benefit from a hearing aid, visit your physician, who may refer you to an otolaryngologist or audiologist. An otolaryngologist is a physician who specializes in ear, nose, and throat disorders and will investigate the cause of the hearing loss. An audiologist is a hearing health professional who identifies and measures hearing loss and will perform a hearing test to assess the type and degree of loss.

Aural Rehabilitation: The professional efforts designed to help a person with hearing loss. This includes services and procedures for lessening or compensating for hearing impairment and specifically involves facilitating adequate receptive and expressive communication. (ASHA, 1984; WHO, 2000). 2.5.5.1-Amplification options The most important tool to help the hearing impaired person surmount the hearing handicap is a hearing aid or educational amplification unit. No system of amplification can restore hearing, but it can make useful residual hearing which could not otherwise be reached. Using amplifications the clients will be able to achieve goals unattainable without it. 2.5.5.2-Types of hearing aids: All hearing aids consist of four basic parts: 1. Microphone - picks up the sound and sends it to the amplifier 2. Amplifier - makes the sound louder 3. Receiver - sends the amplified sound into the ear canal 4. Battery - supplies the power to the hearing aid

127 2.5.5.3-Behind-

the-Ear Aids The behind-the-ear (BTE) hearing aid is the device most used by children. The components

are all contained in a plastic case which sits behind the ear. The case is connected to an earmould by a piece of clear plastic tubing. The earmould is specially designed to fit inside of the user's ear. A BTE hearing aid may be used with any degree of hearing loss and can be very flexible for use with a telephone or assistive listening device. 2.5.5.4-In-the-Ear

Aids The in-the-ear (ITE) hearing aid is smaller than the BTE hearing aid. All of the components fit inside of the plastic case which is made to fit the user's ear. The ITE hearing aid is not always the most appropriate choice for pediatric amplification because the aid must be replaced as the child grows. 2.5.5.5-In-thc-Canal Aids The in-the-canal (ITC)

hearing aid is even smaller than the 1TE hearing aid, fitting entirely inside of the ear canal. The ITC is used primarily with mild-to-moderate hearing losses. It is not recommended for pediatric use because of its size, and because it must also be replaced as the child grows. 2.5.5.6-Body Aids A body aid consists of a rectangular case and an earmould. The rectangular case contains the microphone, amplifier, and batteries and may fit into a pocket or "fannypack". There is a cord which connects the case to the button receiver. The button receiver is snapped into an earmould which is placed in the ear. The body aid is often used by people who have a severe-to-profound hearing loss. 2.5.5.7-Bone Vibrator Aid The bone vibrator hearing aid is primarily used by patients with conductive losses, or those who cannot wear traditional hearing aids, such as patients with atretic or microtic ears. The vibrator sits on the mastoid bone and is held in place by a headband. 2.5.5.8-Cochlear Implants: This is not a hearing aid but an implantable device, which stimulates the auditory nerve directly with help of intra-cochlear electrodes. The cochlear implant is a relatively new

128 device. It consists of internal parts, which go under the skin behind the ear and in the cochlea, and external parts worn behind the ear and on the body. The internal component, which is inserted during a surgical procedure, is made up of an electrode array, a receiver, and a magnet. The electrodes are inserted into the cochlea and the receiver and magnet are set into the bone behind the ear. The external component is made up of a transmitter coil, a microphone, and a speech processor. Both the transmitter coil and microphone are worn behind the ear, while the speech processor may be fit into a pocket or fanny pack. There are several criteria which a child must meet in order to be considered an implant candidate. The child must have a severe-to-profound bilateral loss, and receive little or no benefit from hearing aids. Medical, psychological, and educational status are also taken into consideration prior to implantation. 2.5.5.9 FM Systems FM systems, or auditory trainers, are primarily used in the school setting; however, they may be useful in a variety of listening situations. The system consists of two parts: a transmitter and a receiver. The speaker wears the transmitter and speaks into a microphone attached to it. The listener wears the receiver which picks up the signal from the microphone and delivers it to the ear through an earpiece on the child's hearing aid. The size and shape of the two components may vary; but the purpose remains constant: to raise the level of the speaker's voice above the background noise (increase the signal-to-noise ratio). 2.5.5.10 "Check your progress" - 3

129 2.5.6 Auditory Training Hearing mechanism plays a very vital and important role in the development of speech and language ability for purpose of communication. We are always surrounded by various types of sound and through experience and exposure and we learn to select and response to the sound which are important. So hearing serves as the primary sensory modality through which we maintain an awareness of our surrounding. 2.5.6.1 Importance Auditory training is essential and important for the hearing impaired child. Auditory training is required to make use of his/her residual hearing and to listen and understand the sound and acquire the speech and language skills gradually. Auditory training for hearing impaired child must be designed to serve mainly two purposes. (a) To perceive a wider variety of environmental sounds which will allow the child to be at least to unexpected change in his/her environment and thus ensure his safety well being for his/her life. (b) To perceive verbal signal, to acquire the linguistic role of language and develop speech skills and it is able to exchange idea and use oral communication. 2.5.6.2 When to start Auditory Training As early as possible. Auditory training should be started when routine audiometric assessment is completed. Then the hearing impaired child wearing hearing aid in both ears and speech therapist as teacher gives speech stimuli and teacher should be given study) 2.5.6.3 Pre requisite issue for auditory training The auditory training is very important for the development of speech and language. Few essential requirements given the auditory training start. The requirements are: (1) Fitted suitable hearing aid. (2) Suitable reinforcement may be given and co-operation of the child and the family member in the auditory training programme. (3) Child's response to different kinds of sounds and intensities need to be checked carefully.

130 (4) Always remember that the sound which is exposed to child often might be listed in hierarchical manner. (5) The activities and the material required for training the child should be prepared in advance and it is available normally in home. (6) It is better not to give auditory training when the child is likely to sleep or is involved other in activity. 2.5.6.4 Conditioning Sounds Conditioning is an important stage in auditory training. So, sound visual and tactile clues should be provided to show the child from where and how the sound is coming. The condition may be started with sound. These sounds are rubbing the finger, marble sound etc. Auditory training may be carried out at different levels as per the following steps. (1) Introduce the sound one by one and make a note at which levels child gives the response. (2) Vary the intensity of sounds and distance between the child and sound and note the lowest intensity and longest distance from where the child can detect the sounds. (3) Train the child to say how many times he/she has heard the sounds. (4) Train the child to say if the sound is of shorter or longer duration like /a/ and /aa/, /e/ and /ee/ etc. (5) The child may be trained to localize the sound i.e. to detect from which direction the sound is coming. (6) Train the child to listen and repeat the number or words in proper sequence. 2.5.6.5 Stages of Auditory Training The auditory training consists of 4 major stages of development such as: (1) Sound awareness training (2) Sound discrimination training (3) Discrimination of gross sound (4) Fine discrimination of speech sound (1) Sound awareness training: Introduce to different sounds one by one. The child

131 should respond to these sounds and from where the sound comes. Every day add loud sound a little more for the purpose of child's attention and focus on loud sound. Sound awareness training helps to assess hearing ability of the child in terms of the types of sound, intensity level and distance level from which the child can hear or understand. (2) Sound discrimination training: This training involves the child to various auditory sounds produced by noise makers i.e. bells, drum, horns, whistle etc. As the child learns to respond to the presence of the sound and to discriminate between one or more sounds. This training should be given in the following steps. (a) Train to listen to two sounds repeatedly. (b) Child should consistently respond to both the sounds properly. (c) Using conditioning procedure the child should be given auditory visual and tactile clues. (d) Care should be taken in the presentation of the stimulus. (e) Every step should be provided suitable encouragement and connect responses 80-90%. (f) Gradually introduce many more sounds in the training. (3) Discrimination of gross sound: At this stage the child has learnt the skills in recognizing the presence of the sound and perceiving gross difference between vowel sound with grossly dissimilar phonetic elements and between phrases which are closely related to his/her everyday experience e.g. p/g, s/l, pen/table etc. (4) Fine discrimination of speech sound: It is last stage of auditory training. This stage helps the child to recognize suitable difference between similar vowels and consonants sounds as well as integrating the child's expanding vocabulary to permit him/her quick and accurate understanding of connected speech such as p/ b, k/g, pin/bin, /tip/dip, ball/mall etc.

2.5.6.6 Auditory Training Material Drum, Table, Khanjiri, Whistle, Rattle, Bell, Horn, Telephone, Dog bark, Cat's meow, Cow's moo, Crowing the cock, Singing bird, Moving train, Motor sound, Fire engine, Cycle bell, Door bell, Door knock, Laughing, Crying, Running, Dancing, Eating, Clapping, Cooker whistle, Calling name, Dad's Mummy's voice, Aero plane sound, T.V., Radio, Computer etc and other natural and unnatural variety of sound.

132 2.5.6.7 "Check your progress" - 4 1. What is Auditory Training?

-
- 2. Mention any four pre-requisites of auditory training?
- 3. How many stages are present in Auditory Training Name them.

..... 2.5.7 Let us Sum Up llll Deafness is a silent disability and is either partial and total. llll In the hearing world deaf people face many challenges in hearing environment. llll The challenges are education, communication and employment. llll Hearing impaired people can communicate by lip-reading, sign language and using hearing devices such as hearing aids and also cochlear implant. When they use lip-reading, sign language and hearing devices that means loss of normal hearing and restoring using (human interpreter) technological supports (hearing device) llll Restoring techniques are (1) Human interpreter (lip-reading, sign language, communication worker) (2) Technical support (hearing device/amplification option) (3) Auditory training.

2.5.8-Answer to Check Your Progress "Check your progress" - 1 Ø Speak clearly but avoid speaking artificially slowly, exaggerating your lips, or shouting as this affects the natural rhythm of speech. Ø Make use of natural gesture and facial expression as a clue to meaning.

133 Ø Make sure that there is adequate light on your face. Do not stand with your back to windows. Ø Position the student so that he/she can lip-read you easily and see the projector or board and as much of the class as possible if there is to be a group discussion. Ø Repeat questions asked from the floor.

2. British Sign Language (BSL) or Sign Supported English. "Check your progress" - 2 1- llll A hearing aid does not correct a hearing loss like glasses correct vision problems. Most persons with hearing impairments have sensory neural hearing losses and the clarity of speech is affected. The hearing aid does not make speech more clear; it merely amplifies the sound. llll Many people with hearing impairments are easily understood. Others cannot monitor the volume and tone of their speech and may be initially hard to understand. llll Students who have hearing impairments, just like students who do not have hearing impairments, vary to some degree in their communication skills.

2- llll Get the individual's attention before speaking. llll Look at the individual when you speak. llll Do not block the area around your mouth as it may inhibit lip reading. llll Speak naturally and clearly. Slowing down slightly may help. Do not exaggerate lip movement and do not shout. llll Try to avoid standing in front of windows or other light sources. The glare from behind makes it difficult to read lips and other facial expressions.

"Check your progress" - 3 1. Microphone, amplifier, receiver, battery. 2. Body worn hearing aids, behind the ear, in the ear aids, in the canal aids, bone vibrations aids. 3. Cochlear Implant and Frequency Modulated system.

134 “Check your progress” - 4 1. Auditory Training is a process of listening capacity which improves in hearing impaired child for the purpose of listening his/her residual hearing. 2- • Fitted suitable hearing aid. • Suitable reinforcement may be provided and co-operation of the child and the family member in the auditory training programme. • Child’s response to different kinds of sounds and intensities need to be checked carefully. • Always member that the sound which are exposed to child often might be listed in hierarchical manner 3- The auditory training consists of 4 major stages of development such as: • Sound awareness training • Sound discrimination training • Discrimination of gross sound • Fine discrimination of speech sound 2.5.9 Unit End Exercises 1. What is Auditory Training? Describe the details about Auditory Training. 2. Describe the details about restoring technique human interpreter and technical support. 2.5.10 References 1. Unit-3.1 ppppp

Process of Seeing and Common Eye Disorders

in India Structure: 3.1.1 Introduction 3.1.2 Objectives 3.1.3

Anatomy and Physiology of the Seeing Media 3.1.4 Different Parts of Eye and Their Function in Seeing 3.1.5 Process of Seeing 3.1.6 Common Eye Disorders In India 3.1.7 Symptoms And Teratment Of Refractive Errors 3.1.1 Introduction: There is a kind of perception that takes place as our brain decides what it is we are actually seeing. You can actually watch this process of settling upon the right image if you look for it. It is especially pronounced if the brain can't immediately decide what it's viewing. For example, if you see something in the distance you can't quite make out the gestalt changes from image to image until the brain is satisfied that it is the correct one. Try to catch it sometime. In any case, we see what we have been taught to see. That is, the process of seeing is learned from the time we are infants. This is basically why all of us see the same things, and why anyone who doesn't is considered crazy. Artists have long played on the edge of perceptions that are not readily available to the rest of us. Impressionism is a good example. These artists realized that light affected colour and form in unimaginable ways (at that point in the history of art), and painted impressionistic scenes so the rest of us could also see them. Of course, now most of us do, if we allow ourselves to. This really is the essential point—allowing ourselves to. We are much more resilient and stable than we imagine. We can all handle more uncertainty than we imagine. Just because we see or think something out of the ordinary does not mean we're insane. It's a normal part of perception.

Unit-3 ppppp Visual Impairment–Nature and Assessment

139 3.1.2

Objectives: After going through this unit you should be able to: 1. Draw the structure of seeing media 2. Describe the functions of the media 3. Explain the process of seeing 4. Describe the disorders of eye 5. Explain the treatment procedure of refractive errors 3.1.3 Anatomy And Physiologhy Of Seeing Media The process of perception is done through eye which

is the predominant sense organ of human being. It is

a very sensitive organ in our body to be taken care of properly. Around 85% of the information is received through our eyes. Sight is the sense through which the brain received approximately 75% of its information. The eye is essentially formed from both ectoderm and mesoderm.

The eye collects information about size, shape and colour and transmits those to brain where these are interpreted.

So it must be said that eye is the apparatus for seeing. The structure of the orbit, the ocular adnexa, the ocular muscles, the nerves and the blood supply system are so as to help the eyeball to see and to protect it from injury. To understand the mechanism of vision we have to understand the function of the eyeball, the ocular adnexa (the eyelids, the conjunctiva and the lacrimal system) and the ocular muscles.

3.1.4 Different Parts of Eye And Their Function in Seeing:

The eyeball: The eyeball rests in a soft cushion of fat protected by the bony orbit of the skull. It is almost a perfect sphere with clean window in front of cornea. The parts of eyeball are as follows-

Cornea The cornea has an important role in image formation; it forms a primary refractive element in the eye. So it says that cornea is a clear front window of the eye which transmits and focuses (i.e., sharpness or clarity) light into the eye.

140 Iris: The coloured part of the eye which helps regulate

the amount of light entering the eye. When there is bright light, the iris closes the pupil to

let in less light. And when there is low light, the iris opens up the pupil to let in more light. **Pupil:** The dark centre opening in the middle of the iris. The pupil changes size to adjust for the amount of light available (smaller for bright light and larger for low light). This opening and closing of light into the eye is much like the aperture in most 35 mm cameras which lets in more or less light depending upon the conditions.

Lens: Focuses light rays onto the retina. The lens is transparent, and can be replaced if necessary. The lens is not noticed normally because it is hidden within the dark cavity of the inner eye. **Intraocular lenses** are used to replace lenses clouded by cataracts. **Sclera:** The white outer coat of the eye, surrounding the iris. It is similar to the cornea, except that it is vascular, and has dense, irregular, fibrous connective tissue. **Choroid:** Layer containing blood vessels that lines the back of the eye and is located between the retina (the inner light-sensitive layer) and the sclera (the outer white eye wall).

Retina: The nerve layer lining the back of the eye. The retina senses light and creates electrical impulses that are sent through the optic nerve to the brain.

Macula: The area in the retina that contains special light-sensitive cells. In the macula these light-sensitive cells allow us

to see fine details clearly in the centre of our visual field. **Fovea:** The centre of the macula which provides the sharp vision.

Ciliary Body Structure containing muscle and is located behind the iris, which focuses the lens. **Aqueous Humour :**

Produced by ciliary processes of ciliary body. It provides nutrients for lens and cornea. It also maintains intraocular pressure (25mm.Hg), and is replaced several times a day 2 F 1/min).

141 Vitreous Humour: The, clear, gelatinous substance filling the central cavity of the eye secreted by the ciliary body up to the time of maturity. It has very loose connective tissue: contains water, hyaluronic acid and collagen. Pressure from the vitreous humour prevents retinal detachment. It supports the lens anteriorly and the retina posteriorly. It contains a

hyaloid canal, which is a remnant of blood vessels during development. **Optic Nerve:** A bundle of more than a million nerve fibers carrying visual messages from the retina to the brain. (In order to see, we must have light and our eyes must be connected to the brain.) Your brain actually controls what you see, since it combines images. The retina sees images upside down but the brain turns images right side up. This reversal of the images that we see is much like a mirror in a camera.

Ocular adnexa: Accessory structures of the eye, including the eyelids, conjunctiva and the lacrimal apparatus. **The eyelids:** The chief function of the lids is to

protect the eyes from injury and excessive light. The eyebrow and eyelashes also participate in protective role.

Conjunctiva: It is continuous

with the skin of the eyelids. The palpebral Conjunctiva is the part of the conjunctiva that covers the inner surface of the Eyelid; the bulbar conjunctiva covers the surface of the eyeball. It is lined by stratified squamous epithelium, and contains goblet cells, which secrete the deepest, mucus, layer of tear film, which adheres to the surface of the globe. It is highly vascular. The conjunctive blends with the skin of the lid margins as well as with the corneal epithelium. It is also continuous, via the lacrimal puncta and canaliculi with the mucosa of the nasolacrimal sac and duct and hence nose. The

lacrimal system: The two main part of lacrimal system are (a) the lacrimal gland which secretes tears and (b) the lacrimal ducts which carry the tears from the eye into cavity of the nose. It also contains three layers of the tear film: 1. Deep mucous: from conjunctival goblet cells, adheres tears to the conjunctiva a. Middle aqueous: from main and third eyelid lacrimal glands; it cleanses, oxygenates and fills optimal defects. 3. Superficial oily layer: from tarsal glands prevents

evaporation

evaporation

evaporation

142 Extra ocular muscles: The muscles which control the movements of eye ball are six in number, all named by their positions with regard to eyeball. These are as follows- 1. Dorsal rectus muscle 2. Ventral rectus muscle 3. Medial rectus muscle 4. Lateral rectus muscle 5. Dorsal oblique muscle 6. Ventral oblique muscle Usually carrying out the eye movements two or more muscles work together. In addition to the co-ordinated action of muscles in one eye, it is essential for proper vision that there be perfectly co-ordinated muscular action in both eyes. 3.1.5 Process of Seeing: From the above discussion we can compare the eye with a camera. Vision is a complex function that requires more than the eye alone.

The act of seeing requires light to see by and the brain to interpret what is seen. The light rays reflect from an object in a person's field of vision, fall on the eyes. The rays pass through the cornea through the aqueous humour and through the pupil of the colour iris

which dilates or contracts to control light in accordance to the brightness of the object.

In addition the pupil contracts when it looks something small in order to increase the sharpness. Vitreous body Lens Conjunctiva Optic nerve Yellow spot Papilla Sclerotic coat Choroid coat Retina Cornea Iris

143 The rays then pass through the crystalline lens when the eye is relaxed and looking into the far distance the rays of light are focused on to the retina. When we wish to look at something nearer say at 6ft the focus of the lens is automatically adjusted by the surrounding ciliary muscles. The fluid in the aqueous humours in front of the lens and the vitreous body behind the lens allow it to expand or contract easily. This

process of focusing is called accommodation. The cornea and the lens combine to bend the light rays as they pass through. The rays pass through the vitreous body and penetrate the retina, where they set up a photochemical response in the outer most layers, there stimulating the rods and cones. The impulse is picked by the retinal nerve fibres and pass along the optic nerve to the brain where upside down image is formed. Based on experience, the inverted image is psychologically transposed.

The eyes move together and send the brain almost identical images. The brain then joins these two images into a single mental picture. The slight difference in the images is needed to produce stereographic vision. By this long process we are able to see. 3.1.6 Common Eye Disorders in India:

Eyesight is one of the most precious gifts that nature has given to mankind. It's only because of the eyes; one can enjoy the beauty of this world. It's impossible to imagine life without sight. Though a very small part of body, eye is one of the most complex human organs. It has various parts, all of which are responsible for normal vision. Smallest structural or functional alteration in the functioning of an eye can cause tremendous visual disturbances.

This type of visual disturbance makes people helpless and also dependable. The other name of visual disturbance is called visual disorder .on the other hand it is also known as refractive error. In India maximum cause of the adult blind is refractive error or injury or accident. If they are identified at first time there is a chance for curing. But due to lack of knowledge or person's negligence most of the time these disorders are not properly treated or identified. To see external object clearly, it is necessary that sharp images of objects must be formed upon the retina. The cornea, the aqueous humour, the crystalline lens and the vitreous body act together as refractive media to bring parallel rays of light reflected from external object to a focus on the retina. The images become sharp in the macula. The normal eye is called emmetropic while the abnormal condition is called errors of refraction or ametropia.

Refractive error or need of glasses is one of the most common eye problems. It can start at any age. This is due to alteration in length, shape & / or capacity of eyes.

144

What is

refraction? Refraction is the bending of light as it passes

through one object to another. Vision occurs when light rays are bent (refracted) as they pass through the cornea and the lens. The light is then focused on the retina. The retina converts the light-rays into messages that are sent through the optic nerve to the brain. The brain interprets these messages into the images we see. What are refractive errors?

Refractive errors occur when the shape of the eye prevents light from focusing directly on the retina. The length of the eyeball (longer or shorter), changes in the shape of the cornea, or aging of the lens can cause refractive errors. Not all eyes are optically perfect and consequently light rays may not be brought accurately to focus on the retina. Faulty optical conditions, or refractive errors may be classified into four basic categories. These are as follows- Hyperopia (farsightedness): It is a common type of refractive error where distant objects may be seen more clearly than objects that are near. When the optics are too weak for the length of the eyeball, one has hyperopia or farsightedness. This can arise from a cornea or crystalline lens with not enough curvature (refractive hyperopia) or an eyeball that is too short (axial hyperopia) However, people experience hyperopia differently. Some people may not notice any problems with their vision, especially when they are young. For people with significant hyperopia, vision can be blurry for objects at any distance, near or far. This can be corrected with convex lenses which cause light rays to converge prior to hitting the cornea.

145 Myopia (nearsightedness) It is a condition where objects up close appear clearly, while objects far away appear blurry. When the optics is too powerful for the length of the eyeball one has myopia or nearsightedness. This can arise from a cornea or crystalline lens with too much curvature (refractive myopia) or an eyeball that is too long (axial myopia). With myopia, light comes to

focus

in front of the retina instead of on the retina

Myopia can

easily be corrected with a concave lens which causes the divergence of light rays before they reach the cornea.

Astigmatism It is a condition in which the eye does not focus light evenly onto

the retina, the light- sensitive tissue at the back of the eye.

This can cause images to appear blurry and stretched out. Cylindrical errors cause astigmatism, when the optical power of the eye is too powerful or too weak across one meridian, such as if the corneal curvature tends towards a cylindrical shape. The angle between that meridian and the horizontal is known as the axis of the cylinder. A person with astigmatic refractive error sees lines of a particular orientation less clearly than lines at right angles to them. This defect can be corrected by refracting light more in one meridian than the other. Cylindrical lenses serve this purpose.

146 Presbyopia It is an age-related condition in which the ability to focus up close becomes more difficult. As the eye ages, the lens can no longer change shape enough to allow the eye to focus close objects clearly. The individual would experience difficulty in near vision, often relieved by reading glasses, bifocal, or progressive lenses. Other type of refractive errors are- Amblyopia: Amblyopia is any reduction in visual acuity in one or both eyes. This condition of mentally shutting out the images of one eye is also known as lazy eye. Amblyopia in young children may not present a permanent reduction in vision since correction may be possible. Treatment may consist of glasses, patching, surgery or a combination of procedures including eye exercises. Squints (strabismus): Defects of eye muscles are cause for eye disorder. If one or more muscles which help rotate the eye become weak or paralysed both eyes then fail to focus on some object at the same time or same angle. The condition is known as strabismus. It means that in coordinated action of the muscles cause the failure of the visual axes of the two eyes to meet at the objective point. Squint is convergent when the eyes turn towards the medial line; it is divergent if the eyes turn outward. Squint in children may some time lead to serious visual impairment as the brain tends to accept only the good images of the weaker or squinted eye. Due to disuse the weak eye may reduce to low vision.

147 Nystagmus: It is the term applied to rapid oscillatory movements of the eye ball. The movements are involuntary. They are usually lateral but vertical, rotator and mixed rotator and lateral or vertical nystagmus occurs. Nystagmus may be congenital, early infantile or it may be acquired. Nystagmus is present in most cases of total colour blindness in which vision is carried out by the rod alone. In some cases head nodding with Nystagmus is congenital or hereditary a condition which persists throughout life. 3.1.7 Symptoms and Treatment of Refractive Error: What are the signs and symptoms of refractive errors? Blurred vision is the most common symptom of refractive errors. Other symptoms may include: Double vision, Haziness, Glare or halos around bright lights, Squinting, Headaches and Eye strain. How are refractive errors diagnosed? An eye care professional can diagnose refractive errors during a comprehensive dilated eye examination. People with a refractive error often visit their eye care professional with complaints of visual discomfort or blurred vision. However, some people don't know they aren't seeing as clearly as they could. How are refractive errors treated? Refractive errors can be corrected with eyeglasses, contact lenses, or surgery.

Eyeglasses: These are the simplest and safest way to correct refractive errors. Your eye care professional can prescribe appropriate lenses to correct your refractive error and give you optimal vision.

148 Contact Lenses: It works by becoming the first refractive surface for light rays entering the eye, causing a more precise refraction or focus. In many cases, contact lenses provide clearer vision, a wider field of vision, and greater comfort. They are a safe and effective option if fitted and used properly. It is very important to wash your hands and clean your lenses as instructed in order to reduce the risk of infection. If you have certain eye conditions you may not be able to wear contact lenses. Discuss this with your eye care professional. Refractive Surgery: It aims to change the shape of the cornea permanently. This change in eye shape restores the focusing power of the eye by allowing the light rays to focus precisely on the retina for improved vision. There are many types of refractive surgeries. Your eye care professional can help you decide if surgery is an option for you.

149 Unit : 3.2 ppppp Blindness and Low Vision-definition and Classification Structure: 3.2.1. Introduction 3.2.2. Objectives 3.2.3. A Brief Historical Review 3.2.4. Definition 3.2.4.1 Blindness 3.2.4.2 Low Vision 3.2.5. Classification 3.2.1 Introduction It is a true phenomenon that visual impairment tends to evoke more awkwardness from us than any other disability. For one thing, blindness is visible. The blind person is usually not one who can easily weave himself into the fabric of a crowd. Unlike many other exceptional people he stands out. The visually impaired person, however, has a variety of symbols. Cane, thick or darkened glasses, a guide dog etc. 3.2.2 Objectives After going through this unit you should be able to: 1. Draw out the position of impairment 2. Know about blind 3. Tell about low vision 4. Also gather knowledge about visual classification

150 3.2.3 A Brief Historical Review: The history of Special Education in general and of visually impaired children in particular had visualized many ups and downs in its progressive phase of development. Globally it evolved through the following five stages. 1) Pre-Christian Era- During this stage, disability was viewed as punishment of past sins and nobody wanted to interfere in the justice meted out to the disabled persons by God. 2) Christian Era- In this stage they are protected and pitied to reduce their pains and miseries. 3) Dawn of 19th century- Institutions were established to provide them separate education. 4) Late 20 th century- The movement started to integrate them in the society. 5) Present age- The concept of special and integrated system of education has been emerged out on the basis of needs of disabled persons. 3.2.4 Definitions: 3.2.4.1 Blindness: The term blindness is used for complete or nearly complete vision loss. Legal/ medical definitions

The current definition does not make a distinction between those who have "irreversible" blindness (NO perception of light) and those that have light perception but are still less than 3/60 in the better eye. The legal definition involves assessment of visual acuity and field of vision. It is used to determine whether or not an individual qualifies for legal benefits. The American Medical Association (AMA) proposed this definition in 1934.this definition is now accepted by American Foundation for the Blind (AFB) and other Blind Association in different countries.

In India, the broad definition of visual impairment as adopted in the Persons with Disabilities Act (PWD), 1995 as well as under the National Programme for Control of Blindness (NPCB) is given as "

Blindness refers to

a condition where a person suffers from any of the following conditions:

151 Total absence of sight or

Visual acuity not exceeding 6/60 or 20/200 (Snellen) in the better eye even with correction lenses or limitation of the field of vision subtending and angle of 20

degree or worse.”

Educational/functional definition Many educators are disinterested in the legal or medical definition of blindness. Their argument that visual acuity is not very accurate prediction of how one will function or effectively use the remaining sight he has. A common misconception is that legally blind having absolutely no vision, the vast majority are able to see. Recognizing the limitations of the legal definition of blindness and partially sightedness, many have favoured an educational definition. For educational purpose, “the blind are those who are so severely impaired that they must be taught to read by Braille, while the partially sighted can read print by using magnifying glasses or books with large print.” The educational definition of visual impairment considers the extent to which the child’s vision affects learning and makes special methods or materials necessary. Educators often differentiate between blind and low vision students. For deciding the blindness, the visual acuity as well as field

of vision has been considered. Visual acuity: It refers to the ability of the eye to see details.

The visual acuity for distance is measured as the maximum distance at which

a person can see a certain object, divided by the maximum distance at which a person with normal eyesight can see the same. Thus a visual acuity of 6/60

means that the person examined cannot see, at a distance of 6 meters, the object, which a person with normal eyesight would be able to see at 60 meters.

Visual

efficiency: Visual efficiency is the extent to which available vision is used effectively. The term visual efficiency includes visual acuity at long and at short, control of eye movements, accommodative ability etc. this also includes the processing ability of the brain. Visual efficiency is unique to each child.

The visual efficiency can be developed by training but cannot be measured

or predicted clinically with any accuracy by medical, psychological, or educational personnel. As defined by Barrage, Visual efficiency includes such skills as controlling eye movements, adapting to the visual impairment, paying attention to visual stimuli and

152 processing visual information rapidly. The fundamental premise in developing visual efficiency is that children learn to see and must be actively involved in using their own vision.

Field vision It refers to the field which both the eyes can easily see in the front. The normal field of vision is 150 degrees in front of eye. Visual functioning

The visual functioning refers to the degree to which ability of a person to use vision for all activities. 3.2.4.2

Low vision Low vision is a term often used interchangeably with visual impairment and refers to a loss of vision that may be severe enough to hinder an individual’s ability to complete daily activities such as reading, cooking, or walking outside safely, while still retaining some degree of useable

vision. The Person with Disabilities Act, 1995 also recognizes LOW VISION as a category of disability and defines it as follows: “Person with

low vision means a person

with

impairment of visual functioning even after treatment or standard refractive correction

but who uses or is potentially capable of using vision for the planning or execution of a task with appropriate assistive device.”

This definition is incomplete as it inadvertently omits quantification of the acuity as well as the field of vision as is done in the case of the WHO definition. It is desirable to modify this definition and the following quantification should be added: “Low vision are those who suffer visual acuity between 20/200 to 70/200(Snellen) or 6/18to 6/60 in the better eye after the best possible correction or a Field of vision between 20 to 30 degrees.”

In

the practice of eye care “LOW VISION” has a specific meaning as defined by WHO. This

is

as follows: “

A person with low vision is one

who has impairment of visual functioning even after treatment and/

or standard refractive correction, and has a visual acuity of less than 6/18 to light perception, or a visual field of

less than 10 degree from the point of fixation,

153 but who uses, or is potentially able to use, vision for planning

and/or execution of a task.”

The points emphasize are that there is significantly reduced vision visual performance is affected but there still is vision that can be used.

For deciding the low vision, the residual vision as well as functional vision has been considered. Residual vision The use of remaining vision by the visually impaired individuals to perform their daily activities is known as residual vision.

Functional vision Functional vision is the use of vision for particular activities. Functional visual skills are required to carry out every day activities.

Central Scotoma A hazy or dark hole appears in the centre of objects. Causes include macular degeneration and optic atrophy. Tunnel vision

Loss of peripheral vision causes a restricted field of vision, Objects in the centre remain visible. Causes include glaucoma and retinitis pigmentosa.

Accommodation If while looking at an object situated at infinity, the gaze be transferred to an object near at hand, some readjustment of the power of the crystalline lens will have to occur, otherwise the image will fall behind the retina. This adjustment of the power of the lens is called accommodation. 3.2.5 Classification:

The importance of functional definition lies in the 'label' people are given. Someone with visual acuity of 2/60 can have useful vision, for example, for mobility. However, he or she will be labelled blind person. The consequence is this person is then treated as if he

or

she is blind. This ignores the usable vision. There should be a difference between legal blindness and functional blindness or low vision. The

World Health Organization uses the following classifications of visual impairment. When the vision in the better 154 eye with best possible glasses correction is: 20/30 to 20/60 : is considered mild vision loss, or near-normal vision

20/70 to 20/160 : is considered moderate visual impairment, or moderate low vision 20/200 to 20/400 : is considered severe visual impairment, or severe low vision 20/500 to 20/1,000 : is considered profound visual impairment, or profound low vision

More than 20/1,000 : is considered near-total visual impairment, or near total blindness No light perception : is considered total visual impairment, or total blindness. Blindness is defined by the World Health

Organization as vision in a person's best eye of less than 20/500 or a visual field of less than 10 degrees Category

Corrected Visual WHO's Working Indian acuity in the better Defmition(standard) Definition Definition eye 0 6/6-6/18

Normal Normal Normal 1 >6/ 18-6/60 Visual impairment Low vision Low vision 2 >6/60-3/60 Severe visual Low

vision Blind impairment 3 >3/60-1/60 Blind Low vision Blind 4 >1/60-PL Blind Low vision Blind 5 NPL Blind Total

Blindness Total Blindness

The WHO standard definition defines blindness

as visual acuity of less than 3/60 in the better eye with the

best possible correction as compared to that of 6/60 in India. The WHO functional definition however considers

blindness starting at light perception or when a person has no usable vision. Similarly a person with visual acuity better than 3/60 but equal or less than 6/60

is graded as "blind" in India, while WHO grades him as low vision. In India

a person with a visual acuity >6/60 is legally blind, which enables to receive certain services and financial benefits.

However a person who is legally blind can still have useful vision to do certain tasks as can be seen in the working

definition. This refers to the fact that they still have functional vision which is the use of vision for a particular purpose. For India or other developing countries, it is essential to maintain the legal definition of blindness at the level of visual acuity of

6/60(20/200 Snellen) or less and field of vision of 20 degree or less. Already the travel concessions scholarship and other benefits are very meagre, if 'perception of light' to 'no perception of light' is considered blindness, a large

number

of persons who are at present availing these

155 concessions would fall outside the eligibility criteria and thus remain bereft of these benefits. Alternatively, if these concessions are extended to all the persons with low vision in the acuity range of 6/18 to 'perception of light' as defined by WHO the appropriate Government may not be able to meet demand due to financial constraints. For India and other developing countries it is desirable to maintain the definition of blindness as adopted in the Persons with Disability Act 1995 i.e. visual acuity of 6/60(20/200) or less and field of vision of 20 degree and less and to consider all the persons in the range of acuity of 6/18 to 6/60(20/60 to 20/200) as persons with low vision.

According to above discussion visually impaired are classified as follows- Partially Sighted The generally accepted definition for educational purposes now includes: 1. Those students with visual acuity of 20/70 or less in the better eye after the best possible correction, who can use vision as the main channel of learning. 2. Those students, who in the opinion of eye specialist and educational authorities will benefit by the use of special facilities provided by the programme for partially sighted students. One eyed

The definition of blindness adopted in India excludes people with impairment only in one eye from the purview of blindness.

Generally the impairment of 40% or more is considered a handicap but in the case of one eyed person it is only 30% according to the approved definition in medical parlance, a person with one good eye is not a blind person.

Vision loss It refers to individuals who have trouble seeing, even when wearing glasses or contact lenses, as well as to individuals who are blind or unable to see at all. Monocular vision impairment "Monocular vision impairment" or "Monocular Blindness"; are used both eyes separately. By using the eyes in this way, as opposed by binocular vision, the field of view is increased, while depth perception is limited. The fellow eye in these need not necessarily to be "normal".

156 Self-reported vision loss It is determined on an individual basis based on that person's perceived visual ability and its effect on daily functioning. Functional limitation It refers to the interaction of visual functioning and ability to perform activities of daily living/instrumental activities of daily living. Common daily activities affected by vision loss are reading, safe pedestrian travel, self-care, cooking, and recreational activities. Visual impairment It is often defined clinically as a visual

acuity of 20/70 or worse in the better eye with best correction, or a total field loss of 140

degrees. Additional factors influencing visual impairment might be contrast sensitivity, light sensitivity, glare sensitivity, and light/ dark adaptation. Legal blindness It is a level of vision loss that has been legally defined to determine eligibility for

benefits. The clinical diagnosis refers to a central

visual acuity of 20/200 or less in the better eye with the

best possible correction, and/or a visual field of 20 degrees or less. Often, people who are diagnosed with legal blindness still have some useable vision. Total blindness It refers to an inability to see anything with either eye.

157

Unit : 3.3

ppppp Demographic Information-NSSO and Census 2011 Structure: 3.3.1 Introduction 3.3.2 Objectives 3.3.3

Demographic Information 3.3.4 Nssso 3.3.5 Census-2011 3.3.1 Introduction: It is a constitutional obligation of the government to promote the welfare of people by securing and protecting as possible a social order in which social, economic and political justice shall inform all the institution of national life. For this reason census is necessary. There are several estimates about the size of the disabled population in India with reference to the world situation. 90% of the world's blind people live in developing countries. Visually impaired people account for 48.5% of more than 2 core figure in India. To give them proper prevalence demographic information has great importance. 3.3.2 Objectives: After studying this unit, you should be able to: 1. Explain the need of census 2. Discuss the role of census 2011 3. Explain the services provided by NSSO 4. Write about demography 3.3.3 Demographic Information Demography is the statistical study of human population. As a very general science, it can analyze any kind of dynamic living population, i.e., one that changes over time or

158 space. It encompasses the study of the size, structure, and distribution of these populations, and spatial and/or temporal changes in them in response to time, birth, migration, ageing, and death. The word demography taken from Greek word where demos, means "the people" and -graphy means description or measurement. Demographics are quantifiable characteristics of a given population. Demographic analysis can cover whole societies, or groups defined by criteria such as education, nationality, religion and ethnicity. Educational institutions usually treat demography as a field of sociology, though there are a number of independent demography departments. Formal demography limits its object of study to the measurement of population processes, while the broader field of social demography or population studies also analyzes the relationships between economic, social, cultural and biological processes influencing a population. Demographic thoughts can be traced back to antiquity, and are present in many civilisations and cultures, like Ancient Greece, Ancient Rome, India and China. There are two types of data collection — direct and indirect — with several different methods of each type.

Direct methods Direct data comes from vital statistics registries that track all births and deaths as well as certain changes in legal status such as marriage, divorce, and migration (registration of place of residence). In developed countries with good registration systems (such as the United States and much of Europe), registry statistics are the best method for estimating the number of births and deaths. A census is the other common direct method of collecting demographic data. A census is usually conducted by a national government and attempts to enumerate every person in a country. However, in contrast to vital statistics data, which are typically collected continuously and summarized on an annual basis, censuses typically, occur only every 10 years or so and thus are not usually the best source of data on births and deaths. Analyses are conducted after a census to estimate how much over or undercounting took place. These compare the sex ratios from the census data to those estimated from natural values and mortality data. Censuses do more than just count people. They typically collect information about families or households in addition to individual characteristics such as age, sex, marital status, literacy/education, employment status, and occupation, and geographical location. They may also collect data on migration language, religion, nationality and citizenship. In countries in which the vital registration system may be incomplete, the censuses are also used as a direct source of information about fertility and mortality.

Indirect methods Indirect methods of collecting data are required in countries and periods where full data are not available, such as is the case in much of the developing world, and most of 159 historical demography. One of these techniques in contemporary demography is the sister method, where survey researchers ask women how many of their sisters have died or had children and at what age. With these surveys, researchers can then indirectly estimate birth or death rates for the entire population. Other indirect methods in contemporary demography include asking people about siblings, parents, and children. Other indirect methods are necessary in historical demography. There are a variety of demographic methods for modelling population processes. They include models of mortality, fertility, marriage disability, population projections and population momentum.

3.3.4 NSSO

The NSSO (National Sample Survey Organisation), now known as National Sample Survey Office, is an organization under the Ministry of Statistics of the Government of India. It is the largest organisation in India conducting regular socio-economic surveys. It was established in 1950. Employees of NSSO belong to Indian Statistical service and Subordinate statistical service. NSSO has four divisions: 1. Survey Design and Research Division (SDRD), 2. Field Operations Division (FOD), 3. Data Processing Division (DPD) and 4. Co-ordination and Publication Division (CPD)

The Survey Design and Research Division (SDRD) It is a professional organ of NSSO, mandated to do the job of: Planning of the survey, Formulation of sample design, Drawing up of schedules of inquiry, Formulation of concepts and definitions, Preparation of instruction manual for survey field work, Survey Design and Research Division (SDRD). Training of field and data processing personnel on survey Methodology Formulation of scrutiny check points Drawing up of tabulation programme Preparation of survey reports Analysis and presentation of survey results and Undertaking studies for the improvement of survey methodology

SDRD, NSSO is located at Mahalanobis Bhavan, Kolkata and is headed by an Additional Director General - a Higher Administrative Grade (HAG) level officer, and has sanctioned strength of three SAG (Senior Administrative Grade), fifteen JAG (Junior Administrative Grade), eight STS (Senior Time Scale) and four JTS (Junior Time Scale) level officers of Indian Statistical Service besides one Deputy Director (Administration) and the supporting staff members.

The Field Operations Division (FOD) The one of the four Divisions of the National Sample Survey Office, is responsible for conducting surveys in the field of Socio- Economic, Industrial Statistics, Agricultural

160 Statistics, Prices, etc. as per the approved programmes. It is also responsible for updating the frame for conducting Socio-Economic Surveys in urban areas. This Division with its Headquarters located at New Delhi and Faridabad functions through a network of 6 Zonal Offices, 49 Regional Offices and 116 Sub-Regional Offices spread throughout the country and have staff strength of about 4000. The Division is headed by Additional Director General (ADG), an Additional Secretary Level Officer. In Headquarters, four Deputy Director Generals as well as other officers in the rank of Director/ Joint Director/ Deputy Director/ Assistant Director assist him. All the Zonal Offices are headed by Deputy Director Generals while the head of Regional Offices are Deputy Director General/ Director level officers except for Port Blair which is headed by Assistant Director. Field Operations Division (FOD). The Data Processing Division (DPD) This department of NSSO with Headquarters at Kolkata and five Data Processing Centres outside Kolkata at Ahmadabad, Bangalore, Delhi, Giridih and Nagpur are primarily mandated to undertake the processing, the tabulation and the dissemination of data collected through Nation Wide Large Scale Sample Surveys on various Socio-economic issues conducted by National Sample Survey Office (NSSO) under the Government of India. This task of transforming large volume of raw data into the final form of Key Indicators or Estimates in Tabular Format with due process of scrutiny and validation is carried out by a large number of trained and experienced technical officials in Electronic Data Processing Cadre under the overall supervision and guidance of the officers of Indian Statistical Service. The role of DPD starts from the initial stage of formulation of the Sample Design for NSS Surveys by SDRD wherein apart from providing input for the formulation it has to undertake the job of sample selection. Later on DPD undertakes the job of software development for Data Entry, Data Verification, Computer Edit, Other Data Validations, Howler Checks, Tabulation, etc. DPD also assists the States by providing complete IT solutions in all their data processing related activities and also through periodic training/workshop and other interactive methods. With the advent of Information Technology, DPD is now introducing modern technology to reduce time and effort in data capturing and transmission besides improving quality of unit level data. It also helps other countries/organizations in enhancing their capacity building particularly in data processing/analysis by conducting various need based training programmes. Main Functions are as follows

1. Selection of samples and preparation of Sample lists. Data Processing Division (DPD)

- 161 2. Manual checking of identification particulars and pre data entry scrutiny.
3. In-house development of validation and tabulation software.
4. Data Entry & Verification of filled-in schedules.
5. Validation of data through various stages covering both content check and coverage check.
6. Preparation of Directory and Multiplier files for estimation of parameters.
7. Tabulation of validated data as per approved tabulation plan.
8. Processing & tabulation of monthly Rural retail price data and release of Quarterly Rural Price Bulletin.
9. Assistance to state statistical agencies in processing of NSS state sample data.
10. Providing training in application of computer and on data processing.
11. Undertaking special data compilation and tabulation work for: Various analytical studies, Methodological studies etc. undertaken by NSSO in support of Working Group/Steering Committee Special users/Committees/Ministries/Depts./Orgs.
12. Organising scrutiny feedback workshop for FOD.
13. Providing technical guidance/assistance to NSS Data Users.
14. Meeting Data requirements (Adhoc tabulation/drawing of Samples etc.) and User's queries.

Co-ordination & Publication Division (CPD) It is located at New Delhi and is responsible for:

1. coordinating the activities of all the Divisions of NSSO.
2. Dissemination of survey results and analysis through the biannual technical journal 'Sarvekshana' and 'National Seminars' to discuss the survey.
3. Providing technical and secretarial assistance to Steering Committee of National Sample Surveys.
4. Supplying survey data of various rounds to individuals, researchers, research institutions and other private and govt. bodies.
5. Liaison with other Departments/ Ministries on various matters concerning NSSO.
6. Providing the technical and secretarial assistance to DG& CEO of NSSO.

3.3.5 Census 2011

The 15th Indian Census was conducted in two phases, house listing and population enumeration. House listing phase began on 1 April 2010 and involved collection of

162 information about all buildings. Information for National Population Register was also collected in the first phase, which will be used to issue a 12-digit unique identification number to all registered Indians by Unique Identification Authority of India. The second population enumeration phase was conducted between 9 to 28 February 2011. Census has been conducted in India since 1872 and 2011 marks the first time biometric information was collected. According to the provisional reports released on 31 March 2011, the Indian population increased to 1.21 billion with a decadal growth of 17.64%. Adult literacy rate increased to 74.04% with a decadal growth of 9.21%. The motto of census 2011 was 'Our Census, Our future'. Spread across 29 states and 7 union territories, the census covered 640 districts, 5,767 tehsils, 7,933 towns and more than 600,000 villages. A total of 2.7 million officials visited households in 7,933 towns and 600,000 villages, classifying the population according to gender, religion, education and occupation. The cost of the exercise was approximately 2200 crore— this comes to less than 0.50 per person, well below the estimated world average of 4.60 per person. Conducted every 10 years, this census faced big challenges considering India's vast area and diversity of cultures and opposition from the manpower involved C. Chandramauli is the Registrar General and Census Commissioner of India of 2011 Indian census. Census data was collected in 16 languages and training manual was prepared in 18 languages. The census was conducted in two phases. The first house listing phase began on 1 April 2010 and involved collection of data about all the buildings and census houses. Information for National population register was also collected in the first phase. The second population enumeration phase was conducted from 9-28 February 2011 all over the country. The eradication of epidemics availability of more effective medicines for the treatment of various types of diseases and the improvement in the standard of living these are the main reason for the high growth of population in India.

163 Census 2001 has revealed that over million people in India as suffering from one or the other kind of disability. This is equivalent to 2.1% of the population. Among the total disabled in t he country, 12.6 million are males and 9.3 million are females. Although the number of disabled is more in rural and urban areas. The disability rate (number of disabled per 100,000 populations) for the country as whole works out to 2130. This is 2,369 in the case of males and 1,874 in the case of females. Among the five types of disabilities on which data has been collected, disability in seeing at 48.5% emerges as the top category. Others in sequence are: In movement (27.9%), Mental (10.3%), in speech (7.5%), and in hearing (5.8%). The disabled by sex follow a similar pattern except for that the proportion of disabled females is higher in the category in seeing and in hearing. Across the country, the highest number of disabled has been reported from the state of Uttar Pradesh (3.6 million). Significant numbers of disabled have also been reported from the state like Bihar (1.9 million), West Bengal (1.8 million), Tamil Nadu and Maharashtra (1.6 million each). Tamil Nadu is the only state, which has a higher number of disabled females than males. Among the states, Arunachal Pradesh has the highest proportion of disabled males (66.6%) and lowest proportion of female disabled.

164 Number of Disabled Population and Type of Disability POPULATION PERCENTAGE (%) Total population 1,028,610,328 100.0 Total disabled population 21,906,769 2.1 Disability rate (per lakh population) 2,130 __ Type of Disability (a) In seeing 10,634,881 1.0 (b) In speech 1,640,868 0.2 (c) In hearing 1,261,722 0.1 (d) In movement 6,105,477 0.6 (e) Mental 2,263,821 0.2

165 From the above discussion we come to conclusion that-

the number of physically disabled persons in India was 16.15 million and they formed about 1.9 percent of the total population. 74.3

percent persons with disabilities live in rural areas. The prevalence of physical disability is reported to be 2 percent in rural areas and 1.6 percent in urban areas. Similarly, Incidence Rate is reported to be 90 per 1, 00,000 in rural areas which is higher than that of 83 in urban areas, c. Between the two sexes, prevalence as well as incidence is reported to be marginally higher among males than among females. About 12.4 percent of these persons suffered from more than one type of physical disabilities. The persons with locomotors disability are largest in number (7.6 million); followed by those with speech and/or hearing impairment (4.5 million) and then those with visual impairment (4 million). About 9 and 7 percent households in rural and urban India respectively have at least one disabled person in the household. Among these households, about 92 percent had one disabled person, about 7 percent had 2 disabled persons and less than 1 percent reported 3 or more disabled persons, both in rural and urban sectors. About 25 percent in rural areas and 20 percent in urban areas are reported

to be severely disabled as they could not function even with

aids and appliances. About 70 percent of disabled persons are found to be illiterate in rural areas as against 46 percent in urban areas. Only 4 percent persons with disability

in rural India have an educational level "secondary and above" as against 12 percent in urban

areas. Only 29 percent and 25 percent persons with disability are employed in rural and urban India respectively. Out of these, 60 percent were self employed, 7 percent regular employees and remaining 33 percent as casual labourers.

166 Unit : 3.4 ppppp Importance of Early Identification and Intervention Structure: 3.4.1 Introduction 3.4.2. Objectives 3.4.3. Early Identification of Vision Problem 3.4.3.1 Importance of Vision And Learning About Vision Loss 3.4.3.2 Symptoms of Vision Problems 3.4.4. Early Intervention Programmes 3.4.4.1 Meaning of Early Intervention 3.4.4.2 Deficit Model 3.4.4.3 Classification of Intervention Programme 3.4.5. Importance 3.4.1 Introduction 'Catch them young and teach them well' is the slogan reflected all over the world for the education of children with special needs. There are a lot of advantages over identification of children with visual problems at their young ages. Most of the eye problems are medically treated and cured. After medical correction, most of the children would see normally. Some medically untreatable conditions of eye defect lead to blindness. However, a very few children would suffer from total blindness and most of the children may have residual vision. Therefore early identification of child with visual problems will help the child to go for medical and educational interventions. In this unit a detailed discussion is held on early identification, intervention and their importance. 3.4.2 Objectives After studying this unit, you should be able to: 1. Explain the early identification of child with visual impairment

167 2. List out the factors and behavioural indicators for vision-loss 3. Describe the early intervention programme 4. Able to write about importance of identification and intervention 3.4.3 Early Identification: Early eye- examination is of utmost importance. All eye surgeons have been exposed to the frustration of an adult when informed that nothing can be done to improve vision in the lazy eye. This can be prevented to a great extent if it can be detected around the age of 3-4 years. It has been observed that 24% have refractive errors and many of these errors are present at birth and go unnoticed for a long time.

Early identification is the step to set the intervention programmes. 3.4.3.1 Importance of Vision and Learning about Vision Loss Although every one of our senses plays a role in early development, vision certainly seems to lead the way. Early bondage of the child with parents is based on the child's ability to make eye contact and sustain a gaze with his parents, response to their voices by gurgling and cooing. An infant tries to move because he sees something. He learns that things and people exist in the world primarily because he sees and hears them come and go. He visually tracks an object he pitches to the ground. He can inspire his parents to play with them by making eye contact, the earliest form of conversation. He learns about size, shape, and colour, function of objects, social interactions and so much more just by looking at the world at work. Every child with or without a disability should have regular and periodic vision checking. If the child is severely disabled, this can be even more important since their other senses may not be as useful in compensating for what they miss visually. In fact this is so important that schools should have vision screening at regular intervals throughout the remainder of the child's educational career. Factors And Behavioural Indicators For Vision Loss A child is at risk for vision loss if the child encounters the following factors: • Family history of vision loss • Malformation of the eye • Prematurity and low birth weight • Birth trauma

168 • Congenital viral or bacterial • Meningitis, Encephalitis, Hyperthyroidism, Microcephaly The following behaviours indicate the child's vision loss • The child does not have eyes that look typical • The child does not recognize caregivers' faces or smile in response to their smiles • He does not get excited when he sees other familiar object • The child's eyes do not move together when following object • The child may hold an object very close to his eyes • The child may over reach or under reach for objects 3.4.3.2 Symptoms of Vision Problem Young children with vision problems often do not know that the way they see the world is not the way everyone sees it. 1. Permanent vision loss 2. Learning difficulties Any changes in the appearance of eyes or vision should be investigated further.

Signs to Watch Out for Early Detection (As Adopted by UNICEF) General symptoms that may occur from birth • Squints or blinks when looking at something •

The eyes are crossed • Favours one eye more than the other when looking at an object • One or both of the eyes turn in or out • The pupils are hazy • Eyes are tearing excessively, they are red or eye-lids are encrusted with matter •

Turns or tilts head abnormally • Has frequent or persistent sites May occur from 0-3 Months • Child does not follow an object in his visual field. Child does not play with his hands.

169 May occur from 3-6 Months • Child does not reach for toys in his visual field • Child does not make eye contact when being fed • Child does not visually inspect object May occur from 6-9 Month • Child's mother skills such as rolling over, sitting or crawling • Child does not appear to discriminate between similar objects or people • Child does not pick up small objects successfully May occur from 9-12 Months • Child shuts or covers one eye when focusing • Child holds playthings very close to eyes • Child bumps into large objects when crawling • Child rubs his eyes excessively • Child does not attempt to grasp spoon • Child does not appear to notice

May occur from 1-2 Years • Walking is delayed • Bumps into large objects • Child is not interested in playing • Child not interested in picture book • Child holds book very close to eye • Child is afraid to walk • Child is clumsy and awkward for his age • Child pays more attention to sound May occur from 2-5 Years • Stumbles over small objects

170 • Not interested in task that require Sustained visual concentration • Complains of headaches, burning, itching of eyes • Cannot see distant things clearly • Does not notice colour difference May occur at School Age • Short attention span and daydreams • Uses unusual or fisted pencil grasp, frequently breaking pencil • Difficulty in remembering what is read • Loses place while reading • Cover one eye • Very hard to read hand writing • Skips words and re-read •

Difficulty in sequential concepts • Poor eye hand coordination • Gets easily frustrated 3.4.4

Early Intervention The term early intervention refers to services given to very young children with visual problems, generally from birth until the child turns three. For this reason these programmes are sometime called "birth to 3" or "zero to 3". Services included medical treatment, follow-up service, visual efficiency development, training on daily living skills and mobility etc. Deficit Model Current practice of early intervention is viewed as a deficit model. That is strategies address deficit of vision. The time to intervene is before the delay occurs. The goal is to prevent the delay if possible. That is why the identification of a vision problem as early as possible is essential. As soon as visual problem is identified the sooner intervention can be provided, the more likely it is that delays can be prevented.

171 Classification Of Intervention Programmes Early intervention programmes are classified as vision screening, medical intervention and educational intervention. All these programmes go simultaneously for prevention of eye deficit, restoration of vision development of vision efficiency. Vision screening All children should be screened for possible vision problems, especially those under age of three with a suspected or identified risk factor, regardless of severity. The initial screening should be conducted by trained personnel on vision screening procedures. The trained personnel may be low vision specialist, special teacher, rehabilitation workers and village nurses. Identified cases of visual problems are referred to the medical personnel who would attend to thorough eye examination. Medical intervention There are many possible defects or diseases of the visual system, but fortunately many of them appear after the first few years of life. There are still many malformations, defects, diseases, infection and disorders that can affect the visual system in infants and toddlers as it is presumed that medical follow up to screening will identify and prescribe treatment. The medical professionals will take care of treatment aspects for the diseases and defects of the eyes. Educational intervention Educational intervention includes the preschool training such as development of daily living skills, mobility skill, visual skill etc and placement of the child into formal school system. The trained teacher or rehabilitation worker who is qualified on visual impairment takes the child with visual impairment for training on various skills required by the child. He/she also provides counselling for the parents, family members, relative and neighbours about the development of the child with visual impairment and their role on caring the child. 3.4.5 Importance Early Identification Early identification is extremely important because early intervention will be most effective. Sometimes it is unclear whether a child has a vision problem or not. Physical signs of vision problems include eyelids drooping over one or both eyes, or eyelids that

172 do not completely cover the eyes when the child closes them. If a child has a clear squint, has jerky eye movements, or has eyes that do not move together, parents should see a paediatric ophthalmologist. Other signs include: Not looking at others in the eyes, Reaching in front of or beyond an object, Holding objects very close or very far to see them, Turning or tilting his head when he uses his eyes, Continuously pushing or poking his eyes, Looking above, below or off to one side of an object, rather than directly at it Bumping into objects and having a lot of trouble seeing at night, Feeling for objects on the ground instead of looking with her eyes. After the identification of visually impaired students under these, parents should begin working with an early childhood interventionist. Young children who are visually impaired are eligible for early intervention services, which can help a family through the child's first few years of life. Early intervention for students with visual impairment is vital in enhancing social, physical, and intellectual development. When a child who is over three, he will qualify for special education services if the visual impairment impacts his education. Parents should contact their district's special education office to locate services for their child. A child with visual impairment may qualify for services from teachers of students with visual impairment, an orientation and mobility specialist, a physical therapist, a speech therapist, or a psychologist, depending on individual needs. Children with visual impairment should also be provided with modifications and accommodations in an inclusive classroom. Early Intervention Research has shown that the time between birth and age of months is a critical developmental period in a child's life. These months offer a window of opportunity that will not be available later. Early intervention programmes minimize and in some cases prevent delays in development of infants and toddlers with disabilities. High quality early intervention programmes for vulnerable infants and toddlers can reduce the incidence of future problems in their learning, behaviour and health status. They can decrease the need for special education and related services when a child enters school, and increase independence. There is an urgent and substantial need to identify as early as possible those infants and toddlers in need of services to ensure that intervention is provided when the developing brain is most capable of change. Children whose special needs are identified and addressed during these crucial early years have a greater chance of reaching their full potential. Intervention is likely to be more effective and less costly when it is provided earlier in life rather than later.

173 Unit : 3.5 p p p p p Functional Assessment Procedures Structure: 3.5.1 Introduction 3.5.2 Objectives 3.5.3 What Is Functional Assessment 3.5.4 Functional Assessment Methods 3.5.5 Functional Assessment Procedures For Visually Impaired Child 3.5.6 Importance 3.5.7 Activities 3.5.8 Let us Sum Up 3.5.9 Unit end Exercises 3.5.10 References 3.5.1

Introduction One of the key factors in achieving safety, permanency and well being is the creation of an effective assessment process. The assessment of needs is, in fact, so critical to the child and family's well being and dynamic in its focus that no single form, tool or single event can adequately support it. Needs assessment is a process that continues throughout the life of each case. Assessment tools are merely instruments that are useful in bringing attention to issues that need particular focus and in identifying current strengths, needs and functioning for purposes of decision-making. 3.5.2 Objectives After going through this unit, you should be able to 1. understand and explain functional assessment 2. State the importance of of assessment 3. List out the activities of functional vision assessment 4. Understand about helpers for doing assessment

174 3.5.3 What Is Functional Assessment? A set of procedures to identify the causes of a maladaptive or socially inappropriate behaviour and reduce it through teaching replacement behaviours instead of suppressing it through punishment. The body of empirical and scientific literature which supports these methods is found in the field of applied behaviour analysis. Within functional assessment methodology the causes are sought in the immediate environment and the learning history of the individual. Causes of the maladaptive behaviour based upon intrapsychic variables or psychodynamic processes are given little attention. The outcome of the assessment is an analysis of the way the person learned the maladaptive and how it is presently supported or maintained in the present learning environment. Functional assessment does not emphasize a search for a diagnosis or classification of symptoms according to psychodynamic processes. Instead, the purpose of the assessment is to classify the maladaptive behaviour by its function (cause) and then select treatments or interventions which are effective in reducing behaviour in that functional category. Consequently, treatments or interventions are classified by functional categories and not by form of the maladaptive behaviour. In the field of education many practitioners choose interventions or treatments based upon topography or form of the behaviour instead of the function. As a result some recommended interventions actually strengthen the maladaptive behaviour instead of reducing it. This situation can make school and their personnel vulnerable to successful legal, administrative and ethical challenges.

3.5.4 Functional Assessment Methods There are three specific functional assessment methods: (a) Direct Observation, (b) Informant Methods and (c) Functional Analysis. The terms "functional assessment" and "functional analysis" are sometimes thought to be the same thing but they are not; a functional analysis is one specific type of functional assessment.

1. Direct Observation For direct observational methods, an observer would watch the client engage in activities within their natural environment. When the challenging behaviour occurs, the observer would record what happened just before it, what happened just after it and also take notes on what they perceive to be the potential cause of the behaviour. This method is used to develop a hypothesis about the function of the behaviour. The terms used for

175 this method include: Direct Observation. Descriptive Functional Behaviour Assessment.

2. Informant Methods The informant method involves interviews and questionnaires that can be completed by the client, their parents, staff members, teachers etc. These interviews would be used to identify what is happening before the behaviour occurs and then what happens after the behaviour. Just like direct observation, this method is also used to develop a hypothesis for the function of the behaviour. The terms used for this method include: Indirect Methods, Indirect Functional Behaviour Assessment, Informant Methods

3. Functional Analysis This method, functional analysis involves practitioners deliberately changing what happens before and/or after the behaviour in an effort to test what might be causing the behaviour. Unlike the other two methods that are used to create a hypothesis, this method is used to actually test the hypothesis and is the only method that can truly predict when the behaviour will occur.

3.5.5 Functional Assessment Procedures For Visually Impaired Child Like other disabilities in case of visual impairment, functional assessment is necessary to improve their remaining functional vision.

Functional vision is the ability to use vision to perform desired tasks. Because of impairment in the eye and other parts of the system, low- vision children will not learn visually without intervention and help. Selection of instructional programmes and techniques requires a thorough assessment and understanding of child's capabilities.

The

process of functional

assessment should be done-

- 1) At the age of three months of a baby if the child is not attracted by the light or not move his/ her neck to see the colourful objects, the parents should report that the child may be visually impaired.
- 2) The child has not attracted the colourful toys.
- 3) If the child complains about headache, body ache etc
- 4) The child may complain, to the parent, pain in eye at early stage.
- 5) At the time of playing the visually impaired child may not hold the ball as easily
- 176 as the normal child.
- 6) The normal functions of day to day activities are much more affected — reading, writing, walking etc.
- 7) It is always seen searching objects at any time in his/her working experience.

Who conducts a functional vision assessment? A functional assessment is typically conducted by a teacher certified in the area of visual impairment. The specialist is a certified teacher of the visually impaired, trained to evaluate how a child utilizes vision. The vision specialist will measure and observe the visual methods a child uses throughout a routine day and will speak with parents, teachers and other caregivers who know the child well. Information about how the child uses vision, the conditions and purpose of use, is essential and will be utilized in the functional vision assessment report. The vision specialist will review records and may talk to the eye doctor to learn more about the child's visual condition.

3.5.6 Importance

1. It helps to determine the current visual functioning level of the person.
2. It helps to determine the extent of

visual stimulation and instruction needed to help the person make optimum use of remaining vision. 3. It enables the person to use his limited vision in the highest potential 4.

It helps to plan the person's mobility training programme 5. It helps in decisions regarding the use of visual stimulation materials 6. It helps to decide upon the nature of the primary reading medium 7. It enables one to decide on the type of devices needed by the person 3.5.7 Activities Vision is functional if a child is able to utilize visual information to plan and carry out a task.

A functional vision assessment measures how well a child uses vision to perform routine tasks in different places and different material throughout

a day. Functional vision assessment has two types of activities like-1. Optical functioning and 2. Perceptual functioning.

Optical functioning may consist of seven activities like- visual awareness,

177 visual attention, visual fixation, visual focus, visual fusion, visual tracking and visual scanning. On the other hand

perceptual functioning consists of eight activities like- visual discrimination, figure ground, visual memory, visual closure, spatial relation, mobility, visual motor coordination and form constancy. VISUAL SKILLS OPTICAL FUNCTIONING : Visual

Awareness:

To find out the ability of the child to identify an object

Visual Attention:

To find out the ability of the child to attend to

the objects. Visual Scanning: The ability to search for a particular object among other objects Visual fixation: The ability of

the child to fix the eyes on the object. Visual focus: The ability of the child to see a known object at various distances.

Visual fusion: The ability of the child to see the object as one. Visual Tracking: The ability to follow moving objects.

PERCEPTUAL FUNCTIONING: Visual Discrimination: The ability of a person to distinguish different objects on the basis of their colour shape or size

Visual Figure-Ground Discrimination: The ability to isolate a particular stimulus from the background, i.e. seeing the distinctive

178 features of an object

Visual Memory: Ability to store and recall past experiences and integrate them into new ones. Visual Closure: Ability to

perceive a total picture or object when only part of it is visible/available Form Constancy: Ability to perceive the same

objects at different angles Visual motor coordination: This refers to the child's ability to perform a task using eyes and

hand /foot in harmony. It consists of two types these are follows- Eye-Hand Coordination: Ability to use hands and eyes

in harmony. Eye-Foot Coordination: Ability to perform a task using both eyes and foot in co-ordination. Visual spatial

relation: This refers to the child's ability to identify spatial concepts like direction, distance etc. Visual mobility: This refers

to the child's ability to indentify right and left concepts through movement. 3.5.8

Let us Sum Up

The process of seeing mainly organized through the parts of eye and image sharpness depends on the functions of the parts of the eye. But sometimes this process is aelayed or faces problems due to some errors which come under eye disorder. These refractive errors are curable if they are identified early and also get the treatment properly these. All these happen if people are aware. Problem in eye does not come under blindness; blind are those who face problems for sight disturbance. According to PWD act and WHO's definition visual impairment has

179 many classification. And these divisions depend on visual acuity, field vision, visual efficiency, functional vision etc. The

NSSO conducted the 15th round of a nation-wide comprehensive survey of dis- abled persons during 1 st April 2010 to 28 th February 2011. The survey arrived at an estimate of 21 million persons having at least one or the other disability,

which consti- tuted 1.9 percent of the total population

of 50

million. The survey revealed that population of the visually impaired in India at 850 million level of population. Among them minimum of them come under prevalence facilities. Without early detection and treatment children's vision problems can lead to permanent vision loss and learning difficulties. So it is very much essential to prevent vision loss and preserve eyesight. Early intervention programme helps them for guiding properly and also helps them in their future establishment. The development of visual ability is not innate or automatic. It requires stimulation and motivation to use vision in a variety of environments. A visually impaired child owing to uncertain and frustratingly limited vision may not always be motivated to use his vision to control and manipulate his environment to achieve specific goals. As a result he loses the ability to use whatever vision he has efficiently and purposefully. But modern researchers have proved that systematic techniques can facilitate the emergence of visually guided behaviour in some children and maximize the use of vision in others. On the other hand

functional assessment procedures also measures how well a child uses vision to perform routine tasks in different places and with different

materials throughout the day. 3.5.9 Unit exercise: 1. Draw a diagram of eye and label 2. Write, about refractive errors 3. How do we see? 4. Who are blind? 5. Write the causes of low vision. 6. Classify the visual impairment. 7. Write short note on: (a) Visual acuity (b) visual efficiency (c) field vision

180 8. What is NISSO? 9. How does it function? 10. Write the salient features of

the census data published in 2011 11. Explain the importance of census 12. Prepare a list of symptoms of visual problems. 13. What is meant by early intervention? 14. Who should conduct the vision screening to whom and when? 15. What is

functional assessment? 16. List out the activities of functional assessment procedures. 17. How functional assessment help/problem child? 3.5.10 References Smith, M.R. And Neisworth, J.T.(1975). 182 Unit-4 :

Educational Implications of Visual Impairment Unit-4.1 Effects of Blindness-Primary and Secondary Structure 4.1.1. Introduction 4.1.2. Objectives 4.1.3. Primary Effects A. Cognitive : (a) Berthold Lowenfeld's Interpretation (b) Role of Senses (c) Jean Piaget's Theory of Intellectual Development (d) Some Factors Responsible for Cognitive Development B. Attitudes affecting Blindness : (a) Community attitude (b) Parental Reaction (c) Psycho-social Effects 4.1.4. Secondary Effects 4.1.5.

Let us Sum Up 4.1.6. "Check Your Progress" 4.1.7 "Check Yourself" 4.1.1

Introduction : 'Blindness' has varied interpretations.

It relates to impaired sense of vision. It means that the person suffers from the loss in the sense of seeing, the organ responsible for vision is defective. Blindness in all countries and through ages has come to develop as a connotative term. It evokes different emotional reactions in different persons. The societies across

183 the globe have developed their own images of blind persons, of their

capabilities and of their limitations. Even beyond that, they have developed their own ways of coping with the capabilities and/or limitations of the Blind.

Parents are the part of the community and they

share social ways and attitudes. But when a blind child is born to them, they find their personal ways to cope with. As the attitudes and reactions of the community in general, and parents in particular, impinge upon the child, blindness does not remain a simple sensory loss to him; it is confounded with psychological overtones resulting in changes in self concept of the child. The present sub-unit outlines below the above mentioned points and a note upon the role of the teacher face to face the blind child, his parents and his community. 4.1.2.

Objectives : After studying this sub-unit you will be able to (i) Understand and interpret effects of Blindness/visual impairment on the child. (ii)

Discuss the implications of child's blindness for the parents and the family. (

iii) Describe the prevailing attitudes of the community towards blindness and blind persons. (iv) Analyse the effects of family and community attitudes on the blind child. (v) Realise his/her own role as a teacher in relation to the blind child, parents and the community. 4.1.3

Primary/Basic Effects of Blindness : A—Cognitive:

The effects of blindness are basically cognitive. Since blindness relates to the sensory deficit of vision and because senses are the gateways to knowledge. Vision is the most actively used sense

by human being and hence knowledge grows chiefly of visual experience. (a) Berthold Lowenfeld's Interpretation : The resulting effects of blindness

have been discussed widely, but the most accepted interpretation has come from Berthold Lowenfeld (1975). In his own words,

184 "Blindness imposes three basic limitations : 1. In the range and variety of experiences. 2. In the ability to get about. 3. In the control of the environment and the self in relation to it." All these

interpretations may have great effects on cognitive development. They have sociological, psychological and educational implications on blindness. According to him, the visually disabled individual gets a reduced experience and therefore, 'loss of sight' cannot be interpreted as the 'loss of experience'. The sociological implication is that visually disabled persons do have experiences but those are limited in comparison with sighted persons.

The psychological implication is that blindness does not mean 'loss of life' since blind persons are more like than unlike sighted persons in terms of basic needs. The educational implication is that the reduction of experience imposed by blindness can be overcome by appropriate training to the affected individual. (

b) Role of Senses :

These three obstacles to independence and self-fulfilment are the special education provisions demand for the blind child. A brief note at the three limitations may be helped in understanding the depth of losses. It has been estimated that 90-95% of all

knowledge and experience

comes through the eyes. Vision is the major mode of acquiring information about people, places and processes.

Therefore the blind child by definition is experientially deprived.

Vision provides much more continuous information than sound. Although touch may be equally continuous, its range is extremely limited. This definition may affect development of object permanence and conservation capability. The capacity to organise a wide range of experiences through vision is much greater than through touch and sound. Further vision gives much more detailed information than any other sense modality. Another educationally significant difference in sight and touch is that sight is a holistic sense. It provides information at one glance. Whereas touch is an analytical sense. We all know the story of gaining knowledge of an elephant by four blind persons. Information gathering range of touch is limited. Therefore, if you want a visually impaired child to build

an

accurate image of any object in his mind, you

185 should show it to him bit by bit till he has synthesized the image in his mind for unifying experience. A totally blind child, in particular, depends to a very large extent on verbally mediated information. The mediation of words may leave gaps in experience and the filling of these gaps may require a very special effort on the part of the teacher. Firstly, the blind child learns in pieces. He learns in a fragmentary way. He

has to get time to put these bits and pieces together to form a concept which is not exactly like ours but which is enough like ours so that we can communicate. This is the restriction in the 'range and variety of experiences.' The child with severe visual impairment may be deprived of such experiences as the ordinary child has without effort. For example a young seeing child may look at an orange, jump to pick it up, feel it, smell it and eat it. At one go, the child has visual, auditory, tactile, gustatory and olfactory experience. But a severely visually impaired child may have great difficulty in locating an orange. The child will be able to locate it if it is within the range of his grasp, or within the reach of his arm. In this way the ordinary child easily gets a total experience, whereas a visually impaired child has a limited experience. His experience range can be enhanced only by supplementary tactile or auditory inputs given by a teacher or parents. Secondly, blindness tends to create a very sedentary kind of existence. A blind person will just sit unless he is pulled out, motivated to get out and move out independently :

He sits because of fear. He sits because of lack of skill in using information available in his environment and lack of skill in moving about within it. Certainly the ability to get about is restricted. A severely visually impaired child has difficulty in moving about independently in unfamiliar environment. Because sight does not give the child the total framework of the space in which he has to move. Therefore, determining the direction of movement poses special problems. This is particularly difficult in large open spaces. Again detection of obstacles in the way may pose serious troubles. The child may run the risk of injury. Thirdly, a blind person talks loudly in a room that is too small for a loud voice or he talks "to a corner" or an empty chair rather than to another person. The common reaction is what a silly man. But it is not silly. It simply shows how a blind person is very much at

a disadvantage. Not knowing where one is, being unable to control one's environment and oneself in relation to it is a significant deficit.

186

It is not easy for a severely visually impaired child to read facial expression. Reinforcement of positive behaviour may be denied to him if he cannot read the face of his mother to whether she is happy. Parental approval in strong positive reinforces, The child's eye contact with his mother is also not possible. Now it is clear that vision is the dominant sense giving us information about the environment. No interaction with the environment is possible without gathering, storing, retrieving and organizing information. The loss of vision tends to restrict this process. Now we are to consider to what extent loss of vision hinders cognitive development and to what extent this deficiency is made up as the child grows in age and experience. (c) Jean Piaget's (1896-1980) Theory of Intellectual Development will help us to know all in this respect. Piaget says that Intellectual development takes place through the process of assimilation and accommodation. What is Assimilation ? Assimilation occurs when an already learnt stimulus evokes a response. For example, if a child sees a mango and recognizes it properly, this is an example of Assimilation. What is Accommodation ? Accommodation takes place when a child adds a new activity to his repertoire. After recognising a mango if a child begins to eat that, this is an example of Accommodation. These two processes involve acquiring information, storing it, organizing it, retrieving it in response to an appropriate stimulus and developing behavioural responses appropriate to the task in hand. In the light of the limitations entire activity of information processing is influenced by visual disability. Piaget divided Intellectual Development into several stages. Most important stages are : 1. Sensory Motor Stage (0 to 2 years) 2. Preconceptual Stage (2-4 years) 3. Intuitive Stage (4-7 years) 4. Stage of concrete operations (7-11 years) 5. Stage of Logical operations (11 year or above)

187 1. Sensory Motor development : According to Piaget's theory of cognitive development. The first two years constitute the sensory motor period during which infants' behaviour progresses from being characterised by simple reflexes to showing an internalised and representational form of problem solving. This period is broken down in to six stages. (i) Reflexes (birth to one month) : The infant's behaviour is characterised primarily by reflexive responses to his own body and to some aspects of the external world. The infant discovers some objects are suckible and some are not. (ii) Primary Circular Reactions (One to four months) : The infant begins to repeat selectively those actions that produce effects that are interesting and satisfying to him. These actions are primarily directed to his own body rather than external objects. (iii) Secondary Circular Reaction (four to eight months) : The infant reproduces behaviour that produces effects in the external world that are satisfying or interesting to him. This stage marks the beginning of the infant's effective orientation to the external world. (iv) Co-ordination of the Secondary Circular Reaction (eight to twelve months) : The beginnings of intentionality are seen in this 4th stage. Infant begins to co-ordinate his behaviour with respect to the external world in more complex ways. The use of his specific means to obtain specific ends shows his increasing organization of the world. (v) Tertiary Circular Reactions (twelve to eighteen months) : In this stage the infant's behaviour clearly involves active trial and error experimentation on the world. (vi) Internalization of thought (eighteen to twenty four months) : This stage marks the beginning of internalized thought. In this sensorimotor stage intelligence is demonstrated through motor activity without use of symbols. Knowledge of the world is limited (but developing) because it is based on physical interactions/experiences. Children acquire object permanence at about 7 months of age (memory). Physical development (mobility) allows the child to begin developing new intellectual activities. Some symbolic (language) abilities are developed at the end of this stage. A visually handicapped child may reach a particular stage late but cannot skip it. This also confirms the view that even if there is some delay in developments, the quality of mental ability remains uninfluenced by visual disability. There has been

188 very little direct effects of blindness on the infant's progress through the stages of the sensory motor period. Stephens (1972) discussed some implications of visual impairment. She noted Piaget's stress on the importance of the infant's interaction with his environment as well as the fact that in the normal infant a large measure of that interaction depends on vision. 2. Preconceptual Stage : During this stage children gradually construct more complex mental images. But these images obviously depend on the sensory data available to the child. Unless specific efforts are made by parents, teachers and neighbours, the sensory data made available to the child is deficient. Therefore, the visually handicapped child crosses this stage later than the sighted child. 3. Intuitive Stage : At this stage a child is dominated by what is known as 'here and now' i.e. the child's thinking is dominated by immediate percepts. The sighted child reads print and may look at a number of two dimensional objects. But the blind child lives in a three dimensional worlds. Even the reading of Braille is a three dimensional operation. Again a great deal of experience coming to the blind child is verbally mediated. 4. Stage of Concrete Operation : At this stage child is expected to make use of reason and logic relating objects to concrete objects. The limitations pointed out by Lowenfeld are applicable to blind children at this stage as well. If the range and variety of their experience is limited, their logic and reasoning cannot but be affected. Actually this is the result of limited experience and not of blindness. 5. Stage of Logical Operation : At this stage children are able to reason without the presence of concrete objects. In this stage of formal operations children can present problems mentally and operate on them. The blind children can make mental representation as effective and at about the same age as sighted children even if the precise nature of their mental representation is somewhat different. (d) Some Factors Responsible for Cognitive Development : Concept Formation : Concepts have been styled as building blocks of thought. They are therefore, basic to cognitive development. A fundamental ability required for concept formation is classification. It involves noting similarities and disregarding insignificant differences. The use of long or meaningless words not based on actual experience often described in the literature as verbalism. It is the use of words without knowing the precise meaning. Conservation : The conservation of a property refers in general to the ability

189 to retain correct judgement of the property even in the face of perceptual transformation. The general finding is that blind children show a lag in the development of conservation of volume, weight and substance. But these are temporary lag and as a blind child grows in experience he is most often able to make up his deficiency in day to day functioning. □ Imagery : Imagery plays an important role in the child's cognitive growth and later in practically every aspect of his life. What do we precisely mean by Imagery ? Most of our actions are based on the thinking process. An image comes to our mind before we eat, talk, jump, run or perform a more complex task. What are these images ? There are the residue of stored experience. Indeed they are learned responses. But these learned responses may be visual, auditory, tactile, or kinesthetic or combination of visio-motor, audio-motor or verbal-motor. In fact no physical activity will be possible without such imagery. □ Creativity : Creativity often depends on unique and efficient combination of images. It is often been asked whether blind and sighted children differ in divergent thinking. There is no fundamental difference between blind and sighted children on divergent thinking except that blind children exhibit much greater verbal fluency where as sighted children use much greater visual imagery. B. Attitudes Affecting Blindness : (a) Community Attitudes and Reactions : The deficits caused by blindness are not taken as objectively by the community as occur to the individual. The reaction varies from community to community depending on its traditions, culture and belief. Killing of disabled persons existed. As the society progressed towards being a welfare state from a warfare state, so did the changes occur in the total outlook. The blind persons became members of the society who needed to be looked after but not at the equal level with others. They were to live in charity. It has also an undertone of religious beliefs. To-day the scenario is changing. The community is based on the principles of equality and fraternity. The motto is equal opportunities for all including handicapped people. Though psychologists and educationists do talk about individual differences, yet we as human beings try to generalise things. Charities its general tendency is to perceive a blind person as one who can make a livelihood only through begging, 190 hence blindness implies low level of living. Another misconception refers to the special talents of blind people like musical talents, fantastic memories. As normal human beings they depend on senses of hearing and touch as the sight is denied. The stereotypes go beyond the beliefs and saying of it. It is reflected in the distortion in interaction with blind people. In daily life situation they are denied the opportunities, expectations are restricted and thus we 'socialise' the impairment into disability which is further extended to become a handicap. The community at large affects the blind child not only because of its general attitude but also through the ways that are reflected in the attitudes and behaviour of the immediate human contacts of the child, the neighbours, the parents and the peers. (b) Parental Reaction to Blindness : When a child is born blind, the parents feel at a loss for so many social, personal and psychological reasons. The reactions occur on a continuum neglect to over-protection. Due to inability of most parents to understand the implications of an impairment, the impairment is perceived as handicap, on one extreme is the response of neglect. Because it is felt that a blind person is devoid of all normal human functions of being an active member of the society. Not only this even parents at times feel the birth of a blind child to be the result of some sin. Hence in their own frustration, the child, is ignored and naturally the 'expectancy prophecy' comes to be true, the child develops into a person who cannot contribute socially or economically to the society. Neglect causes certain personality problems but the child has to learn certain basic living skills. Over protection is more dangerous. It denies the child all of the natural demands or expectations of society. In between these two ends of the continuum of neglect and over protection, are the discrepant behaviours of parents which add to the problems of the blind child. The discrepant behaviour is the gap between what a person says and what a person does/feels-- The social structure is such that we try to say or act what is socially acceptable. Real feelings are rarely expressed especially when they are contrary to the socially desirable ones. The parents of a blind child, at times, pose the full acceptance of the blind child as an over behaviour, because today society expects parents to stand by their children. But covertly, it is difficult to accept a child who becomes a liability, a reason for social talk and criticism. Overt rejection is manageable but covert rejection does not

only

deceive a child, it hurts him psychologically. It affects not only his growth and social relationships but also his own self-concept, the very basic of a person's development.

191 (

c)

Psycho-social Effects on the Child : Psycho-social development of a blind child is not affected, so much by blindness, perse, as it is disrupted by the emotional over-tones of blindness, for the parents and thr community. It is now a well-known fact from reaserch that children tend to achieve as much, and only as much as their parents aspire them to achieve or the significant persons in their environment expect them to achieve. But once the community deos not treat them as individuals, they are lost into a crowd, the crowd of blind persons--beggars, musicions or do whatever they like, once, the parents stop treating the child as a developing individual, once they refuse to accept his capabilities and limitations, both in a realistic manner, his self concept is bound to be severey affected. Overprotection takes away his independence, neglect turns him to

exhibit undesirable behaviour--Either way, it is the suffering child whose miserices multiply. 4.1.4. Secondary Effect of Blindness: After going through the effect of Blindness--primary, the students have clearly understand that there are some effects of the Visual Impairment which are due to impairment, disability and for the deficient vision. These conditions are not final. Some can be minimised with the learning of some teachiques. For example a visually impaired person is handicapped in a new place and with the new things. If he/she is oriented properly with exploration and narration barring verbalism he/she will be able to do for himself/herself. Then he/she will no more be handicapped. The on-set of blindness makes the effects whether it will be primary or secondary. Formation of concept differes in respect of born blind (congenitally) and later age blind (adventitiously) or acquired blindness. In case of later age blind the effects become secondary. We should keep in mind the issue of residual vision. Visual disability is considered from 40%. The visual disability ranging from 40% to 90% relates secondary effect. 90% to light perceptioon will be considered severe visual disability and they have only functional vision. Hence the percentage of visual disability refers whether the effects will be primary or secondary. Training and practice of some teachiques like orientation & mobility, concept formation either by TLM or getting in touch of real objects as far as possible, activities of daily living skills, have management, personal management, arranging of reading materials, assistive devices will minimise the handicapping condition.

192 Apart these the attidutes of parents, family, peers, community need to be changed through awariness making them reciant of the ability of the visually impaired, trying for their real acceptance. People in the media need to be educated to write about blindness accurately and carefully. The public need imformation

not only on the realities of blindness but also on the techniques which make both the blind and the sighted persons comfortable.

Fortunately at the Govt. level some services are also extended for making the visullay imparied at par the sighted people. Hence the primary effects gradually become secondary with the progress of science, Information & Technology. 4.1.5.

Let us Sum Up

The ordinary child easily gets a total experience where as a visually impaired child has a limited experience. The child's experience range can be enhanced, compensated to a great extent only by supplementary tactile or auditory imputs given by teachers or parents. In view of the above stated implications that a teacher is supposed to play his/her role face-to-face the blind child, his parents, and his community. The specific understanding and skills required of the teacher of blind children are given below with suggested activites for their development. 1. The teacher should know the social climate from which the child comes. Activity : (i) Prepare a case study of the observations/perceptions of the blind child of his social acceptance. (ii) Make interview of the parents, neighbours, peers and fellow teachers about their reactions to the blind child. 2. The tecaher should have experience, knowledge of and faith in the capabilities of blind child. Activity : (i) Make observations from the Daily Lives of some blind persons employed in significant jobs. 3. Reduce discrepant behaviour. Activity : (i) Introspect your own attitude towards blindness. (ii) Analyse the attitude of the parents. 4. Aviod negative or inappropriate semantics.

193 Activity : (i) Analyse the tasks that are given to sighted & blind children. (ii) Analyse the expressin of speech used for interacting with blind and sighted children. 4.1.6 "

Check your Progress" 1.

List how the blindness affects objectively.

..... 2. Define stereotype behaviour.

..... 3. To-day, the scenario is changing-- Explain.

..... 4. Senses are the gate-ways to knowledge--
Describe.

..... 5. Over protection snatches way independence--
Clarify.

194 6. Distinguish between over behaviour and covert behaviour.

..... 4.1.7 Check Yourself Some questions are here for
self-check. Tick the most appropriate answer for each. 1. Three Major/basic limitations imposed by severe visual
impairment was put forward by-- (a) Jean Piaget (b) Berthold Lowenfeld (c) Valintin Hauy (d) Samual Gridley Howe. 2.
The number of the most important stages of intellectual development as stated by Piaget is-- (a) 8 (b) 6 (c) 3 (d) 5 3.
Sighted persons feel pity for visually impaired because-- (a) Visually impaired cannot live properly in the world of sighted
(b) Sighted people fail to understand strength of visually impaired (c) By the society it is taught to the sighted (d) Kindness
is a human value. 4. A visually imparied person can learn effectively if-- (a) he is given variety of experience (b) he is
taught only through auditory mode (c) he is given a chance to learn (d) he is left to learn by himself

195 5. Parents of visually impaired children tend to overprotect because-- (a) They love thier children (b) They despise
their children (c) They are afraid for thier safely (d) They try to hide their guilty feeling. 6. Tick the most appropriate
response. (a) Senses are the geteways to knowledge [True/False] (b) The community affects a blind child by not only its
general attitude but also the attitude and behaviour of he neighbours, parents and peers. [True/False] (c) Teachers can
generalise about blindness on the basis of their limited experience.[True/False] (d) All blind persons have special talents
like musical talent and fantastic memory. [True/False] (e) Blind persons are like any other normal human beings.
[True/False] Answer Key : 1. (b), 2. (d), 3. (b), 4. (a), 5. (c), 6. (a) False, (b) True, (c) False, (d) False, (e) True.

Educational Institutions A. Special Schools B. General Schools C. Open Schools D. Non-Formal Schools 4.2.4. Models of
Educational programmes for children with disabilities. A. Resourcc Model B. Itinerant Teacher Model C. Dual Teaching
Model D. Distance Learning Model E. Alternative School Model F. Home Based Education Model. 4.2.5. The Need of
Inclusive Eduction for the Disabled in India. 4.2.6. Let us Sum Up 4.2.7. "Check your progress". 4.2.1 Introduction :
Mainstreaming of the disabled children is more than a half century old attempt in India. To-day equal opportunities to all
disabled persons have become a mandate for all welfare states. In the preamble to our Indian Constitution, it has been
emphatically declared that the people of India are resolved to provide equalify of status and opportunity for everyone of
its citizens including the disabled persons of the country.

197 "Education For All" (EFA) has been The Thrust of our Government and our people for many years. But due to several reasons including inadequacy of financial and personnel resources, this dream has not been completely materialised so far. An alarming percentage of our school-going-age population or still illiterate and ignorant remaining out-side the educational programmes. 4.2.2. Objectives : (i) The students will have a clear idea of educational programmes and placement of disabled children particularly the Visually Impaired. (ii) They would be more encouraged for the education of the visually impaired children and the target EFA will be achieved. (iii) Being aware of the educational programmes for the Visually Impaired children they could counsel V. I. Children for their education and get inspiration for conducting some Research Study. 4.2.3. Types of Educational Institutions A : Special School Special school concept for the disabled is the earliest one implemented in India. The attitude changes to the services for the disabled persons in India parallelly as those existed internationally. As a matter of fact, the educational community did not realise that disabled children could be educated. But the inception of special schools for different disabilities proved them to be wrong. What is a special school ? A Special school is a place of education for the disabled children. What is a Residential School ? Residential School is an institution where all students reside and learn. Are all Special Schools Residential ?

No. Some are completely residential where all enrolled students reside in the hostels arranged by the school. Some are partly residential and partly day-scholar i.e. Some students reside in the hostels and some students come to school from outside. Again some special schools have hostels, all students are day-scholars.

198 Do all special schools follow a special curriculum widely suited to a disabled child ? No. Some categories of disability have some special curriculum widely suited to a disabled child. But in case visual Impairment and Hearing Impairment, the existing curriculum for the normal education is followed. For other categories of disability only the mild and moderate groups can study under normal curriculum. What are plus curricular activities for the Visually Impaired Students ? In order to perform well in curricular aspects, Visually disabled children should learn skills which are

peculiar to blindness. These skills are called "Plus curricular activities' The correlation between general and plus curricular activities is positive and high. We will read more about this in the curriculum sub-unit. In most cases the special schools provide 24 hours custodial care to the children with disabilities in a protective environment. The growth of special services for disabled children in India has followed the global trends of care and help. It suggest the availability of some form of educational and rehabilitation of persons with disabilities. In pre-independent India, foreign missionaries introduced services for the disabled in the country. Besides direct service to these persons, the missionaries also assisted the Indian counter parts in attaining skills by undergoing technical courses abroad. The 1st school for the deaf in Mumbai and the first school for the Blind in Amritsar were started by The Missionaries in 1883 and 1887 respectively. At the time of independence in India, there was no formal legislation to ensure compulsory education for the disabled. Though the articles 45 of the constitution of India is assuring better services to persons with disabilities in India, it was not enforced through legislation until recently. As on today more Than 3000 special schools for the disabled are functioning in India of which approximately 900 are institutions for the hearing impaired, 400 for the children with visual impairment, 1000 for mentally retarded and the remaining 700 for children with other physical disabilities. A 'blind school' as it is commonly called is a special school, because it caters to the needs of a special kind of students—the visually handicapped. Visual impairment creates special problems and difficulties in the psychomotor, cognitive and affective areas, and in interpersonal relations of the individual—which require special kind of approach and solution. A blind school is supposed to do all these. It is different from a general school in the sense that it imparts not only, 'academic'

199 education but also aims at the development of compensatory skills i.e. rehabilitation among its students. The speciality of a blind school lies in the fact that almost always it is a residential school, though an insignificant number may attend it as day scholars here and there. This characteristic depends on both historical and demographic necessities. Historically, the modern blind schools have evolved from the pre-1784 asylums before the establishment of valentine Hany's school in Pasis. From that time till the present day, no other way of schooling seems feasible than separating blind children from the seeing in special residential schools. Special features of these schools can be noticed in the words of Lowenfeld, "In Germany, for instance, blind children entered the residential school and upon graduation were transferred from one building to another where handicrafts kept them productively occupied until they became too old to work and were moved to still another building, on the same ground, for he aged blind— a kind of 'cradle to grave security'.....In many parts of the world, it has not yet moved for beyond this stage. Demographically, the geo-scatter of the blind population makes it imperative that they should be collected in one place so that they can be given education and training properly. The institutionalization of visually handicapped children in residential special schools illustrates in concrete terms the quality of attitudes to handicapped— the desire to create some positive means of assistance and the willingness to separate and confine. In these schools, the manners of instruction is also different— either there are special teaching methods, or the teacher-pupil ratio is very low, the close connections between the medical and para-medical staff is also a distinctive feature of special school. Special schools have several aims for their pupils which are quite different from the regular schools. These Schools include making the visually handicapped child as normal in behaviour as possible. This means, imparting training in for example, orientation and mobility, training, sensory training, use of residual vision, daily living skills development etc. The aim is to enable the child to blend into his/her social context as far as possible. A general aim is the vital notion of independence— the maximum economic, social and personal self-sufficiency for the child. The school also tries to help the child to live with his/her disability in a way which minimizes its handicapping effects. These are some of the aims which distinguish a special school from a normal regular school. To enable the special school to achieve these goals all the component factors

200 which constitute a school must be brought together and made to work like a, well- oiled machine. This is called "School Organisation" Combining both— human and non-human elements, we get four major factors essential for good organisation and these are (i) Management, (ii) Teaching Personnel, (iii) Curriculum & (iv) Pupils. Apart from the above-mentioned factors, there is another equally important element in the organisation of a special school which is 'community' including the parents. This fact is generally not taken into account as it remains beyond the boundaries of the school premises, but nonetheless, its importance cannot be minimised because it is the community which is the means and the ends, of the education and training of the handicapped child. Just to bring all the elements together is not organisation, a force is required to make all these factors work in union. This force in the school organisation is the Headmaster or in some cases the Principal, or in other words the Head of the Institution is the Pivot round which the whole organisation revolves. □ Special School as Innovator : "To innovate" means "to introduce something new or novel in the existing system." The necessity of ushering in the new becomes imperative when the old and traditional system fails to deliver the expected result in the changing situations. In the New Education Policy (NEP) a basic change in the outlook and approach was proposed. By providing effective lobby for legislation, sensitizing the decision makers in the Government, helping the regular schools in the proper management of Integrated system, diversifying their own activities, initiating research and experiment in the field, the special school can play the role of responsible guide and innovator. □ Special School—its relevance Setting up a special school with all the necessary resources like infrastructure, equipments and manpower warrants a huge capital. In a developing country like India which can't afford to huge investments on alternative system became imperative so as to bring all the disabled children under the umbrella of education. Inclusive education is one of the viable approaches to make the dream come true. Inclusive education is not a threat to integrated education concept or the special school programmes rather an important component for education of the disabled. The special schools can concentrate more on difficult groups such as severe and profound group of children and children with additional disabilities. It is noted that the introduction of one system had never suppressed the old system but has widened the scope and action of such system. Therefore, special schools can change their role

201 in the following ways for expanding inclusion. 1. Serving as resource centres for a cluster of general educational schools which are involved in inclusive education. 2. Organising inservice courses to the teachers of general schools in methods of handling children with disabilities. 3. Sharing special equipment with general schools for enriching learning experiences of children with disabilities. 4. Organising summer camps for non-disabled children

to create awareness in them an disability related issues. 5. Providing residential school facilities to children with severe and profound disabilities. 6. Undertaking action research studies on disability related issues and disseminate the information to general schools. 7. Initiate community based rehabilitation services to provide alternative education and rehabilitation to persons with disabilities in their own localities. Therefore, special schools can play a vital role for the betterment of inclusive education in India. The inclusive education and special school concepts are not competitive to each other. In fact they are complimentary to each other. This spirit would go a long way in establishing a base for the harmonious growth of services for persons with disabilities in India. □ Integration and Inclusion—how do they differ ? In India the two systems—integrated education and inclusive education have a major difference. In integrated education, specialist teachers provide most of the essential as well as support services, whereas general classroom teachers provide additional assistance to blind children in the classroom. In inclusive settings, the education of disabled children is treated as an integral part of general education. Therefore,

essential services are provided by general classroom teachers and only support services are provided by specialist teachers. Provision for education of children with disabilities is usually made in special schools. But these special schools are completely inadequate to cater to the need

202 of the vast population of children with disabilities. So the steps have been taken to make provision of education of these children in general, open and non-formal schools. B. General Schools : More than 5,00,000 schools are there in India to look after the educational needs of the children in the country. These schools are meant for the normal children. But the constitutional provision to make education compulsory and free for children including disabled ones up-to the age of 14 years has compelled the policy makers and administration to make available the facilities of these schools for the education of the disabled children. In this context, these general schools may be grouped into Four Categories : □ Schools with normal children only. □ Schools where disabled children are enrolled but without any special facility of trained teachers or special teaching aids. □ Schools where disabled children read along with normal children but trained teachers are there to understand their special needs and try to satisfy their needs to some extent. □ Schools where there are special sections for disabled children. C : Open School : All disabled children cannot be benefited from formal learning system. There are many over-aged children and dropouts who may like to continue education through distance mode. The clients in vocational and rehabilitation centers who want to continue higher education many pursue the same through distance learning system. The Indira Gandhi National Open University, The Netaji Subhas Open University, some universities in every states of India, some foreign universities, Rabindra Mukta Vidyalaya etc have also started special study centres to assist persons with disabilities to continue school education and higher education. Such distance education opportunities must be used to the maximum possible extent to make more disabled persons educated. Open learning system is considered as the panacea of the general educational system. When developed nations as well as developing nations are acknowledging the need of open learning as a viable alternative to make any country literate, the special education system, being a part of general education system, needs to

203 examine the feasibility of open learning to make more disabled persons literate. The National Open School has developed instructional material for adaptation of curriculum in the case of disabled children. It has also started providing accreditation to selected institutes in the country to offer all levels of academic and vocational courses for the benefit of disabled children. The strengths of the National Open School curriculum are its wider range of options for course selection and facility to learn at the pace of the learner. These two aspects suit the requirement of children with disabilities. The children, according to their abilities, may select either academic or vocational courses. D : Non-Formal Schools : While open learning system may be encouraged for school-going and academically capable children, many adult disabled persons may not be benefited from this approach. There is a need to promote non-formal education programmes in the existing community based rehabilitation programmes to provide educational services to their clients. These clients may not opt for higher education, but they may become lifesafe for better living. Adult disabled persons are the potential seekers of non-formal education.

4.2.4 Models of Educational Programmes For Children with Disabilities

A. Resource Model : This is an educational plan in which a child with any type of disability specifically visually Impaired is enrolled in a regular class. Within the school building a special teacher called resource teacher is available to the child along with his regular teacher. The regular teacher assumes major responsibility for the children with all disability in general programme. The resource teacher is responsible for instruction in special techniques or skills required for children of all types of disabilities. One full time resource teacher can manage 8–10 children of different types of disability in the resource programme. As far as possible, the children should be distributed in different classes/sections, preferably not more than 2 in one class/section. In developing countries, at least seven models of Resource System are in practice. These are the following— (a) Resource model where visually impaired children study in general schools and stay in hostels for non-disabled children. (b) Resource model where visually impaired children study in general schools and 204 stay in hostels of the near by special schools. (c) Resource model where visually impaired children study in general schools and stay in hostels exclusively arranged for them. (d) Resource model where visually impaired children study in general schools and stay with parents at home. (e) Semi-resource model or co-operative model where visually impaired children are taught only by the resource teacher in a separate class in a general school. (f) Multi-category resource model where disabled children of different types are educated in a general school by the regular teachers and a specialist teachers. (g) Multi-category itinerant model where one special teacher attends to the need of visually impaired children of different categories in a particular locality.

B. Itinerant Teacher Model : This is an educational plan in which the children with all disabilities are enrolled in a regular class in his/her home school where his needs are met through the combined efforts of the regular teachers and visiting itinerant teacher qualified to offer special service. The salient features of the Itinerant model. □ The children in this programme are distributed in different schools. □ The Itinerant teacher has to travel everyday to reach the children. □ Each child will be visited by the teacher twice or thrice a week. However children with all disability of primary classes should be given frequent visits. In this case, limited number of children with all disability should be enrolled at the primary level especially in the beginning stages of the Itinerant programme. □ Each school will not be having a resource room. So for the itinerant teacher, a resource kit is must. □ The schools selected for the programme can be within a radius of 8 kms. However, this distance depends upon the topography of the locality. □ Depending upon the topography, the itinerant teacher should be provided with transportation arrangements— a bicycle or a motor cycle can be given.

C. Dual Teaching Model : This is the model which can make the universalisation principle, a reality. Even though resource and itinerant programme can reach a huge number of children with 205 all types of disability, there are numerous places where educational services for this population are not existing. For example, an isolated village which has one or two children with multi-category disability can very well go for the dual teaching plan. This plan is successful only when the number of disabled children is very limited, not more than two for ideal programme. The regular teachers with the support instructional material and limited competency oriented training can look after children with multi-category disability in addition to their regular classroom responsibilities. A token incentive may be provided for their

additional work with disabled children. A large number of teachers, at least one teacher per school have to be trained through crash programmes of two to three months duration to serve in the dual teaching plan. When such arrangements are made, any visually impaired child also can avail the educational facility in the local school itself. D. Distance Learning Model : The present day scenario is changed. The out-reach programme services of education is at every doorstep now. Expensive college and university centralised higher education is brought very close to our home through the study centres. Institutions like Indira Gandhi National Open University, Netaji Subhas Open University, all other universities of our own state and other states even the foreign universities facilitate higher

education available in the home locality. Apart these to- day Information & Technology has brought the world and all resources of education to our room-corner. Like general students all category of disabled students including Visually Impaired can avail themselves of the opportunities of higher education seating at home keeping personal business and engagement undisturbed and intact. E. Alternative school model : The possibility of alternative schooling such as night schools, evening schools, package programme etc. may also be explored and take into account for providing are needed to improve the skills of the disabled individual to become economically as well as educationally rehabilitated. India has great potential for the growth of alternative education models to promote maximum services to all disabled persons. F. Home based education model : "This programme is meant for children who are physically handicapped also to the extent that they cannot attend a school, or who live where a school suitable for them is not available."

The purpose of this school is that the physical inequity
206 should not and need not create
a "mental vegetable".

If the children are unable to attend the school education can be brought to them. In this approach specialised teachers are nominated routinely to minimise interruptions in a student's education caused by short and long time confinement at home.

The special teachers in this system are assigned with a caseload and visit the student in the home on a regular basis. The major responsibility of these teachers is to assist the child's regular classroom teacher in preparing instructional plans and guidelines which can be pursued with the homebound student on one-to-one tutorial basis. It is desirable that the learning environment should be made more compatible to the child's basic physical and emotional needs in this system. The homebound programmes are rarely practised in Indian conditions. 4.2.5.

The need of Inclusive Education for the Disabled in India In India special school services are more than a century old. At present, approximately 30,000 blind children are served in nearly 400 special schools for the blind. The present scenario is that : (i) A disabled child has to travel to far off places, whereas a non-disabled sibling from the same family can attend the local school. This accessibility of local school is not made available to children with visual impairment. (ii) In most villages of the country, children with disabilities of different conditions are present. As far as the standard models are concerned, one specialist teacher serves 8-10 disabled children of the same category. But the scattered villages in the country do not have an adequate number of the same category to justify the appointment of a full-time resource teacher. Therefore, the need of multicategory personal becomes inevitable. (iii) The extent of disability in each category ranges from mild cases to severe and profound cases. The mild and moderate cases are more in number than the severe and profound cases. Due to a lack of sensitivity of general education to the needs of children with visual impairment, even the mild and moderate cases are not attending schools. This invites the involvement of general education so that children who are currently left out can be served. (iv) Last but not the least, the enrolment in the integrated education as per the sixth All India Survey on Education (1998) in 8633. The total coverage in both special schools and integrated settings constitutes less than 57 of the population of

207 blind children. Therefore, special schools and integrated education models are not able to provide access to all. The Education for All (EFA) campaign should not become 'education for all minus blind children'. If EFA in the case of blind children is to become a reality, inclusive education needs to be nurtured and implemented. In addition to the accessibility factor, the nature of distribution of visually impaired children too demands inclusive education. At present the SarvaShiksha Abhiyan/ Mission is the active force for full implementation of Inclusive programme. 4.2.6. Let us Sum Up : □ Education of disabled children in India is served by mainly four types of schools—special, general, open and non-formal. □ There are various models of Education available for disabled children such as—Resource Room Model, Itinerant Teacher model, Distance Learning Model, Alternative School Model, Home Based Education Model. 4.2.7. "Check Your Progress" : 1. (i) The teacher should know the educational placement of disabled children. Activity : Enquire disabled children's learning in your locality (ii) Type of study materials of a visually impaired child. Activity : Locate a visually impaired child. List his/her study materials and techniques of learning. 2. Point for discussion. After going through the sub-unit you may like further discussion on some points and classification on other Note down those points. 3. (i) Inclusive and Integrated setting of education is not a Threat to Special Residential System—Justify. (ii) Inclusive and integrated educational setting for the disabled children—Differentiae.

208 4. Assignments : Prepare a Report regarding the types of schools and models of education available in Your Block. Collecting data from various sources and give your suggestions and recommendations for promotion of education of the children with disability. 5. Self-Check : Tick the most appropriate answer : (i) The first school for the visually impaired in India was established India— (a) 1784, (b) 1883, (c) 1987, (d) 1887. (ii) Constitution of India assures better services to persons with disabilities under article No.— (a) 54, (b) 45, (c) 24, (d) 44. (iii) Expanded core curricular items for the visually unpaired are followed more in— (a) General Schools, (b) Open Schools, (c) Special Residential Schools, (d) Non-Formal Schools. (iv) This model of Education for the disabled can make the universalisation principle, a reality.— (a) Dual Teaching Model, (b) Itinerant Teacher Model, (c) Resource Room Model, (d) Home Based Education Model. (v) Instructional material for adaptation of curriculum for disabled children has been developed by— (a) The National Open School, (b) General School, (c) Special Residential School, (d) Non-Formal School. (vi) Inclusive education is essential in India for— (a) Larger coverage of disabled children population, (b) Huge cost for running special school will not be needed, (c) Implementation of EFA will be possible normally, (d) All of the above. (vii) The categories as per percentage of disability is— (a) 4, (b) 5, (c) 6, (d) 3. Answer Key : (i) d, (ii) b, (iii) c, (iv) a, (v) a, (vi) d, (vii) a.

209 Unit - 4.3

Principles of Teaching for the Visually Impaired children 4.3.7. Some more points to be taken into granted 4.3.8. Let us Sum up 4.3.9. "Check Your Progress" 4.3.10. Check Yourself 4.2.11. References 4.3.1. Introduction : Rehabilitation council of India (RCI) in the preamble of B.Ed. Spl. Ed. Programme—2015 has stated rightly and significantly about the new trend of teaching—moving away, from 'show and tell' to 'learning by doing'. A disabled child is a child first like all normal children, then we are to consider the disability accordingly in course of teaching-learning process. Hence we are to glance first. The principles of teaching prescribed for normal children as all these are applicable to all categories of children and then the disability particularly the visually impaired will be taken for discussion.

210 4.3.2. Objectives : The clear knowledge of the principles of teaching will help the teacher-students (i) to take their teaching in the goal-oriented right direction without groping or hovering aimlessly (ii) to take steps for teaching properly both in inclusive, integrated, special & home-based set-ups. 4.3.3. Child Centred Approach to Teaching : • Meaning of Child Centred education—The claim of the teacher, 'I teach children, not subjects' implies care for the 'whole' child—his/her personality, needs & learning style and not just for his/her academic process. Child-centred education stresses the need for taking care of the child, its growth and development. It requires 'individualisation' of approach, so that one must study each child carefully, keep observations over a period of time, study the growth and development in sensory-motor, intellectual, emotional, social, language areas and soon. • Key Concepts of Child Centred Education—Aim—The aim is development of the total personality of the child Programme—Programme is to be activity based with different teaching strategies. Pace of Learning—It is to be based on children's needs & abilities. Teaching-Learning—Teacher's role is that of a facilitator in learning and development. Discipline—It is to be achieved through the maintenance of positive human relationships between teachers and pupils. • Need for child—Centred Approach and its implications (i) The child is the most important agent in his/her own learning. Out of the three components of learning situation—the child, the teacher and the environment,

211 the prime place is occupied by the child. It means that curriculum must be thought of in terms of activities and experiences which appeal most to the child. (ii) Children learn best when they are active. Learning takes place through a continuous process of interaction between the learners and its environment. (iii) Knowledge or information is not the goal. Self-realization is the goal. Personality and character are more important than the subject matter. (iv) Child-centered approach is more psychological than logical. It emphasises the process rather than the product. (v) Child-centered approach gives boundless freedom to the child under the creative and sympathetic direction of the teacher. (vi) One single exposure to an experience does not affect all the necessary co-ordination of the physical and mental faculties of a child to preserve the net value of exposure. Hence there have to be repetitive exercises and drills to give a certain knowledge and the efficiency and tenacity of skill and value. (vii) A Child is a unique being and has a Specific role to play. The teacher's role is to help the child to conform to its unique role, both in its spirit, habitual values, choices and consistent behaviour patterns. (viii) The child's sense of wonder and astonishment and his/her natural curiosity leads to a learning process which should be encouraged by the teacher. • Limitations of Child-Centred Education- Child-centred education has a few limitations which must be taken care of by the teachers. Too much freedom is likely to engender egocentrism in children. Children may grow to be unwilling to accept reasonable authority. If all the times and at all places likes and dislikes, preferences, whims and interests of children are elevated above the matured judgements of parents and teachers, it may result in undesirable outcomes. Adams, therefore, wanted that both the children and their teachers should be on the same footing of importance. Pragmatically speaking, learning cannot be child centred always in absolute

212 term. Child-centred education implies that each child may have a separate learning activity besides a few group activities. Perhaps no nation can afford to spend so much money, resources and time on child-centered education. There are so many children under the charge of a teacher that it is rather impossible to attend to the specific needs of children individually. • Corrective Measures : Of Course emphasis on child-centred education tends to free the child from the tyranny of the traditional approach to education like 'chalk and talk', 'bookish knowledge' and 'The supremacy of rod'. Implicit in all the positions of child-centred education is that the teacher must be prepared to give initiative to the learner in the educational encounter. The role of the teacher in child-centred education is encouraging self-disciplinary function of the child which cannot be over-emphasised. It can be summed-up as-- (i) Motivating children. (ii) Developing trust and confidence in children's capacity to learn. (iii) Becoming a resource for creating meaningful learning experiences. (iv) Accepting the individual and the group. (v) Participating as a member of the group in guided learning. (vi) Becoming sensitive to the child's needs and interacting in a way that would provide a sense of feeling and security. (vii) Recognising and reinforcing the individual contribution. 4.3.4. Principle of Teaching : The educators and philosophers have emphasised certain principles of teaching which the teachers are expected to bear in mind for making their teaching effective, efficient, and inspirational. These are classified as psychological general principles. 4.3.4.1 Psychological or Learning of Teaching : (i) Principle of Activity or Learning by Doing : Children are active by nature and any process or method that is not based upon the student's activity is not

213 in accord with the progressive educational theories. Rousseau considers the child as a "hero" in the drama of education and as such he/she must be allowed to play. The dominant role. So the first principle is to keep the class active. The great vitality of our children cannot be permanently restrained without providing a positive purpose which will interest the children and give them opportunities for observation and the use of their hands. This is to offer them the fulfilment and satisfaction which nothing else confers. Activity does not mean mere physical activity. To develop all sides of pupils' personality it is necessary for them to be active in all ways, to exercise all the powers they have. (ii) Principle of Playway : This principle is closely related to the principle of learning by doing. According to Froebel play is the chief activity of childhood. It gives joy, freedom, contentment and inner and outer peace. It holds the source of all that are good. But "without rational conscious guidance", says Froebel, "childish activity degenerates into animals play instead of preparing for those tasks of life for which it is designed." (iii) Principle of Motivation : The teacher will do his/her best to motivate all children in the lesson-motivation arouses the interest of children and once they become interested, they are willing to concentrate and work. Motivation is developed by the following techniques--(a) utilising the instinctive tendencies of the children in an effective manner; (b) satisfying the curiosity of children; (c) utilising all the senses of children; (d) relating closely body and mind; (e) linking teaching-learning with life. (iv) Principle of Self Education : Best teaching is enabling the child to learn by his own efforts. Teachers must fire the imagination of their students. Children must be left free to express themselves, for the best education is self- education. Teachers must stand aside. They must talk less, explain less and direct less. The essential activity in teaching is not the adjustment of child to teacher but is to enable him/her to adjust himself/herself to the environment and also to change the environment to adjust himself/herself. Teaching must enable the child to work independently and without the teacher at a later state. (v) Principle of Individual Differences : No two children are alike. Teaching to be effective must cater to individual differences of children. 214 (vi) Principle of Goal Setting : A definite goal must be set before each child according to the standard expected of him/her. Short term or immediate goal should be set before small children and distant goals for older ones. It must be remembered that goals should be very clear and definite and the children must understand their goals. (vii) Principle of Stimulation : Burton has said teaching is the stimulation, guidance, direction and encouragement of learning. Ryburn emphasises, the guidance of the teacher is mainly a matter of giving the right kind of stimulus to help him/her to learn the right things in the right way. (viii) Principle of Association : Thorndike points out that things we want to go together should be put together. Many different things or ideas which want to go together should be associated with each other. They should form a part of one process. Then it becomes easier to make the students understand their relationship. (ix) Principle of Readiness : This principle is the indicative of learner's state of mind to participate in the teaching learning process. Readiness is preparation for action. (x) Principle of Effect : This principle states that a response is strengthened if it is followed by pleasure and weakened if followed by displeasure. (xi) Principle of Exercise or Repetition : According to it, the more a stimulus induced, response is repeated, the longer it will be retained. This principle has two sub-parts- principle of use and principle of disuse. (xii) Principle of Change and Rest : Psychological experiments in learning have demonstrated that fatigue, lack of attention and monotony can be overcome by making appropriate provision for change, rest & recreation. (xiii) Principle of Feed-back and Reinforcement : Learning theories point out that the immediate knowledge of the results and positive reinforcers in the forms of praise, grade, certificates, taken money and other incentives can contribute to make the task of learning joyable. (xiv) Principle of Training of Senses : Senses are the gateways of knowledge. The power of observation, discrimination, identification, generalisation and application can only be appropriately developed through the effective functioning of senses.

215 (xv) Principle of Group Dynamics : Under the influence of group behaviour, appropriate changes in the behaviour of the members of the group can take place. Individuals composing the group think and feel as the group feels, do as the group does. A suitable climate for group dynamics is to be created in the classroom environment. (xvi) Principle of Creativity : Opportunities should be provided to the students to explore things and events and find cause-effect relationships. This principle envisages that every student possess some element of creativity which must be explored and developed to the maximum extent. (xvii) Principle of Correlation : Gandhiji was of the firm view that correlation should be the basis of all work. He advocated that correlation of the learning task should be established with the craft, physical and social environment. 4.3.4.2. General Principles of Teaching : Successful teaching necessitates that the teacher comes down to the level of the pupils and at the same time assists them in rising above it. To a great extent, the principles of teaching to be followed depend upon the age of the pupils, the subjects and topic of the lesson. However, there are certain general principles which should underline the teaching of all subjects. Actually there is no clearcut dividing line between psychological and general principles of teaching. (i) Principle of Definite Goals or Objectives : Destination or goals of teaching- learning must be clear to the teachers and the students. Goals and objectives keep them on the track. Definiteness of goals helps in planning, executing and evaluating every step, phase or act of teaching-learning process. (ii) Principle of Child Centredness : The entire teaching endeavour is for the child. Therefore, it is essential that teaching strategies should cater to the aptitude, interest and abilities of the students. In the drama of education, child should be assigned the role-of 'hero'. (iii) Principle of Individual Differences : No two children are alike. Teaching to be effective must cater to individual differences of children. (iv) Principle of Linking with Life : Teaching can never be performed in a vacuum. It is always in a social context. In the teaching of all the school subjects, examples from everyday life should be given their due place.

216 (v) Principle of Correlation : Knowledge is one 'whole'. Various ideas and events are inter related. There exist links among various subjects. Correlation of the present events can be made with the past. Similarly future can be visualised on the basis of the present happenings or state of affairs. (vi) Principle of Active Involvement and Participation of Students : Teaching- learning is a two-way traffic. Traditional teaching was almost teacher-centred. There was very little scope for the involvement of the students. The teacher used to teach and the students would listen to him passively. The new teaching emphasises that the students must actively participate in all the stages and steps of teaching-learning. (vii) Principle of Cooperation : Classroom environment becomes lively when the teacher and taught work in union, helping each other in carrying out the task of teaching and learning. All the participants have the same common interest. Naturally they must cooperate with teacher. (viii) Principle of Remedial Teaching : All the students do not learn with the same speed and accomplishment. Some lag behind and need extra coaching. The teacher has to find out where the fault lies and think for positive measures. He may have to arrange for remedial or compensatory or extra teaching for any particular group of students for removing their specific difficulties. (ix) Principle of Creating Conducive Environment : Physical as well as social environment of the classroom plays a vital role in motivating the learners. Arrangement of light, fan, furniture etc. should be properly attended to. There should be proper discipline and order. The teacher should be sympathetic but firm. (x) Principle of Planning : Planning determines the quality or success of any task. Planning in teaching involves the preparation of the lesson notes, provision of teaching aids and working out strategies to be adopted in the delivery of the lesson. (xi) Principle of Effective Strategies : Teaching process to be effective must adopt proper means, strategies and tactics. A

76% MATCHING BLOCK 53/108

SA DB manual.docx (D110503252)

teaching strategy is a generalised plan for a lesson which includes structures, desired

learning behaviour in terms of goals of instruction and an outline of planned tactics necessary to implement the strategy.

217 (xii) Principle of Flexibility : Strategies should serve as guides for effective teaching. Strategies may have to be changed, if the classroom situations, so warrant. Teaching is a complex task and a live phenomenon. The possibilities of alternation in planned strategies cannot be ruled out at the execution stage. A teacher must be quite imaginative and resourceful for adapting himself/ herself and his/her teaching to the requirements of the teaching-learning environment.

(xiii) Principle of Variety : A variety of teaching aids and strategies should be adopted to motivate and sustain the interests of the students. Variety serves as great tonic for creating fresh environment and checking boredom and lethargy.

(xiv) Principle of Activity : Children are active by nature and any process or method that is not based upon the students activity is not in accord with the progressive educational theories. Rousseau considers the child as a "hero" in the drama of education and as such he/she must be allowed to play. The dominant role. So the first principle is to keep the class active. The great vitality of our children cannot be permanently restrained without providing a positive purpose which will interest the children and give them opportunities for observation and the use of their hands. This is to offer them the fulfilment and satisfaction which nothing else confers. Activity does not mean mere physical activity. To develop all sides of pupils' personality it is necessary for them to be active in all ways, to exercise all the powers they have.

4.3.5. Maxims of Teaching : The maxims of teaching are very helpful in obtaining the active involvement and participation of the learners in the teaching learning process. They quicken the interest of the learners and motivate them to learn. They make learning effective, inspirational, interesting and meaningful. They keep the students attentive to the teaching-learning process. The maxims will be discussed under course code A3 and unit-3 in Semester-II. Here only the points are to be noted :

(i) Proceed from the Known to the Unknown

218 (ii) Proceed from Simple to Complex. (iii) Proceed from Easy to Difficult. (iv) Proceed from the Concrete to the Abstract. (v) Proceed from Particular to General. (vi) Proceed from Indefinite to Definite. (vii) Proceed from Empirical to Rational. (viii) Proceed from Psychological to Logical. (ix) Proceed from Whole to Parts. (x) Proceed from Near to Far. (xi) Proceed from Analysis to Synthesis. (xii) Proceed from Actual to Representative. (xiii) Proceed Inductively. In the ultimate analysis it must be observed that the maxims are meant to be our servants and not masters. Moreover, by and large, all are interrelated. It is also to be kept in view that children differ in their aptitudes, capacities, interests, mental and physical make up. Different maxims suit different situations and different children. It is, therefore, essential that a judicious use should be made of each maxim.

4.3.6. The Principle of Teaching for the Visually Impaired Children : The discussion of a general principles of teaching for all children is now over. We will proceed to highlight the specific principles of teaching required to be obeyed in course of dealing with the visually impaired children. Ever since formal education of blind children began, enlightened teachers of the blind have practiced such principles, mostly without being theoretically aware of them.

(i) Educational Set Up : To what extent these principles can be applied in the actual process of teaching depends somewhat on whether visually Handicapped children receive their education as a group in an environment geared to their

219 needs, as residential schools are, or as single individuals in general school facilities where they may have an understanding general classroom teachers and should have a resource or an itinerant teacher who is aware of and knows how to meet their special needs. (ii) Need For Concrete Experience : In order to give the blind child a knowledge of the realities around him/her the teacher must aim at providing him/her with a wide variety of concrete experiences. Thus making up to a certain extent for the limitation in the range and variety of his/her experiences. For the blind child it is not important to learn concretely about exotic things; his/her primary need is to learn about his/her environment. The young seeing child is familiar with a multitude of characters and scenes of domestic and social life. Experiences of such things as these, and of their observed relationship, are the very stuff of the child's mind, and on them the teacher draws daily activities for the purpose of teaching. The deepest and most fundamental needs of blind children are a rich and intimate experience of common things, and a direct acquaintance with the many characters that move across the scenes of daily life, and the activities of the characters. The children must learn to know persons and things in terms of their own sensory persons and to meet the situations in which they occur on an independent footing. For these no verbal substitutes will serve. They need the direct contact with the world. Concreteness in teaching can be achieved in essentially two ways : by having the children observe the object or situation itself or by providing them with a model of the object. In all cases if there is any possibility, reality is to be preferred. Children must be given sufficient time for the observations. Study excursions and field trips can familiarize children with many situations which otherwise would remain abstract for them. A model or replica can only be a substitute and will always in some ways be incomplete or distorted, unless the teacher is careful and persistent in making the students fully aware of size and other distortions. The use of embossed pictures to give blind children an equivalent of visual illustrations has often been tried but never had only lasting success. Embossed outlined representations of essentially two-dimensional objects, such as leaves, a fork, or a butterfly, may be identified by the blind children and even a man's figure will

220 be understood because the child will relate the body parts to his/her own bodily experience. Such embossed pictures can even result in wrong ideas, for instance when a four-legged animal is shown with only three legs, since the fourth-leg is visually hidden. Though limitations are there diagrams and embossed maps are the most valuable from the early school years on in developing spatial concepts and basis relationship needed for orientation and other purposes. Giving blind children a knowledge of the realities around them is not a question of enriching the child's vocabulary, but of giving him/her a sense of reality about his/her environment. It will prevent him/her from following into a pattern of unreality towards which he/she may be inclined for other reasons. It will also be valuable to him/her in his/her social life, because in conversations he/she will not feel left out by lack of concrete knowledge but will be able to take an active part as the result of experiences which he/she has in common with others. (iii) Need For Unifying Experiences : Blind children are at a services disadvantage in experiencing things and situations in their totality. Touch permits simultaneous observation only of objects that can be embraced by either the hands or the body. Larger objects must be observed by consecutive touch motions and in many instances only parts of them are observed in this way. Vision permits a unification of observations and it structures and organizes discrete impressions received by other sensory organs. The lack of unifying integrative experiences must be counteracted by teachers who give blind children opportunities to experience situations in their totality and to unify part-experiences into meaningful wholes. The teaching by study units is an important means of achieving this end. By this method blind children will not only learn the facts of a given topic as seeing children do, but will also recognize how the different parts combine into a total object, situations, or topic. (iv) Need For Learning by Doing : As a result of their blindness and because of the environmental reactions to this handicap, blind children have in general significantly less opportunities for self acting. Special attention must be given at home and school to encouraging blind children to do as many things for themselves as are desirable and compatible with a well-conceived time economy. That blind children from an early age on are not visually stimulated

221 by their environment to imitate activities of others combined with tendency of many parents to be content with just satisfying their child's bodily needs, causes a tendency toward inertia in many blind children. The general approach should be to encourage blind children to learn to do things themselves with as little assistance as possible. The blind child should be encouraged to become independent and successful at the endeavours like eating, dressing, playing, meeting people and getting about. The more situations he/she has learned to master, the stronger will be his/her feelings of security and the more positive his/her self-concept. As regards the creative activities of blind children, educators should not impose their 'seeing taste' on blind children, but should let them create things according to their own concepts and emotions. The visual aspects of a piece of clay modeling are irrelevant for the blind child, who works by touch and expresses his/her sculpture his/her touch concepts of things and events. Thus the result may be a product which in no way resembles the visually perceived objects, but truly expresses what the blind child knows and feels. It is the process that counts not the product. From all that has been said about individual considerations and about special educational needs of blind children it is obvious that the teaching can fulfil his/her role only if the number of children in his/her group is small. This is true for classes in residential schools as well as for facilities in local schools, with either resource room or itinerant teachers. The actual number of children will depend on such factors as grade level, age, subject matter (is the upper grades), and geographic location (for itinerant teachers). In general, between five and ten children can normally be assigned to one teacher. If special conditions exist, such as an itinerant teacher serving blind children in primary grades, or if the children are multilaterally disabled, a much smaller teacher-pupil ratio, sometimes one to one, is essential for success.

4.3.7. Some more Points to be taken into Account Apart the above mentioned major points the educators should keep in mind the following in course of teaching a blind child. (i) Age of onset of blindness is of crucial importance. (ii) Extent of residual vision determines the nature and dominance of visual imagery. (iii) Stability of residual vision and suffering from trauma. (iv) Knowledge of family background. (v) Contrive concrete life situations to give the visually handicapped child experiences that he/she would miss day-to-day life. (vi) Where necessary take the visually handicapped child to experiences that he/she cannot have at home or in the classrooms. (vii) Use models where absolutely indispensable. (viii) Organise visits to Museums, Post office, Markets, and social and cultural centres in the city, town or in the neighbouring areas where the school is located. (ix) Touching objects should not be prohibited. Indeed, it should be encouraged. (x) Verbal description should be supported where possible with concrete experiences. (xi) Reward and punishment should be judiciously given to motivate the visually handicapped child to interact extensively with his environment. (xii) Diagrammatic representation in braille or in large print should be used where necessary to give the visually handicapped child an idea not only of two dimensional perspective but also of the three dimensional world. (xiii) Learning by doing should be the basic principle of the teacher. In this way the formation of imagery and concepts could be fostered. (xiv) Play at home and in the classrooms should be extensively used as a tool promoting cognitive development. (xv) Acting should be used in appropriate situations to improve the visually handicapped child's expression and strengthen his retention and recall. (xvi) Role playing should also be used to give a visually handicapped child experience of life situations.

223 4.3.8 Let us Sum up : The principles of teaching help to navigate the goal-oriented teaching-learning process efficiently, competently and successfully. Committed quality teaching is expected from an educator. Hence each and every educator should know well and obey the principles of teaching. These days are the days of child-centred education. Hence the child whether normal or disabled particularly visually handicapped should be given appropriate principle-based teaching-learning environment, care and attention. Principles-psychological and general help the education to be endowed with proper techniques and strategies for education of all children. But for the visually impaired children some specific principles are to be taken into account in addition to the two principles meant for all. ● "Course Work" : (a) Write the process and name or articles needed for preparing 4 models and 4 maps for teaching the visually handicapped children. (b) Give critical analysis of these models and maps. 4.3.9 "Check Your Progress" : 1. 'Learning by doing'--What type of activity does it mean ?

----- 2. Principle of Individual Difference--Explain.

224 3. Remedial Teaching--Does it prove teachers lack of competency ?

----- 4. Type of education set up of a visually handicapped child changes the role of the educator--Clarify.

----- 5. In the process of teaching-learning of visually handicapped child the age of on-set blindness is of crucial importance --Explain.

----- 6. Teaching of totally visually handicapped and low vision child differs--Justify.

225 4.3.10. Check Yourself : Tick the appropriate answer-- 1. Child is the 'hero' in the drame of education has told by-- (a) Johann Heinrich Pestalozzi (b) John Dewy (c) Jean Jacques Rousseau (d) Alfred Binet 2. Principle of motivation does not include the technique of-- (a) linking teaching-learning with life (b) relating closely body and mind (c) satyifying the curiosity of chidren (d) utilising only the sense of vision of the children 3. Planning of teaching does not involve-- (a) preparation of excessive talk (b) preparation of lesson notes (c) making provision of teaching aid (d) working out strategies for delivering lesson. 4. The most fundamental needs of visually handicaped children do not include-- (a) rich and intimate experience of common thing (b) a passive sedentary tendency (c) a direct acquaintance with the characters that move across the senses of daily life. (d) the activities of the characters that come in their contact. 5. The teaching of visually impaired multiple disabled (VIMD) children the ideal teacher-pupil ratio should be--

226 (a) one to more than ten (b) one to eight (c) one to one (d) one to ten • Answer Key : (1) (c), (2) (d), (3) (a), (4) (b), (5) (c)

Let us Sum up 4.4.11. "Check Your Progress" 4.4.12. Check Yourself 4.4.13. References 4.4.1. Introduction : Curriculum planning for visually impaired children follows the same maxims as for normal children. The motto is to facilitate children's learning. The effects of 228 visual impairment necessitate some adjustment in the planning and execution of the curriculum. Some skills for learning which are natural to a sighted child need to be developed through a well planned programme hence the need for expended core curriculum/plus curriculum. Similarly the visually impaired child needs some special in-puts from the teachers besides what is given to every child. He/She also needs, at times, special inputs in terms of equipments or efforts. 4.4.2. Objectives After completing the subs unit the teacher/students are expectable to be able to : (i) Describe the concept of curriculum in general and its implications for teaching visually impaired children for classroom practice. (ii) Specify curriculum adaptations for teaching visually impaired children. (iii) Identify the components of Expanded core curriculum/plus curriculum activities for visually impaired children 4.4.3. What is Curriculum ? (a) Education is treated as a race, with its objectives as the goal and curriculum as the course leading to the goal. The traditional system insisted on curriculum as the acquisition of mastery over certain skill and certain areas of knowledge. According to modern educational thoughts curriculum does not mean only the academic subjects traditionally taught in schools, but includes the sum total of experiences. That a pupil receives through a variety of activities in the school, in the classroom, library, laboratory, play grounds, in formal contacts between teachers and pupils. In this sense, the whole life of the school becomes the curriculum, which can touch the life of the students at points and helps in the evolution of a balanced personality. Modern curriculum. Thus, "covers all the wider areas of individual and group life. It encompasses all meaningful and desirable activities outside the school provided that these are planned, organised and used educationally." The concept of curriculum reflects the following concerns : (i) Curriculum exists only in the experiences of the children. 229 (ii) Curriculum includes more than the content to be learnt content does not constitute the curriculum until it becomes a part of the childrens total experiences. (iii) The school curriculum is an enterprise in guiding living. (iv) The curriculum is a specialised learning environment deliberately arranged to direct the interest and abilities of children towards effective participation in the life of the community and the nation. 4.4.3.1 Functions of the Curriculum : (b) The functions of the school curriculum are determined by two factors : (i) Taking into account the varying capacities and the endless potentialities for good or evil in the life of the community and the nation (Social goals) (ii) Problems encountered by the individual for living in the society (individual goals) The curriculum is the instrument through which these two factors are brought together; it consists of experience through which children achieve self realisation and at the same time learn to contribute to the building of better communities and a better nation. 4.4.4 Need For Special Approaches For Visually Impaired Children : (a)

96%

MATCHING BLOCK 52/108

W

The whole gamut of the curriculum for children in school and community is centered around two significant aspects, "The Opportunity" and "The Experience". Often children are provided with opportunities, but the mere provision of opportunities does not mean acquisition of experience.

The understanding of the self and the world is not a 'whole' when experience is denied. Sighted children have advantage over visually impaired children in the acquisition of knowledge through experience. The vision, which brings an enormous amount of information in just a glimpse enables sighted children to have rich experiences in a "Natural Way". They learn the experience as a "whole".

71%

MATCHING BLOCK 55/108

SA

SED-14 Final.docx (D93662759)

But the 230 learning of visually imparied is not "whole" but in "Pieces" of information.

Thus there is a significant diference between the two groups. The sighted having "Natuall Learning" and the visually imparied child having "Mediated Learning". There is therefore a need for different approaches to the curriculum for visually-imparied children. 4.4.4.1 Objective Effects of Blindness Causing Experiential Deprivation In Visually Impaired Childern : (b) According to Dr. Berthhold Lowenfeld, The objective effects of blindness are : (i) Reduction in the range and variety of experiences--As vision is the major mode of acquiring information, the visually-impaired child learns in a fragmentary way. He/She has to have time to put these bits & pieces together to form a concept which is not exactly like that of the sighted but which is sufficiently like ours to enable us to communicate. (ii) Reduction in the ability to move about-- Blindness tends to create a very sedentary kind of existence. A visually impaired person may just be inactive become of fear, lack of skill in using information and lack of skill in moving about within it. (iii) Control over the environment and self in relation to its--By just being blind and not knowing where you are, to whom you are speaking and what you are facing, being unable to controla the self and environment in relations to self is a significant defecit. Except these, all other effects such as etiology, extent of blindness and all other mitigated experiences are purely subjective. The three obstacles in the form of "objective effects" to independence and self-fulfilment are the underlying reasons for all the "Plus Curriculum" or "Expended Core Curriculum" set forth for visually impaired children. 4.4.4.2 Curriculum for Inclusive or Integrated Education Programmes : (c) A visually impaired child in the regular class is one among many children in That class. The curriculum meant for visually impaired children of, the inclusive/ imtegrated programmes should be more like than 'unlike' that of the sighted 231 children. Most information is received by the visually impaired child through 'Touch' and 'Hearing'. Hence these experiences must be planned to facilitate the acquisition of at least the near normal experience acquired by other children through 'vision'. Hence there is no need for a special curriculum for visually impaired children in the inclusive/integrated education programmes but special approaches based on multi-sensory experiences are needed. To learn the general curriculum, the visually impaired child should possess some skills which are peculiar to blindness and dealt with under 'Plus curriculum'/'Expended Core Curriculum'. In the light of this, the curriculum for visually impaired children may be stated as follow : 4.4.5. General Curriculum With Modified Experiences : The general curriculum which contains more "visual experiences" and less "non-visual expearence" must be analysed to convert visual to non-visual experiences for the betterment of the concept development of the visually impaired child. The four steps are given hierarchy of preferred management of "educational experience". (a) We give Duplicate experiences; but cannot always, so we (b) Modify experience some times; These modifications may be

87%

MATCHING BLOCK 54/108

W

in terms of--Content, Method of Display, Type of Material used, Response Expectations From The Child. (

c) Sometimes, there is no suitable means of modification, and we must therefore substitute one kind of lesson for the visually impaired child, which as closely as possible, approximates that presented to his/her sighted peers. But even then, and specially in the early days, we may sometimes. (d) Omit a lesson These four steps are very important in giving experiences to the visually impaired child through the mutli sensory material. It has been found by experience that higher the academic standard, easier it is to produce the material exactly. That is most omissions occur during the first year. The pattern shifts quickly, and in no time at all, omissions are rare, substitions are infrequent, modifications continues to be desirable; but of the greatest

232 importance is the fact that more and more duplicate experience are possible. The visually impaired children could be divided into two main types. Those for whom braille or recorded study materials must be the medium of learning. Children with low vision who can read print with magnification in good and defused lighting. By and large, in both cases no significant modification is required in the curricular content. However, many boards of secondary education in India have exempted visually impaired children from appearing in maths and science in the 10th and 12th class Examinations. They are allowed to take music or an additional at language. Therefore, many schools teach science and maths to children from 6th to 8th class but discontinue the subjects from 9th class onwards. This is not absolutely necessary in the light of modern equipments now available. It is possible for a visually impaired child to take 10th or 12th class examination with maths and science. Over the years changes may come. Particularly in West Bengal Board of Secondary Education does not allow entire exemption of any subject, to the visually impaired students appearing at the final examination. Only alternative questions of equal marks are set against a few questions in the subjects like Mathematics--The construction portion and in Geography & Life Science against the pictorial portion alternative questions are set other wise all papers & questions are like the normal students. In all standards from 1st to 10th no change in there. Special equipments are needed for teaching Braille, Mathematics, Science and expanded core curriculum subject. Embossed maps are necessary for teaching social studies. It may be necessary for a teacher to adapt his/her teaching strategies to suit the needs particularly of visually impaired children. The following points should be borne in mind. (i) Show models instead of illustration. (ii) Orally spellout, whatever you write on the black-board. (iii) Assignment should be taken either in Braille or on any audio system. In case of non-feasibility of the both, oral examination is necessary.

233 (iv) Orient the child fully to his classroom and the school building. Do this bit by bit so that an accurate image is formed in the child's mind. (v) It will be preferable to adopt what is sometimes called the buddy system. This means association of one other peers who will take the responsibilities of giving the visually impaired child lecture notes, taking him out when necessary, playing with him/her in suitable hour. (vi) Encourage the child to be as mobile as possible within the school campus. (vii) Let him/her use in the classroom, all the equipments he/she needs for doing all the subjects taught in the school. (viii) Given the right environment, equipments and encouragement, the blind child should be expected to perform well as the rest of the students. (ix) Blindness should not be treated as an excuse for poor performance. (x) Encourage all the students in the class to interact freely and without inhibition to the blind child. (xi) Enforce the same discipline to the visually impaired child as it applies to other children. There should be no positive discrimination in matters of disciplines with visually impaired children. (xii) Low vision children usually do not require special methods except giving them more time for doing assignments. If they have mobility problem, some visual orientation may be given.

4.4.6. Expanded core curriculum/plus curriculum : The expanded core curriculum commonly known as plus curriculum is not 'extra' for visually impaired children but 'compensatory'. These are the basic skills on which the general curriculum skills are developed. These skills are skills peculiar to blindness, which a sighted person does not need. Experiences have shown that the strength in, the 'expanded core curriculum' or 'plus curriculum' always facilitates better learning of the general curriculum. The special areas are as follow :

234 4.4.7 Special areas (a) Braille Braille Louis Braille himself blind, introduced the Braille System for the educational purpose of visually impaired, persons. Braille is a tactical approach to reading and writing for the visually impaired, in which the letters are formed by a combination of raised dots in a cell. The cell consists of six dots which can be arranged in 63 combinations or characters. The finger tips possess sensitive nerve endings which make touch reading possible.

79%

MATCHING BLOCK 56/108

SA

SED-14 Final.docx (D93662759)

The area covered by light pressure of the finger tips on paper gives the necessary information to the child to discriminate between different configuration of braille letters,

written within the braille cell, which is approximately 6mm vertically and 3.6 horizontally. The braille system is classified as Grade I, Grade II and Grade III levels. In Grade I, each letter of the braille word is specified. Grade I braille is sufficient for those who do not read braille for extensive reading. It is sufficient for lower primary school children and adult blind people of rehabilitation. Programmes when they try to learn braille for the first time. Grade II represents the contracted form of the Grade I braille characters, prefixes, suffixes, pronouns, conjunctions are denoted by contractions. Grade II braille is needed for the child to proceed to higher education. Mastery over Grade II braille helps the learner to read more Braille books in less time. Braille is based on phonetic scripts and, therefore, Indian languages and all world languages are easily written and read in braille. Grade III braille system is not followed by many visually impaired people because of its complexity. It is the complicated form of the Grade II Braille and presented more or less in a form of a "short hand system"/stenography. A few visually impaired people who take note and record the proceedings of meetings learn Grade III braille. • Braille Reading : Braille learning requires some pre-requisite skills called 'Braille mechanism', which means the efficient flow of hands over the braille lines with proper hand and finger position together on the dots from left to right.

94% MATCHING BLOCK 57/108

SA SED-14 Final.docx (D93662759)

When the right hand reaches the end of the line, the left hand should, retrace the line which was just read, and identify the beginning of the next line.

To develop this braille

235 mechanism, certain tactual discrimination activities should be undertaken as these activities have great importance for developing the sensitiveness of the finger tips. Tactile tolerance needs to be developed among visually impaired children for effective Braille reading. Learners having no good braille mechanism just "butterfly" over the braille sheet. Scrubbing hampers the speed of Braille reading. Braille reading should come first and Braille writing next. • Brailled Writings : Braille slate and stylus are commonly used by learners in developing countries for writing purposes

80% MATCHING BLOCK 58/108

SA SED-14 Final.docx (D93662759)

while writings, the child has to punch the dots from the right to the left of the slate.

Braille writing frame is used placing the paper in between the two parts of the frame (Guide). After this, the child has to

100% MATCHING BLOCK 59/108

SA SED-14 Final.docx (D93662759)

reverse the paper and read it from left to right.

In order to write Braille effectively, the child should possess skills such as (i) Flexibility of fingers, (ii) Fine motor coordination and control of muscles, and (iii) Competency to read familiar Braille codes. Writing in Braille slate and stylus needs enormous muscles control, and thus may be introduced during the second year of a child's schooling. To develop

76% MATCHING BLOCK 61/108

SA SED-14 Final.docx (D93662759)

speed in writing, the lefthand should always identify the braille cell while the right hand punches the letter in the previous cell. The stylus and the left hand should be placed on consecutive cells. By this the lefthand assists the right hand which holds the stylus to identify the correct of in the braille cell. While writing, the stylus should be held vertically. Tilting the stylus may make holes

on the braille paper, which spoils neatness in braille writing work. Braille typing with the use of Brailles can be used with learners of higher classes. Sophisticated electronic equipment such as talking machines, audio materials and optacons make the reading activity of the child easier. However, presently this advanced technology is available only in developed countries. Whatever the innovations, Braille continues to be the primary mode of communication for visually impaired learners. 4.4.7.1 Orientation And Mobility : (b) Independence in travel breaks the sedentary condition caused by blindness. Two important skills are necessary to attain such an independence—one being the knowledge of the environment and the other, moving from one place to another in the environment in relation to oneself.

236 The skills that are related to the use of the

73%

MATCHING BLOCK 60/108

W

remaining senses of the sightless person to establish one's position in and relationships to, significant objects in the

environment are widely classified as orientation skills. In the environment the abilities of the individual to move from one place to another are classified as mobility skills. By nature both skills are interlinked. A sightless learner with excellent orientation skills and graceful mobility skills is said to have attained physical independence and such learners are easily acceptable by the sighted community. 'Orientation and Mobility' is a typical area in the development of the sightless student in which the client needs absolutely individualised instruction and practical assistance mobility is not a subject for discussion with the sightless persons, it must compulsorily be practised by them. This area warrants individual, one-to-one attention because the onset of blindness in individuals leaves them sometimes with no visualisation of the world. Approach wise, there are differences between a bornblind (congenital) and adventitiously-blind (acquired) person. The later-age blind may have acquired some concepts about the objects of this world; for one born-blind, everything needs to be started from scratch. Therefore, the techniques of the orientation and mobility, briefly "O & M" are the same but the approaches are different for the visually impaired individuals. • Sensory Training & Mobility : The good and efficient training in the use of the remaining sense enables the sightless individual for independent travel. The loss of sight is compensated by the sense of touch & hearing. Sensory stimuli enable a sightless person to determine his position or direction. Such sensory stimuli are classified as "clues". Hearing plays a dominant role in mobility. The important areas required for sensory training may be branched off as follows. (i) Sense of Hearing : Sense of Hearing is essential as we rely on the auditory information of the world consciously or unconsciously. The sightless student has to depend on this sensory training to a great extent. It overcomes the difficulties of the student suffering from lack of visual perception. (ii) Sense of Touch : Exploration of an object is worth a thousand words used in explanation. Objects, perceived through touch, determine the definiteness of the objects and help the individual to form a neat conception of them. More than mobility, the sense of touch has a lot to do with the reading of the sightless student. It has its limitations as large objects lie beyond tactile exploration. "Wholeness" can be perceived by the child only when the object is within the reach of the non-seeing child's hands. (iii) Sense of Smell : A good nose voluntarily effects the information of the objects which can be smelt. These are sensible clues for a traveller during his/her travel, the smell of a gutter, the smell of smoke in a chemical industry smell of flowers in a garden or smell of a kitchen, are sources of information for him/her to locate where he/she development of this skill speaks well of the chemistry laboratory of the child's school experience. This also helps in the day-to-day life of the individual. If the student has an "educated nose" his surroundings can transmit enormous information to him/her. (iv) Sense of Taste : Of course, this sense has less utility in the mobility of the child, as it does not relay any details from the outside world. Unless the sense is provoked, sensing is not spontaneous. This skill helps the sightless person to associate the names of the substances with the sensed taste. For example, sweet, sour and hot should be associated with the substances which provide such experiences. For a sighted person, seeing such objects is a stimulus. The conditioning by observation is natural for a sighted person, best for the sightless, it is a vital experience. (v) Sense of Kinesthesia : The feeling of the body is responding to external stimuli, otherwise the kinesthetic sense, enables the child to get certain information like cold, heat, breeze and elevation of surface. Mobility is guided by his/her efficient kinesthetic sense. It is a misunderstanding to suppose that the loss of sight leads to extraordinary abilities in the other senses. A child who has acquired the necessary sensory skills, orientation to environment becomes easier and this leads the child to a greater level of confidence in mobility. • Types of Mobility Techniques : The major techniques which are widely accepted are the sighted guide techniques, guide dog techniques and the long cane techniques. All the systems have

238 their own advantages and limitations. It must be left to the discretion of the individual to select the particular system that suits his/her need and temperament. (i) Sighted Guide Techniques : It is the skill of traveller with a sighted companion. It is learning for both the sighted and the sightless persons. (ii) Guide Dog : It is popular in Europe and America. The system could not stand the test in developing countries for many reasons. It involves an enormous cost. (iii) Long Cane Technique : The system is widely accepted by many countries recent years for independent travelling of the sightless. It is accepted for many reasons—it is expensive; it is handy; the length can be adjusted according to the height of the person in collapsible canes; the techniques are simple; the techniques learnt in a known environment can be applied in an unknown environment and so on. Despite the advantages, some sightless are reluctant to use the cane as device for mobility because of the feeling it confirms that the person is sightless. But people who have realised the richness of the cane techniques advocate the long cane for their sightless fellows. (iv) Safety Techniques : Safety techniques are necessary for sightless persons to protect body in a restricted environment and outdoors. A sightless person is said to have mastered the Orientation and Mobility Training when he/she feels safe in moving from one place to another, when he/she feels secured in the environment and moves gracefully. Safety, security and gracefulness are the three main outcomes expected on mobility training. 4.4.7.2 Daily Living Skills : (c) Education of sightless children has undergone periodical changes. Many new methods are being developed in educating sightless children. They are trained to be independent so that they may be accepted by the society. As a medium of communication, the invention of Braille has made a big breakthrough. This enables visually impaired children to overcome to a great extent the losses of written communication. Similarly the invention of Orientation & Mobility skills, using the devices like long cane and other mobility aids, helps sightless people to move freely

239 from place to place without much dependence on others. This independence is slowly changing the attitude of the society towards sightless people because they perform many activities like sighted people. Daily living skills are helping them to socialise effectively in the community. Due to the lack of sight, visually impaired people have the disadvantage of not getting the visual feedback, which in turn, retards the child from possessing the skills normally acquired by imitation. Therefore, it becomes vital to teach the daily living activities to the child who is visually impaired. Daily living skills together with the orientations and mobility can make the child readily accepted by the seeing world. • What is Daily Living Skills ? Daily living skills are those abilities that enabled the disabled child to carry out his/her day-to-day activities without assistance or minimum assistance. Development of these skills instils confidence in the child to enter the mainstream of normal children. Loss of sight at times retards the daily living skills of the child. Lack of opportunity and environment are the reasons for the development lag in sightless children. The goal of education set forth for sightless children should not be too general, for this may fail to give any measure of how the student can achieve a goal and under what circumstances. It is necessary to prepare a list of individual tasks, ranging from the use of the hands to the preparation of a complete meal. This, in itself, however, is not sufficient. There is need to develop a criterion to judge the success of the student's performance in each standard. • Training Strategies : Where, when and how to teach daily living skills to the usually impaired children need to be specified in clear behavioural terms before taking up education for such a task. In designing a daily living skills development programme, one should have the following objectives. (i) Observation of the daily living skills exhibited by sighted children at various grade levels. (ii) Diagnosing the difficulties faced by sightless children in acquiring the skills

240 possessed by sighted children in a natural manner. (iii) After the necessary diagnosis, pre-requisite skills must be defined for sightless children that will lead them to perform daily living skills in a better way. (iv) Even though daily living skills are defined in a general context, they must be classified according to grade levels and, if possible, age levels. (v) For each skill, a methodology must be developed. Methodology should primarily mention the teacher approach to a specific task. (vi) Some daily living skills may warrant certain aids for learning. Such aids and appliances should be made available for teaching those specific skills. (vii) Teaching skills should not stop with training. The teacher should design his/ her own criteria for evaluating the acquisition of the required skills by the visually impaired child. (viii) The abilities developed through the training are sustained when there is a continuous follow-up. The teacher plan should also suggest the various sources, either direct or indirect that can provide follow-up services after the necessary skill-development training. The evaluation should be on an individual basis.

- Areas of Interest in Daily Living : The efficient use of daily living skills depends upon the ability in sensory training, as well as the mobility training of the child. For example, in the task of going to the market and buying vegetables, the skill of going to the market is mobility, whereas the skill of purchasing, choosing. The right vegetables, getting change and speaking to people, constitute the daily living skills. Hence, the art of daily living and mobility teaching should go together. The main areas of interest in daily living activities may be classified as follows. (i) Techniques to be used at meal time. (ii) Shopping Techniques. (iii) Care and maintenance of clothing and personal belongings. (iv) Maintenance of personal records. (v) Systematisation of daily routine.

241 (vi) Money identification and money management. (vii) Use of Telephone and other devices. (viii) Development of tactile, kinesthetic and olfactory abilities. (ix) Skills in using electrical appliances. There is a feeling that deficit in the daily living techniques is one of the most continually humiliating and frustrating of all the shortcomings imposed by blindness. Times are changing. There are now better opportunities for visually impaired children to erase this feeling by demonstrating their skills. Inclusive/Integrated education programmes and the introduction of new methods of teaching in residential programmes are important signs of development in this vital area. It is the duty of every person working for the education of the visually impaired to provide them ample opportunity. Then they can show their potentiality; they can overcome the embarrassment caused by this limitation; they can rejuvenate themselves to self-sufficiency and responsibility. It is the art of daily living that works wonders.

4.4.8. Co-curricular Activities in Brief : Recreational & physical activities are the personality builders and should not be left out from curriculum. Intellectual activities like singing, playing instrument composing poems, eloquence etc. Physical activities like games & sports, swimming etc. intellectual-cum-physical activities like dance, etc are very essential for the sightless children.

4.4.9. Difficulties To Cope With : One of the main difficulties in this area is the slow pace of the performance of the visually impaired children. It is true that the sighted and the sightless could take part in some activities with little modifications. As sighted children tend to opt for "fast activities", they may be reluctant to join with the visually impaired child, not because of blindness but owing to the slow pace of performance of the sightless. Therefore, the approach in this context should be purely on an individual basis. This adjustment is necessary in the Inclusive/Integrated education programmes for visually impaired children.

242 On no account, should the curriculum in the inclusive/integrated education programme be changed only for the sightless child. On the other hand, it is not advisable and feasible as the inclusive/integrated programme is a part of the 'General' school which has a common curriculum. Therefore, it is suggested that we provide modified and special approaches, so as to reach the 'near normal' experience at par with sighted children. This should be the main objective of the curriculum approaches in inclusive/integrated education programmes. A rich curriculum approach depends upon the nature of instructions expected by the sightless child, type of materials used by the child, the method of teaching followed by the regular teacher and the nature of remedial and resource instructions organised by resource teachers/special educators. A thorough understanding of these aspects facilitates understanding of a better approach in adapting the curriculum content of sightless children in the inclusive/integrated education programme. Experience makes it clear that visually impaired children in fact gain more than they lose through this special approach. The understanding between the resource teacher/ special educator and regular teachers makes the curricular approach more effective. It constantly improves and there is no saturation point. 4.4.10. Let us Sum up : Curriculum meant for sighted children should be followed in the education for the sightless children without major omissions. Research studies (Jangira, 1986; Mani, 1982) indicate that 80-85 percent of the general curriculum could be duplicated for visually disabled children. The rest can also be provided through modified and substituted experiences. Omissions are rare and it is for less especially at the higher grades when the students learn more of content. Expanded core curriculum/plus curriculum, therefore, is a foundation for development in general curricular areas and teaching of these skills should be an integral part of the education of visually disabled children. 4.4.11 "Check Your Progress" Give four examples of content for visually impaired children in the integrated/ inclusive set up one each.

243 1. Duplication : 2. Modification : 3. Substitution : 4. Omission : 4.4.12 Check Yourself Tick (✓) the alternative which you consider to be the best choice. 1. Curriculum means the-- (a) content taught in the classroom (b) experience acquired at home (c) totality of experiences of the child in his/her day-to-day life (d) all content and experience deliberately planned for educational purposes. 2. Modern curriculum covers-- (a) the individual life experiences (b) the family life experiences (c) individual and group life experiences (d) none of the above 3. Provision of opportunity-- (a) ensures provision of experiences for visually impaired children (b) does not ensure provision of experiences for sightless children (c) is the same as experience (d) mentions the needs of visually impaired children 4. Visually impaired children-- (a) learn in pieces (b) learn the content as a whole (c) learn like sighted children

244 (d) none of the above 5. The learning of visually impaired children is treated as-- (a) natural learning (b) mediated learning (c) unnatural learning (d) isolated learning. 6.

Reduction in the range and variety of experiences-- (a) is a subjective effect of blindness (b) is impersonal loss for visually impaired children (c) is an objective effect of blindness (d) reduction in experience provided to children 7. Sightless children in inclusive/integrated education programmes need-- (a) the same curriculum meant for sighted children (b) the curriculum for special schools (c) the same curriculum meant for sighted children with various approaches (d) a different curriculum 8. More duplicated experiences may be provided for the visually impaired child at-- (a) the primary level (b) the secondary level (c) the pre-school level (d) the college level 9. The skills peculiar to blindness are known as-- (a) plus/expanded core curriculum (b) extra curriculum (c) co-curriculum

245 (d) core curriculum 10. Visually impaired children can participate more effectively with sighted children in-- (a) physical activities (b) intellectual activities (c) social activities (d) recreational activities 11. Grade II braille represents a contracted form of-- (a) prefixes, suffixes, pronouns (b) sentences (c) words (d) capital letters 12. Universally accepted technique of good braille reading is-- (a) using the right hand forefinger (b) using the left hand forefinger (c) using both the forefingers (d) using all fingers 13. The teacher should always compel the students to follow the correct techniques-- (a) yes, it should be (b) no, it need not be so (c) teaching should be through correct techniques, but the student may be inclined to go his own way. Therefore, the teacher should not compel him/ her. (d) it should left to students. 14. Braille reading is-- (a) as fast as print reading (b) a little slower than print reading (c) same as print reading

246 (d) none of the above 15. Braille writing on a slate is done-- (a) from right to left (b) from left to right (c) anywhere in the braille cell (d) in the cell horizontally 16. Reading braille and writing can go together simultaneously-- (a) yes (b) no (c) braille writing should come after braille reading (d) braille writing and braille reading have no relationship 17. The abilities of the individual to move from one place to another are known as-- (a) orientation skills (b) plus curriculum skills (c) mobility skills (d) walking skills 18. Teaching of mobility skills should be the same for all visually impaired children-- (a) yes it should be the same for all (b) no, it depends upon the onset of blindness (c) no, it depends upon the daily living skills (d) it depends on the capability of the teacher 19. Orientation skills are greatly influenced by-- (a) the sense of taste (b) the senses of touch and hearing (c) the sense of smell

247 (d) the vision 20. Widely used mobility techniques in developing countries are-- (a) sighted guide techniques (b) guide dogs (c) electronic aids (d) long cane techniques 21. Guide dog techniques cannot serve the purpose of developing countries owing to the-- (a) inadequacy of training methodology (b) enormous cost of the system (c) prejudice among visually impaired people (d) shortage of dogs 22. At the primary schools, The visually impaired child should-- (a) not be taught O & M skills (b) be taught the long cane techniques (c) be taught the pre-cane mobility skills (d) be taught guide dog techniques 23. In an inclusive setting the sighted child can be oriented to the school environment in a better way by-- (a) the sighted peer group (b) the regular teacher (c) the special educators (d) the parents 24. Daily living skills are-- (a) expanded core curriculum skills (b) extra-curriculum skills (c) skills for performing day-to-day activities

248 (d) skills for maintaining good health 25. Skills required for the readiness of the child to learn day-to-day survival skills are-- (a) daily living skills (b) pre requisite skills (c) academic skills (d) curriculum skills 26. For teaching all daily living activities-- (a) a common methodology should be followed (b) methodology should be based on the nature of activity (c) methodology is not necessary (d) none of the above 27. Daily living skills should be taught according to-- (a) age levels (b) grade levels (c) ability level (d) living background 28. Aids are necessary for teaching-- (a) all daily living skills (b) certain daily living skills (c) academic and not daily living skills (d) none of the above 29. Learning of daily living skills by an individual-- (a) continues even after the schooling (b) continues till the end of the school year (c) takes place at different time intervals

249 (d) takes place in pre-school years 30. Listening to music is-- (a) an academic skill (b) an auditory skill (c) daily living skill (d) none of the above. Answer Key : (1) (d), (2) (c), (3) (a), (4) (a), (5) (b), (6) (c), (7) (c), (8) (b), (9) (a), (10) (b), (11) (a), (12) (c), (13) (c), (14) (b), (15) (a), (16) (c), (17) (c), (18) (b), (19) (b), (20) (d), (21) (b), (22) (c), (23) (a), (24) (a), (25) (b), (26) (b), (27) (c), (28) (b), (29) (a), (30) (c). 4.4.13 References : See Pages 67 & 68.

250 Unit-4.5 ppppp Commonly Used Low Cost and Advanced Assistive Devices Structure : 4.5.1. Introduction 4.5.2. Objectives 4.5.3. Importance of Technology 4.5.4. Available Technology 4.5.4.1 Traditional Low-Tech A. Linguistical B. Computational C. Geography D. Science E. Mobility F. Recreational, Games & Sports G. Other-Daily Living Devices Personal Devices etc. 4.5.4.2. Low vision Devices 4.5.4.3 Modern High-Tech 4.4.5 Let us Sum up 4.5.6 "Check Your Progress" 4.5.7 Check Yourself 4.5.8 References 4.5.1 Introduction : Over the years, it has been considered that the only occupation a blind person can pursue is related to playing musical instruments and singing. It is widely still believed that auditory faculties are more developed in the blind. As schools for the

251 blind were set up in various parts of the country during the late 18th century, the doors to higher education opened. While some studied law and became successful lawyers and solicitors, other opted to enter the teaching profession some pursued careers in Railway & Bank sectors, in social work and others settled to work as telephone operators etc. In recent years, however, blind persons have ventured to take up opulent management studies. They have embraced technology and as a result, have positioned themselves into very competitive front. Advancement, in technology has brought in revolutionary changes in the quality of life and patterns of work and leisure. Assistive devices have helped the visually impaired to achieve better levels of independence through more access to information. The technology available is (i) traditional-low-tech, (ii) modern-high tech, and (iii) low-vision. However, users have to depend on imports for high-tech devices. Technology has tremendous potentialities for facilitating economic rehabilitation of the visually impaired and there is a need to improvise technology in the absence of universal designs. The government of India has taken initiatives to promote technology and assist the disabled to purchase such devices however, there are still a few bottlenecks. New areas of technological development have to be explored. So that the objective of equal opportunities for the visually impaired is achieved.

4.5.2. Objectives : After reading this sub-unit the student-teachers will be able to : (i) Understand what assistive devices are to be used for the visually impaired learners; (ii) Gain a general understanding of assistive devices available in the country for the visually impaired learners. (iii) Gather knowledge when and where to use particular type of assistive device. (iv) Have clear idea of using assistive devices in different educational placement of the visually impaired learners; (v) Acquire readiness for use of assistive devices before its handling is practical; (vi) Know how to make teaching-learning-materials (TLM) (vii) Estimate the contribution of modern technology to make assistive devices visually impaired friendly.

252 4.5.3 The Importance of Technology : The twentieth century has witnessed phenomenal advancements in technology in almost every sphere. Those developments have brought in revolutionary changes in the quality of lives of human beings. Today, even a common man is utilising specialised equipment to his/her advantage in activities of daily living and productivity. No doubt, technology has influenced our patterns of work and leisure. Technology has played a very important role in mitigating the limitations imposed by a disability. The use of assistive devices has helped persons with visual impairment to achieve new levels of independence and facilitate their rehabilitation print continued as a barrier to access to information until recently, however, modern technology has paved the way for using Internet with audio. Braille and large-character displays resulting in improved independence access to a large amount of printed information. Technology advances have provided numerous new devices also challenges to the visually impaired. Technology encompasses a broad spectrum of assistive devices. Quite a number of these devices both low-tech and high-tech are now available and used side by side by the visually impaired all over the world.

4.5.4.1 Tradition – Low-Tech Devices : In India most of the visually impaired continue to use traditional and low-tech devices for linguistic, computational, recreational, mobility and activities of daily living purposes. Most of these devices are low priced also.

A. LINGUISTICAL : ●

Braille Writing Devices : [i] Inter-Line Writing Frame : It is used for writing interline standard Braille characters. The frame comprises a wooden board/plank, with holes on either sides, a metal/plastic frame called guide, a reversible paper clamp and a stylus. The guide is fitted in these holes and brought gliding down as writing progresses. The metal/plastic foot-scale like guide has two flaps joined with a hinge. Each cell in the top flap of the guide has 253 six notches representing six dots. The bottom flap of the guide has fine pot-hole craters cell-wise which helps to emboss raised dots on the paper with punch of the pin of the stylus. The guide has two lines of Braille cells. The clamp is fitted at the top of the board/plank with pins to hold the paper in position. The clamp

88%

MATCHING BLOCK 62/108

SA

SED-14 Final.docx (D93662759)

has a small swivel stud for locking and holding braille papers. When one side of the paper has been brailled, the clamp with the paper still held, is turned over, as a until the binding margin is made automatically.

The paper holding clamp is of two types— –in one type two-fold clamp is fixed on the plank and can be opened when needed; in other type the clamp holding with the paper can be reversed. Writing progresses from right to left. The brailled paper to be read requires to be reversed and reading progresses from left to right. This is the simplest and low cost appliance for Braille writing. [ii] Interpoint Writing Frame : Plastic made frame has two flaps joined with a hing, and is opened like book opening. The top flap has braille cells with thorough cell notched holes. The bottom flap has only cell-wise very fine pot-holls craters. The paper is set in between the two flaps and paper holding corner pins locks the paper with a little snap. Writing needs punch by the stylus. Writing and reading method is same as like inter-line frame. Only differences between Inter-line and Inter-point are : (i) Wooden and Plastic; (ii) no need of gliding the guide in the Inter-point frame; (iii) cell in the Inter-point is smaller, (iv) In the Inter-point frame no writing on the reverse is possible; (v) the Inter-point frame is light in weight and easily portable. The Inter- point is convenient for the students from standard-III. [iii] Taylor Post-Card

90%

MATCHING BLOCK 63/108

SA

SED-14 Final.docx (D93662759)

Frame : It is used for writing small braille characters on one side of the paper. The corner pins are arranged in such a way braille can be read without removing the paper from the frame; when the top section is lifted, the paper remains attached to it. [iv] Pocket Braille Frame : The four-line pocket braille frame produces small braille characters on one side of the paper. This is specially used for making small and occasional notes. 254 [

v] Stylii / stylus : Braille writing in the above explained frames is not possible without a sytlus. For punching to produce Braille characters this is the sole device and hence is indispensable. These are produced with plastic or aluminium or wood handles of various shapes like ball-head, bull-head, concave head etc.

84%

MATCHING BLOCK 64/108

SA

SED-14 Final.docx (D93662759)

to suit individual needs. The pins of all stylii are made of stainless steel and the handles are of

ploished hard wood or synthetic material. These are normal low-cost stylus. But it runs a little risk as the pin remains open. [vi] Safety Stylus : Aluminuin body, the handle is caved, the pin is fitted with a screw. While writing the pin-side is taken out unscrewing from the handle. Screw side of the pin in set tightly in the handle hole. After use the pin is set again in the handle hole. [vii]

Braille Kit : It is rexine coated or a decorative wood box 36 cms x 28.5 cms. with a weight of 3085 Gms and contains the itmes like--■ Braille Frame; ■ Braille Writing Pocket Frame; ■

Two Stylii ■ Taylor Mathematical Board with Arithmetic Types; ■ Abacus; Rubber Sheet; ■ Spur Wheel; ■ Foot Ruler; ■ Measuring Tape; ■ Compass Set; ■ Some Braille Papers; ■ Circket Ball; ■ Some Play-way Braille Utter Composing Apparatus; ■ Folding Mobility Stick (cane); ■ Signature Guide. The itness may very sometimes. [viii] Braille Writer : It is a top-side

96%

MATCHING BLOCK 66/108

SA

SED-14 Final.docx (D93662759)

writing machine for writing on one side of the paper, enabling to read as it is written. This machine can be compared to a normal type, writer with a major difference that it has only nine keys, three for paper setting and six for embossing

and one spacer.

87% MATCHING BLOCK 67/108

SA SED-14 Final.docx (D93662759)

The braille embosses combinations of six dots in a braille cell. The

Braille is made of metal with an enamel finish, with plastic key-tops and adjustable margin stops. The paper is roller-fed and line spacing is achieved by pressing a special key. The most popular Braille writers are : ■ Perkins Braille; ■ Stensby Braille writer; ■ Taj Braille; ■ Worth trust Perkins Braille; ■ Minal Braille.

255 [ix] Braille Paper : To write braille in all the above mentioned apparatus the must item is thick braille paper, the standard size of Braille paper is 22"x28" and weight of each gross is 8.6kg. Manufacturers : ■ Titagarh Paper Mills Ltd; ■ Andhra Pradesh Paper Mills Ltd; ■ West-Coast Paper Mills Ltd; ■ Rohtas Paper Mills Ltd; ■ Orient Paper Mills Ltd. [x] Braille Duplicators (Braille Copier) : (a) Thermoform Machine : It is

82% MATCHING BLOCK 68/108

SA SED-14 Final.docx (D93662759)

semi-automatic braille duplicating machine. It is useful for taking out multiple copies of the braille matter on the 'Brailon' sheets from the master copy generally prepared on the braille paper.

These braille sheets are plastic made. This

100% MATCHING BLOCK 69/108

SA SED-14 Final.docx (D93662759)

machine operates on the principle of vacuum and high temperature.

It is power operated Foreign made is 'American Thermoform' and indigenous is 'Induthrem'. (b) Vacuum Forming Machine : It is available in standard sizes. It is used for taking out multiple copies of braille matter using PVC, HIP, Acrylic & ABS sheets with 2mm thickness. [xi] Braille Box : It is a play-way learning Braille device for the 1st year learners. Wooden finish the smallest size of the is 5"x10"x2". Braille cells with holes are set in the box. Thin round headed aluminium pegs are used to compose braille characters--letters, words. It is available in larger sizes. [xii] Study Material Listening Appliances : Talking Book.

94% MATCHING BLOCK 70/108

SA SED-14 Final.docx (D93662759)

The material recorded on cassettes has emerged to be the most popular mode of imparting education to visually impaired persons. As Braille books are very heavy,

damaged prone, require high cost in production, storing difficulties and many newly blind persons are unable to learn braille easily and many of them don't like reading braille talking books are gradually becoming to be the best viable alternative. In the present day for listening recoded study materials visually impaired persons use mostly C.D. Player or I. Pod.

256 B. COMPUTATIONAL / MATHEMATICAL APPLIANCES : [i] Taylor Frame : The surface of this frame is an aluminium or a plastic sheet with star shaped holes in straight rows. The holes are octagonal having eight angles. The lead pegs known as types are double-ended having a line on one side and two dots on the other. The pegs move in the holes clock-wise starting from position 6 of the clock. The rotating of these pegs with line side in the hole in different angle position denotes the digits starting from 1 to 8. Then the type is set up-ward down i.e. dotted side with rotating will denote 9, 0, +, -, x, ÷, ., =, signs.

100% MATCHING BLOCK 71/108

SA SED-14 Final.docx (D93662759)

This frame is suitable for teaching arithmetic to visually impaired

learners specifically in lower classes. There are Algebraic types also for doing Algebra from standard-VI. [ii] Abacus : A simple instrument for performing rapid arithmetical calculations. Abacus is an oblong frame having 13 to 15 vertically arranged rods called column on which beads slide up and down-Each column is separated by a bar technically known as centre bar.

86% MATCHING BLOCK 72/108

SA SED-14 Final.docx (D93662759)

The beam supporting the beads is marked with a raised bar between every third rod. The bars serve to indicate the decimal point and other units of decimal measure.

The abacus is to be held straight. The bottom portion of the centre bar contains 4 beads in each column and the upper portion of the centre bar contains one bead in each column. It is to be held in such a way that the 4 beads below the centre bar are at the bottom and the single bead above the centre bar is at the top. Each bead in the lower portion of the abacus denotes 1 unit and the bead above the centre bar denotes 5. Each column denotes the position of the number it represents. the extreme right column is the units column, the 2nd column from the right is the tens column, from the right 3rd is the hundred column, the 4th column from the right is the thousand column and soon and so forth. [iii] Counting Device : Wooden Board with holes. Aluminium round-headed pegs are set in the holes. It helps to learn counting and to develop pre-requisite skill of Taylor Frame by setting. The pegs in straight line and to place the pegs in the holes properly and swiftly. It is for use of the 1st learners.

257 [iv] Geo Board : Wooden Board with fixed pegs. Geometrical shapes are made and practiced with rubber bands. It is for use in upper classes. [v]

90% MATCHING BLOCK 73/108

SA SED-14 Final.docx (D93662759)

Talking Calculator : Audible calculator in synthesized speech useful for calculation, clock, alarm and calendar. Manufactured by casio and sharp companies, Japan. [

vi] Primary Mathematics Kit : Specially designed kit for the visually handicapped children to comprehend mathematics concepts. It contains ■ a plastic box; ■ slide strips, ■ number boards; ■ fractional strips; ■ braille clock; ■ geometrical shapes--geometrical figure tray; ■ magnetic board; ■ geometrical devices. [vii]

92% MATCHING BLOCK 74/108

SA SED-14 Final.docx (D93662759)

Spur Wheel : A serrated revolving wheel in a plated metal handle. It is used for making continuous embossed lines on the reverse side of the paper. [

viii]

84% MATCHING BLOCK 75/108

SA SED-14 Final.docx (D93662759)

Compass Set : It includes a foot ruler, a protractor and a set square in nylon and a spur wheel. It enables visually impaired students to use the same techniques as his sighted counter part. the foot ruler and set square have embossed markings for their convenience. The compass has a removable component fitted with a toothed wheel for drawing embossed dotted lines on the reverse of the braille paper. [ix] Geometry Mat : A rubber sheet for use as a base in conjunction with the spur wheel and braille paper for making geometrical drawings. [x] Opisometor : A bell rings each time the disc moves a distance of one meter. Useful for mapping and understanding mathematical problems in length and perimeter. [

xi] Some Other Mathematical Devices : • Counting Stand/Device • Graded Abacus

258 • Fraction Boards • Hundreds, Tens, Units Board • Geometric Shapes and Solids etc. C. GEOGRAPHY DEVICES : [i] Sensory Quill : It is an

86% MATCHING BLOCK 76/108

SA SED-14 Final.docx (D93662759)

equipment for obtaining a raised line format of any writing or drawing. The height and texture of the line can be altered. Useful in learning hand writing skills, mathematics, science, drawings & spellings. [ii] Raised Relief Plastic Maps : Vacuum formed plastic maps printed in strong colours with names in letter press for the benefit of person with low vision. The main towns are shown by large dots and principle rivers by depressions. Braille symbols denote the names of seas, main rivers and towns, a key to which is given in the guide. The boundaries on political maps are indicated by raised lines. [

iii] Geographical Features Model : Models of features of mountains, vallies, lands & rivers are there in vacuum plastic two diamenssion sheets & three dimenssions all in briht colour useful for both visually impaired and low vision person. [iv]

96% MATCHING BLOCK 77/108

SA SED-14 Final.docx (D93662759)

Relief Globes : A plastic globe in textured relief. The lans masses are shown in different colours. The principle towns are indicated by raised dots; rivers and lakes by depressions. Dotted lines indicate the tropics, arctic and antarctic circles, the international date-line and meridians. The names of oceans and the main land are shown in Braille. Nystrom's Bathymetric world model is raised relief map of the world with oceans drained. All under-water features are exposed. A cassette recording explaining the features is supplied with the product. [v] Braille Diagram Board : Metal sheet fixed on a board with closely formed holes in which round-headed pins are stuck to form maps and diagrams.

D.

82% MATCHING BLOCK 78/108

but not a means of support. The four sections, covered with ribbed plastic sleeving, are joined through the center by means of an elastic cord enclosed in nylon sleeving. It is fitted with an elastic loop handle and a standard nylon tip. (c) Long Canes : A wooden or aluminium stick of 85 to 90 centimeters. Three models are available—■ rigid ■ two pieces and ■ four pieces. 260 The aluminium cane is generally sleeved with PVC material, having a rubber grip and a nylon tip with or without a crook.

The nylon tip at the bottom touches the ground and generates very subtle sound to indicate difference of surface of the ground. the lower lastpart of each cane measuring is generally red, sometimes white. The cane day is observed in the name 'White Cane Day'. [ii]

Electronic Travel Appliances : An ETA is described as a device that sends out signals to sense the environment within a certain range or distance, processes the information received and furnishes. The person with relevant information about the environment. Most of these devices are based on integrated circuits and emit sound or tactile signals.

As

94% MATCHING BLOCK 90/108

SA SED-14 Final.docx (D93662759)

ETAs are not available and prevalent in India, it is not very necessary to give description of these devices. However for the sake of information,

some names

80% MATCHING BLOCK 91/108

SA SED-14 Final.docx (D93662759)

of these devices are noted here. • Lind say Russel E-model Path Sounder • C5 Laser Cane • Ultrasonic Torch • Sonic Guide • Light Probes • Mowat Sonar Sensor • Nottingham Obstacle Sensor • Electro Cortical Prostheisi • Electro Rofalm •

AF B's Computerzed Travel Aid. • Polaroid Ultrasonic Travel Aid. For details about ETAs, refer to NIVH publication "Selected Abstracts & Annotated Biography On Orientation and Mobility" [iii]

88% MATCHING BLOCK 92/108

SA SED-14 Final.docx (D93662759)

Mobility Show Cord : A plastic show card to help visually impaired persons to cross busy roads and to hail a taxi. [iv] Mini Beeper : A battery operated, hand-held electronic gadget having application in mobility, recreation, sports and obstacle location. 261

F. RECREATION GAMES & SPORTS : (a) Recreation : [i] Playing Cards : Superior quality standard playing cards with reverse embossing in standard Braille on the top left corner. [ii] Chess : A wooden board with the black squares raised and all the squares drilled in the centre for the reception of the pegged chessman. Holes are provided at each end for pieces not in play. The pieces are of uniform height, the white having a point with pin at the top to distinguish them from the black. [iii] Dominoes : Made of plastic and having raised black dots on a white back ground with black inset pieces on the reverse. These dominoes are ideal for players with low vision also. [iv] Brahma Puzzle : The puzzle consists of three pegs on a wooden base and eight discs of different diameter each with a hole in the centre. The purpose is to transfer all the discs from the peg to another without allowing any disc to be placed over a smaller one. [v] Audible Ball : Made of strong good quality plastic in which hole has been punched. Small metal ball bearings are inserted. The hole is sealed. These small balls are inserted for creating sound enabling the visually impaired children to locate the ball. An ordinary good quality ball of plastic of 5 cms. radius can be converted into an audible ball by drilling a hole, putting small size pebbles or ball-bearings and then sealing the hole using the soldering rod. The ball can be used for playing cricket. [vi] Draught Board : A wooden board with sunken playing squares. The colours of the men are distinguished by size. Pieces of double thickness are used as kings. A variety of other games as listed here under have also been adapted for the visually impaired. ■ Beziq maker; ■ Bridge scorer; ■ Lexicon; ■ Happy Family; ■ Whot; ■ Patience Board; ■ Chess Clock; ■ Jigsaw Puzzle; ■ Electronic Ball; ■ Beetle Game; ■ Centre-peg; ■ Scrabble; ■ Dice and Dice Cub; ■ Nine Men's Morris; ■ Tic- Tac-Toe; ■ Unilock Word Building Device; ■ Checkers Set; ■ Rattle Bells. Only chess, playing cards, Nine men's morris, Draught Board and checker set

262 and various puzzles are available in India. Other games are available from the Royal National Institute for the Blind, London. (b) Games & Sports : [i] Football, Basket Ball and Soccer Ball : These are equipped with a small electronic beeper which is battery powered and emits a compact sound. The beeper is held within a moulded cavity designed for easy access to 'on' & 'off' switch. [ii] Cricket : It is becoming very popular in India. The standard rules have been drawn. It can be played using the audible ball as mentioned earlier. [iii] Stilt Walking : The ordinary strong bamboo poles or wooden poles with foot rest at a height of 30 cms from the ground can be used for training the visually impaired in stilt walking. [iv] Swimming : It is also emerging to be a popular sport among visually impaired persons. The normal swimming pool with sound indicators on the sides and lane ropes with thermocol pieces can be used for training them in swimming. [v] Athletics : The normal tracks with some precautions and safety measures can be used for training the visually in race, shotput, Javelin Throw, Sack-race, musical chair, hit the target etc. In the present time the visually impaired runs in conjunction with the sighted runner as guide/navigator binding very loosely with a tether on their wrist. For one pair double track is used. [vi] Table Tennis : It has become a popular in-door game for the visually impaired in many south-east countries. The normal table tennis table with some modifications in the net and the sides can be used for the purpose. G. OTHER DEVICES : (a) Daily Living Devices : [i] Clocks & Watches : A standard alarm clock is adapted for the use of the visually impaired. It has strengthened hands and an open plastic dial having the hour positions indicated by two raised dots at the 3, 6, 9, 12 positions and single dots at the remaining hours. Manufacturer : HES Limited, Patel Estate Jogeshwari (west), Mumbai-400102

263 [ii] Travel Alarm Clock : This adapted clock as mentioned above is fitted into a case. The whole clock is packed into the case when folded. When opened, the case also serves as a stand for the clock. ALIMCO Alarm clock has time setting knobs. The dial is encased in a transparent plastic cover which can be easily removed from the top for obtaining access to the clock dial. The raised dots are provided for indicating hours with two dots for 3, 6 & 9 position, 3 dots for twelve hour position and signal dots at the remaining hour positions. [iii] Pocket Watch : A hunter watch, the hinged cover of which opens when the winding knob is depressed. Fitted with strengthened movements and dots as mentioned earlier. [iv] Ringer Timer : A one-hour ringer, in streamlined plastic case for timing any operation when an audible reminder is required. Each five minute period is indicated on the embossed setting dial by two dots and the first quarter hour is additionally marked to show the individual minutes. [v] Wrist Watch : It has the appearance of an ordinary wrist watch with the front cover being fitted with a transparent centre. The front can be lifted with a lever mechanism when the winding knob is depressed. The general arrangement for dial marking is two dots on the 3, 6, 9 & 12 positions, and a single dot at the intervening hours, but for the 12 O'clock position two or three dots according to the particular watch. Manufacturer : Hindustan Machine Tools Ltd... Watch Marketing Division 26/1, Leveel Road, Bangalore-560001 [vi] Talking Time : This is an electronic watch as well as alarm clock fitted with an electronic device which announces the time whenever the knob is pressed. It is possible to set time, date, day and alarm etc. All the settings are audible in signals, it is thus possible for a visually impaired persons to do the settings himself/ herself. The most popular brands are sony and sharp. In India, Sikkim tme corporation limited (SITCO), Sikkim has introduced talking wrist watch. The SITCO has established marketing divisions in all the major towns in India.

264 (b) Personal Devices : [i] Sound Beacon : This pocket size electronic device emits a sound which can be varied from a loud continuous whistle down to low intermittent beeps at various rates. It is generally used as a homing device. [ii] Notex : It consists of a rectangular base and flaps made of high-density polythene hinged together. It differentiates Indian currency notes of different denominations. It considers length and breadth of a currency note for its differentiation. Available from : NAB Louis Braille Memorial Research Centre Mumbai. [iii] Magnets : Round, square and u-shaped magnets for picking up pins, small nails and other iron or steel objects. [iv] Signature Guide : A template to guide the visually impaired persons in placing signature in proper place. [v] Address Template : Made of cardboard with four raised lines to guide a visually impaired person to write his/her address on Inland letters and envelopes. [vi] Light Probe : Full function light detector may be adjusted for desired sensitivity to light. [vii] Location Finder : Own house, apartment or office can easily be found out with portable, light weight location finder. A siren, attached outside location, will sound on pressing transmitter attached to a key chain. [viii] Other Personal Devices : The Americal Foundation for The Blind and Maxi Devices are supplying a variety of personal devices for the visually impaired persons as noted here under. These are so far not available in India. • Thermo voice : announces temperature • Talking Blood Pressure & Pulse Monitoring Kit • Becton Dickinson Magni Guide : for accepting barrille of insulin syringe • Insulin Needle Guide • Talking Blood Glucose Moniforing Kit • Big Print Address Book.

265 • Talking Wallet • Locklid Saucepan • Weight Talker • Key finder • Clothing Identifiers • Tactile Braille Signs • Eye-Ease Eyedrop Guide • Medicine Spoon For the present we will set aside a long list of vocational training, Home Management, kitchen etc equipments modified and developed for use by the visually impaired persons. 4.5.4.2 Low Vision Devices : There are two main types of Low Vision Devices : Optical Devices which use lenses to magnify objects Non-optical Devices and techniques which make objects easiler to use. (a) VTS Link : It is a portable large print computer and work station, specially designed to meet diverse needs of the visually impaired. It provides people with low vision with the most comprehensive solution to computer access available today. It features a custom-made high contrast flat display screen which present a sharp clear image of character up to 75 mm. (b) Visualtek : Closed circuit TV magnifying system magnifies upto 60 times the normal size with wide variation of light intensity and btch positive and negative images. (c) Schmidt Reader : It is also a close circuit TV and functions on the same principle as the visualtek. (d) Overhead Projector : It is supplied with screen, stand, lamp and transparency sheets with magnification facilities. (e) Magnifying Lenses : These lenses have many applications other than

266 reading; they make everything bigger & brighter. Following models of magnifier lenses are available. [i] Mounted Magnifying Lens : It has an extra large sized Fresnel lens as magnifier. It provides large visual field and leaves both hands free for manipulation of reading material or hand work. It is useful for quick scanning of large surfaces and objects. [ii] Flexible Arm Illuminated Magnifier : It has a large sized precision glass lens and a circular tube light mounted around the lens. The lens-light assembly is mounted on a spring balanced stand with feather touch movements and a reach of 900 mm, allowing the lens to be placed in any position and freeing both hands of the observer for work. It is an ideal aid for inspection, quality work in electronics, instrumentation and precision engineering industries, gems and jewellery, geology and hospitals. (Lense Product Catalogue) [iii] Magnifying Binoculars : It is handy in close work, both hands free. [iv] Book Magnifier : Having a large field it enables reading of printed material such as newspapers, paper back books, fine legal print etc. It magnifies one page at a time. [v] Illuminated Magnifier : Provides magnification along with illumination of the object. A range of models, including battery operated ones. Ideal for viewing maps, directories, botanical and geographical specimens when ambient light is not adequate. Useful for close work. [vi] Paper Weight Magnifier : It is a moulded plastic lens. Clear plastic allows light through to copy. [vii] Super Loupe : It is handy 2x magnifying lens hangs from neck cord and rests against chest, leaving hands free to do hand work. [viii] Eye Loupe : A favourite with watch makers and jewellery. Using precision acrylic lens the unit is very light and can be held comfortably in eye sockets. It is also available with adapter for use with spectacles. It can be put on and taken off easily. [ix] Head Loupe : Mounted on a comfortable handband, it can be flipped up when not in use. As both eyes are used this magnifier provides 3D vision enabling fine manual coordination. The lenses have built in prisms that eliminate squinting 267 and eyestrain. It can be worn over spectacles also. It is best suited for any kind of detail work where both hands are required to be free to attend to his/her work. [x] Flashlight Magnifier : Ivory light hood rests on printed material keeping focal distance steady. [xi] Fresner Wallet Magnifier : Slim, extremely light weight and visiting card size, it fits easily into pocket or purse. A ready at hand magnifier for reading fine print in dictionaries, menu cards, instructions on medicine bottles etc. [xii] Pocket Magnifier : A general purpose magnifier commonly used as an inspection tool and a reading aid. It is easy to hold and can be used to read a sign or a bus number. [xiii] Rayner Recumbent Spectacles : It has a single prism mounted on a study block plastic frame which requires little adjustment. [xiv] Super scan Reading Glasses : It can be worn over ordinary spectacles. [xv] Windsor Spherical Magnifiers : It is a range of hand-held magnifiers available in 50,76 and 102 mm lens diameter giving 3.0, 2.0, and 1.8 magnification. [xvi] Stand Magnifier : Handy table top magnifier, ideal for magnifying printed matter, films, art works, maps etc. Rests on work surface and leaves both hands free. The stand has side openings allowing illumination and easy accessibility of tools to the object being viewed. (Lense Product Catalogue). [xvii] Hand-held Magnifier : Commonly used general purpose magnifiers. They have precision lenses made of optic grade acrylic. The lenses are break-resistant and much lighter than equivalent glass lenses, hence more convenient to use. Manufacture : Lense Optics Pvt. Ltd. 66/2, D2, Mide Chinchwad Pune-411019 4.5.4.3. Modern High-Tech Appliances : The impact of modern technology, which is volatile and ever-changing, is yet to be experienced by a majority of the visually impaired in India. At times the changes are so rapid. That is really difficult to keep pace with them. High-tech 268 aids are now available-Though at a high cost, even exorbitant in certain cases. But these devices have significant impact on education and employment of the visually impaired. [i] Digital Tapes Recorder : Yeoksam-Dong, Kangnam-Ku, Seoul, Korea has developed Digital Tapeless Recorder (Check-back) for the blind. The blind people can use it alone without someone's help. It has a special voice prompt for the blind which includes a voice guide, easy research mode, volume adjustment and option for use of earphone. [ii]

Language Software : The Indian Institute of Technology (IIT) Chennai has developed Braille Software as well as language software which enables a visually impaired person to access computers for Braille as well as language outputs in all the Indian Languages.

The Vidya Vriksha Training Centre for the disabled, a Chennai 270 based NGO is imparting training to visually impaired persons in the use of software. It is also providing the software completely free of cost to the users and institutions. It has also developed a system of key board mapping and operations in Indian languages and instruction manual for use of the special version of the ITI multi lingual software. Computers provide a rich and diverse bearing in the lives of the visually impaired. No device in the journey of time can boast a better feat. Every day new devices are coming up. Let us Sum up : Education of children with disabilites requiries special equipments and TLM. Braille ruler, protector and special compass can enable a blind child to draw any diagram in geomety. Low vision children require magnification. In the case of blind child, Braille state/writing frame, Taylor/Arithmetic Board/Frame are essentials. Teachers–students having keen interest, tenacity and inquisitiveness can impart lessons to visually impaired learners with the objects easily available at hand using sas TLM. Sometimes they can also make low-cost or no-cost equipments by themselves for this purpose. 4.5.6 “Check Your Progress” : (i) Name the low-tech indispensable equipments to teach the children with visual impairment. (ii) Suggest how you can prepare TLM from locally available materials for teaching children with usual impairment. (iii) Briefly describe when and where to use particular types of equipments. • Activity :

Unit - 5 ppppp DeafBlindness 5.1 Definition, causes, classification, prevalence and characteristics of deaf-blindness

Structure 5.1.1 Definition of Deafblindness 5.1.2 Causes 5.1.3 Classification 5.1.4 Prevalence 5.1.5 Characteristics of

deafblindness 5.1.1 Definition of Deafblindness Deaf-blindness is a unique disability. It is

a condition in which a person may have a combination of

both hearing and vision impairments

of varying degrees, causing severe communication, developmental, and educational needs. Since 95% of the information is acquired through vision and hearing, restrictions in seeing and hearing means significant challenge in accessing information in a clear and consistent way. 5.1.2 Causes Deafblindness is not caused by a single medical condition. A child

can be born deafblind or a person may acquire deafblindness later in life. A child

born deafblind as a result of infection, genetic syndrome or birth

defect are termed as having congenital deafblindness or early onset deafblindness. Those who acquire deafblindness later in life as a result of trauma or accident, genetic syndrome, ageing or progressive infection are termed as having acquired

deafblindness. It is important to note that a genetic syndrome can result in deafblindness at birth or later in life. This

happens because genes might have an immediate effect on developing foetus or its effects may not be apparent until later in life.

Congenital or early onset deafblindness.

278 1. Infections as a cause | Historically one of the most common infectious causes was the Rubella virus commonly known as "German Measles". If the mother is infected with this virus during the first trimester of her pregnancy, the child becomes deafblind | TORCH syndrome (Toxoplasmosis, Other agents, Rubella, Cytomegalovirus, Herpes Simplex) 2. Genetic or chromosomal syndromes as cause | CHARGE syndrome | Down syndrome | Goldenhar syndrome 3. Congenital birth trauma or infection as a cause | Premature birth | Low birth weight | Asphyxia or stoppage of breathing due to obstruction in the air passage | Anoxia or lack of oxygen | Other trauma or birth injury | Trisomy 13: in case of three chromosomes in the 13 th pair, child develops deafblindness | Hydrocephaly | Microcephaly | Encephelitis-inflammation of the brain cells | Meningitis Acquired deafblindness 1. Genetic syndromes as a cause | Usher syndrome: Usually hearing loss is present from birth, and progressive visual impairment from late childhood to early adolescence or even adulthood. | Norrie Syndrome: born with blindness and later develop hearing impairment

279 2. Accidents or other trauma as a cause Accidents or some traumas such as stroke or cerebral haemorrhage can cause deafblindness in people due to injury to parts of the brain that deal with information processing tasks through sight and hearing. 3.

Ageing as a cause

After the age of 50 years, hearing and vision impairments become more common and prevalence of sensory impairment increases with age.

Other than these significant causes, malnutrition of the mother during pregnancy can cause premature birth or low birth weight. Infants who survive these conditions are more likely to have mental retardation, cerebral palsy, epilepsy and respiratory disease which may result in deafblindness, Maternal jaundice during pregnancy can also be vital for the developing foetus. High level of bilirubin can harm the developing brain of foetus affecting vision and hearing. 5.1.3 Classification Deafblindness is an umbrella term which is used for children and adult who may suffer from varying degrees of hearing and visual impairments. Total deafness with total blindness is rare. Thus, deafblind would include children and adult who are Totally blind with profound hearing loss Ø Totally blind with partial hearing loss Ø Partially sighted with profound hearing loss Ø Partially sighted with severe or partial hearing loss. Another grouping: Ø Congenitally deafblind Ø Congenitally blind and later acquire deafness Ø Congenitally deaf and later acquire blindness Ø Acquired deafblindness, meaning people born with hearing and vision, but later lose both senses to varying degrees. The losses may occur at different times.

280 5.1.4 Prevalence Of the total world population, 0.02% people are deafblind. It is estimated that, in India, there are about 450000 deafblind people children and adults. 5.1.5 Characteristics of deafblindness It is commonly estimated that 95% of the information are gathered from vision and hearing. Individuals who have a hearing or vision loss cannot access the same amount of information without accommodation for their sensory loss. Depending on the age of onset, the characteristic features of deafblind individuals vary from one another, thereby giving them unique characteristics. Wide ranging characteristics are observed among diverse group of people with deafblindness. Ø Lack the ability to communicate in a meaningful way Ø Have a distorted perception of the world Ø Deprived of the information necessary to anticipate future events or the results of his close one's actions Ø Deprived of many of the most basic motivations Ø Have medical problems that lead to serious developmental lags Ø Mislabeled as developmentally disabled or emotionally disturbed Ø Forced to develop unique learning styles to compensate for the sensory impairments Ø Have extreme difficulty in establishing and maintaining interpersonal relationships

281 5.2 Effects and Implications of deafblindness on activities of daily living and education Structure 5.2.1 Effects of deafblindness 5.2.2 Implications of deafblindness on a person 5.2.1 Effects of deafblindness People who are deafblind experience difficulties in: •••• Finding out information This does not only mean restrictions in accessing information through newspaper, books, radio or TV channels, but also missing the experience of seeing the face/hearing the voice of an unfamiliar person, the shape of any object larger than the size of the hand to hold, any object beyond one's reach. Therefore, life experience is severely reduced to build up a store of world knowledge. Without that knowledge what is there to communicate about? | Communicating with others This is perhaps the most obvious challenge to a person who is deafblind. Each person has individual communication needs and ways of communication. Some use simple gestures, facial expressions or movements of the body. Very few people understand these communications of a person who is deafblind. It becomes difficult for him also to understand other's communication and learn to communicate. | Moving around the environment The person who is deafblind cannot compensate for vision with hearing, or for hearing with vision. This person is cut off from the world into a world of "invisible silence". Due to constrained information through sensory system, they cannot interpret whatever information they have received, and prefers to remain in a secured position.

282 5.2.2 Implications of deafblindness on a person Ø Vision Loss of or restrictions in vision may have different implications on persons with deafblindness. These may be: •••• loss of visual acuity meaning difficulty in seeing objects accurately •••• loss of visual field meaning limited field of vision •••• difficulty in moving eyes when fixating, scanning or tracking objects with eyes •••• reduced contrast sensitivity meaning difficulty in seeing the relative difference between the lightness and darkness of objects •••• processing problems meaning difficulty in making sense out of what she/he is seeing | difficulty in seeing parts of the image or complete picture together | squint or Strabismus meaning eyes do not work together | oculomotor problems meaning difficulty in coordinated movements of the eyes to focus or fixate | Nystagmus meaning involuntary movement of eyeballs. Due to this child fails to see and understand the object clearly. Ø Hearing We interpret our environment by hearing different information that comes our way and we develop concepts on our own without being taught by others. But, for a child with deafblindness, these inputs are missing; the use of functional hearing also gets restricted due to lack of interveners. | Sometimes, a child with deafblindness responds to a particular sound and not to other sounds. | A child with deafblindness may face problems related to balance due to the structural impairment in the ear.

283 Ø Motor and mobility

Children use their vision and hearing to gather information about their surroundings, to understand

their own bodies and their own capabilities of movement. The sight of toys or people and the sounds of voices or objects encourage them to move and discover.

Children with deafblindness do not experience this due to loss of or restricted vision and hearing. Sometimes, severe medical problems are associated leading to developmental delays affecting motor and mobility. As a result, they face difficulty in independent exploration which restricts the ability to get a control over the environment. Conceptual development and experience of space and direction remains severely restricted and/or totally absent. Ø Behaviour A person with deafblindness may acquire behavioural patterns that may not be well understood to others in the society. Some of these are: •••• Self-stimulatory behaviours such as eye poking, body rocking, etc. •••• May have incorrect manner of eating food •••• May have unusual sleep patterns •••• May have variety of behaviour patterns to express needs and emotions Ø Socialisation skill A person with deafblindness has very limited scope of reaching out to others to share his/her needs, events and entertainment. •••• They face extreme difficulty in establishing and maintaining interpersonal relationships with others. As they have different ways of communication, they face difficulty in initiating and understanding conversations. •••• Due to communication problem, they remain isolated. •••• Their isolation also leads to social deprivation Accessing information, communicating with others and moving around the environment are central to daily living and learning. All three of these depend on each other. Thus, people who are deafblind experience difficulties in their daily living and learning.

284 Ø Implications of deafblindness on education Educationally, children with deafblindness are isolated because impairments of sight and hearing require attentive and unique educational approaches in order to ensure that children with this disability can have the opportunity to reach their full potential. If a child with deafblindness has some usable vision/hearing, as many do, his/her world will be enlarged. Many of them have enough vision to move about, recognise familiar people, see sign language at close distance” and read large print. Others have sufficient hearing to recognise familiar sounds, understand some speech, or develop speech themselves. As deafblind children get fragmented and distorted information from their contact with people and environment, it is important to provide access to opportunities that helps in incidental learning as sighted/hearing children do have. In other words, deafblind children will need to experience activities in real life settings as they are occurring naturally in the environment around them. They will learn best by doing things together by using his tactile, olfactory, kinaesthetic and proprioceptive senses along with whatever residual vision and hearing they might be having. They must be involved in full sequence of the activity. To reduce the impact of dual sensory loss, it is important to develop routines in the life of the deafblind child.

285 5.3 Screening, Assessment, Identification and Interventional Strategies of Deafblindness Structure 5.3.1 Screening and Identification 5.3.2 Assessment 5.3.3 Instructional strategies 5.3.1 Screening and Identification Screening is a service in which people, who do not perceive that they are at risk of, or are already affected by a disease, are asked a question or offered a test, for early identification. The aim of screening is to identify the number of people affected from suspected eye or ear problems. It reduces the risk of developing further complications through early identification; at the same time, it is not a guarantee of prevention, or of diagnosis and cure. lllll Why screening? Because deafblind people remains invisible and hidden from everyone, and are often misdiagnosed as mentally challenged or hearing impaired with vision problem, screening helps in identifying the number of population with these dual sensory impairments. lllll Possible outcomes of Screening Process i) No problems are observed. The child is screened again at the next recommended age. ii) One or more of the high risk conditions have been identified, but there are no observable problems with visual or hearing performance. Parents should be informed of high risk indicators of visual/hearing problems; how to observe visual/hearing performance and/or resources to contact, if vision/ hearing problems are observed at a later date. iii) A prompt referral to an eye care or ear specialist should be made if: a) the child has an observable eye condition such as excessive tearing, redness, eye deviation or misalignment, nystagmus, drooping eyelids, cloudiness of the 286 cornea or pupil, etc. or the child suffers from frequent discharge from ear, does not respond to sounds, etc. b) the child has observable difficulty with one or more behavioural items. 5.3.2 Assessment Functional Assessment is a process using observation, screening test, and test analysis to determine an individual’s strength and weaknesses in order to plan educational services. It should be set in the context of the clinical information including aetiology, visual acuity and hearing thresholds, and the assessor should integrate the whole information to provide a commentary of the child’s needs and provide useful recommendations about strategies to meet them. A proper assessment requires family participation and a trans- disciplinary team. Purpose of assessment: Assessment is the first step that is taken by an educator/therapist to develop a holistic programme for the child. This includes child’s environment, communication, functional abilities of vision and hearing, cognitive abilities, physical difficulties, socialisation skills, child’s likes and dislikes and strengths, and where development is required. It must include an evaluation of the child’s communication, cognitive, and adaptive and everyday functioning including behavioural concerns. Assessment is not done once for the child; it is periodic, depending on the condition of the child. Components of assessment: The assessment format must contain questions relating to child’s social and communication domain, sensory/motor domain, functional vision domain, and functional hearing domain. Tools for assessment are: l Learning through doing: This tool was developed by National Institute for the Visually Handicapped (NIVH) and Blind Peoples association, Ahmedabad in 2002. It is an assessment tool as well as a programme manual. l Screening checklist for sensory impairment developed by National Institute for the Mentally Handicapped (NIMH) l Callier-Azusa Scale is a developmental scale specially designed to aid in the assessment of deafblind children. This is composed of 18 sub-scales in five

287 areas. These are motor development, perceptual development, daily living skills, cognition, communication and language, and social development. Functional assessment for vision and hearing problem in children developed by Sense International (India). Now this format is used for assessment in camps and community, and in special schools. 5.3.3 Instructional strategies Instructional strategies for children with deafblindness mean intervention into their world of "invisible silence". The strategies to be taken are: Creation of effective environment, that helps in acquiring maximum learning, is the prime thing that an educator needs to act upon in a systematic way. Adaptations to the physical environment, e.g. arrangement of the room, lighting, noise level, location of materials and resources, accessibility to other rooms, etc. are all considerations for environmental modifications. Adaptations in the class programme include

- Ø Allowing more time for the task
- Ø Pacing the lesson differently
- Ø Ensuring a variety of ways of processing information
- Ø Setting up structures that enable achieving smaller steps to the goal
- Ø Checking more frequently than usual for understanding
- Ø Giving more frequent feedback
- Ø Simplifying questions/instructions

Modifications to resources and materials Materials have to be adapted to allow them to access the information or demonstrate their understanding. This can be done by simplifying resources and materials, using different materials, enlarging print, using Braille prints, provision of support personnel. Despite the adaptations and modifications, some children or adults need higher levels of assistance from the educator/caregiver.

288 Components of Teaching Strategies

1. Stability : It refers to the orderly approaches that would help the child to predict about the environment. Structured environment supports structured learning. It helps in building confidence in the world of the child.
2. Routine to create stability: Routines allow the child to experiment with more confidence in a predictable situation Teaching curriculum is embedded around routine activities.
3. Role of Motivation: Activity has to be planned in a way to motivate the child to act and enjoy with the educator. Think of rewarding to maintain the enthusiasm in the child.
4. Small Steps (task analysis) in implementing the goal: Before introducing the whole activity to the child, it should be spread into small steps. Short steps achieved builds confidence in the child, and s/he loves to learn the next steps.
5. Pace of learning: It refers to the time required and taken by the child in learning any task. Based on the individual needs, each child has his/her own learning pace.
6. Repetitions of the task: Children with deafblindness may need more repetitions of an activity due to restricted or limited input from the senses.
7. Presentation of the task: The task has to be designed in such a way that it is of maximum use. The Teaching Learning Material (TLM), selected on the basis of the needs as well as the strengths/limitations of the child, should be easily seen, heard or explored tactually.
8. Prompts: Prompts are cues/indications given to the child to perform the task. It requires high level of prompting at the initial stage, and reduced gradually.
9. Working hand over hand: Before working hand over hand, rapport with the child has to be built so that the child must feel secured. The educator generally places his/her hand over the child's hands gently to show him/her to perform a task.

289 5.4

Fostering Early Communication Development : Methods, assistive devices and practices including AAC

Structure 5.4.1 Fostering Early Communication Development 5.4.2 Modes of communication 5.4.3 Using assistive devices and practices including AAC

5.4.1 Fostering Early Communication Development Communication is the process of transmitting thoughts, ideas, information and messages from one person to another. For children who have vision and hearing problems, communication may be somewhat different. There are a variety of ways through which deafblind children communicate in early years. These are:

- l Facial expression
- l Vocalisation such as crying, cooing and babbling
- l Change in muscle tone
- l Touching and manipulating others
- l Body movements
- l Assuming positions
- l Pointing
- l Natural gestures
- l Behaving aggressively (biting, pinching, throwing things etc.)

For communication three things are required:

- l Someone to communicate with
- l Something to communicate about
- l A means of communication

290 It is therefore a two way process: receptive and expressive. It is crucial for the child to gain meaning from experience, learn to anticipate and predict, and learn to control the learning environment. Receptive communication is the process of receiving and understanding the message. It is often difficult to determine how a child with deafblindness receives messages and responds to the communication of his/her family members. Expressive communication means sending message to another person for any need or responding to the message already received. There are certain strategies to foster early communication development. These are

- l Good lighting with the light coming from behind
- l Create a good listening environment
- l Use of hearing aid/s
- l Sometimes song helps the child to anticipate or cooperate
- l Enhance sensory information
- l Use of scented materials to identify places/activities/persons
- l Provide consistency
- l Routine activity recommended
- l Use "Calendar Box" to denote "beginning of activity" and "finish of activity"
- l Different types of cues and objects are used in fostering receptive and expressive communication.
- l Touch Cue: Cue is given by touching child's body part related to the activity or action; e.g. touching lips for feeding; waist for nappy change
- l Movement Cue: Moving body part that relates to an activity; e.g. moving hand to mouth for eating; moving two hands for clapping for recreational play
- l Contextual Cues: Cues given or taken by the child during an activity or in a situation; smell of cooking food from kitchen, tactile feeling of grass in the garden, taste of sour while licking pickle, etc. Cues are helpful in developing anticipation and understanding associations, the most vital aspect for developing communication skills. However, certain things to be kept in mind while using cues with the children. These are:

291

- l Cues must be used same way each time by every person working with the child.
- l Cues must precede a relevant activity for the child.
- l Cues have to be different from one another so that the child gradually understands the differences and later on discriminate and relate to particular activity.
- l When a child develops understanding and responding to cues, educators may move to next level of receptive communication through object cues. Objects are chosen for daily activities that are presented to the child as cues for activities. For example, spoon for eating, soap for bath, ball for play, cane for outing, etc.

5.4.2 Modes of communication Children with deafblindness use different modes to communicate. These are :

- l Sign Language In visual signing, signs are made in front of the person. Tactile signing involves signing with the receiver's hand resting lightly on the signer's hand. This mode is suitable for people who have very little vision or no vision at all.
- l Print on palm This mode is used where block capital letters are drawn on the palm of the deafblind person's hand, one after the other.
- l Tadoma Tadoma is tactile lip reading. The person reading the speech places his/her thumb on the speaker's lips and his/her fingers along the jaw line, touching the speaker's cheek and throat. From this s/he is able to pick up the vibrations of speech as well as the lip patterns.
- l Braille Braille is a system of touch reading and writing in which raised dots represent the letters of the alphabet. Both hands are usually involved in the reading process and reading is generally done with the index fingers from left to right along each line.
- l Gestures Gestures or non-verbal communication and body language communicate as effectively

292 as words and may be even more effective. Some deafblind children express their needs through vocalisations (crying/cooing/babbling).

- l Symbols Communicating with the help of symbols is called symbolic communication. Spoken and written languages are examples of abstract symbols and real objects are examples of concrete symbols.
- l Cues A cue is a prompt that is individualised for each deafblind child and is used to encourage a specific behaviour. It is dependent on specific activity or context. For example, tapping a child on chin may be a prompt for "open up mouth" for food. Cues are of different types, e.g. touch, movement, contextual cues, and object cues. Gestures and cues are anticipators to let a deafblind child know what is about to happen.

5.4.3 Using assistive devices and practices including AAC Augmentative and alternative communication (AAC) means methods of communication which can be used to add to the more usual methods of communication including speech and writing when impaired. AAC includes unaided systems such as signing and gesture, as well as aided techniques ranging from picture charts to the most sophisticated computer technology currently available. AAC strategies assist persons with deafblindness with severe communication disabilities to participate more fully In their social roles including interpersonal interaction, learning, education, community activities, employment, recreation, home management and so on. AAC is just the means to develop the abilities to communicate when, where and what is desired. AAC includes unaided and aided methods.

- l Unaided communication: This method does not involve a piece of additional equipment. Body language, gestures, pointing, eye pointing, facial expressions, vocalisations and sign language.
- l Aided communication: This method involv~additional equipment, e.g. picture chart, a computer. Adults with deafblindness use the Power Braille attached to the computer.

293 5.5 Addressing orientation, mobility and educational needs of students with deafblindness Structure 5.5.1 Problems of Orientation and Mobility for persons with deafblindness and strategies to develop mobility 5.6 Let us Sum Up 5.7 “Check your Progress ” 5.5.1 Problems of Orientation and Mobility for persons with deafblindness and strategies to develop mobility A child with deafblindness has very limited access to learn skills of Orientation and Mobility. This restricts the child’s motivation to explore, initiate interaction or participate in activities. As a result child becomes dependent on others and becomes passive or engages himself in less meaningful activities. What is Orientation and Mobility?

Orientation is the ability to locate oneself in one’s environment.

In absence or significant loss of vision and hearing of a person with deafblindness, orientation requires a skill that is related to using the residual vision and remaining hearing with the sense of touch and smell to establish position in, and in relation to significant objects in the environment.

Mobility is defined as action of travelling, going from one place to another, safely and freely. To be mobile, a person with deafblindness should be able to gather and use sufficient information from the environment to avoid hazards, and to reach the destination safely. Orientation and mobility training is important for every child with deafblindness, The goals of orientation and mobility are | Enhancement of the sense of orientation | Development of means of supporting the child to move about and explore the environment freely and safely

294 | Development of prerequisites for integration of the child into the community | Development of sense of independence Focus of Orientation and Mobility training The training must include | Sensory awareness: Gaining information about the environment through smell, touch, movement, and using partial hearing and/or vision | Spatial concepts: Realising that objects exist even if not heard or felt, and understanding the relationships that exist between objects in the environment | Searching skills: Locating items or places efficiently. | Independent movements: Such as crawling, rolling, walking and so on. | Sighted Guide: Using another person to aid in travel | Protective techniques: Specific skills which provide added protection in unfamiliar areas. | Cane skills: Use of various cane techniques to clear one’s path or to locate objects along the way. Sensory Training Sensory stimuli are environmental clues that enable the child with deafblindness to determine position or direction in respect with other objects in the environment. Systematic instruction is needed to develop the other senses for use in travel and finding things in the environment. While providing sensory training, it is of utmost importance to use the fact sheet prepared for the child after functional assessment of vision, hearing and motor control. | Touch: The children with deafblindness need to learn the use of their hands and feet to explore the environment, to understand spatial relationship, about texture, temperature and weight. Hands give the idea of diversity of objects, while feet provides idea of position, pathways, changes in ground surface, slope and so on. Often the children with deafblindness are found to be tactually defensive; they should be trained to gain information through their whole body, and be able to use that information through auditory, visual and olfactory senses to determine their current location. For example, developing the tactual sense will help the child in finding a toy he dropped on the floor.

295 | Smell: Smell is useful for orientation both indoor and outdoor. Many physical locations can be easily identified through smell: bakery, tea/coffee stall, gas station. Therefore, smell can be a very good clue for directions. A particular place can also be used as landmark. The children with deafblindness should be exposed to a variety of fragrances; but not all at one time; the educator must link a fragrance with any meaningful activity. For example, familiarising the smell of lemon and then the activities of lemon cutting, squeezing and making juice. Use of smell can be used for a wash by using a particular soap. | Residual vision: teaching the child with deafblindness to use his residual vision is important and beneficial for his independent daily living. Use the functional vision assessment sheet for activity plan. | Awareness of body parts: Knowing the names of body parts and their functions develop mobility skill. Because of absence of incidental learning, the child is shaky in movement. Therefore, slowly the fundamental concepts of body awareness, spatial relationship, different tactual feelings relating to objects and surface, smells of objects and the environment have to be provided. Then the educator can initiate assisted movement with a goal. This would build confidence in the child and s/he would develop enjoyment while moving around. | Once a child with deafblindness learns to walk independently, there are a number of techniques to be taught to the child. This includes Ø Protective techniques help a person to be safe. The upper arm techniques protects the upper body around the chest and head. It can be used from open door, sharp wall curves, cupboards, hanging objects, tree branches and so on. The lower arm technique protects the lower part of the body near waist level. In both these techniques, hands are used like a bumper. Ø Trailing technique is used to trail wall or other similar furniture or object. Extend arm that is closer to the wall or object. It helps a person to walk straight, and to detect landmark or find doorways. One gets useful tactual information by trailing. Ø In Sighted guide technique, person with deafblindness holds the arm of the guide just above the elbow and maintains the position one step behind the guide. The sighted guide must know the how to guide a person while moving.

296 Ø Cane technique is taught when a child with deafblindness of school age, can walk and maintain balance. Cane should always be in line with middle of the body and in front of the traveller. The cane is moved from side to side by flexion and extension of wrist with tip touching the ground in each movement. The arm should not move. The aim of training children with deafblindness in orientation and mobility is to create positive experiences of movements, and instill the confidence of moving and travelling independently. 5.6

Let us Sum up

| Deafblindness is a unique disability with a combination of vision and hearing impairment of varying degrees affecting mobility and communication. | Causes of Deafblindness include congenital and acquired factors. | After screening and identification, functional assessment of the sensory abilities of the persons with deafblindness by a trans-disciplinary team, educator can adopt instructional strategies. | Among all the challenges faced by the persons with deafblindness, communication is the most significant. Systematic training helps in developing communication for the persons with deafblindness. | For orientation and mobility, self awareness and sensory training gives the understanding of self in the environment. Techniques of mobility gives confidence in independent movement. 5.7 "Check your Progress" Essay type questions 1. How would you define deafblindness? Discuss the implications of deafblindness in a person. 2. What are the causes of deafblindness? 3. What is assessment? Why is important? Discuss the tools of assessment.

297 4. Describe the need for functional assessment. What would be the strategies of instruction for a child with deafblindness? 5. Explain different modes of communication used by the persons with deafblindness. What are the strategies to enhance communication? 6. What is Orientation and Mobility? Explain the strategies for teaching orientation and mobility to a person with deafblindness 7. Explain the different categories of persons with deafblindness. Short questions 1. What are the characteristic features of deafblindness? 2. What are the major causes for deafblindness? 3. What may be the possible outcomes of screening? 4. How will you teach orientation and mobility to a student with deafblindness? 5. Discuss the modes of communication used by the persons with deafblindness. 6. Discuss the role of assistive devices and AAC for persons with deafblindness. 7. What are the protective techniques for safe and independent mobility of a person with deafblindness? Objective questions 1. Find out the true answer: i) Congenital Rubella Syndrome means infection of the baby after birth/ mother during pregnancy/family gene. (mother during pregnancy) ii) Persons with deafblindness depend mostly on ... residual vision/ hearing/ touch (touch) iii) Socialisation skill can be imparted through individual training/play therapy/ gardening. (play therapy) iv) For early intervention of a child with deafblindness, caregiver has to observe the child's behaviour/gesture/total communication. (Total communication) v) Before early intervention programme, functional assessment of hearing & vision/neck control/toilet control are necessary. (Hearing & Vision)

298 2. Find out True or False (

Tick in the appropriate answer) i)

Meningitis may damage brain leading to hearing and vision impairment. (True/False)

ii) ep children never have vision or hearing problems. (False/False) iii) Deafblind persons communicate through gesture and sign. (True/False)

iv) A child with deafblindness requires 1:1 training for future mainstreaming. (True/False) v) Dual sensory loss detaches a person from environment and community, both. (True/False)

Answer of the objective Question No. 2 (i) T, (ii) F, (iii) T, (iv) T, (v) T.

<p>The term "hearing handicap" refers to the effect of the hearing impairment on the person's everyday situations and the disadvantages imposed by the impairment sufficient enough to affect one's personal efficiency in the activities of daily living. Thus in other words, the influence of the hearing impairment is the hearing handicap. According to the definition adopted by Ministry of Social Justice and Empowerment, Govt. of India and Persons with Disability Act (P.W.D.-1995-96), "hearing handicap" refers to hearing loss of 60dB HL or more on the better ear. 1.4.5</p> <p>SA 8 UNIT-I (FUNDAMENTALS OF HEARING).docx (D162037136)</p>

3 Netaji Subhas Open University From the Vice-Chancellor's Desk Dear Students, from this Academic Session (2015-17) the Curriculum and Course Structure of B. Ed.- Special Education have been thoroughly revised as per the stipulations which featured in the Memorandum of Understanding (MoU) between the Rehabilitation Council of India (RCI) and the National Council for Teacher Education (NCTE). The newly designed course structure and syllabus is comprehensive and futuristic has, therefore, been contextualized and adopted by NSOU from the present academic session, following the directives of the aforesaid national statutory authorities. Consequent upon the introduction of new syllabus the revision of Self Instructional Material (SIM) becomes imperative. The new syllabus was circulated by RCI for introduction in the month of June, 2015 while the new session begins in the month of July. So the difficulties of preparing the SIMs within such a short time can easily be understood. However, the School of Education of NSOU took up the challenge and put the best minds together in preparing SIM without compromising the standard and quality of such an academic package. It required many rigorous steps before printing and circulation of the entire academic package to our dear learners. Every intervening step was meticulously and methodically followed for ensuring quality in such a time bound manner. The SIMs are prepared by eminent subject experts and edited by the senior members of the faculty specializing in the discipline concerned. Printing of the SIMs has been done with utmost care and attention. Students are the primary beneficiaries of these materials so developed. Therefore, you must go through the contents seriously and take your queries, if any, to the Counselors during Personal Contact Programs (PCPs) for clarifications. In comparison to F2F mode, the onus is on the learners in the ODL mode. So please change your mind accordingly and shrug off your old mindset of teacher dependence and spoon feeding habits immediately.

4 I would further urge you to go for other Open Educational Resources (OERs) - available on websites, for better understanding and gaining comprehensive mastery over the subject. From this year NSOU is also providing ICT enabled support services to the students enrolled under this University. So, in addition to the printed SIMs, the e-contents are also provided to the students to facilitate the usage and ensure more flexibility at the user end. The other ICT based support systems will be there for the benefit of the learners. So please make the most of it and do your best in the examinations. However, any suggestion or constructive criticism regarding the SIMs and its improvement is welcome. I must acknowledge the contribution of all the content writers, editors and background minds at the SoE, NSOU for their respective efforts, expertise and hard work in producing the SIMs within a very short time. Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor, NSOU

Introduction to Neuro Developmental

Distibilities (B 8) Unit-1 Learning Disabilities, Needs and Intervention Structure : 1.1. Introduction – Definition, types and characteristic 1.1.1 Objective 1.1.2 Definitions 1.1.3 Types and characteristic 1.1 Introduction Now we often here a term Learning Disability. It is a different problem in education. We cannot identify such a children with that particular disability by his or her external behaviour. We have already meet with such types of children in our educational field. Some children cannot achieve the target in the class due to their learning disability.

History suggest that the term learning disabilities originated with and became popularized by Dr. Samuel Kirk based on his writings in the early 1960s and comments that were made at the April 6, 1963 Conference on Exploration into Problems of the Perceptually Handicapped Child. His proposed label was "enthusiastically received and helped to unite the participants into an organization known as the Association for Children with Learning Disabilities, the forerunner of today's Learning Disabilities Association" (Learner, 2000). I have used the term "learning disabilities" to describe "

a group of children who have disorders in development in language, speech, reading, and associated communication skills needed for social interaction.

In this group I do not include children who have sensory handicaps such as blindness or deafness, because we have methods of managing and training the deaf and the blind. I also exclude from this group children who have generalized mental retardation, (Kirk, 1963, p.2) During the latter part of the 1960s, there became greater awareness about 10 learning disabilities, both from the general public and Congress. In response, the U.S. Office of Education was charged with creating a federal definition for what constitute a learning disability. Samuel Krik chaired this committe. In 1986, the first annual report of the National Advisory Committe on Handicaped Children, headed by Dr. Kirk, worte : Children with special learning disabiltilities

exhibit

a disorder

in one

or more of the

basic, psychological processess involved in understanding or in using spoken or written

languages. These

may be manifested in disorders of listening, thinking, talking, reading, writing, spelling, or arithmetic. They include conditions which have been referred to

as perceptual handicaps, brain injury, minimal brain dysfunction, dyslexia, developmental aphasia, etc.

They do not include

learning

problems

which

are

due primarily

to visual hearing, or motor

handicaps, to mental retardation, emotional disturbance, or

to environmental

disadvantage. (

Special Education for Handicapped Children, 1968) By the end of 1968, "specific learning disability" (abbreviated SLD or LD) became a federally designated category of special education (U.S. Office of Education, 1968) and in 1969, the

Specific Learning Disabilities Act was enacted, Public Law 91-230. In 1975, Congress enacted P.L. 94-142, the Education for All Handicapped Children's Act. Here, the defination of a learning disability was formalized for children in special

education. Under P.L. 94-142,

a specific learning disability was defined as follow. "...

a disorder

in one

or more of the

basic

psychological processes involved in understanding or

in using

language, spoken or written,

that

may
manifest itself in
an
imperfect ability to listen, think,
speak, read, write, spell, or
do
mathematical calculations,
including conditions such as perceptual
disabilities,
brain injury, minimal brain dysfunction, dyslexia, and developmental aphasia."

However,
learning
disabilities do
not include
learning problems that are primarily the result of visual, hearing or
motor
disabilities,
of
mental retardation,
of emotional disturbance, or of environmental, cultural or economic,
disadvantage.

The
continuance of
the P.L. 94-142 definition in federal law prompted further analysis. In the 1980s, a coalition of parent and professional
organizations, described as the National Joint Committee on Learning Disabilities (NJCLD), criticized the definition under
P.L. 94-142 for including concepts that were unclear or difficult to use identify children with learning disabilities. In
response to the criticisms, the NJCLD proposed an alternative definition.

11
Learning
disabilities is a general term that refers
to
a heterogeneous group of disorders manifested by significant difficulties in the acquisition and use of listening, speaking,
reading, writing, reasoning,
or
mathematical abilities.

These disorders are intrinsic to the individual
and
presumed
to be
due to central nervous system dysfunction,
and may occur across the
lifespan.

Problems in
self-regulatory behaviours, social perception, and social interaction may exist with learning disabilities but do not by
themselves constitute a learning disability.

Although learning disabilities may occur concomitantly with other
handicapping conditions
or with extrinsic influences, they are not the direct result of those conditions or influences (NJCLD, 1994). Today, children in special education are protected under Public Law 108-446, The individuals with
Disabilities Education Improvement Act (IDEA 2004). The definition under IDEA has not changed in its criteria and
guidelines for what constitutes a learning disability. Under current federal law the following language was established.

The term "specific learning disability" means a disorder in 1 or more of the basic psychological processes involved in understanding or in using language, spoken or written, which disorder may manifest itself in the imperfect ability to listen, think, speak, read, write, spell, or do mathematical calculations.

We are more conscious about this problem. Many educationist and psychologist have emphasized on learning disability. As we are in 21 st century we can confirm the education of all types of children. In this unit you are going to study about the definitions, types and characteristics, tools and areas of management of learning disability. Definition, Types and Characteristic :

As should be evident, the debate surrounding what constitutes a learning disability continues on a

strong as ever. Remember, this is a multidisciplinary field that embraces sometimes competing viewpoints as the very nature of the construct and its causes. It is perhaps best to envision LD as "a family or syndrome of disabilities affecting a wide range of academic and/or behavioural performance (Gargiulo, 2004, p. 206). In particular, regardless of the definition used, children with learning disabilities have intellectual functioning within the normal range, there is a 12 discrepancy between potential and achievement, the learning disability is not due to other causes, there is difficulty in learning, and there is a presumption of central nervous system dysfunction. 1.1.1.

Objectives Upon completion of these subunits, you

will be able to : Define Learning Disability Describe the types of Learning Disability Explain the characteristics of Learning Disability. 1.1.2.

Definitions Learning Disability is an important meaningful word. The person who has learning disability may have rigid personality, cognitive ability and development characteristic also. The perceptual problem and lack of communication skill are only seen in this kind of disability. This kind of disability is not seen externally as such as other disabilities. So this type of disability is called Hidden Disorder (Anderson 1970). Therefore we can say that if a child cannot adjust with his curriculum due to other disabilities we can't say that the child is with learning disability. Because it is a different type of disability and a child cannot able to learn properly due to other causes of disability. But if a child has the particular cause of learning disability the child categorized as the learning disabled. Dr. Kirk (1963) said in a conference at Chicago – "

A learning disability refers

to retardation disorder, or delayed development in one or more of the processes of speech, language, reading, writing, arithmetic,

or other school subject resulting from a psychological handicap caused by a possible cerebral dysfunction and/or emotional or behavioural disturbances.

It is not the result of mental retardation, sensory deprivation, or cultural and Instructional factors.

Kirk

also said that LD refer to a retardation, disorder of delayed development in one are more of the processes of special language, reading, spelling, written or arithmetic resulting from a possible cerebral dysfunction and emotional or behavioural disturbance. U.S. Office of Education 1977 definition. By the early 1970s NACHC definition of 1968 had become the most popular one among state departments of education 13 (Mercer, Forgnone, & Wolking, 1976). This no doubt figured into the USOE's virtual adoption of the NACHC definition for use in the implementation of P.L. 94-142 :

The term "specific learning disability" means a disorder in one or more of the psychological processes involved in understanding or in using language, spoken or written, which may manifest itself in an imperfect ability to listen, speak, read, write, spell, or to do mathematical calculations.

The term includes such conditions as perceptual handicaps, brain injury, minimal brain dysfunction, dyslexia and developmental aphasia. The term does not include children who have learning disabilities which are primarily the result of visual, hearing, or motor handicaps, or mental retardation, or emotional disturbance, or of environmental, cultural, or economic disadvantage. (

USOE, 1977, p. 65083). Early during this period, several new and revised definitions surfaced : the ACLD (now the LDA) definition of 1986, the Interagency Committee on Learning Disabilities (ICLD) definition of 1987, and the NJCLD revised definition of 1988. In the meantime, the definition in federal law covering learning disabilities remained virtually unchanged. ACLD / LDA definition (1986). The LDA definition is distinctive for its emphasis on the lifelong nature of learning disabilities, its lack of an exclusion clause, and its reference to adaptive behaviour : Specific Learning Disabilities is a chronic condition of presumed neurological origin which selectively interferes with the development, intergration, and/or demonstration of verbal and/or nonverbal abilities. Specific Learning Disabilities exists as a distinct handicapping condition and varies in its manifestations and in degree of severity. Throughout life, the condition can affect selfsteem, education, vocation, socialization, and/or daily living activities. (ACLD, 1986, p. 15). ICLD definition (1987). The ICLD, consisting of representatives from several federal agencies, was charged by Congress to report on several issues. Although Congress did not direct them to do so, they did formulate a definition. Their definition was essentially the same one as the 1981 NJCLD definition, except for two changes. It mentioned deficits in social skills as a type of learning disability, and it added attention deficit disorder as a potential co morbid condition with learning disabilities :

Learning disabilities is a generic term that refers to

a
heterogeneous group of disorders manifested by significant difficulties in the acquisition and use of listening, speaking, reading, writing, reasoning,
or mathematical
abilities,
or of social skills.

These disorders are intrinsic to the individual and presumed to be
due to central
14 nervous system dysfunction.

Even though

a
learning disability may occur concomitantly
with other handicapping conditions (e.g., sensory impairment, mental retardation,
social and emotional disturbance),
with socioenvironmental influences (e.g., cultural differences, insufficient
or inappropriate instruction,
psychogenic factors), and especially with attention deficit disorder, all of which may cause learning problems,

a
learning disability
is not the direct result of those conditions or influences. (ICLD, 1987, p. 222) NJCLD revised definition (1988). The NJCLD revised definition was in response to the LDA definition's emphasis on the lifelong nature of learning disabilities and the ICLD's listing of social skills deficits as a type of learning disability. The NJCLD revised definition agreed with the former but disagreed with the latter :

Learning disabilities is a general term that refers to

a
heterogeneous group of disorders manifested by
significant difficulties in the acquisition and use of listening, speaking,
reading, writing, reasoning,
or
mathematical abilities.

These disorders are intrinsic to the individual,
presumed to be
due to central nervous system dysfunction,
and may occur across the

life span.

Problems

of selfregulatory behaviours, social perception, and social interaction may exist with learning disabilities but do not by themselves constitute a learning disability.

Although learning disabilities may occur concomitantly with other handicapping conditions (for example, sensory impairment, mental retardation, serious emotional disturbance) or with extrinsic influences (such as cultural differences, insufficient or inappropriate instruction), they are not the result of those conditions or influences. (

NJCLD, 1988, p. 1). Individuals with Disabilities Education Act (IDEA)

Reauthorized definition (1997). The definition in federal law has remained virtually unchanged since the one included in P.L. 94-142 :

A.
IN GENERAL. --

The term " specific learning disability" means a disorder in one or more of the basic psychological processes involved in understanding or in using language, spoken, or written, which disorder may manifest itself in imperfect ability to listen, think, speak, read, write, spell, or do mathematical calculations.

B. DISORDERS INCLUDED.--

Such term includes such conditions as perceptual disabilities, brain injury, minimal brain dysfunction, dyslexia, and developmental aphasia. C. DISORDERS NOT INCLUDED.--

Such term does not include a learning problem that is primarily the result of visual, hearing, or motor disabilities, of mental retardation, of emotional disturbance, or of environmental, cultural, or economic

disadvantage. (

IDEA

Amendments of 1997, Sec. 602(26), p. 13)

15 Continuation or Research Strands of the Learning Disabilities Research Institutes As we noted earlier, Keogh (1983) noted that four of the learning disabilities research institutes funded by the USOE in the late 1970s and early 1980s (Columbia University, University of Illinois at Chicago, University of Kansas, University of Minnesota, and University of Virginia) approached learning disabilities as a strategic, information processing problem and developed their intervention within this framework. She pointed out that the institutes' data on outcomes were very promising. McKinney (1983) reported that the institutes' intervention research demonstrated that students with learning disabilities are capable of learning task-appropriate strategies that enable them to succeed in academic learning and adaptive functioning. Although it is conjecture, it is easy to postulate that the institutes' rigorous research standards and encouraging findings provided a springboard for future research. Columbia University. The Columbia institute's research in reading most likely helped facilitate the proliferation of reading intervention research that has occurred in the field of learning disabilities. For example, Lyon (1988) reported that the National Institutes of Health (NIH) has received more than \$25 million to study how students with and without disabilities learn to read. Today, findings from the NIH studies are having a significant impact on the reading instruction provided youngsters with learning disabilities. Judith Birch of Columbia University recently teamed with numerous NIH researchers to develop a very informative video series that present research-based practices in teaching reading to students with learning disabilities. According to public law 94-142, section 602-15 (April 13, 1978) "

Children with specific learning disabilities" means those children who have a disorder

in one

or more of the basic psychological processes involved in understanding

of

using language, spoken or written which disorder may

manifest itself in

imperfect ability to listen think, speak, read, write, spell or do mathematical calculation

such disorders include

such conditions

as perceptual handicaps brain injury, minimal brain dysfunction, dyslexia and developmental aphasia.

Those children who suffer from learning problem due to visual hearing or any physical disability they are not included under this section. The children who also suffer from mental retardation, emotional disorder or any environmental disorder are not included under LD. This definition has two dimensions.

16 1. The children with learning disabilities face the problems in hearing, thinking, speaking, reading, writing, spelling, mathematical calculations etc. 2. They have no such problem which them physical, mental or behavioural handicapped.

Public law : 94-142 has accepted above definition Federal Registrar (1977) has given importance on four dimension of this definition. 1. Academic difficulties : The children with learning disabilities suffer from some problem in education and mathematical calculations also than the other children of some age. 2. Discrepancy between potential and achievement : The children with learning disabilities have poor educational achievement rather than their cognitive capacity this is also called aptitude achievement discrepancy. 3. Exclusion of other factors : If a child faces learning problem due to visual disability, hearing disability or speech and language disorder or mental retardation, any physical problem, emotional disorder or any environmental disorder we can't say that the child is learning disabled. 4.

Neurological disorder : A child can suffer from some learning problems due to neurological disability. We cannot categorize him/her under

learning disability. National Joint Committee (1991) has given a definition "

Learning disabilities are

a generic term that refer to
a heterogeneous group of disorders
that are
manifested by significant difficulties
in the acquisition and use of writing, reasoning or mathematical abilities.
These disorders are intrinsic to the individual
and
are presumed
to be
due to central nervous system dysfunctions.
Even though
a
learning disability may occur
with other
handicapped
conditions (e.g. sensory impairment, mental retardation, social and emotional disturbances,
insufficient or inappropriate instruction, psychological factors). It
is not the
real result of those conditions or
influences."
According to the
definition of National Joint Committee (1991) 'Central nervous system dysfunction refers to there is no damage in the
brain or in the system of
17 perception of the child. But it has some different activities in their brain rather than other general children. In America,
office of Education (1997) has given a
definition about
learning disability."
A disorder
in one
or more of the
basic
psychological processes involved in understanding or in using language, spoken or written
which may manifest itself
in
on
imperfect ability to listen; think, speak, read, write, spell or
do
mathematical calculation.
The
term includes such
conditions as perceptual handicaps brain injury, minimum brain dysfunction, dyslexia and developmental aphasia.
The term does not include
children who have
learning problem which
are
the result of visual, hearing or motor handicaps, mental
retardation,
and emotional disturbance or of environmental, cultural or economic disadvantage.
Therefore, according to we can say that learning disability which is a problem is related with one or more psychological
process of the children in about the use of oral and written language and understanding the meaning. This kind of
disability is

speaking, reading, writing, spelling, or mathematical calculations. This disability is related with the perceptual conditions, brain injury, minimal brain dysfunction, dyslexia, developmental problems. But who have visual, hearing or motor disability, mental retardation, emotional disorder or social and economical barrier are not included under the term--learning disability. 1.1.3 Types and characteristic The term "

learning disability" is an umbrella term describing of more specific learning disabilities.

Definitions of these problems are not standardized; however, we do know that learning disabilities are due to genetic and/or neurobiological factors or injury that alters brain functioning in a manner which affects one or more processes related to learning. These disorders are not due primarily to hearing and/ or vision problems, socio-economic factors, cultural or linguistic differences, lack of motivation or ineffectual teaching, although these factors may further complicate the challenges faced by individuals with learning disabilities. Learning disabilities may co-exist with various conditions including attention, behavioural and emotional disorders, sensory impairments or other medical conditions. The experts classify the learning disabilities on the basis of features surman of Rizzo suggest three type of learning disabilities.

18 1. Minimal Brain Dysfunction (MBD) : The doctors think that MBD is a special type of learning disability. The damage in brain of the child causes this type of disability. The child who has damage in his/her brain may show some behavioural problems such as per concentration irritability, slowness of thought, forgetfulness, impulsive behaviour, easily included fatigue etc. Kurt Goldstein (1942) noticed that the persons who got injury in their brain in the First World War lost their capacity of abstract thought. Thereafter Strauss & Kephart (1955), Strauss & Lehtinen (1947), Werner & Strauss (1940) et. Al. Decided from their experiments that some behavioural approached are related with the damage of brain. These are very high activity level, poor attentionspan, distractibility, impulsive behaviour and emotional instability etc. These behaviour are known as strauss are know as strauss syndrome or Brain Injured syndrome. Strauss did not use the tern learning disability. He thought that through the above problems were seen among the children but no damage of the brain was proved. So these types of children are called 'Strauss Syndrome Children or 'Minimal Brain Dysfunction children.' Clements & Peters (1962) indicated ten features of children with MBT. These are hyperactivity, specific learning deficits in the presence of normal intelligence, perceptual motor deficits, impulsivity, emotional, short attention span, coordination deficits, distractibility, unclear neurological sign; frequently abnormal

E.E.G.S etc. 2. Perceptual motor disabilities : Perception is a process by which any living being make him conscious through his sense organs about his environment. Perceptual motor mence relation and balance in between visual perception and activity based behaviour. Perceptual--motor process is very important motor process is very important for classroom learning. Kephart (1960) suggested that the perceptual motor problem was a cause of learning disability. He thought that the problem started in development disorder. There after the researches who work with the problems of learning disability increase their thought about perceptual and perceptual motor development. Werner & Strauss stated that if any damage accouterd in central nervous system of the child the perceptual motor development was not 19 balanced. Many reserachers have followed him. They agree with themselves that a relation is present in between perceptual motor ability and academic achievement. Barsch (1965), Getman (1065), Frastig (1964) et.,al. indicate that the perceptual motor disability is an another type of learning disability. 3. Psycholinguistic or language disability : Language disability is also accepted as a type of learning disability. The utility of language is very important for learning. The language disability has three types. Inner Language Disorder Receptive Language Disorder Expressive Language Disorder Academic Difficulties : American National Institute of Health has classified Academic Learning Disability into three types : Dyslexia -- Difficulty reading Dysgraphia -- Difficulty writing Dyscalculia -- Difficulty doing math. What is dyslexia ? Children who have an average or above IQ and are reading 1 1/2 grades or more below grade level may be dyslexic. True dyslexia affects about 3 to 6 percent of the population yet in some parts of the country up to 50% of the students are not reading at grade level. This means that the reason for most children not reading at grade level is ineffective reading instruction. The dyslexic child often suffers from having a specific learning disability as well as being exposed to ineffective instruction. Children may have dyslexia or a learning if they have one or more of the following symptoms : Letter or word reversals when reading. (Such as was/saw, b/d, p/q). Letter or word reversals when writing.

20 Difficulty repeating what is said to them. Poor handwriting or printing ability. Poor drawing ability. Reversing letters or words when spelling words that are presented orally. Difficulty comprehending written or spoken directions. Difficulty with right--left directionality. Difficulty understanding or remembering what is said to them. Difficulty understanding or remembering what they have just read. Difficulty putting their thoughts on paper. Children with dyslexia do not exhibit these symptoms due to poor vision or hearing but because of brain dysfunction. The eye and ears are working properly but the lower centers of the brain scramble the images or sounds before they reach the higher (more intelligent) centers of the brain. This causes confusion as well as frustration for the learner. When a child is having difficulty learning, a comprehensive neurodevelopment exam is important. This includes testing of hearing, vision, neurological development, coordination, visual perception, auditory perception, intelligence, and academic achievement. Often, perception problems can be helped with simple exercises which either help to improve a specific problem or teach techniques to compensate for a problem. These often can be done at home. In a few cases, a referral to an educational or speech therapist may be helpful. What causes dyslexia and reading problems? The main reasons for reading problems are: Ineffective reading instruction Auditory perception difficulties Language processing difficulties. Over 180 research studies to date have proven that phonics is the BEST WAY

21 to teach reading to all students. They also have shown that phonics is the ONLY WAY to teach reading to students with dyslexia and other learning disabilities. Unfortunately, 80% of our nations schools do not use an intensified phonics approach for reading instruction. They either use the whole word (see & say) approach or a cursory use of phonics along with the whole word method. While most people can learn to read using the whole word approach, it is not the best way to learn. It teaches through memorization of word pictures and guessing. Unlike Chinese or Japanese which are picture languages, the English language is a phonetic language. With the exception of the United States which dropped phonics in the 1930's, all other countries that have a phonetic language, teach reading through phonics. There are only 44 sounds while there are about 1 million words in English. These facts readily explain why having to memorize 44 sounds as opposed to memorizing hundreds of thousands of words is the most efficient way to learn to read. Reading and writing is simply "talking on paper." Children learn to talk by imitating sounds and then combining the sounds to form words. The brain is programmed to learn language in this fashion. Therefore, the most efficient way to learn to read is through phonics because it teaches children to read the same way they learned to talk. Children and adults who do not learn to read through an intensive phonics program often have one or more of the following symptoms: Below grade level reading achievement Slow reading Poor comprehension Fatigue after reading only for a short while Poor spelling skills Lack of enjoyment from reading Some children have auditory discrimination problems. This may have been the result of having chronic ear infections when they were young. Others may be born with this learning disability. Correction involves educational exercises to train the brain in discrimination and to over teach the formation of the sounds used speaking and reading.

22 Another group of children have visual perception problems. They may actually reverse letters or words. They have difficulty matching the word image on the page with a previously stored image in their brain. Exercises that train the brain to "see" more accurately may help but instruction with phonics is the best approach to overcome this problem. Language development problems can contribute to poor reading and listening comprehension along with difficulty in verbal and written expression. Learning appropriate word attack skills through phonics along with special help in receptive and/or expressive language skills improves this type of learning disability. Helping Children with Reversals: It is not unusual for children to reverse letters and words when they read or write up to the age of 6 or 7. This is due to immaturity in brain development. Children who have problems with reversals usually also have problems with left-right directionality. Below are some exercises that have been found to help improve directionality and reduce reversals. Symptoms: Spatial confusion--unable to differentiate left-right, on self, other, or paper. Confuses letter pairs as b-d, m-w, p-q. Confuses words such as was-saw, on-no. Remediation: 1. Simplify tasks so that only one new discrimination is made at a time. 2. Make each simple discrimination automatic before the next one is introduced. Overteach 'b', then overteach 'd', before presenting both together. 3. Each discrimination that causes repeated errors should be worked with by itself until the problem is overcome. 4. Trace, then write, the confused letter or word and pronounce it as written. 5. Use short frequent practice periods. Lengthen the time between practice sessions as the material is retained. 6. If the child is confused about his own left/right, use a ring, watch, ribbon or band on his writing arm. Colour cue side of desk or paper or word as a starting place. 7. Gradually increase the difficulty of material to discriminate. If errors are made, go back to simple practice. 8. Suggestions for Improving Laterality:

23 Trace hands on paper. Label "right", "left". Play "Simon Syas" – "Touch right foot; raise left hand," etc. Child follows the directions in drawing lines up, down, right or left, etc. and in touching parts of body. Child connects dots on blackboard to make a completed pattern; repeats process on paper. Child shows hands in sequence pattern : left, right, left, right, etc. Use marching as a variation. Child names objects on right and on left. He moves to different parts of the room and repeats. Arrange story pictures in sequence, left to right. Use lined paper for writing. Use weighted wristband to designate right or left hand. Tracing activities, left to right. Mark left with small "x." Use colour tracing to repeat. When beginning writing the lessons teach the child to begin as close to left edge of sheet as possible (then can move only toward the right). In reading, use markers, "windows," and other left-to-right directional aids. What is dysgraphia ? Dysgraphia means difficulty with handwriting. There are several different kinds of dysgraphia. Some people with dysgraphia have handwriting that is often illegible and shows irregular and inconsistent letter formations. Others write legibly, but very slowly and/or very small. When these individuals revert to printing, as they often do, their writing is often a random mixture of upper and lower case letters. In all cases of dysgraphia, writing requires inordinate amounts of energy, stamina and time. Dysgraphia can interfere with a student's ability to express ideas. Expressive writing requires a student to synchronize many mental functions at once : organization, memory, attention, motor skill, and various aspects of language ability. Automatic accurate handwriting is the foundation for his juggling act. In the complexity of remembering where to put the pencil and how to form each letter, a dysgraphia student forgets what he or she meant to express. Dysgraphia can cause low classroom productivity, incomplete homework assignments, and difficulty in focusing attention.

24 Emotional factors arising from dysgraphia often exacerbate matters. At an early age, these students are asked to forego recess to finish copying material from the board, and are likely to be sent home at the end of the day with a sheaf of unfinished papers to be completed. They are asked to recopy their work but the second attempt is often no better than the first. Because they are often bright and good at reading, their failure to produce acceptable work is blamed on laziness or carelessness. The resulting anger and frustration can prevent their ever reaching their true potential. What cause dysgraphia ? A few people with dysgraphia lack only the fine-motor coordination to produce legible handwriting, but some may have a physical tremor that interferes with writing. In most cases, however, several brain systems interact to produce dysgraphia. Some experts believe that dysgraphia involves a dysfunction in the interaction between the two main brain systems that allows a person to translate mental into written language (phoneme-to-grapheme translation, i.e. Sound to symbol, and lexicon-to-grapheme translation, i.e. mental to written word). Other studies have shown that split attention, memory load, and familiarity of graphic material affect writing ability. Typically, a person with illegible handwriting has a combination of fine-motor difficulty, inability to revisualize letters, and inability to remember the motor patterns of letter forms. Who is qualified to diagnose dysgraphia ? Dysgraphia cannot be diagnosed solely by looking at a handwriting sample. A qualified clinician must directly test the individual. Such a test includes writing self-generated sentences and paragraphs and copying age-appropriate text. The examiner assesses not only the finished product, but also the process, including posture, pencil grip, fatigue, cramping or tremor of the writing hand, eyedness and handedness, and other factors. The examiner may assess fine-motor speed with finger-tapping and wrist turning. What is the treatment for dysgraphia ? Prevention, remediation and accommodation are all important elements in the treatment of dysgraphia. Many problems can be prevented by early training. Young children in kindergarten and grade one should learn to form letters correctly; kinesthetic memory is powerful and incorrect habits are very difficult to eradicate. Muscle training and over-learning good techniques are both critical for the

25 remediation of dysgraphia. Specifically designed exercises are needed to increase strength and dexterity. A specialist can recommend the most appropriate plan of exercises. For all students, kinesthetic writing, that is writing with eyes closed or averted, is a powerful reinforce. Work needs always to begin with the formation of individual letters written in isolation. Alphabets need to be practiced daily, often for months. Finally, individuals can benefit from a variety of modifications and accommodations. One effective method is to teach the use of a word processor, bypassing the complex motor demands of handwriting. Many students may find learning the keyboard by the alphabet method easier than beginning with the home keys. For many, touch typing offers a whole new opportunity to learn to spell through a different kinesthetic mode. Students should also experiment with different writing tools; some people with dysgraphia may find pencil grips helpful. Other bypass methods include allowing a student to answer questions orally or into a tape recorder instead of writing, modifying written assignments so that less writing is required, and allowing extended time to complete tests and assignments. Copying from the board is an especially difficult task. Teachers need to provide notes. Photocopying the notes of another student is one possibility. Providing an outline, with spaces left for the student to fill in information is another. Writing on a slightly, inclined plane may be helpful.

Dyscalculia—Difficulty doing math :
Dyscalculia is difficulty in learning or comprehending arithmetic, such as difficulty in understanding numbers, learning how to manipulate numbers, and learning facts in mathematics. It is generally seen as a specific developmental disorder. Dyscalculia can occur in people from across the whole IQ range, often, but not always, involving difficulties with time, measurement, and spatial reasoning. Estimates of the prevalence of dyscalculia range between 3 and 6% of the population. A quarter of children with dyscalculia have ADHD. Mathematical disabilities can occur as the result of some types of brain injury, in which case the proper term is acalculia, to distinguish it from dyscalculia which is of innate, genetic or developmental origin. Dyscalculia has been associated with female children who have Turner syndrome. Symptoms : The following are seen in primary school, and well established by educational researchers :

26 1. Delay in counting. Five to seven year-old dyscalculic children show less understanding of basic counting principles.
2. Delay in using counting strategies for addition. Dyscalculic children tend to keep using inefficient strategies for calculating addition facts longer than their peers.
3. Difficulties in memorizing arithmetic facts. Dyscalculic children have great difficulty in memorizing simple addition, subtraction and multiplication facts (eg. $5 + 4 = 9$), and this difficulty persists up to at least the age of thirteen. [6-10]
4. Lack of "number sense". Dyscalculic children may have a fundamental difficulty in understanding quantity. They are slower at even very simple quantity tasks such as comparing two numbers (which is bigger, 7 or 9?), and saying how many there are for groups of 1-3 objects. The brain areas which appear to be affected in dyscalculia are areas which are specialised to represent quantity.
5. Less automatic processing of written numbers. In most of us, reading the symbol "7" immediately causes our sense of quantity to be assessed. In dyscalculic individuals this access appears to be slower and more effortful. Thus dyscalculic children may have difficulty in linking written or spoken numbers to the idea of quantity. Dyscalculia involves frequent difficulties with everyday arithmetic tasks like the following :
Difficulty reading analog clocks
Difficulty stating which of two numbers is larger
Inability to comprehend financial planning or budgeting, sometimes even at a basic level, for example, estimating the cost of the items in a shopping basket or balancing a checkbook
Difficulty with multiplication-tables, and subtraction-tables, addition tables, division tables, mental arithmetic, etc.
Difficulty with conceptualizing time and judging the passing of time.
May be chronically late or early.

27 Problems with differentiating between left and right
Inability to visualize mentally
Difficulty reading musical notation
Difficulty with choreographed dance steps
Difficulty working backwards in time, (e.g. What time to leave if needing to be somewhere at 'X' time)
Difficulty comprehending things relating to occurrences in different time zones
Difficulty navigating or mentally "turning" the map to face the current direction rather than the common North = Top usage.
Having particular
difficulty mentally estimating the measurement of an object or distance (e.g., whether something is 10 or 20 feet (3 or 6 meters) away).
Inability to grasp and remember mathematical concepts, rules, formulae, and sequences
Inability to concentrate on mentally intensive tasks
Mistaken recollection of names. Poor name/face retrieval. May substitute names beginning with same letter.

28 1.2 Tools and areas of Assessment Structure : 1.2.1 Identification and Assessment : 1.2.2 Tools 1.2.3 Assessment Strategies Introduction : According to the discrepancy model, L.D., students have discrepancy between their academic performance and intellectual ability. "

The child does not achieve adequately for the child's age or meet state-approved grade-level standards in one or more of the following areas (

i) oral expression, (ii) listening cooperation, (iii), (iv) basic reading & writing skills, (v) reading comprehension, (vi) mathematics calculation

or (vii) mathematical problem solving; or that the child does not make sufficient progress to meet state or age approved grade-level standards." Objectives : To learn Identification and Assessment of Learning disability Students 1.2.1

Identification and Assessment : For identification of learning disability, educational assessment is essential. Educational assessment is multi-dimensional process that involves much more than test administration. "Assessment is the process of collecting data for the purpose of making about students (Satvia & Ysseldyke, 1995). McLoughlin and Lewis (1994) discuss five primary purpose of educational assessment : (a) Screening to locate who may have learning difficulties. (b) Determining eligibility i.e., collecting data that enable diagnosticians to identify a student as having learning difficulty. (c) Planning a program for placement and specific interventions. (d) Monitoring students progress through periodic data assessment.

29 (e) Evaluating a programme annually in remediation of the learning practices. In USA, Public Law : 94-142 (November 1975) ensures that all students with disabilities receive a free, appropriate public education for which assessment must be done in non-discriminatory or unbiased manner. Therefore, PL : 94-142 (1975) established a set of procedures to protest against inappropriate assessment and placement practice. 1.2.2 Tools For learning disabled student we may use some of tools for the assessment i.e. Reading Achievement – Swarup Mehata. NIVANS BATTERY TEST Visual Motor Perceptual Measure (Gestalt Test) Screening Check – List of LD Auditory Skill Test – Woodcock Psycho Educational Battery – Woodcock & Johnson. 1.2.3 Assessment Strategies : Assessment learning disabilities requires that we assess an individual student's academic and social learning. However, besides finding out what a student knows or can do, we also must have a basis for comparing the student's performance to what we assume is normal or typical for students similar in age, gender, cultural group, intelligence, and opportunities to learn. The same strategies are used to assess learning disabilities and all students' learning, but particular attention is paid in the former to low performance in specific areas differs from what the student's other characteristics lead us to expect (Hallahan, Kauffman & Lloyd, 1999). Various assessment strategies include : (a) Neuro-Psychological assessment – focuses on how brain function affects learning (b) Contextual assessments which includes : (i) Interviews with the student and important others.

30 (ii) Observations of the student in the classroom and other place in school. (iii) Error analysis to discover predictable mistakes. (c) Standardized testing, which includes : (i) Norm referenced tests of cognitive ability and achievement – compare the student to a large normative group. (ii) Criterion-referenced tests – what specific standards of performance the student has reached. (iii) Non-referenced tests – may reveal how the students approach problems. (d) Teacher-made tests – cover material presented in class. (e) Curriculum-based assessment – systematic and frequent sampling of the student's performance on the instructional tasks in the daily curriculum. (f) Behavioural assessment – observation and recording of specific target behaviours. (g) Interactive assessment – observation of the student's response to instruction during testing. (h) Authentic assessment, which include : (i) Performance assessment – samples of what the student can do following might be used for performance assessment. ? Constructed-response items, in which the student must offer a response rather than choose from alternatives ? Essays, letters, instructions, speeches or oral response to questions ? Experiments and their results or reports ? Exhibitions and other performances (ii) Portfolio assessment – collections of student work over a period of time.

31 1.3 Strategies for reading, writing and maths Structure 1.3.1 Introduction 1.3.2 Objectives 1.3.3 Reading strategies 1.3.4 Strategies for writing 1.3.5 Strategies for mathematics 1.3.1 Introduction The strategy is method that the teacher can use to help the students to complete a given task, or a way for the student to think about the task is explained. Therefore, such strategies of teaching are needed that help a learner with learning disabilities to acquire new information to solve problems and to transfer learning to related situations. Here are the six characteristics of effective teaching strategies (Ibid, p. 148- 149) (a) The strategy takes account of how the student is currently thinking about the task. (b) The strategy provides for both the action of the teacher and the action of the student. (c) The strategy encourages generalization and transfer. (d) The strategy matches the highest level of thinking which the student is capable of. (e) The strategy generated through teacher student interaction. Therefore, the teachers must know how the student is currently thinking to stop providing misdirected instruction. So the teacher will carefully understand students mental structures, what the students need to learn, imagine the steps in between, generate disequilibrium, teachers switches roles to move to new step in the teaching process, and playing with the new concept to stabilize the new structure and transfer likely.

32 1.3.2 Objective : To learn strategy of reading for learning Disability students To learn strategy of writing for Learning Disability students To learn strategy of mathematics for Learning Disability students 1.3.3 Reading Strategies : Reading involves skill, it involves thinking and affects the entire personality of the reader. It makes a man perfect. Reading means reading with comprehension and with logical thinking. It is the key to the wealth of experience. It includes learning, reflection, judgement, analysis and synthesis, problem solving behaviour, inference and organization, comparison of data, or what is being read (Thronkike) Some

of the following suggestions and strategies may help children who are experiencing problems with decoding, comprehension, or reading retention.

Many of those listed are accommodations that work around a child's differences by offering alternative approaches at home and

at school. Look for those that you think might work best and, when applicable,

talk to your child's teacher about using some of

them in class.

Play word games. Word games and puzzles are fun and also build vocabulary and word understanding. Try crossword puzzles, word bingo, etc. Read every day. Encourage children to read directions, labels and signs in the classroom, at home, in the car, and at stores or shops, and have them take turns reading aloud with a classmate, parent, or sibling.

Discuss in class or at home what you are reading. Model reading as an enjoyable activity. You might informally discuss what you are reading with your child or let

him or

her see family members or teachers enjoying reading. Have DEAR time several times a week where everyone "Drops Everything And Reads" for 20 minutes. Put learning to use. Help children remember by having them explain, discuss, or apply information they have just read, letting them "teach" you facts or ideas they have learned from their

33 reading, or encouraging them to act out characters from their reading selections. Listen to books. Child may benefit from listening to his or her textbooks and trade books on

tape or

by using assistive technologies like screen readers. Read to child every night. Read novel above his or her reading level to stimulate and enrich language, creativity, and interest. Ask structured questions and encourage the child to predict

multiple endings to each chapter. Engage children's senses while learning. Children with learning disabilities learn best when they use many of their

senses to

get information. Multisensory instruction allows the child to see, hear, touch,

and act

our words. For example, to learn letters children may read the printed letter, say the letter name, shape the letter out of clay, trace the letter onto paper, and

form their bodies into the shape of the letter. Remediation in Reading : Difficulties with reading fluency are nearly universal among individuals with learning disabilities in reading. Reading fluency is the ability to read text not just accurately, but also and effortlessly. Fluency is characterized by appropriate intonation and expression during oral reading, as well as by a high degree of accuracy and speed in recognizing individual words in the text. Accurate word decoding is necessary, though not sufficient, for fluent reading. Thus, a student who reads quickly, but with many decoding errors or substitutions of words, is not "fluent." Reading fluency is important for at least three reasons. First, if students need to put effort into reading individual words, they tend to lose comprehension. Second, students with poor fluency often experience reading as laborious and difficult, so they lose motivation to read. Lack of motivation to read results in less practice, further compounding the difficulties of struggling readers. And third, as they advance in school, students with poor fluency have difficulty keeping up with the high volume of reading required for academic success beyond the elementary grades. Some following remedial recommendation for reading disorder. A. Errors in reading 1. Omissions : Omits letter. eg, Belt & Bet or whole words when reading. Remedy: Teach him to scan the complete word. 2. Additions and insertions : eg., play & played or care & careful. Remedy : Help to him to understand the context word, to comprehend the meaning of the what he is reading, to identify the word quickly; in choral reading and reading with a taped reading. 3. Substitutions : Substitute words which look the same. eg., house & home, guess & guest, us & biscuit. Remedy : Use flash cards, choral reading and rhyming. 4. Repetition : Repeating words. Remedy : Silent reading before loud reading, use phrase cards, develop stroke of sight words. 5. Reversals : Twist symbols like p&q, b&d, was&saw. Remedy : Establish the concepts of right and left, teach them to distinguish between letters like, P,p,q,h,m,r,e,a,d,q,f and use of colours. 6. Word by word Reading : Loses his place of reading, using no intonation, expression, punctuation, pausing. Remedy : Increase the pace of reading by moving a piece of paper, read along with the child in a faster pace, use flash card. 7. Sound Blending : Cat & Kat. Remedy : Meaningful word patterns and words in context. B. Teaching word identification : Letter with similar configurations, eg., h-n, i- j, v-w, m-n, -d and pair words, lap-lip, bat-dad, tip-tin, house-horse. C. Teach phonics : the (the, thin), ph (Phone, phantom) etc. D. Teaching words meaning. E. Comprehension skills. Among students with reading disabilities, two patterns of difficulties are especially common. In the first pattern, a student has difficulty reading words accurately and also reads in a slow, labored fashion. In the second pattern, a student may have achieved reasonably accurate word decoding, especially after remediation in phonemic awareness and phonics, but still reads very slowly relative to other students his or her age. Fluency deficits in individuals with reading disabilities may be linked to several underlying factors. One especially important factor involves a cumulative lack of exposure to printed words. Struggling readers receive much less exposure to words

35 (e.g., through independent reading both in and out of school) than do skilled readers. If struggling readers' difficulties are not remediated early, this cumulative deficit in exposure to words may be extremely difficult to overcome. In addition, some scientific investigators have linked problems in developing reading fluency to underlying deficits in naming speed, or the speed with which children can retrieve the names of familiar items, such as letters or numbers. Other researchers view these difficulties as reflecting a single underlying phonological deficit, the core deficit in most individuals with reading disabilities. The use of fluency measures in early identification : Measures involving fluency can be very useful in identifying at-risk readers in the early elementary grades. Depending on the age of the children, these measures may involve identifying letters, real words or nonsense (made-up) words out of context, or reading grade-appropriate passages. The measures are timed and the child's score is simply the number of letters or words read correctly per minute. Children must be tested individually because the measures involve oral reading; however, typically these measures are easy to administer, take only a few minutes of time, require only minimal training of teachers, and are excellent predictors of children's risk status. Thus, fluency measures can be used in general education settings to monitor the progress of all children and to identify early those who are in need of additional help. Early identification and appropriate intervention (which may or may not include special education) can help to prevent the cumulative deficits which make it so difficult for older struggling readers to catch up to their age peers. Instruction and remediation in fluency : Once serious fluency problems have developed, they can be resistant to remediation. However, several approaches have shown promise for addressing fluency difficulties. An especially helpful technique involves repeated oral reading of text under timed conditions. In this technique, the teacher selects an appropriate level passage—one that is not too difficult—for a child to read aloud repeatedly. The child rereads the passage until he or she reaches a predetermined criterion for accuracy and rate, then moves on to another, more difficult passage. A somewhat similar approach, but one that does not necessarily use timing, involves having children reread familiar books aloud several times, with appropriate guidance and feedback from the teacher. Other approaches to developing reading fluency include the use of timed speed drill on individual words (e.g., common sight words), readers' theatre, paired or partner reading, and encouraging independent reading (e.g., by making books available to children that are interesting and at an appropriate level of difficulty). Teaching basic phonics and skills for decoding multisyllabic words, such as syllabication strategies and structural analysis, is essential for students whose reading is not accurate. Without a foundation of accurate decoding, students cannot become fluent. However, by itself, phonics instruction will not meet students' needs for building fluency. Rather, fluency must be directly addressed, through the kinds of approaches discussed above, as part of a comprehensive program of reading instruction.

1.3.4 Strategies for writing : Introduction

Writing is both a social and a cognitive process. In the world outside the classroom, people write to communicate with an audience, drawing on their knowledge of content and writing, strategies for planning and revising, and basic writing skills. Writing development and disabilities in terms of five components: the social context for writing the writer's knowledge planning processes text production evaluation and revision self-regulation It will outline components of effective writing instruction, to help parents assess the quality of instruction in their child's classroom. The goals of good writing instruction for students with disabilities are the same as those for all students. All students need to develop their knowledge about the purposes and forms of writing, basic writing skills, strategies for planning and evaluating their work, and motivation. However, struggling writers need more support and more intensive, explicit instruction in skills and strategies. A high-quality writing program will provide a balance between opportunities for children to engage in writing that is meaningful to them, and to receive explicit

37 instruction in the skills and strategies they need to become proficient writers. Development of the self-regulation strategies and motivation needed for independent writing are also important. The writing classroom should provide : a context for regular, meaningful writing instruction in handwriting, spelling, and sentence formation, as needed instruction in strategies for planning, revising, and self-regulation during the writing process attention to development of motivation for writing use of technology to support the writing process (this important topic will be addressed separately in a future article) Developmental Hierarchy of Writing Tasks i. scribbling ii. Tracing – (a) Connected letters or figures (b) Disconnected letter or figures iii. Copying – (a) From a model (b) From memory (c) Symbolic and non-symbolic iv. Completion tasks – (a) Figure, (b) Word completion--supply missing letters and sentence completion. v. Writing from direction : writing from letters as they are spoken,w writing words and sentences and supply missing word, supply missing sentence. Source : Central Processing Dysfunction in children : a review of Research J. C. Chalfant and M. A. Scheffin, NINDS Monograph no-9, Bethesda Md : U.S. Department of Health, Education and Welfare, 1969, p. 112. Remediation : According to mercer, (1997, pp, 466-469) Teacher should help the students develop a positive attitude towards handwriting encouraging progress and stressing the importance of the sill. In upper elementary grades and in secondary classrooms, greater emphasis should be placed on identifying specific deficits in student's daily routine work. Marketing must be on the basis of students handwriting quality. The teacher needs to help each student develop his skills in the area like

38 muscular control, eye hand coordination and visual discrimination before the students is ready to begin handwriting. The proper position of the paper pencil must be taught before extensive handwriting. Multi-sensory approach should be used in teaching letter forms--vision, hearing and touch. Letter with easier strokes (viz. E, F, H, I, L, T, I, I, and t) may be taught first (before teaching b, f, h, p, q etc). 1.3.5 Strategy for Mathematics Introduction : Dyscalculia is a mathematics-related disability resulting from neurological dysfunction. Students who are diagnosed with Dyscalculia have average to above- average intellectual functioning and a significant discrepancy between their math skills and their chronological-age-peer norms. For a diagnosis of Dyscalculia, it must be determined that the math deficit is not simply related to issues such as poor instruction, vision, hearing or other physical problems, cultural or language differences, or developmental delays. In Accommodating Math Students with Learning Disabilities, author Rochelle Kenyon lists the following strategies for teaching a student with math-related disabilities. Avoid memory overload : Assign manageable amounts of work as skills are learned. Build retention by providing review within a day or two of the initial learning of difficult skills. Provide supervised practice to prevent students from practicing misconceptions and "misrules." Make new learning meaningful by relating practice of subskills to the performance of the whole task. Reduce processing demands by preteaching component skills of algorithms and strategies. Help students to visualize math problems by drawing. Use visual and auditory examples.

39 Use real-life situations that make problems functional and applicable to everyday life.

Do math problems on graph paper to keep the numbers in line.

Use uncluttered worksheets to avoid too much visual information. Practice with age-appropriate games as motivational materials. Have students track their progress. Challenge critical thinking about real problems with problem solving. Use manipulatives and technology such as tape recorders or calculators. This is was adapted from the following source : Garnett, K., Frank, B., & Fleischner, J. X. (1983). A strategies generalization approach to basic fact learning (addition and subtraction lessons, manual #3; multiplication lesson, manual #5). Research Institute for the Study of Learning Disabilities. New York, NY : Teacher's College, Columbia University.

Some of the following math strategies and suggestions may help children who are experiencing problems with mathematics. Identify strategies that you think will help your child and, if appropriate, talk to your child's teacher about using some of the strategies in school. Maintain consistency and communication across school and home settings. Parents, tutors, and classroom teachers should coordinate and use the same instructional approach. Teach basic concepts using concrete object. For example, let children explore number concepts by counting the legs of a chair to find the number four or by subtracting crayons from a box. The progression from understanding concrete materials, pictorial representations, and abstract number representations may take some children longer than others. Provide specialized materials. To help children organize their calculations, have them use graph paper (or lined paper turned sideways) to keep numbers in columns. Encourage the use of scrap paper to keep work neat, highlighters to underline key words and numbers, and manipulatives such as base-ten blocks or fraction bars. Make your expectations explicit. Tell children the procedures you would like them to use when solving a problem, model each procedure for them, then have them tell you what they are expected to do. Some students benefit by having a math notebook filled with examples of completed problems to which they can refer if they become overwhelmed or confused.

40 Provide time for checking work. Emphasizing that completing math assignments is a process, encourage children to become comfortable reviewing their work, making changes, or asking questions when they are unsure of their answer. Give children opportunities to connect mathematical concepts to familiar situations. For example, when introducing measurement concepts, have children estimate their measurements before measuring classmates' and family members' heights or weighing their book bags' when empty and when full. Help children apply math concepts to new situations. For example, show them how to use percentages to understand the price of a pair of shoes on sale at the mall or the amount of their allowance they spend on snacks. Provide access to programs or tutors that can help a child improve his or her math skills. Tutors can assist children with weak math sub-skills, such as multiplication and division. Provide tutors during summer months or after school to boost performance and ensure that the child retains his or her skills. Help children keep track of problematic areas. When doing math homework, children may benefit from having their most common errors listed on flashcards. They can then refer to the cards while completing their assignments. Play math games. To encourage automaticity with math facts, students may benefit from playing math games (i.e. dice, playing cards) and listening to commercially available audiotapes that provide a fun way of learning math facts.

The PBS Parents Activity Search can help you find great games from PBS Children's television series.

41 Unit 1.4 : Curriculum Adaptation, IEP, Further Education Structure 1.4.1 Introduction 1.4.2 Objectives 1.4.3 Curriculum Adaptation 1.4.4 IEP 1.4.5 Further Education 1.4.1. Introduction There is no recipe for adapting general education curriculum to meet each student's needs. Each teacher, each student, each classroom is unique and adaptations are specific to each situation. Keep in mind that curriculum does not always need to be modified. By providing multi-level instruction you will find that adapting a lesson may not always be necessary. Differentiating instruction and providing multiple ways assess allows more flexibility for students to meet the standards and requirements of the class. At other times, the curriculum can be made more accessible through accommodations. In addition, supports for one student may not necessarily be the same in all situations, e.g., a student who needs full time support from a paraprofessional for math may only need natural supports from peers for English, and no support for art for learning disability students. And, supports should not be determined by the disability label, instead supports should be used when the instructional or social activity warrants the need for assistance (Fisher and Frey, 2001). The forms and examples on the following pages provide information about curriculum and types of adaptations that could be considered in developing the appropriate strategy for a particular student. 1.4.2. Objectives To learn curriculum adaptation for L.D. students To learn IEP for L.D. students To learn further education for L.D. student 1.4.3. Curriculum Adaptation A Curriculum Adaptation and Decision-making Process : This decision-making flowchart can be used to conceptualize the process of selecting and implementing curriculum adaptations. It should be used as a tool for a team in determining an individual student's needs.

42 Identify the student's individual educational goal and objectives to be emphasized during general education activities. Articulate the expectations for the student's performance in general education activities? Determine what to teach As a team, determine the content of the general education activity, theme or unit study Determine how to teach As a team, determine if, without modification, the student can actively participate and achieve the same essential outcomes as non-disabled classmates. If the student cannot achieve the same outcomes... Select of design appropriate adaptations? ? ? ? Select instructional arrangement Select lesson format Employ student-specific teaching strategies Select curriculum goals specific to the lesson Engineer the physical and social classroom environment Design modified materials Select natural supports and supervision arrangements? ? ? If the above adaption strategies are not effective, design an alternative activity Evaluate effectiveness of adaptations

43 A Curriculum Adaptation and Decision-making Model : Examine the Structure of the Instruction : 1. Can the student activity participate in the lesson without modification? Will the same essential outcome he achieved? 2. Can the student's participation be increased by changing the instructional arrangement? From traditional arrangements to : Cooperative groups Small groups Peer partners Peer or cross-age tutors 3. Can the student's participation be increased by changing the lesson format? Interdisciplinary / thematic units Activity-based lessons, games, simulations, role-plays Group investigation or discovery learning Experiential lessons Community-referenced lessons 4. Can the student's participation and understanding be increased by changing the delivery of instruction or teaching style? Examine the Demands and Evaluation Criteria of the Task 5. Will the student need adapted curricular goals? Adjust performance standards Adjust pacing Same content but less complex Similar content with functional/direct applications Adjust evaluation criteria system (grading) Adjust management techniques Examine the Learning Environment 6. Can the changes he made in the classroom environment or lesson location that will facilitate participation?

44 Environmental / Physical arrangements Social rules Lesson location Examine the Materials for Learning 7. Will different materials be needed to ensure participation? Same content but variation in size, number, format Additional or different materials/devices Materials that allow a different mode of input Materials that allow a different mode of output Materials that reduce the level of abstraction of information Examine the Support Structure 8. Will personal assistance be needed to ensure participation? From peers or the general education instruction? From the support facilitator? From therapists? From paraprofessionals? From others? Arranges Alternative Activities that Foster Participation and Interaction 9. Will a different activity need to be designed and offered for the student and a small group of peers? In the classroom In other general education environments In community-based environments Curriculum Adaptations : It is important to correlate adaptations with the IEP. In other words, we are not adapting for adaptations sake but, to meet the student's needs as identified on an IEP.

45 a. Curriculum as is. This is type we forget most frequently. We need to constantly be looking at the general education curriculum and asking if the students of IEPs may gain benefit from participating in the curriculum as is. We need to keep in mind that incident learning does occur. Curriculum as is supports outcomes as identified in standard curriculum. b. Different objective within the same activity and curriculum. The student with an IEP works with all the other students in the classroom participating in the activity when possible but, with a different learning objective from the other students. This is where the principle of partial participation fits examples include. A student with a short attention span staying on task for 5 minutes. Using a switch to activate a communication device to share during a class discussion. Expressing one's thoughts by drawing in a journal instead of writing. Holding a book during reading time. Understanding the effect World War II has on the present rather than knowing the names and dates of key battles. c. Material or environmental adaptations. The material or environmental changes are utilized so that participation in the general education curriculum by the student with the IEP may occur. Examples include : 5 spelling words from the weekly list instead of the standard 20. Completely a cooking assignment by following picture, directions rather than written direction. Changing the grouping of the class from large group to small groups (possible with the additional support staff). Changing the instructional delivery from lecture to the cooperative learning format. Using a computer to write an assignment instead of paper and pencil. Reading a test to a student. Highlighting the important concepts in a textbook. Having the student listen to a taped textbook. Using enlarged print. Move in this direction only when necessary

46 Overlap does occur among the five types of curriculum adaptation. Using an assistive technology device. Using visual cues such as picture and/or word schedules for those who have difficulty staying on task. Using a note taking guide listing the key concepts during a lecture. d. Providing Physical assistance. Assistance from another person may be needed for a student to participate in a classroom activity. If possible, it is better to use natural supports (peers) as these will be the people always present in the student's life. If the use of peers is not possible, then either the support teacher, the paraprofessional, the classroom teacher, the classroom aide, or a parent volunteer may provide the assistance. Most peers and staff will need training in the correct way of providing physical assistance. In addition, we need to keep in mind the principle of partial participations. Examples include : Starting a computer for an student with an IEP to use. Guiding a hand during handwriting. Assisting in activating a switch. Completing most of the steps of an activity and having a student with an IEP do the remainder. Pushing a student in a wheelchair to the next activity. e. Alternative/substitute curriculum. This is sometimes referred to as functional curriculum as it usually involves the acquisition of "life skills". The decision to use alternative/substitute curriculum is a major change and needs to be reflected on the IEP. This decision should be carefully made after weighing all or the pros and cons of using an alternative curriculum. The alternative curriculum may or may not take place in the general education classroom. Examples include : Community-based instruction (which all students may benefit from!) Learning job skills in the school cafeteria. Learning how to use a communication device. Doing laundry for the athletic department. Learning cooking/grooming skills at the home. Move in this direction only when necessary

47 Nine Types of Adaptions : Input Adapt the way instruction is delivered to the learner. For example : Use different visual aids; plan more concrete examples; provide hands-on activities; place students in cooperative groups. Output Adapt how the learner can respond to instruction For example : Allow a verbal vs. written response; use a communication book for students; allow students to show knowledge with hands on materials. Time Adapt the time allotted and allowed for learning, task completion or testing. For example : Individualize a timeline for completing a task; ...learning differently (increase or decrease) for some learners. Difficulty Adapt the skill level, problem type, or the rules on how the learner may approach the work. For example : Allow a calculator for math problems; simplify task directions; change rules to accommodate learner needs. Level of Support Increase the amount of personal assistance with specific learner. For example : Assign peer buddies, teaching assistants, peer tutors or crossage tutors. Size Adapt the number of items that the learner is expected to learn or compete. For example : Reduce the number of social studies terms a learner must learn at any one time. Degree of Participation Adapt the extent to which a learner is actively involved in the task. For example : In geography, have a student hold the globe, while others point out the locations. Alternate Goals Adapt the goals or outcome expectations while using the same materials. For example : In social studies, expect one student to be able to locate just the states while others learn to locate capitals as well. Substitute Curriculum Provide the different instruction and materials to meet a learner's individual goals. For example : Individualize a timeline for completing a task; pace learning differently (increase or decrease) for some learners. From : Ebeling, D. G., Ed. D., Deschenes, C. M.Ed., & Sprague, J., Ph.D. (1994). Adapting curriculum and instruction. The Center for School and community Integration, Institute for the Study of Development Disabilities.

48 Adaptations : Stage 1 General Adaptations Blueprints or formats for adapting predictable activities and routines Stages of Adaptations Stage 2 Specific Adaptations Time-limited adaptations for a particular lesson, activity or that. Instructions Adapt the taught and over learning is demonstrated ADAPTATIONS Stagout response or output Difficulty/ amount Modality Format/ materials Instructional stimulus or input Difficulty/ amount modality Format/ materials Ecological Adapt the setting where, when and with whom Who Adapt staffing, grouping Where Adapt the schedule When Adapt the place Curricular Adapt what is taught Alternative Teach functional skills plus embedded social, communication and motor skills Simplified Change level of difficulty or include fewer objectives Supplementary Add social, communication, study or processing skills to general curriculum From : Janney, R., Ph.D., and Snell, M., Ph.D. (2000) Modifying Schoolwork; Baltimore, MD; Paul Brooks Publishing Company

49 1.4.4 IEP IEP A federal law called the Individuals with Disabilities Education Act (IDEA) requires that public schools create an IEP for every child receiving special education services. Kids from age 3 through high school graduation or a maximum age of 22 (whichever comes first) may be eligible for an IEP. The IEP is meant to address each child's unique learning issues and include specific educational goals. It is legally binding document. The school must provide everything it promises in the IEP. What does an IEP contain ? IEPs are designed to meet kids' unique needs. That means that every IEP will look different. But by law, all IEPs must contain the following elements: Child's present level of educational performance (PLOP) : This is thorough description of your child's current abilities, skills, weaknesses and strengths. It's the part of the IEP that explains how the child's learning issues affect his ability to learn the general education curriculum. PLOP (also sometimes called PLP or PLAAFP) includes details on how your child handles academic subjects and everyday or "functional" activities, like socializing. The results of the child's evaluations and tests : This should include district- wide and state assessments. Special education and related services to be provided : The IEP spells out what kinds of support and services your child will receive. If your child is going to have speech therapy, for instance, it will say how many minutes a week he will receive this therapy. Accommodations and modifications : These help your child learn the general education curriculum. Accommodations are changes in how a child shows what he has learned. They can help your child work around his learning issues. For example, he may be given extra time on tests. Supplementary aids and services : These are supports to help a child learn in the general education classroom. L.D. student included in general classroom. They might include a one-on-one, aide, highlighted classroom notes, equipment or assistive technology, such a software. 50 Annual educational goals : These should be realistic, achievable and measurable. The IEP lists the academic and functional skills that the IEP team thinks the child can achieve by the end of the year. Annual educational goals should help your child participate in the general education classroom. If the child has multiple or severe disabilities, the law requires that the IEP list short-term goals. These are also called objectives or benchmarks. A description of how the child's progress will be measured and reported to you : By law, the IEP must explain how the school will track the child's progress toward goals. And it must describe how the school will share those results. For instance, one goal might be that the child be able to read at a third-grade level. The IEP will specify how that will be tracked--informal and formal assessments, for instance--and how often those results will be reported to you. If these interim reports show that your child's progress has stalled, the IEP team may discuss new interventions. An explanation of how much your child will participate in general education classes and extracurricular activities : Participation at the fullest level possible is required by law. This is called the least restrictive environment. The date the IEP will go into effect : Many states have formal timelines for this. Depending on your child's age and situation, his IEP might also include : A transition plan : This kicks in when the child turns. Transition planning includes services and support to help a student graduate from high school and achieve post-high school goals. Extended school year services : Some students receive special educational services outside of the regular school year, such as during the summer or, less commonly, during extended breaks like winter break. 1.4.5. Further Education : There is sometimes a misconception that people with learning disabilities will not opt for a college placement prior to attending a day-centre. There has often been limited scope for those with learning disabilities to progress into further education and full-time employment. But people with learning disabilities may often feel that they want to expand their horizons or take their studies to a new level. Further education may offer a wider 51 range of options in terms of long-term planning. However, the focus on students with learning, disabilities tends to fall on shorter-term college studies, with less emphasis on progression to employment. In some cases, a learning disabled person will progress to college, with only around 11% going on to employment. In other cases, the individual may simply progress to attending a day centre and not enter employment at all. Therefore, people with learning disabilities may not always be aware of the further education opportunities and support open to them. Progression And Support : The UK Government's white paper Valuing People asserts that people with learning disabilities should have the same rights and opportunities as everyone else with regards with post 16 education. Objective 7 of the Valuing People paper states, "To enable people with learning disabilities to lead full and purposeful lives within their community and to develop a range of friendships, activities and relationships." It also states that Learning Disability Partnership Boards, the Learning and Skills Council (LSC) as well as colleges should support choices and ambitions of people with learning disabilities, and that they should be able to realise their potential. Person-Centered Planning and Further Education : It is the way forward for supporting people with a learning disability into further education. This also includes getting carers and family involved in supporting planning in post-16 education opportunities, but with an emphasis on the student being at the heart of the provision rather than an assumption that they will have to fit into existing provisions.

52 1.5. Transition Education, Lifelong education : 1.5.1 Transition Education 1.5.2 Lifelong Education 1.6 Unit Summary 1.7 "Check Your Progress" 1.8 References 1.5.1. Transition

Education The term transition refers to passing from one state or condition to another. Many important transitions occur throughout each person's life, and many of them are associated with predictable life events, such as beginning preschool, leaving elementary school, and entering middle adulthood. One of the most critical transition periods for students with learning disabilities (LD) is the transition from school to young adulthood. The 1997 amendments to the Individuals with Disabilities Education Act (IDEA) defined transition services for this particular transition as : a coordinated set of activities for a student, with a disability, that: (a) is designed within an outcome oriented process, that promotes

movement from school to post school activities, including postsecondary education, vocational training, integrated employment (including supported employment), continuing and adult education, adult services independent living, or community participation; (

b) is based on the student's needs, taking into account the student's preferences and interest; (c) includes instruction, related services,

community experiences, the development of employment and other post-school objectives, and when appropriate, acquisition of daily living skills and functional vocational evaluation (*602).

This concept is straightforward and fairly simple, including three major components (Storms, O'Leary, & Williams, 2000).

First, every student and his or her family should be coached to (a) think about post ? high school goals and (b) develop a plan for how to achieve those goals. Second, a high school experience should be designed so that the student acquires the skills and competencies necessary to obtain his or her desired post ? high school goals. Finally, the linkages to post ? high schools

53 services, supports, and programs need to be identified and made before the student exits high school. Transition Planning Important for Individuals with LD : Even though transition planning has been mandated for all students with L.D. for more than 10 years, transition planning for individuals with LD has lagged behind that of other groups. A major reason for this lack of attention has been an assumption that individuals with LD have a mild disability that primarily affects academic achievement; therefore, they have the ability to move from secondary to postsecondary environments without a lot of difficulty. Unfortunately, this is not the case for many students with LD. The results of a number of recent studies have suggested that many adolescents with LD do encounter difficulties in making the transition to adult life, including problems related to unemployment, underemployment, job changes, participation in community and leisure activities, pay, dependency on parents and others, satisfaction with employment, postsecondary academics, and functional skills. 1.5.2.

Lifelong Education : 'Lifelong education' the "ongoing, voluntary, and self-motivated" pursuit of knowledge for either personal or professional reasons. Therefore, it not only enhances social inclusion, active citizenship, and personal development, but also self- sustainability, rather than competitiveness and employability. The concept Lifelong Learning was introduced in Denmark as early as in 1971. Evolved from the term "life-long learners" created by Leslie Watkins and used by Professor Clint Taylor (CSULA) and Superintendent for the Temple City Unified School District's mission statement in 1993, the term recognizes that learning is not confined to childhood or the classroom but takes place throughout life and in a range of situations. Allen Tough (1979), Canadian educator and researcher, asserts that almost 70% of learning projects as self-planned. As per normal life L.D. students can learn as lifelong learning processes.

54 1.6. Unit Summary Learning Disability : Learning disability is a classification that includes several areas of functioning in which a person has difficulty learning in a typical manner, usually caused by an unknown factor or factors. Given the " difficulty learning in a typical manner", this does not exclude the ability to learn in a different manner. Therefore, some people can be more accurately described as having a "Learning Difference", thus avoiding any misconception of being disabled with a lack of ability to learn and possible negative stereotyping. While learning disability, learning disorder and learning difficulty are often used interchangeably, they differ in many ways. Disorder refers to significant learning problems in an academic area. These problems, however, are not enough to warrant an official diagnosis. Learning disability on the other hand, is an official clinical diagnosis, whereby the individual meets certain criteria, as determined by a professional (

psychologist, pediatrician, etc.). The difference is in degree, frequency, and intensity of reported symptoms and problems,

and thus the two should not be confused. When the term "learning disorder" is used, it describes a group of disorders characterized by inadequate development of specific academic, language, and speech skills. Types of learning disorders include reading (dyslexia), mathematics (dyscalculia) and writing (dysgraphia). Tools and Areas of Assessment : Learning disabilities are neurological disorders that affect a person's ability to interpret information and create problems with language, coordination, self-control or the ability to concentrate. Learning disabilities can cause difficulties in tasks such as reading, writing and doing math. When a child is struggling there are steps that parents can take to help. Formal assessment tools are a key part of the process to finding and identifying a learning disorder and getting a child the right support.

55 Strategies for reading, writing and maths Curriculum Adaptation : Even a child with many needs is to be involved with non-disabled peers to the maximum extent appropriate. Just because a child has learning disabilities or needs Reading Strategies Strategies to see when reading. Access background knowledge. Predict what will be learned or what will happen. Figure out unknown words Self-monitor and self-correct Make mental pictures. Connect what you read with what you already know. Extract information from texts, charts, graphs, maps, and illustrations. Identify and interpret literary elements in different genres. Summarize what has been read Make inferences and draw conclusions. Writing Strategies The Essential Writing Skills: Generate ideas in a variety of ways. Organize ideas based on purpose for writing Use a variety of sentence lengths and patterns Write so thoughts flow smoothly and are easy to read. Carefully choose the most effective words to express the ideas. Choose the tone and point of view that suit writing purpose Use personal style to make writing unique. re-read, reflect, revise, and edit. Math Strategies Explore and investigate math ideas. Connect new math ideas with what already know. Figure out the big ideas in math. Computations quickly and accurately Makes reasonable estimations. Use mental math Make sense of problems Use a variety of strategies to solve math problems. Explain and give reasons for math thinking. Work hard at math.

56 modifications to the general curriculum does not mean that he or she may be removed from the general education class. If a child is removed from the general education class for any part of the school day, the IEP team must include in the IEP an explanation for the child's nonparticipation. Because accommodations can be so vital to helping children with disabilities access the general curriculum, participate in school (including extracurricular and nonacademic activities), and be educated alongside their peers without disabilities, IDEA reinforces their use again and again, in its requirements, in its definitions, and in its principles. The wealth of experience that the special education field has gained over the years since IDEA was first passed by Congress is the very resource you'll want to tap for more information on what accommodations are appropriate for students, given their disability, and how to make those adaptations to support their learning. IEP An individualized Education Program, or IEP, is an agreement between school and parent that outlines the special education and related services to be delivered to a child who has been found eligible for services under the Individuals with Disabilities Education Act (IDEA). The document provides several important statements about the progress to be accomplished and the specific amounts of special education and related services to be delivered in order to achieve the desired progress. In addition, an IEP outlines to be furnished both in daily instructional settings and in state- and district-wide testing. It also details how progress will be determined and a method by which parents will be regularly advised of that progress. Further Education In terms of inclusiveness in education, this means providing adequate support services for people with varying degrees of learning disability that wish to enter into further education. This can include support such as helping a person with learning disabilities use public transport services and other services that they will need to use frequently in order to continue into independent further education. Transition Education A transition plan is the section of the Individualized Education Program (IEP) that outlines transition goals and services for the L.D. student. The transition plan is based on a high school student's individual needs, strengths, skills, and interests.

57 Transition planning is used to identify and develop goals which need to be accomplished during the current school year to assist the student in meeting his post-high school goals. Lifelong Education During the last fifty years, constant scientific and technological innovation and change has had a profound effect on learning needs and styles. Learning can no longer be divided into a place and time to acquire knowledge (school) and a place and time to apply the knowledge acquired (the knowledge). Instead, learning can be seen as something that takes place on an ongoing basis from our daily interactions with others and with the world around us. It can take the form of formal learning or informal learning, or self-directed learning for L.D. students.

1.7. "Check your progress" : 1. What is Learning Disability ? 2. What is the characteristic of Learning Disability (L.D.) ? 3. What are the types of L. D. 4. Discuss about strategies for reading, writing and maths. 5. Discuss about Curriculum adaptation for L.D. students. 6. What is IEP ? Discuss about IEP for L.D. students. 7. What is Transition Education ? Discuss about transition education for L.D. students.

63 2.1 Introduction An intellectual disability (also commonly referred to as a developmental disability among other terms) is, simply stated, a disability that significantly affects one's ability to learn and use information. It is a disability that is present during childhood and continues throughout one's life. A person who has an intellectual disability is capable of participating effectively in all aspects of daily life, but sometimes requires more assistance than others in learning a task, adapting to changes in tasks and routines, and addressing the many barriers to participation that result from the complexity of our society. 2.2

Objectives After going through this unit you will be able to:- ? Understand the concept of

Intellectual Disability ? Describe the types

and characteristics of Intellectual Disability ? Explain the

scope of

assessment ? Understand the meaning of assessment ? Explain the purposes of assessment ? Understand the types of

assessment ? Describe the Strategies for Functional Academics and Social skills ? Understand the concept of

Assistive Devices, Adaptations, Individualized Education plan, Person Centered Plan, Life Skill Education ?

Explain

the

meaning of Vocational Training and Independent Living 2.3 Definition, Types and Characteristics 2.3.1

Definition

Internationally the definition of Mental Retardation has moved away from medical model to rehabilitative model. Current trend is to describe the condition by using functional and educational terms rather than clinical terms. Definitions are listed

chronologically to demonstrate the variations in describing condition of Mental Retardation. a. Definition of Mental

Retardation - American Association of Mental Retardation (AAMR) 1983:

64 As per American Association on Mental Deficiency, also previously known as American Association on Mental

Retardation - Mental Retardation refers to a

significantly sub - average general intellectual functioning resulting in or associated with concurrent deficits

in adaptive

functioning. b. Definition of Mental Retardation - Persons with Disabilities Act 1995:

Mental Retardation means a condition of arrested or incomplete development of a person, which is

specially characterized by sub-normality of

intelligence manifesting before age of 18 years. c. Definition of Mental Retardation -

American Association of Mental Retardation (AAMR) -1992: Refers to significantly sub-average intellectual functioning,

existing concurrently with or more of the following applicable adaptive skill areas: Communication Self-care

Home Living Social Skills Community Use Self-direction Health and Safety Functional Academics Leisure Work

In adopting this definition and accompanying classifications system, AAMR (1992) suggested that Mild, Moderate, Severe

and Profound classification categories in previous definitions to be substituted with "levels" of support needed by an

individual using term listed below: Intermittent: Support of high or low intensity is provided as and when needed.

Characterized as episodic or short-term during life - span transitions. Limited: Supports are provided consistently over

time, but may not be extensive at any one time. Supports may require fewer staff members and lower expense than more

intense levels of support.

65 Extensive: Supports are characterized by regular involvement (daily) in at least some environment (work or home) and

not limited (example: Long-term support & long-term home living support). Pervasive: High intensity supports are

provided constantly, across environment, mostly and may be of life sustaining and intrusive nature. Pervasive

supports typically

involve a variety of staff members. This definition essentially restates the 1993 AAMD definition, except that it describes

the developmental period age as 22 years, consistent with the USA federal definitions of developmental disabilities. d.

Definition of American Association of Mental Retardation (AAMR) - 2002 Definition reads, "Mental Retardation

is

a disability

characterized by significant limitations, both in intellectual functioning and in adaptive behavior,

as expressed in conceptual, social and practical adaptive skills,

the disability originating

before the age of 18 years. The complete and accurate understanding of Mental Retardation implies that a particular state of functioning, which begins in childhood, having many dimensions and affected positively by individualized supports. As a model of functioning, it includes the context and environment within which the person functions and ecological approach that reflects the interaction of the individual with the environment.

The outcomes of interaction are with regard to independence, relationships, societal contributions, participation in school and community and to personal well-being. e. Definition of Intellectual Disability

Intellectual disability is a disability characterized by significant limitations in both intellectual functioning and in adaptive behaviour, which covers many everyday social and practical skills.

This disability originates before the age of 18. (

American Association on Intellectual and Developmental Disabilities (AAIDD)- 2010) All the key terms are explained below: 1)

Intellectual Functioning

Intellectual functioning—also called intelligence—refers to general mental capacity, such as learning, reasoning, problem solving, and so on. One way to measure intellectual functioning is an IQ test. Generally, an IQ test score of around 70 or as high as 75 indicates a limitation in intellectual functioning.

66 2) Adaptive Behaviour Adaptive behaviour is the collection of conceptual, social, and practical skills that are learned and performed by people in their everyday lives. ? Conceptual skills—language and literacy; money, time, and number concepts; and self-direction. ? Social skills—interpersonal skills, social responsibility, self-esteem, gullibility, naïveté (i.e., wariness), social problem solving, and the ability to follow rules/ obey laws and to avoid being victimized. ? Practical skills—activities of daily living (personal care), occupational skills, healthcare, travel/transportation, schedules/routines, safety, use of money, use of the telephone. Standardized tests can also determine limitations in adaptive behaviour. 3)

Age of Onset

This condition is one of several developmental disabilities—that is, there is evidence of the disability during the developmental period, which is operationalized as before the age of 18. 4) Additional Considerations But in defining and assessing intellectual disability, the AAIDD stresses that additional factors must be taken into account, such as the community environment typical of the individual's peers and culture. Professionals should also consider linguistic diversity and cultural differences in the way people communicate, move, and behave. Finally, assessments must also assume that limitations in individuals often coexist with strengths, and that a person's level of life functioning will improve if appropriate personalized supports are provided over a sustained period. Only on the basis of

such many-sided evaluations can professionals determine whether an individual has intellectual disability and tailor individualized support plans. 2.3.2

Types A child may be classified as having an intellectual disability at one of the levels listed below. Mild intellectual disability (MID). (1) Intellectual functioning ranging between an upper limit of approximately 70 to a lower limit of approximately 55;

67 (2) Deficits in adaptive behaviour that significantly limit a child's effectiveness in meeting the standards of maturation, learning, personal independence or social responsibility, and especially school performance that is expected of the individual's age level and cultural group, as determined by clinical judgment. Moderate intellectual disability (MOID). (1) Intellectual functioning ranging from an upper limit of approximately 55 to a lower limit of approximately 40; and (2) Deficits in adaptive behaviour that significantly limit a child's effectiveness in meeting the standards of maturation, learning, personal independence or social responsibility, and especially school performance that is expected of the individual's age-level and cultural group as determined by clinical judgment. Severe intellectual disability (SID). (1) Intellectual functioning ranging from an upper limit of approximately 40 to a lower limit of approximately 25; and (2) Deficits in adaptive behaviour that significantly limit a child's effectiveness in meeting the standards of maturation, learning, personal independence or social responsibility and especially school performance that is expected of the individual's age-level and cultural group as determined by clinical judgment. Profound intellectual disability (PID). (1) Intellectual functioning below approximately 25; and (2) Deficits in adaptive behaviour that significantly limit a child's effectiveness in meeting the standards of maturation, learning, personal independence or social responsibility and especially school performance that is expected of the child's age-level and cultural group, as determined by clinical judgment. 2.3.3

Characteristics of Target Group The general characteristics of children with Intellectual Disability are: 1. Delayed development in developmental milestones. 2. Poor language development. 3. Short attention span and poor communication. 4. Poor motor integration and coordination.

68 5. Poor social skill. 6. Poor memory. 7. Poor in thinking, generalization, reasoning and imagination. 8. Poor or delayed concept formation. 9. Poor in scholastic or in academics. 10. May be associated with a typical physical feature i.e. small head/ large head, small eye etc.

The signs and symptoms of intellectual disability are all behavioural. Most people with intellectual disability do not look like they are afflicted with such, especially if the disability is caused by environmental factors such as malnutrition or lead poisoning. The so-called typical appearance ascribed to people with intellectual disability is only present in a minority of cases, all of which are syndromic.

Children with intellectual disability may learn to sit up, to crawl, or to walk later than other children, or they may learn to talk later. Both adults and children with intellectual disability may also exhibit some or all of the following characteristics: ? Delays in oral language development ? Deficits in memory skills ? Difficulty learning social rules ? Difficulty with problem solving skills ? Delays in the development of adaptive behaviors such as self-help or self-care skills ? Lack of social inhibitors Children with

intellectual disability learn more slowly than a typical child. Children may take longer to learn language, develop social skills, and take care of their personal needs, such as dressing or eating. Learning will take them longer, require more repetition, and skills may need to be adapted to their learning levels. Nevertheless, virtually every child is able to learn, develop and become a participating member of the community. In early childhood, mild intellectual disability (IQ 50–69) may not be obvious, and may not be identified until children begin school. Even when poor academic performance is recognized, it may take expert assessment to distinguish mild intellectual disability from learning disability or emotional/behavioral disorders. People with mild intellectual disability are capable of learning reading and mathematics skills to approximately the

69 level of a typical child aged nine to twelve. They can learn self-care and practical skills, such as cooking or using the local mass transit system. As individuals with intellectual disability reach adulthood, many learn to live independently and maintain gainful employment. Moderate intellectual disability (IQ 35–49) is nearly always apparent within the first years of life. Speech delays are particularly common signs of moderate ID. People with moderate intellectual disability need considerable supports in school, at home, and in the community in order to participate fully. While their academic potential is limited, they can learn simple health and safety skills and to participate in simple activities. As adults they may live with their parents, in a supportive group home, or even semi-independently with significant supportive services to help them, for example, manage their finances. As adults, they may work in a sheltered workshop. People with severe or profound intellectual disability need more intensive support and supervision their entire lives. [5] They may learn some activities of daily living. Some require full-time care by an attendant. 2.4 Tools and Area of Assessment 2.4.1

Assessment

Assessment is an inevitable process in daily life for understanding, adjustment, and for taking decision for future action.

Assessment is carried out in a family, in classroom, in the religious places, in the market, in the corporate office, in the execution of Government duties and responsibilities and all other everyday work of the society. It is a vital part of the scientific method of understanding and intervention.

Assessment starts from collection of information and continues in making decision for appropriate action to be taken for improvement of the individual.

This process is very much useful in

different essential services like - physical health, mental health, guidance and counselling, educational process, training, employment, and performance appraisal etc. In all these services collection of information for particular purpose, analysis of the information and making a decision for future course of action for improvement are essential features.

Definition Assessment in general is a process of collection of information about an individual or a group and taking a decision for that particular individual or group for future course of

70 action. Assessment refers to the process of gathering and analysing information in order to make instructional, administrative and/ or guidance decisions about or for an individuals (Wallace, Larsen, and Elksnin, 1992). Definition of assessment focuses on three aspects :- 1. Collection of information 2. Analysis of information 3. Making decision for instructional, administrative and guidance.

2.4.2 Types of Assessment Special Educational Assessment involves collection of information relevant to educational need of the children. This includes personal data, educational performance, the resources, the family involvement in training, and voluntary supports that could be gained for training mentally retarded student. For all these information, it is essential to collect information through different methods. These methods are :- a)

Formal b) Informal Formal In this method, the information is collected by administering test/ behavioural scales / checklist, interview or administering questionnaire. The information is collected through very structured situation. It needs lots of preparation for the tester or observer. Informal In this method, the information is collected through natural interaction between the subject and observer. As because the information is being collected in a natural situation, there is a chance of getting appropriate response from the subject. Different Tests are constructed for Assessment. Constructions of the tests are also vary as per the process of construction. There are two types of tests. These are Norm Referenced Test and Criterion Referenced Test. Norm referenced assessment and Criterion referenced assessment are named on the basis of the test used in the assessment process. The details of these two assessment process is given below :-

Norm Referenced Assessment Norm Referenced Assessment is the more traditional approach to assessment. These tests and measurement procedures involve test materials that are standardized on

71 a sample population and are used to identify the test takers ability relative to others. It is also known as formal assessment. Norm referenced assessment is defined as a procedure for collecting data using a device that has been standardized on a large sample population for a specific purpose. Every standardized assessment instrument will have certain directions that must be followed. These direction specify the procedure for administering the test and ways to analyse and interpret the results and reporting them. Examples of the more commonly known formal assessment devices are the Wechsler Intelligence Scales for children - Revised (WISC-R), the Illinois Test of Psycholinguistic Ability (ITPA). The Stanford- Binet Intelligence Test and the Peabody Picture Vocabulary Test - Revised (PPVT-R) and Peabody Individual Achievement Test (PIAT). Advantages of Norm-Referenced Assessment Norm Referenced tests are widely used in special and remedial education for many reasons. * First, the decision of categorizing the children as exceptional or special is mainly based on the test results of NRTs. *

Second,

it is easy to communicate test results to parents and others unfamiliar with tests. *

Third,

norm-referenced tests have received the most attention in terms of technical data and research. They are specifically useful in problem identification and screening.

Disadvantages of Norm-Referenced Assessment The use of norm referenced tests data for the purpose of educational programming is questioned in many instances for the following reasons. * Information obtained from norm-referenced testing is too general to be useful in everyday classroom teaching. Many educators disregard the prognosis and interpretative types of data provided by standardized tests because the information is often not directly applicable to developing daily teaching activities or interventions. What does knowing a student's WISC-R score or grade equivalent in reading specifically tell a teacher about what and how to teach ? For instance, what is important is to know whether the student needs to learn initial consonants or is he having difficulty with comprehension. * NRTs tend to promote and reinforce the belief that the focus of the problem is within the student. It is because the primary purpose of NRTs is to compare one

72 student with another. However, although a student

may differ from the norm, the real problem may not be within the student but in the teaching, placement or curriculum. Educators must begin to assess teacher behaviours, curriculum content, sequencing and other variables not measured by norm referenced tests.

Criterion Referenced Assessment Criterion Referenced Assessment is concerned with whether a student is able to perform a skill as per the criteria set, or not. In contrast to norm-referenced assessment, which compares one persons performance to others, criterion referenced assessment compares the performance of an individual to the pre-established criteria. In criterion- referenced test, the skills within a subject are hierarchically arranged so that those that must be learned first are tested first.

In math, for example addition skills would be evaluated (and taught) before multiplication skills. These tests are usually criterion referenced because a student must achieve competence at one level before being taught at a higher level.

Advantages of Criterion Referenced Assessment The criterion referenced test results are useful :- * to identify specific skills that need intervention * to determine the next most logical skill to teach as the implications for teaching are more direct with criterion referenced tests. * to conduct formative evaluation, that is, the performance of the student is recorded regularly or daily when the skills are being taught.

This makes it possible to note the student progress, to determine if intervention is effective and to help decide the next skill to be taught if achieved, if not to decide what other strategies or methods and materials are to be used for teaching. Disadvantages of Criterion Referenced Assessment * Establishing the passing criteria for a specific skill is a problem in criterion referenced testing. For example, if a test were needed to determine whether student had mastered high school mathematics, there is a problem of determining exactly which skills should be included in the test. Further, should a student pass the test if 90% of the questions are answered correctly or only if 100% are correct ? These decisions must be carefully considered, because setting inappropriate criteria may cause a student to struggle unnecessarily with a concept.

73 * It is difficult to decide exactly which skills should be included in the test. * There is also a problem that the skills assessed may become the goals of instruction rather than selecting the skills that the student should know. Due to this, the teachers may narrow down their instruction and teach in accordance with what is measured on the test rather than what is truly required for the student to know. Continuous Assessment Assessment is an ongoing process. In the process of Special Education to the children with Intellectual Disability, their abilities are assessed periodically to plan the future training programme. A flow diagram of which is given below :- Assessment Programme Planning Implementation Evaluation Suggested Modification In the above diagram, evaluation is carried out after implementation of the programme to see the level of achievement compared to set criteria. Evaluation is restricted to the programme planned for the child. Assessment covers the other non-planned area for training. Assessment after each year or after a particular period of training is inevitable for decision making about the child. For example, a student of Primary class in a Special School for the Intellectually Disable children is assessed at the joining time for programme planning. After one year and completion of 4 years in that class assessment is carried out for further decision making both for administrative purpose and training purpose. Assessment is a continuous on-going process which is a vital part of Special Education. 2.4.3 Tools and Areas of Assessment In special education assessment, the same tool can be used for diagnostic, prescriptive and evaluation purposes. Purposes for assessment include monitoring student

74 understanding during a lesson, checking student progress during a specific programme implementation and evaluating student achievement at the end of training programme. In the first two instances, the assessments are called Formative Evaluation; in the latter instance, it is Summative Evaluation. It is used to measure how well students have learned key content and skills as defined by the learning segment's goals and objectives. The selection of assessment tools and methods vary depending on the purpose for which the assessment is to be carried out and the type of the data that has to be gathered. Following are the various tools available for special educational assessments developed for the Indian context. 1.

Madras Developmental Programming System (MDPS) The first Indian comprehensive Behavioural Scale developed in 1975 at Chennai,

the then name Madras to use for assessment of behaviour potential and programme planning of mentally retarded children. This scale

could be used for any age, sex and level of retardation in our country. This is a Criterion Referenced Assessment Scale, which provides an inbuilt system for periodic assessments and evaluation, which helps for planning, execution and monitoring of special education, and related services for children with

mental retardation. Description This scale

could be used for individualized Educational Programming and in classroom teaching. There are 18 domains in the scale and each domain comprises of 20 items. The items in the domains are sequentially arranged in most of the domains.

The domains are listed below :- 1. Gross Motor Activities 2. Fine Motor Activities 3. Meal Time Activities 4.

Dressing 5. Grooming 6. Toileting 7. Receptive Language 8. Expressive Language 9. Social Interaction 10. Reading

75 11. Writing 12. Numbers 13. Time 14. Money 15. Domestic Activities 16. Community Orientation 17. Recreation, Leisure Time Activities 18. Vocational

Administration The administration of this scale is very simple. The user should have an assessment kit ready on different items of the domains

and collects information by a) direct observation, b) report from the parents, caretakers and others informal.

The item already the student achieves is marked by A and fails is marked by B. at the end of the administration all the A's and B's are counted in each domain and entered at the right side column of the domain. The A's are coloured with blue and the B's are coloured with red. The blue area indicates the student's performance and red area indicates the needs to be given training. Use The scale is widely used for both IEP and assessment and management in the classroom due to its unique features like :- 1.

Contains wide area of behavioural domain. 2. Details of items in each area. 3. The items of many areas are sequentially arranged. 4. Easy administration. 5. Helps in curriculum development. 6. Helps in Educational Grouping of the children and summative evaluation. 7.

Helps in formative evaluation of the curriculum transaction. 8. Helps in monitoring the special educational services. 9. Could be used throughout the schooling of the student.

76 2.

NIMH - Vocational Assessment and Programming System for Persons

with Mental Retardation (NIMH-VAPS) This scale was developed at NIMH under the supervision of Ms. A.T. ThressiaKutty in 1998. The scale is developed to assess

the general ability, vocational potential and work behaviour of the mentally retarded adults. This aims at assessing the vocational potentiality of an adult with MR and helps in planning and execution of vocational training. It provides information on work readiness skills, helps to identify suitable jobs in the community. It is useful for formative and summative evaluation of the vocational training also. It could be used in training set up in the institution, sheltered workshop or workshop or open employment system while job training. Description The scale is mainly divided into 4

parts :- 1. Vocational Profile. 2. Generic Skill Assessment Checklist. 3. Job Analysis Format. 4. Work Behaviour Assessment Checklist. Generic Skills Assessment Checklist Personal 04 Communication 05 Social Behaviour 10 Functional Academics 30 Safety Skills 07 Domestic Behaviour 13 Mobility and Hand Functioning 05 Occupational Skills 06 TOTAL 80 Job Analysis Format I Main Work Area I Additional Duties I Work Related Skills

77 VOCATIONAL ASSESSMENT Trainee Assessment Community Assessment Generic Skill Assessment Job Identification (Specific Skills Personal Job Analysis Communication Job Matching Social Behaviour Job Training Functional Academics Job related Skills and Safety Domestic Mobility Work Behaviour Training Job Placement Supported Employment / Open Employment / Sheltered Employment / Self Employment

78 | Personal | FA | Sex | Education | Recreation | Independent Living Skills Work Behaviour | Job Requirement | Job Training Procedures | Trainers Responsibilities | Parents Cooperation Work Behaviour - Assessment Checklist | Physical Appearance | Personal Interaction | Regularity & Punctuality | Communication/ Social Manners | Quality & Quantity Aspects of Work Scoring System Performance of each item by the trainee must be observed and codes must be given against each item as per the instruction given below :- Description Code Always 3 Attention 2 Rare 1 Never 0 Use | Provides information on jobs selected | Identifies areas in which training is needed

79 | Emphasizes on the job training. | Evaluates work related skills and work behaviour. | Targets employment for all trainees who are assessed. | Extends support for job retention. 3.

Behavioural Assessment Scale for Indian Children with Mental Retardation (BASIC-MR)

This behavioural scale was developed at NIMH under the guidance of Peshwaria R. and Venkatesan A. in the year 1992.

This is developed to assess and evaluate the performance of the children with mental retardation of various level and age group. This has

two parts. 1. BASIC-MR Part-A 2. BASIC-MR Part-B BASIC-MR Part-A

is used for understanding the strength and needs of the children with mental retardation to develop the educational programming. Part-B is used to assess the problem behaviours of the children with mental retardation to intervene to reduce the problem behaviour which are the main hindrances for their learning. Both the parts are useful for assessment of adaptive behaviour and maladaptive behaviour of children with mental retardation for classroom management.

Description BASIC-MR Part-A has seven areas and each area has forty items. The details of the test is given in the table:-

Sl No. Domain No. of Items 1. Motor (Gross Motor & Fine Motor) 40 2. Activities of Daily Living (ADL) 40 3. Language (Receptive & Expressive) 40 4. Reading - Writing 40 5. Number - Time 40 6.

Domestic - Social 40 7. Pre-Vocational - Money 40

80 BASIC-MR Part-B has ten areas. Different areas have different varying number of items. The details of the test is given in the table :- Sl No. Domain No. of Items 1. Violent & Destructive Behaviours 16 2. Temper Tantrums 04 3. Misbehaviours with Others 07 4. Self Injurious Behaviour 10 5. Repetitive Behaviour 08 6. Odd Behaviours 08 7. Hyperactivity 03 8. Rebellious Behaviours 06 9. Anti-Social Behaviours 09 10. Fears & others 04

Administration BASIC-MR Part-A : The information is collected through observation, interview the parents and report from the teachers and caretakers. The degree of performance in each item could be noted by different points.

The description of the points is described below :- Scoring Description Code Independent 5 Clueing 4 Verbal Prompting 3 Physical Prompting 2 Total Dependent 1 Not Applicable 0

81 Use It is used for the following purpose :- 1. Assessment to understand the strength and needs of children with mental retardation. 2. Programme planning for IEP & Group Teaching 3. Evaluation of performance 4. Monitoring of the programme 5. Report writing 4.

Functional Assessment Checklist for Programming (FACP-NIMH) Functional Assessment Checklist for Programming - FACP-NIMH was developed at NIMH in the Department of Special Educational under the supervision of Dr.Jayanthi Narayan.

It was developed keeping in view that, it would lead to appropriate programming. It also provided inbuilt periodic evaluation facility for monitoring progress and modifying the programmes. It also provides quantitative and qualitative measurement of the student's progress. The FACP has 7 parts. These are: - 1.

Pre-Primary 2. Primary-I 3. Primary-II 4. Secondary 5. Pre-Vocational-I 6. Pre-Vocational-II 7. Care Group

Grouping is done for the purpose of maintaining uniformity in special education, time bound programming and for easy transaction of curriculum in special school for the children with mental retardation. The different checklists are developed for different classes. The particular checklist contains minimum required skill for that class and scope of inserting items those are required for each domains of the checklist. The items to be inserted is being decided by the special educator involved assessment. This is being done as per the need of the student according to his socio-cultural background. After completion of stipulated training in particular class decision will be taken for promotion.

82 Promotion procedure could be easily administered through evaluation. After achieving more than 80% task prescribed in a particular group the student could be promoted to the higher class. Each checklist has 5 domains. These are: - 1. Personal 2. Social 3. Academic 4. Occupational 5. Recreational Administering Checklist The student's performance on each item must be noted. The information regarding the student's performance could be collected by observation through activities, report from the parents, the caretakers and from the last records. Performance could be recorded as code given below :- Encoding the students performance for the domains - Personal Social Academic & Occupational Performance Code Description Yes + The student can perform the item with no help. Occasional causes C The student reads to be given classes which requires thinking by the student to perform the task. Verbal Prompting VP Telling each subtasks verbally to the trainee like - rinse hands, 'pick up soap' apply so on. Physical Prompting PP Physically helping the student to complete the task. No - Student is totally dependent on the task hence one has to completely perform the task for the student. No Exposure NE Lack of opportunity to learn.

83 Scoring Recreational Activities Code Description

A Takes initiative and participate effectively. B Participates when other initiates. C Involves self but not aware of rules. D Observes with interest. E Not interest (Indifferent) NE No Exposure

Usefulness of FACP 1. The items are easy to understand. 2. Necessary activities are enlisted. 3. Necessary items are to be observed for a particular class. 4. Scope of including items necessary in a particular domain for students from specific cultural background. 5. Proper weightage could be given to their performance. 6. It has scope for monitoring and evaluation. 7. It could be used for curriculum transaction and reference for promotion. 5.

Upanayan - A programme of Developmental Training for Children with Mental Retardation This is an assessment tool for young children. This programme covers children in the age group of 0-6 years. The programme consists of a checklist, a user manual, a set of activity cards and material for assessment and training. Description The checklist covers five areas of development viz., motor, self-help language, cognitive and socialization. Each domain has 50 items totaling upto 250. The items are arranged in a sequence based on normal development.

84 Administration The activity cards are colour coded to separate each domain from the others. The manual contains a list of materials to be used during assessment. The record formats are provided to note the background information and the assessment data periodically. If a student performs an activity it is marked "A" and the student does not perform the task it is marked "B". The programme is computerized so that the parent can be given the respective activity cards needed for training their student. The programme is intended for home training in home based and center based intervention. 6. Portage Guide to Early Education This is developed

by S.M. Bluma, M. Shearer, A.H. Frohman and Jean M. Hilliard (USA). It

is basically a system for teaching skills to pre-school children with developmental delays. The portage project is a home based training system, which directly involves parents in the education of their children in the early childhood i.e., 0- 6 years of age. The training is provided by a specially trained teacher or a public health worker with a special training and experience in the field of student development. However, the key person in the home-based programme is parents/ family members. It can be used by Para-professionals like the staff of Anganwadis, Balwadis, non- professionals like parents, siblings,

and professionals such as pre-school educators, psychologists, and doctors. Description

The portage checklist covers areas such as infant stimulation, self-help, motor, cognitive, language and socialization. In each area, the activities are listed in a sequential order corresponding to the age. In addition to the checklist, there are activity cards for each skill, which explains the materials and procedure to be used to train the student. The checklist also provides age norms for each task on the margin, which help the trainer estimate the age equivalence of the student's functioning. Administration The first step is to check through the listed skills in all the areas and record the performance of the student against each skill under the column entry behaviour. There is also the provision to mark date of achievement and remarks. A separate provision is made (Activity chart) to record activities, achievement and targets. As the format accommodates daily and weekly recording of progress, there is close monitoring.

85 2.5

Strategies for Functional Academics and Social Skills 2.5.1

Functional academics Functional academics is merely academics made functional

designed to teach skills which allow each student

to succeed in real-life situations at home, school, work and in the community. The functional academics curriculum includes a range of areas namely: ? Pre-requisite concepts ? Maths ? Reading ? Writing ? Communication ? Community orientation ? Skill oriented activities

etc..... Given these areas

the teachers tailor the academic programs to the age, gender, needs and functioning of the student. Each of the subcomponent is divided into skill level and task analyzed to sequential steps which ranges from early childhood to transitional skills. Such skills are not taught in isolation but as part of multi-sensorial approach. Key outcome of functional skills is for the students to exercise maximum sense of control, engage in self-directed behaviour and autonomy over his/her environment. Functional

Reading Functional Reading is defined as a

student's actions or responses resulting from reading printed words (

Brown and Parlmutter, 1971). Functional term is related to application of learnt skills in real community settings. Hence

words selected for reading must be "functional" allowing the reader to become independent in community living. As

stated by Polloway and Patton (1993), reading is the key to personal and social adjustment and for successful

involvement in community activities. Kirk and Monroe (1948) outline three goals that help develop frame for teaching

readers with disability: Primary goal for all students who are mildly or moderately disabled for learning academics, is to

develop "ability to read for protection and survival". This includes examples like – Directions in community, Sign Boards in

community, Labelson consumer products for daily use and significant symbols that direct for safety and survival such as

symbol for toilets, danger symbol, signage for restaurant etc.

86 Second goal is for reading to gain "information and instruction" which implies an individual to deal with application for jobs, reading news-papers to be updated on current happenings for general knowledge, reading advertisements,

facilitate usage of telephone and address book for accessing social contacts. Third goal is to read for "pleasure". For most

of students with Mental Retardation this is an essential pre-requisite and a realistic goal which helps them engage in

making simple accessible choices in daily life at home and outside home in community. Teaching Functional Reading:

Teaching functional reading has several approaches as stated by Auckerman (1971), however he endorses an eclectic

method is necessary for meeting individualized needs of students with Mental Retardation. However approaches are

separately explained for purpose of clarity in selecting approaches rationally to suit each child with disability meaningfully

and disability level wise. (i) Sight Word Vocabulary (Whole Word Approach): By helping student recognize the "whole

word" at one time and later introducing the awareness to decode each letter to spell appropriately helps child first pay

attention to group of familiar alphabets in a cluster. Later while decoding the student can become familiar with sequence

of placement of letters and the rational for spelling the word by associating sound with specific letter and arrangement of

letters and corresponding sounds that represent placement of letters in given word spelling. We use this technique for

the student to identify his or her own name and then the alphabets in it. Start with the student's name to read and write.

The letters in the name have to be associated with the pics first, then letter-letter matching and then writing the whole

name. Matching left -right then diagonal and then placing the letters in the required sequence for the name. Similarly for

surname, home address. Once these are achieved father's name, mother's name, sister's name, brother's name. Start

with words the students can associate and is relevant for them through this method. (ii) Errorless Discrimination (Walsh &

Lamberts, 1979): Here teacher can present the whole word in isolation and read aloud by pointing to the word beginning

with 3 to 4 letter words then slowly progressing using same method to read complex words increasing in letters from 5

to 6 and onwards according to the child's pace and ability to progress in reading, in 4 to 6 trials.

87 Functional Writing One of the important mode of communication is written expression. This demands eye - hand coordination, motor co-ordination, sense of direction and recognition of symbols (pictures/letters/ numbers/words /punctuation etc). Some writing tasks require "left to right" orientation in horizontal direction (for writing words), whereas some tasks require vertical orientation (for writing numbers in arithmetic problems as in addition or subtraction). Writing involves Four Stages: i. Tracing ii. Joining Dots iii. Copying iv. Writing by Memory (including spellings of words and sequence of words in a sentence). Functional Arithmetic Numbers play an important role in our lives. Our communication involves reference to negotiating quantities. Schwartz and Budd (1983), define Functional Mathematics as "use of mathematics needed for vocational, consumer, social, recreational and home making activities". Functional mathematics includes: Functional Arithmetic: At the preschool level of education and primary, the students need to count parts of the body, things in the classroom, blades of the fan, legs of an animal, table, fingers of one hand, etc. Pre-Computational Skills: Development of maths skills follows a sequence: Relative position of one in quantities - such as being aware of terms to describe quantities "more"/ "less"/ "few"/ "none" even before introducing number values. Teach the student to identify "1" object only. Then introduce the symbol "1" only after student successfully identifies real object in "1" quantity. Then place the object under the flash card with written symbol "1". Finally ask the student to read the numeral "1" by showing the flash card. Teach the student further numbers only after learning concept of "1" successfully. Place "one more" after "1" and then by counting say "1" and "2" in orderly manner. Also encourage to identify which of the body parts are in "2" numbers on one's own body. Same procedure will follow for teaching higher numbers in sequential order. Counting items in daily use must follow "left to right" orientation. Writing Numerals: This includes - Tracing, Copying and Writing from Memory. Cardinal and Ordinal Numbers: Numbers indicating "quantity" is called a "cardinal numbers" (Ex: How many boys have visited house.) and those values that identify "position" are called as "ordinal numbers" (Ex- in case you are searching a house address, often directions read left turn and third house on the left side, this denotes position of the house (ii) Computational Skills: It includes basic skills in addition, subtraction, multiplication, division etc. (iii) Application Skills Daily experience in our life requires application of maths skills, some include money, time, capacity, weight and mass, length and distance. All these areas involve some form of measurement, which is based on relative comparisons. Money - It helps us compare worth of objects. Instruction about money should follow sequence throughout, in relation to practical experiences. Therefore it should be planned in such a way that each student's needs in terms of utility are met. They can be asked to make the totals of list of grocery items on calculator. Students can be sent to purchase a few items from the shop. They can make a total of clothes for laundry or given for ironing. Time - While defining time we are comparing a period between two events with predetermined duration. First thing while teaching time is to build concept of events happening in sequence. An important pre-requisite for telling time is an identification of clock and calendar. To relate parts of the day and night and understand its relevance with reading time in clock. Understanding progress of time in days, weeks and months year wise and relate use of calendar. It is important that student honours daily routine for respecting time limits for getting ready to school, mealtime, TV watching, or visiting friends or places and differentiate between school and holiday schedule. Student must also comprehend frequency of events that occur weekly, monthly and yearly, such as festivals and birthdays occur once a month but Sunday comes once in a week and school going is a daily routine.

89 Weight / Mass / Length / Distance: We use measurement in day-to-day activities to describe "how much", "how long", "how far" concepts very frequently for making important decisions. Comparative statements like more vs. less, big vs. small, heavy vs. light are used meaningfully in daily practical real situations. These relative measurements are very essential for daily living, therefore adaptive options for measurement are necessary to use in teaching students with Mental Retardation for regular use. a. Capacity / Volume: Introduce that liquids like water, oil, milk and petrol are measured in unit of Litres (Ltr) and Millilitre (ml), which refers to "capacity / volume". b. Weight and Mass: Drawing from example of measuring liquids, introduce concept of weight of objects or person how they may be heavy or light and therefore unit of measurement for that is "Kilogram", "grams". c. Length and Distance: Length of bench, plot and height of a person is measured in feet and cloth is measured in metres or centimetres. Distance between places or locations like distance between two cities is measured by Kilometres or metres. These are all measurement concepts used in daily life. These concepts can be taught with simple exercises for students.

2.5.2 Social Skills Appropriate social behaviours are necessary for any person to be an acceptable member of the society. Every human being is expected to follow certain standards of social behaviour, set by the society according to the cultural norms and age level of the individuals. In case of persons with mental retardation, intensive training is needed to cultivate appropriate social behaviours. Instead of keeping them away from the society, giving them chances to mix in the society from the childhood itself will lead them towards gaining social competency. The training should be started very early in life. The family, the relatives, neighbours, friends, and the society at large are responsible for the social skills training of the persons with mental retardation. ? The following social skills are need to be taught: 1 Waits for needs to be fulfilled 90 2 Plays with peers sharing objects 3 Greets others 4 Obeys Commands 5 Says 'Please', 'Thank you', 'Sorry' appropriately 6 Helps parents in household tasks 7 Asks permission 8 Takes turn 9 Participates appropriately at meal time 10 Dresses and grooms appropriate to the situation 11 Visits relatives and friends 12 Participates in social functions 13 Behaves appropriately with the opposite sex 14 Returns borrowed materials 15 Identifies human service persons and community helpers HOW TO TRAIN? ? Give chances to learn the skills through regular selected activities. ? Gradually reduce the number of repeated instructions and observe his performance in natural environments. ? Include him as a family member, in all family get together. ? Give him chances to participate in social and religious functions. Outings help in enhancing social skill training. ? Accept the intellectually disabled child as a member of the family and the community. Intensive training is needed to cultivate appropriate social behaviours in the persons with Mental Retardation. The training should started early in life. The family, the relatives, neighbours, friends and the society at large are responsible for the social skills training of the persons with mental retardation. The persons with mental retardation need stimulation, repeated chances, supervision and training to develop proper skills.

91 2.6

Assistive Devices, Adaptations, Individualized Education Plan, Person Centered Plan, Life Skill Education 2.6.1

Assistive Devices

Assistive technology is the term used to describe devices used by people with intellectual disabilities and/or other disabilities that help

compensate for functional limitations and increase learning, independence, mobility, communication, environmental control and choice.

This term also refers to direct services that assist individuals in selecting, acquiring or using such devices. How do people with intellectual disabilities use assistive technology? Communication: Low to high tech communication devices can be the

means for communication for a person who cannot communicate with his or her voice, due to physical and/or cognitive reasons.

Environmental Controls: Devices to control the environment are important to people with severe or multiple physical disabilities and/or cognitive disabilities, who have limited ability to move about in their environment or control electrical appliances. Technology allows a person

to control electrical appliances, audio/video equipment such as home entertainment systems or to do something as basic as lock and unlock doors.

Mobility: Simple manual to sophisticated computer-controlled wheelchairs and mobility aids such as walkers and canes are available for a person who cannot walk.

Education: The computer can be a tool for improved literacy, language development, mathematical, organizational, and social skill development. Alternative ways to access computers are available for people who cannot operate a keyboard. A variety of software is available to help computer-users who have visual impairments and facilitate improved spelling and literacy skills for individual users with print disabilities. Activities of Daily Living: Examples are: ? Devices to assist a person with memory difficulties to complete a task

or to follow a certain sequence of steps from start to finish, such as making a bed or taking medication ?

Directional guidance systems with auditory cues to help a person travel from one place to another

92 ? Devices to help a person shop, write a check, pay the bills, or use the ATM machine Employment: In response to the Americans with Disabilities Act, employers are making the workplace more cognitively accessible. This may require worksite modifications by the employer, to permit the employee to perform a job. For example, an audiotape might be used to prompt a worker to complete each task in a job. Sports and Recreation: Adaptations can be made to computer games which allow the game activity to be slowed down

for a user who cannot react as quickly to game moves and decision-making.

Specially adapted sports equipment is available to compensate for functional limitations, such as specially designed ball ramps that are used in bowling. How can assistive technology benefit people with intellectual disabilities?

Assistive technology can help people with intellectual disabilities overcome barriers towards independence and inclusion. Technology can compensate for a person's functional limitations.

People with intellectual disabilities should be introduced to assistive technology as early as possible. The AT device should be available for use throughout the day and

in natural settings, including home, school, work and recreation. There should be consistency in the kind of technology available, how it is used, and methods for instructing the user on operating the device. Transitions from one device to another should be made as smooth as possible by building on and integrating previously learned skills. Technology solutions

should be flexible and customized to accommodate the unique abilities of each person with intellectual disabilities.

There is a growing use of assistive technology with infants and young children, particularly with communication devices introduced to facilitate early language development. 2.6.2 Adaptations

Adaptations retain the learning outcomes of a prescribed curriculum, and are provided so the student can challenge the regular learning outcomes. A child on an adapted program may be well below the standard of the class, but still may be able to minimally meet the grade level expectations. Class or grade level comparisons in establishing if a student meets expectations should be avoided. These adaptations can include alternate formats, instructional strategies and assessment procedures.

Adaptations include, but are not limited to: ? extended time for assignments or tests, ? a learning assistance support block is scheduled to develop and practice study skills,

93 ? audio tapes or a peer helper to assist with assigned readings, ? a computer to facilitate the completion of written assignments, ? alternatives to written assignments to demonstrate understanding, ?

separate settings for tests and exams, and ? supervised breaks for tests and exams.

Adaptations/Accommodations: For Mild to Moderate Intellectual Disability: ? Do not use complex sentences with a person who is mentally slow. ? Concentrate on concrete ideas and skills. An individual with Intellectual Disability often has trouble with abstract concepts. ? Make instructions clear and concise. Break directions down into small steps or tasks. ? Demonstrate whenever possible. Showing is often more effective than telling. ? Be patient, persistent, and consistent. ? Provide warmth and acceptance. Promote a sense of security through a smile, words of praise, or physical expressions of affection. ? Show respect. Do not be condescending. Talk to the individual as a person; talk to an adult as an adult, not as a child. ? Don't have low expectations for a person with Intellectual Disability. Given training and support, a person with retardation can be gainfully employed and totally integrated into society as a valuable, contributing member. For Severe to Profound Intellectual Disability: ? Use the accommodations listed above. ? Do not react with pity, anxiety, or a variety of other negative emotions when first meeting a person with a severe handicap. ? Use age-appropriate conversation. ? Use age-appropriate activities. ? Include these individuals in community and family activities. Even an individual with profound retardation profits from events that provide integration/interaction with persons who are not handicapped. In fact, this is the way he/she learns

94 best. Being exposed to every phase of community life allows him/her to learn the behaviours necessary for achieving maximum participation in society. Parents must be made fully aware of adaptations to their child's program on an ongoing basis and formal reports or IEP's should note the adaptations being made.

2.6.3 Individualized Education Plan (IEP)

To make teaching and learning effective for Person with Intellectual Disability, an individual educational program is prepared to meet the individual need of the child as every child is unique and needs are specific. Hence, a comprehensive evaluation is carried out to facilitate the process of program planning. The evaluation involves health history, education history, family history etc. mental ability, sensory ability, adaptive behaviour, maladaptive behaviour, academics status and many other elements. Intellectual impairment in mental retardation is characterized by poor or less ability to understand and learn. The individual differences between people with mental retardation are varied to such an extent that every child needs can only be met through a well planned IEP. Special educator, principal, teachers, parents and other professionals as per requirements of the multidisciplinary team (Occupational Therapist, Physiotherapist, Social worker, nurses, psychologist etc.) who are concerned with the needs of the students need to participate in the meetings to develop and evaluate the IEP. The well formatted written IEP document serves as a management tool for intervention. Depending upon the child needs the IEP should have program in PT, OT, ST along with the special education programme. In totality the IEP helps in implementing, monitoring and evaluating the program. Components of IEP Globally IEP contains a specific format with all the components, intact to write IEP. This is written in two parts. Part-1

1. Demographic data It includes, child's name, age, sex, education, mother tongue, address, parents name, occupation, income, date of filling the IEP, registration number, class and roll no. etc. on specific heads on which information is required.

2. Significant information about the "person with mental retardation" Any significant and specific information in relation to the child may be documented. E.g. Sensory preference, learning time preference, attention span, rate of learning etc.
3. Goals: Goals selected on annual basis which the teachers expect the students to achieve over a period of one year as per curricular content is documented.
4. Associated condition: Many person with mental retardation have an additional disability or more are technically referred to as multiple impairment/ disability. For e.g. Mental Retardation, Visual Impairment, Mental Retardation and Hearing Impairment, Mental Retardation and Cerebral Palsy, Mental Retardation and Epilepsy, Mental Retardation and Autism etc. Curricular strategies and planning may differ in cases with additional impairments.
5. Staff responsible: The person responsible for implementation of the IEP is documented for administrative and clinical reasons.

PART-B

1. Skill: Specific statements of what skill / task / activity to be taught is documented in the specific terms. E.g. writing names of month of year.
2. Baseline or current level: The current level or baseline performance level of the student in reference to the task/ skill/activity for teaching is documented. E.g. can write names, 3-4 letter words.
3. Specific objectives or Behavioral objectives: This is the statement that specific what the student will learn(content) what the student will do with the content(behavior), performance level of the student in the content(criteria) and how much is the time period required for achieving the target(duration).
4. Material and learning aids: Learning aids make learning meaningful and easier. Every child has unique needs hence; learning aids effective for one child may not be effective for other child. Depending upon what is to be taught and child specific interest, level and needs learning aids may differ for same activity.
5. Procedure: How to motivate the child to learn the activity and how the task will be taught is described stepwise under procedure. This all includes different strategy to be used to make the learning effective.
6. Evaluation: The student's performance in the particular task chosen against the set criteria as per the specific objective is noted.

96 Some more information on the IEP content Background information: This information is noted briefly focusing on educational relevant details which help in IEP planning. Child family background (siblings, socio economic status, educational status, status of family members); birth and developmental history, school history, occupational history are required for appropriate IEP planning and family intervention. For e.g. for a rural child with illiterate parents more sketches, less written matter and material as per rural availability will be required. Child having history of epilepsy without medical intervention may have to be referred to medical intervention. Assessment of current level of functioning: Without being subjective and adding any interpretation the teacher notes down the exactly what the child does while performing a specific activity. The teacher at this stage doesn't says no or doesn't point out the mistakes. Assessing the current level required skill and efficiency and to be done with accuracy. A wrong assessment will lead to a long goal i.e. to high or too low goal. A total assessment of a child may take a week or more and a natural environment is preferred for assessment. Certain specific information like toileting, bathing skills etc. may be availed from the parents. The teacher must make a good interpretation of the parent remarks. The assessment will include various skills in motor, self help, socialization, language, domestic activity, recreational activities, academics activities, time and money concept. For a slow learner and high functioning MR assessment may have to be conducted for grade level functioning using the regular school books. Here silent reading, oral reading, reading comprehension, spelling, writing ability, dictation, writing on own, arithmetic ability, arithmetic comprehension etc. may have to be tested. Assessment of the detailed pre vocational skills need to be conducted. Various assessment tools used for assessment in our country are:- 1. Madras Developmental Programming System (MDPS). 2. Functional Assessment Checklist for Programming (FACP). 3. Behavioural Assessment Scale for Indian Children having Mental Retardation (BASIC – MR) 4. PORTAGE 5. UPNAYAN 6. NIMH-Vocational Assessment Programming System(VAPS)

97 Goal By considering the child past achievement, rate of achievement, current level, practical use of the activity, priority need of the child, time required of the training, parental involvement level and teachers skills; goals are selected. The activities of the daily living goals are the priority areas. Priority goals may differ for home based training and school based programmes. Short term objectives It means breaking down of annual goals into smaller units. Specific strategy can be worked out for the achievement of the objectives. The objectives would contain the condition in which the child would perform, who would perform, what behaviour would be performed, what would be the criteria of the performance and duration for the achievement of the objectives. The objectives are stated in behavioural terms specifying observable behaviour and criteria for mastering. It clearly tells what is expected from students and what is to be done. 2.6.4 Person Centred Plan Person centred planning has been used for over 20 years and, in that time, there has been much learning. It cannot be explained with a simple one-sentence definition. In fact, the use of the word 'planning' leads to significant misunderstandings and a focus on doing a 'plan', rather than the more important essential components of listening and thinking with the person, learning what it is the person and their family want, and responding to providing the supports needed to achieve the goals and aspirations of the person and their family and friends. The process is embedded in the person's social and cultural context and therefore reflective of, and responsive to, their personal, social and cultural circumstances. Probably the best way to ensure that its complexity is understood is to quote from some of the people who have written about, practised and taught person centred planning over the years. Helen Sanderson describes it as: "...a process of continual listening and learning, focused on what is important to someone now, and for the future, and acting upon this in alliance with their family and friends. It is not simply a collection of new techniques to replace individual program planning. It is based on a completely different way of seeing and working with people with disabilities which is fundamentally about sharing power and community inclusion."¹ (Sanderson, H. (2000) PCP: Key Features and Approaches, <http://www.helensandersonassociates.co.uk>)

98 The NSW Community Participation Program Guidelines state that service providers should move to person centred planning and identified five key issues. These are that: _ the person is at the centre _ their wider social network is involved as full partners _ there is a partnership between the person, their family and the service provider _ the whole of life is considered _ there is continued listening, learning and action. (NSW Community Participation Program Guidelines 2006, DADHC, www.dadhc.gov.nsw.au) 2.6.5 Life Skill Education Life skills have been defined by the World Health Organization (WHO) as "abilities for adaptive and positive behavior that enable individuals to deal effectively with the demands and challenges of everyday life".

They represent the psycho-social skills that determine valued behaviour and include reflective skills such as problem-solving and critical thinking, to personal skills such as self-awareness, and to interpersonal skills. Practicing life skills leads to qualities such as self-esteem, sociability and tolerance, to action competencies to take action and generate change, and to capabilities to have the freedom to decide what to do and who to be. Life skills are thus distinctly different from physical or perceptual motor skills, such as practical or health skills, as well as from livelihood skills, such as crafts, money management and entrepreneurial skills. Health and livelihood education however, can be designed to be complementary to life skills education, and vice versa. Key Life Skills

Life skills include psychosocial competencies and interpersonal skills that help people make informed decisions, solve problems, think critically and creatively, communicate effectively, build healthy relationships, empathize with others, and cope with managing their lives in a healthy and productive manner. Essentially, there are two kinds of skills - those related to thinking termed as "thinking skills"; and skills related to dealing with others termed as "social skills".

While thinking skills relate to reflection at a personal level, social skills include interpersonal skills and do not necessarily depend on logical thinking. It is the combination of these two types of skills that are needed for achieving assertive behaviour

99 and negotiating effectively. "Emotional" can be perceived as a skill not only in making rational decisions but also in being able to make others agree to one's point of view. To do that, coming to terms first with oneself is important. Thus, self management is an important skill including managing/coping with feelings, emotions, stress and resisting peer and family pressure.

Young people as advocates need both thinking and social skills for consensus building and advocacy on issues of concern. The Ten core Life Skills as laid down by WHO are: 1. Self-awareness 2. Empathy 3. Critical thinking 4. Creative thinking 5. Decision making 6. Problem Solving 7. Effective communication 8. Interpersonal relationship 9. Coping with stress 10. Coping with emotion The method used in teaching of Life Skills builds upon the social learning theory and on what we know of how young people learn from their environment; from observing how others behave and what consequences arise from behaviour. It involves the process of Participatory learning using 4 basic components: 1. Practical activities 2. Feedback and reflections 3. Consolidation and reinforcement 4. Practical application to day to day life challenges. 2.7 Vocational Training and Independent Living Approximately 156 million in the world (nearly 3% of world's population) are persons with intellectual disability. It is estimated that 1.8% (18.53 million) of total population constitutes Persons with disability in India. The prevalence of intellectual disability is 100 94 out of 1,00, 000 population (NSSO 2002). There is a paradigm shift in the approach to disability rehabilitation from charity mode to right based. This enables inclusion of persons with disabilities in all aspects of society. Inclusion of persons with disability in Employment is a trend being practiced all over the world. For many people who have disabilities, work is an important goal, but because of physical and attitudinal barriers in the workplace and society, they were denied productive work in competitive work environments. However, Persons with intellectual disability have been proving their skills in specific jobs. Department of Adult Independent Living (DAIL) of National Institute for the Mentally Handicapped (NIMH) strives towards improving quality of life of Persons with Intellectual Disability through vocational training and placement services. As part of these services, the Adult persons with intellectual disability are trained to acquire vocational and independent living skills. Independent living means living like anyone else with same limitations and same opportunities. Persons with intellectual disability also observe the same style of living like other individuals of their society. The ability of Persons with intellectual disability to be productive was linked to social behaviour and practice and bore very little relationship to their intelligence (Cornelius D.J.K, 2009). The competencies and the instructional areas related to vocational training are listed below: Competencies Instructional area Managing family finances - Identifying coins, rupee notes and making a change. - Writing cheque. Managing a home - Decorating and maintaining Classroom. - Aware of basic home repairs. - Planning balanced meals - Eating proper food - Understanding the need of vitamin Caring for personal needs - Developing hygiene and grooming skills - Learning common games 101 - Learning first aid skills - Obtaining knowledge of common illness and when to seek medical attention. Buying and preparing food - Mathematics- basic skills. - Developing table manners - Planning & preparing nutritious meals - Obtaining knowledge about super market - Storing food - Kitchen cleanliness Buying and caring for clothes - Reading & following label directions - Using a clothes washing machine - Ironing - Selecting clothes (Choosing clothes, styles) - Sorting clothes for laundry. Engaging in civic activities - Social skills - Identifying own country and state - Aware of the right for voting. - Aware of personal rights as a citizen - Basic knowledge of politics - Chief- Minister, Governor, Prime Minister, President - Election. Recreation and leisure time - Physical education

102 - Aware of community recreation - Spectator sports. Getting around the community - Reading transportation schedule - Reading traffic signs. - Understanding the function of traffic police. - Planning a trip - Riding a bicycle
Achieving self- awareness - Identifying values and emotions. - Identifying conflicts and coping with stress - Expressing feelings (anger, joy) - Experiencing group interaction - Developing awareness of body. Acquiring self confidence - Understanding potential of Performance - Developing awareness of strength and weakness. - Awareness of personal behaviour - Accepting praise and criticism - Accepting teasing - Listening actively to others Achieving socially responsible behaviour - Developing acceptable behaviour during outings. - Involving in activities to improve strength and overcome weakness - Recognizing the rights of self & others.

103 - Expressing realistic ambitions and hopes. Maintaining adequate interpersonal skills - Ability to develop and maintain friendship. - Identifying different levels of friendship. - Developing self organization in home, school and community - Developing ability to listen, ask questions, and respond appropriately. - Developing appropriate relationship with opposite sex. Achieving independence - Completing assigned responsibilities Achieving problem solving skills - Accepting consequences for personal action. - Taking assistance in difficulties. Communicating adequately with others - Recognition and responding appropriately during emergency situations. - Realizing the need for reading and writing. Knowing and exploring occupational Possibilities - Realizing the need of work. - Developing an attitude to get trained and seek on employment. Making appropriate occupational courses - Obtaining knowledge of various types of jobs.

104 - Identifying appropriate types of work. - Identifying strength and weakness for the jobs. - Identifying possibilities for entry level job. Exhibiting appropriate work habits - Following written and verbal instructions. - Aware of the team concept. - Developing ability to take turns. - Developing ability to agree/ disagree appropriately. - Developing awareness of the importance of attendance, punctuality, quality of work, and productivity - Realizing the need for physical exercise for well being and success toward work and community living. Since the ultimate aim of education is to provide opportunity for employment, the vocational training is crucial for employability. 2.8 "Check Your Progress" 1) Define Intellectual Disability. Briefly discuss the types and characteristics of Intellectual Disabilities.

.....
.....
.....
.....

105 2) Discuss briefly about the different assessment tools available in Indian context to assess the children with Intellectual Disabilities.

.....
.....

..... 3) What are the promotional procedures of FACP?

.....
.....

..... 4) What is assessment ?

.....
.....

..... 5) Write a few examples for NRT and a few for CRT.

.....
.....

..... 6) What are the purposes of assessment you find in your case of assessment for IEP?

.....
.....

.....
.....

106 7) Explain the need and importance of social skills training for persons with mental retardation.

.....
.....
.....

..... 8) Mention 5 social skills, which are to be taught at primary and secondary levels.

.....
.....

..... 9) Define IEP. State the components of IEP.

.....
.....

..... 10) Briefly discuss the importance of Vocational Training.

.....
.....

2.9 Let Us Sum Up ?

Intellectual disability is a disability characterized by significant limitations in both intellectual functioning and in adaptive behaviour, which covers many everyday social and practical skills. This disability originates before the age of 18. (

American Association on Intellectual and Developmental Disabilities (AAIDD)- 2010) ? Types and Characteristics of ID. 107 ? Each Mentally Retarded child

is unique in nature. Special Education can identify the unique need of each child through proper assessment and plan intervention activities as per the requirement. Assessment is a pivotal and the first step of rehabilitation programme for the

Mentally Retarded children. The following points need to be attended by the students. ? Assessment is a collection and organisation of information for making administrative and/ or instructional decision for an individual or group. ?

Assessment is carried out for various purposes. Some of these purposes are:- (a) initial screening and identification, (b) determining eligibility, (c) determination of current performance level and educational need, (d) decision about classification and programme placement, (e) determination and evaluation of teaching programmes and strategies, (f) development of educational programme, (g) monitoring students performance, (h) evaluating the effectiveness of educational intervention programme. ? Assessment report should be clear so that it will be useful both by the assessor and the assessee. ?

There are different types of assessment. Based upon the manner of data collection it is formal and informal assessment and based upon the construction of test assessment could be Norm Referenced Assessment (Test) or Criterion Referenced Assessment (Test). ? NRA/NRT helps more in administrative decisions where as the CRA/CRT helps more in instructional purpose. ?

Most of the psychological test such as Development Test, Intelligence Test and Aptitude Test are NRT in nature where as most of the behavioural scale used in Special Education are CRT in nature. ? For school age children, the first criterion referenced scale developed to suit Indian conditions is Madras Developmental Programming System (MDPS). Later, BASIC- MR and Functional Assessment Checklist for Programming (FACP) were developed. Similarly, with the emphasis on early childhood special education, Upanayan checklist and Portage kit, translated in Hindi and adapted to Indian culture are developed and are used for assessment and programming in early intervention programmes.

111 Unit-3.1 Definition, Types and Characteristics. Structure 3.1.1 History and brief note about Autism 3.1.2 What is Autism 3.1.3 Signs and symptoms of autism in babies and toddlers 3.1.3.1 Early signs of autism in babies and toddlers 3.1.4 What causes autism 3.1.5 Characteristics Associated with Autism Spectrum Disorders 3.1.5.1 Common Characteristics in Autism Spectrum Disorders. 3.1.5.2 Related Characteristics in Autism Spectrum Disorders 3.1.6 Types of Autism 3.1.6.1 Differential Diagnostic Feature: Autism and Related disorder 3.1.6.1 Treating Autism 3.1.1 History and Brief Note History In 1943, Leo Kanner released an article titled "Autistic Disturbances of Affective Contact" It was in this article that 'autism' was first used to describe 11 children exhibiting what are now recognized as symptoms of autism Kanner noted that: "The basic desire for aloneness and sameness has remained essentially unchanged..." It was based upon this observation that he decided to use the word 'autism' itself, because of it's meaning in Greek which is 'self Autistic adults and children alike were being mLsdiagnosed in the early twentieth century.

112 The word autism has been derived from 'auto' and 'ism', which means 'to be with oneself. In 1906, Eugene Bleuler, a Swiss psychiatrist used autism as an adjective. Initially childhood schizophrenia was used to refer to this condition. Later, after several researches Leo Kanner (1943) used autism as a noun and differentiated autism from schizophrenia when he described 11 self-absorbed children who had "autistic disturbances of affect contact." Autism is the most common of the Pervasive Developmental Disorders, affecting an estimated 2 to 6 per 1,000 individuals. Autism can't be identified distinctively in any subgroup, viz., race, ethnic or SES in its number or intensity. Current estimates suggest that approximately 400,000 individuals in the United States have autism. In India's current population, it is estimated that approximately 1.7 million autistic persons in the country have autism or autistic-like symptoms. Autism is three to four times more likely to affect boys than girls. Autism occurs in individuals of all levels of intelligence. Approximately 75 percent are of low intelligence while 10 percent may demonstrate high intelligence in specific areas. One common misconception about autism is that: it is a condition that only affects children. The truth is children with autism grow up to become adults with autism. While the disorder is not rare, the majority of autistic people has not been diagnosed and do not receive the services they need. This problem occurs in many countries, but is especially true in where there is a tremendous lack of awareness and misunderstanding about autism even among the medical professionals, who may either misdiagnose or under diagnose the condition. So, diagnosis of autism is a major problem in science before entering into its intervention. At first, autism can be described by the symptoms like.

113 AUTISM A lone even with others U unusual play T waddle and twirl object I indifference to other people S trance movements and mannerism M sot have a learning disability 3.1.2 What is Autism Definition ASD is a lifelong neurodevelopmental disability, a behaviorally defined syndrome that is recognized by the manifestation of behavioral characteristics across multiple areas of functioning. Characteristics are observed, to varying degrees, in social relationships, communicative competence, pattern and range of interests, and sensory responsiveness. These characteristics are generally evident during the child's early years, and must adversely affect educational performance. The definition of ASD has been written sufficiently broad to encompass children who exhibit a range of characteristics related to ASD. This includes Autistic Disorder, Rett's Disorder, Childhood Disintegrative Disorder, Asperger's Disorder, and Pervasive Developmental Disorder Not Otherwise Specified, Children with mental retardation or significant behavior disorders are not automatically excluded since, in many cases, these conditions coexist with ASD. Autism means a developmental disability. Now Autism is called a Neuro-biological disorder, significantly affecting verbal and non verbal communication and social 114 interaction, generally evident before age 3. It adversely affects a child's educational performance. Other characteristics often associated with "Autism are-engagement in repetitive activities, stereotyped motor movements, unusal responses to sensory experiences and resistance to enviornmental changes.

Autism

is a complex developmental disability that typically appears during the first three years of life

It

is widely recognized as a neuron developmental disorder that affects the functioning of the brain. It is a

spectrum disorder Children with autism are unable to interpret the emotional states of others, failing to recognize anger, sorrow or manipulative intent

It impacts

the normal development of the brain in the areas of social interaction and communication skills

Children and adults with autism typically have difficulties in verbal and non-verbal communication, social interactions, and leisure or play activities

Stereotypic (self-stimulatory) behaviors may be present. In some cases, aggressive and/or self-injurious behaviors might be present

It is not a behavioral, emotional or conduct disorder. It is not a mental illness. There are no medical tests that can be used to diagnose autism.

3.1.3 Signs and symptoms of autism in babies and toddlers. If autism is caught in infancy, treatment can take full advantage of the young brain's remarkable plasticity. Although autism is hard to diagnose before 24 months, symptoms often surface between 12 and 18 months. If signs are detected by 18 months of age, intensive treatment may help to rewire the brain and reverse the symptoms. The earliest signs of autism involve the absence of normal behaviours but not the presence of abnormal ones so they can be tough to spot. Some autistic infants don't respond to cuddling, reach out to be picked up, or look at their mothers when being fed.

115 3.1.3.1 Early signs of autism in babies and toddlers. Doesn't make eye contact (e.g. look at you when being fed). Doesn't smile when smiled at. Doesn't respond to his or her name or to the sound of a familiar voice. Doesn't follow objects visually. Doesn't point or wave goodbye or use other gestures to communicate. Doesn't follow the gesture when you point things out. Doesn't make noises to get your attention. Doesn't initiate or respond to cuddling. Doesn't imitate your movements and facial expressions. Doesn't reach out to be picked up. Doesn't play with other people or share interest and enjoyment. Doesn't ask for help or make other basic requests.

3.1.4 What causes autism? A specific cause is not known, but current research links autism to biological and neurological differences in the brain

but also environmental influences play a role as well. Recent researchers have shown that autism does run in families, but not in a clear-cut way. Siblings of people with autism have a 3 to 8 percent chance of being diagnosed with the same disorder. It can be safely said that:

Autism is not caused by bad parenting or 'refrigerator mothers' as was suggested by psychiatrist Bruno Bettelheim in the 1950s.

3.1.5 Characteristics Associated with Autism Spectrum Disorders. Characteristics: According to DSM IV, Autism is such a developmental disorder under P.D.D., that includes three qualitative deficits-

116 1. Lack of Socialization 2. Lack of Communication 3. Lack of Flexibility. These three are together called 'Autistic Triad'

1. Lack of Socialization: Deficit in social emotional reciprocity. Deficit in maintaining, developing and understanding relationship to parents, friends and siblings. Deficit in eye contact. Inefficiency in pretend play and turn taking. Cannot ask for help or cannot help other too. Attention deficit needs an overview of one's work and educational experience.
2. Lack of Communication: Deficit in verbal and non verbal communication behaviour used for social interaction. Echolalia. Pronominal reversal. Immediate and delayed verbal imitation. Monotone. Use of Jargon. Lack of joint attentions. Lack of emotional and body gesture.
3. Lack of Flexibility: Stereotype or repetitive motor movements, use of object and speech. Maintenance of sameness. Highly restricted, fixated interest that are abnormal in intensity and focus. Self injurious activities.

117 Self stimulatory activities. Hypo and Hyper activity to sensory input.

3.1.5.1 Common Characteristics in Autism Spectrum Disorders. Social Characteristics. May exhibit poor eye contact. May not differentiate between strangers and those seen every day or show anxiety towards strangers. May have a narrow range of emotions inappropriate displays. May not enjoy social games like peek-a-boo or patty cake. May lack pretend/imaginative play skills. May not show an awareness of others. May have difficulty reciprocating emotionally and socially and have difficulty relating to others. Often demonstrate little or no interest in establishing friendships, or have difficulty in developing and maintaining friendships. Difficulty initiating or sustaining play with peers or groups. May lack understanding of social cues, gestures, emotional expressions. May lack understanding of how others feel/express moods, May have strange fears or lack fear of real danger. May repeat preferred play schemes over and over again. Communication Characteristics. May have difficulty in reading and showing emotion (e.g. little smiling or bland face). May be unusually quiet. May not respond to name, or appear not to hear or attend. May not babble and coo. Language may be delayed. Stereotyped or idiosyncratic speech is common -may have echolalia (repeating words or phrases they hear) either immediately or later. Used to say a few words, but now does not. Often have trouble imitating or using nonverbal gestures and appropriate facial expressions to communicate.

118 May have difficulty initiating interaction with others. May appear not to be interested in communicating with others. May not imitate or demonstrate functional and pretend play. May not point or wave bye-bye. Abnormal pitch, intonation, rhythm, stress. Grammatical structure may appear immature. Difficulty understanding & interpreting pragmatic language. Behavior Characteristics May dislike being held or stiffen when held. Exhibits repetitive body movements such as hand or finger flapping or rocking. May be extremely sensitive to some auditory stimuli. May not respond to some auditory stimuli. May exhibit stereotyped and repetitive use of language or idiosyncratic language. May persevere on certain activities. May demonstrate persistent preoccupation with parts of objects. May resist changes in routines; unreasonable insistence on following routine. May lack fear of real danger. May explore environment by inappropriate methods such as licking, smelling and handling objects. Avoids looking at other people. Avoids contact with other people, preferring to touch objects. Learning Characteristics Will perform unevenly within and across skill areas, sometimes demonstrating exceptionalism in some areas. Resists changes in the learning environment. Has difficulty waiting or using unstructured time. May not generalize skills to other settings. Has problems with abstract and conceptual thinking; requires concrete interactions. Uses and interprets speech literally; doesn't usually read facial expressions, body language or other social cues.

119 May be impulsive, compulsive, or perseverate on certain activities; behavior is inconsistent. May be distracted by auditory or visual stimuli. Has trouble with organizational skills, planning, or making choices. Relies on learned routines, cues, and other learned patterns. 3.1.5.2 Related Characteristics in Autism Spectrum Disorders Sensory/Motor Characteristics May be over or under sensitive to certain sensory stimuli. These are Sounds, Tastes, Visual input, Textures and Smell May have insensitivity to pain/ high pain threshold. Poor fine motor skills (e.g. writing may be extremely difficult and laborious or sloppy, off the lines, and out of the boundaries). Gross motor skill difficulties. These are: Difficulty with coordination, Balance problems and Playground activities or sports may be difficult. Limited awareness of the physical presence or needs of others. Unaware of their bodies place in space. Attention / Organization Characteristics Poor Concentration: Poor organizational skills: < Often off task < May lose papers, assignments, etc. < Distractible < Desk may be messy < Overloads easily < Backpack never emptied < May be disorganized < May not be able to predict or organize things needed for homework: book, packet, etc. < Difficulty sustaining attention. < May not remember homework < Papers can be messy and written work unorganized < Difficulty knowing how and where to start work. 3.1.6 Types Autism spectrum disorders are disabilities with many variations in symptoms and/ or behaviours. Furthermore, people with autism spectrum disorders vary widely in abilities, intelligence, and behaviours across those indicators. In other words, characteristics associated with autism spectrum disorders may be observed in a range 120 of mild to very severe forms. For example, some children do not speak; others have limited or even advanced language skills. Those with more advanced language skills tend to use a small range of topics, as well as have difficulty with abstract concepts and pragmatic (practical) language skills. Repetitive play skills, a limited range of interests, and impaired social skills are generally evident as well. Unusual responses to sensory information such as loud noises, lights, and certain textures or food or fabrics are also common. Because the three disability groups included in autism spectrum disorders are syndromes (i.e., a collection of symptoms), different children experience distinct characteristics with varying degrees of impairments. Each child is at different developmental levels from other children. Each child will be ready to learn certain skills at different ages. The Diagnostic and Statistical Manual for Mental Disorders (DSM-1V-TR) is used to classify disabilities and provides refined definitions of autism spectrum disorders. ASD are a set of disability groups that are identified under the heading of Pervasive Developmental Disorders (PDD). PDD are characterized by severe and pervasive impairment in several areas of development, including social interaction skills, communication skills, or the presence of stereotyped behaviour, interests and activities. Figure 1-Shows the five disability disorders under the umbrella of FDD.

121 Pervasive Developmental Disorders Pervasive Developmental Disorder Asperger's Autistic Childhood Disintegrate Rett's Disorder Not Otherwise Specified Syndrome Disorder Disorder Autism spectrum disorders (see figure 2) account for three of the five Pervasive Developmental Disorders: pervasive developmental disorder-not otherwise specified, Asperger's Syndrome, and autistic disorder. The term, autism spectrum disorder, implies that the three disorders share common characteristics, but also have unique qualities that allow for a differential diagnosis of each. Consequently, the severity of impairment varies within and across each individual diagnosed with an autism spectrum disorder. Figure 2 - Autism Spectrum Disorders (ASD) Autism Spectrum Disorders (ASD) Pervasive Developmental Disorder Not Asperger's Syndrome Autistic Disorder Otherwise Specified A brief description of the three categories under the term ASD is provided below. Pervasive Developmental Disorder-Not Otherwise Specified (PDD-NOS) The category of Pervasive Developmental Disorder-Not Otherwise Specified is used when a child does not meet the diagnostic criterion for other disabilities, but does display a severe and pervasive impairment in the development of social interaction or communication skills or the presence of restricted, repetitive, and stereotyped patterns of behaviour, interests and activities. Asperger's Syndrome Children with Asperger's Syndrome have significant difficulties in social interaction and may exhibit restricted, repetitive and stereotyped patterns of behaviour, interests and activities. Asperger's syndrome causes observable significant impairment in social, occupational or other important areas of functioning.

In contrast to Autistic Disorder student with Asperger' Syndrome do not display clinically significant delays in language acquisition although there may be deficits in the practical use of language and social-communication skills. Students with Asperger's Syndrome typically do not demonstrate cognitive delays during the first three years of life. Autism/Autistic Disorder Children with autism have significant difficulties in social interaction, expressive and 122 receptive communication and may exhibit restricted, repetitive and stereotyped patterns of behaviour, interest, and activities. Onset of autism may be evident before age three, with observable delays and/or abnormal functioning in social interaction, language, or symbolic play. 3.1.6 Differential Diagnostic Feature : Autism and Related disorder 3.1.6 Treating Autism Behavioral Interventions - Research suggests that early, intensive behavioral interventions may improve outcomes for children with autism and help the children achieve their maximum potential.

Sensory Integration - Integration and interpretation of sensory stimulation from the environment enhances cognition.

Diet: People with autism are more susceptible to allergies and food sensitivities than the average person. The most common food sensitivity in children with autism is to gluten and casein.

Vitamin Therapy: Parents have reported that they have tried B6/magnesium and/or DMG, often with good or even spectacular results.

123

124 3.2 Tools and Area of Assessment Structure : 3.2.1 Interdisciplinary and Multidisciplinary assessment 3.2.1.1 Interdisciplinary assessment 3.2.1.2 Multidisciplinary assessment 3.2.2 Different Diagnostic tools for ASD 3.2.3 Assessment of ASD 3.2.3.1 Child Health History a. Prenatal History b. Perinatal History c. Past Medical History d. Review of Systems 3.2.3.2 Developmental and Behavioral History of the Child 3.2.3.3 Family Medical and Mental Health History 3.2.3.4 Medical Evaluation 3.2.3.4.1 Components of a Medical Examination 3.2.3.4.1. a-Physical and Neurodevelopment Examination 3.2.3.4.1. b-Developmental Neurological Examination 3.2.3.5 Laboratory Tests 3.2.3.6 Genetic Testing and Consultation 3.2.3.7 Neurological Laboratory Evaluation 3.2.3.8 Other Laboratory Investigations 3.2.3-9 Sensory Evaluation 3.2.3.10 Direct Behavior Observation 3.2.3.11 Play Environment 3.2.3.12 Degree of Structure

125 3.2.3.13 Observation Domains 3.2.3.14 Cognitive Assessment 3.2 Tools and Area of Assessment Tool is a monitor to Guidelines and to refers to the identification of children birth through age 5 most likely to have an ASD and/or developmental delay and it applies to children different age level and also to the process of initiating the evaluation of a child's different in this age groups. The terms Assessment used to describe the intervention planning process. 3.2.1 Interdisciplinary and Multidisciplinary assessment The interdisciplinary and multidisciplinary processes stress the importance of gathering information from a variety of disciplines that have unique knowledge of a particular aspect of the child and family. Professionals most often involved with persons with ASD include psychologists, psychiatrists, neurologists, pediatricians, other physicians, speech pathologists, audiologists, occupational therapists, social workers and behavioral and educational specialists. Input from all involved professionals may be necessary to obtain a complete picture of the child and family for effective service planning. 3.2.1.1- Interdisciplinary assessment requires respect, integration and coordination among professionals with diverse backgrounds. The interdisciplinary team model is the preferred model in the evaluation and assessment of ASD. The interdisciplinary process involves professionals from various disciplines providing their unique contributions regarding aspects of the child's development and family functioning. The defining feature of this approach is the ability to integrate and synthesize information through an interactive group process. Members are aware that their interpretation informs the whole and are able to formulate conclusions and recommendations based upon the combined efforts of all. The members are psychologists, psychiatrists, neurologists, pediatricians, other physicians, speech pathologists, audiologists, occupational therapists, social workers and behavioral and educational specialists. 3.2.1.2-Multidisciplinary process can take with the child and family participating in numerous sessions or it can take place over the course of several months. Professionals in a multidisciplinary process often operate without benefit of collaboration with other team members and often draw separate conclusions based

126 upon their particular experience. This is a highly stressful process for children and families. Information gathered using the multidisciplinary model is often redundant, and the results from other multidisciplinary team member evaluations may not be available at the time they are needed by another team member. At times, professionals may repeat portions of previous assessments, regardless of the information available, due to lack of a relationship with the other professional and/ or concerns regarding knowledge or conclusions drawn. 3.2.2 Diagnostic tools for ASD There are many areas to assess of children with ADS. Some important diagnostic tools for ASD which should be mentioned are - 1) Clinical Assessment: CARS rating system (Childhood Autism Rating Scale) developed by Eric Schopler in the early 1970s. Behavior. Using a 15-point scale, professionals evaluate a child's relationship to people, body use. and adaptation to change, listening response, and verbal communication. The Checklist for Autism in Toddlers (CHAT) is used to screen for autism at 18 months of age. It was developed by Simon Baron-Cohen in the early 1990s to see if autism could be detected in children as young as 18 months. The screening tool uses a short questionnaire with two sections, one prepared by the parents, the other by the child's family doctor or pediatrician. The Autism Screening Questionnaire is a 40 item screening scale that has been used with children four and older to help evaluate communication skills and social functioning. The Screening Test for Autism in Two-Year Olds, being developed by Wendy Stone at Vanderbilt, uses direct observations to study behavioral features in children under two. She has identified three skills areas - play, motor imitation, and joint attention - that seem to indicate autism. Autism Diagnostic Interview -Revised (ADI-R) The ADI-R (Rutter M, Le Couteur et al., 1989) is a standardized (93 items), structured interview based on ICD-10 definition of autism for caregivers of individuals with autism before the age of 36 months. It is used for diagnosing autism, planning treatment and distinguishing autism from other developmental disorders. Autism Diagnostic Observation Schedule (ADOS)-ADOS diagnose and assess

127 autism and pervasive developmental disorder (FDD) This semi-structured assessment can be used to evaluate almost anyone suspected of having autism from toddlers to adults, from children with no speech to adults who are verbally fluent adolescents and adults. Autism Behavior Checklist (ABC) The Autism Behavior Checklist (ABC) is a list of questions (57 items in 5 categories) about a child's behaviors. The ABC was published in 1980 (Krug et al., 1980) and is part of a broader tool, the Autism Screening Instrument for Educational Planning (ASIEP) (Krug et al., 1978). The ABC has been used with children as young as 3 years of age. Behavioral Summarized Evaluation (BSE) The Behavioral Summarized Evaluation (BSE) (Barthelme et al., 1992) is a rating scale developed in France and designed to measure changes in behavior in autistic children and adolescents. Social Communication Questionnaire (SCQ) The SCQ is a cost effective way to determine whether an individual should be referred for a complete diagnostic evaluation or not. The questionnaire can be used to evaluate anyone over 4 years age as long as his/her mental age exceeds 2 years. It is available in two forms, namely life time and current form, each composed of 40 yes or no questions. Gilliam Autism Rating Scale (GARS) The Gilliam Autism Rating Scale (GARS) (Gilliam, 1995) is a 42 items (grouped under three subscales) behavior rating scale designed to measure the severity and probability of autism from age 3yrs to 22 yrs Recently two standardized tests on Indian population has been developed. Autism Diagnostic Check-List (ADCL) Autism Diagnostic Check-List (Banerjee, 2007) is a 60 items (with six sub-scales) check list in both English and Bengali version. The test diagnoses and help assessing the impairment in specific area/s for planning of management programmed. Indian Scale for Assessment of Autism (ISAA) Developed by NIMH, ISAA is a 45 itemed scale (6 subscales) to diagnose and assess autism. Above the all types of check list are used to measure and asses the children with ASD in clinical environment that's why it's call Clinical Assessment (2) Behavioural Assessment : The process of understanding the complex behaviour in simpler forms based on 'ABC' model. (3) Observational Assessment : Systematic observation of behaviour helps in monitoring teaching methodologoes. It has two steps—Formal and Informal.

128 (4) Educational Assessment : Selection of tests depends on the purpose for which the assessment to be carried. Like as—N.R.T, C.R.T. (5) Functional Assessment : Assessment of purposeful behaviour. 3.2.3 Assessment of ASD There are many areas of assessments. These are; 3.2.3.1 Child Health History A detailed child health history would include prenatal and perinatal history, a complete health history of the child (including review of pertinent medical records) and family health history. This information can be obtained by the physician or another health care professional (e.g., pediatric nurse, medical social worker) with adequate training and experience in conducting health history interviews. Health care professionals often are able to obtain this information with the provision of basic guidelines, but the information obtained should be reviewed by a physician. Use of a health history questionnaire is acceptable practice with the provision that relevant issues are clarified by an in-person interview. Whether obtained by interview or questionnaire, essential elements of the health history should include the following. a. Prenatal History: Obtain information about previous pregnancies, since previous miscarriages may be a clue to the presence of genetic disorders. Document medical illnesses, which occurred during the pregnancy, since prenatal infections (such as cytomegalovirus and toxoplasmosis) can affect fetal development. Determine medications taken during pregnancy, as they may affect the development of the fetus or predispose the newborn to medical conditions, such as neonatal hypoglycemia in an infant born to a mother with gestational diabetes. Anticonvulsants, for example, are frequently given to mothers with epilepsy. b. Perinatal History: Obtain information about the length of gestation, onset of labor, and any complications that occurred during labor and delivery. If, for example, a Caesarian section had been performed, determining whether an indication of fetal distress would suggest that further information might be helpful, such as exploring for signs of fetal hypoxia.

129 Establish the infant's birth weight, length and head circumference, which are helpful in determining whether intra-uterine growth retardation was present and evaluating gestational age. Document the neonatal course, as it can be quite useful in evaluating the onset of subsequent developmental issues. Early feeding difficulties, for example, can be due to neurological abnormalities of coordination of suck and swallow. c. Past Medical History: Obtain information about all hospitalization, surgeries and significant injuries, especially those with head injuries associated with loss of consciousness. Document and explore previous medical illnesses, as they may provide information about the need for specific medical diagnostic testing or treatment. Examples of this would be recurrent episodes of vomiting and dehydration, which could be caused by a deficiency in amino acid metabolism. Specifically question the possibility of clinical seizure activity, as a significant number of children with ASD (approximately 30 percent) develop seizure disorders over time. Obtain specific documentation of infectious diseases and immunization status. This information may be helpful in determining whether any immunological deficiencies might be present and warrant further evaluation. Determine dietary information, which is extremely relevant, since many children with ASD are on restricted diets, either by self-selection or as part of various treatment methodologies. This information should be specific enough to determine if the child is at nutritional risk due to inadequate intake of various essential nutrients or calories. Explore the presence of any known allergies, including the way the allergy was determined and its manifestations in the child. This information should be utilized to determine whether any further evaluation or treatment is indicated. Explore previous medications that had been administered, including prescribed medications and non-prescription medications. Document any behavioral effects of the medications, in addition to the medical effects. This would be helpful to determine whether paradoxical effects on behavior have been observed. Thoroughly explore the possibility of developmental regression. Many children

130 with ASD have a period of apparently normal development, although with further detailed questioning, it may be clear that signs or symptoms of developmental abnormalities were previously present. It is important to specifically document which developmental skills were previously present and at what ages and to compare those skills to current function. d. Review of Systems: Explore all relevant medical organ systems to determine whether signs or symptoms of underlying medical disorders may be present. Direct special attention to sleep, since many children with ASD have sleep disorders, which can interfere with child and family function. Obtain information about difficulties with falling asleep, night awakening. Specifically elicit signs of problems with hearing and vision. Many children with developmental disorders have impairments in hearing and vision; therefore, obtaining information about parent concerns, past evaluation of vision and hearing acuity (including the methods of testing, child compliance and testing results) and sensory hypersensitivities is important. Obtain information about the possible presence of diarrhea or constipation, since some children with ASD may have gastrointestinal problems. 3.2.3.2 Developmental and Behavioral History of the Child The parent interview should include the developmental and behavioral histories and current functioning of the child. This information is gathered using either questionnaires or direct interviewing. In practice, a combination of both components is best. Questionnaires include objective, easily identifiable developmental information such as developmental milestones, motor skills, eating and sleeping patterns, etc. Other information provided through this format could include history of evaluations, past treatments and interventions, if appropriate. The clinician uses this information to supplement the parent interview. Collection of easily identifiable and verifiable information before the interview allows more time for the clinician to pursue current concerns and obtain detailed information pertaining to specific diagnostic criteria. The clinical content of the parent interview should document the following domains: First concerns about the child's development. This includes the parents' first concerns as well as concerns of others (relatives, PCP) that may have preceded parental concerns. It is also important to ascertain their interpretation of the events at that time (i.e., family move, illness, daycare experience, etc.).

131 Characteristics of the infant's temperament. Social-emotional milestones. This includes engagement in typical baby games (pat-a-cake, peek-a-boo), eye contact during feeding and games, shared attention, greetings and similar significant events. It is sometimes helpful to provide a reference point (i.e., first birthday) to aid with recall. Sensory abnormalities. It is important for the clinician to provide examples to help discriminate atypical patterns from typical developmental patterns. For example, arm flapping and jumping are common in many preverbal children. For example, children respond to exciting stimuli such as the currently popular children's characters, Barney and Elmo. Feeding and sleep problems or patterns. Fine and gross motor development and milestones. Atypical interests and activities. Interest in other children and/or siblings. Patterns of attachment to caregivers. Ability to use nonverbal communicative means such as gesture and facial expression. Communication, including both verbal and nonverbal intent. Preferred activities and play. Other notable characteristics such as loss of skills or deterioration of behavior.

3.2.3.3 Family Medical and Mental Health History

The focus of this portion of the interview is to ascertain the presence or absence of any medical, developmental or psychiatric disorders in the family history that may be related to the current concerns or assist in differential diagnosis. While many genetic conditions may have variable expression within members of the family, a knowledgeable clinician should determine which conditions might be relevant to the child's primary diagnoses or other concurrent medical conditions and require further information. Some conditions, such as tuberous sclerosis, are frequently due to a new genetic mutation, while other conditions, such as fragile X syndrome, may have variable expression in family members. Particular attention should be paid to other family members who have developmental disabilities or metabolic disorders or who died at an early age.

132 3.2.3.4 Medical Evaluation

The American Academy of Pediatrics (AAP) has made recommendations on the role of the pediatrician in the diagnosis and management of ASD (American Academy of Child and Adolescent Psychiatry, 1999). According to the AAP, the purpose of the medical evaluation for children with ASD is to assist with determining the etiology of the disorder, associated medical conditions and any other health conditions that may also be present. Determination of the etiology and associated medical conditions may have numerous important potential benefits, including genetic counseling, family counseling to help the family understand the cause of the disorder, possible treatment options, information about prognosis, potential for prevention (both primary and secondary) and facilitation of the development of a comprehensive database which can be used for epidemiological purposes. Over time, new information, including new clinical genetic syndromes, is expected to be available. It is therefore important for clinicians seeking expertise in ASD to stay involved with the care of children with ASD and to remain informed about current research results.

3.2.3.4.1-Components of a Medical Examination

There are two type of Medical Examination. These are: Physical and Neurodevelopment Examination and Developmental Neurological Examination.

3.2.3.4.1.a-Physical and Neurodevelopment Examination

A comprehensive physical examination including a neurodevelopment examination is an essential part of the- medical evaluation of children with ASD. It should be performed by a qualified health professional with expertise in the area of ASD. One purpose of the general physical examination is to evaluate the child for signs of genetic disorders and specific growth impairments such as microcephaly, macrocephaly or organomegaly; abnormalities of the sensory organs such as cataracts; and manifestations of neurocutaneous syndromes such as neurofibromatosis or tuberoussclerosis. Some examples of the more common disorders, which may be associated with ASD, or must be considered in the differential diagnoses of ASD, and their common manifestations, are as follows: Fragile X Syndrome: Physical features present in young children with fragile X syndrome may include prominent ears (70 percent), high arched palate (63 percent), hyperextensible fingers (49 percent) and a long face (64 percent) (Hagerman, 1999). Features may be present in girls as well as boys, and may present in more subtle ways.

133 Fetal Alcohol Syndrome: To qualify for a diagnosis of fetal alcohol syndrome (Institute of Medicine, 1996), there must be a confirmed history of maternal alcohol exposure during gestation, evidence of growth retardation, characteristic facial features and evidence of central nervous system neurodevelopment abnormalities. The growth impairment may be evidenced by low birth weight for gestational age, decreasing weight over time (not due to nutritional factors alone) or disproportional weight for height. The characteristic facial features include short palpebral fissures, thin upper lip and flattened philtrum. Children who do not meet these specific criteria may be considered for other diagnoses such as alcohol-related birth defects (which may be cardiac, renal, skeletal, ocular or auditory), or alcohol-related neurodevelopmental disorder. Tuberous Sclerosis: Facial nodular lesions (fibrous angiomas) are present in 50 percent of children by the age of 5 years, and may include hypopigmented lesions in an "ash-leaf macular pattern" in other areas of the skin. Teeth may show pit-shaped enamel defects. Hamartomas can develop in any organ, including cardiac, renal, gingival and subungual. Seizures frequently develop in infancy or early childhood. Congenital Infections: Children who have developed symptomatic or asymptomatic congenital infections may later develop symptoms of ASD. Conditions such as congenital cytomegalovirus infections, for example, in young children can manifest, in addition to other medical problems, such physical findings as microcephaly, later onset hearing loss or hepatomegaly.

3.2.3.4.1.b- Developmental Neurological Examination The purpose of the developmental neurological examination is to determine whether there is evidence of developmental neurological abnormalities, as compared to the neurologic function expected of a child at a specific chronological age, which may be associated with other specific developmental disabilities, co-occurring conditions or warrant further neurological laboratory testing. The essential components of the examination are as follows: Head circumference Cranial nerve function Cerebellar function Deep tendon reflexes Postural responses Primitive reflexes

134 Motor examination, including active and passive tone, strength, involuntary movement Tests of gross and fine motor coordination Presence of abnormal reflexes and signs, such as Babinski response

3.2.3.5- Laboratory Tests Medical laboratory testing should be decided upon the basis of the clinical history and physical examination, including the family history. In particular, behaviors such as pica might lead to a decision to perform lead screening. In addition, evidence of growth impairment or failure to thrive might lead to further investigation of thyroid function, and history of cyclic vomiting or protein intolerance might suggest further metabolic screening including amino acid chromatography. Careful consideration should be given to a history of developmental regression, especially if family history or neurological examination provides indication for further testing.

3.2.3.6 Genetic Testing and Consultation It was the opinion of the Guidelines advisory panel that routine laboratory testing, at a minimum, should include performing a high-resolution karyotype and fragile X probe (DNA probe for FMR-1 gene). This will enable the clinician to determine if major chromosomal disorders are present, but not eliminate the possibility of non-chromosomal genetic disorders. For that reason, the medical clinician should determine whether further consultation with a geneticist is indicated or whether further testing should be undertaken to delineate the etiology of mental retardation, if present. An experienced medical clinician should decide further laboratory testing as appropriate and as further research demonstrates the utility of such measures as FISH testing for chromosome 15q abnormalities. The clinician should also consider whether the clinical presentation could be consistent with Rett's disorder, for which a specific genetic test is now available (MECP2). Since other chromosomal abnormalities have been associated with ASD as well (including 7q abnormalities) in a small number of cases, the benefits of further laboratory investigation should be evaluated, and discussed with the family. The importance of genetic testing cannot be overemphasized, since families with a child with ASD have an increased risk of having further children with ASD. The overall risk is considered to be 6 percent, but can be considerably higher (or lower) if a known genetic etiology is determined. This etiology can have implications for genetic risk of ASD for other family members as well. As further research is completed, more specific tests, more specific genetic information for families and more specific treatments for

135 ASD depending upon the etiology may be available. 3.2.3.7-Neurological Laboratory Evaluation Other non-routine tests, which should be considered on an individual basis, include an EEG if there is a history consistent with seizures, documented developmental regression of language or behavior (beyond that consistent with ASD presentation) or clinical neurological abnormalities. A cranial MRI or CAT scan should be considered if clinical neurological abnormalities are present, such as microcephaly, neurological asymmetries or rapidly increasing head circumference. Isolated macrocephaly is not generally an indication for neuro imaging. Special studies, such as a sleep or video EEG may be indicated if the clinician suspects Landau Kleffner syndrome (acquired epileptic aphasia), where subclinical seizure activity leads to a progressive loss of receptive and expressive language. Further laboratory studies, such as urine organic acids, may be appropriate if a degenerative neurological disorder is suspected. 3.2.3.8 Other Laboratory Investigations Other tests, such as allergy testing, trace mineral analysis and immunological investigations should be considered only if clinically indicated based upon the presence of clinical history or additional symptoms or signs. Unless clinically indicated, intrusive neurological testing should not be the routine course of referral before evaluation with a specialist in ASD. 3.2.3.9-Sensory Evaluation Vision Questions or observations about the child’s functional vision should be asked during the diagnostic process. Since strabismus, hyperopia and myopia are common in children with developmental disabilities, the evaluation of visual function is an important part of the medical evaluation. As part of the physical examination, the clinician should perform an eye examination, documenting the extra-ocular movements and pupillary responses as well Hearing All children suspected of ASD should have their hearing screened using appropriate methodology and should be referred for a formal hearing assessment if concerns are present. The child should be referred to a pediatric audiologist as part of the diagnostic work-up if hearing screening cannot be performed or if the child fails hearing screening. Since some children with ASD have difficulties with compliance and cooperation with these 136 3.2.3.10-Direct Behavior Observation Direct observation of the child’s behavior is essential to a diagnostic evaluation for several reasons. First, it allows the clinician opportunities to directly observe the child in unstructured situations. After a period of adjustment, children often display typical play behaviors (or lack of) and other behavior anomalies that may be have concern. Observations can also clarify issues that may come up during the parent interview by helping to elicit observation that is more explicit or ascertaining whether such behavior is typical. With direct observation, situations can be structured or created to clarify these issues (e.g., by a parent or clinician saying “look” to draw attention to an interesting toy, understanding of the gesture can be assessed). Observation can add additional data to parent report. Parents have the utmost knowledge of their child and, often, the highest degree of adaptation to their child’s pattern of communication and behavior. They may not realize how they unknowingly compensate for subtle child deficits (e.g., by standing in front of or close to the child when calling his/her name, thus ensuring eye contact). Finally, observations allow the clinician to observe patterns of interaction with family and unfamiliar adults. This is not essential, but should be accommodated if appropriate. as the eye morphology. In addition, the child’s vision should be screened using acceptable methods for infants, toddlers and preschoolers. This may be functional vision screening or use of other standardized methods. If there are concerns from the parent or diagnosticians, a referral to a pediatric ophthalmologist or optometrist should follow during the assessment for intervention planning phase. The procedures used should correspond to the professional standards of the field. procedures, it may be necessary to sedate the child to perform auditory brainstem evoked potentials. Newborn screening tests are insufficient for assuring adequate hearing as some children may have hearing impairment due to injury or illness (such as repeated ear infections) in the infancy or toddler years, which was not present at birth. Vision Hearing

137 Direct Observation Assessment Checklist: Autism Spectrum Disorders Child’s

Name.....Date of Assessment.....

Interviewer/Observer.....Informant..... 1 2 3 4 5 Domains Behaviors
 Observed Reported Not Observed Don't know Social marked impairment in Competence moverbals/gestures Little joint attention/ sharing of interests Rarely initiates social interactions Rarely shows appropriate imitation Shows poor social reciprocity does not enjoy social games (e.g., peek-a-boo) Few appropriate peer relationships Little interest in other children Trouble establishing/ maintaining eve contact will not look to an object pointed at Communication Echolalia (repetitive/ nonfunctional speech) delayed /absent spoken language does not point to indicate interest or desire Little response to 1 anguagt /appears deaf Shows little communicative intent Inability to initiate or sustain conversation no varied make-believe/social imitative play oddities in volume/ cadence/ pitch

138 1 2 3 4 5 Domains Behaviors Observed Reported Not Observed Don't know Failure to generalize word meanings Pronoun reversal/ misuse rarely asks "wh" questions Behavior Interest in parts of objects (e.g., Patterns wheels) Inappropriate use of objects Rigid adherence to routine/ ritual/social rules negative reaction to change/ transition preoccupation with topics / details / patterns stereotypic movements unusual interest in sensory stimuli unusual avoidance of sensory stimuli Environment demands too high (Circle location overwhelming stimuli below) Home/ School/ no direct teaching of social Clinic interactions need for more positive teaching interactions need help identifying additional reinforcers Inconsistency across people/ settings

139 1 2 3 4 5 Domains Behaviors Observed Reported Not Observed Don't know weak collaboration Cognitive/ atypical developmental rates Development or sequence poor abstract thinking/ over selectivity delayed intellectual development Difficulty taking another's perspective Physical/ Motor Gross motor clumsiness Fine motor clumsiness toe walking Play/Leisure Poor imaginative/symbolic/ pretend play Inappropriate toy play Academic skills Poor application of facts Can't work independently Trouble following tasks in sequence Self-help Trouble dressing Trouble feeding Trouble toileting Unusual/ difficult sleep patterns Dangerous/ unsafe behaviors

140 1 2 3 4 5 Domains Behaviors Observed Reported Not Observed Don't know General/ Trouble following directions Vocational Trouble working independently Excessive tantrums Physical aggression Trouble following simple rules Self injurious behavior 3.2.3.11 Play Environment Available toys should be geared towards a range of developmental levels (i.e., sensory, functional, symbolic, etc.) due to the wide variability in functioning levels of these children. Materials should also be age and gender appropriate. Again, information provided before the evaluation can help guide in material selection so that children are neither overwhelmed nor under challenged. Gearing toys and materials as closely as possible to the child's functioning and interest levels will lead to a greater likelihood of observing representative behaviors and typical play for that child. 3.2.3.12 Degree of Structure Observations should include structured and unstructured observations of the child. Structured observations allow the clinician to press for specific behaviors common to children with ASD. They also allow for more standardized documentation of symptoms and behaviors to the extent that the observation measure provides psychometric data. This allows for documenting behavior in comparison to similar children as well as more easily tracking intervention response in the future. However, structured observations may inhibit more typical child behavior due to noncompliance, unfamiliarity with materials and difficulty with changes in activity and interactive partners. Unstructured observations of child behavior often provide the clinician with a more representative sample of the child's typical behaviors and use of play materials in the absence of specific adult demands or intrusions. For the purposes of establishing functioning levels, unstructured observations provide information regarding behavior that is typically displayed rather than that which is evidenced in response to specific environmental press.

141 3.2.3.13 Observation Domains A naturalistic setting should be arranged so that the child is able to engage with the environment and others as comfortable as possible. Specific behaviors to be observed include: Turn-taking Shared attention Social reciprocity Pretend play Sustained interaction Spontaneous giving/showing Imitation of novel acts Ability to have examiner direct attention Use of toys and objects 3.2.3.14-Cognitive Assessment Initial descriptions of children with ASD (Kanner, 1943) suggested that general intellectual functioning was not affected and that these children often possessed superior intelligence. This was often due to the presence of highly specific or "splinter" skills often demonstrated (e.g., counting, memorization). Since that time, it has been repeatedly established that children with ASD vary widely in their cognitive potential. Among children who demonstrate normal or superior nonverbal skills, a significant proportion demonstrates verbal and/or adaptive skills in the impaired range of functioning. It is now recognized that assessment of cognitive functioning is crucial to the differentiation of ASD from other disabilities. Cognitive ability also has an important role in prognosis and intervention planning. An estimation of potential is necessary for the following reasons: Functioning level, which includes cognitive and adaptive evaluation, is important for differential diagnosis and intervention planning. A diagnosis of ASD is appropriate when a child shows communicative, social or interest deficits that are inconsistent with overall cognitive functioning. For example, a child of 4 who is functioning at a 12-month developmental level would not receive a diagnosis of ASD if he or she displayed communicative and play behaviors similar to that of other 12-month-old children. It is

142 also extremely difficult to document significant social and communicative deficits below this age level. Treatment research generally has supported the notion that response to various treatment approaches has some relation to overall cognitive functioning. For example, certain intensive behavioral approaches have been shown to be less successful with children at lower cognitive levels who are unlikely to develop spoken language. Degree of cognitive functioning may indicate expected rates of progress. This, of course, is dependent upon the relative degree of certainty with which cognitive impairment can be established.

143 3.3 Instructional Approaches Structure 3.3.1 Principle 3.3.2 Instructional Approaches 3.3.2.1 Developmental Approach 3.3.2.2 Applied Behaviour Analysis (ABA) 3.3.2.3 Structured Teaching 3.3.2.4 Psychotherapies 3.3.2.5 Sensorimotor Therapies 3.3.2.6 Play 3.3 Instructional Approaches This chapter provides brief information of instructional approaches for young children with autistic spectrum disorders. In this chapter discuss the principle of instructional approaches and six representative comprehensive programs of instructional approaches. The principles are: 3.3.1 Principle Determine the most efficient and effective program for the child. And it's based on current research and effective practices. Is provided by appropriately trained and competent personnel including parents as appropriate. Make sure staff have specialized training and certification or licensure. Is reflective of the child's areas of strengths and needs that drive the curriculum. Allow the program to integrate techniques or strategies designed to address an array of the child's needs. Includes a variety of methodologies and approaches, which can be integrated. Use strategies that are most cost effective. Is based on comprehensive assessment results. Ensure that programming addresses aspects of ASD and have social validity.

144 Is determined by an IEP team that is multidisciplinary and includes the parent. Ensure that the program is efficient, consistent, and compatible among providers and settings. Program should be outcome-based and evaluation program must be the effectiveness of the child. Make sure the services allow for individualization, and can be validated for the specific child. Provide ongoing evaluation of programming and intervention outcomes via performance based assessment and observational data. Have standards for mastery of goals and objectives. 3.3.2 Instructional Approaches There are six representatives comprehensive programs of instructional approaches are: 1. Developmental Approach 2. Applied Behaviour Analysis (ABA) 3. Structured Teaching 4. Psychotherapies 5. Sensorimotor Therapy 6. Play 3.3.2.1 Developmental Approach A good way to begin thinking about children with ASD is to consider their developmental levels in much the same way you would for any typically developing child. Developmentally appropriate practices are the most important considerations in programming for younger children with ASD and functional skills become more of a focus for older students. Professionals and support personnel working with students with ASD should look for variations in developmental sequences across, and within, skill areas. It is important to recognize in abilities i.e. some skill areas more strongly developed than others and to examine the deficits in developmental skill areas i.e., mastering some age- or higher-level skills while not consistently performing lower level or more basic skills. Children with ASD have learning profiles should be require specific educational approaches to meet their individual needs.

145 Treatment methodology derived from the developmental approach provides a "blueprint" from which to select sequential skill objectives, according to the individual's unique profile of learning strengths and weaknesses. The Developmental Approach particularly lends itself to programming for social relationships and affective behaviours. Specific goals could involve establishing the developmental sequence of social and emotional skills. 3.3.2.2 Applied Behaviour Analysis (ABA) The ABA principles, with their emphasis on highly structured and sequenced teaching strategies, and systematic, data-based evaluation methods, are especially suited to the goal of effective instruction for students with ASD. Intervention programming that employs an ABA approach attempts to Understand skill and behaviour strengths and deficits. To structure the learning environment. Systematically teach discrete, observable steps that define a skill. Teach generalization and maintenance of newly learned skills. There are ten application system should be applicable in Applied Behaviour Analysis (ABA). These are: i. What does effective ABA include? ABA includes direct teaching within a formal systematic framework. It is based on principles of learning derived from laboratory work that is data based and includes differential reinforcement, task analysis, and continuous monitoring of performance. The purpose of the ABA approach is to increase or decrease a given behaviour, depending on the goal. These techniques are useful for addressing behavioural difficulties (e.g., decreasing hitting others and increasing the individual's ability to follow a predictable visual schedule), as well as skill deficits (e.g., increasing length of sustained eye contact). ii. What strategies are associated with ABA? Prompting Shaping Fading

146 Chaining Modeling iii. What are types of prompts used in ABA? Verbal/vocal Modeling/demonstration Visual Positional Physical Expectant waiting iv. What is shaping in ABA? Shaping begins with any approximation of the response and reinforces small increments or steps toward acquisition of the target behaviour. Increments are called "successive" approximation. Guidelines for shaping include clearly defined goals, observation in a natural setting to set the start point, clear steps that are either too large or too small, and fading prompts to set the stage for the next step. v. What is meant by chaining? Chaining may be backward by beginning with the final link and proceeding in reverse. It may also be forward by beginning, teaching the first link in the chain, and guiding the child through the rest of the steps. vi. How is modeling done? Modeling may be verbal or nonverbal individual actions or a sequence of actions, actual or pictorial or multi-person. vii. What is involved in Task Analysis? Decide what skill you wish to teach Break the skill into component parts Decide if components are sequential or simultaneous Map out how you will teach the skills viii. What kinds of feedback should be used? Positive reinforcement increases the likelihood of behaviour

147 Negative reinforcement increases the likelihood of behaviour Punishment decreases the likelihood of a behaviour ix. What reinforces work? Primary reinforcers include food and sensory or compulsive drive Secondary reinforcers include praise, social routines, intense interests, and need for closure x. What are the features of Discrete Trial Training? Discriminative stimuli Task analysis Every trial has a clear beginning and end Each trial is identical Instruction is repetitive Cue are exaggerated Each trial has 4 parts: presentation of instruction, child response, consequences and a short pause. It is important to realize that "Applied Behaviour Analysis (ABA)" is a broad approach for facilitating behaviour change and this specific training method is referred to as "Discrete Trial Training (DTT)" and can be effective when applied to a particular skills and behaviour.

3.3.2.3 Structured Teaching Structured teaching is a way to develop teaching strategies and to change the environment to make the world more meaningful for children with special needs. These structures can be utilized at all developmental levels and do not limit the curriculum. They are simply a component of the curriculum. Reasons for using structured teaching Use the child's visual strengths to help him focus on the relevant information in his environment Adapts the environment to make it more orderly and predictable Incorporates routines and makes things more familiar Emphasizes "finished" and teaches the concept of "finished"

148 Focuses on the development of independent skills Students with autism benefit from: Physical structures ? Clear physical and visual boundaries ? Minimal visual and auditory distractions ? Identified teaching areas including snack, play, transition and work areas Daily schedule ? Daily schedules visually tell the student in a way that he can understand what activities will occur and in what sequence. ? Each student should have a way to indicate when an activity is finished on the schedule. Individual work systems ? A systematic way for the student to receive and understand information ? A meaningful routine that answers these questions for the student What work? How much work? When is it finished? What happens next? Visual structures ? Teach the student to look for the visual instructions that give meaning to the task ? Shows student what to do with materials ? Includes both visual instructions and visual organizations

3.3.2.4 Psychotherapies Mental health providers can play a valuable role in a comprehensive program for a student with ASD. For example, mental health professionals within the schools, communities and medical facilities should provide support for families, particularly for families whose child has recently received a diagnosis of ASD. Mental health providers can also consult with teachers, facilitate social skills groups for students, and assist with in-service training for school faculty and community personnel. Although it has been well-documented in individualized psychotherapy (e.g., "talk therapy") is not particularly effective with children with ASD, therapeutic

149 strategies can certainly be geared toward behavioural change and skill-building. 3.3.2.5 Sensorimotor Therapies
Sensory integration theory has provided valuable information about how individuals with ASD process and respond to incoming sensory stimulation. There is now clear evidence that sensory integration difficulties can significantly influence an individual's behavioral functioning, and that activities which address sensory deficits or excesses can assist students with ASD in developing independent functioning. For example, inclusion of stimulatory and regulatory activities such as rhythmic rocking, sequential body pressure and joint compression input, swinging, jumping, moving to music, and swimming may be beneficial strategies for encouraging attention to task and calming children. 3.3.2.6-Play Play activities have long been included in interventions for children with various psychological and medical disorders. The literature on educational practices has documented the role of play activities as an effective tool for teaching children diagnosed with ASD. The TEACCH program, for example, has acknowledged that typical play behaviors are very difficult for many children with ASD to learn independently or vicariously. However, structured teaching of play activities fits with the adage "play is work, and work is play" for children with ASD. Play should be used to teach appropriate manipulation of a variety of play and leisure items. Play activities can gradually increase the child's tolerance for playing alongside and cooperatively with others. These play activities can be conducted in individualized instructional settings, and through small play groups. Play training can also be instrumental in facilitating social, language, and cognitive development in non-threatening and natural environments. Development of individual play goals, and even a play group, for children diagnosed with an ASD should involve consideration of each child's level of functioning, and unique needs. The group activities should be carefully planned with specific target goals and structured to provide each child with the opportunity to develop or enhance new skills. NOTE: Traditional, psychoanalytically oriented play therapy geared to help the child develop more effective coping strategies, is not an effective strategy for children with autism.

150 3.4 Teaching method in Autism 3.4.1 Teaching Tips for Children with Autism 3.4.2 Parenting a Child with a Disability 3.4.3 Quality Program Indicators 3.4.3.1 Comprehensive Team Approach Involving the Family 3.4.3.2 Comprehensive Assessment of Skills and Deficits 3.4.3.3 Defined Goals 3.4.3.4 Structure the Environment 3.4.3.6 Applying Functional Behaviour Assessment to Challenging Behaviour 3.4.3.7 Assessment of the Intervention 3.4.3.8 Transition 3.4.3.9 Opportunities with Peers 3.4 Teaching method in Autism There are various kinds of teaching methods for children with ASD. At first the T.T. assesses the problem area of his client and then he applied the necessary teaching method properly.

(a) ABA : The full name is Applied, Behaviour Analysis, based on Skinner's Operant Conditioning. According to this positive reinforcement helps to increase positive behaviour. It is applied either in school or home or in play ground also to increase the skills 'of eye contact, listening, imitating, reading, conversing, understanding other's mind. (i) Assessment and (ii) Intervention are the two steps of ABA. In Assessment the Behaviour analyst assesses his clients ability, inability, like-dislike from various domains. Then, which skill he wants to teach, at first divides the skill in some

151 small -parts and teaches every stpes easy to complex. After the implementation the teacher measures his Clint's development and starts re-assessment if necessary. There are some techniquesa to conduct ABA—Shaping, Modeling, Prompting, Enhancing, Time Out, Extraction.— 'Differential reinforcement' and 'Punishment' are two essential techniques for management problem behaviour. ___ (6) Curriculum based Assessment : Assessment of skills based an the curriculum. It is useful for the children with special needs in a regular class. (e) Montessory Method : In this method the children get most priorit than the teaching style and environment. Here the development of a child's sensation is more essential to teach his something. Didactic Apparatus like blocks, dolls, wooden steps, playing object at variable shapes and sizes, bells, picture are used as teaching material. To use these materials the students gradually can. learn reading, writing and counting. Teachers must be affection to the students. 3.4.1 Teaching Tips for Children

with Autism Use visuals Avoid long strings of verbal instruction Encourage development of child's special talents Use child's fixations to motivate school work Use concrete, visual methods to teach number concepts Let child use a typewriter instead of writing Protect child from sounds that hurt his/her ears Place child near a window and avoid using fluorescent lights Use weighted vests to calm nervous system Interact with child while he/she is swinging or rolled in a mat Don't ask child to look and listen at the same time Teach with tactile learning materials (e.g., sandpaper alphabet) Use printed words and pictures on

a
flashcard Generalize teaching

152 3.4.2 Parenting a Child with a Disability Seek the assistance of other parents Rely on positive resources in your life (

e.g., counselors, Special Educator, Speech therapist and occupational therapist.

Take it one day at a time Learn the terminology Seek information (e.g., internet, support groups, library) Do not be intimidated Maintain a positive outlook Find programs for your child Take care of yourself Decide how to deal with others Keep daily routines as normal as possible Know that you are not alone Most importantly, keep your sense of humor

3.4.3 Quality Program Indicators

The importance of teaching method programs for children with autism spectrum disorders and the importance of family involvement in that educational programs. Programs will differ from child to child because of the uniqueness of autism spectrum disorders and the range of potential symptoms involved. There is consensus among researchers, practitioners, and educators that appropriate intervention begins early, usually by thirty months. Furthermore, researchers and professionals have identified a number of strategies that are essential to implementing an effective program. The following are suggested components or indicators to be considered in developing and maintaining a quality educational program for children with ASD.

1. Comprehensive team approach involving the family
2. Comprehensive assessment of skills and deficits
3. Clearly defined goals addressing the characteristics of autism spectrum disorder

4. Structure the environment
5. Effective teaching strategies
6. Applying functional behaviour assessment to problem behaviour
7. Assessment of the intervention (data collection)
8. Transition planning
9. Opportunities with peers

3.4.3.1 Comprehensive Team Approach Involving the Family

Autism spectrum disorders are characterized by deficits in communication, behaviour, and social skills. Consequently, an effective program for students with ASD requires the expertise and input of family members and staff from multiple disciplines trained to understand the implications of autism spectrum disorders. A comprehensive team approach includes the child's parents and, as appropriate, related services personnel such as speech-language pathologists, psychologists, and/or occupational therapists to address the child's social, behaviour, language and motor skills as determined by the evaluation results. Furthermore, a comprehensive team includes special and general education teachers and/or para educators to ensure progress in meeting the individualized educational goals of each student. Working together, a comprehensive team assists in establishing and maintaining consistency of teaching and intervention techniques across individuals, lessons, and settings, increasing the potential for students with ASD to acquire, maintain, and generalize new skills and abilities. Comprehensive Team Approach are: Parents are active members of the educational team, contributing to decision-making, training issues, and follow-up provisions. All team members work together to assist in establishing and maintaining consistent interventions. Sufficient classroom support allows the student to demonstrate progress in meeting the individualized educational goals, objectives, and outcomes. Related services personnel, such as speech-language pathologists, psychologists, and occupational therapists address social, behaviour, language and motor skills as identified by evaluation results. Goals are consistently generalized throughout the educational program. Professional and parents discuss how often and in what format ongoing

communication can best take place. Problems are discussed as soon as they arise and before they get out of control. Teachers involve the parents in problem solving. Parents are not afraid to ask questions about any aspect of their child's program.

3.4.3.2 Comprehensive Assessment of Skills and Deficits

A comprehensive assessment of a student's skills and abilities. Assessments may differ because of each student's age and ability level. However, it is essential to consider the characteristics of autism spectrum disorders in completing each assessment. Thus, assessment may include are: Pre-academic and academic skills Pre-vocational and vocational skills Self-help and adaptive skills Communication Socialization Sensory regulation Motivation and reinforcement Behaviour Fine and gross motor Leisure activities Cognition

3.4.3.3 Clearly Defined Goals

The key to teaching new skills, or improving emerging skills, is creating clearly defined of IEP goals that are developmentally appropriate, functional, and based on the assessment results, student's strengths and interests, and individual characteristics of autism spectrum disorders. The IEP process and procedures for eligible special education student's vital role of parents in the development and implementation. So number of factors must be considered in developing individualized goals for students with ASD. Although individual goals will vary for each child based on their age, diagnostic characteristics and ability level, research has revealed that attention paid to the areas

155 below may increase the child's ability to benefit from the educational experience. Based on the results of the child's evaluation, goals may be written in one or more of the following areas: Attention (awareness of others, objects, or activities) - Attention goals may focus on sustained attention; joint attention; and shifting attention from event to event, object to object, object to person, and person to object. Imitation - Imitation is an essential prerequisite skill in learning from others. Imitation goals may include imitation with objects, motor actions, oral motor actions, vocalizations, verbalizations, gestures, academic tasks, and social skills. Communication - Communication goals may focus on expressive and/or receptive language and include verbal or augmented communication skills, social-communication skills, and the use of functional communication systems to provide alternatives to challenging behaviours. Social development - Social development is a core deficit area for individuals on the autism spectrum. Goals in this area may include body language, manners, conversation skills, friendship management, cooperative play skills, self-regulation, empathy, and conflict management, among others. Play - Developmentally appropriate and functional play skills can be targeted as an avenue to increase social skills with peers. Cognitive development - Cognitive goals may include a focus on conceptual development, problem-solving, academic performance, and executive functions (i.e. flexible, strategic plan of action to solve a problem or attain a future goal). Challenging behaviours - The function of challenging behaviours are identified and appropriate alternative behaviours are taught using positive behaviour supports. Sensory and motor development - Individual differences in motor and sensory functioning are identified and planned for, including tactile/touch, visual, smell, sound, and taste; environmental stressors are identified and modified. Adaptive behaviour - Essential life skills, including hygiene, self-help and safety are considered and planned for in order to enhance personal independence and create opportunities for greater community participation, including independent living, working and recreating.

156 Recreation/Leisure/Physical Education - Recreation skills are important goals as they enhance cognitive, social and motor skills enhance relationships between self and environment; shape appropriate use of unstructured time; increase opportunities to get physical exercise and stay healthy; and increase enjoyment of life. In writing clearly defined outcomes of IEP team should consider the following: Have meaningful IEP goals been identified for the child/student? Were family members involved in identifying goals to be addressed at home and school? Are the outcomes developmentally significant and appropriate for the child/student? Have the characteristics of the autism spectrum disorder been considered? Do the goals promote educational gain? Do the goals allow for the learned skills to be used in other settings (home, community) and with a variety of people? 3.4.3.4-: Structure the Environment Students with autism spectrum disorders are especially sensitive to changes in the environment or routine. Although the level of structure needed for each student will vary based on their age, diagnostic characteristics, and ability level, research has revealed that effective educational programs for students with autism spectrum disorders have structured environments which include: Physical Structure Routines Visual Supports Activity schedules Physical Structure Physical structure refers to the way each area in the classroom or school is set up and organized. To the student with ASD who may perceive the world differently or has unique sensory impairments, the school or classroom can be a confusing and overwhelming place. Therefore, the classroom should be set up and organized with clear physical and visual boundaries. Boundaries such as carpets, bookcases, dividers, or study carrels are frames that visually identify an area, helping the student to understand 157 where different activities take place and materials are stored. Two examples of work stations can be seen in Figures 1a and 1b. Consider providing a specific location for quiet activities and individual work activities. Once the various locations and boundaries are identified, signs, symbols, schedules, and choice boards can provide visual information on the rules and expectations of each area. Additionally, when planning the physical structure of the classroom, it is important to consider and decrease visual and auditory distractions, such as bright lights and noises, e.g., bells, children's loud voices, chairs scraping on the floor, and the humming of overhead projectors, lights, or computers. Example of Individual Work Stations Routines Students with ASD are more socially responsive and attentive to learning in the classroom, when information is presented in a highly predictable and routine manner. They can also become easily overwhelmed at even minor changes in their daily schedule or routine. To build independent work skills and to create a comfortable environment in which the student is ready to learn, develop and teach within routines. For example, a routine for independent seatwork may be as simple as "first we work", and "then we take a break". A routine for large group instruction might be, first, the teacher lectures; second, the students do group practice problems, followed by independent seatwork; and, third, take a break.

158 Routines are also effective in teaching functional, leisure, and vocational skills. Routines can become problematic if the student begins to demonstrate an obsession for sameness that results in negative behaviours when change occurs. To decrease the stress, plan and prepare the student for potential changes in the routine by utilizing transition strategies, role playing, and visual supports systems. Visual Supports Below the figure shows an example of a visual support for routines. Students with autism spectrum disorders have strong visual skills. Visual organization of instruction and materials allows the student to utilize these visual learning strengths. Examples of helpful visual supports may include the use of activity schedules and calendars, posted rules, choice boards, and other organizational methods as appropriate for individual students. Activity schedules are a set of pictures or words that cue a student to participate in an activity. Depending on the student's age and ability level, an activity schedule may be a three ring binder with only one activity on each page, it may be a partial or full day picture schedule, or it may be as complex as a day timer or personal digital assistant (PDA). Mini-schedules are a set of pictures or words that cue children to the individual steps involved in a complex task.

159 Activity schedules 3.4.3.5 Effective Teaching Strategies In addition to the use of structure, visual supports and routine, programs that result in educational progress for students with autism spectrum disorders also utilize motivational strategies and teach skills in a highly structured method either in a one-to-one or small group format, with minimal distraction, attention to specific details of the skill, and a focus on consistency, repetition, and predictability relative to the individual needs of the child. This section addresses such strategies and provides practical, low-tech suggestions for teaching students with ASD. When choosing an intervention or teaching

160 strategy remember that no single approach is likely to be right for every child; rather, teachers may need to utilize a wide variety of teaching strategies for their students with ASD. So varieties of teaching strategies for their students with ASD are:

- a. Motivation and Reinforcement Social activity Take a break Play a game Use the computer Spend time with a preferred person Tangible/Edible: Healthy snack or beverage Small toy Bubbles Baseball/trading cards, videogames Token System A token economy is a system in which an individual earns tokens for targeted behaviours. Once the student has collected a predetermined number of tokens he can trade them for an item or activity that he desires. Examples of tokens include: Points Play money Gold stars Stickers Tickets, coupons Poker chips Example Token System
- b. Teaching Strategies Discrete Trial is a structured teaching strategy, used to teach tasks or lessons that have been broken down into their simplest teachable components. It consists of four components: the instruction, the child's response, a consequence, and a brief pause. Pivotal Response Training utilizes the discrete trial paradigm in lessons that are child directed. It also encourages teachers to create lesson plans and to work within the student's preferred activities.
- 161 Shaping, which is the reinforcement of successive approximations of the target behaviour, is helpful when the student does not initially have the desired skill in her repertoire. Prompting provides students with extra help to achieve the desired response. Strategies may include verbal prompts, modelling, physical or gesture prompts, and the use of positional cues. Prompts can be used at the same time as instruction, during the student's response to help decrease errors, or after the student's incorrect response to demonstrate the correct answer. Although prompting strategies can be helpful in teaching new skills.
- c Academic Strategies Most students with autism spectrum disorders require some sort of academic modifications. Modifications are diverse and range from altering the way in which materials are presented to modifying how children indicate competence of academic concepts. Graphic organizers, handwriting modifications, priming and assignment and test taking modification are useful strategies to consider for students with autism spectrum disorders. Graphic organizers, such as semantic maps, Venn diagrams, outlines, and charts help children with autism spectrum disorders organize and visually represent important concepts. Handwriting modifications, for children with fine motor difficulties, may involve responding orally, keyboarding, answering questions in true/false format, transcribing into tape or digital format, or using a scribe. Priming refers to the process of preparing the student for an activity in advance of its completion. Previewing an upcoming activity helps to decrease the stress associated with change and the unknown. Some examples of priming may include reviewing an upcoming worksheet or activity; or going over an outline of what will be covered in the next section of a class, the next day, or in the next hour. Priming typically occurs close to the activity and can occur at home or in school. Assignment and test taking modifications should match each student's specific need. Some examples of modifications include: additional time, advanced practice/ priming, having the assignment /test read aloud, reduced number of items, a sample problem example, multiple choice versus essay format, keyboard versus handwritten.

162 d. Communication Strategies The communication abilities of students with autism spectrum disorders vary greatly, from students who are pre- or nonverbal to students with amazing expressive vocabularies, and from students who have very limited receptive abilities to those who can understand complex conversations and instructions. For preverbal and nonverbal students with autism spectrum disorders, a communication program may focus on teaching the student to communicate through gestures, speech and/or an augmentative or alternative communication system. Alternative and augmentative communication systems such as sign language, visual symbol systems, communication boards, and voice output devices can provide an effective format for allowing students to communicate their wants and needs in any setting. Augmentative and alternative communication are most effective when implemented early to ensure a method interaction and a system for teaching functional communication skills such as making requests, asking for help, protesting, and making choices. Early systems should be very functional and concrete. A typical progression for a visual-symbol communication system might be to move from a concrete to more abstract system. For example, starting with objects or actual photographs, moving next to colour photos and line drawings, and finally to printed words. Teaching ASD student to communicate through gestures, speech, or an augmentative or alternative communication system, new skills should generally be introduced in quiet, no distracting environments, with generalization occurring in more natural contexts where natural cues and reinforcements are available to make the skills meaningful and spontaneous. Utilize student interests to help motivate the child to initiate and use the communication system. For example, if a student has a favourite toy or book, the teacher may keep the material just out of reach but within visual sight of the student; thus, encouraging the student to request the wanted item using the communication system. All communicative attempts and initiations should be praised and encouraged. In contrast to the pre- or nonverbal student, many students with ASD are able to utilize complex language. However, these students, along with their nonverbal peers, often demonstrate a significant impairment in pragmatic (practical) language. For example, students with autism spectrum disorder often struggle with such

163 skills as having a social conversation; perceiving, understanding and using gestures, facial expressions, and body language; initiating, maintaining and closing conversations; as well as understanding and using social conventions and rituals. Pragmatic communication skills are an important component of the student's educational program effectively taught through direct instruction as well as through social skill instruction. In addition to difficulty with pragmatic language, students with ASD also have difficulty understanding and comprehending complex language. When working with any student with an ASD, a verbal or nonverbal student, it is important not to assume understanding. Teachers must closely monitor the student for receptive comprehension'. Talk slowly and carefully. Some students will require simplified one or two step directions, while others will require extra time to process spoken language. Clearly state instructions and directions indicating what the student is expected to do rather than telling the student what not to do. Additionally, use proximity, gestures, and visual supports to the spoken message. While the content of language and communication instruction is similar for all children, the problems and strategies may differ. Work with the speech language pathologist to develop a comprehensive communication program. e. Social Development Strategies Most students with autism spectrum disorders want to have friends, fit in, and be an active member of the social world. However, they have difficulty reading, understanding, and responding to social cues. Social skills, such as having a social conversation; perceiving, understanding and using gestures, facial expressions, and body language; initiating, maintaining and closing conversations; as well as understanding and using social conventions, and rituals, are difficult for students with ASD. Because of this deficit in social understanding, students with autism spectrum disorders may say or do things that irritate and offend other people. Helping students with autism spectrum disorders to develop social understanding requires both systematic instruction as well as opportunities to practice the skills within naturally occurring routines. Rules, social stories, role-playing and scripts, cue cards and checklists, coaching, modelling, and friendship groups are all effective strategies for systematically teaching social skills. Classroom teachers find it helpful to teach and post the classroom social rules to help students understand the expectations of the classroom or other social situation. In writing rules, be sure to provide concrete positively stated rules that are easy for the student to see and understand. For example, "we use an inside voice so that students can finish their work."

164 f. Behaviour Strategies Challenging behaviours, such as self-injurious behaviour, stereotypic behaviour, physical aggression, tantrums, defiance, and property destruction, are among the most difficult and stressful issues faced by parents and educators of children with ASD. g. Other Considerations Parents and education staff work together to identify appropriate intervention methods. Intervention methods are consistent across environments (i.e. home, school, community). Intervention methods, tools, and materials are supported by research and address the areas of strength and needs of the student. Intervention methods allow the child to demonstrate progress toward her IEP goals. New skills are taught are developmentally appropriate and meet the child's individual needs. Once new skills are acquired, these are practiced in all natural environments (home, school, community).

3.4.3.6 Applying Functional Behaviour Assessment to Challenging Behaviour As mentioned before behaviours, such as self-injurious behaviour, stereotypic behaviour, physical aggression, tantrums, and property destruction, are difficult and stressful for parents and educators of children with ASD. Research supports the use of functional behaviour assessments (FBA) or functional analysis and positive behaviour supports (PBS) in the treatment of challenging behaviours for children with ASD (Iwata & Worsdell, 2005). A formal approach to the FBA process typically involves at least three steps using an assessment process. The basic steps are: Identifying the challenging behaviour; Identifying antecedents (events before the behaviour occurred), consequences of the behaviour and setting events which maintain the problem behaviour. o Designing an intervention, based on the conclusions of the assessment, which may alter the identified antecedents, consequences or setting events.

165 3.4.3.7 Assessment of the Intervention Prior to intervention, baseline data on functioning level in the particular area of need is collected. IEP team determines how often and in what format data is recorded. A criterion is set for determining when a particular intervention is unsuccessful. Data are recorded to monitor progress in the program designed to improve the area of need. Data are recorded to identify problems or lack of progress. Ongoing assessment of the child's skill via the data collection system determines the next set of goals (if appropriate).

3.4.3.8 Transition Activity to activity Home to school School to home One grade/school to the next grade/school School to post-school environments

3.4.3.9 Opportunities with Peers Structured activities with one peer or in small groups are provided to practice newly learned social, academic, communication, coping and self-help skills. Opportunities are provided for interaction with peers who have different abilities and skills, which allows for generalization of mastered social, academic, communication, coping and self-help skills. Student is given support and opportunities to develop friendships with peers in order to initiate and practice social interaction. Peers are provided with a time and environment where they are comfortable to ask questions and receive age appropriate information about autism spectrum disorders. Parents are encouraged to meet the staff and share information about their child. Resources, such as videos, books and pamphlets on ASD are available for staff, students, and families. Support for the staff is provided as they learn to include the student into activities.

166 3.5 Vocational Training and career Opportunities Structure : 3.5.1 The Importance of Promoting Generalization of Vocational education of ADS 3.5.2 School-based employment training for persons with autism spectrum disorder. 3.5.2.1 Observe other Programs and Collaborate with District Teachers 3.5.2.2 Align your Program with Core Academic State Standards 3.5.2.3 Involve Your Students in the Planning Process in a Meaningful Way 3.5.2.4 Connect the Program to Real-World Experiences 3.5.2.5 Create Training Materials and Pre-vocational Tasks that Mimic Real-world Processes 3.5.2.6 Use Research-Based Training Methods 3.5.2.7 Integrate Your Program within the School Community 3.5.2.8 Use Authentic "Real-world" Reinforcement 3.5.2.9 Vocational Evaluation Checklist for an Individual with Autism 3.5 Vocational Training and career Opportunities IDEA ensures that in U.S.A. special education services are provided to youth with disabilities, including autism. Rather IEP help students to achieve goals according to their interest. They can also choose employment. However, research indicates that as few as 25% of individuals with ASD are employed recently. A recent study of 169 adults with H.F.A found that only about half of the participants were in paid employment (49%) and many (36%) were on social security benefits. Existing employment options for ASD described in literature include sheltered employment, supported employment and competitive employment. So, there is evidence that employment can positively impact the lives of individuals with ASD, as employment had positive outcomes relating to cognitive performance, reduced anxiety and depression,

167 and developed, relationship with peers. Moreover, employment must strengthen (heir will be self-confident. 3.5.1 The Importance of Promoting Generalization of Vocational education of ADS Foundational to implementing steps to effective employment training is a focus on generalization children youth with ASD cause experience difficulty generalizing newly learned skills to other settings, situations, people, and environments. Cause as such a critical component of any employment skills program is to develop a sound plan for transfer of skills across settings, persons, contexts and time. So The goal of any training program is behavioral change; that is, if the students are not impacted in a positive way across most aspects of life, the change cannot be considered very meaningful. Bellini et al. (2010) recommended the following techniques to facilitate generalization. Train with multiple persons and across multiple settings. Ensure the presence and delivery of natural reinforcers for the performance of social skills. Practice the skill in the natural environment. Fade prompts as quickly as is feasible. Provide multiple exemplars for social rules and concepts. Train skills techniques self-monitoring strategies. Children with autism too eventually need to make a living just like other children. Vocational training help the youngster with autism develop such a skill. Training that leads to employment offers the youngster a sense of self-esteem, confidence, dignity and a sense of accomplishment. More importantly the opportunity to be a productive worker and to contribute to the community promotes independence and enhances a positive self-awareness and self-identity. Adolescence is the prime time to start training in vocation ideally around age 14 even though it might seem that adulthood is far away. What kind of vocational training children should go for will depend on the functional level of the child, their strengths and their interests. Most kids with autism enjoy repetitive work they do well in jobs that require assembling as well as in the information technology industry and in the manufacturing industry. Several vocations should still be explored to find the right fit. Vocational training will -include working on independent life skills, vocational job training, and self-care. No matter how functionally affected a youngster with autism is, with the right training there are things that they can all do. While starting vocational training early is the key to success vocational preparation begins early in life. There are three stages of vocational training considered. These are: 1. Elementary school years: Preparation for prevocational training starts in

168 elementary school. Children with autism are strong at visual tasks hence they are quick to learn tasks that use this skill. Skills that are useful in developing career awareness and feeling of job satisfaction include: matching, sorting, correcting sorting errors, matching to jigs (instructions using pictures, drawings, words, or a combination), simple alphabetizing, collecting papers, cleaning tables, serving snacks, getting own snack, delivering messages, packaging and assembly and making simple purchases. 2. Intermediate school years: In the intermediate school years work habits such as attention to task, rule compliance, sustained work on already mastered tasks is important. Systematic typing office work such as collating and sophisticated alphabetizing, measurement, survival signs, money calculations, use of vending machines can be taught. These can be taught in both classrooms and community based settings. 3. High school years: Skills to learn include self preservation and safety skills, work without supervision and independent movement. The students should receive a combination of classroom instruction and training at varied worksites. It is important that social communication, social performance and interpersonal behaviours are: addressed at all stages. Focus areas include: Initiate and respond to interactions with familiar and unfamiliar people Understand prohibitions Understand and follow unwritten rules Participate in positive social experiences Maintain an acceptable level of hygiene and grooming Recognizing and managing anxiety and other responses to over stimulation. 3.5.2 School-based employment training for with autism spectrum disorder. There are nine steps are school-based employment training for with autism spectrum disorder. These are : Observe other Programs and Collaborate with other-agencies Align your Program with State Standards Involve Students in the Planning Process in a Meaningful Way Connect the Program to Real-world Experiences

169 Create Training Materials and Pre-vocational Tasks that Mimic Real-world Processes Use Research-based Training Methods Integrate Program within the School Community Use Authentic "Real-world" Reinforcement Vocational Evaluation Checklist for an Individual with Autism 3.5.2.1 Observe other Programs and Collaborate with other agencies as far as practicable. Collaboration is an essential element of developing effective employment training and overall quality transition programming for ADS. Ensuring that school personnel establish collaborative partnerships and network within and across other model school and community settings can greatly inform educators regarding best practices. Design of a vocational program is to locate and observe other classrooms in the area and take into account the methods and strategies they employ to promote vocational instruction and job skills among the students with ADS. Schools have a transition coordinator whose job it is to build interagency collaborations, provide technical assistance, conduct needs assessments and engage in communication to support student transition needs among stakeholders. Professional can also link teachers to other model school and community- based programs through the establishment of community of practice groups that can share best practices and support implementation of long term goals and policy recommendations related to effective transition. In a practical way, these collaborations can help teachers interface with others in their school districts and analyze the programs that have been successful in vocational training such as copy centres, mail delivery, and recycling. Such communities of practice can also enable participation in continuous training on transition needs and resources available in the community and state. 3.5.2.2 Align your Program with Core Academic State Standards The alignment of the program should be done in a rational manner so that available facilities and requirement may be taken into consideration. Some alternations and practices have been proposed in the coming pages, these may be followed depending upon the available facilities. For example, high school language arts common core standards

170 require students to be able to understand the meaning of words in this context includes technical text from a variety of sources in order to solve a problem. 3.5.2.3 Involve Your Students in the Planning Process in a Meaningful Way Career and vocational development begins with the student must be utilizing a student- directed approach requires consideration of student preferences and interests. Determining students' interests and providing them the autonomy and responsibility to decide on, design and evaluate their work empowers them to connect with the content and promotes self-determination. By giving students the opportunity to meaningfully participate in the curriculum, teachers can develop in their students the skills necessary to be pro-active and self-determined members of society. Incorporating meaningful participation in vocational programs by securing student input in job choices, services offered, and outcome-related rewards may increase student "buy-in." This buy-in will consequently increase student motivation and engagement, which are related to improved achievement. The preparation and planning for a classroom requires means decorations, finance decisions and a host of other responsibilities. Including the students in the process of creating the menus based on their favorite meals and snacks and determining prices not only connects to the common core standards but also contributes to increased student motivation. Giving the students artistic design in the creation of the restaurant space is another way to increase the sense of self-determination and emphasize choice in the development process of the vocational program. 3.5.2.4 Connect the Program to Real-World Experiences The overall goal of vocational program is to teach job skills in a realistic vocational setting that will transfer to a supported, integrated employment setting in the community. So step in any vocational training program is to give students with ASD opportunity to gain experience that will logically lead to jobs after high school in a variety of settings. Although the most directly translatable option would be community-based instruction, many barriers exist that can make it impossible for schools to implement such programs such as funding, transportation, personnel, and location in proximity to possible job placements. In a school community will produce in vocational program is an environment

171 that incorporates key vocational skills for long-term success. The skills consultation with local community businesses where students might someday work and/or become customers. Important skills such as money management, vocational communication (e.g., greeting customers, taking orders, accepting direction, and inter-staff communication), self-determination, and performance of routine job functions such as cleaning and uniform/hygiene maintenance were identified for instruction. Academic skills necessary to participate in the general education curriculum and community beyond the classroom. Academic skills included: writing (e.g., orders, receipts, and menus), reading (e.g., menu items, orders coming in/going out of the kitchen, and order forms for inventory), and mathematics (e.g., adding bill totals including tip, calculating change receipts after closing, and depositing money into store account). 3.5.2.5 Create Training Materials and Pre-vocational Tasks that Mimic Real- world Processes In order to achieve an authentic connection to community job settings, teachers and staff must treat the vocational training setting as the equivalent of a community job placement. Part of this process includes creating the training materials necessary for a vocational setting and ensuring that the process is as realistic as possible. It is important to develop training materials such as employee manuals that can be used when the

172 students begin their job placements within the school. These training materials should also be based on scientifically validated practices .For students with ASD and other developmental disabilities, visual supports have been found to be particularly helpful. Prior to participating in our restaurant vocational program, students were required to take and pass the state food safety exam, just as they would be required for this type of employment position in the community. The students, now considered restaurant staff, were assisted in their daily activities by laminated checklists that they used to track their progress and evaluate their task completion. By linking evidence-based strategies to real-world employment expectations in the creation of our materials, our student staff members were trained to become self-reliant and able to self-prompt their way through the day's work. 3.5.2.6 Use Research-Based Training Methods The school curriculum and instructional methods used within both the special and general education settings must be derived from scientifically based strategies, The goal is to ensure each student's academic success and applies equally to students with and without disabilities. For students with significant disabilities at the transition stage, it is critical that these research-based approaches be applied to the development of their vocational skills in a functionally relevant way. Teachers must investigate evidence- based and scientifically validated practices and apply these in their training programs. 3.5.2.7 Integrate Program within the School Community Integrate Your Program within the School Community should be to encourage meaningful interaction among students such that students and staff in self-contained classrooms are a vital part of the school community. Connecting students to the school community via a simulated community environment offers real world challenges similar to a typical employment context. Moreover, communicating with school personnel in a business setting has many potential benefits. The benefits are: First, students in self-contained settings often become accustomed to communicating only with other students and staff in their own classroom. By expanding the program to personnel outside of the self-contained setting, atypical school communication was encouraged and expansion of students' language use and abilities was facilitated.

173 Second, providing a service that is not only tangible but is also visible within the school setting provides natural reinforces that a contrived setting is simply unable to offer effectively. Third, school-wide recognition of the students' efforts creates a sense of responsibility and identification that increases the students' sense of self-worth and self-esteem. 3.5.2.8. Use Authentic "Real-world" Reinforcement People go to work for a variety of reasons. Those that stay at their jobs and perform to the best of their ability do so partly due to a level of pride and purpose they experience in their work. This level of satisfaction should be no different for students working in an inclusive vocational setting. Naturally occurring reinforcers such as social praise from a job well done can increase generalization of learned skills. The increase in self-determination can be established easily in a vocational setting and in self-determination have been correlated with enhanced "social capital" or connection with those in the surrounding community, greater choice and control, as well as enhanced health and economic success. So some following these steps from beginning to end with the students' participation and input creates these are: ? Sense of ownership that will drive them to continue and to further develop their skills. ? Establishing a vocational setting with natural maintaining contingencies such as payment and evaluation systems similar to those used in everyday work settings can reinforce appropriate work ethics and behaviour. ? Developing a "pay check" system to reward employees for their efforts aligned with a reward system such as a classroom store motivates students the same way we are all motivated to get up each day and go to work.

174 3.5.2.9. Vocational Evaluation Checklist for an Individual with Autism Vocational Evaluation Checklist for an Individual with Autism Student:..... Work Setting:..... Evaluator:.....

Date:..... What are this student's strengths/limitations? Can do Can do with help Comments
 COMMUNICATION : Understands verbal language Requests things desired/needed Expresses refusals Engages in social conversatioa Initiates communication Uses pictures/gestuies to communicate Recognizes words Comprehends sentences Can do Can do with help Comments SOCIAL SKILLS; Initiates social interaction Responds to social interaction Shares with peers Waits when necessary Takes turns with peers Models from peers Can do Can do with help Comments
 WORK BEHAVIORS: Works accurately Works at appropriate rate

175 Follows rules Stays oft task Keeps things in order Finishes a job Works neatly Can do repetitive tasks Can do multi-step tasks Can. solve easy problems Remembers steps in activities Can do 2-3 step loag sequences Can do Can do with help Comments MOTOR: Has strength to do job Has gross motor ability Has fine motor ability to do job Has visual motor ability to do job Can do Caa do Trith help Comments FUNCTIONAL ACADEMICS: Reads Tells time Counts Where/How does this student do the following: Where How Greets people Gives eye contact Negotiates Initiates Waits

176 Answer questions: Where How Who? What? When? Where? Why? Shares Materials Shares food Responds to compliments Initiates comments Cannes on 4-6 exchanges on a subject "What problem-solving skills does this student have? What does the student do when; Answer questions: Where How Something is missing: Something is too difficult: Routine changes: Someone she cales about is absent: Doesn't knowwhar to do Does something incorrectly: Something doesn't work right: Corrected:

177 During work breaks, does take student: Yes No sometimes Imitate what others do? Follow a set routine? Imitate appropriate things to do? Pace OT engage in sell-stimulatory activities? Socially interact with others? What does this student need to complete a job successfully? Yes No Comments Consistent /clear definition'of beginning and finish What is his or her motivation "Likes doing activities with someone. "Likes doing" something preferred "Likes doing" something of special interest "Likes doing" something utilizing strengths "Likes doing" something to get something later How well does the student do tlie following tasks? (Indicate approximate time to complete task) Good Fair Poor Assemble Move item Repetitive cleaning Sequence cleaning Cooking Collating Typing Filing Computer work Calculator

178 What prefereuce/aptitudes for jobs does this student demonstrate? As reported by: Family members: Past experiences: Observations: Other comments: Vocational assets: Vocational liabilities and suggestions for support; Specific recommendations: WORK BEHAVIOR CHECKLIST STUDENT:.....SCHOOL:..... EYALVATOR:.....DATE:..... Code each behavior

as MS- Mastered Skill; ES - Emerging Skill; ND-Not Demonstrated Commnunication: _____Communicates basic needs (i.e. asking for help, accessing information) _____Initiates contact with supervision _____Relays needed information _____Understands work routine and expectations Social Skills: _____Interacts with co-workers and supervisors _____Works along-side co-workers _____Cares for personal hygiene needs _____Responds appropriately to social contacts Manaaes free time during breaks Social Appropriate Behavior: _____ Works continuously without disruptions _____Works without displaying/engaging in major disruptive behaviors

179 _____Accepts correction/supervision without becoming upset _____Exhibits acceptable behavior during break time Rate and Production: _____Works continuously _____Leaves job site only at appropriate times _____Works with limited supervision _____ Works independently and increases production _____Works without disruptions in group settings _____Maiutams a reasonable production rate across the day and across time _____Transitions to new task in reasonable period of time with adequate productivity Accuracy and Quality: _____Completes, tasks with sequenced steps _____Demonstrates consistency over time _____Demonstrates ability to prepare work area _____Demonstrates ability to do a variety of tasks and maintain quality

3.6 Let us Sum Up Autism means a developmental disability. Now Autism is called a Neuro-biological disorder, significantly affecting verbal and non verbal communication and social interaction, generally evident before age 3. It adversely affects a child's educational performance. Other characteristics often associated with Autism are—engagement in repetitive activities, stereotyped motor movements, unusual responses to sensory experiences and resistance to environmental changes. In characteristics of Autism according to DSM IV, Autism in such a developmental disorder under P.D.D., that includes three qualitative deficits- Lack of Socialization, Lack of Communication and Lack of Flexibility. There three are together called 'Autistic Triad' The Assessment of ASD are Clinical Assessment, Behavioural Assessment, Observational Assessment Educational Assessment, Functional Assessment. After assessment of autism should

180 be provide in proper education that's why teaching methods of autism various kinds. These are ABA (Shaping, Modeling, Prompting, Enhancing, Time Out, and Extraction), Curriculum based Assessment and Montessori Method. After schooling the foundational to implementing steps to effective employment training is a focus on generalization children youth with ASD cause experience difficulty generalizing newly learned skills to other settings, situations, people, and environments. Cause as such a critical component of any employment skills program is to develop a sound plan for transfer of skills across settings, persons, contexts and time .So The goal of any training program is behavioral change; that is, if the students are not impacted in a positive way across most aspects of life, the change cannot be considered very meaningful. Adults with Autism need level supports and services analogues by their school age counterparts; particularly important are support employment services and behavioural supports. They rightfully expect to be able to live meaningfully, productive lives. 3.7 Check Your Progress 1. What is Autism? Ans: Autism means a developmental disability also is called Neuro-biological disorder and significantly affecting verbal and non verbal communication and social inter-action generally evident before age of 3 years. 2. Mention any two or three Signs and symptoms of autism? Ans: There are many signs and symptoms of autism. These are: Doesn't make eye contact (e.g. look at you when being fed). Doesn't smile when smiled at. Doesn't respond to his or her name or to the sound of a familiar voice. Doesn't follow objects visually, Doesn't point or wave goodbye or use other gestures to communicate. Doesn't follow the gesture when you point things out. Doesn't make noises to get your attention. Doesn't initiate or respond to cuddling. Doesn't imitate your movements and facial expressions

181 3. What is the cause of autism? Ans:

A specific cause is not known, but current research links autism to biological and neurological differences in the brain also

environmental influences play role as well also recent researchers have shown that autism does run in families, but not in a clear-cut way. 4.

What are the meaning of of 'Autistic Triad' Ans: Characteristics : According to DSM IV, Autism is such a developmental disorder under P.D.D., that includes three qualitative deficits. 1. Lack of Socialization 2. Lack of Communication 3. Lack of Flexibility. These three are together called 'Autistic Triad' 5. Write a full form of PPD-NOS? Ans. Pervasive Developmental Disorder Not Otherwise Specified. 6. What are the meaning of Interdisciplinary and Multidisciplinary assessment? Ans: Interdisciplinary assessment requires respect, integration and coordination among professionals with diverse backgrounds. The interdisciplinary team model is the preferred model in the evaluation and assessment of ASD. The interdisciplinary process involves professionals from various disciplines providing their unique contributions regarding aspects of the child's development and family functioning. The members/ professionals are psychologists, psychiatrists, neurologists, pediatricians, other physicians, speech pathologists, audiologists, occupational therapists, social workers and behavioral and educational specialists. Multidisciplinary process/assessment can take with the child and family participating in numerous sessions or it can take place over the course of several months. Professionals in a multidisciplinary process often operate without benefit of collaboration with other team members and often draw separate conclusions based upon their particular experience and it is a highly stressful process for children and families.

182 7. In asses the ASD children how many clinical assessment are there? Ans: There are five assessment are there. These are Clinical assessment Behavioral Assessment Observation Assessment, Educational Assessment Functional Assessment.

8. Write a full form of A.A.P. Ans: The American Academy of Pediatrics (AAP) 9. Mention any four or five Principles Instructional Approaches of Autism. Ans: There are many principles of instructional approaches of autism. These are: Determine the most efficient and effective program for the child. And it's based on current research and effective practices. Is provided by appropriately trained and competent personnel including parents as appropriate. Make sure staff have specialized training and certification or licensure. Is reflective of the child's areas of strengths and needs that drive the curriculum. Allow the program to integrate techniques or strategies designed to address an array of the child's needs. Includes a variety of methodologies and approaches, which can be integrated. Use strategies that are most cost effective. Is based on comprehensive assessment results. Ensure that programming addresses aspects of ASD and have social validity. Is determined by an IEP team that is multidisciplinary and includes the parent. Ensure that the program is efficient, consistent, and compatible among providers and settings. Program should be outcome-based and evaluation program must be the effectiveness of the child. Make sure the services allow for individualization, and can be validated for the specific child. Provide ongoing evaluation of programming and intervention outcomes via

183 performance based assessment and observational data. Have standards for mastery of goals and objectives. 10. Mention the various representative comprehensive programs of instructional approaches of ASD. Ans: There are six representative comprehensive programs of instructional approaches. These are: i. Developmental Approach ii. Applied Behaviour Analysis (ABA) iii. Structured Teaching iv. Psychotherapies v. Sensorimotor Therapy vi. Play II. Write a full form of AFBAC. What is the function of this approach and mentions the steps. Ans: The full form of AFBAC is an Applying Functional Behaviour Assessment to Challenging Behaviour. The function of this behaviour approach is it is functional behaviour assessments (FBA) or functional analysis and positive behaviour supports (PBS) in the treatment of challenging behaviours for children with ASD. The challenging behaviours such as self-injurious behaviour, stereotypic behaviour, physical aggression and tantrums. A formal approach of Applying Functional Behaviour Assessment to Challenging Behaviour basic steps are: a. Identifying the challenging behaviour; b. Identifying antecedents (events before the behaviour occurred), consequences of the behaviour and setting events which maintain the problem behaviour. c. Designing an intervention, based on the conclusions of the assessment, which may alter the identified antecedents, consequences or setting events. 12. Mention any three and four stages of The Importance of Promoting Generalization of Vocational education of ADS.

184 Ans: Train with multiple persons and across multiple settings. Ensure the presence and delivery of natural reinforcers for the performance of social skills. Practice the skill in the natural environment. Fade prompts as quickly as is feasible. Provide multiple exemplars for social rules and concepts. Train skills techniques self-monitoring strategies. 13. How many stages will be considered in early student with ASD for vocational training. Ans: There are three stages of vocational training considered. These are: Elementary school years: Preparation for pre-vocational training starts in elementary school. Children with autism are strong at visual tasks hence they are quick to learn tasks that use this skill. Skills that are useful in developing career awareness and feeling of job satisfaction include: matching, sorting, correcting sorting errors, matching to jigs (instructions using pictures, drawings, words, or a combination), simple alphabetizing, collecting papers, cleaning tables, serving snacks, getting own snack, delivering messages, packaging and assembly and making simple purchases. Intermediate school years: In the intermediate school years work habits such as attention to task, rule compliance, sustained work on already mastered tasks is important. Systematic typing office work such as collating and sophisticated alphabetizing, measurement, survival signs, money calculations, use of vending machines can be taught. These can be taught in both classrooms and community based settings. High school years: Skills to learn include self preservation and safety skills, work without supervision and independent movement. The students should receive a combination of classroom instruction and training at varied worksites. 14. How many steps are there school-based employment training for with autism spectrum disorder. Ans: There are nine steps are there school-based employment training for with autism spectrum disorder. These are:

185 Observe other Programs and Collaborate with other agencies. Align your Program with State Standards Involve Students in the Planning Process in a Meaningful Way Connect the Program to Real-world Experiences Create Training Materials and Pre-vocational Tasks that Mimic Real-world Processes Use Research-based Training Methods Integrate Program within the School Community Use Authentic "Real-world" Reinforcement Vocational Evaluation Checklist for an Individual with Autism 15. What is the meaning of Integrate Program within the School Community? What are the benefits of this Program? Ans: The meaning of integrate Your Program within the School Community is it should be to encourage meaningful interaction among students such that students and staff in self-contained classrooms are a vital part of the school community. Connecting students to the school community via a simulated community environment offers real world challenges similar to a typical employment context. Moreover, communicating with school personnel in a business setting has many potential benefits. The benefits are; First, students in self-contained settings often become accustomed to communicating only with other students and staff in their own classroom. By expanding the program to personnel outside of the self-contained setting, atypical school communication was encouraged and expansion of students' language use and abilities was facilitated. Second, providing a service that is not only tangible but is also visible within the school setting provides natural reinforcers that a contrived setting is simply unable to offer effectively. Third, school-wide recognition of the students' efforts creates a sense of responsibility and identification that increases the students' sense of self-worth and self-esteem.

186 3.8 Unit End Exercise: 1. What is Autism? Describe the details about the Signs, symptoms, characteristics associated with autism spectrum disorders and common characteristics in autism spectrum disorders. 2. What is Autism? Autism is Treatable? What are causes about the autism? Describe the details about the types of autism and differential diagnostic feature about the autism and related disorder. 3. What is a tool? Describe the briefly interdisciplinary and multidisciplinary assessment and Different Diagnostic tools for Autism Spectrum Disorder. 4. Describe the details about the assessment of Autism Spectrum Disorder. 5. Describe the details about the instructional approaches of Autism Spectrum Disorder. 6. Describe the details about the teaching methods of Autism Spectrum Disorder. 7. Describe the details about Quality Program Indicators Autism Spectrum Disorder. 8. Describe the details about school-based employment training for with autism spectrum disorder. 3.9

without the written permission from the NSOU authorities. Dr. Ashit Baran Aich Registrar, (Acting) NSOU 3 Netaji Subhas Open University From the Vice-Chancellor's Desk Dear Students, from this Academic Session (2015-17) the Curriculum and Course Structure of B. Ed.- Special Education have been thoroughly revised as per the stipulations which featured in the Memorandum of Understanding (MoU) between the Rehabilitation Council of India (RCI) and the National Council for Teacher Education (NCTE). The newly designed course structure and syllabus is comprehensive and futuristic has, therefore, been contextualized and adopted by NSOU from the present academic session, following the directives of the aforesaid national statutory authorities. Consequent upon the introduction of new syllabus the revision of Self Instructional Material (SIM) becomes imperative. The new syllabus was circulated by RCI for introduction in the month of June, 2015 while the new session begins in the month of July. So the difficulties of preparing the SIMs within such a short time can easily be understood. However, the School of Education of NSOU took up the challenge and put the best minds together in preparing SIM without compromising the standard and quality of such an academic package. It required many rigorous steps before printing and circulation of the entire academic package to our dear learners. Every intervening step was meticulously and methodically followed for ensuring quality in such a time bound manner. The SIMs are prepared by eminent subject experts and edited by the senior members of the faculty specializing in the discipline concerned. Printing of the SIMs has been done with utmost care and attention. Students are the primary beneficiaries of these materials so developed. Therefore, you must go through the contents seriously and take your queries, if any, to the Counselors during Personal Contact Programs (PCPs) for clarifications. In comparison to F2F mode, the onus is on the learners in the ODL mode. So please change your mind accordingly and shrug off your old mindset of teacher dependence and spoon feeding habits immediately.

4 I would further urge you to go for other Open Educational Resources (OERs) - available on websites, for better understanding and gaining comprehensive mastery over the subject. From this year NSOU is also providing ICT enabled support services to the students enrolled under this University. So, in addition to the printed SIMs, the e-contents are also provided to the students to facilitate the usage and ensure more flexibility at the user end. The other ICT based support systems will be there for the benefit of the learners. So please make the most of it and do your best in the examinations. However, any suggestion or constructive criticism regarding the SIMs and its improvement is welcome. 1 must acknowledge the contribution of all the content writers, editors and background minds at the SoE, NSOU for their respective efforts, expertise and hard work in producing the SIMs within a very short time. Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor, NSOU

100% MATCHING BLOCK 4/149

W

Cerebral Palsy is a persistent but not unchanging disorder of movement and posture due to a defect or lesion of a developing brain.

Development of the brain starts in early pregnancy and continues until about age three. This damage interferes with messages from the brain to the body, and from the body to the brain. Cerebral = "of the brain", Palsy = "Lack of muscle control". It occurs in about 2 in 1000 live births. It may be the most common paediatric problem referred to Physiotherapists and at the same time represent the least understood paediatric neurological problem. (iii) Many children with cerebral palsy may have associated problems because the brain that control posture and movement can be damaged, so too other parts of the brain can be damaged. Therefore their intellectual abilities, hearing, sight, perceptual capacities may be affected. About half the children with cerebral palsy have epilepsy. (iv) In developed countries, most children with cerebral palsy need to see a physiotherapist, an occupational therapist and a speech therapist. The physiotherapist will work with the child to help to develop good posture and movement, the occupational therapist will help the child's function, visual perception and fine motor control, and the speech therapist will help with eating, drinking and communication. (v) Depending on the physical ability, some children with cerebral palsy may need extra support. For many children, a table placed in front of them may provide adequate support. The children who cannot control their head or are unable to keep their body straight, a special seat may be required when they are placed in a sitting position. In the following discussion some ideas of the special furniture are given which may be suitable for the children. 1.2

EDU 294 Introduction To Locomotor And Multiple ...
(D165064983)

Objective After going through this unit you will be able to know

about :— (i) According to English Surgeon William Little in 1862, “cerebral” refers to the brain and the word ‘Palsy’ describes a lack of muscle control. (ii) Cerebral Palsy (CP) is an umbrella like term used to describe a group of chronic disorders impairing control of movement that appear in the first few year of life and generally do not worsen over time. (iii) Cerebral Palsy (CP) is characterized by sensorimotor dysfunction. (iv) The expression of the disorder can appear worse as the child grows, develops etc.

1.3 Nature, Types and its Associated Conditions

1. Cerebral Palsy is an umbrella like term used to describe a group of chronic disorders impairing control of movement that appear in the first few year of 11 life and generally do not worsen over time. The term Cerebral refers to the brains two halves or hemispheres and Palsy describe any disorder that impairs central of body movement. These disorders are not caused by problems in thy muscles or nerves. Instead faulty development or damage to motor areas in the brain disrupts the brain’s ability to adequately control movement and posture.

2. Cerebral Palsy is characterized by sensorimotor dysfunction, which has its expression in abnormal muscle tone and abnormal posture and movement. While Cerebral Palsy is caused by static encephalopathy, the symptoms often appear to be progressive because it affects a changing organism in which a developing, although abnormal, central nervous system (CMS) attempts to direct and control other maturing systems, including musculoskeletal structures.

3. The expression of the disorder can appear worse as the child grows, develops and attempts to compensate for abnormality while confronting the force of gravity in every effort to move.

4. Cerebral Palsy, a developmental disorder affects the total development of the child either directly, relating to sensorimotor function, or indirectly through associated problems. As a developmental disorder, Cerebral Palsy has varying effects on children at different stages of development as well as different chronologic ages. Although the hallmark of cerebral palsy is motor dysfunction, and various other problems frequently coexist.

Aetiology Information about the cause of the disability is helpful for families and essential for generic counseling. Investigations such as urinary metabolic screening and chromosome analysis may elucidate rare causes of cerebral palsy. Radiological procedures such as magnetic resonance imaging (MRI) can be useful if preliminary investigations have been negative.

Cerebral Palsy is associated with a number of variables, which have been grouped into birth weight and gestational age, other biological factors occurring during prenatal and perinatal and postnatal time periods and selected social factors. The most commonly reported relationship is with birth weight. There is a strong association with low birth weight and prematurity. There is remarkable agreement across countries in the marked increase in cerebral palsy as birth weight decreases below 2,500 grams (5.5 pounds). Birth weight is obviously less as gestational age decreases.

12 Birth factors are viewed by some as the major cause of cerebral palsy, While others believe that the damages occurs in utero and leads to perinatal problems. Part of the problem in resolving these different views is that intrauterine insults are more difficult to identify and measure, whereas many perinatal factors are easier to monitor. There are many different causes of cerebral palsy. In a considerable proportion of cases the cause remains unknown or elusive. Note : It is important to establish the cause if possible.

Prenatal Events. Prenatal events are thought to be responsible 75 percent of all causes of cerebral palsy. Known causes include :- Congenital intrauterine infection, e.g. Rubella. Developmental brain anomalies Placental insufficiency (sometimes).

Perinatal Events Birth asphyxia may be caused by antepartum haemorrhage or other placental cord problems. Perinatal asphyxia accounts for about 8 to 10 percent of all cases of cerebral palsy. If hypoxia is severe enough to cause neurological damage it usually results in death or hypoxic encephalopathy with cerebral oedema and associated seizures, irritability and feeding difficulties. The motor centres are the area of the brain most vulnerable to perinatal hypoxicischaemic damage, and if there are long term sequelae they will include cerebral palsy.

Postnatal Events Postnatal events account for about 10% of all cases. Known causes include:- Accidental injury, e.g. hypoxic events such as near - drowning accidents, head trauma from motor vehicle accidents.

13 Non-accidental injury or child abuse Severe brain infections, e.g. meningitis. Classification of Cerebral Palsy 1. Muscle tone refers to a constant state of partial contraction or tension in moving or resting muscles of the body. To maintain a posture or moving in and out of the posture requires us to have postural tone. Children with CP usually have problems with postural tone. Total qualities seen in CP are :- Hypertonia – Too much muscle tone leading to stiffness. Hypotonia – Too little muscle tone leading to floppiness. Dystonia – The muscle tone fluctuates between stiffness to floppiness. Rigidity – Sustained stiffness of limb. Spasm – Involuntary and possibly painful contraction of muscle. Tic-tacs – Repeated rhythmic uncontrolled movements of parts of the body. 2. Classification of Cerebral Palsy by number of Limbs involved. I. Quadriplegia - All four limbs are involved. II. Diplegia - All four limbs are involved - Both legs are more severely affected than the arm. III. Hemiplegia - One side of the body is affected the arms are usually more involved than the leg. IV. Triplegia - Three limbs are involved usually both arms and a leg. V. Monoplegia - Usually one limb is affected. Usually an arm. Quadriplegia Diplegia Hemiplegia Paraplegia Monoplegia Problems associated with CP Mental Retardation - Mental Retardation is a disability characterized by significant limitations both in Intellectual Function and adaptive behaviour as expressed in conceptual, social and

14 practical adaptive skills. This disability originates in childhood Intellectual function should be evaluated by an appropriately trained professional with standardized psychometric tests appropriate to the child's mother tongue & culture. An often quoted incidence is that about 50% of the population has an I.Q below 70. The unsuitability of formal tests of intelligence often used in the past have caused such figures to be questioned. Current procedure is much more likely to use a variety of methods to gather information, such as checklists, administration of appropriate subtests of a number of standardized tests, observation of the child's (or adult's) performance in a variety of situations, and a synthesis made of all the results based on the examiner's experience. Emphasis on early intervention and the increasing use of augmentative communication systems are making it possible to assess the degree, if any, mental retardation in an individual. It is increasingly recognized that sensory deprivation are often important contributing factors to mental retardation. Hearing Impairment Impairment in hearing capacity is defined in terms of degree of hearing loss. Total inability to hear is deafness but those whose sense of hearing is defective but who manage with or without hearing aids are called hard of hearing. It might be congenital or acquired. Congenital - Hearing loss at the time of birth. Acquired - Hearing loss acquired any time in one's life. Eligibility of services under the categories of deafness & HI is based on degree of hearing loss. Degree of Hearing loss - 0-25-Normal 26-40-Mild 41 - 55 - Moderate 56 - 70 - Moderately Severe 71-90-Severe 91+ - Profound. Reports on incidence vary from 8% to round 30% of the population. All children and adults with cerebral palsy need hearing assessment every 2 to 5 years. Hearing

15 problems occur frequently and may remain undetected. It has been noted that a person with the athetoid type of cerebral palsy has a greater likelihood of being hearing impaired. The child with cerebral palsy who is also hearing impaired is handicapped not only in his ability to receive language through speech, but also because, physically, he may not be able to explore his environment, get objects he wants or direct the attention of others. His deafness may not be diagnosed until late, his lack of response being thought to be due to his cerebral palsy or mental retardation. Many schools for the deaf are equipped to provide services to the physically handicapped child. If he does attend a school for the deaf, the severely handicapped child with cerebral palsy may gain a receptive language. Opportunity to learn to use an aided technique, such as a communication board, will be very useful. Visual Impairment Vision Visual Impairment is defined in terms of visual acuity, field or vision & visual efficiency. Vision is the most actively used sense by man. Cognition depends upon his visual experiences. Their ability to get along is also limited because of restricted mobility. They are unable to control their own environment and themselves in relation to it. These are significant defects. Visual ability of the eye to see the distant objects clearly is assessed using the Snellen Chart. An individual may be considered as blind if the visual field is severely limited even if visual acuity is better than 20/200. If the visual field is no greater than 20 degree in width, the individual can still be classified as being blind though visual acuity is not within typical range of blindness. Visual efficacy means how well one can use one's vision. This means how this visual information is processed analyzed and interpreted in the brain. Individuals with cerebral palsy have special eye care needs that should be examined and monitored by an ophthalmologist. All children and adults require visual assessment every 2 to 5 years. Vision disorders particularly strabismus are common. Visual acuity may be impaired and can remain undetected. Reports indicate that as many as 25% to 50% of children with cerebral palsy have visual impairments that could significantly affect academic work (Cruickshank, 1976). The most prevalent of the visual impairments in the population, strabismus and nystagmus, can be related to muscle imbalance and muscle control respectively. Assessment of impairments may be more difficult than usual in the presence of reduced or uncontrolled head movements. Assessment of vision is often difficult, especially with nonspeaking children who are severely physically involved.

16 Disorders of Bodily Sensations Noted in the literature on the cerebral palsied population are such problems as disorders in tactile sensation, two-point discrimination, body image and position sense, pain and temperature, any of which will affect to a lesser or greater extent, a person's relationship with his environment and the people in it. For example, a visually impaired person who has difficulty in recognizing objects by their shape is extremely handicapped. Seizure Disorders Epilepsy Epilepsy could be defined as a sudden uncontrolled episode of excessive electrical activity which could lead to a change in behaviour consciousness or movement. Epilepsy is not a disease it is a sign/symptom of a structural or a chemical disorder it can range from severe to minimal and are exhibited in a number of ways. Epilepsy is the most common neurological disease. Due to seizure there is a sudden change in intellectual sensory motor, autonomic or emotional activity limited in length and presumably associated with neural over activity. Treatment to control fits is important. Cerebral Palsy and epilepsy often occur together. Epilepsy occurs in up to 50% of children and approximately 20% of adults with cerebral palsy. It is most common in those with severe motor problems and requires careful management. Adults may have been on antiepileptic medication for many years and are also at increased risk of osteoporosis and therefore fractures. Regular review of antiepileptic medication is important. Reports as to the degree of incidence vary widely, but there is less incidence in the athetoid than in the spastic type of cerebral palsy. Cruickshank(1976) suggests that 35% - 60% of all children with cerebral palsy are likely to develop seizures at some time in their lives. Seizure problems, such as frequent petit mal seizures, may have significant effect on the attention. Drugs to control seizures may, but not necessarily, affect the individual's alertness.

17 Visual-Motor Deficits Visual motor deficits are reported more frequently than in the general population. This may affect writing, ability quite apart from the presence or otherwise of a motor handicap. Physiological - Sociological Problems An individual with cerebral palsy is an individual first with his own strength and personality traits. His particular circumstances and experiences combine to help him react to a situation in a particular way. Some individuals triumph over exceeding odds to become examples and sources of strength to us all. However, given the variety of frustrations which an individual with cerebral palsy may have to face daily, it is not surprising to find reports of emotional problems, such as emotional immaturity and instability, introversion and depression (Mysak, 1980) occurring with more than average frequency in this population. Motivation is an element of personality which has much bearing on a person's ability to achieve communicative competence. In recent years it is becoming increasingly recognized that it is the attitude of others - parents, friends, professionals, and society at large- whether overprotecting or rejecting, which forms a person's biggest handicap. A negative self concept is more often a result of these attitudes than the frustration arising in adolescence. The public awareness and acceptance of the person with cerebral palsy are paramount. These will contribute to the formation of a positive self concept by the individual". After Physiological- Sociological Problem Eating, Drinking & Speaking problems- Eating & Speaking are skills that come from the coordinated, controlled movement of lips, tongue, throat etc. Taking is good, chewing and swallowing gets difficult on there is no muscle control. Learning to speak also gets affected. Drooling - Unintentional loss of saliva from mouth occurs on there is poor coordination of swallowing mechanism. Specific learning difficulties - Essential cause mostly due to logical and cognitive defects in children with CP. They may have problems in memory, attention, physical co-ordination activities like hand writing & self-help.

18 1.4.

100%	MATCHING BLOCK 8/149	SA	EDU 294Introduction To Locomotor And Multiple ... (D165064983)
Assessment of Functional Difficulties of CP Including Abnormalities of Joints and Movements (Gaits)			

Possible Physical Problems Unable to lift head when lying or held in sitting position Unable to move to change position Unable to use hands for support or movement or for function Unable to function, protect or reach out with arms while sitting independently Unable to get in and out of sitting position Unable to lean forwards or backwards while sitting independently Unable to do active forward and backward weight shift of the trunk in different positions, e.g., long sitting, supported crawling position, supported standing position Poor balance reactions in standing (unable to protect effectively when falling) Unable to transfer weight forward, backward or sideways in the standing position Unable to get into or get out of standing position Can step but cannot stop To get into, maintain and get out of standing position Balance reactions and weight transference in standing Types of Motor Disorder Spasticity It is characterized by an increase in muscle tone causing difficulty in movement. Movements are slow and laborious or, in severe cases virtually non-existent. Spastic muscles are tight and stiff hypertonic - and have an increased resistance to being stretched (clasp knife).

100%	MATCHING BLOCK 9/149	SA	EDU 294Introduction To Locomotor And Multiple ... (D165064983)
Normal muscles work in pairs; when one group contracts, the other group relaxes			

to allow free movement in the desired direction. Spastic muscles become active together and block effective movement. This muscular " tug-of-war" is called co-contraction. Sensory loss occasionally occurs in spastic hemiplegic hand and visual field. Growth of hemiplegic limbs is less on affected side.

19 Epilepsy is more common in this type of CP. Excitement, fear or anxiety increase hypertonus; sudden rather than slow movements increase hypertonus. Athetosis Almost always affects the whole body and all four limbs and generally results from damage to the basal ganglia. It is characterised by variable muscle tone, dysarthria, loss of control of body posture and constant involuntary movements. Hearing loss of specific high frequency types is associated with athetoids, caused by kernicterus. Ataxia Refers to a disorder of balance associated with damage to the cerebellum. They have poor muscle tone (hypotonic) staggering walk. Tremor may be present. Disturbance of balance. Poor fixation of head, trunk, shoulder and pelvic girdle. Poor fine hand movements occur. Nystagmus may be present. Mixed A mixture of more than one type of cerebral palsy is common, particularly the combination of spasticity and athetosis. Presentation and Diagnosis Childhood:- Follow-up of at risk infants. Delayed motor milestones. Development of asymmetric movement patterns. Abnormalities of muscle tone. Management problems, e.g. severe feeding difficulties, abnormalities of behaviour such as irritability.

20 It is important to remember that many young infants may have normal tone during the first few months of life. The onset of spasticity may be gradual; Similarity, athetoids movements may not appear until between 9 and 18 months of age. It is also important to exclude progressive neurodevelopmental and spinal lesions that may initially present in a similar manner to cerebral palsy. Presentation and Diagnosis Adulthood Adults with an established diagnosis of cerebral palsy may also present for management of other acute or chronic health issues. A decrease in overall functioning may be related to the interaction between lifelong motor impairment, associated conditions, ageing and age - related disease.

1.5 Provisions of Therapeutic Intervention Possible Physical Needs for Developing Head Control Weight bearing on arms in different positions: prone, sitting, crawling. Developing righting reactions in lying (maintain balance by moving head or body. Promoting active extension of trunk which will make it easier for child to lift and hold head up (reaching up and out with alternate arms in prone or supported sitting). Encouraging segmental rotation of trunk through rolling. Bringing hands together in front of the body (holding objects such as toys). Encouraging reaching out with arms - in lying, side lying and supported sitting position. Recommended Positions for Mealtimes Feeding or Eating to be done in sitting position using Floor seat with a floor table or cut-out table in front.

21 Sitting on a Chair or wheelchair with a cut-out tray in front (Please note you may need to support the head with your hand) Play Sitting on floor seat. Sitting on chair with cut-out tray. Standing with support (wearing gaiters) Toileting. The child/ student must be well secured on plastic or wooden potty chair. Possible Physical Needs for Developing Sitting To get in and out of sitting position To improve balance reactions in long sitting (to sit without support and be able to do an activity with the hands) Active forward and backward weight shift of the trunk in different positions, e.g., long sitting, supported standing position Recommended Positions for Mealtimes Feeding or Eating to be done in sitting position using Floor seat with a floor table or cut-out table in front Sitting on floor against a wall with floor table or cut-out table in front Sitting on a Chair or wheelchair with a cut-out tray in front Toileting Western toilet with grab rail attached to wall at side Potty chair-wooden or plastic Methods of Mobility Moving on board with castors Chair with castors Wheelchair Possible Physical Needs for Developing Standing Getting into, maintaining and getting out of kneeling, half-kneeling and standing positions Balance reactions and ability to transferring weight actively in long sitting, kneeling, hal kneeling and bear standing positions Standing against wall or holding grab rail.

22 Recommended Positions for Mealtimes Normal seating arrangement which is available in child's environment for eating, play and work Toileting Normal Indian / Western style toilet with a grab rail or some support for holding. Cut-out stool over Indian style toilet to enable child to be self-sufficient while washing Methods of Mobility Crawling Bottom shuffling Walking with Kaye Walker Walking with crutches Possible Physical Problems for Developing Walking Poor balance reactions in standing (unable to protect effectively when falling) Unable to transfer weight forward, backward or sideways in the standing position Unable to get into or get out of standing position Can step but cannot stop Possible Physical Needs for Developing Walking To get into, maintain and get out of standing position Balance reactions and weight transference in standing Recommended positions for Functional Needs Independence in all functional skills using normal facilities available as far as possible. Methods of Mobility Independent walking Lifting, Carrying and Transfer Lifting and / or carrying a person with a physical disability should always be kept to minimum. Wherever possible a wheelchair should be used to move a person. When lifting or carrying is required ensure : Dignity of the person being lifted / carried

23 Safety of person being lifted / carried That the person who is lifting / carrying should care his / her back Techniques for Lifting and Carrying Always explain to the person you are going to lift: What you are going to do How you are going to do it What you would like them to do Stand as close as possible to the person you are going to lift When lifting a person, bend your knees, not your back, so you are at the same level as the person Move as close to the person as possible, bend your knees, place one arm under the thighs and place the other hand across the back and under the armpit When two people are required, Bend your knees and link hands firmly with each other under the thighs and across the back Decide beforehand the direction in which you will move Work in unison (e.g., 'on count of three lift') Ask the person being lifted to lean forward as much as possible Techniques of Transfer When transferring a person to or from a wheelchair to bed / toilet / car / floor or to another chair the wheelchair should always be placed as close possible to the place where the person is being transferred to. 1.6

Implications of Functional Limitations of children with CP in Education and Creating Prosthetic Environment in School and Home: Seating arrangements, Positioning and Handling Techniques at home and school			

Education Reading Difficulty in Early Literacy Children may have difficulty in the following areas Concepts about print 24 Visual matching Whole-word recognition Phonological awareness Comprehension Creative comprehension Difficulty in Formal Reading, Writing, Handwriting Children may have difficulty in - Naming the letters Spelling words Accuracy of Reading (Aloud) - words, text, poetry b) Types of errors Mispronunciations Omissions Substitutions Reversals Additions. Loses place c) Rate of reading may be Too fast Fast, jerky, unclear Variable - in bursts, sometimes fast, sometimes slow Slow, jerky, unclear Too slow, loses flow of text d) Children may have difficulty in Comprehension of text Creative writing Handwriting

25 Seating Arrangement: Special Furniture Some children with cerebral palsy have difficulty sitting on their own. A special seat may be required when they are placed in a sitting position. Some ideas of the special furniture are discussed that may be suitable for the children with cerebral palsy. Advantages of Special Furniture If a child with cerebral palsy

76%	MATCHING BLOCK 10/149	W	
has difficulty controlling his head or sitting upright, a special seat may help him in many ways: It will give extra support He will be more comfortable He will feel more secure			

He will be able to maintain a better posture Disadvantages of Special Furniture:

89%	MATCHING BLOCK 11/149	W	
Special furniture keeps the child in one position and may hence limit his activities.			

Children's size and sometimes their posture changes in time but special furniture is static and usually cannot be adjusted.

87%	MATCHING BLOCK 12/149	W	
A prolonged period of sitting can be very tiring for a child. If he is stiff, he is also at risk of becoming stiffer or getting contractures (permanent tightness) especially in his hips and knees.			

Making Special Furniture To make any special furniture for the child, give exact measurement to the carpenter. Make sure that the carpenter uses adhesive along with nails or screws on all wood joints, as this will make the furniture sturdier. It will also prevent urine or spilt liquid seeping through the joints of the wood.

26 Always make sure that the wood surface is smoothed well with sandpaper before it is painted. Ensure that all sharp edges and corners are removed to prevent the child from hurting himself. Laminated sheets can be used on the surface of tables or trays if preferred. This makes cleaning easier. Painting the furniture makes it much more attractive. Use the child's favorite colour for painting.

92% MATCHING BLOCK 13/149

W

How to measure a child for a special seat Seat the child on a low stool (the height of the stool should be such that he / she can place his/ her feet flat on the floor) If the child cannot sit by himself, hold him in the sitting position on the stool. Try to keep the child as straight as possible. 27 28 Seat Length Measure from the child's back to where his knee bends (A to B).

82% MATCHING BLOCK 14/149

W

Seat-width Measure the width of the child's back and add an extra 2 inches (C to D). Arm rests (sides of the seat) Measure from the stool to 2

inches above the child's waist (A to G).

100% MATCHING BLOCK 16/149

W

Height of the back of the seat Measure from the stool to the top of the shoulders (A to E). If the child cannot hold his head straight and does not have head control; measure from the stool to the top of the child's head (A to F). 29

100% MATCHING BLOCK 17/149

W

Height of seat from the floor Make sure that his knees are at right angles and his feet flat on the floor. Measure from the back of the knee to the floor (B to H). Following are some examples of special furniture and the type of child who may benefit from using the furniture. Floor Seat A floor seat is a simple seat that is suitable for children and families who sit on the floor at home or for

many of their activities,

100% MATCHING BLOCK 18/149

W

such as eating and playing. It is most suitable for small or young children. The floor seat gives support at the back and sides. If the head is not steady, it can be made higher at the back to give the child support at the back of his head. If the child is tight between the legs or tends to slip forward in the seat, a pommel can be fixed to the seat. The measurement for the pommel is given

100% MATCHING BLOCK 19/149

W

The measurements for the floor seat are as explained earlier

on page 3. The only difference is that

80% MATCHING BLOCK 20/149**W**

the measurement of height of seat from the floor is not required as the seat is on the floor. 30 If you want to move the child around in the box seat, castors can be attached to the bottom of the seat so that it moves easily. If castors are attached, a foot rest will have to be added to the seat. To measure for the height of the foot rest, measure the child from the back of the ankle to the back of the knee (B to A).

100% MATCHING BLOCK 21/149**W**

Box Seat The same type of seat as the floor seat can be made at a higher level for the child who does not sit on the floor. The measurements for the height of the seat from the floor should then be included. 31

100% MATCHING BLOCK 22/149**W**

The height of the rod will be from the seat to just below the armpits. It should be at a distance of 2 inches in front of the child's chest. There will be a hole cut in the seat of the chair through which the child passes stool or urine. A bucket or container is placed under the hole. Remember the hole in the potty seat should be pear-shaped for boys.

98% MATCHING BLOCK 23/149**W**

Potty Chair If the child cannot sit, or has unsteady sitting balance, it is often very difficult for him to use the toilet, whether it is western or Indian style. A potty seat should give the child enough support for him to sit without being held by anyone, so he has some privacy. It can be placed in a convenient discrete place in the home. It is also useful for children who are not yet toilet trained and need to be taken to the toilet very regularly. The measurements are the same as for the box seat. However the sides of the potty seat should be straight up to the shoulder. Two circular holes are made in the sides of the seat through which a rod can be inserted to ensure that the child does not fall out of the potty chair. 32

100% MATCHING BLOCK 24/149**W**

Ramped Seat Children who tend to slip forward on the seat often benefit if a ramp is fitted to the seat to prevent slipping. It is more comfortable than a pommel and often adequate to keep the child in place. If the child still slips forward even with the ramp, then a pommel may be required.

100% MATCHING BLOCK 25/149**W**

Pommel Some children who have tightness between their legs may require a pommel which separates the legs. It also helps to stop children slipping forward in the chair. This is a cylindrical block of wood 6 inches high and 2 inches in diameter. It is secured to the seat at a distance of 1 inch in front of the child's groin. For extra comfort, pad the pommel with 1 inch thick foam and cover it with rexine. 33

100% MATCHING BLOCK 26/149**W**

The ramp is usually two inches high at the front. It slopes gradually to cover 1/3 of the chair and becomes level with the rest of the seat. It can be made from ply wood, but should always be well padded with 1 inch thick foam which covers both the ramp and the rest of the seat. Pelvic Strap A pelvic strap gives added support and stability for children, who tend to slip forward in the seat. It is also a safety factor, as the child cannot fall out of the seat if left alone. The pelvic strap is always fixed at the back and below the level of the seat, so that it comes upwards and round the waist. This ensures that the child cannot slip under it. The strap should be made of thick cotton strapping 2 inches wide, which can be knotted in front.

99% MATCHING BLOCK 27/149**W**

Padding for Seating Children often spend a great deal of their day sitting so it is very important that the seat is comfortable and well padded. The padding usually consists of 1 inch foam. If the child is not toilet trained or if he tends to spill food when eating, it is best to cover the seat with rexine, which can be easily wiped clean and dry. If the child sweats a lot, it is advisable to place a towel over the rexine when the child is sitting in the seat. For children who do not have toilet accidents and are not likely to spill food or water, it is more comfortable to cover the seat with cloth. When padding a seat, the back, sides and seat of the chair should all be padded. Padding is not advisable for toilet seats. 34 Floor Table This type of table is very useful for children who sit on the floor. It is simple to make and does not take up too much space. If children have difficulty sitting, it gives a support in front on which they can lean. They will be able to use their hands more effectively. Children who have a tendency to keep their knees bent and sit with their legs crossed or between their knees can be encouraged to sit with their legs straight if they have a floor table to lean on. The floor table can also be used with the floor seat. There should always be raised beading round the three sides of the table not in contact with the child to prevent objects or toys from rolling off the table. The measurement for a floor table is usually 18" X 18". However for a younger child who uses a smaller chair, the floor table can be 15" X 15". Cut-out Tray This type of tray can be fitted to a chair or wheelchair. It gives extra support for the child who tends to fall forwards or sideways when placed in a seat. The tray gives support round the trunk, and enables the child to be more upright and if possible, use his hands more effectively. 35

93% MATCHING BLOCK 28/149**W**

The tray needs to be anchored to the chair with hooks at both sides. It could also be made into a table, by fitting it with legs, so it can be used with a floor seat. Measurement for the cut out tray will be the same as for a cut out table. The height of the table should be just above the child's waist. The cut-out portion should be measured to fit the child. The diameter of the semi-circle should be the width of the child's waist, plus two inches (A-B). It should fit comfortably around the child. As with the floor table, beading should be placed round the three sides of the tray. A child will be most comfortable in a chair for which he has been measured carefully.

These are just few ideas that may be suitable for the children.

90% MATCHING BLOCK 29/149**W**

However, when possible, it is always better to seek expert advice before making a seat.

92% MATCHING BLOCK 30/149**W**

As the child grows and develops we may need to change the size and the design of the seat. 36 1.7.

MATCHING BLOCK 31/149

W

Facilitating Teaching-Learning of children with CP in school, IEP, Developing TLM, Assistive technology to facilitate learning and functional activities.

Many children with CP will also have some type of learning disability. Assessment by a psychologist and the support of special educators can reduce the handicapping effects of the learning disability. Children with CP will often start their education early to help improve their mobility and communication skills before starting school. Most children with CP will receive an integrated education enabling them to mix with their peers in their neighborhood school. A child with mild CP may simply require minor programme adjustments. For example, he may need a little more time to write an exam if his hand control is poor. A child with more severe disabilities may require considerable support from resource staff and teaching assistants. Children should have an Individualized Education Plan (IEP) which assesses the child's performance, sets goals and specifics which supports are required. The amount of support offered and the commitment to successful integration varies widely between school boards and individual schools. A good partnership between parents and educators will help children to achieve their goals. The ultimate long term goal is realistic independence, to get there we have to have some short term goals, those being a working communication system, education is his potential, computer skills and above all friends. IEP To facilitate learning, all children with cerebral palsy need to be assessed to determine what kind of help they need. An assessment involves gathering information about the children and his development. It generally includes what kind of help a child needs. Information comes from a variety of sources, for e.g., parents, the multidisciplinary assessment team, the child's doctor and medical history, reports and results from developmental tests and or checklists. A multidisciplinary assessment team of professionals includes a special educator, an occupational therapist, a physiotherapist, a speech and language specialist, medical specialist, and a psychologist. These professionals observe and test the child, and determine the child's strengths and needs. Based on their reports the Individual Educational Programme / plan (IEP) is

37 prepared. The written plan describes the child's needs, as well as the services that are to be prepared for the child. In the school at an IEP meeting the people who have assessed the child explain their findings, what tests/ checklist they used, and they also report the strengths of the child. On the basis of this meeting the IEP is developed. The plan lays out what the school intends to do during the school year. After that, during the whole academic year in a regular interval the school must schedule a meeting with the team to review the child's progress and if needed the IEP may be modified. The IEP - IEP is a well formed written document which serves as a management tool for intervention. Components of IEP - this is written in two parts. Part A 1. Demographic data - It includes, Child's name, age, sex, education, mother tongue, address, parent's name, occupation, income, date of filling IEP, registration number, class and roll no. etc. specific heads can which information is required. 2. Significant information about the person with CP. Sensory preference, learning time preference, attention span, rate of learning etc. 3. Goals - Goals selected on annual basis which the teachers expect the students to achieve over a period of one year as per curricular content is documented. 4. Associated condition - Many person with CP have an additional disability or more. Curricular strategies and planning may differ in cases with additional impairments. 5. Staff responsible - The person responsible for implementation of the IEP is documented for administrative and clinical reasons. Part-B 1. Specific statements of what skill/activity to be taught is documented in the specific term. E.g. writing names of month of year. 2. Baseline or current level - The current level of the student is reference to the task/activity for teaching is documented. Eg. Can write names, 3 - better words. 3. Specific objectives - This is the statement that specifies what the student will learn (content) what the student will do with the content (behavior), performance level of the student in the content (criteria) and how much is the time period required for achieving the target (duration).

38 4. Materials and learning aids - learning aids make learning meaningful and carrier. Depending upon what is to be thought and child's specific interest level and needs learning aids may differ for same activity. 5. Procedure - How to motivate the child to learn the activity and how the task will be taught is described in a stepwise procedure. This all include different strategy to be used to make learning effective. 6. Evaluation - The student's performance in the particular task chosen against the set criteria as per the specific objective is noted. Teaching Learning Materials (TLM) for Children with Cerebral Palsy TLM are a necessary and important part of any classroom or learning situation. Learning materials to be imparted or conveyed through a medium which the learner easily accepts and comprehend. The TLM to be used depends on the subject to be taught and the age of the learner. Bruner talks about three modes of Learning. They are: ENACTIVE MODE (Activity -based learning) ICONIC MODE (Learning by use of images and diagrams) SYMBOLIC MODE (Learning by use of symbols / languages) We must always remember that each subject of study requires a different kind of TLM because ? It depends on the nature of the material to be learnt ? The methods of teaching being employed ? The needs and the nature of the learner at each stage of development There are various criteria of selection of learning materials. Wood (1963) has suggested six criteria for selection of TLM. All TLM should make a definite contribution in achieving the goal on the part of the learner. There are individual differences in a group of students - variety of learning materials should be used. To increase the objectivity of analysis TLM should be authentic. TLM should be adapted to the maturity level of the pupils who are to use them.

39 TLM should be selected on the basis of efficiency- the materials that result in the greatest amount of learning in the least amount of time. If there is a choice between two types of materials of equal learning value, the less expensive one should be chosen. Using TLM Junior-Most (Infancy) Classes (approx 2- 6 years) - we use play-way method. Children are instinctively curious and have innate desire to play, explore and learns through play. Use - concrete objects made of different materials, shapes, colours etc. Early Childhood (approx 6-10 years) - imagination and make believe play are important. Role playing, hand work, project work are incorporated into the TLM. Late Childhood (10-13 years) - the peer group becomes more important than parents and family. Students like to participate in group activities requiring participation of each learner like project work, competition, exhibition, etc. Adolescent (13+ years) the learner requires intellectual stimulation, emotional security, physical exercise, opportunity to make personal or individual decisions and contributions. So demonstrations and guidance are employed Group activities Workshops Projects, etc become part of the learning process Assignments completed by the learners become important as TLM. The Requirement of Visual Aids To attract attention to what is being taught To keep thoughts focused To highlight the key points of a lesson

40 To introduce new, unfamiliar concepts To outline or summarize the points of discussion To advance the learning situation To add interest and involvement To make learning more permanent To help to overcome language barrier To develop greater understanding. Audio-Visual Aids help to learn 35% faster and retain 55% longer. Language and Reading Aids Look and say card Feely bag Mystery picture What's happening cards Half-moon cards Alphabet booklet Beginning-ending Read, write and draw Action words Action dice Flannel board & cut-outs(for story telling) Number Aids Colour box and pegs The sorting tray Sandpaper numbers on cards Number jigsaws Fishing games Number dice The abacus, etc

41 Assistive Technology to Facilitate Learning Technology Refers to Any tool that has the potential to remove the tedium and repetition and will allowus to perform that which is most human Application of knowledge to meet the goals, goods and services desired by people The way to use, to develop a 'tool', any 'tool' to solve a specific problem minimizing the effort to do it. Information Communication Technology (ICT) Deals with information Facilitates communication The concepts covered by the word ICT are - Computer technology Networking Data collection- analysis Gathering information and managing it efficiently Interactive Innovative Entertaining Assistive Technology (AT) is

any item, piece of equipment, or product system whether acquired commercially off the shelf, modified or customized that is used to increase, maintain or improve the functional capabilities of individuals with disabilities.

Different types of Assistive Technology (AT) : * Furniture, Work Surfaces and Work Stations * Mobility devices * Low tech devices or assistive devices for the activities of daily living * Computer Access: Hardware and Software * Aids for people with low vision and visual impairment

42 * Hearing impairment * Augmentative and Alternative communication devices and software * Electronic Aids to Daily Living (EADLs) or Environmental Control Units (ECUs) * Mounting Devices and other Performance Enablers * Single switches and controllers - for access to many types of AT devices Inclusive Technology Is the application of scientific advances to benefit humanity Supports the Rights of All Citizens Provides support for learning, communication and living Empowers All people Therefore Inclusive Technology needs to be Pragmatic Affordable Flexible Culturally relevant 1.8 Let us Sum Up "Cerebral Palsy" (CP) or "Cerebral Paralysis, was first indentified by English Surgeon William Little in 1862, and therefore the condition is known as "Little Disease". The term CP was given by Phelps (1946). According to him, "Cerebral" refers to the brain and the word 'Palsy'describes a lack muscle control. cerebral Palsy describes a group of permanent disorders of the development of movement and posture, causing activity limitation, that are attributed to the nonprogressive disturbances that occurred in the developing fetal or infant brain. The motor disorders of cerebral palsy are often accompanied by disturbances of sensation, perception, cognition, communication, and behaviour, by epilepsy, and by secondary musculoskeletal problems. Cerebral Palsy (CP) does not always cause profound disabilities. While one child

43 with severe cerebral palsy might be unable to walk and need extensive, lifelong care, another with mild cerebral palsy (CP) might be only slightly awkward and require no special assistance. Supportive treatments, medications, and surgery can help many individuals improve their motor skills and ability to communicate with the world. 1.9 "Check your Progress" 1. Define cerebral Palsy.

..... 2. Give a brief descriptions of associated conditions of C.P.

..... 3. Classify Cerebral Palsy?

..... 4. What are the possible physical problems of CP?

..... 44 5. What are the areas children may have face due to CP?

..... 6. Describe the criteria of selection of learning materials for CP Children.

Amputations : 2.3.1 Defination : An amputation is the loss of same part of the body. Rarely children are born		

with out

81%	MATCHING BLOCK 35/149	W
one or both hands or feet. More after, children lose one arm or leg because of		

injuries in accidents. Accidents with agricultural implements are a major cause of amputations. Machines like fodder cutters are often used with out proper safety devices. Adults working on these machines and large portation of fingers and arms. Therefore, accidents often result in severe injuries of the forearn and evenarn, resulting in amputations. Some time lack of proper case of the wound can lead to the amputation of a limb, for example ofter tourniquents or tight bandages around the lime are applied as a first aid for shaked and for control of bleeding. In the urben areas road accidents are significant cause of amputations. Sometimes

100%	MATCHING BLOCK 36/149	W
limbs must be cut off because of advanced bone infections		

of dangerous tumors (cancers) burns, leprosy, surveys around the country have shown that most children and adult amputees. 2.3.2 Therapeutic Management of Amputee :

91% MATCHING BLOCK 37/149

W

Care of the Amputated Limb : The goals in caring for the stump are to maintain a good shape and good position for fitting an artificial limb. This means taking active step to : 1. Avoid swelling 2. Keep the full range of motion (Prevent Contractures) 3. Maintain strength Wrapping the Stump : To prevent swelling and keep a good shape for fitting an artificial limb. It is important to wrap the newly amputated limb for a long time after it has been cut off. The leg should be wrapped in a way that squeezes the liquied in the leg upward (rather

the trapping it at the end). 2.3.3

100% MATCHING BLOCK 38/149

W

Prevention of Contractures : A child with an amputated leg does not use his leg normally. He usually keeps it bent and he tends to develop contractures of the hip or knee (or both) 48 Therefore special positioning and exercises are needed to prevent contractures and maintain full range of motion.

Position :

90% MATCHING BLOCK 39/149

W

Encourage positions that keep the joints stretched, and avoid those that keep the joint bent.

Stretching Exercises : Stretching exercise for the fight muscles to avoid contracture and to avoid contracture and deformity. Surgical intarvention if necessary 2.3.4 Assessment of Functional Difficulties : Muscle tone of both upper limbs and lower limbs. Tightness/deformity/contracture -- of muscles joint range of motion of both upper limbs and lower limbs. Muscles strength of upper limbs and lower limbs. Hand function (Reach, grasp pinch, release, grip, pinch) Functional skill achieved -- Spine to sit, sit to stand, squat, bed mobility etc. Balane -- Static, Dynamic. Co-ordination-- Upper and Lower Limbs. Sensory Evaluation : pain, temp, pressure--present or absent sensibility--tactile, vestibular, auditory visual presnet or absent. Skill Achieved : Gross motor skill--skill achieve/ Not achieved Fine motor skill--skill achieved/Not achieved Adl skill--feeding, toileting, dressing, bathing, grooming, mobility. Shoret term goal-- Long term goal-- 2.4. Polio : Polio is the single most common cause of physical disability amongst children. 2.4.1 Defination : Poliomyelitis is a virus infection of the Anterior Horn Cells (AHC) in the prain stem and spinal cord resulting into temporary or permanent paralys's or weakness of muscles associated with those A.H.Cs.

49

69% MATCHING BLOCK 40/149

W

What causes it? A virus (infection). The infection attacks parts of the spinal cord, where it damages only the nerve cells that control movement. In areas with poor hygiene and lack of Sanitary Latrines, the polio infection spreads stool of a sick child

to the mouth of a healthy child i.e facco--oral route. The virus can contaminate drinking water or food through flies or dirty hands and attack another

90% MATCHING BLOCK 41/149

W

child. Where sanitation is better, polio spreads possibly through coughing and sneezing. Do all children who become infected with the polio virus become paralyzed? No, only a small percentage become paralyzed. Most only get what looks like a bad cold, with fever. However, if a child a 'cold' caused by the polio virus is given an injection of any medication, the irritation caused by the injection can bring on paralysis. (1)

Pre-paralytic stage (About 2 days) : In this stage there are symptoms of fever, nausea and pain, spasm and fatigue (tiredness) in muscles of vertebral column / limbs / respiration. (2) Acute paralytic stage (About 2 weeks) : In this stage muscles become tender and are completely or partially paralysed. If the muscles of respiration are involved breathing becomes difficult. (3) Convalescent stage (Upto 2 years) : In this stage the infection subsides. The muscles recover in their action depending on the recovery of the A.H.C which supplies them. Those A.H.Cs which recover fully, the muscles supplied by them recover fully. Those A.H.Cs recover partially the muscles supplied by them recover partially and they remain weak in power. Those A.H.Cs die out, the muscles supplied by them do not recover and they remain paralysed forever. (4) Residual stage (After 2 years) : In this stage the patient relearns to compensate his motor deficits. The patient may learn to adapt and adjust the actions of paralysed muscles with the help of the actions of affected weak muscles or non affected strong muscles.

95% MATCHING BLOCK 42/149

W

How does the paralysis begin : It begins after signs of a cold and fever, sometimes with diarrhoea or vomiting. After a few days the neck becomes stiff and painful and parts of the body become limp. Parents may notice the weakness right away, or only after the child recovers from the acute illness. Once a child is paralyzed, what changes or improvement can be expected ? Once the

child is paralyzed the paralysis will not go away, nor, will it get worse.

50 In the initial acute stage of the disease, the child may not be able to move his limbs because of the pain and paralysis. He may seem more paralyzed than he actually is. Once the pain goes and as the partially damaged muscles recover there will be improvement in function. Symptoms : 1. Paralysis in young children, which is accompanied by illness such as

100% MATCHING BLOCK 43/149

W

bad cold with fever and sometimes diarrhea. 2. Paralysis may affect

the

100% MATCHING BLOCK 44/149

W

muscles of the body but is most common in the legs.

It is usually a symmetrical. 3. Paralysis causes the limb to be flaccid (not stiff but very loose) 4.

90% MATCHING BLOCK 45/149

W

The muscles and bones of the affected limb become thinner than the other limb. 5. The

feeling is not affected (sensation) 6. There may be many deformities or contractures due to paralysis of the position in which the limb is held and disuse of the limb.

90% MATCHING BLOCK 46/149

W

Other Common Deformities : Weight bearing (supporting the body's weight) on weak joints can cause deformities.

What

94% MATCHING BLOCK 47/149

W

Can be Done : During the Original Illness when the child first become paralyzed. No medicines help, either during the first illness or later. Rest is important

Good food during recovery helps

100% MATCHING BLOCK 48/149

W

Position the child to be comfortable and to avoid contractures. At first the muscles will be painful, and the child will not want to straighten his joints. Slowly and gently try to straighten his arms and legs so that the child lies in as good a position as possible.

100% MATCHING BLOCK 49/149

W

Following the Original Illness : Continue with good food and good positions. As soon as the fever drops, start exercises to prevent contractures and return strength. Range of motion

exercise.

51 2.4.2 Causes : The cause of poliomyelitis is a neurotropic virus. They enter the body by the way of interlineal tract, pass through the blood stream and finally infect the ANCs. The origin of infection can be established through a previous attack of chicken pox, mumps, measles or upper respiratory tract infection. It is caused by three strains of the polio virus namely-- 1. Brunhilde; 2. Lansing; 3. Leon. Lansing is the most virulent. It spread through the stool of another child who has sub-clinical polio. 2.4.3 Types : There are three main types of polio myelitis. (1) Encephalitic type : involving the brain. (2) Bulbar type : involving the brain stem. (3) Spinal type : involving the spinal cord. The most common is the spinal type. The diseases progress through the following stages-- 2.4.4 Deformities Commonly Seen in Polio : 1. Scoliosis : It is when the spine curves laterally. It decreases the space in the thoracic cavity thus decreasing space for the heart and lungs. 2. Over-extended knee joints : It is also called genu recurvatum. It is caused due to weight bearing on a weak leg causing the knee to bend backwards. 3. Knee flexion contracture : If the knee is in a bent position then it gets fixed in that position. 4. High arched foot (pes cavus) : It is caused due to bending down of the bones of the mid foot. Since the middle of the foot bends it appears as if the foot arches are very high.

87% MATCHING BLOCK 50/149

W

Contractures of Joints : A contracture is a shortening of muscles and tendons (cords) so that the full range of limb movements is prevented. 52 2.4.5

Therapeutic Management for Polio : When ever possible, make exercise fun. Active games, swimming.

93% MATCHING BLOCK 51/149

W

Crutches, leg braces (calipers) and other aids may help the child to move better and may prevent contractures or deformities. In special cases surgery may be needed to correct contractures or to change the place where strong muscles attach. So that they help

to

100% MATCHING BLOCK 52/149

W

the work of weak ones. When a foot is very floppy or bends to one side, surgery.

95% MATCHING BLOCK 53/149

W

Encourage the child to use his body and mind as much as possible, to play actively with other children to take care of his daily needs, to help with work.

100% MATCHING BLOCK 54/149

W

Rehabilitation of the child with paralysis : All children paralyzed by polio can be helped by certain basic rehabilitation measures – such as exercise to keep a full range of motion in the affected limbs. However, each child will

be

100% MATCHING BLOCK 55/149

W

have a different combination and severity of paralyzed muscles and therefore will have his own special needs. (

i)

95% MATCHING BLOCK 56/149

W

Exercise : To keep as strong as possible and prevent, contractures, probably the best therapy, at least at first, is to stay active, to walk, run, and play. While range of motion and stretching exercises may help, it is even better to involve the child in games, work and other activities that keep his joints flexible. Even though he is slow and awkward, encourage him to take part. Feeling sorry for him and just letting him sit is the worst thing you can do. (

ii)

91% MATCHING BLOCK 57/149

W

Braces. Long-leg braces should not be used until absolutely necessary, as they will let the child's legs grow weaker faster. Sometimes lightweight plastic ankle splints, worn day and night, will help delay ankle contractures and keep him walking better. (iii) If contractures of the knees and hips begin to develop, try resting or sleeping with 'sand bags' to press down the legs and help straighten them. 2.5

Spinal Cord Injuries : 2.5.1 Definition :

93% MATCHING BLOCK 58/149

W

Spinal cord injury usually results from an accident that breaks or severely damages the central nerve cord in the neck or back : falls

of old people in a soapy bathrooms, onunlit staircases, due to crush injuries during beilding construction, falls 53 fom frees on muclees or into unprotected wells, automobile, mining and

82% MATCHING BLOCK 59/149

W

diving accidents, bullet wounds and other injuries spinal cord injury is more common in young adults and in general it is twice as common in men as in women. The spinal cord is the line collection of nerves that comes out of the brain and runs down the back bone from the cord, nerves go out to the whole body.

Sensation of pain temperature, pressure

88% MATCHING BLOCK 60/149

W

and movement are controlled by messages that travel back and forth through the spinal cord. When the cord is damaged, sensations and movement in the body below the level of the injury are lost or reduced. 2.5.2 Level of the Injury : How much of the body is affected depends on the level of the injury along the backbone. The higher the point of injury is the greater the area of the body that is affected. Complete and incomplete injuries : When the spinal cord is damaged so completely that no nerve messages get through the injury is said to be complete feeling and completely and permanently lost. If the injury

are cormplete or partial

91% MATCHING BLOCK 61/149

W

some feeling and movement may remain or felling and controlled movement may return (partly or entirely) little by little during several months. In incomplete injuries, one side may have less felling and movement than the other.

90% MATCHING BLOCK 62/149

W

Early Question That a Spinal Cord Injured Child and Family May Ask : "Will my child always remain paralyzed?" This will depend on now much the spinal cord has been damaged. If

paraoyosis example, if the child has some felling and control of some invpovement.

89% MATCHING BLOCK 63/149

W

Helping The Child and Family Adjust : Spinal cord injury expecially in the child brings many of the same problems as does are similar. Suggest you read spina bifida to get additional ideas for the rehabilitation of young children with spinal cord injuries. Perhaps the biggest difference from spina bifida is that spinal cord injury beging later. One day the child is physically active and able the rest he is suddenly prarlyzed and (at first) unable to do much for himself. He has lost all feeling and control inpart of his body. It is like a dead weight. This is very hard for the child and family to accept. Both have

a anormous

100% MATCHING BLOCK 64/149

W

fear and uncertainty about the future the child may become deeply depressed or angry and

unco-operative. He may refuse even to sit in a wheel chair because this means acceptance not being able to walk.

100% MATCHING BLOCK 65/149

W

The child in the hospital to make sure the child is kept clean and turned regularly. So that

the

54 bad, sores and pneumonia are avoided. (Busy hospital staff with less experience treat on spinal cord injuries, sometimes severe bed sores develop.) 2.5.3 Therapeutic Management of Spinal Cord Injury : Rehabilitation goals in a child with spinal cord injury : (1) Education of the child and the family in spinal cord function and spinal cord injury. (2) Training in appropriate movement. (3) Training in self care and activities of daily living. (4) Prevention of deformities and pressure sores. (5) Bladder and bowel training and pressure sores. (6) Control of somatic dysfunction (postural hypotension and autonomic dysreflexia). (7) Maintenance of nutrition without letting the child come fat. (8) Control of pain. (9) Sex education. (10) Emotional and special adjustment. (11) Introduction of appropriate recreation and sports. (12) Return to home and school. (13) Information on financial and other assistance available from the government and other agencies (for parents). (14) Regular life long follow up.

87% MATCHING BLOCK 66/149

W

Preventing Pressure Sores (bed sores) : When feeling has been lost pressure sores

and

84% MATCHING BLOCK 67/149

W

sores can easily form on the over body areas-especially on the hips and buttock. The biggest risk of sores is in the first weeks after the injury. This is because. The child,

due to paralysis,

86% MATCHING BLOCK 68/149

W

must stay very still and has not yet learned to move or turn over his body. Prevention of pressure sores is extremely. Importance and needs understanding and continuous care, both the child and house caring for him.

83% MATCHING BLOCK 69/149

W

Avoiding Contractures : In the first weeks following a spinal cord injury, when the child is lying position, joint contractures (muscles shortening) can easily develop, especially in the feet and elbows, pillows and pads should be placed to keep the feet supported the elbows straight, and the hands in a good position, gentle range of motion exercises of the feet, hands and arms should begin as early as possible taking care not to move the back until the injury is healed.

Further discussion on the prevention of contractures in the spinal cord injured is on P. 215.

82% MATCHING BLOCK 70/149

W

Physical Therapy Following Spinal Cord Injury : Assisted Breathing and Coughing : Persons with spinal cord injury in the neck or upper back after have past of their breathing muscles paralyzed. Slowly the remaining muscles become stronger and breathing improve. But breathing often stays weak.

89% MATCHING BLOCK 71/149

W

Movement and Exercise : Do range of motion exercises for about 10 minutes for each arm and leg in the first week do this twice a day. Later once a day may be enough.

85% MATCHING BLOCK 72/149

W

Range of motion exercises should begin with great care the day after the spine is injured, the exercises will help to improve the flow of blood to prevent contractures, and to build the strength of the muscles that still work. 2.6

Spina Bifida 2.6.1 What is Spina Bifida : Spina bifida is a defect in the early development of the body when it is in the womb.

89% MATCHING BLOCK 73/149

W

It happens when some of the back bones (vertebral) do not close over the

large central nerve, i.e. incomplete closure of the vertebral canal. (the spinal cord). As a result there remains a soft unprotected area of the spinal cord which bulges out in the centre of the back. This bulged out area (sac) may contain the covering (meningeal membrane) of the spinal cord with fluid (cerebro-spinal-fluid) and sometimes either nerve fibres or even a part of the spinal cord. It may be covered by very thin skin or normal skin. The cause of spina bifida is not known. All spina bifida are not alike. All of them do not contain nerve fibres or the spinal cord in the sac. In some the sac may be very small but the spinal cord lies exposed on the surface.

56 2.6.2 Types of Spina Bifida : Spina bifida can be divided into two broad groups, as (a) Spina Bifida Occulta (b) Spina Bifida Cystica. (i) Spina Bifida Occulta : In this condition there is no bulge (sac) on the surface but there is non closure of the vertebral canal around the spinal cord. In a large number of these children the condition is indicated by the presence of skin vesicles at the site of the spina bifida occulta. Characteristics : (a) The posterior arches of the vertebra are not formed. (b) The meninges do not come out of the opening. (c) The spinal cord does not come out of the opening. (d) The defect is fully covered (hidden) by skin. Hence the term 'occulta' which means 'hidden'. (ii) Spina Bifida Cystica : In this condition there is a bulge (sac) on the surface of the back because of the non closure of the non-closure of vertebral canal. The problems that these children will face at birth or later will depend on the contents and nature of the sac. There are 3 types of spina bifida cystica. (i) Meningocele : The sac on the back is covered by normal skin. It contains only fluid and covering of spinal cord. It does not contain any nerve fibres. (ii) Meningomyelocele : This is a common and difficult condition. The bulge is in the centre of the back. It contains fluid the coverings of the spinal cord. Characteristic of Myelomeningocele : (a) The posterior arches of the vertebra are not formed. (b) The meninges come out of the opening. (c) The spinal cord comes out of the opening. (d) The defect is covered by a thin transparent membrane and the cerebro-spinal fluid (C.S.F) ooze through it. (iii) Myelocele : In this condition the spinal cord lies exposed on the surface. Like a red ribbon like structure in the centre of the back. Problems Associated With Spina Bifida Birth : High risk

57 Muscle weakness Big head Brain damage

79% MATCHING BLOCK 74/149

W

Hips one or both hips may be dislocated The feet may turn down and in. If the defect is relatively highly up the back

Poor urine and bowel control 2.6.3 Problems Associated : What to look for when a baby is born with spina Bifida : First of all examine the baby to see if there is any other birth defect which may be serious. For example a heart defect Try to make out the type of spina bifida and where exactly it is located on the back. What is the size of the bulge and what is the condition of the skin covering it? Try to see if there is any movement or sensation in the legs. Does the child urinate or is there dribbling of urine. Are there any problems in the feet. Joints or in the back bone. What are the problems when the child is older : Urinary infections : Because of poor control on the passing of urine the bladder is never completely emptied out. Curve of the spine : The spine may be curved at birth and this may become more marked later. Pressure sores : If the child cannot feel, pressure sores may form over the body areas, due to pressure. Posture : Due to muscle weakness or paralysis fo the legs, the child may not be able to sit or stand with out support.

100% MATCHING BLOCK 75/149

W

Foot injuries : Children who can walk but have no feeling in their feet may easily develop sores or injuries. 58

Contractures : In correct postures may result in contractures. Social problems : Because of a lack of urine and bowel control, sometime children with spina bifida get socially isolated.

85% MATCHING BLOCK 76/149

W

Bladder and Bowel Management : A child with spina bifida usually does not develop the some control of urinating (bladder control) and

passing stool (

87% MATCHING BLOCK 77/149

W

bowel control) as other children do. The child may always dribble urine or as she gets older she may continue to empty her baldder or bowels with out warning perhaps without even knowing or feeling it. 2.6.4

Therapeutic Management :

90% MATCHING BLOCK 78/149

W

Prevention and correction of contractures : Some children with spina bifida tend to develop contractures either because of muscle imblance or, less often, because of spasticity (abnormal muscle tightness). Contractures most often develop in the feet heps, and knees range of motion and stretching exercises can help prevent and correct early

contracutres.

92% MATCHING BLOCK 79/149

W

Helping the child develop : Many children with spina bifida are paralyzed from the waist down. In spite of their disability,it is important for them to develop their bodis, their minds, and their social abilities as much as possibles. Certain adaptive aids can be used to help paralyzed children go through the same stages of development.

Whent adapting aids for children with spina bifida, some children manage to walk with out

100% MATCHING BLOCK 80/149

W

braces perhaps with the aid of parallel bars like these, and later crutches, others will need above knee or below knee braces.

96% MATCHING BLOCK 81/149

W

Prevention of pressure sores and injuries : As a child who has no feeling in parts of his body grows older and heavier there is increasing danger that pressure sores (bed sores) will form over bony areas that support his weight (mostly his

bottom of

81% MATCHING BLOCK 82/149

W

his feet) to prevent this : Have the child sleep and sit on a mattress or cushion that is soft (such foam rubber) clean and move on turn over often. Examine the child's lower body daily for early signs of irritation on sores everyday check especially the hips knees and feet

clean the child's body every day.

92% MATCHING BLOCK 83/149

W

When he is a little older the child can learn to check his own body each day for sores. 59 2.7

Muscular Dystrophy Muscular Dystrophy is a muscular skeletal condition. In this condition the muscle fibres are replaced by fat cells and the muscle gradually waste (atrophy). This causes "a progressive" loss of muscle power. Definition : Muscular dystrophy is a progressive diffuse weakness of all muscles groups characterized by degeneration of muscle cells and their replacement by fat and fibrous tissue. 2.7.1 What is Muscular Dystrophy :

100% MATCHING BLOCK 84/149

W

Muscular dystrophy is a condition in which muscles, month by month and year by year, get weaker and weaker. Because the disability gradually gets worse, we say it is progressive. 1. How to Recognize if Muscle Weakness is Caused by Muscular Dystrophy : (i) Mostly affects

body (rarely girls) (ii) Often brothers or male relatives have some

81% MATCHING BLOCK 85/149

W

problem. (iii) First signs appear around ages 3 to 5 the child may seem awkward or clumsy or

the

83% MATCHING BLOCK 86/149

W

begins to walk 'tiptoe' because he cannot put his feet flat. Runs strangely. Falls often. (iv) Problem gets steadily worse over the next several years. (v) Muscle weakness first affects feet, fronts of thighs, hips, belly shoulders and elbows later it affects hands, face and neck muscles. (vi) Most children become unable to walk by age 10. (

vii) May develop a severe curve of the spine. (viii)

85% MATCHING BLOCK 87/149

W

Heart and breathing muscles also get weak. Child usually dies before age 20 from heart failure or Pheumonia. 2. Early Common Sign of Muscular Dystrophy : (i) To get up from the ground, the child 'walks up' his things with his hands. (

climbing his own body)--Gower's sign.

87% MATCHING BLOCK 88/149

W

This is maily because of weak thigh muscles. 3. Questions about Muscular Dystrophy : (

i)

94% MATCHING BLOCK 89/149

W

What causes it? Nobody knows, but in 2 out of 3 families with muscular dystrophy, there is a history of it among male relatives of the mother. Though 60 the parents are usually normal the mother carries the 'gene' that produces dystrophy in her sons. Her daughters will develop normaly, but they may have sons with muscular dystrophy. 2.7.2

Cause : The exact cause of the disease is not fully known. It is observed to be inherited genetically from mother by mostly the male child. There are even cases where no positive history is tracted in the family. 2.7.3 Types : There are several types. The most common and severe type is the Duchenne type or Duchenne Muscular Dystrophy. Hence only this type of muscular dystrophy has been described here. Duchenne Muscular Dystrophy : Characteristics of Duchenne Muscular Dystrophy are : (1) Progressive weakness of muscle which starts at the age of 3 years. (2) Weakness progresses from muscles of ankle joint to the muscle of hand, face and neck. (3) Muscles around pelvic girdle and shoulder girdle are affected more leading to a typical manner of getting up the floor (Gower's sign). (4) The muscles show false enlargement (pseduo-hypertrophy) owing to deposit of fatty material in place of degenerated muscle tissur. The common site of pseudohypertrophy is the calf muscle. (5) Postures and gait become atypical. [waddling gait] (6) Respiratory and cardiac muscle are eventually affected in the later stage leading to death. 2.7.4 Associated Problems : (1) Locomotor Retardation : Locomotor retardation starts appearing in the form of frequent falls and slowness in walking at an early age. Subsequently climbing, running and finally walking becomes impossible. The person needs to move around only in a wheelchair in the last stages.

61 (2) Skeletal Deformities : Weakness of muscles leads to their shortening i.e. contractures. This leas to deformities. (a) Trunk-Scoliosis (b) Neck-flexion deformity (c) Lower limbx -- (i) ankle - downward an downward bending [planter flexion] (ii) knee and hip - flexion deformity (3) Obesity : Because of restricted activity and probable compensatory overating, these children tend to become obese. (4) Slowness in Learning : Slowness in learning, not mental retardation, is present in about 70 percent of the cases, The intelligent Quotient is normally above 80 but generally below 90.

Educational Implication : Progression of the disease does not allow the child to attend school regularly. This leads to poor performance in school work and eventual scholastic backwardness. Owing to their slower speed in learning a special teacher doing a remeidal educational programme at home is most effective. But even such special educational approach goes on becoming difficult as the age progresses because the child becomes increasingly tired. Motivation to study becomes less. 2.7.5 Therapeutic Management : (1)

Helping the Child to keep Walking for as lang as Possible : (ii)

96% MATCHING BLOCK 90/149

W

Other aids. The child will reach a point where he needs to use cratchess, later (often by age 10) he will not be able to walk. Do not force him when it becomes too hard. Instead, try to obtain or make a wheelchair. (

iii)

95%	MATCHING BLOCK 91/149	W
Breathing deeply is important, especially when the muscles that move the lungs begin to weaken. Encourage the child to sing loudly to shout to blow whistles and to blow up		

bolloons. Other Problem : (i) Getting fat is a common problem in children with dystrophy. (ii) Constipation (hard, difficult stools) may become problem.

62 (iii) Spinal curve can become severe. (iv)

100%	MATCHING BLOCK 92/149	W
Arm weakness in time may become a problem for self care and eating. 2.8		

Implication

100%	MATCHING BLOCK 96/149	SA	EDU 294Introduction To Locomotor And Multiple ... (D165064983)
of Functional Limitations for Education and creating Prosthetic Environment in School and Home : Seating Arrangements, Positioning and Handling Techniques at Home and School.			

Widen aisles to make room for wheelchairs. Also, add walkers and Handrails where needed/ramp should be there. Hang paper and other art supplies in reach of the children. Allow for adaptations in the classroom. Seat the child closer to the front if she has visual or hearing impairments. If the child has hard time writing, allow him to record lectures with a tape recorder. Change your style to teaching you may have to make text larger on the overhead machine or the chalk board. Remember to write lower on the board so it at eye if it is only by nodding. Encourage social relationships by having the children form small group to discuss ideas of recent chapters covers in the class. Stay involved with the other education and therapists involved in the child's individualized education programme (I.E.P) Generally, a student with cerebral palsy will have impaired motor abilities. He/ She might not be able to write with a pen/pencil without it taking a long time or possible at all. He/she might be able to speak, but is probably hard to understand. Though he/she is wheelchair bound, he/she has normal achieving cognitive abilities. The ideas below are some possible adaptations that might help these students to succeed in your classroom. These adaptations are fairly simple and can be applied in your classroom. Without much disruption to your normal routine. If possible, let him/her use a lap computer at the desk so that he/she can type the work instead of writing it by hand. A computer with adaptive devices would work best, if available. This would be a lot easier on him/her and it would help the student

63 to keep up with the rest of the class of course, it would depend on if a lap computer were available to the student. Adaptation of pen/pencil if required. Positioning of chair, bench/table etc. Should be proper to avoid contracture. Design activities to develop fine motor skill. Proper anatomical position : Chair, table for study. Foot rest if needed should be those Assist the child with adaptive and assistive devices. 2.9 Facilitating Teaching - Learning : IEP Developing TLM; Assistive Technology : Activities : Tug-of-war, Backpack hiking, Jumping over obstacles, crab walking relay races, crawling under a Parachute. Crawling (can crawl through tunnel, over beanbags or pillows), Running, Climbing, Marching, Wall push-ups, Weighted garments, Pressure, Heavy work, Scooter board, Therapy ball. Jumping on a trampoline, activities for auditory sense, soft music, soft voice, white noise, quiet room up beat music, loud voice, Instruments/noise makers, Classical music, Activities for visual sense : Sense of colours, soft colors, solid backgrounds, Dim lights, Desk lamp, Flash light tag, Visual schedules, Bright colours bright lights. Name identification through puzzle Material – 1 colour paper, marker, scissors. 2. Ice Cream sticks, colour Pencils, scissors group activity Action Dice Material – unused box, marker, picture....

64 TLM for developing pre-writing skill Line Tracing. Material – match stick, glue, cardboard play Dough letters. Material – clay, straw Letter Tray Material – tray/dish, sand/ flour, shavin foam cdor, salt tray games. Salt, old box, flash cord, market Sensory Tracing Materials – colour material paper, white paper, pencil, glue TLM for developing pre-math skills. Big-Small Sorting Materials – Egg crate, square colour paper. Number writing and counting Materials – Flash cards with dots, salt, old box. Balloon counting–1–10 Materials–balloons, market Shapes Materials – ice cream sticks, market, glue number object relationship 2.10 Let us Sum up : To define as a process through which child born with certain impairment are helped to channelise their capacity and explore to their maximum development so that he/she could live as normal life as possible. To help a child born with an impairment. Development of abilities that never existed. Need to develop basic skills of day to day life. Usually as long time process. Sensory motor development begins from birth. The rapeutic approaches help the child to restore his functions and facilitate his functional skill and minimize secondary complication.

multiple disabilities refers to "concomitant [simultaneous] impairments (such as intellectual disability-blindness, intellectual disability-orthopedic impairment, etc.), the combination of which causes such severe educational needs that they cannot be accommodated in a special education program solely for one of the impairments. The term			

does not include deaf-blindness."

In other words, a student whose special needs are categorized under multiple disabilities requires coinciding adaptations for more than one disability. The exception is the combination deafness and blindness, as this pair of impairments has its own classification under IDEA. This disability category includes those students with the most severe physical, cognitive, and communicative impairments. It should be noted however, that these students can also have average or even above-average intelligence. The common connection between students in this category is not just that they have two or more coexisting impairments, but that they generally need extensive support across any number of skill areas.

69 A key part of the definition is that the combination of disabilities causes the student to have severe educational needs. In fact, those educational needs must be severe enough that they cannot be addressed by providing special education services for only one of the impairments. The federal definition of multiple disabilities gives two examples of possible combinations of disabilities: ? intellectual disability and blindness; and ? intellectual disability and orthopedic impairment. But these are just examples. A child may have another combination of disabilities that causes severe educational needs- cerebral palsy and autism, for example, or blindness and an emotional disturbance. Whatever the combination is, a child served under IDEA's category of "multiple disabilities" will have a special education program that is designed to address the educational needs that arise from all of the child's disabilities, not just one. 3.3.2 Meaning according to Persons with Disabilities

87%	MATCHING BLOCK 105/149	SA	EDU 294Introduction To Locomotor And Multiple ... (D165064983)
Act Multiple disabilities means a combination of two or more disabilities as defined in clause (i) of Section (2) of the Persons with Disabilities. (Equal Opportunities,			

Protection of Rights and Full Participation) Act, 1995, namely - I. Locomotor disability including leprosy cured II. Blindness/low vision III. Speech and hearing impairment IV. Mental retardation V. Mental illness.

and severely disabled children is never easy and they need an enormous			

amount of time, patience and love.

Realising the need for promotion of services for children with multiple disabilities, an autonomous organization of the Ministry of Social Justice and Empowerment, Government of India, was set up under the "National Trust for the Welfare of Persons with Autism, Cerebral Palsy, Mental Retardation and Multiple Disabilities" Act (Act 44 of 1999). The National Trust was set up to find an answer to the worries of parents of such children.

Speech Therapists, Community Based Rehabilitation Workers and Special Educators. The combination of disabilities and degree of severity is different in each child. The time at which the disability occurs in the child, what is known as the 'age of onset', may also range from birth to a few days after birth, from early childhood till late teens. Sometimes children are born with one disability but acquire the second or third disabling conditions during childhood. The characteristics and the needs of the children depend on the nature of combination of the disabilities, the age of onset and the opportunities that have been available to a child in his environment. Multiple Disability refers to: a combination of two or more disabling conditions that have a combined effect on the child's communication, mobility and performance of day-to-day tasks.

Children with multiple disabilities will have a combination of various disabilities that may include: speech, physical mobility, learning, mental retardation, visual, hearing, brain injury and possibly others. Along with multiple disabilities, they can also exhibit sensory losses and behaviour and or social problems. 3.4.1

Various Combinations of Multiple disabilities Cerebral Palsy (CP) "

88% MATCHING BLOCK 114/149

W

Cerebral" means brain. "Palsy" means a disorder of movement. CP refers to a group of non progressive

neuromuscular problems of varying severity.

72 Cerebral Palsy is damage to the brain, primarily to the part of the brain that controls motor functions. However other parts of the brain may also be affected. In such cases the person affected has more than one disability. The extent of the damage varies from person to person. Mild disability might mean fine motor skills, like using scissors or writing, are difficult. Severe disability can mean poor movement of all four limbs, the trunk and neck. The child may even have difficulty in swallowing. Autism All children with ASD demonstrate deficits in 1) social interaction, 2) verbal and nonverbal communication, and 3) repetitive behaviours or interests. In addition, they will often have unusual responses to sensory experiences, such as certain sounds or the way objects look. Each of these symptoms runs the gamut from mild to severe. They will present differently in each individual child. For instance, a child may have little trouble learning to read but exhibit extremely poor social interaction. Each child will display communication, social and behavioural patterns that are individual but fit into the overall diagnosis of ASD. Intellectual Disability Intellectual disability is characterized both by a significantly below-average score on a test of mental ability or intelligence and by limitations in the ability to function in areas of daily life, such as communication, self-care and getting along in social situations and school activities. Intellectual disability is sometimes referred to as a cognitive disability or mental retardation. Children with intellectual disability can and do learn new skills, but they develop more slowly than children with average intelligence and adaptive skills. There are different degrees of Intellectual disability, ranging from mild to profound. A person's level of Intellectual disability can be defined by their intelligence quotient (IQ), or by the types and amount of support they need. Locomotor Disability "Locomotor disability" means disability of the bones, joints or muscles leading to substantial restriction of the movement of the limbs or any form of cerebral palsy. ? Spinal cord injuries: usually the result of a traumatic blow to the spine. Some spinal cord injuries can completely heal; others will cause paralysis. ? Cerebral palsy: a group of non-progressive conditions involving muscle control, posture, and movement caused by brain damage.

73 ? Polio: a highly contagious infectious disease caused by polioviruses. It is destructive to the nervous system and can cause paralysis. ? Muscular Dystrophy: an inherited group of diseases that affect the muscles, causing them to weaken and break down over time. ? Contractures: permanent tightening of muscles and joints ? Club Foot (talipes equinovarus) : There are 3 components of deformity - equinus, hindfoot varus and forefoot adductus. Club foot is more common in boys. Hearing Impairment "Hearing impairment" means loss of sixty decibels or more in the better ear in the conversational range of frequencies. Deafness A hearing loss greater than 90 dB. Individuals who are deaf have vision as their primary input and cannot understand speech through the ear. Deafness means a hearing impairment so severe that the child is impaired in processing linguistic information through hearing, which adversely affects educational performance. (IDEA). Different types of Hearing loss Sensor neural Hearing Loss: Permanent hearing loss that is a result of damage to the cochlea or auditory nerve. The treatment for sensorineural hearing loss is often the use of hearing aids or cochlear implants. Conductive Hearing Loss: Conductive hearing loss results from defects in the outer or middle ear. The sound is not conducted efficiently to the inner ear. All sounds heard thus become weak and/or muffled. Usually such individuals speak softly irrespective of the surrounding environmental noise. It can generally be offset by amplification or medical intervention. Sometime surgery can restore hearing in a conductive hearing loss. Mixed Hearing Loss: A hearing loss resulting from a combination of a conductive hearing loss and a sensorineural hearing loss. Central Auditory Disorder: Central hearing loss is due to a damage, malformation or infections of the neural pathways and the hearing centers in the brain. The child may

74 hear but has difficulty in understanding what he hears. Some of the children classified as learning disabled or slow learners may have this type of hearing loss. Visual Impairment Blindness: refers to a condition where a person suffers from any of the following conditions, namely: Total absence of sight or Visual acuity not exceeding 6/60 or 20/ 200 (Snellen) in the better eye even with correction lenses; or limitation of the field of vision subtending an angle of 20 degree or worse. For deciding about blindness, the visual acuity as well as field of vision has been considered. Low Vision: The Persons with Disabilities Act, 1995 also recognizes low vision as a category of disability and defines it as follows: "Person with low vision" means a person with impairment of visual functioning even after treatment or standard refractive correction but who uses or is potentially capable of using vision for the planning or execution of a task with appropriate assistive device". The loss of vision caused by these conditions can range from a mild impairment to complete blindness. The children with visual impairment and brain damage may seem to use their vision differently at different times of the day. In addition these children have trouble with perceptual responses, such as perceiving depth, remembering visual information, searching for objects they see and identifying important visual information. (Punani and Rawal) Mental Illness Studies indicate that approximately 2% of children and adolescents receive intervention for mental illness and psychosocial problems (Cohen, Cohen, & Brook, 1993). Psychological Disturbances The most common types of psychological disturbances seen in children are Anxiety Disorders: Children with anxiety disorders respond to certain things or situations with fear and dread, as well as with physical signs of anxiety (nervousness), such as a rapid heartbeat and sweating. Separation anxiety disorder, overanxious disorder and posttraumatic stress disorder are the common types of anxiety disorder seen in children. Disruptive Behaviour disorder: Children with these disorders tend to defy rules and often are disruptive in structured environments, such as school. Common types seen in children are conduct disorder, oppositional defiant disorder and attention deficit hyperactivity disorder (ADHD).

75 Eating Disorder: Eating disorders involve intense emotions and attitudes, as well as unusual behaviors, associated with weight and/or food. Anorexia nervosa and bulimia nervosa are the two types of eating disorders seen in children. Affective disorders: These disorders involve persistent feelings of sadness and/or rapidly changing moods. Most common types seen in children is major depressive disorder Pervasive Developmental Disorders or Autistic Spectrum Disorders: These children have difficulties and abnormalities in their abilities to form reciprocal social interaction and to verbally and nonverbally communicate. 3.4.2 Associated Conditions with Multiple disabilities Epilepsy It affects 40 to 50% of children with multiple disabilities, and in one case out of 4 or 5 these seizures are difficult to control. There may be absence seizures, brief tonic seizures, and sometimes falls caused by epilepsy with unpredictable seizures, which lead to repetitive traumatic injuries and deformities becoming real secondary impairments. Behavior disorders may also be following repeated seizures (drowsiness alternating with hyperactivity episodes, and sometimes aggressiveness or self-destructive behaviors). At the functional level, these highly disabling but fortunately rare forms are a sign of poor prognosis, especially at the level of life expectancy. In contrast, episodic seizures are more easily treatable with the treatments currently available, and affect the daily life of these individuals to a lesser extent. Severe hypotonia Severe tone abnormality in posture and limbs is observed in some forms of brain deformities. Diagnosing peripheral or muscle lesions are not always easy, and moreover, central, peripheral and muscular lesions coexist in some forms of progressive diseases affecting the nervous system. In addition, rare forms of myopathies are combined with mental retardation, which produce a clinical picture close to multiple disabilities. Motor control disorders These are very specific motor defects mainly observed in children with early epileptic encephalopathy.. There is no actual paralysis present, but severe central hypotonia is at least observed 76 in young children. As a result, a slow recovery of motor activity takes place that may lead children to resume gait, which remains risky. There are unawareness of the body's position in space, balance disorders, robot-like gait, neglecting obstacles. Falls are also commonly observed. Severe motor regression sometimes follows a convulsive state or repetitive absence seizures (form of epileptic seizure during which the subject seems awake, but is 'absent' and does not react or communicate. This regression is usually temporary, but causes motor function to be impaired in a very random fashion. Slightly different motor control disorders may also affect subjects with encephalopathy due to malformation or some chromosomal aberrations. For instance in Angelman syndrome, individuals can hardly use their lower limbs. Congenital joint and peri-articular lesions may also be associated. Secondary motor impairments They are resulting from the impact of spasticity, abnormal postures or motor stereotypes on joints. Hip dislocations, progressive scoliosis in adolescence, as well as limb deformities cause limitations in motor performance and capacity of mobility, and are a source of pain. All the efforts put in early motor training and orthopedic equipment focus on the prevention of these secondary impairments and must be undertaken at a very young age. Sensory impairments They are very often part o the disabling problems experienced by the individual with multiple disabilities. Audiological assessment is not easy to perform, as it requires that the individual can understand what the tester asks of him in order to be properly assessed. Deafness is relatively rare and involves adjustment and tolerance problems to hearing aids. However, middle-ear deafness due to infection or malformation is also observed. Vision impairments are very common and accout for 40% of persons with multiple disabilities. Ametropia (myopia, astigmatism), congenital or acquired cataracts, eye deformities or retinal lesions validated bu ophthalmologic examinations. Emphasis has recently been placed on the frequency of visual processing disorders (cortical blindness or central visula disorders). These disorders cannot be measured with traditional examination methods as vision becomes tedious and random, with difficult perception of depth, background contrast versus object, ans sensitivity to visual clutter. These indiduals perceive moving objects better because the image is formed 77 on the peripheral retina, as opposed to macular or central vision; hence the use of very peculiar visual stimulation methods involving the ovedrall structures of the head and neck. Combined visual and auditory sensory disorders are currently scarce ever since the prevention of congenital rubella syndrome. 3.5

Leprosy cured person" means any person who has been cured of leprosy but is suffering from: (i) loss of sensation in hands or feet as well as loss of sensation and paresis in the eye and eye-lid but with no manifest deformity; (ii) manifest deformity and paresis but having sufficient mobility in their hands and feet to enable them to engage in normal economic activity; (iii) extreme physical deformity as well as advanced age which prevents him from undertaking any gainful occupation, and the expression "leprosy cured" shall be construed accordingly; 3.5.2

Tuberous Sclerosis Tuberous sclerosis causes non-cancerous (benign) tumours to develop in many areas of the body. The condition can lead to a range of different problems, depending on where the tumours grow. The areas most commonly affected are the: ? brain ? skin ? kidneys ? heart ? eyes ? lungs Problems caused by these tumours can develop at any age, but most often start early in

78 childhood. The severity of these problems can vary significantly and some tumours cause no noticeable problems. Tuberous sclerosis has an incidence of 1:6000-12,000, with most being sporadic. Tuberous sclerosis was classically described as presenting in childhood with a triad of: 1. seizures: absent in one-quarter of individuals 2. mental retardation: up to half have normal intelligence 3. adenoma sebaceum: only present in about three-quarters of patients The full triad is only seen in a minority of patients. Nearly half of all children with tuberous sclerosis will have learning problems, which can range from mild to severe. Possible problems include: ? poor memory ? poor attention span ? difficulty making plans or organising activities ? learning much more slowly than other people ? in severe cases, being unable to communicate or look after themselves 3.5.3 Multiple Sclerosis Multiple Sclerosis is a neurological condition of the brain and spinal cord, affecting muscle control, vision, balance and causing fatigue, loss of sensation or numbness. Multiple sclerosis (MS) affects nerves in the brain and spinal cord, causing a wide range of symptoms including problems with muscle movement, balance and vision. Each nerve fiber in the brain and spinal cord is surrounded by a layer of protein called myelin, which protects the nerve and helps electrical signals from the brain travel to the rest of the body. In Multiple Sclerosis, the myelin becomes damaged. This disrupts the transfer of these nerve signals, causing a wide range of potential symptoms, such as: ? loss of vision - usually only in one eye ? spasticity - muscle stiffness that can lead to uncontrolled muscle movements ? ataxia - difficulties with balance and co-ordination ? fatigue - feeling very tired during the day

Facilitating Teaching-Learning: IEP, Developing TLM; Assistive technology 3.7.1 Individualized Education Programme (IEP) Individualised, because the education/training programme is specifically designed to meet the learning needs of the individual child rather than a general syllabus for a group or class full of such children. To put it simply, IEP includes, a brief background of the child (medical and educational), statement of present level of functioning, annual goals, including short-term objectives, teaching strategies, specific educational services to be provided, the child's ability to be able to participate, the projected dates for initiation and anticipated duration of such service, appropriate objective criteria and evaluation procedures and schedules for determining, on at least an annual basis, whether instructional objectives are being achieved.

83 IDEA requires that schools create an Individualized Education Program (IEP) for each student who is found to be eligible under both the federal and state eligibility/ disability standards. In addition to the child's parents, the IEP team must include at least one of the child's regular education teachers (if applicable), a special education teacher, someone who can interpret the educational implications of the child's evaluation, such as a school psychologist, any related professional concerned with the child. Effective teaching leads a child to function as independently as possible in the world around him. A curriculum for a child with Multiple Disabilities needs to reach the goal of enabling the child towards personal adequacy, social competency and economic independence. More significantly make his life easier and healthier. Points to be noted for effective educational program Independence is the goal: No matter how small or big the task is the child should learn to use it to make life easy and simpler for him. Teaching skills that are functional and meaningful with the limited opportunities available to the child, it is wise to teach him things that are directly related to his environment and those that he has high chances of doing through out the day. Teaching skills in natural settings: The child is able to remember things that he learns while going through his/her day to day routines. This helps him to learn better and remember. Providing assistance as needed: Encourage the child in every attempt. Taking advantage of the teachable moment: Sometimes teacher may not plan to teach an activity, but the child shows curiosity to explore a particular object. Teacher should use this time to teach him more about that object. Providing repeated opportunities to practice: This will help the child to get opportunities to try out the activity again and again. Using real/ concrete objects: When experience to know about the world is so limited it is better to use objects that he sees and uses everyday rather than expensive and unusual things. Developing routines/ activity schedule: We should have fixed timetable for the day with the child. This helps him to have more control over his life and to anticipate what is going to happen with him next. This also helps to encourage communication attempts by the child immensely.

84 Multi-sensory approach: It is best to make use of all remaining sensory abilities of the child- like seeing, hearing, touching, smelling and movements. All should form a part of the teaching moments for the child. Planning inclusive activities: With highly individualized activities being planned for the child, there is always a risk that either the parent or one caregiver is constantly trying to teach the child. It is important that the child should know what others enjoy doing and for him to be part of that too. Making use of resource persons from the community: It is important that the best advantage is taken from the resource persons from the community as teachers. 3.7.2 Teaching Learning Materials Children with Multiple Disabilities represent a heterogeneous group in the terms of cognitive and functional capacities. The unique support needs of these students include specialized communication and mobility instruction, the ongoing adaptation of sensory information and the provision of experimental learning opportunities in the context of safe, but responsive, environments. What area will

85%	MATCHING BLOCK 142/149	SA	EDU 294Introduction To Locomotor And Multiple ... (D165064983)
TLM help develop? ? Language & Communication ? Sensory development ? Orientation & Mobility training ? Cognitive & Social skills ? ADL			

Teaching Learning Material (TLM) is a tool available to the teachers/ parents/ CBR workers to achieve learning outcome. It is not just a set of teacher-made or purchased material, but a well designed tool for the child's needs. The teacher decides at what level the child is and what activities within the level he/ she wants to give. Once the decision is made, the teacher looks for appropriate teaching learning materials so that the teaching becomes effective and goal-oriented. 3.7.3 Assistive Technology A variety of AT devices are used to help children with severe and

97%	MATCHING BLOCK 146/149	W	
Mobility aids are appliances used to help people who have difficulty in walking. They enable some of the body weight to be supported by the upper limbs. Selection of a specific type of a mobility device depends on several factors: ? The purpose of using the mobility device ? The indoor and outdoor environments in which it will be used ? The effort required by the individual to use the device ? Positioning needs ?

Commode Chair or Toilet Stool Commode chair or toilet stool is needed for a child who cannot squat and use Indian toilets. It can be made by cutting a hole over the seat of a plastic chair for children. Other options are to place a tyre over the toilet on which the child can sit comfortably. Other modifications in the toilet – Side bars near the toilet will help a child with poor sitting balance to maintain his balance. – Hose pipe for a child who cannot hold a mug with water and clean himself. 86 3.8

Let us Sum Up 1.

Disabilities under the National Trust Act are in fact Developmental Disabilities caused due to insult to the brain and damage to the central nervous system. These disabilities are Autism, Cerebral Palsy, Mental Retardation and Multiple Disabilities. These are neither diseases nor contagious nor progressive. 2. They cannot be cured by drugs or surgery. But early detection and training improve outcome. This is done using the services of Physio-Occupational

and Speech Therapists, Community Based Rehabilitation Workers and Special Educators. 3. Students with severe and multiple disabilities are identified at birth or in the early stages of life, or after a traumatic accident or illness. These children are identified by medical professionals. Assessments performed on these students are to primarily help teachers understand the student's needs and how they can motivate and provide the best possible services to the student. 4. Functional assessment for a child with Multiple Disabilities involves two basic steps. The first is to gather information about the child by talking to the people who know the child well, by examining medical reports and by actually observing the child engaged in typical activities. 5. Support services like physical access, resource rooms at cluster level, special equipment, reading material, special educational techniques, remedial teaching, curricular adaptation or adapted teaching strategies should be provided. 3.9 "Check Your Progress" 1. What are the possible combinations of multiple disabilities?

..... 2. What are the educational opportunities for children with multiple disabilities?

.....
.....

87 3. Discuss about the different adaptive devices available for children with multiple disabilities.

.....
.....
..... 3.10 Unit End Exercise Discuss about the classroom management for children with multiple disabilities. Prepare and IEP for a child with multiple disability, from your practical work. 3.11 References Bennett A E, Garrad J & Halil T (1970) British Medical Journal iii, 762-764 Beukelman, D., & Mirenda, P. The ramp is usually two inches high at the front. It slopes gradually to cover 1/3 of the chair and becomes level with the rest of the seat. It can be made from ply wood, but should always be well padded with 1 inch thick foam which covers both the ramp and the rest of the seat. Pelvic Strap A pelvic strap gives added support and stability for children, who tend to slip forward in the seat. It is also a safety factor, as the child cannot fall out of the seat if left alone. The pelvic strap is always fixed at the back and below the level of the seat, so that it comes upwards and round the waist. This ensures that the child cannot slip under it. The strap should be made of thick cotton strapping 2 inches wide, which can be knotted in front.

Padding for Seating Children often spend a great deal of their day sitting so it is very important that the seat is comfortable and well padded. The padding usually consists of 1 inch foam. If the child is not toilet trained or if he tends to spill food when eating, it is best to cover the seat with rexine, which can be easily wiped clean and dry. If the child sweats a lot, it is advisable to place/towel over the rexine when the child is sitting in the seat. For children who do not have toilet accidents and are not likely to spill food or water, it is more comfortable to cover the seat with cloth. When padding a seat, the back, sides and seat of the chair should all be padded. Padding is not advisable for toilet seats. 34 Floor Table This type of table is very useful for children who sit on the floor. It is simple to make and does not take up too much space. If children have difficulty sitting, it gives a support in front on which they can lean. They will be able to use their hands more effectively. Children who have a tendency to keep their knees bent and sit with their legs crossed or between their knees can be encouraged to sit with their legs straight if they have a floor table to lean on. The floor table can also be used with the floor seat. There should always be raised beading round the three sides of the table not in contact with the child to prevent objects or toys from rolling off the table. The measurement for a floor table is usually 18" X 18". However for a younger child who uses a smaller chair, the floor table can be 15" X 15". Cut-out Tray This type of tray can be fitted to a chair or wheelchair. It gives extra support for the child who tends to fall forwards or sideways when placed in a seat. The tray gives support round the trunk, and enables the child to be more upright and if possible, use his hands more effectively. 35

Speech Therapists, Community Based Rehabilitation Workers and Special Educators. The combination of disabilities and degree of severity is different in each child. The time at which the disability occurs in the child, what is known as the 'age of onset', may also range from birth to a few days after birth, from early childhood till late teens. Sometimes children are born with one disability but acquire the second or third disabling conditions during childhood. The characteristics and the needs of the children depend on the nature of combination of the disabilities, the age of onset and the opportunities that have been available to a child in his environment. Multiple Disability refers to: a combination of two or more disabling conditions that have a combined effect on the child's communication, mobility and performance of day-to-day tasks.

Positioning and Handling Positioning refers to the use of appropriate body positions. Due to abnormal pull of muscles, children with cerebral palsy and MD spend a lot of time in abnormal positions. These abnormal positions can lead to increased tightness and other contractures and deformities and should be avoided whenever possible. Proper positioning should be used in all routines throughout the child's day. Try to encourage proper positing appropriate to the child's motor development. Handling refers to the techniques and methods that are used to move a child or assist a child

as independently as possible from one position to the next. It relates to how the child is picked up, put down, carried, held etc through movement transitions (e.g.: laying to sitting). Actually, handling is not done only with therapist's hands, but with his/her entire body. Specific handling, lifting and carrying techniques will vary according to the child's individual needs. Support can be gradually decreased as the child learns to support himself.

Netaji Subhas Open University From the Vice-Chancellor's Desk Dear Students, from this Academic Session (2015-17) the Curriculum and Course Structure of B. Ed.- Special Education have been thoroughly revised as per the stipulations which featured in the Memorandum of Understanding (MoU) between the Rehabilitation Council of India (RCI) and the National Council for Teacher Education (NCTE). The newly designed course structure and syllabus is comprehensive and futuristic has, therefore, been contextualized and adopted by NSOU from the present academic session, following the directives of the aforesaid national statutory authorities. Consequent upon the introduction of new syllabus the revision of Self Instructional Material (SIM) becomes imperative. The new syllabus was circulated by RCI for introduction in the month of June, 2015 while the new session begins in the month of July. So the difficulties of preparing the SIMs within such a short time can easily be understood. However, the School of Education of NSOU took up the challenge and put the best minds together in preparing SIM without compromising the standard and quality of such an academic package. It required many rigorous steps before printing and circulation of the entire academic package to our dear learners. Every intervening step was meticulously and methodically followed for ensuring quality in such a time bound manner. The SIMs are prepared by eminent subject experts and edited by the senior members of the faculty specializing in the discipline concerned. Printing of the SIMs has been done with utmost care and attention. Students are the primary beneficiaries of these materials so developed. Therefore, you must go through the contents seriously and take your queries, if any, to the Counselors during Personal Contact Programs (PCPs) for clarifications. In comparison to F2F mode, the onus is on the learners in the ODL mode. So please change your mind accordingly and shrug off your old mindset of teacher dependence and spoon feeding habits immediately.

I would further urge you to go for other Open Educational Resources (OERs) -available on websites, for better understanding and gaining comprehensive mastery over the subject. From this year NSOU is also providing ICT enabled support services to the students enrolled under this University. So, in addition to the printed SIMs, the e-contents are also provided to the students to facilitate the usage and ensure more flexibility at the user end. The other ICT based support systems will be there for the benefit of the learners. So please make the most of it and do your best in the examinations. However, any suggestion or constructive criticism regarding the SIMs and its improvement is welcome. I must acknowledge the contribution of all the content writers, editors and background minds at the SoE, NSOU for their respective efforts, expertise and hard work in producing the SIMs within a very short time. Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor, NSOU

Unit - I □ Introduction to Guidance and Counselling Structure 1.1 Introduction 1.2 Objective 1.3 Guidance and Counselling: Definition and Aims 1.3.1 Definition of Guidance 1.3.2 Definition of Counselling 1.3.3 Aims and Objective of Guidance and Counselling 1.4 Areas of Guidance and Counselling 1.4.1 Areas of Guidance 1.4.2

Areas of Counselling 1.5 Core condition

of Counselling 1.6 Skills and Competencies of the Counsellor 1.7 Role of Teacher in Guidance and Counselling Students with Special Needs 1.8 Let Us Sum Up 1.9

Check Your Progress 1.10 Reference 1.1 Introduction Guidance and Counselling is indispensable in every cultured civilization where

attempts have been made to discover human potentialities, to assess human behaviors and to predict human activities.

Guidance

and Counselling is prevalent in every civilized and organized society. In modern era life needs new skills which were not so much necessary in earlier societies, rather the teachers need to master those skills to meet the day by day necessities of the young stars. Guidance efforts are not based on personal experiences, superstitions or sudden idea of the parents and teachers. Moreover, guidance efforts are based on the study and research in the periphery of natural and social sciences. Guidance and counselling programs are the reflection of the scientific work performed in the fields of psychology, sociology mental hygiene and

10 education. Education, guidance and counselling are interrelated as they are all concerned with the social welfare of the society. This chapter attempts to create awareness among teachers about the significance and application of guidance and counselling in any educational institution. 1.2

Objective After passing through the unit the learners will be able to: - • Define the concept of guidance and counselling. • Explain the nature, purpose and scope of guidance and counselling. • Describe the need for guidance. • Describe the bases of guidance and counselling. •

Establish the relationship between guidance and education. • Examine the roles of guidance and counselling services in the field of Special Education. 1.3 Guidance and Counselling: Definition and Aims Guidance is not a direction neither it is a decision of another

individual which he can make by himself nor it is the burden of another's life.

Crow and Crow have defined guidance as the assistance made available by competent counsellors,

to an individual of any age

to help him direct his own life, develop his own point of view, make his own decisions,

and

carry his own

burdens.

Jones points out that

the focus of guidance is the individual, not his problems; its purpose is to promote the growth of the individual in self-direction.

According to Good,

guidance is a process of dynamic interpersonal relationship designed to influence the attitude and subsequent behavior of

the person.

Good has given emphasis on interpersonal relationships, which plays a great role in determining the degree of success the individual will achieve in the society. Guidance can help an individual to develop his desirable attitudes and behaviors.

National Vocational Guidance Association established by Fatima Wilson has defined

guidance as the

process of helping a person to develop and accept an organized and fully sufficient picture of himself and his role in the world of work, to test his concept against reality and to convert it into reality with satisfaction to himself and benefit to society.

11

Guidance is a support given to individuals through various techniques

so that he is able to understand the social requirements and to know the ways and means to adjust himself to these situations, Guidance is a classified set of specific services established as a basic part of the education system sketched to boost the development of students and assist them toward comprehension of sound, decent adjustment and maximum attainments appropriate with their potentialities. Guidance is also a point of view that includes a positive attitude toward students and a realization that it is to complement, make more

powerful and make more intelligible to all other phases of an individual's education. Counselling symbolize only one but most valuable of the service to be found in any guidance programme. Guidance affects all aspects of an individual's life and it tries to help the individual in clarifying his problems, counselling may be considered of as the gist of helping process. Counselling wrap ups a wide area of measures like advising, psychotherapy and follow-ups. Counselling is the focal point of all guidance services. It is a confronting relationship in which evolution takes place. It accelerates an individual's self-understanding, self-acceptance and self-realization. Halm and McHean defined Counselling as

a one-to-one relationship between an individual worried by problems with which he cannot deal alone and a professional worker whose training and experience have equipped him to help others to achieve a solution.

Counselling is that communication which occurs between two individuals called counsellor and client which takes place between a

professionally trained counsellor and an individual seeking help. This relationship is not accidental, or trade like. It is characterized by compassion, understanding, acknowledgement and dependence 1.3.1. Definition of Guidance: "

Guidance involves personal help given by someone; it is designed to assist the individual to decide

where he wants to go, what he wants to do and how best he can accomplish his purpose."- Jones. "Guidance is a term with many meanings. It is a point of view a group of services, a field of study which we should be required to choose one of the emphasized service would pre-dominate."- Moser and Moser. "Guidance is a process of enabling each individual to understand his abilities and interest to develop them as well as possible and to relate them to life goals and finally to reach a state of complete and matured self-guidance as a desirable human element of the social order."- Traxler.

12 "

Guidance is a

means of helping individuals to understand and use wisely the educational, vocational and personal opportunities they have or can develop and as a form of systematic assistance whereby students are aided in achieving satisfactory adjustment to school

and

in life."- Dunsmoor and Miller "The elements of guidance are learning about the individual student, helping him to understand himself, affecting changes in him and in his environment which will help him to grow and develop as much as possible."- Knapp 1.3.2. Definition of Counselling: ●

Counselling is a dynamic and personal relationship between two people who approach a mutually defined problems with mutual consideration

of

each other to the end that the younger or less mature, or more troubled of the person is aided to a self-determined resolution of his problem. -Waen. ● Counselling is a

personal and face-a-face relation between two people in which the counsellor by means of his special competencies, provides a learning situation in which the counsellee a normal person is helped to know himself and his possible future so that he can use his characteristics and his potentialities in a way that is satisfying both to himself and to society, can learn further as how to solve further problems and future needs. - Tobler ●

Counselling

is a series of direct contact with the individual which aims to offer him assistance in

attitude and behavior. -

Carl Rogers. ● A counseling

is a person to person relationship in which one individual turns another person for assistance. - Ericson. ● Consultation, mutual interchange of

opinions, deliberation together. - Webster's Dictionary. 1.3.3. Aims and objectives of Guidance and Counselling Guidance and

Counselling ensues at helping the clients to understand and accept themselves "as they are", and Counselling is to help the student to help himself.

The main objective of counselling is to

bring about a spontaneous change in

the

client. For this purpose, the counsellor provides facilities to collect the desired changes or make the suitable choice.

13

According to Dunsmoor and Miller, the purpose of student guidance counselling are: - 1. To give the student clue on matters important to success. 2. To get information about student which will be helpful in solving his problems. 3. To establish a rapport between student and teacher. 4. To help the student to execute a plan for solving his difficulties. 5. To help the student know himself better his curiosity, performances, inclinations and favorable circumstances. 6. To stimulate and cultivate distinctive abilities and appropriate attitudes. 7. To elicit favorable effort toward achievement. 8. To help student in outlining for educational and vocational choices. 1.4

Areas of

Guidance and Counselling 1.4.1. Area of Guidance Life is getting more and more complicated and miscellaneous nowadays. The present situation is that people have to face many difficult problems in their everyday life. All these life situations point to different areas of guidance and counselling which are as follows: - 1. Education 2. Vocation 3. Avocation 4. Social Relationship 5. Health 6. Morals 7. Personal Problems 1. Education:- As educational problem is prime in the list of student's problems, education is an important guidance area. Guidance in education includes syllabus offered by colleges and universities, guidance in education may be categories in the following two classes: 14 A. Pre-admission guidance B. Post admission guidance Pre-admission guidance focuses on people who are considered as entering into an Intermediate Care Facility(ICF). 2. Vocation: - All persons are not suitable for all jobs. Every job requires certain academic and skilled environment and arrangement. In order to guide the people for right choice of job compact lay out has been made to benefit. 3. Avocation: - Woodrow Wilson has truly said," The real intellectual life of a body of undergraduates, if there are any, manifests itself, not in the classroom, but in what they do and talk of and set before themselves as their favorite objects between class and lectures." Thus the liability of any College or University doesn't end with covering the syllabus by the teacher's performance. Teacher must help the students plan for them and cooperate in activities of them. 4. Social Relationship Social communications or relationships create problems for most of the people in our society. Social Relationships refer to social interactions between two or more individuals. We human beings sometimes get puzzled with social relationships, hence social relationships can be improved by the help and support of guidance and counseling. By this means friendship can be established spontaneously and casually. 5. Promotion of Health People has a special stake in the health and tangible prosperity of the society. Guidance aims at the entire health of the people. Surveillance, Booster Doses and Injections and other guidances are also provided by the guidance services. 6. Moral Needs Moral development focuses on the emergence, change and understanding of morality from infancy to adulthood. In the field of moral needs morality is defined as principles for how individuals ought to treat one another, with respect to justice, other's welfare and rights. In this periphery too, we sometimes face awkward situations. Guidance about moral needs is to be provided to students to keep them on the track and lead noble lives. 15 7. Personal Problems:- People may face many personal issues related to themselves, their friends, family, relatives and teachers their educational enactment and social adaptation. Through guidance these problems can be sorted out. 1.4.2.

Area of Counselling

Addictions (Alcohol, Drugs, Gambling, Shopping, Smoking, Work, Sex) People often becomes habituated to something as a way of trying to get some kind of command in their lives.

Controlling and limiting anger is very important in every aspect of one's life. Without control one is putting limits on what one can accomplish. Anger can incredibly destroy many things which is too much essential in one's life.

Anger management counselling is about teaching people that anger can be expressed in a constructive way.

Whether the bereavement or loss

is sudden or wanted, it is highly painful and shocking. People feels under great tension and pressure when someone they love dies, and no matter what

is the state or situation, agony can include an ample sphere of mental states from depression to violence. Loss can also be the loss or deprivation of a bond after apemisfortune that can leave people feeling vacant and unattended but also help to sink him into total bereavement. In that case counselling can really support people as they go through the phases of mental sufferings and tries to secure the platform which they need.

Depression Living with despair can be very hurtful and troublesome place to be. Low spirits can take over and leave people both sensibly and intensely exhausted. People often feel very detached and confined, as though no one fully understands what they are undergoing through, counselling aids to afford people with a room where they are perceived and sustained through a very shadowy and awful period. It also benefits people to deliberately reconstruct and steadily put their lives

well organized, well balanced and well adjusted. Eating Disorders (Thinness, Spree Eating Disorder, Compulsive

Eating Disorder and Irresistible Overeating) Eating disorders can really seize people's lives and existence, and often they find themselves absorbed with issues around food, body size, shape and obesity. Eating 16 disorders purviews binge eating to constricting, and they can frequently contain mismanagement of purgatives, vomiting and activity. Eating disorders are not just about food and activity though, they have lot to do with affairs, acquaintances, past events and in belief in oneself. Counselling can help people virtually to change the manner they eat and exercise, and advice to confront the harmful motive.

It can also benefit people to flourish and raise all other scopes of their lives. Low Self-Esteem and Confidence People often come for counselling because they have very low dignity. This means that they lack determination and their self-respect is very shatter able. This can often be the consequences of what they have suffered in the past, either in their

growing up, or in a commitment. It may be the conclusion of intimidate or corruption for instance. Counselling can honestly guide people how to begin to rely in themselves afresh and to identify what they have to suggest, and the definite and visible features

of themselves. It can cooperate people in prospering and acquiring. Relationships (Couple's Counselling, Divorce Counselling, Issues around Sex/ Affinity, Adultery) Relationships can often be intensely problematic and challenging. Couples come for counselling because they are striving to broadcast, or because they have controversies about closeness between them or their sex life is being afflicted. Sometimes one mate has been disloyal and people want to be able to work through with a noncommittal person. A counsellor can surely cure couples to initiate listening to one another repeatedly, to perceive and sense each other and to shape up their way of relating. On the contrary counselling can also be profitable if individuals or couples are going through a divorce and they want someone to guide them through this. Stress (Money, Health, Relationships, Work) Stress performs a substantial part in many people's life.

Sometimes jobs, commitments, wealth and or health concerns can cause people to feel under a lot of compression. Evidences of being stressed are feeling overpowered, depreciate, annoyance, lack to sleep and sometimes eating can be influenced (either over or under eating). Stress can often precede to phenomenal fitness dilemmas and impulsive outbreaks. Stress is practically tough to live with, and counselling can offer an avenue for this, and a field where you can converse and perform through the antecedents that are evoking you to feel so much affected mentally.

17 Trauma (Experiencing/witnessing accidents, attacks, abuse, violence, wars, natural disasters etc.) As an outcome of either enduring or observing a traumatic event an individual can be left in inquisition

their faiths and with their expectations destroyed. They can feel devastated and their mental states may be puzzling and difficult to apprehend. They may experience memories, upsetting memories, fantasies and restlessness. People can often feel deeply disconnected from what has happened and find themselves recapturing the event repeatedly. The aftereffect of this can neither be despair, low self-content, annoyance, stress, nervousness or even anxiety attacks. Some people may also promote obsessive markings as a way of coping. Counselling can comfort people to manage with shocking experiences and cooperate them to conceive what they have passed through. It can also lay hand to them in dealing with the signs of illness

that they may have grown. Post-traumatic Stress Disorder(PTSD) PTSD is most generally used to define manifestations originating from intensely scary experiences. However not everyone who experiences a dreadful accident will develop PTSD.

There may be an acute sensitivity of apprehension and a sense of being upset. Others may stay away from expressing or pertaining to think

about the event as a mode of self-protection. This can lead to confinement, a feeling of apathy and extended shock. In turn relationships will

collide,

feeling on edge and likely to leap at any noise or sound. Insomnia or restlessness

and mood swings are also likely. In the case of PTSD Cognitive Behavioural therapy techniques work best, as these can inspire an individual to alter undesirable thoughts and feelings with decisive ones. It is recommended that therapy initiates at least four weeks after the event has taken place.

Any other areas are also required for the Counselling like Vocation, Education etc. 1.5 Core Conditions of Counselling
Carl Roger was the founder of Humanistic psychology. At that time Freud's style was the model and Roger was worried about corrupt the unconcealed. It is truly said that he didn't like people of isolated type. The last time he fascinated someone is when she came out of coma and welcomed him. Carl Roger turned the chair reverse to face the patient and greeted him. He switched the autocratic pattern of therapist led psychotherapy toward a client or person-centered convention. That gave command to the client's self-knowledge and appetite toward mending one's own problems. The primitive idea of Rogarian theory is that the human experience is exclusive to each
18 individual and under suitable conditions, people will cut down their walls such as masks or covers and possibility of danger becomes healthy. Rogers believed the person (or self) is not a constant structure but a progress and the person is always becoming. He trusted in the instinctive affirmative abilities of all living creatures. In addition to the dilemmas that emerges when personal power is decreased, divergences between a personal Absolute Self and an Actual Self may lead to psychological pain or agony. The following are his percepts about people: - 1. Openness to Experience: His own and around him and "abide vagueness." "It is the opposite of defensiveness." 2. Trust in one's own emotional Self: "there is a continuous development of faith or hope in and even passion for the complicated, affluent, diverse combination of feelings and impulses which remain in each of us. This assurance leads to preminent self-acceptance and dependence on one's internal foresight. 3. An Internal Locus of Evaluation: Rogers believed power or control lies within the self rather than in society or even another person. The fundamental assumption deviates from trying to live up to or make others happy: "Am I living in a way which is who I truly am and expresses my passion?" 4. Willingness to be a Process: Rather than seeing people as a commodity, Rogers believed the human experience is a flowing energy. Therapy doesn't conclude in the outcome of a permanent state where problems are resolved, rather, it allows the legitimization of the individual to be able to handle situations while still being true to self. For Rogers, the process of therapy should be non-directive. The prime aspect of the therapist in client-centered therapy is related to the attribute of the psychotherapeutic relationship: that "unconditional positive regard." He considered it is essential for therapists to establish "a coordination which give emphasis to the significance and value of each person and their individuality. 1.6. Skills and Competencies of the Counsellor

The personal and professional traits of counsellors are very important in simplifying any helping relationship. A counsellor must be well equipped to support individuals to make adaptations and live a cheerful and cordial life.

The orientation can be with regard to the school and syllabus, job and a person's character.

For adequate counselling, the counsellor must be equipped with two kinds of evidence. First he must
19 have data relating to the counselee's

history of inclinations, efforts, curiosities, strategies etc. In addition to this

he must have the proficiency to clarify this data. Secondly, the counsellor must have knowledge about the areas in which the counselee may look for his service. These areas may be educational or personal.

With these two kinds of information he helps the counselee to meet his individual diagram of aptitude with convenient favorable circumstances. As the method of counselling advances, both the counsellor and the counselee must appear at a commonplace. Counsellors who steadily cultivate their self-awareness expertise are in contact with their principles, thoughts and feelings. They are probable to have a fair understanding of their own and their client's need and precisely evaluate both. Such awareness can help them be truthful with themselves and with others. They are able to be more compatible and frame trust concurrently. Counsellors who acquire this type of knowledge are most expected to relate distinctly and precisely. Three other characteristics that make counsellors originally more effective are recognized proficiency, charisma and dependability. Specialization

is the grade to which a counsellor is recognized as knowledge able and well versed about his or her traits. Counsellors who demonstrate certificates and diplomas in their offices are usually perceived as more dependable than those who do not and as a result, are likely to be effective. Clients went to work with counsellor who appears to know the line of work well.

Attractiveness is a behavior of seen closeness between a client and a counsellor. Counsellors can make themselves attractive by speaking in

fine, understandable and dialect free sentence and proposing relevant self- disclosure. Any other qualities of a Counselor are as follows: - 1. Sympathy 2. Listening skill and patience 3. Virtue or Self-Respect and Confidentiality 4. Attention power 5. Conversation Skill 6. Sensitivity or Delicacy 7. Crisis or critical situation Management 8. Knowledge of Psychology 9. Organizing or systematizing Facts

20 The Desirable Qualities of a School Counsellor are the Following:- 1. Hypnotic Personality 2. Personal adjustment 3. Interpersonal or Mutual Relationship 4. Professional Competence or Ability 5. Leadership 6. Professional dedication or Commitment 7. Philosophy of life 8. Wide range of interest Counsellors who are nonverbal signs in responding to clients, such as more nodding and eye contacts are seen as more attractive than those do not. The apparel of the counsellor also makes a distinctness, clothes should be clean, neat and professional looking but not emphasized to themselves. Dependability

is related to the sincerity and abiding of the counsellor. The counsellor should be genuinely concerned about the client by establishing an intimate relationship with the client. "

There is and can be no such thing as instant intimacy" or trustworthiness. Rather, both should be generated through patterns of behavior that are demonstrated and most clients should neither disbelief nor given to blind trust. 1.7 Role of Teacher in Guidance and Counselling Students with Special Needs Special education counselling is a specialization of school counselling that is concerned with the success of special needs students. The essential purpose of special education counselling is to ensure that special needs of students and their families who have approach to the appropriate supports and interferences in order to facilitate enhanced accomplishment in a school ambience. In addition to facilitating academic and rational growth, special education counselling is concerned with improving a student's ability to function in civil, sentimental and behavioral capacities. Special education counselling is a multi-modular discipline in which special education counsellors must be well versed in counselling theories and techniques, as well as educational theory, educational law, and special

21 education regulations. Special education counsellors work with special needs students in elementary schools, middle schools, and high schools to certify that they have the support services they need in order to achieve their highest potential in the areas of academics, personal and social growth, and career development. This is cultivated by working with students in social, emotional, behavioral, and physical disabilities in various frameworks including in one-on-one counselling, group counselling, in special education classrooms, as well as in regular education classrooms. Another essential duty of special education counsellors is to work with special education and general education teachers and staff members to guarantee that the needs of each special needs student are being met. Special education counsellors do this by advocating on the child's behalf co-functioning with teachers to cultivate more effective support services for the child, or working with teachers and staff members to develop a considerate understanding of the interventions in place to help the child succeed. Much collusion and consultation is also undertaken with other special services workers, such as school psychologists, occupational and physical therapists, speech-language pathologists, and the like. Special education counsellors work broadly with families as well. In this context, they might serve as an intermediate helping families to understand school policies and procedures or laying services to families about their rights concerning special education services. Special education counsellors also often work with families to improve their competence to meet their child's needs at home. This might comprehend tendering parent's and guardian's intuition into productive planning for enhancing their child's functioning. It may also be associated with assigning to families to outside resources, such as child and family counsellors, vocational training, or non-profit organizations that specialize in working with families of special needs children. What is the Role of a School Counsellor in Special Education? The aspect of a school counsellor is to help all students, combining those with special needs, to attain their full potential. Introducing an appropriate Individualized Education Program (IEP) at an early age can make all the difference, not only in these children's bookish learning, but also in their ecstatic health and social balancing and eventually in their ability to become fruitful endowing members of society. However, the population of children who are referred to special education classes is very assorted. So simply section them into broad categories won't work. It is vital for

22 each child's particular stamina's, weaknesses, and special needs to be adequately diagnosed and consigned. The school counsellor is the person who can help earnestly by justifying these children. The following are some of the other important services that school counsellors provide :

- Holding Counselling sessions with special education students.
- Encouraging family involvement in the IEP. It helps extremely if the parents or other accountable adults understand and are route with the services that have been approved, including probable criteria to outside organizations. The special education counsellor can also address specific questions or concerns and inform parents and guardians of their rights.
- Consulting with and working with other school staff to better understand the child's special needs and what backing systems, alterations and modifications may be necessary.
- Co-acting with other school and community professionals, including but not restricted to teachers, school psychologists, physical therapists, occupational therapists, and speech and language pathologists, in the transmission of services.
- Classifying other students who should be evaluated to regulate eligibility for special education.

What are the Educational Requirements to Become a Special Education Counsellor? The educational prerequisites for special education counsellors are quite different from those for counsellors that work outside the school system. It is highly recommended that students begin their studies not in counselling, but instead with a bachelor's degree in special education and gain experience as a special education teacher. To achieve this goal, students must complete a four-year special education program, including a student teaching placement in a special education setting. Upon graduation, students will need to pass a written examination and fulfil the requirements of obtaining teaching license in the state in which they live. After a few years in the classroom as a special education teacher, prospective special education counsellors should then pursue a master's degree in school counselling, which is most often the utmost degree in this field of work. Courses in master's degree programs revolve around developing a deep understanding of human behavior, educational policies and principles, and topics related to working with special

23 needs community. Human development, research methods, evaluation and assessment procedures, and statistics are common areas of study as well.

1.8 Let Us Sum Up

The general public tends to view counselling as a therapeutic function and emphasizes immediate goals, such as problem resolution, tension reduction, and the like. Counselee may refer to the verdict of a particular rivalry or bad situation. However, the goals of counselling are appropriately concerned with such fundamental and basic aspects such as self-understanding and self-actualization. These help provide the counselee with self-direction and self-motivation. Counselling in its attitude and attribute is productive. It aims at assisting the individual to develop such that he becomes psychologically mature and is capable of realizing his potentialities optimally. Counselling has no miraculous solutions. The only concise, rational and pragmatic view of counselling is that it is not and cannot be everything to everybody. It is concerned with helping individuals find prudent and feasible solutions to their problems by helping them gain a vision into themselves so that they are able to apply their own potentialities and opportunities and thus become self-sufficient, self-directed and self-actualized.

An important attribute of a counsellor is that he like and respects himself, but he does not use the counselee to satisfy his own needs. Every normal human being has a craving to be appreciated, acknowledged and accepted. The counsellor must possess good personality, good character and decent philosophy, health, emotional adherence, approachability, sympatric understanding of youth, intelligence, social culture, broad knowledge and interest in guidance and personal working conditions and understanding of social economic conditions.

The above given qualities must be possessed by counsellor.

27 2.8 Let Us Sum Up 2.9 Check Your Progress 2.10 Reference 2.1 Introduction Shallow confidence can be intensely implanted, with its connection with its scary childhood involvements such as continuation of being apart from parental care disregard, or impassioned, tangible, or sexual abuse. In posterior life, vanity can be weakened by ailment, adverse life events such as losing a job or getting divorced, inadequate or discouraging relationships, and an accepted sense of absence of command. This sense of lack of control may be notably manifested in sacrifices of heart-warming, materialistic, or sexual abuse, or victims of bias on the grounds of religion or creed, culture or art, race or pursuit, sex, or sexual coordination. The relationship between low self-esteem and psychological chaos and psychic agony is very complicated. Low self-esteem inclines to mental disorder, which successively strikes self-esteem. In some cases, low self-esteem is in itself an overriding feature of mental disorder, as, for example, in despair or marginal trait anarchy. People with low self-esteem bears to detect the world as an unsympathetic place and themselves as its sufferer. As a conclusion, they are hesitant to precise and insist themselves, fails out on experiences and favorable circumstances, and feels helpless to alter things. All these decreases their self-esteem still further, sucking them into a descending wound. If you feel that you endure from indigent self-esteem, there are a number of elementary things that you can do to lift yourself and, optimistically, emerge out of the downward spiral. You may already be doing some of these things, and you certainly don't need to be doing them all. Just do those that you feel most cozy with. 2.2 Objective After going through the

unit you will be able to: • Define the concept of self as human. • Explain the understanding of feeling and changes. • Describe the growth to autonomy.

28 • Describe the personality development. •

Establish

the role of teacher in developing self-esteem in children. 2.3 Concept of Self as Human

The emotional and mental constitution of self is the study of either the subjective, conative or intuitive portrayal of one's individuality or the apt of experience. The primeval conception of the self in modern psychology derived from the discrepancy between the self as I, the subjective or abstract knower, and the self as Me, the object that is known. Prevailing views of the self in psychology position the self as playing a component part in human desire, apprehension, influence, and social existence. It may be the case that we can now approvingly work out to ground experience of self in an auditory process with emotional consequences, which will give us penetration into the components of which the intricate build up planted selves of modern identity are repressed. The self has many aspects that aid to create essential parts of it, such as self-awareness, self-esteem, self-knowledge, and self-perception. All parts of the self-enable people to alter, change, add, and customize aspects of themselves in order to payoff social acceptance in society. "Probably, the best account of the origins of selfhood is that the self comes into being at the interface between the inner biological processes of the human body and the sociocultural network to which the person belongs." One's self-perception is defined by one's self-concept, self-knowledge, self-esteem, and social self. One's self-concept (also called self-construction, self-identity, self-perspective or self-structure) is a collection of beliefs about oneself that includes elements such as academic or scholastic performance, gender identity, sexual identity, and racial identity. Generally, self-concept embodies the answer to "Who am I?".

29 Self-concept is detectable from self-awareness, which attributes to the magnitude to which self-knowledge is designated, dependable, and presently pertinent to one's mental outlooks and inclinations. Self-concept also differs from self-esteem: self-concept is about concerning the mind (e.g. "I am a fast runner"), while self-esteem is evaluative and assertive (e.g. "I feel good about being a fast runner"). Self-concept is made up of one's self-architecture, and collaborates with self-esteem, self-knowledge, and the social self to design the self as complete. It comprises the past, present, and future selves, where future selves (or possible selves) perform individuals' ideas of what they might become, what they would like to become, or what they are anxious of becoming. Possible selves may function as encouragement for certain behavior. The recognition people have about their past or future selves is akin to the perception of their current selves. The secular self-estimation theory disputes that people have an addiction to manage a positive self-evaluation by dissociate themselves from their negative self and compensate more consideration to their positive one. In addition, people have an impulse to apprehend the past self-less cordially (e.g. "I'm better than I used to be") and the future self-more positively (e.g. "I will be better than I am now"). The self-concept is a centralized model that uses self-evaluation in order to describe one's self-designs. Features such as personality or temperament, skills and abilities, occupation and hobbies, physical characteristics, etc. are estimated and enforced to self-schemas, which are ideas of oneself in a specific extent (e.g., someone that considers themselves a geek will associate "geek-like" qualities to themselves). An accumulation of self-schemas makes up one's overall self-concept. For example, the statement "I am lazy" is a self-assessment that subsidizes to self-concept. Statements such as "I am tired", however, would not be part of someone's self-concept, since being tired is a momentary state and therefore cannot become a part of a self-schema. A person's self-concept may change with time as revision occurs, which in acute cases can lead to identity crises.

30 2.4 Understanding of Feelings and Changes Emotions are high-priority to your competence to accustom to the confrontations of your daily life. When you feel good or pleasant, you're able to wink off even the most burdensome of tasks, but when you're miserable or unhappy, you stretch even an entertaining activity with a sensation of melancholy and fate. Emotions also influence our relationships with others. If a friend tells you a tragic or unfortunate story and you reciprocate by chuckling rather than looking heartbroken or worried, you'll seem disrespectful and heartless. On the contrary, if you frown when you should smile at your friend's jokes, you'll cause offense for different reasons. Flying off the handle to an insignificant frustration can make you seem aggressive or even not stable. Contrariwise, if you counter with improper delight to a nearly minor piece of good news, people will also inquire your development and dependability. Babies are granted to blare with pleasure or groan with extreme anger but as adults, we're expected to control in the visible show of our feelings. Our mental states affect emotionally not only the way others treat us, but our extrasensory perception of well-being.

We are likely to rely on that whether we are experiencing positive or negative emotions imitates forces outside our jurisdiction, accusing everything from our chromosomes to the weather. However, what many people do not comprehend is that emotions aren't rigorously controlled by your body's anatomy the way that reflexes are. You're not stuck for life with the emotional equipment programmed into your DNA. To understand the way that you can control your emotions, we first have to take a modest deviation through the early history of psychology. Glimpses about what emotions are, and what causes them, have transformed entirely in the last 100 or so years. To take this expedition, who is surpassing to start with than William James, the founder of American psychology? According to James, and the closely related views of physiologist Carl Lange, your emotions are completely governed or administered by your body's responses. In fact, they are the emotions. Imagine you're being pursued by a bear. If you're like most of us, terror and extreme fright will take over your entire being, causing your heart to race, your palms to get sweaty, and your stomach to turn somersaults. James and Lange equated these responses of your autonomic nervous system with the actual emotion of fear. According to their theory (known to intro psych students as the infamous "James-Lange Theory"), your bodily reaction doesn't follow the emotion, it is the emotion. As James said, "Common sense says we lose our fortune, are sorry and weep; we meet a bear, are frightened and run; we are insulted by a rival, are angry and strike, afraid because we tremble ... the more rational statement is that we feel sorry because we cry, angry because we strike, afraid because we tremble" (Ellsworth, 31 1994, p. 222). Quite literally, when James and Lange talked about a "visceral" (or gut) emotional reaction, they meant it. Many people found the James-Lange theory hard to accept. Common sense seems to work out just fine, despite James' assertion. Apart from the theory just "feeling" wrong (so to speak), it also failed to meet the test of scientific acceptability and was therefore eventually dropped as an explanation. One very similar theory that appeared soon after the James-Lange foray into the field was that proposed by physiologist Walter Cannon; a view that is now known as the "Cannon-Bard" theory (reflecting his collaboration with a doctoral student named Philip Bard). This theory suggests that our emotions are organized by the response of a small structure in the brain known as the thalamus. It's the thalamus that would sense, for example, the onrushing bear. This sensation simultaneously causes the visceral reactions in the body and the subjective experience in the brain. The Cannon-Bard theory eventually became discredited too because it did not withstand experimental scrutiny. The thalamus may be involved in some emotional regulation, but it's not the brain's hot spot for our feelings. Instead, the amygdala seems to be the culprit when it comes to such emotions as fear, rage, and jealousy. Rational-emotive psychologist Albert Ellis takes another approach to cognitive theory, accounting more broadly for our tendencies to let our thoughts produce our own self-produced misery. Ellis believed that through "musturbation" we allow our emotions to be dominated by the "must's": "I must be successful," "I must be loved," "I must have what I want." Ellis talked about the "A-B-C" model of emotion: To modify the consequence (i.e. your emotion), you need to change your beliefs. To change your beliefs, you need to analyze them. In this example, you can the belief that "no one likes me" by looking at the evidence for this belief. Why do you think that no one likes you? Does one person's turn you down mean that no one likes you? Does this mean that no one will ever like you? Does it mean that you must have everyone like you? It's through challenging your thoughts and beliefs about yourself that you can change your emotional reactions. Once you start to pick separate the illogical or absurd basis for your emotions you can free yourself from being dictated by the non-adaptative emotions of rage, jealousy, rejection, and dejection and alternatively boost your adaptive emotions of happiness, contentment, and joy. With this emotional mending apparatus, you'll be able to make more than the gray skies clear up. You don't have to be held hostage to your gut, your thalamus, or even your amygdala. Focus on the thoughts that precede your emotions and you'll find that you can control your mood.

32 2.4.1 Are feelings good or bad? A common saying is "you are responsible for your feelings." (For the moment, let's forget about involuntary and out cold feelings.) Prosperously, all feelings can be viewed as instinctive, as neither good nor bad. This is how: many people believe that feelings and thoughts cannot be bad because they hurt no one. Acts can be bad (because they can hurt). From this viewpoint, there would be no need to hide our feelings (unless disclosing the feelings hurt someone) and no need to feel guilty about any thoughts or feelings. However, it is easy to see how we come to believe that thoughts and feelings are bad. Suppose as a child you hit your little brother and were slapped and told, "don't do that." As a 5-year-old you aren't likely to figure out that the parent who hit you meant "your hitting is bad but feeling angry is OK," so you grow up thinking "feeling angry is bad."

2.4.2 Feelings usually leak out Feelings usually find a way to express themselves, however, there are several ways of subjective feelings get expressed: 1. You may act on feelings: scream at someone when angry, cry when sad, communicate (in body language) your enthusiasm when captivated to someone. 2. You may have physiological reactions when feeling something: you blush or bloom when embarrassed, have high blood pressure when anxious, sexual arousal when attracted. 3. You may try to suppress the feelings and deny being upset or angry. Quite often people who decline their emotions think they are healthy and well adjusted, but they tend to have high blood pressure, high heart rate, an immune deficiency, high incidence of cancer (Temoshok, 1992), difficulty sleeping, and lots of aches and pains. 4. You may try to change the situation: shout out orders like a drill informer when things go erroneous or become charming to attract and influence someone. Note: howling "shut up" at someone implies but doesn't directly express your feeling, "I'm angry at you." 5. You may have one feeling to deny or conceal another: criticism or appreciation may hide allurements, crying may occur when you are mad, love may hide scared dependency. 6. You may blame others rather than presuming responsibility for your own feelings: "You are a selfish, mean person" instead of "I feel very hurt," "You are 33 a lazy slob" instead of "I feel furious when you are so sloppy," "You are arrogant" instead of "I'm afraid you won't like me." 7. You may not be aware of the true nature of your emotions but they can still have an aftermath on your life. Sensational examples are people with numerous personalities; an unconscious personality may have feelings which are not known to the person until that personality becomes conscious and "in control" later. 8. You may honestly share your feelings with others. This involves many skills: self-acknowledgement, "I" statements, social skills, assertiveness, self-confidence etc. 9. You may use your feelings as a barometer of your relationships with others and your self-acceptance. Negative, unwanted feelings are a sign that something needs to be changed, that self-help is needed. Now we will look at ways to take control of your emotions.

2.4.3 Methods for Changing Your Emotions Comprehending your emotions-- behavior, feelings, physiology, and thoughts--will help you to layout ways to change them. First, don't forget that methods focusing on the behavior or changing the environment can also reduce an unpleasant emotion, e.g. curtail your fear by putting better locks on the doors or by avoiding someone you are mad at. Fears can also be reduced by carving someone who is less afraid than you are. You can develop other behaviours that will neutralize the undesirable emotions, e.g. activity counteracts depression, assertion counteracts anger, facing the fear counteracts it, relaxation counteracts the hyperactivity of the workaholic, etc. These feeling do decline ifwe repeatedly expose ourselves to the bothered situation or memory over and over again while relaxed or under less distressing conditions (yet, becoming very tormented while talking to friends about the "awful" situation doesn't usually help). However, changing the consequences of a behaviour can alter emotions also, e.g. ask your friends to praise your healthy decision and challenge your bashful allegiance. Second, don't forget that our thoughts strongly influence our emotions. And, since we can sometimes change our thoughts and since psychology is in a "cognitive" epoch, there is great prominence on cognitive means at this time. The methods here comprises with basic raw emotions: anxiety or fears, anger, and sadness. Of course, these same methods can be used on the emotional part (level II) of any other problem. Inactive dependent problems tend to be handled with cognitive-behavioural methods and new skills. Emotions are a crucial part of our lives and they are spellbinding. Several recent books will help you understand.

34 2.5 Growth to Autonomy Psychological autonomy is one of the classical concepts covering the exclusive human modes of living and behaving, which have been the objects of debates and arguments among philosophers and researchers for centuries (Augustine, 1968; Baer, Kaufman, & Baumeister, 2008; Erasmus-Luther, 1988; Murphy & Brown, 2007; Paul, Miller, & Paul, 2003; Schneewind, 1998). Are human autonomy and the psychological freedom that comes with it ever possible? What role do society and culture play in the emergence and functioning of psychological autonomy? How do autonomous individuals relate to other people and broader communities? These are only a few of the questions that scholars try to answer. The debates about the nature of human autonomy and its role in people's motivation, functioning, and well-being have arisen again in the recent decades because of the emergence of positive psychology and the economics of happiness, and because of the dissatisfaction scholars have with both behaviourist and cognitivist approaches to human behaviour and its motivation (Chirkov, 2011a; Chirkov, Ryan, & Sheldon, 2010; Jenkins, 2008; Pugno, 2010; Ryan & Deci, 2006). Why have people throughout history been willing to fight and even die for their freedom? From one perspective the answer is obvious: oppression causes suffering and we're all hardwired to flee suffering. But recent research suggests an additional reason: we also seem to be hardwired to desire autonomy. Autonomy can be defined as the ability to make choices according to one's own free will. (Whether or not that will is free isn't relevant here - only that it feels free.) If we feel coerced by even an internal pressure like guilt or shame - to say nothing of external pressures like other people - our feeling of autonomy vanishes.

2.5.1 Autonomy and Psychological Development

The connection between autonomy and the ideal of developing one's own individual self was adopted within the humanistic psychologies of Abraham Maslow and Carl Rogers, who saw the goal of human development as "self-actualization" and "becoming a person," respectively. For Maslow and Rogers, the most developed person is the most autonomous, and autonomy is explicitly associated with not being dependent on others. More recently Lawrence Kohlberg developed an account of moral psychological development, in which more developed agents display a greater amount of moral autonomy and independence in their judgments. The highest level bears a great resemblance to the Kantian moral ideal, in its reference to adopting universal values and standards as one's own. Kohlberg's work was criticized by Carol Gilligan, who argued that this pattern reflected male development, but not female. Instead of taking "steps toward autonomy and independence," in which "separation itself becomes the model and the measure of growth," "for women, identity has as much to do with intimacy as with separation" (Gilligan 1982, 98). The trajectory is thus less about individualization and independence than toward ultimately balancing and harmonizing an agent's interests with those of others. Gilligan does not entirely repudiate autonomy itself as a value, but she also does not suggest how it can be distinguished from the ideals of independence and separation from others. Her critiques have been widely influential and have played a major role in provoking work on feminist ethics and, despite her criticism of the ideal of autonomy, conceptions of "relational autonomy." The contemporary literature on personal autonomy within philosophy tends to avoid these psychological ideas of individual development and self-actualization. For the most part, it adopts a content-neutral approach that rejects any particular developmental criteria for autonomous action, and is more concerned with articulating the structure by which particular actions can be deemed autonomous (or, conversely, the structure by which an agent can be deemed autonomous with respect to particular actions).

2.5.2 Personal Autonomy

The contemporary discussion of personal autonomy can primarily be distinguished from Kantian moral autonomy through its commitment to metaphysical neutrality. Related to this is the adherence to at least a procedural individualism: within contemporary personal autonomy accounts, an action is not judged to be autonomous because of its rootedness in universal principles, but based on features of the action and decision-making process purely internal and particular to the individual agent. The main distinction within personal autonomy is that between content-neutral accounts, which do not specify any particular values or principles that must be endorsed by the autonomous agent, and substantive accounts which specify some particular value or values that must be included within autonomous decision-making.

2.6 Personality Development

Personality development is the relatively enduring pattern of thoughts, feelings, and behaviours that distinguish individuals from one another. The dominant view in the field of personality psychology today holds that personality emerges early and continues to change in meaningful ways throughout the lifespan.

36 Adult personality traits are believed to have a basis in infant temperament, meaning that individual differences in disposition and behaviour appear early in life, possibly even before language or conscious self-representation develop. The Five Factor Model of personality has been found to map onto dimensions of childhood temperament, suggesting that individual differences in levels of the "big five" personality traits (neuroticism, extraversion, openness to experience, agreeableness, and conscientiousness) are present from young ages.

2.6.1 Evolutionary perspective To use an evolutionary perspective is to consider all behaviors (such as fears, prejudices, relationships, etc.) as the result of evolutionary processes. This perspective takes the stance that behaviors came into existence as a result of adaptations to living conditions. For example, humans naturally dislike and fear spiders and snakes. Using an evolutionary perspective, this is because our ancestors learned that these creatures are frequently poisonous and may be deadly. Likewise, humans have a natural fear of large carnivorous animals and know instinctively to stay away from them. The humans who developed a fear for these creatures were evolutionarily more successful because they avoided these harmful organisms and more of them survived than their counterparts who did not learn to fear harmful animals.

2.6.2 Lifespan perspectives Lifespan can be defined as the period that extends from conception to death. Thus, lifespan development is a process that begins at conception and continuous to death. Lifespan development can therefore be defined as a methodical, intra-individual transformation that is attributed to progressions corresponding to age. The development advances in a way that implicates the level of functioning. As a child grows he exhibits transformations that progresses with time. These may include physical growth, cognitive advancement, and psychological advancement that may entail emotional and social development.

2.6.3 Influencing Factors Personality traits demonstrate limited levels of continuity, smaller but still significant normative or mean-level changes, and individual differences in change, often late into the life course. This pattern or motif is influenced by ancestral, environmental, variable, and hypothetical factors.

37 2.6.4 Genetics Twin and adoption studies have manifested that the heritability of personality traits ranges from .3-.6, with a mean of .5. Heritability of .5 means that 50% of variation in observable personality traits is attributable to genetic influences. But a given genotype will lead to a certain phenotype only under the right environmental circumstances. In other words, the heritability of a trait may change depending on an individual's environment and/or life events.

2.6.5 Environmental With the effects of genetic similarity removed, children from the same family often appear no more alike than hapazardly selected strangers; yet identical twins raised apart are nearly as similar in personality as identical twins raised together. What these verdicts suggest is that shared family environment has practically no effect on personality development, and that similarity between relatives is almost entirely due to shared genetics. The weakness of shared environmental effects in assembling personality came as a wonder to many psychologists, and aroused research into non shared environment, or the environmental influences that make siblings different from one another instead of similar. Non shared environmental effects surround the variability in behavioral outcomes that is not elucidated by genetic and family environmental influences. Further effects of environment in adulthood are demonstrated by findings that different work, marital, and family experiences are conjoined with personality change, and by the collision of major positive and negative life events on personality.

2.6.6 Gene-environment interactions Three main types of gene-environment interactions are active (the process by which individuals with certain genotypes select and create environments that facilitate the expression of those genotypes), passive (the process by which genetic parents provide both the genes and the early environmental influences that contribute to the development of a characteristic in their children), and reactive (the process by which non-family individuals respond to the behavior produced by a genotype in characteristic ways).

38 2.7 Role of Teacher in Development Self- Esteem in Children Teachers play an important role in the nourishment a student's sense of excellence and self- estimation. Research about flexibility focusses the significant influence of even one adult to help children with learning and attention problems become progressively optimistic and prosperous. The late Julius Segal called that one person a "charismatic adult," noting this was an adult with whom children "identify and from whom they gather strength."

2.7.1 Positive, charismatic teachers How can teachers serve as appealing adults? Certainly they must use particular arbitrations to reinforce the self-esteem and resilience of students. However, if preparations are to be effective, the teachers using them must possess a positive disposition, or set of assumptions, about themselves and their students. Some of the main features of this mindset are:

- Every student has a thirst to learn and be successful in school. If they are not, we must contend to understand the nature of their learning problems.
-

If students are displaying self-defeating behaviors, such as quitting, or not trying, or acting like the class clown or class bully, we must recognize these are fruitless coping strategies that often cover feelings of vulnerability, low self-esteem, and hopelessness. Rather than establish disciplinary consequences, we must ask how to underrate the dejection of these youngsters experience each and every day. • If we are to lower the use of these ineffective coping behaviors, we must teach these youngsters in ways they can learn best. This indicates that as educators we must first change our access and teaching style if students with learning problems are to adopt a more hopeful, positive approach. We must be comfortable in making accommodations when needed. • Each child or adolescent possesses "islands of competence," or areas of strength, that must be identified, reinforced, and displayed by educators. A strength-based model does not deny the child's problems but recognizes the importance of using the child's strengths as an important component of any intervention program. • We must actively invite and involve students in the process of their own education.

2.7.2 Nurture self-esteem and resilience at school

If one accepts the principle of this mindset, then it is easier for educators to trust upon acknowledgement theory for proposing signal for bolstering self-esteem and hope. This theory directs us to find ways for youngsters with learning problems to feel an increasing sense of ownership, control, and responsibility for their successes and to view mistakes as experiences from which to learn rather than feel defeated. What follows are several key strategies with examples of how teachers might accomplish this task. Each educator should use these strategies in a way that most successfully meets the particular needs of each student.

2.7.3 Demystifying the problems

A first step in aiding children with learning difficulties is for teachers and parents to acknowledge the nature of these problems, help children understand their exclusive learning strengths and weaknesses, and make appropriate accommodations in their school programs. When one conduct psychological/educational evaluations, she/he explore to recruit the children, as well as their parents and teachers, as active "partners" in the evaluation. He ask these youngsters what they see as their learning strengths and weaknesses. He is often very impressed with their ability to comprehend their learning profile. He describes the evaluation as an attempt to understand more clearly their strengths and weaknesses. So together we can figure out the best ways for them to learn.

2.7.4 Accommodations that maximize success

If all children learn individually, then it makes distinctive sense that we teach them in ways they learn best. The kinds of accommodations I typically recommend do not require major modifications in a student's program, nor do they claim that a teacher have different educational plans for each student in the classroom. What is required is that all parties - students, teachers, parents - understand a child's strengths and weaknesses, appear at common expectations and goals, and recognize what has to be done to reach these goals. However, the kinds of modifications it is typically advised do not crave for major changes. A teacher auditing several of these recommendations recently remarked, "These are all very reasonable." The following are a small selection of these accommodations: • Untimed tests should be provided. I have known students with learning problems whose scores have gone up significantly by taking tests untimed, and yet they only required a few extra minutes. Removing the pressure of time lessened their anxiety.

40 • A maximum time for homework can be defined. I believe that if most members of a class can do six math problems in 15 minutes, then, if possible, teachers should set that as a maximum time. If some students can do only three problems in that time span, the three should be accepted. To ask students with learning and attention problems to put in an inordinate amount of time for homework not only is counterproductive in terms of learning, but also increases tension at home. We should guarantee students know what the homework chores are. Many students with learning problems have difficulty copying homework assignments from the blackboard. Providing the child with a monthly "syllabus" of assignments can be very beneficial. Some teachers assign a "buddy" to ensure the child has an accurate picture of the homework required. • Children should be permitted to use computers for their assignments. Many students who have difficulty broadcasting their ideas on paper do much better with computers. Yet, I know of teachers who still feel "students have to learn to write." By this they mean writing with a pen or pencil. My feeling is if students try hard to write with a pen or pencil but find it effortless to precise their thoughts using a computer, they should be granted to do so.

2.7.5 Teach decision making, problem solving It is constantly stressed that an elementary factor of high self-esteem and resilience is the belief one has control over many areas of one's life and can flawlessly define these areas. This belief is firmed to a feeling of ownership, an integral infrastructure for motivation. If we intend our children to foster this sense of control, it is essential we provide them with conveniences from an early age to learn and apply inquisitive and administrative skills. When I consult with schools and have the opportunity to interview students, I often ask. "What choices or decisions have you made in the past month in school?" Choices and decisions must exist if we are to help students with learning problems yield a feeling of ownership and become self-advocates.

2.7.6 Teachers can provide choices in many ways. Examples include: • Teachers in one school gave a certain number of problems for homework but said to the students, "It's your choice. Look at all six problems, and then do the four you think will help you learn best." By offering the students the choice to "do less," they actually received more homework than in the past, especially since the students felt a greater sense of ownership.

41 • When children are having difficulty learning, it is convenient to discuss with them what they think might be most helpful and to attempt certain strategies. As Dr. Myrna Shure has found using her "I Can Problem-Solve" program, even young children are competent of coming up with different options to help them learn more effectively.

2.7.8 Have children contribute

Self-esteem and resilience are cared when children are provided favorable circumstances to commit to their world and to the well-being of others.

In my exploration, I initiate that when adults are asked, "What is one of your most positive memories of school when you were a student, a memory involving something an adult said or did that boosted your self-esteem and motivation?" the most frequent answer centered around being asked to help. For this reason, when I consult with educators, I request they make a list of their students and what each contributes to the school environment. I have found that when students feel they are making a positive difference in school, they are more motivated to do well and are more agreeable to take suitable possibilities in learning. These acts of nursing can easily be allied with academic tasks. There should not be one student in a school who does not feel he is contributing to a better school environment. A few examples: • Students with learning problems can be asked to read to younger children. • An educator I knew enlisted adolescents with learning problems to sponsor a bake sale and raffle, with the proceeds going to a needy family in the community. This educator noted the students' self-esteem improved as they performed the many academic skills involved in the charitable project. • Students can take care of plants in school, or paint landscapes on the wall, or hang up favorite drawings. • Some schools use unified learning groups so students gain experience work as composed groups and helping each other. For some youngsters with learning problems, it is the initial time they grasp they have something to contribute to the school. All students are bothered about making errors and looking foolish. However, youngsters with learning problems customarily experience more failure situations than peers who do not have these problems. Thus, they are even more vulnerable and fearful about vain. They feel especially "exposed or bare" in school since it is an environment in which their learning problems are very evident. If we are to keep students from losing hope and quitting, we must help them develop a more positive attitude toward mistakes.

42 One of the most effective means of compromising with the fear of making mistakes and failing is to discuss this fear directly with students even before any mistakes are made. This is best done during the "orientation or introduction" period cited earlier. One of my favorite approach for attaining this task is for teachers to ask at the beginning of the school year, "Who feels they are going to make a mistake and not understand something in class this year?" Before any of the students can counter, teachers can raise their own hands and discuss times when they were students and worried about making mistakes and how this interfered with their learning. They can then employ the class in a problem-solving discussion of what they can do as teachers and what the class can do to minimize the fear of failing and looking foolish. Rules can be set up about how to call on students and how the teacher and other students should respond when a student does not know an answer. Openly supporting the fear of failure renders it less powerful and less devastating. Binding this to a discussion of how we all learn differently and have different strengths (islands of competence) and weaknesses sets the foundation for a class environment filled with admiration and understanding. Such an environment is one in which students with learning problems will feel respected and their self-esteem, motivation, hope, and resilience will be nurtured. One of the most valued gifts we can provide children and teenagers with learning problems is to develop their self-dignity and resilience. I hope this series of articles has provided a helpful sketch of the world of these youngsters and what we can do to assist them to lead more satisfying, fulfilling, successful lives. A wonderful tradition we can leave these children and students is to be the charismatic adults in their lives, knowing they have truly "gathered strength" from us.

2.8 Let Us Sum Up Self-enhancement or augmentation is a type of motivation that works to make people feel good about themselves and to maintain self-esteem. This purpose becomes especially outstanding in situations of threat, failure or blows to one's self-esteem. Self-enhancement involves a first choice for positive over negative self-views. It is one of the four self-evaluation motives along with self-assessment (the drive for an accurate self-concept), self-verification (the drive for a self-concept congruent with one's identity) and self-improvement (the act of bettering one's self-concept). Self-evaluation motives drive the process of self-regulation, that is, how people control and direct their own actions.

43 There are a variety of strategies that people can use to enhance their sense of individual value. For example, they can devalue skills that they need or they can condemn others to seem superior by comparison. These artifices are successful, in that people tend to think of themselves as having more positive qualities and fewer negative qualities than others. Although self-enhancement is seen in people with low self-esteem as well as with high self-esteem, these two groups tend to use different strategies. People who already have high esteem enhance their self-concept directly, by processing new information in a partial way. People with low self-esteem adopt more indirect strategies, for example by avoiding situations in which their negative qualities will be apparent.

2.9 Check Your Progress

1. What is the concept of self as human?
2. Discuss about understanding of feeling and changes.
3. Write in brief of methods for changing your emotions.
4. Discuss about growth to autonomy.
5. Discuss about role of teacher in development self-esteem in children.
6. How to teach decision making and problem solving procedure?

Unit 3 □□□□□ Guidance and Counselling in Inclusive Education Structure : 3.1 Introduction 3.2 Objective 3.3 Current Status with Reference to Indian School 3.4

Types of Counselling : Child Centred, Supportive, Family 3.4.1 Child-Centered Counselling 3.4.2 Supportive Counselling 3.4.3 What is Family Counselling 3.4.4 Benefits of Family Counselling 3.5 Guidance in Formal and Informal Situations: Within and Outside Classroom, Vocational Guidance 3.5.1 Formal and Informal Guidance 3.5.2 The Guidance Calendar 3.5.3 Guidance for School Children (Within and Outside of Classroom) 3.5.4 Guidance for Vocational 3.6 Group Guidance: Group Leadership Styles and Group Process 3.6.1 Group Guidance 3.6.2 Characteristics 3.6.3 Objectives 3.6.4 Principles of Group Guidance 3.6.5 Scope of Group Guidance 3.6.6 Relevance of Group Guidance 3.6.7 Group Leadership Style and Group Process

48 3.7 Challenges in Group Guidance 3.8 Let Us Sum Up 3.9 Check Your Progress 3.10 Reference 3.1 Introduction As a system, inclusive education should be flexible. As an ideology, comprehensive education should be flexible. Its doctrine should be education in the traditional classroom whenever possible. This need for adaptability must be reflected in the means and materials used to give these children the ample viable passage to the regular syllabus. When discussing the kind of service required, the starting point should always be what is superlative for the particular child. Giving priority to inclusive education does not reject special schools or centres. They would still be required to cater to children with abstruse and intricate difficulties in demand of more specialised and far-reaching help, including e.g. many deaf children. This substitute should, however, not be considered, unless classroom placement cannot meet their needs. In connection with the new policy of inclusive education, special schools are launched to function more and more as support systems. They involve in superior programmes, where they draw on their immense experience and knowledge. They bond their activities with those of the regular schools, the families, and the communities. Inclusive education services allow children with impairment to reside with their family and to go to the nearest school, alike all other children. This fact is of fundamental importance to their personal development. Hindering a disabled child's normal development may have far more harsh repercussion than the disability itself. In this framework, it is foremost to emphasize the role parents have. They deserves to be involved in all decision-making concerning their child. They should be seen as partners in the education process. Where there is such partnership, parents have been found to be very important resources for the teachers and the schools. There are a number of practical problems that have to be solved before a child with special educational needs can go to school or take part in school activities. The arrangements it takes are moderately easy, provided co-ordinated regional and atypical initiatives are provoked. One should also keep in mind that the child's schoolmates

49 represent a beneficial promising partner who is prepared and apt to help in conquering some of these problems. 3.2 Objective

After undergoing this unit the learners will be able to: • Define the concept of present status of Indian • Types of Counselling: child -centred, Supportive, Family • Explain the formal and informal situations. • Describe the group guidance. • Describe the challenges group guidance. 3.3 Current Status with Reference to Indian

School Education of children with disabilities in India, as all over the world, has moved from discrimination, special schools to integrated education. There is a national level central government sponsored scheme called Integrated Education of Disabled Children (IEDC). This project was started in 1980s and designed based on the experience gathered from a UNICEF assisted pilot project called PIED (project on integrated education of disabled children). In the mid-1980s many NGOs implemented this IEDC with allowance from Government of India. This project is implemented by the Ministry of Human Resource Development. This is fundamentally a nomadic resource teaching approach and one resource teacher was given to every 8 children with special needs. There are around 60,000 children with disabilities getting access to education under this course of action. As a whole the project is managed by the NGO sector. Although the aims and purposes of the IEDC program were admirable, the number of children with disabilities enrolled was woefully small. For example, in Karnataka State about 2% of all children with disabilities acquire education. About 1% of these children are enrolled in special schools and the balance 1% are in the integrated education system.

50 3.4 Types of Counselling : Child–Centred, Supportive, Family There are several types of counselling that follow similar lines to the various different types psychotherapy. Now we discuss: Child–Centred Counselling Supportive Counselling Family Counselling 3.4.1 Child Centered Counselling One-to-one therapy is available for all ages, from pre-school to children, and for all presenting problems. At times, parents may find that their child is experiencing road blocks in one or more of the following areas: depression, anxiety, mood-swings, past trauma, behavior problems; and major life changes (e.g., death of a loved one or divorce). We believe that no one knows their child more than the parents, and we embrace the opportunity to work closely with the parents to best support their child. The child-centered approach is based on accurate and empathic understanding and respect of the past and present personal experiences of parents and child. The child -centered approach is a positive approach where the focus on the constructive side of parents and child. One way of looking at this is by using the metaphor of how a seed, if provided with the appropriate conditions, will automatically grow in positive ways to a healthy mature plant. In the child -centered approach, is a growth- producing environment so that both parents and child are empowered to grow and make constructive changes in lives. 3.4.2 Supportive Counselling Supportive Counselling is a psychotherapeutic approach that integrates psychodynamic, cognitive-behavioral, and interpersonal conceptual models and techniques. The objective of the counselor to reinforce the patient's healthy and adaptive patterns of thought behaviors in order to reduce the intrapsychic conflicts that produce symptoms of mental disorders. Unlike in psychoanalysis, in which the analyst works to maintain a neutral demeanor as a "blank canvas" for transference, in supportive counselling therapy the therapist engages in a fully emotional, encouraging, and supportive relationship with the client as a method of furthering healthy defense mechanisms, especially in the context of interpersonal relationships.

51 Supportive counselling techniques are skills used to bring comfort and to guide the client. They are directed at reducing client-distress without specifically addressing the psychological or behaviour causes. Thus, supportive techniques are non-specific in nature. Supportive techniques can be used at any time during therapy, but are commonly used during the early phases of therapy. This is because during the later phases of therapy, more specific techniques may be required. The counsellor can provide brief counselling sessions using supportive techniques like: listening actively, giving advice, adding perspective, confirming the appropriateness of the patient's concerns, etc. While using the supportive counselling techniques the counsellor may focus on solutions by empathizing with the patient, while moving the dialogue toward the construction of clear, simple and specific plans for behavioural change. This change may be with regards to work, home, finances or health. S/he may focus on coping strategies which may be problem focused or emotion focused. The problem focused strategies are directed at situations that can be changed and emotion focused strategies are directed at situations that cannot be changed. While helping the client, the counsellor needs to recognize whether a situation can be changed or not and accordingly use some helpful coping strategies and supportive techniques. Some of the supportive techniques are presented here for the understanding and their application during the counselling sessions.

3.4.3 What is Family Counselling? Your family is more than just a group of individuals sharing a particular physical space or relational ties. Your family can be considered a system in itself, with its own rules, roles, and power structure. Family members collectively form a whole, or system, that can experience a wide range of difficulties. What affects one member of your family is likely to affect all others in the family. The relationships between members of your family are deep. Individuals in your family are tied to each other by powerful emotional attachments that will persist over the lifetime of your family. Family counselling focuses on the relationships and interactions between your family members.

3.4.5 Benefits of Family Counselling? • You and your family members can change unhealthy patterns of interacting and communicating with each other to more functional patterns of interaction. • You and your family members can strengthen relationships between each other.

52 • You will understand how your childhood family relationships and extended family relationships can impact your current family relationships. • You will learn how a healthy family structure contributes to healthy family relationships. • You will learn to encourage separateness of individual family members, while still maintaining and developing connectedness between family members.

3.5 Guidance in Formal and Informal Situations: Within and Outside Classroom, Vocational Guidance Difference between Formal vs. Informal guidance. Discuss differentiation of formal (professional) from informal (non-professional) guidance. Guidance comes in two zest: formal and informal, which are actually very different, each having advantages and disadvantages based on the situation and person.

3.5.1 Formal and Informal Guidance Formal guidance is professional or trained guidance. Informal guidance is defined in different ways. It consists of nothing more entering into conversation and listening to someone, such as being available or pulling someone aside for a quiet word about some problem they're having. However, in a workplace, for example, as a supervisor might enlist in informal guidance on the actuation of the moment about something that happened only a second ago. In fact, this is probably the best use of this type of guidance, according to some.

3.5.2 The Guidance Calendar The Guidance Calendar is a component of a school guidance programme. It takes care of the needs that cannot be met in a classroom, such as tours, career fairs, talent shows, seminars, visits, drama, etc. This Calendar shows all guidance activities that are projected in the school. It helps to allot time to school activities, and stay away from conflicts. It is for an organization to develop a monthly, quarterly, termly or yearly calendar. Like the Guidance Programme, a school Guidance Calendar is governed by the needs of the clients. It is meant to complement classroom activities. The Calendar confirms that relevant demands are addressed at convenient times and places, and succeed in doing certain activities in a series or order. For instance, after a career talk, a visit to a work place might be the most appropriate reciprocal activity, or

53 after a lesson on cleanliness, a nurse or health worker could be invited to address the pupils. This is an evidence that a calendar is in connection with recognised needs. A Guidance Calendar builds up good management, and developers will take into account the time of the year most advisable for certain activities. It also ensures the appropriate use of resources. The programme leadership should involve staff, parents and community members in creating the calendar, as not to do so might sceptically influence the programme. For instance, a nurse might not be able to address students if he/she was not told the date when needed to support the programme. In drawing up the calendar, there is an urgency to display the date, time, target group, guidance service activity, and human and material resources. 3.5.3 Guidance for School Children (Within and outside of Classroom) To Provide for the Realization of Student Potentialities To all students, the school offers an expanded choice of courses and co-curricular activities. A convincing function of education is to lay hand to students recognize and flourish their potentialities. The guider's role is to assist students to share their energies into the many learning opportunities available to them. Every student needs help in outlining his considerable course of study and diagram of co-curricular activities.

To Help Children with Developing Problems Even those students who have preferred an appropriate educational program for themselves may have problems that require help. A teacher may need to spend from one-fifth to one-third of his time with a few pupils who require a great deal of help, which expropriates the rest of the class from the teacher's full contemplation to their needs. The proficient, by helping these youngsters to resolve their difficulties, frees the classroom teacher to use his time more effortlessly. To

Contribute to the Development of the School's Curriculum Guider, in working with individual students, know their personal problems and inclinations, their capabilities and strengths, as well as the social strains defying them. Guider, therefore, can provide data that deliver as a basis for curriculum development, and they can help curriculum developers form courses of study that more precisely emulates the needs of students. Too often, guider is not comprehended in curriculum development endeavours.

54 To Provide Teachers with Technical Assistance Pre-service teacher training institutions usually provides very definite experience with the more methodological aspects of guidance work. Thus, a need prevails in most schools for assistance with guidance and counselling functions essential to the educational program. Categorically, the guidance counsellor is enough competent to assist teachers with selecting, administering, and interpreting tests; selecting and using collective, informal, and other types of documentations; providing help and suggestions relative to counselling techniques, which teachers can use in instructing their students; and providing leadership in boosting and handling professional development of teachers in guidance functions.

To Contribute to the Mutual Adjustment of Students and the School Guidance has an accountability for cultivating and preserving a cooperative relationship between students and the school. Teachers and guidance counsellors must be apprehensive of students' needs. Students also must make adjustments to the school. They have a duty to devotesomething to the school. A leading contribution of students is that of making relevant use of the school's resources and working toward accomplishments. Such shared adjustment of students and school is simplified by providing suggestions for program improvements, conducting research for educational improvements, contributing to students' adjustment through guidance counselling, and fostering wholesome school-home attitudes. 3.4.4 Guidance for Vocational Guidance helps people accomplish the following goals : • Identify own talents, strengths and weaknesses, family expectations and national requirements to sort out the personal relevance of the educational and vocational options available; • Understand the available education and training options and the requirements for admission and success, and select an appropriate field of study; • Understand the work options that are available, the qualifications required, the means of gaining entry, the life of the worker and the rewards of the jobs; • Translate information about self, educational opportunities and the world of work into short-range and long-range career goals;

55 • Learn effective job-search procedures; • Develop career adaptability to be able to take advantage of opportunities as they occur; • Overcome self-defeating behaviors, gain self-confidence and learn life skills; • Cope with the reactions to job loss of anger, depression, frustration and apathy, and learn to take continuing positive action to become employed again; • Identify alternative occupations when current employment is in jeopardy. Guidance is more than granting information. It is a synthesis of self-development and of the learning and absorption of career, providing educational and labour market information. The development of self-confidence is often a mandatory for taking action for one's career.

The intention of guidance may be achieved via individual counselling, self-preparation, career development courses, computer-assisted guidance and Internet-based guidance systems. 3.5 Group Guidance: Group Leadership Styles and Group Process 3.5.1 Group Guidance Certain definitions of group guidance are cited here to explain the meaning of group guidance clearly. Crow and Crow: "Guidance in group situations usually is thought

of as referring to those guidance services that are made available by school personnel to large or small groups of pupils." Jones: "

Group guidance is any group enterprise or activity in which the primary purpose is to assist each individual in the group to solve his problems and to make his

adjustments." 3.5.2

Characteristics To summarize these, the characteristics of group guidance are as follows:

56 (i) Group guidance is a relationship in which the guidance personnel attempt to help a number of students to overcome their personal problems and difficulties. (ii) Group guidance is a group activity process. (iii) It provides chance to explore a problem, its causes and solution to it as a result of which the individual student gains the ways and knowledge to overcome the difficulty. (iv) The students gain a lot of experiences related to the problem of life in a group situation. 3.5.3 Objectives Objectives of Group Guidance Service: The following are some of the principal objectives

which are to be achieved by group guidance programme: (i) The group guidance is useful for guidance crew to assist the members of the group to attain increased maturity in relation to realistic goals and adjustment. (ii) It empowers the members of group to manifest their individual problem before group and find out the ways for its solution from the group discussion and group judgment. (iii) It helps the members of group to understand and ascertain themselves as a result of which they may be able to achieve broader prospective of themselves and develop intuition in relation to others. (iv) It helps the individual to be aware of their personal needs, demands, strength, weaknesses and problems. (v) It is used to release, painful feelings, frustration and anxiety of the individual member of the group. (vi) It helps individual to explore the unknown problems of the members of the group with typical progress. 3.5.4 Principles of Group Guidance: The group guidance is based on the following principles:

57 (i) The group meant for the group guidance should be compatible in nature. (ii) The group guidance should be helpful and essential for everybody of the group. (iii) Individual problems should not be neglected in case of a group guidance problem. They are to be emphasized, discussed and found out certain solutions. (iv) Almost all members of the group should be initiated and encouraged to solve their individual problems with friendly climate and good relationship. (v) The members involved in the group guidance should not be selfish and in-humanitarian in nature. (vi) The group and the group guidance should be well managed by the needful action of the teachers and guidance workers. (vii) The members of the group should not hide the personal problems before group. 3.5.5 Scope of Group Guidance: The scope of group guidance includes the following issues and problems which are to be explored and solved: (i) Problems in regards to educational courses, educational plans and programmes. (ii) Various curricular issues and topics. (iii) Problems of career choices in the context of facilities gained. (iv) Various occupational issues and problems. (v) Personality problems and issues. (vi) Social problems and related situations. (vii) Job placement and adjustment in job and previous preparations for it. (viii) Economic set-up and problems. (ix) Problems of group life and group adjustment. (x) Solution to various life

problems and success over problematic issues. 3.5.6 Relevance of Group Guidance: In the ambience of school guidance programmes, the group guidance secures an important place carrying several advantages and relevance to individual student and his problems.

58 1. Chance for more contacts: As an integral part of guidance service, group guidance provides a chance for more contacts with friends having similar type of problems. It establishes a good rapport or bond and better relationship with other friends. In a friendly and co-operative situation all the members of the group come forward to expose their faced problems. Then individual problem gets different ways of solution from various minds. "Sink together and swim together" becomes motto of the all students to think over the individual problem which helps them to be closed each other like brothers and sisters of a family. It means the possibility of more contacts becomes possible through group guidance without any disputation and disorientation. 2. Encourages to normal individual student: The prime motive of group guidance is to help the individual students in a group. Generally, the group is designed including normal or average students to be supported by the group guidance services. Various useful information and ways to find out solutions are provided by group guidance to the individual student as a result of which individual student tries to manage himself in his own life situation after the group guidance service. 3. Favorable circumstances for discussion of common problems: The united efforts are chief element of group guidance programme. The group guidance service provides a good opportunity to discuss a common problem which arise in the life of different students. In group guidance programme, the common problems faced by maximum or total number of students are directly quoted and discussed within the group under expert leadership of teachers or guidance workers. Therefore, almost all students of the group work together towards common problems as a result of which they may be capable of solving the problems adequately and fluently. 4. Improvement of student's attitudes and behavior: Group guidance gives much emphasis on the discussion of common as well as individual problems. So, this process of discussion encourages free exchange of opinions and realistic analysis of attitudes. After discussion and analysis about the problems of students, the group members find a path to solve the faced problems which is achieved through balanced judgment and desirable behavior of the students. Therefore, it can be said rightly that group guidance helps the students to improve their attitudes and behavior.

59 5. Emphasis on collective judgment: Sometimes certain students are unwilling to express their personal important problems before interviewer as they feel ashamed of it. Even if some students do not like express their problems before interviewer not taking aim to expose their weaknesses. But in case of group guidance, students of this type like to express their hidden problems before the group as they are the birds of same feather. Then the group guidance service invites collective judgment on problems of individual students. Also collective judgment does not ignore the problems that are common to the group. 6. Opportunity for observation: In the group guidance service, the guidance worker gets chance to observe the student's reaction, behavior and feelings towards a particular problem or group life and situation as a result of which the guidance worker becomes able to know about the various traits of personality of the students. This observation helps guidance worker to understand the student's mental condition, his personality and himself also which are expected to be used in the guidance services. 7. Whole-some development of personality: The student from different family backgrounds, educational status, socioeconomic status participate in the group guidance which encourages better adjustment among students. Besides that, each and everybody gets privilege to express himself before others in a friendly atmosphere. Then all start on thinking on the problems and search for the solution of the problems. This type of co-operative atmosphere and adjustment helps students to develop their personality and its traits as a whole. 8. Awareness of unrecognized needs and problems: The group guidance service is highly required to search about the unrecognized needs and problems of students. The hidden and unrecognized needs and problems of students come out through group interaction, group intimacy and group freedom as a result of which the group guidance worker keeps them in the mind and provides group guidance accordingly. 9. Time saving: The group guidance service, no doubt is time saving as it deals with the large number of students at a time. Much time and attention is needed in case of individual guidance service. But in case of group guidance services, within a limited period of

60 time all students are provided guidance service through guidance worker or group of guidance workers which directly saves much of the valuable times. 10. Money saving: Besides time factor, individual guidance is an expensive process as it engages a separate guidance worker, employs separate techniques of data collection, and extra man power etc. But in a group guidance service large number of the students are provided similar type of guidance service. Therefore, group guidance service is less expensive and it carries much advantages over individual guidance. 3.5.7 Group Leadership Styles and Group Process A leadership style refers to a leader's characteristic behaviours when directing, motivating, guiding, and managing groups of people. Great leaders can inspire political movements and social change. They can also motivate others to perform, create, and innovate. As you start to consider some of the people who you think of as great leaders, you can immediately see that there are often vast differences in how each person leads. Fortunately, researchers have developed different theories and frameworks that allow us to better identify and understand these different leadership styles. The following are just a few of the most prominent leadership frameworks and styles that have been identified: Lewin's Leadership Styles Kurt Lewin recognized that one of the factors that determines a leader's choice of leadership style is the need to make decisions. In 1939 he and his co-workers identified three styles of leadership decision making, the autocratic, the democratic and the laissez- faire. Autocratic leaders make decisions themselves. They do not consult their followers, or involve them in the decision-making process. Having made a decision they impose it and expect obedience. Democratic leaders take an active role in the decision making process but they involve others too. Despite the term "democratic" they don't necessarily put decisions to the vote. Of course, they still carry the responsibility for seeing that decisions achieve the desired outcomes.

61 Laissez-faire leaders have very little involvement in decisions making themselves, pretty much leaving matters to their followers. This might be OK when the followers are capable and motivated but can create problems otherwise! Additional Leadership Styles and Models In addition to the three styles identified by Lewin and his colleagues, researchers have described numerous other characteristic patterns of leadership. The following are just a few of the best-known: The Transformational Leadership Style Transformational leadership is a style of leadership where a leader works with subordinates to identify needed change, creating a vision to guide the change through inspiration, and executing the change in tandem with committed members of a group. Transformational leadership serves to enhance the motivation, morale, and job performance of followers through a variety of mechanisms; these include connecting the follower's sense of identity and self to a project and to the collective identity of the organization; being a role model for followers in order to inspire them and to raise their interest in the project; challenging followers to take greater ownership for their work, and understanding the strengths and weaknesses of followers, allowing the leader to align followers with tasks that enhance their performance. The Transactional Leadership Style Transactional leadership, also known as managerial leadership, focuses on supervision, organization, and performance; transactional leadership is a style of leadership in which leaders promote compliance by followers through both rewards and punishments. Unlike transformational leaders, those using the transactional approach are not looking to change the future, they look to keep things the same. Leaders using transactional leadership as a model pay attention to followers' work in order to find faults and deviations. This type of leadership is effective in crisis and emergency situations, as well as for projects that need to be carried out in a specific way. Situational Leadership Styles Situational leadership is a leadership style that has been developed and studied by Kenneth Blanchard and Paul Hersey. Situational leadership refers to when the leader or manager of an organization must adjust his style to fit the development level of the

62 followers he is trying to influence. With situational leadership, it is up to the leader to change his style, not the follower to adapt to the leader's style. In situational leadership, the style may change continually to meet the needs of others in the organization based on the situation. Hershey and Blanchard's Leadership Styles Hershey and Blanchard's model is one of the best-known situational theories. First published in 1969, this model describes four primary styles of leadership. 1. The telling style is characterized by telling people what to do. 2. The selling style involves leaders convincing followers to buy into their ideas and messages. 3. The participating style is marked by allowing group members to take a more active role in the decision-making process. 4. Finally, the delegating style involves taking a hands-off approach to leadership and allowing group members to make the majority of decisions. Blanchard's SLII Leadership Styles Later, Blanchard expanded upon the original Hershey and Blanchard model to emphasize how the developmental and skill level of the learners influences the style that should be used by leaders. Blanchard also described four different learning styles. 1. The directing style involves giving orders and expecting obedience, but offers little in the way of guidance and assistance. 2. The coaching style means giving lots of orders, but leaders also lots of supportive behaviours. 3. The supporting style, on the other hand, is an approach that offers plenty of help, but very little direction. 4. Finally, the Delegating style is low in both direction and support. What's Your Learning Style? As you can see, there are different ways to conceive of leadership styles. You probably have also noticed that some of these leadership styles bear many similarities to the three core styles initially described by Lewin and his colleagues.

63 3.6 Challenges in Group Guidance The challenges of techniques and activities adopted and employed for group guidance are generally as follows: 1. Career Talk: The career talk is one of methods of providing career information to the students of the group through lectures, seminar's, talk by the professionals in the field and other symposiums related to guidance services. Various information collected by students from different printed materials, books and pamphlets do not serve the practical purposes of guidance services. So that the interaction made by the students with professionals who are in actually on the job provides effective and practical impressions on the students. Objectives: The followings are the objectives of career talk. (i) It helps the students to get information about careers directly from an experienced person in the concerning field. (ii) It provides opportunity to clarify the doubts of the students in relation to career through direct interaction with experts. Phases of Activities: The following are the phases of career talk: (i) Decide the topic which has received much importance. (ii) Prepare a brief note about what is expected from the expert visitor. (iii) Choice of suitable themes. (iv) Selection of the expert. (v) Decision's time and data (vi) Preparation of career brief. (vii) Co-ordination of entire programme. 2. Career Conference: Career conference is organized to invite certain experts and experienced persons from vocational setup to suggest about vocational plans, choices and careers to the students those who are involved in this activities.

64 Objectives: The following are the objectives of career conference: (i) It enables students to get opportunity to collect information about different careers of their choice from experts. (ii) It assists students to get the opportunity to have a direct interaction over a group of careers. (iii) It helps students to achieve broader perspective on various career opportunities. Phases of Activities: The following are the various phases of career conference: (i) Identification of speakers. (ii) Finalization of data, venue and time (iii) Monitoring the activities or programme. (iv) Evaluating the programme. (v) Framing an organizing committee. (vi) Preparation of a plan of activities. 3. Career Corner: Career corner is gathering center of various career books, pamphlets, posters and notices concerning career information. Objectives: The following are the objectives of career corner: (i) It helps students in providing various information about occupations from a variety of career literature of the country and abroad. (ii) It helps students to analyses their employment opportunities by as resulting career index. (iii) It helps students to provide latest information about different jobs. Phases of Career Corner: The following are the various phases of career corner:

65 (i) Selection of a place for career corner. (ii) Collection of career literature from own country and abroad. (iii) Preparation of career index. (iv) Display of career literature. (v) Periodical updating of literature displayed. 4. Case Conference: In the case conference, problems faced by majority of students presented before all. Each student is encouraged to present his way of dealing with problems. Then through discussion of individual cases, a line of action is initiated to solve the problems as a result of which each member of the group learns how to solve his own problems from other's experience, regarding it. Objectives: The following are the objectives of case conference: (i) It enables students to express his own problem before groups. (ii) It enables students to think and find out alternative ways to solve the problem. (iii) It enables students to find out a line of action from discussion. (iv) It enables students to solve own problems learning from others experiences. Phases of Activities: The following are the various phases of case conference: (i) Problem by majority of the group is detected. (ii) Discussion of problems. (iii) Previous experiences about problems of all are discussed. (iv) Finalization of solution of the problems. 5. Committee Reports: The students involved in group guidance are divided into various groups or committees to discuss the problem or various problems from different angles and visions. Then they are advised to prepare and present their reports in groups. Maximum freedom is given to the students to express their views and suggestions in the context of the problem. It helps students to gain knowledge and awareness about the problems and its solutions.

66 Objectives: The following are the objectives of the committee report: (i) It enables students to develop the capacities to adjust with other committee members. (ii) It enables students to understand a problem and think its solutions from different angles. (iii) It enables student to overcome the own problem by experience gained by committee reports.

Phases of Committee Reports: The following are the various phases of committee reports: 4. (i) Formation of various committees. (ii) Problems cited (iii) Solution of problems encouraged (iv) Writing committee reports. (v) Submission of committee reports. (vi) Co-ordination and finalization of committee reports to find out solutions to the problems. 6.

Group Visits: Sometimes the students are encouraged for group visit to particular significant work sites, or places having geographical importance or educational institution to gain direct experiences about the occupation or place or institution. Then they are immediately advised to meet for a conference to discuss and clarify what they observed or what doubts they are having about that visits. Objectives: The following are the objectives of the group visits: (i) It enables students to know about the visited place, occupation and institution. (ii) It enables students to observe the situation and adjust with the concerned person of that occupation, institution and places.

67 Phases of Activities: The following are the various phases of group visits: (i) Selection of spots. (ii) Information about visits should be given to the students. (iii) Organization of visits. (iv) Observation about interested place, person or occupation. (v) Immediate arrangement of conference for clarification of doubts and observations. 7. Audio-Visual-Aids: Audio visual aids like films, slides, film-strips, picture relating various occupations, posters and charts showing importance of curricular choice, and pamphlets regarding other courses and vocational information etc. can be prepared, organized and displayed in an exhibition to provide all the information which would be helpful to students to prepare for solving the problems of educational situation, vocational set up and personal life. Objectives: The following are the important objectives of audio-visual aids: (i) It enables students to know various information's of different educational courses, occupational opportunities and other facilities regarding educational courses and occupations. (ii) It enables students to take right decision after visiting the audio visual aids. (iii) It enables students to adjust in different social set up. Phases of Activities: The following are the various phases of audio-visual aids: (i) Selection of audio visual aids to be cited. (ii) Information of audio visual aids should be verified. (iii) Conduct of showing audio visual aids. (iv) Observation by the students. (v) Co-ordination of the programme.

68 8. Dramatics: Like other techniques, dramatics is an important technique at present. The students are provided good guidance through dramatization of a topic related to student's problem. It is not only meant for the purpose of entertainment, but also it is helpful for the students how to appear interview, how to prepare for an examination and how to achieve good marks in the examination through good notes etc. Keeping these in the mind the topic of drama should be selected and staged. Objectives: The following are the different objectives of dramatics: (i) It helps students to show his latent talents and innate abilities. (ii) It helps students to solve the problems relating to educational, occupational and personal life. Phases of Activities: The following are the different phases of dramatics: (i) Selection of the topic for drama. (ii) Selection and verification of themes of drama. (iii) Arrangement of drama. (iv) Stage of drama. (v) Observation of drama on the basis of topic relating to the student's problem. (vi) Evaluation, co-ordination and achievement of learning the means to solve the problems of life. 9. Question Box: In many cases, it is found that some of the students do not express their problems as they feel shy about their difficulties. Therefore, the need of the question box is highly felt. The students those who are shy in nature are subjects to put their questions in writing into the question box which is meant for the same purpose. After some times, the questions are kept in order for discussion. The students are benefited by the question box technique not being exposed before others by the guidance workers or teachers. Objectives: The following are the important objectives of the question box:

69 (i) It enables students to solve his own faced problems without any hesitation. (ii) It enables students to know the way of solution to the problems by experts not exposing their problems before others. Phase of Activities: The following are various phases of question box: Information for organization of question box is given to the students those who are shy in nature. (i) Question box is kept in a proper place. (ii) Questions are invited. (iii) Questions are sorted. (iv) Questions are left to discussion. (v) Inviting expert views. (vi) Finalization of questions of question box. 10. Informal Discussions: Informal discussion is an important technique which is used for the purpose of group guidance. Here the discussion with the skillful leader and expert is not formal in nature. But the discussion between expert and the group should center around desirable objectives as a result of which the students are benefited. Because the students become able to solve their educational and vocational problems through this informal discussion which is not systematic and formal but helpful for the students. Objectives: The following are the objectives of informal discussion: (i) It enables students to overcome their difficulties what they face without consuming much time for the assistance given by the expert. (ii) It enables students to express all their difficulties before expert to solve their own problems of life situation. Phases of Activities: The following are the various phases of informal discussions: (i) Gathering of students.

70 (ii) Meeting the expert. (iii) Problems are discussed informally. (iv) Finding out solutions to the problems. (v) Evaluation of the informal discussion. 3.7 Let us Sum-up Group guidance services have a much scope and function than merely that of assisting students in making educational and vocational choices in inclusive set up. The aims of guidance are both adjective and developments; its

help the student in making the best possible adjustments to the situations in the educational institution and home and at the

same time facilitates the development of all aspects of his /her personality. Group guidance, therefore should be regarded

as an integral part of education and not a special psychological or social service which is peripheral to

education purpose in inclusive set up. 3.8 Check Your Progress 1. Discuss about current status with reference to Indian School? 2. What is formal and informal guidance? 3. How to prepare a guidance programme for school children in inclusive set up? 4. What is Vocational Guidance? 5. What is Group Guidance? 6. Discuss about the principles of group guidance. 7. Discuss about Group leadership style 8. Discuss about challenges in group guidance How to differentiate between transformational and transactional leadership style. 3.9 Reference Bass, B. 3 Netaji Subhas Open University From the Vice-Chancellor's Desk Dear Students, from this Academic Session (2015-17) the Curriculum and Course Structure of B. Ed.- Special Education have been thoroughly revised as per the stipulations which featured in the Memorandum of Understanding (MoU) between the Rehabilitation Council of India (RCI) and the National Council for Teacher Education (NCTE). The newly designed course structure and syllabus is comprehensive and futuristic has, therefore, been contextualized and adopted by NSOU from the present academic session, following the directives of the aforesaid national statutory authorities. Consequent upon the introduction of new syllabus the revision of Self Instructional Material (SIM) becomes imperative. The new syllabus was circulated by RCI for introduction in the month of June, 2015 while the new session begins in the month of July. So the difficulties of preparing the SIMs within such a short time can easily be understood. However, the School of Education of NSOU took up the challenge and put the best minds together in preparing SIM without compromising the standard and quality of such an academic package. It required many rigorous steps before printing and circulation of the entire academic package to our dear learners. Every intervening step was meticulously and methodically followed for ensuring quality in such a time bound manner. The SIMs are prepared by eminent subject experts and edited by the senior members of the faculty specializing in the discipline concerned. Printing of the SIMs has been done with utmost care and attention. Students are the primary beneficiaries of these materials so developed. Therefore, you must go through the contents seriously and take your queries, if any, to the Counselors during Personal Contact Programs (PCPs) for clarifications. In comparison to F2F mode, the onus is on the learners in the ODL mode. So please change your mind accordingly and shrug off your old mindset of teacher dependence and spoon feeding habits immediately.

4 I would further urge you to go for other Open Educational Resources (OERs) -available on websites, for better understanding and gaining comprehensive mastery over the subject. From this year NSOU is also providing ICT enabled support services to the students enrolled under this University. So, in addition to the printed SIMs, the e-contents are also provided to the students to facilitate the usage and ensure more flexibility at the user end. The other ICT based support systems will be there for the benefit of the learners. So please make the most of it and do your best in the examinations. However, any suggestion or constructive criticism regarding the SIMs and its improvement is welcome. I must acknowledge the contribution of all the content writers, editors and background minds at the SoE, NSOU for their respective efforts, expertise and hard work in producing the SIMs within a very short time. Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor, NSOU

Check your progress 1.9 Let us Sum up 1.10References 1.1 Introduction The latest challenging sub area of the broader field of special education

is learning Disabilities. This term was proposed by Samuel Kirk at a parents meeting in New York city in the early 1960s.

The idea behind this was to clear the confusing variety of levels that were used to describe the child with relatively normal intelligence who are having learning problems. (Reddy, G. L., Ramar, R., & Kusuma, A., 2014) "Learning Disability" is a term used to describe a specific group of people having learning problems. They generally face problems in the area of reading, writing, spelling and mathematics. Some of these people excel in many areas other than the problem areas. Others are merely slow in acquiring skills. Levels such as dyslexics, learning disabled, slow learners, minimally brain damaged and educationally handicapped are being used to describe such type of people. (Santhanam, T., Babu, B. P., & Sugandhi, S., 2014)

1.2 Objectives After completing this unit, the learners will be able to:

- know the concept of learning disability

10 • be familiar with the types of learning disability • understand the meaning of Nonverbal Learning Disabilities • identify the problems of Language Disorders • perceive the learning disabilities with ADHD & ADD and • comprehend what types of Emotional & Behavioural Problems in learning disabilities

1.3 Verbal Learning Disabilities: Dyslexia, Dysgraphia, Dyscalculia

Learning disabilities, or learning disorders, are an umbrella term for a wide variety of learning problems. Children with Learning disabilities do not face problem with intelligence, motivation, laziness or dumbness. Most of them are just smart as other children. Their brains work differently. It affects how they receive and process information.

Disorder

in one or more of the basic psychological processes involved in understanding or

in using spoken or written

language

is noticed in the children with learning disabilities. The disorder

may occur in various forms such as reading disability, writing disability, Communication and comprehension disability

and numerical disability etc. Learning disabilities are classified into various types. Such as: Dyslexia (Reading Disabilities):

(Sharma, A.R. 2012) Reading plays an important role in education and day to day life. Children with dyslexia show

problems with reading task. They are unable to read. There are two forms of this disability- mild form and severe form.

Mild form dyslexic child has difficulty in reading, but in severe form they are having total loss of reading ability which is

sometimes also known as "Word Blindness". If timely identified and properly guided, mild form of dyslexic children can be

integrated easily with their peers. Intensive remedial exercises are required for severely affected children. Types of reading

problems (Santhanam, T., Babu, B. P. & Sugandhi, S. 2014) (i) Visual dyslexia Difficulties are faced by the children with visual

dyslexia in translating written letters into sounds. Confusion is caused by them with similar configuration of letters such

as bad-bed, fan-fun etc.

11 (ii) Auditory Dyslexia Auditory discrimination problem is the main characteristics of the children having auditory

dyslexia. They face some problems to discriminate between nearest phoneme and nearest words like m & n, p & q, mat

and man, beg & bag etc. Some of them face difficulties with certain words e.g. b, t, s, sh, c while others have problems

with only initial or final consonants sounds. (iii) Sound Blending Sound blending is the ability to synthesize sounds into a

complete word. Children with this difficulty are unable, to blend m-a-t into word mat. The three phonemes of this word

remain as separate sounds, (iv) Memory skills Memory disturbed Children face problem in recalling information

associated with various visual or auditory process. (v) Letter and Word Reversals A common problem of children with

reading disability is to read some letters and words backwards, rotated or inverted. Single letters such as b,d,p,q,n,u,m

and w are often read upside down and backwards. LD children are also observed reversing those words, e.g. saw for was,

parts of words, e.g. tow for two and initial letters, e.g., big for dig. (vi) Critical Reading Skills Comprehension is the base of

Critical Reading which involves critical value judgements based on attitudes and experience of the reader. Judging

accuracy, drawing conclusions, evaluating the author's intention, etc. are the factors of critical reading. Dysgraphia

(Writing disabilities) : (Sharma, A. R. 2012) Children who have writing disabilities may have trouble in writing and spelling.

Children with dysgraphia show problems with spontaneous writing. Mild and severe are the two types of this disability.

When the children face problems to write legibly is called mild dysgraphia. Mild dysgraphic children can read in general

school and severe form of dysgraphic children can copy writing without distortion but cannot write spontaneously.

Remedial exercises are required for the severe dysgraphic children and are thus hard to integrate in the academic areas.

Writing requires muscular control, eye-hand coordination and visual discrimination. It also requires smooth control of

arms, hands and finger muscles. It needs adequate perception of the letter and word formation. Poor motor skills, faulty

visual perception

12 of letters and words, poor muscular coordination and poor memory are some of the problems of LD children. (Santhanam, T., Babu, B. P. & Sugandhi, S. 2014) Types of Writing Disabilities (Santhanam, T., Babu, B. P. & Sugandhi, S. 2014) Handwriting, Spelling and Written Expression are the three types of writing disabilities. (i) Handwriting Handwriting is the important part of all the academic skills. Some children with handwriting deficits are unable to hold a pencil while others have problem in writing certain letters. Some of the more common hand writing disturbances are as following: ● Prewriting Skills ● Letter Formation ● Manuscript Writing ● Cursive Writing (ii) Spelling Spelling is a major hurdle of learning disabilities than other problems. Addition of unneeded letters, omission of needed letters, reversals of whole words, reversals of vowels, reversals of consonants and wrong association of sound, etc. are some common spelling errors. ● Phonetic Ability The ability to transpose sounds to letters accurately is called spelling skills which is not there in many children with learning disabilities. These children have difficulties in auditory memory and auditory discrimination skills, e.g., they spell cat as cad, etc. ● Visual Memory The visual memory is nothing but to retain the memory of either individual letter or the sequential order of letters in words and this is not available in some children with learning disabilities. ● Motor memory Remembering ability is missing with the children with learning disability due to which during movement of hand in writing, certain words are totally forgotten by them. (iii) Written Expression Learning Disabled children are facing some problems in following areas: -

13 ● Expression of Ideas The children with learning disabilities cannot express their ideas properly in written form. ● Syntax and Grammar Some of the children with learning disabilities can expressed their thoughts in writing but many syntax and grammatical errors are observed in their writing. ● Inadequate Vocabulary Lacks of various experiences, the children with learning disabilities have poor vocabularies. Dyscalculia (arithmetic disabilities) Children who have arithmetic disabilities may have problems in calculations, even simple arithmetic, because of an inability to manipulate number relationships. It has also two types- Mild and Severe. Simple mathematical problems have been difficult to them. Children with mild form can read in general school. When difficulties are severe then child cannot understand or not be able to learn number symbols and their relationship. So in severe cases intensive remedial exercises are required. Types of Arithmetic disabilities The most commonly observed difficulties in children with this disorder are: (i) Shape Discrimination In this case it is shows that child cannot understand the shapes. For this it is affect later recognition of specific numbers. Such as 6 as 9. (ii) Size Discrimination Concrete geometric concepts such as big, small, long and short, and abstract numerical concepts such as more and less, cannot be understood by these children. (iii) Classification For mastering math., it is a very important concept to categorize objects into sets. If it is done then problems may arise even in simple operation like counting. (iv) One-to-one Correspondence In this case children with learning disabilities cannot understand ordinal numbers for lack of understanding. (v) Sets and Numbers

14 A well-defined collection or group of objects is called a set and every part of a set is an element of that set. Concept of set is not understood by many learning disabled children. It is difficult for them to recognize the commonalities that distinguish a box of crayons, a bowl of apples or a group of boys as three sets. (vi) Counting In arithmetic training, counting is an important and first step. Basic computational skills of addition and subtraction become a big problem for the children who are unable to count properly and with this difficulty often skip numbers when counting, e.g. 1,2,3,5,6,8,9, 11. Others count correctly, without understanding that each number corresponds to a particular element in a set. (vii) Auditory-visual Association Difficulties are there with these group of children in relating what they see visually with what they know auditorily. They face problem in associating the spoken word 'six' with the written symbol '6' or even written word 'six'. (viii) Place Value The basic to many mathematical functions is the concept of place value. Many learning disabled children do not understand that the same digit may create different value according to its place in numeral (e.g.; 27, 12 or 255). The child with place value difficulty cannot follow the meaning involved in reversing 15 into 51. Some children are not able to complete sums requiring carrying or borrowing (e. g.; add 63 and 18 as 711). (ix) Computational Skills Many of the computational problems are due to difficulties with the fundamental skills of one to one interaction, counting and set notification. (x) Problem Solving Difficulties in solving word problems arise due to problems in language, lack of analysis and reasoning. (xi) Spatial Concept Problems in making measurements of time, distance etc. (xii) Measurement One of the very first principles of measurement is that some objects are taller, shorter, larger or smaller than other objects which might prove confusing to some children.

15 (xiii) Quantitative Language Sometimes an early indicator of later mathematical disabilities are difficulties in understanding such quantitative concepts as more, less, before, after, big, little, larger, fewer, more than, as many as, etc. Some children cannot distinguish a+ from a-, others face problems in perceiving particular symbols as a whole. The equal sign(=)is perceived by some children as two subtraction signs.

1.4 Nonverbal Learning Disabilities

A learning disorder characterized by verbal strengths as well as visual-spatial, motor, and social skills difficulties is called Nonverbal Learning Disorder (also known as nonverbal learning disability, NLD or NVLD). Comprehension of nonverbal clues such as facial expression or tone of voice becomes difficult for the people with this disorder some times. Mathematics and handwriting are the common challenges. Though various nonverbal impairments were recognized since early studies in child neurology, still there is ongoing debate whether the existing ideas of NLD provide a valid diagnostic framework or not. The brain gets information from the eyes and ears and the process is called "input". Learning may suffer if anyone them does not function properly. Auditory processing disorder- According to Professionals, "auditory processing skills" or "receptive language" is the ability to hear properly. The ability to read, write and spell greatly depends on the ability to hear things correctly. If anyone is unable to distinguish subtle differences in sound, or hearing sounds at the wrong speed then it will be difficult to sound out words and understand the basic concepts of reading and writing. Visual processing disorder- Missing subtle differences in shapes, reversing letters or numbers, skipping words, skipping lines, misperceiving depth or distance, or having problems with eye-hand coordination are the symptoms of Problems in Visual Perception."Visual Processing" is referred by the Professionals as the work of eyes." Gross and fine motor skills, reading comprehension, and maths are affected by visual perception. (Sharma, R. 2012)

Motor disorder- People with motor problems might walk with a clumsy gait or have difficulty in throwing or catching a ball, skipping or hopping. Others face fine motor problems when cutting with scissors, buttoning, zipping or even tying a shoe lace. Coordinating perception with motor functions is the problem with the people suffering with the visual motor integration problems. A child suffering with this problem will face problem in tracing, cutting, clipping, throwing, catching and paper -pencil activities. (Santhanam, T., Prasad, B.B. and Sungandhi, S. 2014) In the motor areas, the child faces difficulty in executing: (i) Gross-motor skills (running, jumping, skipping etc.) (ii) Fine motor skills (writing, drawing, pasting etc.) and (iii) Body image and awareness skills (solving puzzles, reading, facial expressions pointing to body parts).

1.5 Language Disorders

The disorders that involve the processing of linguistic information are called Language disorders or language impairments. Grammatical (syntax and/or morphology), semantics (meaning) or other aspects of language may be affected due to this problem. Receptive (involving impaired language comprehension), expressive (involving language production), or a combination of both maybe noticed in this case. All forms of language such as spoken, written and sign language also may occur for the same. According to preliminary research it is observed that biological components, such as low-birth weight, prematurity, general birth complications, and male gender, as well as family history and low parental education may result the chance of developing language disorders. Receptive language disorders (where one cannot properly comprehend language) and expressive language disorders (where one cannot properly communicate their intended message) are the two different indicators of language disorder. (Wikipedia,2018)

Receptive Language Disorders

There are two types of receptive language disorders- acquired or developmental (most often the latter). Due to developmental disorder difficulties in spoken language tend to occur before three years of age. Facing problems to understand meanings of words and sentences, put words in proper order, and inability to follow verbal instruction are the unique symptoms and signs of a receptive language disorder. Language therapy, special education classes for children at school, and a psychologist(if

17 accompanying behavioral problems are present) are the remedy to overcome this problem. Expressive Language Disorders Problems with expressive disorder occur with voice and articulation and also with mental formation of language. Expressive language disorder may take place during the development of child or it can be acquired. A normal neurological development is the result of this acquisition and is brought by a number of causes such as head trauma or irradiation. Certain common features of expressive disorder are limited vocabulary, inability to produce complex grammar and more lexical errors though it may vary. The child may face difficulty in acquiring new words and grammatical structures due to this disorder. Starting to talk later than his/ her peers and progressing at a slower rate linguistically may happen due to this. Struggling with academics and socializing with peers may also occur due to the very nature. Such disorders are commonly treated by the experts like Speech Pathologists and Audiologists. Disorder of spoken language Any short come in the area of listening generally affect spoken language. The following characteristics are noticed in the most learning disabled persons: (Santhanam, T., Prasad, B.B. and Sungandhi, S. 2014) a) Reliance on simple sentence constructions b) Incorrect use of word given in its context. c) Problems with tense, pronouns, possessives, and negatives. d) Omission of words and endings. e) Insertion of extra words or word parts in their sentences. f) Fragmentation of thoughts expressed. g) Awkward organization of spoken language. h) Articulation difficulties. i) Difficulty retrieving words during conversation, often with attempted cover -up through stalling or insertions. The speech of learning Disabled children appears to be very limited in structure and usually contains "filters."

18 Comprehension / Verbal \emptyset Has difficulty following oral directions \emptyset Has difficulty responding to and formulating questions \emptyset May have difficulty expressing self in conversation e.g., incorrect word order, grammatical errors, etc. \emptyset May have word finding problems \emptyset May be slow in responding verbally \emptyset Does not gain information from lectures. 1.6 Associated Conditions: ADHD & ADD ADD and ADHD is the word more or less same. ADD means Attention Deficit Disorder. When attention span is not so normal then called ADD. Every child has some attention problem. But when this problem crossing the limit then suggests it is under ADD. Very young children have short attention spans and act impulsively, but this usually improves with age. If these problems are severe or persistent, they may be due to Attention Deficit Hyperactivity Disorder (ADHD). Children affected by ADHD often have problems paying attention to instructions, finishing tasks, relating to others and staying settled. If the following signs are present in the child for more than six months, professional advice should be sought: \emptyset Easily distracted by their surroundings or other thoughts. \emptyset Inability to focus on any activity for long. \emptyset Overactivity, unable to keep still or stop talking, or \emptyset Impulsively acting without thought to the consequences. These type of children may have difficulty in making friends, have problems at school as a result they are wrongly labeled 'bad child'. If it is noticed that the child needs help the professional advice should be suggested. There are some type of competent of challenging behaviours which is described 'difficult' or 'problematic' behavior. Each individual varies from each other in the frequency and intensity of these behaviours

19 Emerson (1995) define challenging behavior as "culturally abnormal behavior(s) of such intensity, frequency, duration that the physical safety of the person or others is likely to be put in jeopardy, or behavior which is likely to limit the use of, or result in the person being denied access to ordinary community facilities." Challenging behavior can also be learned behavior - if behavior produces a pleasant or desired outcome, it is more likely to happen again. These type of behaviour do not have serious consequences but could be disruptive, stressful or upsetting. In this reference challenging behavior is followed to children with a learning disability or neurological impairment but it is not exclusive. (Sharma, R. 2012) Attention is the ability to concentrate on a task long enough to grasp its essential features. Learning disabled children with attention problems are unable to avoid extraneous stimuli and are attracted by irrelevant stimuli. This also includes inability to focus on one activity for even a reasonable period of time. LD children are always on the move switching from one activity to another fast without completing anyone of them. Depression, anxiety, emotional problems or stress can lead to problems of concentration. The LD persons are considerably inferior in selective attention (cannot select the relevant details), and that they cannot sustain attention or maintain attention till the task is completed. They might exhibit short attention span, distractibility, impulsivity and hyperactivity. 1.7 Emotional & Behavioural Problems

Children with learning disabilities (LD) often have problems that go far beyond those experienced in reading, writing, math, memory, or organization. For many, strong feelings of frustration, anger, sadness, or shame can lead to psychological difficulties such as anxiety, depression, or low self-esteem, as well as behavioural problems such as substance abuse or juvenile delinquency. "Unfortunately," says Dr. Marshall Raskind, an expert in the field of learning disabilities, "these problems can be far more devastating than the academic challenges themselves. Although the severity and duration of a child's psychological difficulties may vary as she grows up, such issues can find their way into and through adulthood." On the basis of several researches in the field of LD some suggestions can be provided to parents for helping them protect their children from developing such problems.

Some explanations for psychological difficulties in kids with LD

It is not difficult to see why children with LD are at greater risk for developing 20 psychological difficulties

Despite the child's efforts and adult promptings to "try harder," children with LD may receive little positive feedback. Their academic struggles and failures are often met with disapproval by teachers, peers, and parents. Such disapproval can take the form of negative labeling of a child as "slow," "lazy," or "dumb." Rather than developing a sense of pride in their accomplishments, children with LD may end up in frustration and shame. Such feeling never helps the child having learning disability develop

positive self concept. In fact, as a result of constant struggle and failure, a negative self-image may develop. Low self-esteem and a lack of confidence only serve to further interfere with learning and academic success and reinforce a cycle of failure and negativity.

The second frequently offered reason as to why kids with LD may develop psychological problems is the social difficulties they often experience

have social difficulties in making and keeping friends.

Psychological problems can have a negative effect on social interaction. Research has shown that children with learning disabilities are less accepted

by the society,

and often rejected by their peers. Teachers and other adults also may tend to have negative views of children with learning disabilities." Such social rejection can result in loss of self-esteem and negative views of oneself. In addition, social rejection can result in feelings of loneliness, which, in turn, may lead to psychological difficulties such as anxiety and depression. There are several psychological, emotional, and behavioural difficulties experienced by children with learning disabilities.

Ø

Research has shown that individuals with learning disabilities may experience increased levels of anxiety. Ø individuals with learning disabilities may be at greater risk for depression. Ø individuals with learning disabilities experience higher levels of loneliness. Ø individuals with learning disabilities may have a lower self-concept (self-esteem). Ø individuals with learning disabilities are at greater risk for substance abuse. Ø individuals with learning disabilities may be at greater risk for juvenile delinquency (there is some debate here).

Kids with LD shows the following

self defeating coping strategies like Ø Quitting, when tasks become difficult or frustrating;

Ø Avoiding a task or activity for fear of failing;

21 Ø

Clowning, to hide lack of confidence or to relieve pressure; Ø Controlling, to counteract a sense of helplessness;

Ø

Being aggressive and bullying, to fend off feelings of vulnerability;

Ø

Denying, in order to manage the pain they would feel if insecurities were acknowledged; Ø Being impulsive, finishing tasks as quickly as possible "just to get it over with." Occasional and short-term use of these unproductive coping strategies is probably not a cause for concern. But when they become the habitual way a child approaches daily tasks, interfering with learning, growing, and enjoying life, it's time to look at the feelings behind the behavior. Some kids with learning difficulties may become either anxious or depressed as a result of ongoing academic and non-academic struggles related to their LD. According

to the

Diagnostic and Statistical Manual of Mental Disorders, Fourth Edition (DSM-IV),

which is used by physicians to diagnose psychological problems, a child who is anxious may seem worried most of the time; may act nervous in certain settings, such as in crowds of people, at school, or when expected to perform; or may fear being separated from home or from parents or other adults to whom he's attached. A child who is depressed, according to DSM-IV criteria, seems sad or irritable most of the time; loses interest and pleasure in many activities she used to enjoy; over-eats or loses her appetite; feels inappropriate guilt; has trouble thinking, concentrating, and making decisions; feels worthless or hopeless

The parents should

begin to support the LD kid to regain self esteem, motivation and the pleasure with friends, families and daily activities as soon as they identify or notice unusual attitude among the child's behaviour. 1.8 Check your progress 1. What do you mean by Learning Disability? 2. Discuss briefly the types of Reading Problems. 3. Write a short note on Written Expression. 4. Describe in detail about Arithmetic Disabilities. 5. What do you mean by Non-verbal Learning Disability? 6. Narrate briefly the Emotional and Behavioural Problems related with Learning Disabilities

22 1.9 Let us Sum up In this unit students have the idea of learning disability and which component are involved with the learning disabilities. They have understood the difference between dyslexia, dysgraphia and dyscalculia. After reading this unit, students are familiar with the non-verbal learning disabilities and also identify the language disorder. They have been know the biological components, such as low-birth weight, prematurity, general birth complications, and male gender, as well as family history and low parental education may result the chance of developing language disorders. It is also known that receptive and expressive language disorders are the two different indicators of language disorder. Student can know in this unit Learning disabled children with attention problems are unable to avoid extraneous stimuli and are attracted by irrelevant stimuli. This also includes inability to focus on one activity for even a reasonable period of time. LD children are always on the move switching from one activity to another fast without completing anyone of them. It is clear that Emotional and behavioural problems plays most important role in LD. parents should

begin to support the LD kid to regain self- esteem, motivation and the pleasure with friends, families and daily activities as soon as they identify or notice unusual attitude among the child's behaviour. 1.10 References Reddy, G.L., Ramar, R. & Kusuma, A. 24 2.1 Introduction The National Information Center for Children and Youths with Disabilities (NICHCY, 1999) listed five purposes of assessment: (1) screening; (2) evaluation; (3) eligibility and diagnosis; (4) IEP development; and (5) instructional planning. Screening is concerned with identifying students who are suspected of having a disability. In the area of Learning Disability assessors would be evaluating children who are exhibiting learning difficulties or delays in acquiring academic skills. Data from the screening would point out the degree to which these students with suspected Learning Disability are approximating average academic growth patterns. Students with extremely deficient skills would be recommended for a full evaluation. This evaluation would delineate the student's strengths and weaknesses, and overall academic progress across the curriculum. Evaluation would encompass three areas, namely, pre-academic, academic, and learning style assessment. Pre-academic assessment provides information related to a student's status on prerequisite behaviors (e.g. attention to task) that need to be acquired before instruction in an academic domain (e.g. math) occurs. Academic assessment allows educators to: pinpoint deficit academic readiness skills; describe a student's overall skill performance level; identify academic skills necessary for learning a domain area; and delineate the steps of a learning task a student has mastered. Learning style assessment involves the identification of a student's individual learning pattern that she has acquired based on her learning and behavior assets and weaknesses (Anthony, et. al. 2005).

2.2 Objectives After going through the unit the learners will be able to: -

- Concept of assessment of readiness skills.
- Explain the assessment of reading writing and maths skills.
- Describe the teacher made test
- Describe the standardized test
- Establish the interpretation of test report

2.3 Assessment of Readiness Skills Young children cultivate swiftly, repeatedly enduring overwhelming alteration and progress substantially,

cognitively, linguistically and culturally. Youngsters, for

25 example, seem to relay from one breakthrough to the next. Still, the ratio of growth and development among young children differs greatly. Undeniably, as a consequence of this immense changeability during early childhood that can be seen in nearly any environment with preschoolers and kindergartners, many professionals hesitate at labeling children as learning handicapped. Studies signify that early arbitration can make a convincing difference in a child's development and many other professionals demand to acknowledge hastily when they figure regenerative delays or see that certain children are not gathering conventional expectations. When this is the case, a convenient appraisal

is essential to regulate whether or not a child will benefit from early intervention and, if so, what kind of intervention. A distinctive all-inclusive judgement will analyze at-risk indicators, make identifications, and approve services needed. This is exceptionally true for children with questionable learning disabilities who display widely-varying differences in cognitive tasks that can complicated overall abilities. Children presenting evidences of developmental delay will profit from efficient, thorough appraisal in some or all of the following areas:

- Upbringing clue about family, early development, health, language, literacy and educational experiences. A document of early developmental turning points will supply information about rate of learning, and note should be made of the age at which parents or teachers first observed "problems."
- Audition and Perception. Some anatomical accounts influence developmental delays. For example, a hearing deterioration can intervene with language procurement; a child with a visual impairment may be impotent to construe and communicate with his or her environment suitably.
- Perception, memory, language, thinking skills, and problem solving. Valuation of these competences and inclinations can boost in differentiating between children deferred in all manners of development and those slow in a few areas, who otherwise perform as well or better than their age peers.
- Listening apperception and expressive language. Observation of the child as he or she broadcasts with parents, teachers and peers validates his or her capability to assimilate single words, sentences, questions and short stories. A child should be able to use words antecedently learned, express ideas in a systematized way, employ the sounds that make words, and play rhyming games, as relevant. Pressures concurred with ceremonial testing may be less apparent during observation, disclosing more of what a child knows or can precise. This is a

26 meaningful area of observation because other representative systems, such as reading, writing, and mathematics are station largely on lingual language. • Alertness and direction of sounds in words, letter names, and picture names. These are good predictors of early reading. • Writing logistics and early content. A child's pencil clamp during the writing process, fragment of drawings, fictitious spellings, and falsify messages can adequately additive the results of more awkward orderly testing. • Mathematics. Testing apparatus assess a child's oral, ocular and cognitive skills by his or her ability to admit numerals and notice determinative and subjective characteristics (more, less, bigger, similar, different). Supplementary intimate scrutiny is also priceless. • Interpretation. A child's ability to sort, group, classify objects and attributes, solve problems, and discern cause and effect can be purposeful by the accomplishment of various assignments and by painstaking detection. • Social and self-help skills and use of non-verbal communication. Children should show the aptitude to put on articles of clothing in the legitimate order, tie shoes, button buttons, select clothes that are appropriate for contrasting activities and weather conditions, and feed themselves. A child should learn to take turns, as play progresses from sensory exploration to a blend of survey and representational play. Penetrating the child perform tasks that require careful surveillance and other visual-spatial skills can be profitable. • Attention. Younger children may be familiar to lack uninterrupted consideration and be uncontrollable, while kindergartners should evolve the ability to stay on- task for a sustained period. Estimation can confess problems in this area. • Maturation. Parents can lend information about a child's ability to concern for himself or herself and for others. From this information, along with observation, a child's level of acceptedliberty can be driven. Finally, periods of indicative testing should reveal a child's rate and pattern of learning and intuitiveness into favorable forms of apprenticeship by affording treasured data on his or her execution over time and across frameworks. 2.4

Assessment Before a specific interpretation of a student is attended, pre-referral consultations by teachers respecting the temperament of the problem, and what available adaptations to

27 instructions in the classroom might be made are significant. The child must be evaluated in all areas accompanying to the doubtful

disability such as health, vision, hearing, social and emotional status, general intelligence, academic performance, communicative status, and motor abilities. (

National Information Centre for Children and Youth with Disabilities, 2000). An ideal assessment for LD is anexpanded system requiring assorted sessions with a qualified educational psychologist. Afar from carrying out a battery of tests, the psychologist also accumulates pertinent information about the child from the teachers and school records. The assessment procedure for LD embraces the following steps: Parental Consent and Parent Interview o Parents' assent must be received before evaluating the child.

The academic, developmental and medical history along with the grammatical usage and communications patterns of the child must be obtained from the parents. The

parent must be involved in the planning of the

intervention program such as attending a resource room, groundwork of compromise and modifications to the child.

2.4.1 Gathering Information from the Teachers/School The psychologist must also notice the child in his/her school setting to know about the child's administration and behaviour in the class, and gain insights from the teacher.

Oversight of previous grades will splash the pattern of academic advancement. These may deliver light into the problem areas of the child. A student's contemporary classroom performance can be compared to Test scores.A number of paths being used freshly include curriculum-based assessment, task analysis, dynamic assessment, and assessment of learning style. These approaches yield rich information about students and are specially important when assessing students from culturally or linguistically diverse backgrounds, and therefore, are critical methods in the over all approach to assessment. (National Information Centre for Children and Youth with Disabilities, 2000).

2.4.2 Interview with the Child "An Interview should be a conversation with a purpose" (Wallace, Larsen, &Elksnin, 1992, p.16), with questions designed to collect information that "relates to the observed or suspected disability of the child". (National Information Centre for Children and Youth with Disabilities, 2000). A careful review of the student's school records or work samples help the assessment team identify patterns or areas of specific concern which may be focused on at the time of interview. The student too, may have much to say to

28 illuminate the problem (Hoy & Gregg, 1994, p. 44). (National Information Centre for Children and Youth with Disabilities, 2000). 2.4.3 Testing Though increasingly controversial, most assessments for LD include standardized tests. There are two types of tests. (i) Criterion-referenced tests are chalked up according to a standard, or benchmark assured by the teacher, the school, or the test publisher. An example of a criterion referenced test might be a teacher-made spelling test where there are 20 words to be spelled and where the teacher has defined an "acceptable level of mastery" as 16 correct (or 80%). (National Information Centre for Children and Youth with Disabilities, 2000). (ii) Norm-referenced tests: Points on these tests are not elucidated according to an infinite standard or criterion (i.e., 8 out of 10 correct, etc.) but, on how the student's performance in contrast with that of the norm group (a large number of representatives of that age group). This helps analysts determine whether the child is performing at a typical level, below, or above that is expected of a given ethnicity, socio-economic status, age, or grade. (

National Information Centre for Children and Youth with Disabilities, 2000). The hindrance of this type of test is that the norms in different regions of a country will vary and too, the norms of the same region will change over a period of time. Hence, in a country like India, each area would have to develop its own barometer which would need to be reviewed annually. Virtually,

the checks for LD have two leading components: 1. Testing for Potential: Performance Discrepancy. 2. Testing Processing Abilities. A two-year conflict between potential and performance is an indicator

of a possible LD. Validity of a significant discrepancy will be evaluated on a case by case basis (Hirisave U, et al., 2002).

The recommended Psycho-educational tests are discussed below

under various heads: 1. Intellectual Assessment: Weschler Adult Intelligence Scale Third Edition (WAISIII),

Woodcock Johnson Tests of Cognitive Ability. 2. Achievement: Recommended tests include: Woodcock Johnson

Psycho Educational Battery-Revised, Nelson Denny Reading Test, SATA.

29 3. Cognitive Processing Abilities:

Woodcock Johnson Psycho-Educational Battery- Revised (Part 1 - Tests of Cognitive Ability), Weschler Memory Scales-Revised, Benton Visual Retention Test, Berry Visuo-Motor Integration Test, Raven Colored Progressive Matrices, Rex Auditory-Verbal Learning Test, Bender Visual Motor Gestalt Test, Halstead-Reitan Neuropsychological Test Battery, Memory-For-Designs Test, Nimhans Index (Hirisave U, et al., 2002).

These tests would have to be altered and norms constituted

for children who come from

divergent backgrounds. Segregation of other disabilities as the primary cause of learning difficulties is vital. Such disabilities include: • Mental retardation. • Sensory deficits. Example: Visual and/ or hearing impairment. • Physical impairment. • History of multiple education settings. • Poor educational background or lack of prior learning. • Cultural differences or lack of experience with the English language (Office of Disability Services).

However, a learning disability may co-exist with the above.

SLD being a language based disorder, it is compulsory that tests for both approachable and expressive language be comprehended in the assessment procedures. 2.4.4 Co-Morbidity with ADHD Many children with LD prosper subordinate

negligence and behavioural complications, Attention Deficit Hyperactivity Disorder (ADHD), which is characterized by developmentally- inappropriate inattention, hyperactivity and/or impulsivity, is often co-morbid with dyslexia (Kadesjö&Gillberg, 2001). The two disorders crop up concurrently in 12% to 24% of individuals with dyslexia (Shaywitz, 2003). However, they do not materialize to divide a common cause (Doyle, 2001; Shaywitz, 2003). Under these precedences, it becomes troublesome to extricate LD from a Primary ADHD (National Information Centre for Children and Youth with Disabilities, 2000). 2.4.5 Other Assessment Procedures Curriculum Based Assessment

30 Straight assessment of academic skills (Curriculum Based Assessment) is one alternative that has lately attained acceptance. "Tests" of performance in this case come directly from the curriculum. For example, a child may be inquired to read from his or her reading book for one minute. Facts or news on the veracity and the velocity of reading can then be correlated with other students in the class. CBA is quick and offers specific information about how a student may vary from his peers. (National Information Centre for Children and Youth with Disabilities, 2000). On account of the assessment is clinched to curriculum content, it grants the teacher to bout guidance to a student's current strengths and diagnose areas where curriculum transformations or adjustments are desired. CBA caters information that is right away compatible to instructional programming. (

National Information Centre for Children and Youth with Disabilities, 2000). The benefits of a

CBA are off-track in a system with a strict curriculum based principally on consciousness as is real in India where CBA may not be the appropriate preference. Dynamic Assessment The aim "is to analyze the character of learning, with the objective of accumulating information to bring about emotional change and to upgrade instruction" (Sewell, 1987, p. 436) (National Information Centre for Children and Youth with Disabilities, 2000). Dynamic assessment comprises a conference or communication between the examiner and the student. This interaction may include designing the chore for the student, giving the student hint or cues as he/she tries to resolve a given problem, asking what a student is deliberating while running on the problem and giving adoration or assistance (Hoy & Gregg, 1994). The interaction allows the examiner to draw terminations about the student's thinking processes and his/her feedback to a learning situation. The "teaching" aspect is followed by a retesting of the student with an identical task but without backing from the examiner (National Information Centre for Children and Youth with Disabilities, 2000). Dynamic Assessment Tools (LPAD) have been advanced by Prof. Reuven Feurenstein at the International Centre for Enhancement of Learning Potential (ICELP), Jerusalem. By all means, dynamic assessment is not without its restraints or critics. One distinct affair is the bulk of training required by the examiner to plan both the assessment and decipher results. Another is a deficiency of operational procedures or "instruments" for appraising a student's achievement or competence in the contrasting satisfied areas (Jitendra & Kameenui, 1993).

31 Alike with these constraints, it is an auspicious extension to current estimation techniques because it merges a teaching component into the assessment process. (National Information Centre for Children and Youth with Disabilities, 2000). Inclined to the difficulties in diagnosis due to environmental destitution evolving understandable dynamic assessment tools would notably profit children with learning difficulties. 2.4.6

Assessments in India

The National Institute of Mental Health and Neurosciences (NIMHANS), Bangalore has developed the index to assess children with LD (Hirisave, U. et. al., 2006).

There are two levels of this index. They are: Level I for children 5-7 years and Level II for 8-12 years. The index comprises of the following tests: a. Attention test (Number cancellation). b. Visuo-motor skills (the Bender Gestalt test and the Developmental test of Visuo- Motor integration). c. Auditory and Visual Processing (discrimination and memory). d. Reading, writing, spelling and comprehension. e. Speech and Language including Auditory behaviour (Receptive Language) and Verbal expression. f. Arithmetic (Addition, subtraction, multiplication, division and fraction) (Hirisave U, et al., 2006). At the Lokamanya Tilak M.G. Hospital, Sion, Mumbai, the procedure for assessment of Specific Learning Disability involves the following: a. Neurological assessment. b. Vision and Hearing tests. c. Analysis of school progress report. d. I.Q. test. e. Educational assessment. f. Psychiatric assessment. g. Case conference. h. Counselling.

32 Most private institutions in India pursue some, if not all of these procedures.

In our country where numbers usually decide procedures, it would be advantageous to support elementary cases for assessments within the educational ambience. The reasons are astounding: Children encountering interruptions or learning problems may be secluded at the first level, provided with favorable help and only those demanding additional assessment would wish to bear further testing. • Ideal assessment procedures being very intricate, cannot be done in a single session. •

Attending clinics and hospitals would be strenuous for the parents from an inferior socioeconomic framework. Information can be comfortably harvested from within the school. Surveillance of the child in the educational setting would be desirable to those made in a clinic. • The

assessment team could involve a psychologist, special teacher/educator, class teacher which, with recommendation from the parent and child, would expedite an all-embracing assessment of the child. • Assessment procedures would include instructional planning, installation and growth of an Individualized Education Program (IEP) appropriate to the child's special needs or demands with a follow up estimation of student proficiency. • Eligibility for special education services/ classroom and accommodations/ modifications is finest determined by a knowledgeable school team. 2.4.7 Reading Assessment Techniques The unlike types of assessment that can be used for calculating development in reading skills in the aspirations that teachers will better understand how distinct accomplishments can be assessed by diversified measures. This characterization of the various assessment techniques may also help teachers to sketch their own classroom assessments, and may help teachers to better understand the district or campus assessments that are already being used with their students. These are: Reading Comprehension Language Comprehension Decoding Linguistic Knowledge Phonology etc

33 2.4.8 Writing Assessment Hughes (2003: 83) suggests that assessing writing involves three issues: 1. Writing tasks should be set that are properly representative of the range of tasks we would expect students to be able to perform. 2. The tasks should elicit writing that is truly representative of the students' writing ability. 3. The samples of writing can be appropriately scored. Many different writing tasks can be used to elicit examples of students' writing ability. The length of text that students produce should be specified. For example: • Writing a letter. • Writing a description of something from a diagram or picture. • Writing a summary of text. • Writing on a topic to a specified length in words or paragraphs. • Completing a partially written text. • Writing a paragraph using a given topic sentence. • Completing a paragraph. • Writing a criticism or a response to a piece of writing. • Writing a story, based on an outline provided. 2.4.9 Assessment of Maths Skills This circumstantial type of learning in which students are learning lessons on how to solve real-life problems can be employed in mathematics. These ideas are bestowed as follows: • Thinking and reasoning: Generating students to communicate in such activities that include gathering evidence, inspection, inquisition, comprehension, generalization, carving, plotting, analyzing, formation of hypotheses, use of trial and error, abstraction and solution-checking. • Settings: Admitting the students to work individually or in smaller groups. • Mathematical tools: The students enroll to use symbols, tables, graphs, drawings, calculators and computers.

34 • Attitudes and dispositions: Students in this class of learning environment learn doggedness, self-managing conducts and contemplation, cooperation and a distinctive keen interest for learning various kinds of situations. 2.5 Teacher Made Test: Cautiously assembled teacher-made tests and patterned tests are akin in many ways. Both are fabricated on the basis of attentively projected table of stipulations, both have the carbon type of test items, and both provide fair directions to the students. Still the two diversify. They differ in the attribute of test items, the dependability of test measures, the agendas for superintending and scoring and the interpretation of scores. No doubt, uniform tests are fine and exceptional in quality, more trustworthy and genuine.

Features of Teacher -Made Test: 1. The items of the tests are organized in order of difficulty. 2.

The test is inclined by the teacher. 3.

The test covers the whole content area. 4. The groundwork of the items harmonizes to the master plan. 5. Test

construction is not a single man's livelihood, rather it is a co-operative venture. 6. A teacher made test

is not a standardized test. 7. Teacher made test

may also be engaged as a tool for impressionable appraisal. 8. The test is advanced by the teacher to double-check the student's achievement. 2.5.1

Construction of Teacher Made Test Teacher made test does not lack a well - planned preparation.

The following steps may be followed for the test: 1. Planning When the teacher prepared a teacher made test, teacher should have programmed for the test. In this connection teacher should include such types of planning like a) Objective of the test

35 b) Syllabus should be covered c) Deciding the objective in behavioral terms

d) Deciding the number and forms of items e) Having a clear knowledge 2. Preparation of the

Test: Outlining is a philosophical facet and preparation is the realistic aspect of test construction. It craves much thinking, rethinking and reading before construction of the test.

After construction of the test items should be aligned in a simple to complex order.

Direction or Command

is an important part of a test construction. Without offering a proper direction or instruction there will be a possibility of defeating the accuracy of the test reliability. It may constitute a misconception in the students also.

Formal assessments give teachers a technique to evaluate knowledge and plan future instruction, but standardized exams or commercially prepared tests don't always correctly assess that information. The excess time required to prepare exams enhance with the promising for more accurate assessments, and with the welfares in mind, teachers can more accurately oversees student learning and progress.

2.6 Standardized Test

The denotation of a standardized test has somewhat replaced over time. In 1960, standardized tests were defined as those tests in which the conditions and content were equal for everyone taking the test, regardless of when, where, or by whom the test was disposed or sorted. The intention of this standardization is to make sure that the scores dependably signify the abilities or skills being measured, and no other things, such as different instructions about what to do if the test taker does not know the answer to a question (Olson, Amy M.; Sabers, Darrell, 2008) By the beginning of the 21st century, the point of convergence switched away from a harsh similarity of conditions towards balanced fairness of conditions. For example, a test taker with a broken wrist might write more slowly because of the injury, and it would be more fair, and produce a more reliable understanding of the test taker's actual knowledge, if that person was given a few more minutes to write down the answers to a most test. However, if the aim of the test is to see how rapidly the student could write, then this would become an alteration of the content, and no longer a standardized test (Olson, Amy M.; Sabers, Darrell, 2008).

3.6 Standardized tests are frequently assigned to as assessments.

An assessment is customarily defined as the accumulation and breakdown of information about one or more students. When tests are standardized, this means that a specific group of students will take the same test that will be scored and analyzed the same way. The Score result for each student is then distinguished to the rest of the group to see how well the students performed. The federal law is noted as No Child Left Behind, or NCLB, was constructed so that schools were held answerable for what students learned all over the school year. States were prescribed to set ambitions and aspirations for students commencing in grade three and, at the end of the year, assess whether students met the required goals and objectives. These standardized, or high stakes, tests not solely provide schools, districts, and states with information about student achievement (or lack of), the tests can also resolve whether or not students are advanced to the next grade level. Furthermore, teachers and/or schools with high numbers of students who do not carry out well on the end-of-year tests could cast unfavorable consequences as a conclusion.

2.6.1 Needs of Standardized Test

A standarlized test is needed (a) to study an individual from different aspects. (b) to study the specific qualities and disqualifications of a person, (c) to study a society or a community from different angles, (d) to compare the different aspects of an individual or a society with another individual or another society.

2.6.2 Purpose of Standardized Test

Through a standarized test we can study any type of behaviour, beliefs, attitude, knowledge, abilities, skill, competency of an individual which are visible and measurable and test able.

2.7 Interpretation of Test Report

During interpretation of test results a taster concentrate himself/herself in the following aspects : (a) Have the hypotheses been adequately tested; (b) is the analysis of rate relationship is logical and perceptive; (c) is it significance of statistical results tested properly; and (d) one the statistical results interpreted and presented without any bias.

3.7 2.8 Let Us Sum Up Learning disability assessment and curriculum Assessment Type of Test Curriculum

in very much important for the students. To obtain a comprehensive set of quantitative and qualitative data, accurate and useful information about an individual student's status and needs must be derived from a variety of assessment instruments and procedures including Response- to-Intervention (RTI) data, if available. A comprehensive assessment and evaluation should use a valid and the most current version of any standardized assessment. curriculum-based assessments, task and error pattern analysis portfolios, diagnostic teaching, and other non-standardized approaches continuous progress monitoring repeated during instruction. Non- standardized and alternative assessments is the traditional form of Assessment, where teachers construct questions, evaluate student responses, assign and check homework, and informally assess student progress every day. Types of tests for reading, writing and math - scholastic reading inventory (SRI) is important test for the students. Woodcock reading mastery test (WRMT-III) is also essential reading skills test. Any other test is gray oral reading test (GORT-5), comprehensive test of phonological processing, test of word reading efficiency (TOWRE-2), rapid automatized naming tasks, test of early reading ability (TERA-3), wide range achievement test. WECHSLER INDIVIDUAL ACHIEVEMENT TEST is measures: Reading, writing and oral language, as well as math skills (depending on which subtests are used) and subtests used, the test can take from 45 minutes to two hours to complete. What the scores mean: Results for this test, like other tests, give a sense of how your child is doing in various academic areas. In this unit is also discuss teacher made test standardized test and test interpretation

References 3.1 Introduction

The term "

Specific

Learning Disability" (SLD)

means

a

disorder

in one or more of the psychological processes involved in understanding or

in

using language, spoken or written,

which may manifest itself

in

an imperfect ability to listen, speak, read, write, spell, or

to do mathematical calculations.

Sample Test papers of student with Specific Learning Disabilities are shown below :

40 Source: www.rehabcouncil.nic.in/writereaddata/ld.pdf Learners

with

Specific Learning Disabilities (SLD)

exhibit

a

disorder

in one or more of the basic, psychological processes involved in understanding or

in using spoken or written

languages. These may be manifested in disorders of listening, thinking, talking, reading, writing, spelling, or arithmetic.

They include conditions which have been referred to

as perceptual handicaps, brain injury, minimal brain dysfunction, dyslexia, developmental aphasia,

etc. 3.2

Objectives After completing this unit, you will be able to:

- explain how to use specific intervention strategies to meet the needs of children with language based learning disabilities (LBD);
- explain how to use specific intervention strategies to meet the needs of children with reading difficulties;
- explain how to use specific intervention strategies to meet the needs of children with writing difficulties;
- explain how to use specific intervention strategies to meet the needs of children with difficulties in basic skills of mathematics and
- explain how to use specific intervention strategies to meet the needs of children with difficulties in study skills.

41 3.3 Language Skills

Language-based learning disabilities are problems with age-appropriate reading, spelling, and/or writing. This disorder is not about how smart a person is. Most people diagnosed with learning disabilities have average to superior intelligence. Many children with reading problems may have spoken language problems too.

The child who has dyslexia as part of a larger language learning disability has trouble with both the spoken and the written word. These problems may include difficulty with the following (

American Speech- Language- Hearing Association, n.d):

-

Expressing ideas clearly, as if the words needed are on the tip of the tongue but won't come out.

What the child says can be vague and difficult to understand (e.g., using unspecific vocabulary, such as "thing" or "stuff" to replace words that cannot be remembered). Filler words like "um" may be used to take up time while the child tries to remember a word.

- Learning new vocabulary that the child hears (e.g., taught in lectures/lessons) and/ or sees (e.g., in books)
- Understanding questions and following directions that are heard and/or read
- Recalling numbers in sequence (e.g., telephone numbers and addresses)
-

Understanding and retaining the details of a story's plot or a classroom lecture

-

Reading and comprehending material

-

Learning words to songs and rhymes

- Telling left from right,

making it hard to read and write since both skills require this directionality

- Letters and numbers
- Learning the alphabet
-

Identifying the sounds that correspond to letters, making learning to read difficult

-

Mixing up the order of letters in words while writing

-

Mixing up the order of numbers that are a part of math calculations

- Spelling
- Memorizing the times tables
- Telling time

42

Intervention Strategies: Special education classes are the place of primary treatment. These classes focus on activities that sustain growth in language skills. The foundation of this treatment is repetition of oral, reading and writing activities. Usually the

Speech Language Pathologist (

SLP), psychologist and the teacher work together with the children in small groups in the class room. Another treatment is looking at a child's needs through the Individual Education Plan (IEP). In this program teachers and parents work together to monitor the progress of the child's comprehensive, verbal, written, social, and motor skills in school and in the home. Then the child goes through different assessments to determine his/her level. The level that the child is placed in will determine the class size, number of teachers, and the need for therapy.

The

goals of speech and language intervention for the child with a reading problem target the specific aspects of reading and writing that the student is missing. For example, if the student is able to read words but is unable to understand the details of what has been read, comprehension is addressed. If a younger student has difficulty distinguishing the different sounds that make up words, treatment will focus on activities that support growth in this skill area (rhyming, tapping out syllables, etc.). Individualized programs always relate to the school work. Therefore, materials for treatment are taken from or are directly related to content from classes (e.g., textbooks for reading activities, assigned papers for writing activities, practice of oral reports for English class).

The student is

taught to apply newly learned language strategies to classroom activities and assignments. To assist the child best, the SLP may work side- by-side with the child in

his or her classroom(s). Intervention with spoken language (speaking and listening) can also be

designed to support the development of written language. For example, after listening to a story, the student may be asked to state and write answers to questions. He or she may be asked to give a verbal and then a written summary of the story. Articulation (pronunciation)

needs are also

treated in a way that supports written language. For example, if the child is practicing saying words to improve pronunciation of a certain sound, he or she may be asked to read these words from a printed list. The SLP consults and collaborates with teachers to develop the use of strategies and techniques in the classroom. For example, the SLP may help the teacher modify how new material is presented in lessons to accommodate the child's comprehension needs. The SLP may also demonstrate what planning strategies the student uses to organize

43 and focus written assignments (

American Speech- Language- Hearing Association, n.d).

Landmark's Six Teaching Principles Landmark's Six Teaching Principles create the conditions for learning that students with learning disabilities need to succeed. Students with language-based learning disabilities(LBLD) make stunning progress with targeted, intensive, skills-based instruction under these conditions. Essentially, these principles are(Newhall Patricia, 2012): ●

Provide opportunities for success to foster a sense of self-efficacy. ● Use multisensory approaches so that all content is conveyed in visual, auditory, and tactile modes (see it, hear it, say it, do something with it). ● Micro-unit and structure tasks to form step-by-step processes, which facilitate learning and provide incremental opportunities for success that help students persist in the face of longer, more complex tasks. ● Ensure automatization through practice and review, as consistency and repetition develop skill. ● Provide models to give students samples of successful work and set clear standards, which helps students begin assignments and self-assess as they work. ● Include students in the learning process, because increasing students' self- awareness as learners helps them engage and invest in the classroom. 3.4

Reading

Over the past 30 years, a great deal of research has been done to identify the most effective reading interventions for students with learning disabilities who struggle with word recognition and/or reading comprehension skills.

Martin, Martin and Carvalho (2008) reviewed a study by the U.S. Department of Education which reported in 2002 that the majority of the approximately 2,887,217 children receiving special education services were identified with a learning disability in reading. The number of children identified as having a reading disability has grown considerably. The preferred methodology for teaching reading fluctuates because of on-going debates as to which methods are most effective. For a reading program to be effective, the program must combine various methodologies based on each child's needs while at the same time implementing the principal techniques of the program.

44 Intervention Strategies:

Following suggestion and strategies may help children who have language problems i.e problems with decoding, comprehension, or reading retention (

NSOU, B.Ed. Special Education SLM, 2016): ●

Play word games. Word games and puzzles are fun and also

build vocabulary and word understanding. Try crossword puzzles, word bingo, etc. ● Read every day. Encourage children to read directions, labels and signs in the classroom, at home,in the car, and at stores or shops, and have them take turns reading aloud

with a classmate, parent, or sibling. Discuss in class or at home what you are reading. ● Model reading as an enjoyable activity. You might

informally discuss what you are reading with your child or let himor her see family members or teachers enjoying reading. Have DEAR time several times a week where everyone "Drops Everything And Reads" for 20 minutes. ●

Put learning to use. Help children remember by having them explain, discuss, or apply information they have just read, letting them "teach" you facts or ideas they have learned from their reading, or encouraging them to act out characters from their reading selections. ●

Listen to books. Child may benefit from listening to his or her textbooks and trade books on tape or by using assistive technologies like screen readers.

- Read to child every night. Read novel above his or her reading level to stimulate and enrich language, creativity, and interest. Ask structured questions and encourage the child to predict multiple endings to each chapter.
- Engage children's senses while learning. Children with learning disabilities learn best when they use many of their senses to get information. Multisensory instruction allows the child to see, hear, touch, and act out words. For example, to learn letters children may read the printed letter, say the letter

45 name, shape the letter out of clay, trace the letter onto paper, and form their bodies into the shape of the letter. Beyond phonics, there are key intervention strategies that do not necessarily isolate students from one another by sorting them into levelled groups. A few highlights include (Lexia, 2016):

1. Peer-Assisted Learning Strategies (PALS) exercises pair strong and weak readers who take turns reading, rereading, and retelling.
2. Teacher Read-Aloud This activity, says Julie Adams of Adams Educational Consulting, is "perhaps one of the most effective methods for improving student fluency and comprehension, as the teacher is the expert in reading the text and models how a skilled reader reads using appropriate pacing and prosody (inflection)." Playing an audiobook achieves similar results.
3. Shared Reading/Modeling By reading aloud while students follow along in their own books, the instructor models fluency, pausing occasionally to demonstrate comprehension strategies.
4. The Crazy Professor Reading Game According to the article, to bring the text to life, students will:
 - Read orally with hysterical enthusiasm
 - Reread with dramatic hand gestures
 - Partner up with a super-stoked question-asker and -answerer
 - Play "crazy professor" and "eager student" in a hyped-up overview of the text
 - With Fluency-Oriented Reading Instruction (FORI), primary students read the same section of a text many times over the course of a week. Here are the steps:
 - The teacher reads aloud while students follow along in their books.
 - Students echo-read.
 - Students choral-read.

46 | Students partner-read. | The text is taken home if more practice is required, and extension activities can be integrated during the week.

3.5 Writing "There is nothing to writing. All you do is sit down at a typewriter and bleed." ? Ernest Hemingway

Writing is one of the most important tools for learning and showing what someone has learned (Harris & Graham, 2013). It requires the ability to plan, produce text, revise, and self motivate (Santangelo, 2014) which can be a difficult academic skill for many students. It is even more difficult for students with a learning disability (LD) who have executive functioning deficits that affect how they "receive, store, process, retrieve, express, or manipulate information" (Cortelle & Horowitz, 2014, p. 3). Executive functioning helps people manage time, pay attention, switch focus, plan and organize, remember details, and do things based upon personal experiences (Bhandari, 2015). Poor executive functioning skills make it difficult to plan how much time should be dedicated to the writing process, plan ideas during prewriting, organize topics within the paper, and use memory to relate text-to-self ideas. Dysgraphia is the term associated with a specific learning disability in writing. Cortelle and Horowitz (2014) described characteristics of dysgraphia as "a tight, awkward pencil grip and body position, tiring quickly while writing, avoiding writing or drawing tasks, trouble forming letter shapes as well as inconsistent spacing between letters or words, difficulty writing or drawing on a line or within margins, trouble organizing thoughts on paper, trouble keeping track of thoughts already written down, difficulty with syntax structure and grammar, large gap between written ideas and understanding demonstrated through speech."

INTERVENTION STRATEGIES:

Some of the following writing strategies and suggestions may help children who are experiencing problems with writing. Many of those listed are accommodations

designed to

work around a child's differences by offering alternate approaches at home and school.

Choose the strategies that you think might be helpful to your child. (PBS Parents, n.d)

47 | Create a safe environment for writing. Balance feedback between what is good about the writing and what needs improvement, always highlighting whatever is positive in a child's writing and avoiding direct comparison to other children's work. | Make your expectations explicit. Clarify your expectations when presenting an assignment or giving directions to children by telling them the process you want them to use to write a report and by modeling that process for them. | Evaluate content and mechanics separately. Help a child to see that he or she may have good ideas and still need to work on a particular writing sub-skill. Always correct any grammatical or other speech errors in private and do so in a respectful way. | Encourage a variety of writing activities. Keeping a daily journal can be motivating and can provide needed writing practice. Consider other fun writing assignments such as writing to pen pals or suggest that your child compose songs or record family trips. | Encourage free writing. Set a time each day during which children can write about anything that interests them. Stress that no one else will read or evaluate what he or she writes. | | | | | Separate the creative aspects of writing from the motor aspects. Some children who struggle with the physical process of recording their own ideas benefit from dictating assignments to a parent or someone else. | Allow enough time for each assignment. Help children estimate how long a given task will take to complete. Consider giving them additional time to complete a written assignment or test rather than have something due at the end of the class period. | Provide time for revision and proofreading. Encourage children to revise and proofread their drafts, and provide time for them to do so. Explain to them that writing is a process and that it is easier to proofread what they have written several days -rather than immediately- after writing it. Introduce your child to one of a variety of simple graphic organizers.

48 Investigate computer programs including word webs, story maps, and venn diagrams, to help him or her approach writing in a systematic way. The Education Place Web site has a number of useful tools you can download. Provide access to programs or tutors that can help your child improve his or her word processing skills. Many children who struggle with motor output (handwriting) benefit from using a computer for their written work. Summer time is optimal for acquiring these skills. 3.6 Math Skills Many students face difficulty in learning the basic skills of mathematics and in their efforts to mathematical problem solving in daily life. Mathematics based tasks like handling money, measurement, telling time, recognize bus number etc. are essential part of our daily life. In the absence of intensive instruction and intervention, students with mathematics difficulties and disabilities lag significantly behind their peers (Jitendra et al. 2013). INTERVENTION STRATEGIES:

Some of the following math strategies and suggestions may help children who are experiencing problems with mathematics. Identify strategies that you think will help your child and, if appropriate,

talk to your child's teacher about using some of

the strategies in school (

PBS Parents, n. d). | | | | |

Maintain consistency and communication across school and home settings. Parents, tutors, and classroom teachers should coordinate and use the same instructional approach.

| | | | |

Teach basic concepts using concrete objects. For example, let children explore number concepts by counting the legs of a chair to find the number four or by subtracting crayons from a box. The progression from understanding concrete materials, pictorial representations, and abstract number representations may take some children longer than others.

| | | | | Provide specialized materials. To help children

organize their calculations, have them use graph paper (or lined paper turned sideways) to keep numbers in columns.

Encourage the use of scrap paper to keep

49 work neat, highlighters to underline key words and numbers, and manipulatives such as base-ten blocks or fraction bars.

| | | | |

Make your expectations explicit. Tell children the procedures you would like them to use when solving a problem, model each procedure for them, then have them tell you what they are expected to do. Some students benefit by having a math notebook filled with examples of completed problems to which they can refer if they become overwhelmed or confused.

| | | | |

Provide time for checking work. Emphasizing that completing math assignments is a process, encourage children to become comfortable reviewing their work, making changes, or asking questions when they are unsure of their answers. | | | | |

Give children opportunities to connect mathematical concepts to familiar situations. For example, when introducing measurement concepts, have children estimate their measurements before measuring classmates' and family members' heights or weighing their book bags' when empty and when full.

l l l l l

Help children apply math concepts to new situations. For example, show them how to use percentages to understand the price of a pair of shoes on sale at the mall or the amount of their allowance they spend on snacks. Provide access to programs or tutors that can help a child improve his or her math skills. Tutors can assist children with weak math sub-skills, such as multiplication and division. Provide tutors during summer months or after school to boost performance and ensure that the child retains his or her skills.

l

Help children keep track of problematic areas. When doing math homework, children may benefit from having their most common errors listed on flashcards. They can then refer to the cards while completing their assignments.

l

Play math games. To encourage automaticity with math facts, students may benefit from playing math games (i.e. dice, playing cards) and listening to commercially available audiotapes that provide a fun way of learning math facts.

50 3.7

Study Skills Study skills refer to the method or strategies, a student adopts to learn the content of his course materials effectively and independently and reproduce contextually. All of us have different study habits. Success of the student is largely dependent on the study habits one adapts. As there is a wide variation in study skills, there is no single foolproof method. However, there are a few strategies, which will certainly help in improving the study habits and developing good study skills. Good study skills involve listening to what is being taught, taking notes, storing in memory the subject matter, systematic organization of the learnt subject matter and responding correctly when asked to answer questions in the subject- orally or in writing (NIMH, 2003). INTERVENTION STRATEGIES: The following method of reading, called the SQ3R Method, was developed to help people read faster and study better (Mayland Community College, 2002). SQ3R Method of Reading SURVEY—QUESTION—READ—RECITE—REVIEW Survey: This step takes only a few minutes. Go through the chapter quickly. Glance at the chapter title, the introduction, headings, and summary paragraphs, if any. Notice any pictures, diagrams, graphs, tables, etc. Read any bold print. Previewing your text gives you some background about topics you may have never encountered before. You pick up general information. You know where to find information. You gain a better idea of how the information is organized and presented. It opens up a place in your brain where the new information will be stored. It saves time by reducing the amount of time it takes to read the chapter. Another advantage is that it creates an interest in what is coming up. It motivates you to read less interesting material to get to the "good stuff." Question: Before you begin reading a section, turn the heading into a question. For example, if the heading is Basic Causes of Stress, your question would be "What are the basic causes of stress?" This arouses your curiosity and increases your comprehension. It also brings to mind information you already know. The questions you ask help make important points stand out as you read. This forces you to think about what you are reading. Read: Read the material under the heading with the purpose of getting the answer to your question. Read with concentration. Identify the main ideas and highlight or

51 underline them. Read sections at a time and stop to ask questions. Jot down notes and ask yourself what you just read. If you can answer your question, read on. If not, look it over again. A good practice for more difficult reading is to do an outline of chapter in your notes. By leaving extra space you can fill in details during the class lecture. Make note of new vocabulary and write definitions in your notes. Recite: This step requires that you recite out loud the answer to the question you asked prior to reading a section of the text. Say it in your own words. If you find you cannot answer your question, go back and look for the answer, then try again. This way you will know if you have understood the material. Besides answering your questions, look away from the book and try to state in your own words what the reading is about. You may jot down brief notes about what you read. When you are done, go back and make an outline of the chapter. Review: After you have read the entire chapter, look over the notes you made to familiarize yourself with the important information. Check your memory by reciting the main points out loud. Then review the main points in your notes, making sure you understand them. Add to your notes from the text, if necessary. Always do a review of the chapter after completing your reading. Then do quick reviews before and after each class. Do longer, more in-depth reviews before exams. Don't wait until exam time to review your textbook. Review once a week all the readings from that week. Be sure you can summarize the key points. Write them down to further reinforce learning. Finally, make up test questions from what you have read. Be sure to write them. The SQ3R Method of reading sets the stage for interacting with your text material. As you go through the five steps you are gaining information, formulating questions, thinking about what you are reading, and trying to find answers to your questions. You are also reciting information out loud. All of these steps require the use of your auditory, visual and kinaesthetic senses. When more senses are involved, more effective learning takes place. Memory Strategies(NIMH, 2003). Poor memory is very common characteristic among children with learning problems. Memory strategies are designed to help students retrieve information quickly. Some common memory strategies are discussed below:

52 Mnemonic devices or memory tricks help you remember factual information like names, dates, formulas, or other information that requires rote memorization. Some sample mnemonic devices are: I Rhymes: "Thirty days hath September, April, June, and November..." I Creative Sentences: "My very eager mother just served us nine potatoes." (the planets in order from the sun) I Acronyms: NASA (National Aeronautics and Space Administration) VIBGYOR (the colors of the rainbow: red, orange, yellow, green, blue, indigo, and violet) IPMAT (stages of cell division: interphase, prophase, metaphase, anaphase and telephase) Creating visual images of the content. Rehearsing by repeating the content. Classifying, grouping and clustering information for easy recall. Semantic/ Concept Mapping: Content to be presented in an order to recall information when needed. One way of semantic mapping is associating the content to a clock dial. Learning Preferences(Mayland Community College, 2002). We all use all three learning channels. In fact, we use all our senses in learning about the world around us, but each of us has a tendency to lean more heavily on one of the three learning channels - visual, auditory, or hands on. You can improve your study habits by developing all three learning channels. TO IMPROVE AS A VISUAL LEARNER... I visualize what you are studying I use color in your notes (colored pens, highlighters, etc.) I visualize what the instructor is lecturing about I draw pictures and diagrams

53 I use mind maps in your notes I use picture and graphics to reinforce learning I learn from videos TO IMPROVE AS AN AUDITORY LEARNER... I listen to tapes of recorded assignments I tape record your own textbook reading I read out loud I talk over ideas from class and what you are studying with other students I participate in class discussions I listen to audiotapes on the subject TO IMPROVE AS HANDS ON LEARNER... I stand up and move around while you are studying I take frequent breaks while studying I make use of your hands and write things down as you study I use the computer to reinforce learning I be physically active; experiment with objects I memorize or drill while walking or exercising 3.8 Check Your Progress 1. How is the term specific learning disability different from term dyslexia? 2. What is SQ3R? 3. Explain "Study Skills". 4. Discuss Landmark's Six Teaching Principles. 3.9 Let Us Sum Up Students with language-based learning disabilities (LBLD) make stunning progress with targeted, intensive, skills-based instruction under Landmark's Six Teaching Principles.

54 Some strategies that may help children who have reading problems i.e problems with decoding, comprehension, or reading retention are play word games, read every day, model reading as an enjoyable activity, put learning to use, listen to books, read to child every night, engage children's senses while learning. Writing intervention strategies involved a safe environment for writing, encourage a variety of writing activities and free writing. Some strategies that may help children who have math problems may include teaching basic concepts using concrete objects, providing specialized materials, applying mathematical concepts to day to day situation, playing math game etc. Study skills intervention strategies follow methods viz. SQ3R Method of Reading, Memory Strategies and Learning Preferences. 3.10 Refereces American Speech-Language- Hearing Association (ASHA). (n.d). Dr. Ashit Baran Aich Registrar(Actg.)

3 Netaji Subhas Open University From the Vice-Chancellor's Desk Dear Students, from this Academic Session (2015-17) the Curriculum and Course Structure of B. Ed.- Special Education have been thoroughly revised as per the stipulations which featured in the Memorandum of Understanding (MoU) between the Rehabilitation Council of India (RCI) and the National Council for Teacher Education (NCTE). The newly designed course structure and syllabus is comprehensive and futuristic has, therefore, been contextualized and adopted by NSOU from the present academic session, following the directives of the aforesaid national statutory authorities. Consequent upon the introduction of new syllabus the revision of Self Instructional Material (SIM) becomes imperative. The new syllabus was circulated by RCI for introduction in the month of June, 2015 while the new session begins in the month of July. So the difficulties of preparing the SIMs within such a short time can easily be understood. However, the School of Education of NSOU took up the challenge and put the best minds together in preparing SIM without compromising the standard and quality of such an academic package. It required many rigorous steps before printing and circulation of the entire academic package to our dear learners. Every intervening step was meticulously and methodically followed for ensuring quality in such a time bound manner. The SIMs are prepared by eminent subject experts and edited by the senior members of the faculty specializing in the discipline concerned. Printing of the SIMs has been done with utmost care and attention. Students are the primary beneficiaries of these materials so developed. Therefore, you must go through the contents seriously and take your queries, if any, to the Counselors during Personal Contact Programs (PCPs) for clarifications. In comparison to F2F mode, the onus is on the learners in the ODL mode. So please change your mind accordingly and shrug off your old mindset of teacher dependence and spoon feeding habits immediately.

4 I would further urge you to go for other Open Educational Resources (OERs) - available on websites, for better understanding and gaining comprehensive mastery over the subject. From this year NSOU is also providing ICT enabled support services to the students enrolled under this University. So, in addition to the printed SIMs, the e-contents are also provided to the students to facilitate the usage and ensure more flexibility at the user end. The other ICT based support systems will be there for the benefit of the learners. So please make the most of it and do your best in the examinations. However, any suggestion or constructive criticism regarding the SIMs and its improvement is welcome. I must acknowledge the contribution of all the content writers, editors and background minds at the SoE, NSOU for their respective efforts, expertise and hard work in producing the SIMs within a very short time. Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor, NSOU

Assessment and Identification of Needs UNIT - 1 : EARLY IDENTIFICATION OF HEARING LOSS : NEED & STRATEGIES 9-40 UNIT - 2 : ASSESSMENT AND IDENTIFICATION OF NEEDS 41-81 UNIT - 3 : ASSESSMENT OF LANGUAGE & COMMUNICATION 82-119 UNIT - 4 : ASSESSMENT OF SPEECH 120-146 UNIT - 5 : EDUCATIONAL ASSESSMENT AND IDENTIFICATION OF NEEDS 147-176 8 9 1.1

Needs for Early Intervention Hearing loss is a silent, hidden handicap in children. Children especially infants and toddlers cannot tell us what they are not hearing well, hence it's hidden. If undetected and untreated, this can lead to delayed in speech and language development, social and emotional problems and academic failure, therefore it's called a handicap. Detection of hearing loss as early as possible and as young as the new-born period can be applied for effective treatment which significantly reduces the handicap of hearing loss. However, since parents are unaware that an accurate hearing test can be received by any child even a new born infant, identification of a child's hearing loss is delayed. During 1989 the United States federal government accepted a new commitment aimed at the reduction of the harmful effects of childhood hearing loss. Research studies have demonstrated that early intervention with hearing impaired children results in improved language development, increased academic success and increased lifetime earnings. Since hearing impaired children who received early intervention require less costly special education services later, hence it is also economically beneficial. Fitch et al (1982) state that the greater value of such programs may lie in the identification of increased numbers of children with mild to moderate conductive losses that are amenable to treatment. Communication is learned in early infancy (Bloom & Lahey, 1978) which is essential for growth and language but the child's need for language and communication should not pressure parents into making hasty choices between program options. In 1969 National Committee was formed of representatives from the Academy of Paediatrics, the Academy of Ophthalmology and Otolaryngology and the American Speech and Hearing Association charged with making recommendations for new born infant hearing screening. The committee at that time addressed itself to the use of behavioural observation hearing screening tests that had been developed and described by Downs and Sterritt (1964) and Downs and Hemenway (1969). Unit - 1 □ Early Identification of Hearing Loss : Needs & Strategies

10 More importance was given by the committee for the development of a high risk register for deafness. Richards and Robert (1967) stated that a high risk register to be efficient should identify a disease that is 14 times more prevalent in the register than in the general population. Concept of high risk assumes identification of a small group of children who have a history of physical condition and identifies them as possessing a high chance of having the target handicap. The high risk register were further recommended for a buttressed by a National Maternal and Child Health Conference that delineated Guidelines for Early Screening (Conference of Hearing Screening Services for Preschool Children, 1977). The conference reaffirmed the Joint Committee program and some supplementary suggestions were made. They are: a) Audiological follow ups of the high risk infants shall be made as soon as possible but certainly by 7 months. b) The mother child relationship shall be safeguarded by education and careful information in the first 4 months. c) Informed consent shall be obtained. d) Information shall be provided on what to look for in later infancy. e) The development and implementation of adequate identification and diagnostic procedures related to hearing impairment be undertaken by public health agencies. The Joint Committee on Infant Hearing met again in 1982 and in 1990 to propose new position statements relevant to practices of identifying the hearing impaired neonate and infant. The Joint Committee on Infant

Hearing (1990) represented the American Speech Language Hearing Association (ASHA), American Academy of

Paediatrics, the American Academy of Otolaryngology Head and Neck Surgery, the Council on Education of the Deaf and the directors of Speech and Hearing Programs in state Health and welfare agencies. Recent research and new legislation suggest the need for expansion and clarification of the 1982 criteria. The 1990 statement expands the risk criteria and makes recommendations for the identification and management of hearing impaired neonates and infants. It has been recognized by the committee that the recommended protocols may not be appropriate for all institutions so modifications in screening approaches

11 may be necessary for accommodation of specific needs of a given facility. In the development" of a screening program, factors such as cost and availability of equipment, personnel and follow up services are important for considerations. Risk Criteria : Neonates (birth-28 days) The risk factors for the identification of those neonates who are at risk for sensorineural hearing impairment include the following: 1. Family history of congenital or delayed onset childhood sensorineural impairment. 2. Congenital infection known or suspected to be associated with sensorineural hearing impairment such as toxoplasmosis, syphilis, rubella, cytomegalovirus and herpes. 3. Craniofacial anomalies including morphologic abnormalities of the pinna and ear canal. 4. Birth weight less than 1500 grams 5. Hyperbilirubinemia at a level exceeding indication for exchange transfusion. 6. Ototoxic medication including but not limited to the aminoglycosides used for more than 5 days and loop diuretics used in combination with aminoglycosides. 7. Bacterial meningitis 8. Severe depression at birth may include infants with Apgar scores of 0-3 at 5 minutes or those who fail to initiate spontaneous respiration by 10 minutes of those with hypotonia persisting to 2 hours of age. 9. Prolonged mechanical ventilation for a duration equal to or greater than 10 days. 10. Stigmata or other findings associated with a syndrome known to include sensorineural hearing loss. Risk Criteria- Infants (29 days-2 years): The factors that identify those infants who are at risk for sensorineural hearing impairment include the following: 1. Parent /caregiver concern regarding hearing speech language and /or developmental delay.

12 2. Bacterial meningitis 3. Neonatal risk factors that may be associated with progressive sensorineural hearing loss (e.g. cytomegalovirus prolonged mechanical ventilation and inherited disorders) 4. Head trauma especially with either longitudinal or transverse fracture of the temporal bone. 5. Stigmata of other findings associated with syndromes known to include sensorineural hearing loss 6. Ototoxic medications including but not limited to the aminoglycosides used for more than 5 days (e.g. gentamicin, tobramycin, kanamycin, streptomycin) and loop diuretics used in combination with aminoglycosides. 7. Children with neurodegenerative disorders such as neurofibromatosis myoclonic epilepsy, Friedrich's ataxia, Huntington chorea, Werdnig-Hoffmann disease, 8. Childhood infectious diseases known to be associated with sensorineural hearing loss (e.g., mumps, measles). JCIH met again in 1994, 2000, 2007 to propose new position statements. According to JCIH (2007) families of infants with all degrees of hearing loss should be offered early intervention. EHDI should be linked to the recognised point of entry for infants with a confirmed hearing loss, and be intervened by professionals with expertise in hearing loss including educators of the deaf and speech language professionals. Appropriate interventions offered include both home based and centre based options. A comprehensive guidelines for early hearing detection and intervention programs has been stated by recent JCIH 2013 to meet the needs of children who are deaf or hard of hearing for establishing strong early intervention systems with appropriate expertise Three groups of people must work together. a) Parents are in the best position to identify their child's hearing difficulties. Our job can be improvised by making the parents aware of the danger signals and of the available sources that are applicable for them. b) Physicians are needed to be more responsive regarding the parent's concerns about their child's hearing. c) Initiation of high risk screening programs can help state agencies. Research indicates that up to 75% of infants born deaf or with hearing impairments can be identified by such programs.

14 1.2 Overview to Behavioural and Objective Techniques in Screening Hearing Loss Hearing loss is not a visible disability, and even normal hearing children may not begin talking upto 2 years of age. Thus if hearing loss is not detected through newborn hearing screening programs, it often goes undetected after 18 months of age, especially in children who have no medical ailments and/or other disabilities. In concert with recommendations of the Joint Committee of Infant Hearing (JCIH- 2000) and the National Institute of Deafness and other Communication Disorder (NIDCD-1997) early hearing detection and intervention programs must use screening measures that demonstrate certain response and measurement characteristics. These are as follows:- 1) The response should be capable of being measured reliably under a wide variety of conditions. 2) The response should have predictive value i.e it should be present in nearly all normal -hearing infants and abnormal in nearly all infants with hearing loss. 3) A screening procedure should use objective criteria to define both the method for a technically correct screening test and the guideline for a "pass versus refer" outcome. 4) The procedure should achieve a low referral rate for follow-up, prevent unnecessary costs and parental anxiety. Types of hearing screening procedures A variety of procedures are presently used in hearing screening programs for children from infancy through high school. Not a single procedure is effective by itself in identifying all hearing losses. 1) Developmental checklist :- It has been used to obtain information from parents or other caregivers regarding the auditory behaviours of children. It is useful to obtain functional information regarding auditory and oral development, especially for very young children or children who are difficult to assess.

15 Northern and Downs (1974) At 0 to 4 months - When he was sleeping quiet, did sudden noise awaken him momentarily ? did he cry at very loud noise? At 4 to 7 months - Did he begin to turn towards sound that was out of his sight? Did he keep on making babbling noises of a large variety at 5 and 6 months? At 7 to 9 months - Did he turn to find the source of sounds out of his vision? Did he gurgle or coo to voices or sounds that he could not see? Did he make sounds with rising and falling inflections? At 9 to 13 months - Did he turn and find a sound anywhere behind him? Did he begin to imitate some sounds what specific sounds did he say ? At 13 to 24 months- Did he hear you when you called from another room? Did his voice sound normal? 2 HIGH RISK RESISTER: - Professional leadership in infant hearing and early detection has been largely provided by the Joint Committee infant hearing (JCIH) They provided historical risk factors for hearing loss as follows 1972 1. Family history 2. Hyper bilirubinemia requiring exchange. 3. Congenital infection (TORCH -toxoplasmosis. Other includes syphilis, rubella, cytomegalovirus, herpes simplex) 4. Craniofacial anomalies (Defects) 5. Birth weight less than 1500 gm 1982 6. Bacterial meningitis 7. Apgar score of ≤ 3 at 5 minutes 1990 8. Ototoxic medications including, but not limited to the amino glycosides used for more than 5 days. 9. Prolonged mechanical ventilation for 10 days or more 10. Associated with syndrome 1994 a change to Apgar score of 0 to 4 at 5 minutes

16 1994 b ototoxic medication, including but not limited to , the amino glycosides, used in multiple courses 1994 c mechanical ventilation lasting 5 days or longer JCIH 2000 indicators for use in neonates (birth through age 28 days) where universal hearing screen is not yet available . 1. An illness or condition requiring admission of 48 hours or longer to NICU 2. Stigmata or other findings associated with a syndrome known to include a sensory- neural and or conductive hearing loss 3. Family history or permanent childhood sensory- neural hearing loss 4. 4. Craniofacial abnormalities ,including those with morphologic abnormalities of pinna and ear canal 5. In utero infection such as cytomegalovirus ,herpes,toxoplasmosis , or rubella 3) AUDITORY BRAINSTEM RESPONSE ABR and Automated auditory brainstem response (AABR ex ALGO -1 plus) are electrophysiological procedures used for hearing screening , based upon brainstem response to sound. When used as a screening procedure ABR primarily detect hearing losses that are greater than 30dB in the frequency range 1000 to 4000 Hz with a sensitivity 100% and specificity 96 to 98%. ABR may be used to detect auditory neuropathy or neural condition disorders in newborns. Because ABR are reflective of auditory nerve and brainstem function, these infants can have an abnormal ABR screening result even when peripheral hearing is normal. ABR MEASUREMENT PARAMETERS - Guidelines for stimulus and acquisition parameters in newborn auditory screening with ABR are summarized below - Parameter Automated ABR System Conventional ABR system (screening) ALGO-1 device Stimulus

17 Transducer Special design Infants tube phone Type Filtered click Click /frequency specific tone burst stimuli Duration 0.1 msec 0.1 msec Rate 37/sec 37. l/sec Polarity Alternating Rarefaction Intensity 35dBnHL 35dBnHL Ear Monaural ,each Monaural ,each ACQUISITION Gain 100,000 Artifact reject Yes yes Analysis time 20sec 15sec Filter settings High pass 50Hz ^5!15 Low pass 1400Hz ISO 60Hz notch no Number of sweeps 500 to 1500 Variable 2000 /4000/upto 6000 Electrode placement Inverting Fz Fz Noninverting Back to the neck Back to the neck Ground Fpz Fpz International test protocol for screening using ABR The first component of test protocol is the method of determining which infants will be screened. A primary objective of chart review is to identify which infants are at risk by careful inspection of available medical records. The frequency with which chart reviews should be done depends on the volume of births and admission to the ICU and intermediate nursery for the hospital.

18 4) Otoacoustic emissions-Otoacoustic emissions are sounds that originate from the cochlea more precisely it generated by electromotile vibration (prestin) of the OHCs and propagate

88%

MATCHING BLOCK 3/28

W

through the middle ear and into the ear canal, where they can be

measured using a sensitive microphone. Use of otoacoustic emissions (OAEs), a relatively recent technology for screening, involves measuring the integrity of the outer hair cells of the cochlea. Transient evoked otoacoustic emission (TEOAE) and distortion product otoacoustic emission (DPOAE) both are used as effective measures in NICU and well-baby population but the DPOAEs has lower fail rates than TEOAEs (Rhodes et al 1999). Both types of measurement are frequency specific; TEOAEs in the frequency range of 500 to 5000Hz and DPOAEs in the 1000 to 8000Hz range. (Gorge et al 1993, Probest et al 1987) TEOAEs generally detect hearing loss at levels of 30dBHL or above, while DPOAEs are reported to detect hearing loss of 40dBHL or above (Gorge et al 1993, Probest et al 1987). Abnormal middle ear conditions usually results in absent of OAEs.

5) Acoustic Immittance Guidelines for screening were adopted by the American-Speech-Language-Hearing Association in 1997 that detailed Immittance procedural recommendation. In addition, the American Academy of Audiology wrote a position statement in 1992, "Audiologic Guidelines for the diagnosis and treatment of Otitis Media in children," which was submitted as the academy's formal recommendation for the development of the clinical practice guideline "Otitis Media with effusion in young children" (U.S. department of health and human service 1994) Acoustic Immittance measurements have historically consisted of three procedures: tympanometric peak pressure, static admittance, and the acoustic reflex. Current screening for middle ear disorders consist primarily of the gradient (i.e. tympanometric width) and static admittance (tympanogram peak). Consideration should also be given to canal volume in the interpretation. Pass and referral criteria must be established with consideration of the age and risk factors of the target population and with consideration of local medical treatment philosophies. Referral criteria from the most recent ASHA guidelines (1997) are summarized in table-

Age	Ear canal volume	Referral criteria
1 to 7 yrs	0.3-0.9 cm ³	90% range for ears with and without tubes
5 th percentile	1.0-5.5 cm ³	95 th percentile

percentile referral criteria Ear canal volume $< 1.0 \text{ cm}^3$ and accompanied by flat tympanogram; do not refer if tube is in place or if TM perforation is under management of a physician Recommended initial tympanometric screening test criteria

Age	Ytm (peak admittance)	TW (daps)
Infants	$> 0.2 \text{ mmho}$	< 235
1 year to school age	$> 0.3 \text{ mmho}$	< 200
6 years and older	$> 0.4 \text{ mmho}$ (when using +400 daps)	

6) Visual reinforcement audiometry Liden and kankkonen (1961) first coined the term "Visual reinforcement audiometry" (VRA). This procedure as currently used employes lighted transparent toys which are flashed on simultaneously with the presentation of the auditory signal during a conditioning period. During the testing phase the light is flashed immediately following a response. Matkin (1974) reported that VRA is successful with 90% of both normal-hearing and hearing impaired children between the ages of 12 and 36 months. In sound field, the loudspeakers on each side of the child produces the signals and the lights for localization.

7) Behavioral observation audiometry Behavioral observation as a screening technique may be considered more of a functional measure of hearing ability because it requires the infant or child to respond to a variety of noise stimuli. In BOA, an infant's response is observed to a variety of moderate to high intensity stimuli, such as calibrated noisemakers, to observe startle, eye-widening, localization, or cessation of activity. As a screening tool, this procedure would likely have a high false-negative rate. Potentially missing many children with significant hearing loss. Therefore, this procedure can no longer be recommended as a solitary screening tool.

8) Conditioned play audiometry (CPA) In CPA, children learn to engage in an activity-putting rings on a spindle, dropping or stacking blocks, putting together simple puzzles-each time hear the test signals. These activities are assumed to be interesting to children, are within their motor capability, and represent a specific behavior that is used to denote a response to a stimulus. The challenge in play audiometry is teaching the child to wait, listen and only respond with the play activity when the auditory signal is presented. Audiologic literature suggests that CPA is widely accepted among clinician who practice pediatric audiology (Thomson et al 1989).

PROCEDURE	TARGET	ADVANTAGES	DISADVANTAGES	POPULATION

23 1.3 Team Members Involved in Hearing Screening and Their Role Hearing loss is a hidden disability. It is hidden because children are not able to tell whether they are hearing or not. Some adults also do not want people to know about their hearing loss so they hide their problems. Hearing loss should be detected and identified as early as possible so that small children should not go undetected and miss their critical age. Critical age is considered 0-5years .During this period all aspects of development occurs like physical,motor,speech and language development, social and psychological development. This critical age has to be taken into account and has to be maximally used for the child's adequate development. By detecting hearing loss as early as possible, even as young as newborn infants effective rehabilitation can be undergone. Hearing Loss in children is a serious concern as it interferes with the development of language. Language is a unique gift of nature for humans. The longer it takes for a hearing loss to go undetected the outcome becomes worse. Adequate speech and language therapy should be provided after amplification so as to develop proper speech and language skills. Our primary goal is that the child should develop communication skills. Many research studies have demonstrated that early intervention with hearing impairment children results in improved language development, increased academic success and increased quality of life. Early Identification and Intervention of hearing loss is a team work and requires a group of professionals who should work rigorously towards the rehabilitation of the client. Reduced or defective hearing sensitivity causes a lot of communication problems. The effects of hearing loss is devastating as it causes many problems in the individual which includes total lack of communication leading to a variety of social and emotional discrepancies. The rehabilitation team should include the following members who should work hand in hand for the successful intervention of the hearing impaired indivisual.The team includes : Ø The health professional on whom parents depend for the general health care of the child, it is probably a pediatrician, who treats only children, or a family 24 practice physician, who treats adults as well as children in the family. This professional will not be able to help parents with the hearing loss itself. However he/she may treat inflammations and infections of the ear and upper respiratory system that can affect hearing, as well as other conditions that children may encounter. Ø The audiologist must have a license to practice audiology. He/She specializes in the study of hearing disorders. An audiologist identifies the hearing loss, measures it, and aids in the habilitation of the deaf and/or hard of hearing person, by recommending appropriate hearing aids.

Periodic hearing screening during the early childhood years increases the likelihood that children lost to follow-up from newborn screening, along with children presenting with post neonatal hearing loss, will receive the timely diagnostic and intervention services needed during the critical language learning years. Ø An ENT surgeon or otorhinolaryngologist is a physician who specializes in diseases of the ear, nose, and throat.

An E.N.T surgeon

must examine a child to rule out any medical complications before parents purchase a hearing aid. An ENT should check every child periodically. Ø The service coordinator is responsible for coordinating all services for the child and will serve as the person for parents to contact when seeking to obtain necessary services and assistance. The service coordinator is also required to assist parents in identifying and locating available services and service providers, and to inform parents (and families) of the availability of rehabilitation services. Ø A speech and language pathologist specializes in the diagnosis and habilitation of speech and language problems. This team member may meet with a child on a regular basis to work on the fine points of speech and language development and speech correction. He/She will explain how parents can help with the child's speech and language development. Ø The teacher of the deaf or hard of hearing should be certified by the State Department of Education to teach students who are deaf or hard of hearing. Parents should begin talking to these special teachers, from programs in their area, even if the child is only an infant. This person can help parents get started immediately with communication and language development, even if the hearing 25 aids have not yet arrived. Most areas have programs for infants and toddlers and their parents. Teachers in these programs will become one of the most valuable members of the team, providing home visits and one-on-one early intervention for parents and children

Ø PARENTS are the most important team members as because they will stay with the child throughout even if the professionals would leave. They are the most important people who will decide on the child's rehabilitation procedures. Parents are the best people who will identify a child's hearing difficulties. Some parents do not accept that their child has hearing loss. They have emotions like shock and denial. It is the professional's role to counsel these parents to overcome this problem. Parents together with help from the professionals will help decide the child's rehabilitation procedures and the hearing impaired child's future. Thus parents play very important role in the rehabilitation process.

Most learning comes through auditory channels and when these avenues are impaired incidental and direct learning is reduced. While the impact of the hearing impairment may not always be the primary impediment to learning it is a factor that has significant impact on a child's ability to learn by affecting their access to the physical, social, and

27 instructional environment. Use of appropriate modifications and instructional strategies can significantly increase access and ultimately development and achievement. Hearing help us our listening capacity of the sound knowledge in around of the world. Because our hearing mechanism is known as an auditory sensory pathway with the help of sensory pathway we receive and perceive the sound knowledge of the world. If affects that path way its call auditory impairment's. Children with auditory impairments may be having difficulty in hearing in both and one ear. Our hearing is a main sensory pathway through which speech and verbal communication develop. If child cannot hear perfectly so therefore he/she cannot speak individual and speak to others perfectly. So early detection of hearing impairment is important to child's overall development. Hearing loss is one of the most commonly unidentified and misdiagnosed conditions in early childhood because hearing impairment is a hidden problem and even when it is present in a child at birth, it cannot be suspected immediately as it is not seen overly. Only when the child grows up and fails to start speaking do the parents/caregivers realize that the child has a problem in hearing. That's why checklist is an essential part parents, caregivers and school teachers. Because Hearing screening checklists have been used to obtain the report of the parents, caregivers and school teachers to know about the auditory behavior pattern of their children. So therefore checklist most important tools of parents, caregivers and school teachers. Behavior observation or auditory behavior of children is being classified in different age level regard hearing status. 1.6.2-Behavior Observation Human development in the first 3 years of life occurs with rapid changes in cognitive development, language, motor skills, and social/emotional skills. This foundation is so important that infant's caregivers must be aware of each child's developmental progress. In a child care setting, knowledge of a child's development is accomplished through the key processes of auditory behavior observation, developmental screening, and ongoing assessment. The child care consultant can play an important role in helping infant caregivers understand the definitions, key concepts, and processes that can support understanding the developmental progress of infants. For behaviour observation to be meaningful and useful it must be objective and factual. The objective is Consultants can help caregivers understand they must document 28 only what they see and hear when recording information about a child. So actual behavior observations should include actions, language, gestures, facial expressions and creations. Behavioral Observation Technique continues to be used even though they do not provide ear specific results for screening but is hearing screening checklists have been used to obtain the report of the school teachers, parents and caregivers regarding the auditory behavior of their children. The principle of this procedure change child's behavior after presentation of sound stimulus in different sound knowledge in around of the world. 1.6.3-Checklists Checklists can be a great tool to monitor a child's hearing, speech, and language development. The different variety of checklist used for documenting children's development are beyond the scope of this module and the following checklist is basic standardized methods can be implemented with instruction to parents, caregivers and school teachers is behaviour observation or auditory behaviour checklist of children. 1.6.4 Check List of School Teacher's Student's Behavioural Observation Hearing Loss. (Congenital and Acquired) 1.6.4-1-STEP-A observe auditory behaviors If you suspect that your student has hearing loss you should document those behaviors that lead you to believe that this is true. Below is a list of behaviors or characteristics typical of children who hearing loss. Check off those behaviors that are suspect, describe them if you think further explanation is needed and add any information you think pertinent to their sensory functioning and behaviors. So check lists of schools teacher's of student's behavioral observation hearing loss can be classified in 1) Additional information 2) Appearance of the ears and 3) Auditory and hearing behaviors of the Student's • Additional information: If you think further explanation is needed and add any information you think pertinent to their sensory functioning and behaviors. Write your information..... • Appearance of the Ears

29 SLNO 2) Appearance of the Ears Yes No 1 Cleft lip or palate 2 Malformations of head and neck 3 Malformations of ears 4 Frequent ear aches or infection 5 Discharge from ears ●●●● Auditory and hearing behaviors of the Student's SLNO 3) Auditory and hearing behaviors of the Student's Yes No 1 Makes few or inconsistent responses to sound 2 Does not look at visual materials when asked to by someone 3 Does not startle or react to unexpected or new sounds 4 Does not respond to caregiver's calling name/not soothed by caregiver's voice 5 Shows a preference for certain types of sound (high or low frequency, louder or softer sounds) 6 Has limited vocalizations does not try to imitate 7 Has difficulty attending to auditory stimuli for a reasonable length of time 8 Does not turn to or localize voices or sounds 9 Abnormalities in voice, intonation, articulation 10 Pulls on or covers ears 11 Breathes through mouth 12 Angles head to one side so as to favor one ear

1.6.4-2-STEP-B Reviewing Medical and Educational Records In reviewing a student's records you should be looking main sources of information about the medical. The information about the medical records is B.1 Congenital factors B.2 Acquired factors. Congenital factors Acquired factors ●●●● Heredity ●●●● Excessive earwax ●●●● Viral infection during pregnancy, e.g. ●●●● Eardrum perforation rubella infection ●●●● Middle ear effusion or infection ●●●● Congenital defects such as anomalies ●●●● Otosclerosis or ear ossicle dislocation ●●●● of the ear, nose or throat ●●●● Sequelae of childhood diseases such as

30 ●●●● Pre mature birth, birth asphyxia, measles and meningitis excessive bilirubin etc ●●●● Head or ear trauma ●●●● Prolonged exposure to loud noise ●●●● Medication that may lead to hearing damage Now the details discuss about the congenital factors and acquired factors. Congenital means born with the hearing loss and acquired means hearing loss means could hear when he or she was born but developed hearing loss later in life. Acquired hearing loss also can be described by the age at which it starts. If hearing loss starts before the age when children usually begin talking, it is called "p/-e-lingual", which means "before speaking". If hearing loss starts after the age when children begin talking; it is called post lingual which means after speaking. So congenital factors and acquired factors depend upon some criteria these are: 1) Hereditary Syndromes and disorders(Syndrome/Condition) 2) Prenatal History(History of maternal infection/exposure during pregnancy) 3) Natal History(Prematurity) 4) Post Natal History(Prematurity) 5) "Red" Flag Terms(Medical Terms associated with Hearing Loss) 1) Hereditary Syndromes and disorders(Syndrome/Condition) 1 CHARGE Syndrome/Association YES NO 2 Down Syndrome 3 Trisomy 13 4 Usher Syndrome 5 Alstrom Syndrome 6 Goldenhar, Hurler, Norrie, Waardenburg Syndromes 7 Other genetic syndromes or defects

31 2) Prenatal History(History of maternal infection/exposure during pregnancy) 1 Rubella Yes NO 2 CMV (cytomegalovirus) 3 Toxoplasmosis 4 Herpes 5 Syphilis 6 Prenatal infant exposure to drugs or alcohol 7 Cleft Lip or Palate 3) Natal History(Prematurity) 1 Birth weight > than 1500 grams (3.31lbs) YES NO 2 Prematurity 3 Preterm birth, exposed to oxygen 4 On ventilator longer than 5 days 5 Elevated bilirubin requiring transfusion 6 Low Apgar scores (1-4 at 1 minute or 0-6 at 5 minutes) 4) Post Natal History(Prematurity) 1 Meningitis or encephalitis YES NO 2 Hydrocephalus/hydrocephaly 3 Cerebral palsy or other neurological disorders 4 Brain disorders, brain tumours or malformations of the brain. 5 Loss of oxygen to the brain 6 Severe head trauma 7 Prolonged fever 8 Child received "mycin" or other known ototoxic medications

32 5) "Red" Flag Terms (Medical Terms associated with Hearing Loss) 1 Anoxia, asphyxia, hypoxia YES NO 2 Atresia 3 Cerebral hemorrhage 4 Cerebral palsy 5 Ischemia 6 Meningitis 7 Peri ventricular damage 8 Fetal Alcohol Syndrome

1.6.4-3-STEP-C: Interviewing the Family Families who have children with hearing impairment usually accurate reports of their child's use of hearing. They have more opportunities to see their child as well as a more diverse set of circumstances in which to see them. They also have the history of their child over the years in which to observe change. Interviewing parents with a set of discrete and open-ended questions will give a much broader view of the child and help to identify any issues with hearing. A checklist about questions to ask parents about their child's hearing. These questions are best asked face to face but, if not possible, then a telephone interview will suffice. These questions should not be treated as a form to send home as the impersonal nature of this approach will not yield useful information. SL

QUESTIONS TO ASK THE FAMILY NO ABOUT THE CHILD'S HEARING 1 What have you been told by medical professionals (such as the paediatrician or family care physician) about your child's hearing? 2 Has your child had ear infections, if so how often? 3 Is your child frequently congested? Do they have frequent colds? 4 What is your impression of your child's hearing? 5 What sounds get your child's attention? Comments/Observations

33 6 What does \ our child do when you call their name? 7 How does your child react to sudden loud noises? (telephone, car, vacuum) 8 What kinds of things do you think your child sees, and in what activities does he/she use their vision? 9 Does your child seem to respond differently when the television or radio is on? 10 Does your child appear to enjoy toys with sound/ noise? 11 Does your child enjoy you talking or singing to them? 12 What words does your child seem to understand? Additional Comments: 1.6.4-4-STEP-D: Meeting with the family If through the first three steps of the identification process it becomes likely that your student may have a hearing impairment a meeting with the family should be requested to discuss the results of your observations and investigation. There is no cut and dry threshold of determination but if both the educational team and the parent have suspicions, and the student's behaviour and medical history support this, then a referral to the appropriate medical professional should be made. The meeting to review this tool should include a discussion of your findings and thoughts as well as helping the parents find medical professionals they can access to have their child tested and. if appropriate, diagnosed. For students suspected of having a hearing loss, a referral to an Audiologist is in order below given the checklist SL QUESTIONS TO ASK THE FAMILY NO ABOUT TH E1R CHILD'S HEARING 1 What kinds of hearing tests were conducted? 2 What did the test results measure and what were the results? 3 How did the tests go? How did my child react? How confident are you in the results (reliability)?

Comments/Observations

34 4 When should my child be retested? 5 What do the results mean for my child's ability to discriminate sounds and understand speech? 6 Would my child benefit from amplification (hearing aids, FM unit, etc.)? 7 What would be the best way to get more information my child's hearing and what are m\ next steps? 8 Is my child's hearing equivalent in both ears? Is there a "better ear" that will assist him/her in accessing speech or environmental sounds better? 9 Do you suspect that my child has a progressive loss? Will his hearing be worse in the future? 10 Is it possible for us to listen to the sounds that my child hears? 11 If my child gets hearing aids what type is recommended? Why is that style better for him/her than others? 12 With hearing aids, when will he/she need to get new molds? 13 Is my child a candidate for a cochlear implant? Why or why not? 14 When should my child be retested? 15 How does ihe information from the test results help my child's educational team? Additional Comments: 1.6.5-5- STEP-E: Referral for Medical Follow - Up Medical appointments are not always an easy experience for parents and helping them to prepare for the appointment will make it more productive for them and ultimately for the educational team, as there is a better chance of getting information that is useful in diagnosing and serving the child. Giving the parents questions to ask the doctor can

35 be extremely helpful in preparing the parcnis and questions for audiologists. These, as well as specific questions the parents or team ha\e, should be formulated beforehand so the parent has them on hand for the medical appointment.

1.6.6-G-S i EP-F: Follow-Up Meeting to Discuss Medical Findings After the child has gone to their medical appointment for hearing a follow-up meeting should be scheduled lo assist the parents in understanding the results. If hearing impairment has been identified the next step is to make a referral for an evaluation by a teacher of the deaf. These individuals will evaluate the child and make a recommendation for services that will be put on the IEP with appropriate goals and accommodations.

36 1.5 Referral Based on Signs and Symptoms of Hearing Loss Hearing impairment is the inability of an individual to hear sounds adequately. This may be due to improper development, damage or disease to any part of the hearing mechanism. Since deafness is an invisible impairment, often signs and symptoms of hearing loss might help in diagnosis and adequate referral. The various professionals working as a team in management of hearing loss is as follows: Roles and Responsibilities of Audiologists

Audiologists play a central role in the identification, assessment, diagnosis, and re/habilitation of patients with permanent/sudden hearing loss. Professional roles and activities in audiology include clinical/education services, prevention and advocacy, and education, administration, and research. Appropriate roles for audiologists include: ●●●● providing prevention information, promoting hearing wellness, and monitoring the acoustic environment; ●●●● educating other professionals on the needs of children with permanent childhood hearing loss and the role of audiologists in diagnosing and managing permanent childhood hearing loss; ●●●● identifying permanent childhood hearing loss, including early detection and screening program development, management, quality assessment, and service coordination: ●●●● conducting a comprehensive assessment, using behavioral, electroacoustic and/ or electrophysiologic methods to assess hearing, auditory function, balance, and related systems; ●●●● referring the patient to other professionals as needed to facilitate access to comprehensive services SPEECH LANGUAGE PATHOLOGIST The speech-language pathologist (SLP) is defined as the professional who engages in professional practice in the areas of communication and swallowing across the life span.

Speech-language pathologists (SLPs) play a role in the screening, assessment, 37 and re/habilitation of children with permanent childhood hearing loss. Professional roles and activities in speech-language pathology include clinical/educational services, prevention and advocacy, education, administration, and research. OTOLARYNGOLOGIST Medical specialist who deals with diagnosis and treatment of diseases of the ear, larynx, and upper respiratory tract are called Otolaryngologist. Individuals with history of sudden hearing loss, ear pain or other medical conditions are treated with medicine and surgical intervention. Individuals with profound sensorineural hearing loss and restricted gain from hearing aids might undertake cochlear implantation. ROLES AND RESPONSIBILITIES OF PSYCHOLOGIST A psychologist and psychiatrist, helps to address some of the potential psychological effects of hearing loss. They help to rule out any intellectual deficits associated with or without hearing loss. Hearing loss can induce observable psychological effects at various points in development. The potential psychological effects of hearing loss are different for children and adults, which leads to difficult inter and intra personal conflicts leading to psychosomatic disorders. Hence proper guidance and counseling is often pertinent. SPECIAL EDUCATORS Rehabilitation council of India aims to promote and facilitate full and equal enjoyment of rights of children who have hearing impairment. The special educators specializing in HEARING Impairment helps to develop knowledge, skills and desirable attitudes to facilitate the differently abled children to blossom to their fullest by providing a barrier free environment. The national goal of Universalization of Elementary Education (UEE) and Education for All (SARVA Shikshya Abhayan) is designed for contributing towards achievement of Millennium Development Goals (MDG) by way of preparing the teacher trainees to meet the challenges of all round development of these children. VOCATIONAL GUIDANCE AND COUNSELLING Career guidance for persons with disabilities is an important step in habilitating the persons with disability. The trained and educated social worker professionals identify the potentials of the individuals. With comprehensive assessments and understanding of the persons abilities they help them to pursue their chosen occupational opportunities.

Unaided Vs Aided Audiogram 2.7.2 Concept of Speech Spectrum 2.7.3 Clinical Applications of Speech Spectrum 2.8 Let us sum up 2.9 "Check your Progress" 2.10 References 2.1 Introduction The hearing mechanism in humans is an interesting and intricate process. An intact hearing system helps to acquire adequate speech, language and communication skills. This further helps in educational, psychological and social development of an individual. Any deficit in the hearing mechanism causes varied amount of effect on an individual depending on the extent of deficit. The most important of these are hearing impairment that is inability to hear. The deficit can be by birth or can be acquired due to any ailment, accident etc. The deficit can take place in the external ear, middle ear or inner ear. For e.g, there can be wax accumulation in the external ear, there can be infection in the middle ear or there can be a permanent damage of hair cells in the inner ear. Moreover there can be a combination of these conditions. The resulting hearing impairment can range from minimal loss to total loss of hearing. An individual with hearing impairment needs early identification, accurate diagnosis and timely rehabilitation in order to lead a healthy life. For this purpose, correct identification and assessment of hearing loss is necessary. There are a number of tests in the field of audiology, which help to assess the hearing capacity of an individual.

43 Correct selection and administration of these test(S) helps to find the degree of hearing loss and also the site of deficit/damage. Audiology is very closely related to education. The role of special educators in assessment and rehabilitation of hearing disorders is well established. Moreover the results of audiological assessment have important implications for educational assessment and planning the educational management of a hearing impaired child. In this chapter we will discuss about the various tests, their procedures, their importance, the instruments used, the interpretation of results and their implication on educational assessment and management. 2.2 Objectives At the end of this chapter students will learn about ●●●●● Concept of sound, its parameters and units. ●●●●● Auditory development in humans ●●●●● Various audiological tests- Subjective and Objective used for children ●●●●● The audiometer ●●●●● Interpretation of results from the tests ●●●●● Implications of results and application in educational management of the hearing impaired child 2.3 Audiological Assessment Orientation Audiology refers to the study of hearing and hearing disorders. Audiology is concerned with the human's response to auditory stimuli which is basically "sound". In order to gain knowledge about the various assessment procedures used in audiology, the basic understanding of "sound" and its properties is essential. As measurement of hearing loss requires accurate and dependable instrumentation, so the knowledge of instrumentation, tests performed with the help of these instruments and the various response patterns is crucial. 2.3.1 Sound Sound is a form of energy which is generated in the form of vibrations and is perceived by the hearing mechanism. It can propagate in any medium like air or water.

44 Sound has two aspects namely physical and psychological. Because hearing disorders represent an inability to respond normally to acoustic stimulation or "sound", it is very important to learn briefly about the physical and psychological aspects of sound. 2.3.2 Physical Correlates of Sound Sound is produced when a force sets an object into vibration that in turn disturbs the molecular movement of the medium surrounding the object. The disturbance is propagated as a sound wave is heard by the human ear. So the chain is Source ►►►►► Medium ►►►►► Object that will vibrate ►►►►► Hearing mechanism. 2.3.3 Psychological Correlates of Sound The act of hearing something that is sound is an auditory experience. There are certain psychological attributes attached to the physical properties of sound namely pitch, loudness and timbre. Pitch corresponds to frequency, loudness corresponds to intensity and timbre corresponds to quality of sound. 2.3.4. Basic Attributes of Sound Physical attributes of sound are frequency, amplitude and phase which are psychologically correlated with pitch, intensity and time. Sound can be a simple single frequency pure tone or a combination of many frequencies called a complex tone. Frequency The frequency of a sound refers to the number of vibrations that occur in one second and is expressed in Hertz(Hz). Each vibration consists of one cycle of compression and rarefaction. So a pure tone of 1000 Hz means 1000 cycles per second. The period of a sound T, is the reciprocal of frequency. $T = 1/f$ The range of human hearing is 20 Hz-20 000 Hz. However in basic Puretone Audiometry we test from 250 Hz to 8000 Hz. The length of one cycle called the wavelength decide the frequency of a sound wave. Low frequency sounds have longer wavelengths and high frequencies have shorter wavelength. All the sounds heard by human ear including speech can be categorised as low, mid or high frequency sound. E.g a sound from a Drum is a low frequency sound whereas a bird's chirp or a whistle are categorised as high frequency sounds. Amplitude The amplitude of a sound refers to how far an object moves back and forth and the amount of maximum and minimum air pressure created. The larger the movement or

45 pressure variation the greater the amplitude for any given frequency. The sounds in human environment are categorised as soft, moderate and loud. E.g Rustling of leaves is a soft sound and sound of a cracker is a loud sound. However a term called intensity is used to express amplitude whether to describe sound energy per area or sound pressure. Logarithmic units are used to express amplitude. Phase refers to amplitude of a sound at a particular time during the cycle. Phase can be expressed in units of time such as seconds or can be expressed as an angle. Phase can also be used to describe the time relationship between two or more tones occurring simultaneously. Fig 1. A simple pure tone waveform showing intensity, frequency and time Fig 2: frequency, intensity and phase

46 Fig 3: Loud and soft sound 2.3.5 Decibels Decibel is one-tenth of Bel, which is a relative unit in logarithm. It is the unit of measurement of intensity used in audiology. Linear scales of intensity or pressure ranges require working with large numbers or scientific notations. To simplify our work, a decibel scale is used. The decibel scale is a logarithmic ratio scale where any measured value is relative to some specified reference value. It can also be stated as a unit for expressing the ratio between two sound pressures or two sound powers. $dB = 10 \log(X_{meas}/X_{ref})$, Where X_{meas} is the sound that is being measured and X_{ref} is the reference sound to which X_{meas} is to be compared. Sound can be measured in sound pressure or sound intensity where Intensity(I) and pressure(P) are related as $I = P^2$ $dBIL = 10 \log(I_{meas}/I_{ref})$ $dB SPL = 20 \log(P_{meas}/P_{ref})$ CONCEPT OF dBHL VS dB SPL dBHL The conventional audiometers used today are set to a standard that the lowest sound intensity that stimulates normal hearing has been variously called 0 hearing loss and 0 hearing level (HL). This was also called audiometric zero. The minimum amount of Sound Pressure Level needed to generate 0 HL is variable across frequencies, due to

47 sensitivity of ears. E.g 7 dB SPL produces a sensation of 0 dB HL at 1 KHz, whereas 13 dB SPL is needed to produce 0 dB HL at 8 KHz. Therefore the hearing dial or the intensity dial of all audiometers was calibrated with reference to normal hearing (audiometric zero) dB SPL Sound Pressure Level is an expression of the pressure of a sound. When in the measurement of decibel the reference value (X_{ref}) is the lowest pressure needed to hear (20 μ Pa), it is called dB Sound Pressure Level. This value is universally accepted standard reference value (20 μ Pa). 2.3.6 Auditory Milestones in Typical Children (0-2 Years) Prenatal Hearing The human hearing organ that is the cochlea has normal adult function after the 20 th week of gestation. There is ample research which shows prenatal hearing. The developmental response to sound in the foetus is primarily reflexive in nature, including startle, generalised body movement, possible cessation of activity and the involuntary eye blink. NEONATAL HEARING At birth or soon after birth the infant is able to discriminate his/her's mother's voice. They are also able to discriminate the various segmental and suprasegmental aspects of speech. The Auditory development can be understood in the following stages Birth to 4 weeks: Startle response: the infant may startle or jump to loud sounds. Eyes may widen or blink, arms and legs may fling out. Infants may awaken from sleep. 3 to 6 months: Searching Response: Baby will turn head and eyes to look for an interesting sound e.g name call. He or she enjoys sound making toys and music. Begins to coo and gurgle, repeats sounds like bababa 6-10 months: Localisation; baby will start to turn towards the source. He or she can move head towards the side and indirectly below. Responds to familiar voices and familiar sounds e.g mobile ring, name call, doorbell. Makes many different babbling sounds, even when alone. Understands common words such as "no" and "bye bye". 10- 15 months: Response to speech; the infant directly locates the sound source to the side and below. Also starts to localise indirectly above. They start to understand simple speech, play with own voice, imitate simple words and start using meaningful words. 15-18 months: Direct Localisation; can identify the source of all sounds, localises on

48 the sides, below and above. By 18 months the infant correctly responds to simple speech, follows simple commands, uses more words in expression, may initiate to join two words. 24 months: the child locates directly a sound at all angles, starts to use phrases and simple sentences. Understands more of adult speech and talking. 2.4 Assessment and Methods of Assessment 2.4.1 Test Battery Approach Children with hearing loss, acquired or congenital will not demonstrate the typical auditory skills described earlier. Audiological assessment is necessary to correctly identify, diagnose and remediate hearing loss in children. Audiological assessment in children should be characterised by TEST BATTERY APPROACH that is more than one test should be carried out to confirm the detection and diagnosis of hearing loss. The test results should be cross-checked and validated. Parents may need to be advised that the paediatric hearing examination is an ongoing, age-specific activity, so that as the child grows older, more accurate hearing results may be obtained. The various tests used for audiological assessment in children can be classified as

49 FORMAL HEARING TESTS All the formal tests make use of instruments which can vary from simple to most sophisticated ones. The tests are characterised by presentation of a sound stimulus such as pure tones, speech, warble tones, noise and elicitation of a time locked response from the child to be tested. The tests are performed by an audiologist (Tester) on subjects with or without hearing loss. The tests give a result, which is again interpreted by the tester. The ultimate goal of each test is to establish the auditory/hearing threshold, which is the minimum stimulus level that elicits a response consistently. It is always advocated to use the cross-check principle in paediatric audiometry. According to this principle the results of subjective tests such as BOA (Behavioural Observation Audiometry) should be cross-checked with objective tests such as ABR. All these tests are carried out in sound treated rooms (usually double room set up) which prevent external noise to enter that may interfere with the testing procedure. The instrument used for basic tests are audiometer, immittance audiometer, instrument for electrophysiological tests such as ABR (with software and other accessories), and OAE instrument. The sound stimulus is presented in sound field condition that is via loudspeakers or under closed field condition that is via headphones. These tests can be used for both screening and diagnostic purposes. These tests can be used for school screening programs also. The tests are carried out by an audiologist and an assistant tester is employed if needed. Prerequisites for Formal Test 1. Case History/Parental Interview 2. Otoscopic examination of ears- to ensure clean ears, no infection/discharge, no ear anomaly Fig 4: Otoscopic Examination 3. Tuning Fork Test – can be performed by using tuning forks in older and cooperative children to get an idea about probable site of pathology (middle ear or inner ear) 50 Fig 5: Tuning fork test 4. Selecting and deciding on the tests to be administered- Usually it is important to use a test battery approach in case of infants and children. This is because, it is often difficult to obtain reliable and complete results from any one particular test. So more than one test should be administered depending on the child's age, hearing status, cognitive status and economic status. e.g For a child aged one year, BOA, IMMITTANCE AUDIOMETRY AND ABR/ASSR can be administered for correct threshold estimation. 2.4.2 Subjective Tests As the name suggests these tests need participation of the subject. The participation can be active or passive. In these tests the response is recorded after the presentation of a stimulus. The response can be a predefined active one, e.g. raising hand in response to a sound stimulus, or it can be a change in behaviour of the child, e.g. searching for the sound stimulus or startle response which can be noted by the tester. 2.4.3 Orientation to Subjective Tests These tests can be classified into two major divisions; 1) Techniques used without reinforcement 2) Procedures based on reinforcement of the infant or child's responses The techniques utilized that do not incorporate reinforcement principles are known as Behavioural Observation Audiometry (BOA). Procedures that use reinforcement to develop repeatable responses are known as conditioned audiometry, such as Visual

51 Reinforcement Audiometry(VRA) The first type of techniques are carried out for younger children (upto 12 months), however can be used till 24 months. Conditioning techniques are carried out for older infants and children,between 12-48 months.However the use of behavioural and conditioning procedures with infants and young childrenmay lack sufficient precision to establish valid auditory sensitivity thresholds. An improvement in response behaviour should always be anticipated as the child matures.Auditory evaluation of hearing in children should be considered as completed when earphone thresholds can be obtained for frequencies 250 Hz to 8000 Hz in a test called puretone audiometry. Let us briefly learn about these tests 2.4.4 Behavioural Observation Audiometry It is an important clinical test in day to day clinical use. This is mostly used for children upto 6months, but can be used for older children as well, especially those who cannot be conditioned. The use of noisemakers and sound field signals from an audiometer as acoustic stimuli is done in BOA.The major advantages of BOA are efficiency in time required and the lack of need for specialised equipment. The disadvantages of BOA include the fact that it is difficult to eliminate tester bias, the responses of infants quickly reach saturation and a wide variance of responses are noted in infants.Moreover the test does not yields ear specific responses and only gives an idea about degree of hearing loss.This test should ideally be carried out in a quiet background, and sound field condition. The stimulus should be presented in an ascending manner (soft to loud). During the test one audiologist makes a sound, making sure that the child cannot see them, while a second audiologist watches for any change in the child's behaviour (e.g., a "startle" or sudden reflexive movement, eye blinks or cessation of activities). The type of sound is recorded together with its intensity and the nature of the behaviour change. The infant or child can exhibit reflexive response such as startle (younger children/infants below 3 months)or attentive behaviour (above 3 months)such as quieting responses.Children quickly grow accustomed to sounds and may stop showing a response if they hear the same sound often enough. For this reason, it is recommended that repeated "testing" at home is avoided prior to formal BOA testing with the audiologist. The intensity and frequency of noisemakers can be premeasured for estimation of hearing levels. Puretones,warble tones,speech andnarrow band noise can be used for sound field testing via an audiometer.Handheld paediatric audiometers with intensity and frequency dials/interrupters can also be used.This test can be used for both screening and diagnostic purposes.

52 Fig 6: BOA Importance of BOA 1. This test is a true test of hearing unlike electrophysiological tests or objective tests, which are not actual tests of hearing. Moreover there are very less chances of the response being affected by instrumental errors or recording artifacts.This test gives information about degree of hearing loss across frequencies. 2. This test can be carried out with passive participation of the child. The child/ infant is the best person to inform about his/her hearing status,that is,it is always very helpful when we can observe the child's actual response to sound stimuli instead of relying on parents' reporting. 3. This test can be carried out in a state of light sleep,as passive participation of the infant/child is needed. 4. This test can also be carried out for difficult to test(for conditioned audiometry)population. E.g children with multiple disability or non-co-operative child. 5. This test is cost effective as not much sophisticated instruments are needed,it is very important to save expenses of the parents. 6. This test can also be performed with the help of noisemakers, if proper instruments are not available. 7. It is an important screening tool.

53 2.4.5 Reinforcement Audiometry These tests involve the use of conditioning techniques.The response of the infant or child is conditioned with use of reinforcers.This procedure has been called as operant conditioning. Reinforcer is any entity-verbal praise, an object, food, that increases the likelihood that response will occur again. If a stimulus is given, then a response is obtained and then reinforced, it is likely that the response will occur for many more stimuluspresentations. With more responses available it is possible to obtain thresholds. Visual Reinforcement Audiometry It is the use of visual reinforcer in the process of obtaining auditory thresholds. A variety of visual reinforcers can be used. It can be used for children aged 6 months to 2 years. The reinforcers can be video- based or made up of animated toys placed in dark Plexiglas boxes located at an angle to each side of the child. The reinforcers should be located approximately level with the child's head at a distance of 1-2 m. Close proximity between speaker and reinforcer is preferred in order to help conditioning when using soundfield stimuli; so in practice adjacent positioning of loudspeaker and reinforcers is recommended. At first, the audiologist lights up the boxes in conjunction with the sound. This "trains" the child to respond by shifting her eyes or turning her head toward the sound source. Once a child understands what to do, the audiologist can "reward" the child by briefly delaying the visual stimuli. The boxes are lit to elicit a head turn associated with a sound source.During the testing phase the light is flashed immediately following the response of the child looking toward the light. Importance of VRA 1. It is an important test for children between 6 months to 2 years and gives accurate findings as the child gets motivated for the reinforcement used 2. It is an important test for developmentally delayed children, who cannot cooperate for puretone audiometry. Fig 7: VRA

54 2.4.6 Conditioned Play Audiometry As the name suggests use of games or play techniques is done in this procedure to obtain hearing thresholds of the child. This procedure can be used for children from 2 years till 5 years. However for younger children, behavioural observation and parental interview should always guide the threshold estimation. The child is conditioned to a sound stimulus through some play activity such as to place a ring on a stand, put a block in a box upon hearing the sound (either in sound field or through headphones). Initially the tester might demonstrate the activity and the try to engage the child. If interesting toys are used the child can be kept interested for long enough to get lots of testing accomplished. Blocks, puzzles, chips, pebbles, all of which can be dropped into a bucket are good. It is important to have many toys available so when the child becomes tired of a toy, it can be changed quickly. It should be kept in mind that the child may not be cooperative through the total testing time, may need breaks or might need a follow up. However it is always wise to test the speech frequencies first, some testers might do the bone conduction testing first or might use speech signals to generate interest of the child. The child will begin by using both visual and auditory cues. When he can do the task by himself using both visual and auditory cues, visual cue can be removed and auditory alone can be tried. The parents can be instructed to teach conditioning to the child at home with use of noisemakers so that the child can give better responses in the next session. Fig 8: Conditioned Play Audiometry

55 Importance of Conditioned Play Audiometry 1. This test prepares the child for puretone audiometry. 2. Frequency wise information on hearing can be obtained. This test gives information about both degree and type of hearing loss. 3. Hearing in both ears can be tested. 2.4.7 Pure Tone Audiometry Pure tone audiometry is a routine audiometric test used to measure auditory threshold of an individual in a sound proof test room. The instrument used in this measurement is known as the audiometer. This is a subjective investigation, the accuracy of which is dependent on the response of the patient. It can be used for children 5 years and above. Pure tone audiometry provides information about the type of hearing loss and also helps in quantifying frequency specific threshold. This test is generally performed with headphones (FIG 9) for air conduction testing (AC) and bone conduction vibrator (Fig 10) for bone conduction testing (BC). Simple pure tones varying in frequency from 250 Hz to 8000 Hz; and varying in intensity from 0 dBHL to 120 dBHL are used for testing. However the frequency and intensity range depends on the test. For example, in case of BC testing, the measurement is done from 250 Hz to 4000 Hz. The intensity range is also maximum up to 85 dBHL. With the help of a particular pattern/sequence of presenting the puretones, the ear specific threshold across all the test frequencies is established and plotted on an audiogram. The tester should be aware of false responses made by the child and should know how to minimize them. Younger children might need reinforcements, breaks in between testing and often repeated sessions for establishment of reliable thresholds across all the frequencies. The better ear is always tested first, and also masked if required. The AC testing gives information about external, middle and inner ear, whereas the BC testing gives information about inner ear. In case of children, the ultimate goal of assessment should be to obtain puretone audiometry results. The response pattern of the child can be any conditioned response from simple hand raising to keeping blocks in a box.

56 Fig 9:A) Air conduction testing B) PTA in double room setup Fig.10: Bone Conduction Testing

57 Importance of Puretone audiometry 1. The ultimate goal in paediatric evaluation is to obtain puretone thresholds because they give accurate information on type and degree of hearing loss. The

76%

information about type of hearing loss is very important for otologists to take decisions about medical treatment.

Audiologists can use this information to plan the other tests to be administered. The information about degree of hearing loss is very important for selection of amplification devices, planning speech-language therapy goals and educational placement 2. It gives independent information about hearing in both ears and the full audiometric frequency range. 3.

early detection of progressive hearing loss. 4. It helps in determining the amount of benefit from medical and surgical treatment. 5. The

pure tone audiometry also helps the audiologist in selection of suitable amplification device and accurate adjustment of the same. The results of pure tone audiometry also help to decide about ear to be fitted and also about monoaural vs binaural fitting. 6. The results of pure tone audiometry also help to decide in selection of assistive listening devices, e.g. classroom amplification solutions and their adjustment. 7. It provides direction for further management and suggests direction for further investigations. 8. The results of this test help the child to get a handicap certificate, which further helps to get benefits from State and Central Government in job reservations, exemption in tax, travel reservations

etc. 9. The results of this test are accepted by agencies to ascertain auditory fitness for certain jobs like pilots, policemen,

corporate sector etc. 2.4.8 Speech Audiometry As the name suggests, the stimulus or signal used for this test is speech. Speech audiometry is an additional test, which is done to confirm the results of pure tone audiometry. Moreover, it gives an idea about difficulty in real life situation where the most important stimulus to be heard is human speech. A pure tone audiometer is used

58 for this testing, when the speech is presented live, the tester speaks in the microphone attached to the audiometer which can be heard by the child wearing headphones, or through loudspeakers in the test room. The speech signal can also be recorded and presented using a CD player which can be connected with the audiometer. The speech stimulus can be monosyllables or PB words like /pa/, /cha/, /sha/, word pairs called spondee like /ma-baap//aaj-kaal/ the child has to repeat the stimulus upon hearing, or they can write it down. Younger children can also point out picture cards corresponding to the stimulus words or sentences. However, the child's receptive vocabulary and cognitive level should be considered while selecting the speech material. There are basically some subtests done under speech audiometry: a) Speech recognition threshold (SRT) - gives us the threshold at which the child can just hear speech clearly and repeat. This is measured in dBHL. It can be correlated with the pure tone audiometric threshold. If there is any discrepancy between the two thresholds, then it can be suspected that either the testing procedure was faulty or the child's response is doubtful. b) Speech discrimination score/word recognition score (SDS/WRS) - gives us an idea about the amount of speech the child can understand or find intelligible in percentage. e.g. WRS is 60% that means out of 100 words, the child can correctly hear 60 words. c) Ling Six-Sound Test - this test can be carried out without or with the audiometer. Six sounds /a/, /u/, /e/, /i/, /m/, /s/ which represent most of the human speech frequencies are used for this test. Detection, identification and discrimination of these sounds is tested. Importance of Speech Audiometry 1. It validates the result of pure tone audiograms. 2. In case of difficult to test population, the child may respond to speech stimulus better than pure tones. 3. Speech discrimination test can be used to differentially diagnose pathologies beyond cochlea, e.g. central deafness, where a discrepancy between PTA and SRT/ SDS 2.4.9 Objective Tests These tests need no active participation from the child. The child's state of arousal, cognitive level or vocabulary do not affect the results of these tests. These tests are time effective and also provide an important tool in the test battery approach. They

59 also help to cross check the results obtained from subjective tests. The use of these tests give information about functioning of the hearing structures, beyond cochlea. These tests give information about type and degree of hearing loss and the probable site of lesion. However these tests are at an extra expense to the routine hearing tests, so the selection of these should be rightly justified. Many of these are also used for screening purposes in neonatal stage. Moreover these tests are very important for difficult to test population e.g. children with intellectual impairment, non-cooperative child.

2.4.10 Immittance Audiometry Also known as impedance audiometry, it is an automatic and objective means of assessing the integrity and function of the peripheral hearing mechanism. The impedance audiometer helps to determine tympanic membrane mobility, middle ear pressure, Eustachian tube functioning, continuity and mobility of middle ear ossicles, acoustic reflex threshold (8th and 7th cranial nerve function) and non-organic hearing loss. This test is routinely performed along with puretone audiometry. This test can be carried out in neonates, in sleeping children. However this test cannot be performed if the child is moving, crying or speaking. As a prerequisite it needs clean ear canals and no active infections, pain or discharge from ears. In this test a small probe is inserted into the external auditory canal of the child. The probe has three small holes. One emits a probe tone, the second is an outlet of air pressure system, and the third leads to a pick up microphone that measures the SPL of probe tone in the ear canal cavity. **Fig 11: Impedance Audiometry**

60 There are two subtests of Immittance audiometry a) Tympanometry—the mobility of tympanic membrane as a function of mechanically varied air pressure in the external ear canal is measured. The introduction of air pressure in the ear canal leads to mobility of the tympanic membrane, this can be recorded as a tympanogram. The movement of the TM depends on the functional status of middle ear. Any abnormality in the middle ear, effects the normal movement of the tympanic membrane. Along with tympanic membrane mobility (compliance), middle ear pressure and ear canal volume are also measured in tympanometry. The tympanogram can be of following types 1) Type A – normal middle ear function 2) Type As – Restricted mobility of tympanic membrane (otosclerosis) 3) Type B – No mobility of tympanic membrane (fluid in middle ear) 4) Type Ad- Abnormal or excessive mobility of tympanic membrane (ossicular chain discontinuity) 5) Type C- normal mobility of tympanic membrane with negative middle ear pressure. **Fig 12: Types of tympanogram**

61 b) Acoustic Reflex Threshold- the acoustic reflex test in the immittance battery is the determination of the signal threshold level at which the stapedial muscle contracts. The lowest signal intensity capable of eliciting the acoustic reflex is the acoustic reflex threshold for the stimulated ear. In normal hearing ears, it is usually between 70 and 100 dBHL. This means an individual with a puretone threshold of 20 dB, is likely to have ART between 90 and 120 dB (20 + 70). The measurement is made both ipsilateral (stimulated ear) and contralaterally (opposite ear) simultaneously. Importance of Immittance Audiometry

1. It helps to determine the type of hearing loss. Also helps to detect the presence of middle ear pathology and probably the type and stage of disease. This further helps otologists to provide medical treatment.
2. It provides as a useful tool to assess pre-treatment and post treatment condition. E.g a child with Eustachian tube dysfunction will have C type tympanogram, after treatment it becomes A type.
3. It is a quick test and can be used for screening.
4. It is a very important test used to cross-check the results of puretone audiometry.
5. It can provide useful information about hearing in difficult to test population who do not cooperate for conditioned responses.
6. It can be carried out when the child is asleep, needs no active participation.

2.4.11 Brainstem Evoked Response Audiometry Also known as Auditory Brainstem Evoked response measurements provide information about functioning of peripheral hearing system and hearing upto brainstem level. This objective test helps in hearing assessment and also helps to locate the site of a particular lesion along the auditory pathway. A stimulus called click or tone burst is given through headphones/insert earphones and the response is recorded from the electrodes placed on various positions on the scalp of the child. There is continuous ongoing activity in the brain, an introduction of sound in the auditory path, causes a change in this ongoing activity and this can be recorded in a form of waveform. This testing is best done when the child is calm or asleep. This can be done in new-borns, difficult to test children and also in children suspected with neurologic dysfunction (8th

62 nerve-tumour, dyssynchrony etc.). This test can also be used for hearing screening programs in NICU. The test is carried out using a BERA instrument. The test also aims to determine the threshold of hearing, however the results obtained are interpreted and deduced in order to get the actual threshold of hearing. The waveform obtained is denominated with certain peaks (I-VI). The lowest intensity upto which peak V can be identified is defined as the threshold obtained from BERA and is usually 15 dB above PTA threshold. Fig 13: Set up for ABR/ASSR Importance of BERA 1. It is a very important screening and diagnostic test. It can be used in neonates also. 2. It is an important component of the test battery used to assess young children and difficult to test population. This is because it gives ear specific information about degree of hearing loss. 3. It is also an important test for differentiating between cochlear and nerve pathologies, e.g. tumor. 4. It is a very important test as it is not affected by state of arousal, cognition and vocabulary of the child.

63 2.4.12 Otoacoustic Emissions Otoacoustic emission are low level, inaudible sounds produced in the inner ear. Further these can be elicited and recorded from ear canal on introduction of external sound. This is a quick procedure. The instrument consists of a probe assembly, to deliver tone and record responses at the same time from the ear canal. The presence of response indicates intactness of some part of inner ear, however the response can get affected by middle ear pathologies, presence of wax in ear canal etc. Used both as screening and diagnostic purposes. Children who fail in this test are referred for further testing. This test is also used as a part of test battery. Diagnostic tests can be Transient Evoked OAE (TEOAE) or Distortion Product OAE (DPOAE). Fig 14: OAE Importance of OAE 1. It is an important test as it is quick, and reliable. It can be used for neonates. It can be used for screening as well as diagnosis of hearing loss. 2. It can detect early signs of sensorineural hearing loss. Frequency wise responses can be obtained in a special OAE test called DPOAE. 2.4.13 Auditory Steady State Response The auditory steady-state response (ASSR) can be thought of as an electrophysiologic

64 response to rapid auditory stimuli. The goal of ASSR is to create an estimated audiogram from which questions regarding hearing, hearing loss, and aural rehabilitation can be answered. Stimulus is modulated pure tone. Has potential to be a faster test than ABR when perfected. Some equipment can test multiple frequencies and both ears simultaneously. Uses same basic set-up and equipment as ABR. ASSR is similar to the Auditory Brainstem Response (ABR) in some respects. For example, ASSR and ABR record bioelectric activity from electrodes arranged in similar recording arrays. ASSR and ABR are both auditory evoked potentials. ASSR and ABR use acoustic stimuli delivered through insert earphones (preferably). ASSR is evoked using repeated sound stimuli presented at a high repetition rate, whereas ABR is evoked using brief sounds presented at a relatively low repetition rate. Importance of Assr 1. ASSR allows the hearing care professional to create valid audiograms for those unable to participate in traditional behavioral tests. 2.5 Audiometer The audiologist uses an instrument called AUDIOMETER for many hearing tests like puretone audiometry, BOA etc. There are different types of audiometers that are commercially available. These can be classified as diagnostic, screening, computer-based depending upon their function. Also there are different makes and models available commercially. 2.5.1 Block Diagram Fig 15: Audiometer

65 2.5.2 Parts And Their Use The basic functions of an audiometer are to produce pure tones at selected frequencies, change the intensity of the signal, select how the signal is delivered to the ear and direct the signal to a desired ear. For example a tester would select 1000 Hz as the frequency, 40dB as the intensity, earphones as the transducer and right ear for the signal presentation. To achieve these functions following parts are required Fig 16: Parts of an Audiometer 1. Pure Tone Oscillator (Frequency dial) - it is the part of the electronic circuit located in the audiometer which generates

83% MATCHING BLOCK 10/28

W

pure tones at different frequencies like 250 Hz, 500 Hz, 1000 Hz, 2000 Hz, 4000 Hz, 8000 Hz.

Some audiometers also provide option to test mid frequencies. It is represented as frequency dial/ switch with markings of various frequencies on the audiometer. 2. Attenuator/Attenuator Dial - This part of the circuit helps to control the sound pressure level or the intensity of the sound. The intensity can be changed in 5 66 dB steps from -10 dBHL to a maximum output level which varies with the test and frequency. 3. Interrupter Switch - this part of the circuit helps to present

the signal to the patient. It is an on-off switch for

puretone presentation. It also controls the duration of the signal presented to the patient. 4. Power Switch- This is used to switch the audiometer ON and OFF.A.C main supply of 220 volts or batteries can supply the power. 5. Transducer Selector - This part of the circuit helps to select the transducer through which the signal will be delivered. Transducers are the parts which convert electrical energy into sound energy or vibratory energy.For example Headphones are selected for air conduction testing.The BC vibrator is selected for bone conduction testing. 6. Router switch - this part of the circuit helps to direct the signal to desired location. For example right ear or left ear. 7. Signal Selector Switch-helps to decide the type of signal to be delivered. For example puretone, speech or noise. 8. Masking Dial/Switch: A part of this test makes use of noise to stop participation of a particular ear. The masking switch is used to present the masking noise in some audiometers. 9. V-U Meter- this helps to monitor the output level. 10. Microphone- is used to present speech through headphones or loudspeakers. 11. Patient Response Switch- Optional facility, given in patient's hand. He can press the switch to indicate his response upon hearing the sound, simultaneously a light glows on the audiometer for the tester to understand. Not recommended for young children as they can give false response. 2.5.3 Type of Audiometry

Sound Field Audiometry Sound field audiometry is a test in which the test stimuli are delivered through a loudspeaker instead of earphones, is commonly used in the clinical evaluation of difficult

67 to test clients, such as infants, young children, and persons with developmental disabilities, as well as in the assessment of hearing aid benefit for adults and children. The loudspeakers are placed at an angle from the child in the test room,for example 45 °.The type of signal used can be pure tones, modulated tones (warble), noise or speech .The response of the child can be obtained by behavioural observation(BOA, VRA) or conditioned responses (free field audiometry). An audiogram can be obtained across the audiometric test frequencies. Fig 17: Sound Field Audiometry Closed Field Audiometry The audiometric results obtained in a sound treated room, under headphone condition. More accurate results (thresholds) can be obtained in this condition. Under headphones the thresholds can be obtained frequency wise and ear wise. The stimuli which can be used are pure tones, warble tones or speech. Moreover we can block the participation of either ear by using noise in a special procedure called masking. This yields the true thresholds of each ear.The stimulus can be presented using a variety of transducers names supraaural headphones,circumaural headphones, or insert earphones. Closed field audiometry is suitable for older children (more than 5 years) and adults, who can keep wearing the transducer during the test time.

68 Fig 18: Transducers for Closed Field Audiometry Supra Aural HeadphoneCircum Aural Headphone Insert Earphones.

2.5.4 : Role of Special Educator in Conditioning for Pure Tone Audiometry Special educators are one of the important team members in the identification and intervention of hearing loss. These professionals are included in the daily routine of a hearing impaired child. A child being conditioned for puretone audiometry, often takes days of practice before delivering the accurate response. Prior to that a regular conditioning practice needs to be carried out. The hearing impaired child spends most of his waking hours in school after being at home, therefore parents and special educators play an important role in conditioning the child for PTA. The concept of classical conditioning or operant conditioning can be implemented in the course of conditioning the child. The special educator can easily communicate with the child and make him/ her understand the whole process as the teacher shares a good rapport with the child. The teacher can make use of certain noisemakers, loud sound generating items to elicit the conditioned response in the child. He can plan to have a daily 15 minutes practice session during classroom hours. He can train the child to give conditioned responses, such as raising hand, keeping a peg etc upon hearing the sound. The teacher can initially

69 give the sounds with visual cues (in front), then without visual cues (from the back). This practice helps the audiologist to finally carry out the entire testing and get a reliable audiogram. 2.6 : Audiogram The results of puretone audiometry, are plotted on a graph. This plotting is done at various frequencies and intensity level. The graph is called an audiogram. 2.6.1 Understanding of Audiogram The figure shows a typical audiogram. The X-axis shows the frequencies and the Y-axis shows the intensity levels across which the testing is carried out. The thresholds are plotted at the junction of frequency and intensity. For example in the figure below, the threshold at 1K(1000 Hz) is 25 dBHL. Each vertical line represents frequency and each horizontal line represent the intensity level. The frequencies are expressed in Hz or KHz from 250 to 8000 Hz (left to right). The intensities are expressed in dBHL, from low to high (top to bottom), -10 dBHL to 120 dBHL. In a typical audiogram the air conduction threshold for both ears is plotted, the bone conduction threshold of better ear is plotted first followed by the other ear. If needed the masked AC and BC thresholds are plotted. A typical audiogram is plotted in figure 19. Symbols: For plotting audiograms, specific

84% MATCHING BLOCK 14/28 SA SEHI-31 - FINAL 23.08.2021.docx (D122369686)

symbols are used for air conduction and bone conduction threshold of each ear.

These symbols are internationally standardised. Red colour is used for plotting of right ear and blue for left ear. The thresholds for air conduction are joined by a solid line, but the thresholds for bone conduction are joined by dotted lines. The symbols are shown in figure 20. Fig 19: Typical Audiogram

70 Fig 20: Symbols used on an audiogram 2.6.2 Audiogram Interpretation Audiogram mainly provides

72% MATCHING BLOCK 15/28 SA SEHI-31 - FINAL 23.08.2021.docx (D122369686)

information about type and degree of hearing loss. Also it provides separate information about each ear, which helps

in diagnosis, as well as planning appropriate management. The PureTone

83% MATCHING BLOCK 16/28 SA SEHI-31 - FINAL 23.08.2021.docx (D122369686)

Average (PTA) provides information about the degree of hearing loss and the

difference between air conduction threshold and bone conduction threshold indicate the type of hearing loss. Degree of hearing loss- for determining

39% MATCHING BLOCK 18/28 SA 8 Unit 3 Identification of Deafness and Assess ... (D162037133)

the degree of hearing loss (amount of impairment) the pure tone average is calculated. The pure tone threshold of each ear at three frequencies 500 Hz, 1000 Hz and 2000Hz,

are summed and divided by three. For example the threshold at 500 Hz, 1000 Hz and 2000 Hz is 50, 60 and 40 dBHL. The PTA is calculated as follows: $50 + 60 + 40 = 150/3 = 50\text{dBHL}$ 3 The degree of hearing loss in the above example is moderate.

71 The degree of hearing loss in the above example is moderate. Table 1 : PTA and Degree of hearing loss PTA Degree of Hearing Loss -10 to 15 dB

63% MATCHING BLOCK 19/28 SA Elveen Thesis before urkund -2.12.2022.docx (D151761506)

Normal Hearing 16-25 dB Minimal Hearing Loss 26-40 dB Mild Hearing Loss 41-55 dB Moderate Hearing Loss 56-70 dB Moderately Severe Hearing Loss 71-90 dB Severe Hearing Loss

Type of Hearing loss: Hearing loss

is categorized into different types, depending on what part of the auditory system is damaged. The

83% MATCHING BLOCK 17/28

W

three types of hearing loss are conductive, sensorineural and mixed hearing loss.

For understanding the various types of hearing loss, we need to understand the normal hearing sensitivity. Normal Hearing Sensitivity: When the thresholds for both AC and BC are within 15 dBHL, also the difference between AC and BC thresholds is less than or equal to 10 dBHL, we can interpret it as normal hearing sensitivity. Fig 21: Audiogram showing normal Hearing

72 Conductive Hearing Loss- When the AC thresholds are abnormal (upto 70 dBHL), BC thresholds are within normal range creating an Air-bone gap (ABG), the audiogram gives an indication of conductive hearing loss. It can be seen for one ear or both ears. Both ears may show the same degree or different degrees. Any deficit or malfunction in external ear and/or middle ear causes a conductive hearing loss. Fig 22: Audiogram showing conductive hearing loss in both ears.

Sensorineural Hearing loss- When both AC and BC thresholds are affected or abnormal, with ABG equal to or less than 10 dBHL, the audiogram indicates sensorineural hearing loss.

76% MATCHING BLOCK 20/28

The defects of inner ear or auditory nerve results in sensorineural hearing loss.

Fig 23: Audiogram showing sensorineural hearing loss

73 Mixed Hearing Loss – When both AC and BC thresholds are affected, the ABG is more than 10dBHL.

91% MATCHING BLOCK 23/28

SA

SEHI-31 - FINAL 23.08.2021.docx (D122369686)

The mixed hearing loss occurs when there is involvement of the outer ear and / or middle ear and

the inner ear. Fig 24:Audiogram Showing Mixed Hearing loss Configuration of Audiogram The shape or contour of the audiogram is called its configuration and can be understood from an audiogram. It suggest the underlying pathology. Depending upon the configuration, certain frequencies will be more affected than others. It helps to decide about amplification device and plan the rehabilitation work up. Also helps to predict benefit from amplification and various rehabilitation programs including educational management. Some configurations are as follows: 1. Flat Configuration; all frequencies are equally affected 2. Sloping Configuration: High frequencies are more affected than low frequencies 3. Rising Configuration: Low frequencies are more affected than high frequencies. 2.6. Audiogram Interpretation and Educational Implication The degree, type and configuration of hearing loss helps to assess the educational needs of the hearing impaired child. The educational needs which can be assessed using

74 information from audiogram are as follows: 1. Deciding on the schooling option. Depending upon the degree and type of hearing loss selecting the type of school- a) Special School placement – this option is for children with more severe hearing loss(bilateral profound hearing loss).Moreover for children who had a late identification and hearing aid fitting with severe to profound hearing loss, special school placement is recommended. b) Mainstream school- Hearing impaired children with less severe hearing losses can be included in mainstream schools provided they had an early identification and intervention. It can be further decided depending on their degree and type of hearing loss about the type of mainstreaming to be done- regular school (minimal or mild hearing loss),integrated school, and inclusive school. c) Non-formal Education – national open school placement d) Some children need special school in early years and then they can move on to mainstream school.(mild to severe degree) e) Some children may need special school after primary education. f) Some children may need specialized individualized input along with enrolment in mainstream school. g) Some children may benefit from mainstream schools and yet require specialized academic support for social studies, science or languages or literacy.(moderate to profound sensorineural hearing loss) h) Some children may need some classroom amplification and some may need sign language interpretation in the class.(severe to profound sensorineural/ mixed hearing loss) i) Some may need certain concessions and exemptions and the others may not need them. 2. Deciding on the curriculum- Some children may follow the standard educational hierarchy, but some might need a flexible curriculum. For example children with more severe sensorineural hearing loss, might need a flexible curriculum, they often find language and literature subjects difficult as these need more proficiency in speech and language skills.

75 3. Deciding on the type of evaluation of performance to be administered. For example, conducting written exams over oral exams, using a grading system instead of any examination etc. 4. Deciding about classroom needs- The most important place where the child spends quality time for acquiring education is the classroom. Classrooms for hearing impaired children should be designed and equipped according to their hearing needs. a) Seating Arrangement- For instance children with severe to profound sensorineural hearing loss and limited benefit from hearing aids may need preferential seating in the classroom, front seat, close to teacher.Children with milder losses,conductive type may not need this seating arrangement. b) Classroom Acoustics- Children with more severe losses and sensorineural type are affected by noise and reverberation. The classroom must be designed to keep them noise and reverberation free. c) Installation of classroom amplification devices – All children with hearing impairment benefit from assistive listening devices installed in classrooms. However children with severe to profound hearing loss benefit the most from these devices.For example, FMsystems, loop induction systems.Children with unaidable hearing loss might need installation of alerting devices,such as flash lights to indicate end of period. 5. Deciding on teacher-student ratio – Children with more severe loss need more individualised support. So a lesser ratio is preferred for more severe hearing losses. 6. Deciding upon the communication strategy to be used – unisensory vs multisensory approach. Children with more severe loss will need multisensory approach for teaching, for example use of visual and tactile clues. 7. Deciding upon medium of instruction and communication to the child. 8. Help to design appropriate teaching aids that will excel the child’s learning in classroom. 9. Assess the child’s hearing every day, with or without hearing aid in the classroom. This can be done by using simple tools like conversation, using Ling Six sound Test. 10. Plan an educational management strategy depending upon the degree, type

and configuration of hearing loss. 76 2.7 Concept of Unaided, Aided Audiograms, Speech Spectrum and its applications 2.7.1

Unaided Vs Aided Audiogram Audiogram obtained in unaided condition (without amplification device) and in aided condition (with amplification device) is compared to know the actual benefit from amplification. This procedure helps to determine the functional gain. In both the conditions, conditioned (VRA OR PTA) or behavioural responses (BOA) are obtained in sound field environment. The stimulus can be modulated tones (warble), narrow band noise, pure tones. The stimuli are presented via loudspeakers in both unaided and aided conditions. The minimum response level of the child are noted on the same audiogram, to compare the difference in both conditions. The amplification device (e.g hearing aid) is adjusted according to child's hearing thresholds. More recently speech stimuli is used. (Speech perception tests) or real ear measurements are carried out to get more appropriate responses. However measurement of functional gain is still practiced as a routine clinical test. The functional gain can also be estimated by using the results of aided ASSR. Fig 25: Aided(A) and Unaided (S) responses Clinical Implication 1. Measurement of functional gain is a very useful tool for young children and infants.

77 2. Measurement of functional gain is very important and useful for children with associated problems. 3. It gives us an idea about the actual benefit from the amplification device. 4. It suggests about the modification to be made in the current aided hearing, or the device setting. 5. Depending upon the results of functional gain measurements comparison between two hearing aid settings or two different devices can be done. As a result the most appropriate device can be chosen for the child. 6. It is a very effective counselling tool, to explain the parents about hearing aid benefit. 7.

Functional gain measurements can be used to select between communication strategies to be used with the child (verbal vs non verbal) 8. The results of functional gain measurement can be used to predict progress in speech language skills and educational skills. 2.7.2 Concept of Speech Spectrum

78 The speech spectrum also called

88%

MATCHING BLOCK 22/28

SA

SEHI-31 - FINAL 23.08.2021.docx (D122369686)

the speech banana is a representation of different speech sounds on the audiogram depending on their frequency and intensity at typical conversation levels. Most speech sounds are within the 250 to 4000Hz range, with a few high frequency sounds between 4000Hz and 6000Hz. A plotting of the child's thresholds at each frequency on the speech banana will show the speech sounds which the child is able to hear. Any sound which is below the level of the child's threshold will be heard, and anything above this threshold line will not be heard. A child with a mild loss may not hear f, v and z in the low frequencies and f, s and th in the high frequencies. Thus, children with mild losses develop speech and respond to sounds, and the hearing loss is identified at a later age. These children will often have difficulties with pronunciation of words, depending on the sounds they are unable to hear. Difficulty will be experienced in noisy environments such as the classroom. A moderate loss will result in missing out on number of consonants in the speech banana, depending on the shape of the loss, while a severe (and greater) loss will result in all speech sounds being missed. However, environmental sounds (like the piano, dog barking,

and heavy machinery)

80%

MATCHING BLOCK 24/28

SA

SEHI-31 - FINAL 23.08.2021.docx (D122369686)

will be heard. These children will respond to sound but, without amplification, will not hear sounds clearly. With amplification the threshold at which sounds are heard will be improved and thus speech sounds will

be heard clearly. 2.7.3 Clinical Applications of Speech Spectrum 1. One use of the speech banana is to help visually understand what sounds are not audible. It is an excellent counselling tools for parents to understand why their child seems to hear certain sounds or words but not others. In some cases, audiologists will do aided testing to show what sounds within the speech banana can be heard when using a hearing aid or cochlear implant. When the child's unaided and aided audiogram are plotted on the speech spectrum, it helps us to understand the child's hearing status (environmental and speech sounds). This further helps us to select amplification device, and plan rehabilitation program.

2. For children who are already wearing amplification device, the aided response can be plotted on the speech spectrum, and depending upon the response, the hearing aid can be readjusted, if required.

79 2.8 Let us sum up 1. Sound is the basic acoustic unit perceived by human ear. It has certain parameters which can be expressed in different units. 2. The auditory development in humans starts before birth and attains almost adult like hearing by 2 years of age. 3. The hearing capacity can be assessed using a variety of tests. These tests can be either objective or subjective depending upon the participation of the child. Usually a test battery approach is used for correct diagnosis of hearing loss. 4. The basic instrument used for testing is an audiometer. The audiometer is capable of generating certain sound signals e.g pure tones, speech etc. The signal generated is presented to the child via transducers like headphone, loudspeaker etc. The selection of transducer depends upon the test to be done. 5. The ultimate goal of assessment is obtaining threshold of hearing with the help of puretone audiometry. 6. The results of pure tone audiometry are plotted on an audiogram. The results can be plotted ear wise. The interpretation of audiogram helps us to understand the probable site of deficit/damage. It also gives information about degree of hearing loss. It helps to plan the rehabilitation process including educational aspect. 7. According to standardised classification the hearing loss might range from minimal to profound degree in either ear or both ears. There can be asymmetric hearing loss in each ear. 8. The hearing loss can be conductive, sensorineural or mixed depending upon the site of deficit/damage. 9. Aided vs unaided audiogram gives us an idea about the child's hearing with and without hearing aid. Also helps to plan the rehabilitation process. 10. Aided and unaided audiogram are plotted on the speech spectrum, which is a representation of all the speech sounds used by humans, depicting their frequencies and intensities. Plotting the aided and unaided audiogram on the speech spectrum gives an idea about the sounds the child can hear with and without hearing aid.

80 2.9 "Check your Progress" 1. What are the physical attributes of sound?

.....
.....

..... 2. By which age the child starts localising the sound source?

.....

..... 3. What are the subjective tests of hearing? Briefly describe the procedure for conditioning a child with hearing loss.

82 Unit 3 □□□□□ Assessment of Language & Communication Structure 3.1.1 Introduction : 3.1.2 Objectives : 3.1.3 Communication : Concepts and types (Linguistic versus Non Linguistic) 3.1.1 Introduction : Communication is “any act by which one person gives to or receives information about one’s needs, desires, perceptions, knowledge, or affective states. Communication may be intentional or unintentional, may involve conventional or unconventional signals, may take linguistic or non-linguistic forms and may occur through spoken or other modes.” Humans convey information through a variety of methods: speaking through telephones, email, blogs, TV, art, hand gestures, facial expressions, body language and even social contexts. Communication can occur instantaneously in closed, intimate settings or over great periods of time in large public forums, like the Internet. However, all forms of communication require the same basic elements: a speaker or sender of information, a message, and an audience or recipient. The sender and recipient must also share a common language or means of understanding each other for communication to be successful. As such, a study of communication often examines the development and structure of language, including the mathematical languages used in computer programming. The act of communicating draws on several interpersonal and intrapersonal skills. These include speaking, listening, observing, questioning, processing, analyzing and evaluating. Recipients of a message must be able to identify the sender’s intent, take into account the message’s context, resolve any misunderstandings, accurately decode the information and decide how to act on it. Such skills are essential to learning, forming healthy relationships, creating a sense of community and achieving success in the workplace. As a field of study, communication spans a broad, rich array of subjects, including sociology, psychology, philosophy, political science, linguistics, history, literature, criticism and rhetoric. Although much of the field’s subject matter is theoretical in nature, communication studies have proven applicable to business, film, theatre, composition, advertising, education, foreign policy and computer science. In today’s globalized, media-driven world, communication studies have become more relevant and exciting than ever. Web developers seek new, inventive ways to draw Internet users to their websites. Public policy writers debate society’s most pressing issues. Through linguistics, computer scientists are developing programming languages that may someday allow humans to interact directly with computers.

3.1.2 Objectives : After completing the unit student-teachers will be able to ●●●● Explain the concept, types and structure of communication and language. ●●●● Acquire knowledge about Developmental milestones in typically growing children. ●●●● Understand the clinical as well as environmental Impact of deafness on communication and language. ●●●● Acquire knowledge about need for assessment of communication and language. ●●●● Understand the various assessment tool related to communication and language.

3.1.3 Communication : Concepts and types (Linguistic versus Non Linguistic) The term “communication” has been derived from the Latin “communis,” that means “common”. Thus “to communicate” means “to make common” or “to make known”, “to share” and includes verbal, non-verbal and electronic means of human interaction. This act of making common and known is carried out through exchange of thoughts, ideas or the like. The exchange of thoughts and ideas can be had by gestures, signs, signals, speech or writing. People are said to be in communication when they discuss some matter, or when they talk on telephone, or when they exchange information through letters. Basically, communication is sharing information, whether in writing or orally.

84 Scholars who study communication analyze the development of communication skills in humans and theorize about how communication can be made more effective. It is the meaningful exchange of information between two or a group of people. Communicative competence designates the capability to install inter subjective interactions, which means that communication is an inherent social interaction. Schramm (1964) defines communication as “a tool that makes societies possible and distinguish human from other societies”. Berelson and Steiner (1964) define communication as the transmission of information, ideas, emotions, skills through the use of symbols, words, pictures, figures, and graph. Theodorson and Theodorson (1969) define communication as “the transmission of information, ideas, attitudes, or emotion from one person or group to another...primarily through symbols.” Human beings can communicate with each other. We are able to exchange knowledge, beliefs, opinions, wishes, threats, commands, thanks, promises, declarations, feelings - only our imagination sets limits. We can laugh to express amusement, happiness, or disrespect, we can smile to express amusement, pleasure, approval, or bitter feelings, we can shriek to express anger, excitement, or fear, we can clench our fists to express determination, anger or a threat, we can raise our eyebrows to express surprise or disapproval, and so on, but our system of communication before anything else is language. In this book we shall tell you a lot about language, but as a first step towards a definition we can say that it is a system of communication based upon words and the combination of words into sentences. Communication by means of language may be referred to as linguistic communication, the other ways mentioned above - laughing, smiling, shrieking, and so on -are types of non-linguistic communication. Most or all non-human species can exchange information, but none of them are known to have a system of communication with a complexity that in any way is comparable to language. Primarily, they communicate with non-linguistic means resembling our smiling, laughing, yelling, clenching of fists, and raising of eyebrows. Chimpanzees, gorillas, and orangutangs can exchange different kinds of information by emitting different kinds of shrieks, composing their faces in numerous ways, and moving their hands or arms in different gestures, but they do not have words and sentences. By moving in certain patters,

85 bees are apparently able to tell their fellow workers where to find honey, but apparently not very much else. Birds sing different songs, whose main functions are to defend their territory or to attract a mate. References: Schramm, W. (1954). How communication works. In W. 86 3.2 □□□□□ Communication Structure 3.2.1 Introduction: 3.2.2 Language 3.2.3 Speech: 3.2.4 Components of Language: 3.2.5 Language Content 3.2.6 Language Use 3.3 Normal Developmental Milestones of Speech and Language: 3.2.1 Introduction: Theoretically, communication can be defined as the process involving sending and receiving messages which is important to transmit information, share feelings, etc. between persons and groups. It involves the process of encoding and decoding via which information is encoded by a speaker and decoded through the listener. Linguistically, communication is defined as a rule based mental system of language codes for expressing an understanding thoughts, feelings and ideas. Communication can be represented in the forms involving either a verbal or a non-verbal mode. Verbal communication involving a set of linguistic codes foral- auditory, visual-graphic) following a set of mental rules is called as oral language. Similarly, non-verbal communication involving use of pantomimes, gestures but not governed by mental rules of spoken language is called as sign language. 3.2.2 Language Introduction: Language has been defined from various perspectives depending on the theories that have been proposed to explain the process of language acquisition. From a social view point, language can be defined as a speech act which includes the reason for speaking (intentions), the situations in which the event occurs (context) and different ways in which one speaks depending on the circumstances (alternation).

87 From a behavioral view point, language is defined as a learned behavior in which the processes of classical and operant conditioning facilitate the development of language. From a linguistic framework, language can be represented as a system that consists of symbols (words) governed by mental rules (grammar) which is used to represent the ideas about the world. From a cognitive framework, language has been defined as a mode that serves to express thought. Language has been defined as a culmination of processes involving sensation, perception, imagery, conceptualization, symbolization and abstraction. Piaget defined language as a fine cognitive act which results into developmental processes including intelligence, social, sensory-motor, emotional and cognition. 3.2.3 Speech: On the other hand, speech has been defined as the verbal manifestation of language and is the result of overlaid function of different physiological systems involving articulation, phonation, respiration, resonance, and regulation. Interaction between communication, language and speech: Types of communication: Basing on mode communication can be of two types (i) Verbal communication- involves use of language and other verbal modalities (paralinguistic cues) (ii) Non-verbal communication- involves use of signs. gestures, sign language, lithography, etc. Basing on the use of senses, communication can be described as (i) Auditory based communication- involves use of auditory signals. Example- sirens, alarms, telephones, etc. (ii) Visual based communication- involves use of visual signals. Example- reading, writing, gestures, facial expressions, etc. (iii) Tactile and olfactory based communication involves use of tactile and olfactory signals such as hand-shake, kiss, hugging, slapping, different smells, etc. Basing on developmental stages, communication can be described as :

88 (i) Perlocutionary stage ●●●●● Present from birth and continues throughout life. ●●●●● Lack of consciousness and goal directed intentions. ●●●●● Communication involves care givers interpretation of infant's behavior. ●●●●● It is a one way process in which caregiver infers messages by willing fully interpreting infant's behavior as communicative signals. Example : (a) caregivers attention to reflexive and differential cry of infant. child directed speech (b) Social smile, gaze coupling. (ii) Illocutionary stage ●●●●● Develops at 6 months of age ●●●●● Represents the emergence of semantic intentions ●●●●● Infant's behavior is consciously directed towards influencing other persons to act on some object the concept of cause-effect and means-end relationship emerge, that is, changes have causes, and persons can be the agents of change. ●●●●● Infants learn to use gestures in phonetically consistent forms and vocalizations to convey intentions during this period, Not only semantic intention, the overall concept of intentionality emerges during this stage (semantic intentions- protesting, requesting, declarative, existence, non-existence, recurrence, rejection). ●●●●● The use of joint reference, i.e., shared focus of infants and caregivers of identifying an object and joint action, i.e., goal oriented motor behavior are routinely performed during an event. The use of proto declaratives and proto imperatives are also seen during this stage. (iii) Locutionary stage ●●●●● This stage is marked by the use of true words along with complex gestures to express intentions. ●●●●● This stage is also identified with development of joint attention in an infant. 3.2.4 Components of Language: Language is a complex combination of several component, rules and systems. Bloom and Lahey (1978) had divided language into three major components-

89 (i) Form (ii) Content (iii) Use The interaction of form, content and use of language is called as knowledge of language. The knowledge and concept of language is called as language competence. Basing on Chomskian views, performance has been viewed as expressive language and competence as receptive language. Performance has been defined as the ability to use the inbuilt grammar and grammatical rules and competence as the inherent capability to acquire grammatical rules from exposure to it from the environment. Disorders of language can be due to faulty interaction between these three components of language. Language form refers to the underlying rule, system, or the grammar of a language. Language form consists of three major components. These are: (i) Phonology (ii) Morphology (iii) Syntax PHONOLOGY Phonology refers to the rules that govern the way in which speech sounds are represented in a particular language. Phonology studies the range of speech sounds used by a native speaker while speaking and the way they are produced. Phonology also governs the way in which speech sounds are categorised in a particular language and the way they are combined to form syllables and words. Example- English has 43 speech sounds, Whereas, Telugu has 47 speech sounds (phonemes). Phonology can be divided into two components- segmentals and supra-segmentals. SEGMENTALS The segmentals refer to the phonemes and syllables found in a language. PHONEME — any speech sound is called as a phone and the meaningful speech sounds which combine to form syllables and words are called as phonemes. Every language has a limited set of phonemes which combine to form the grammar of that language. All the phonemes that exist in all the languages of the world have

90 been represented in an International Phonetic Alphabet Inventory (IPA). The phonemes such as [b], [p], [o] in combination with other phonemes such as [a] form syllables [ba], [po], [pa], etc. phonemes have been categorized basically into consonants and vowels and the consonants have been categorized basing on place of articulation and manner of articulation. Basing on place of articulation consonants are categorised as bilabial, labiodental, dental, alveolar, palatal, velar, glottal and retroflex. Basing on the manner of articulation consonants are categorized as stops, fricatives, affricates, nasals, laterals, aspirates, unaspirates, voiced, voiceless, trills. Based on tongue height, vowels have been classified as front, mid and back vowels. SYLLABLES: A syllable refers to the unit of speech sound composed of a vowel and a consonant or similar combination. Syllable consists of an onset and a rhyme further consists of a nucleus and a coda. Syllables are the smallest units which can be separated in a word SUPRA- SEGMENTALS; When syllables are combined in words and phrases, the rhythmic contour of combination of syllables make up the prosody of the language. Features of prosody include the relative stress on one or another syllable in a string. The melodic rise and fall of the intonation of the syllables and pattern of pause time that occurs between segments. The prosodic features of sound are super imposed of the sound segments, that is, phonemes and syllables and thus arte called as supra-segmentals. MORPHOLOGY: Morphology refers to the study of internal organization of words. The smallest segment of speech that carries meaning is called as morpheme. Thus morphology consists of word and word inflections. A morpheme can also be represented as the smallest meaning of word that carries meaning. Morphology enables the language user to modify word meanings and produce semantic distinction such as numbers, verb, tense and possession, extended word meanings and derived word classes. A morpheme can be of two types- (a) Free morpheme- it refers to the smallest meaningful unit in a word which can exist independently and has its own meaning For example: "cut" in cutting (b) Bound morpheme- they are grammatical markers that cannot function independently and must be attached to free morphemes or to the

91 other bound morphemes. For example: "ed", "ing", "er", "un", "ly", "s", etc. With respect to number -cat, cats With respect to tense -talk, talked With respect to possession-Mary, Mary's With respect to extended word meaning - Respect, Disrespect With respect to derived word classes - beauty, beautiful, etc. Morphology of a language also includes two types of word classes: (i) Content words- these are nouns, verbs, adjectives and adverbs. Content words are the building blocks of a sentence which carry meaning. Content words exist independently in a language. Content words referring to objects are called as substantive words (noun) and those words referring to relationships are called relational words (verb). Content words keep adding on throughout a person's lifetime basing on his experiences and thus are called open class words. (ii) Function words - it refers to those words that connect the content words in a sentence. These are prepositions, articles, conjunctions, and pronouns. Function words are constant in a person in a language and thus are called as closed class words. Apart from functions words and content words, Morphology consists of Morphological inflections called as 'affixes'. Affixes are those morphemes that are added to roots. Roots are those words that cannot be divided. The affixes have been divided into two types: (i) Prefixes - morphemes added at the beginning of roots. (ii) Suffixes - morphemes added at the end of roots. Morphological inflections modulate the meaning of a sentence, i.e., they provide information about the meaning of number and time. Relation between nouns, verbs, and adjectives along with the morphological inflections constitute the syntax of a language. SYNTAX: Syntax refers to the rule system which governs the word order in a sentence. The word order can be described as: (i) The order in which words should be arranged in a sentence (ii) The way in which sentence should be organized (iii) Relationship between words, word classes word types and other parts of the

92 sentence. Syntax specifies which word combinations are acceptable or grammatical and which are not. Word sequences follow definite word order rules, i.e., the phrase structure rules and transformational rules. Each sentence may contain a noun phrase that includes a noun and a verb respectively. Within noun and verb phrases, certain word classes appear. Example- articles always appear before nouns. Thus, 'The boy' is grammatical and 'Boy the1 is syntactically incorrect. Hence, according to. McLaughlin. syntax is that part of grammar which specifies rules for sequencing or ordering words to form phrases and sentences. The sequencing of words in a sentence is governed by two types of grammatical rules: (I) Linear structure: A linear structure is formed when two words in combination do not mean anything more than each of the words alone. Example: The meaning of "more cookie" is same as the meaning of 'more' and the meaning of the relation between 'more' and 'cookie' (two of the words convey the same meaning as one word in isolation). The linear structure relations can be described with the formula $f(x)$ where $*f$ is a fixed value which does not change and 'x' is a variable which can assume many values. (II) Hierarchical structure: When the meaning relation of words in combination with one another, is something more than the meaning of the separate words, the syntactic structure can be described as the hierarchal structure. The hierarchal structure defines how words and phrases are arranged in a sentence. "Noam Chomsky categorized hierarchal structure into two types of structure rules: (a) Phrase structure rules: These rules help in sentence organization where units in each sentence are organized in hierarchy. Each of these units can again be further broken down into its constituent parts. In all languages a sentence contains at least a noun and a verb as its basic units. The basic relationship is written as: (Sentence = Noun Phrase + Verb Phrase) A noun phrase contains noun and associated words such as articles, adjectives, etc. A verb phrase consists of verb, adverbs, prepositional phrases and possibly a noun phrase as an object of the verb. The phrase structure of sentences can be explained through a sentence tree diagram. (b) Transformational rules: They rearrange the basic structure rules to create 93 general sentence types such as declarative, interrogative, negative, passive and imperative. Each sentence comprises of two basic structures: Deep structure and Surface structure. The deep structure contains the basic meaning of the sentence and the actual sentence produced is known as the surface structure. The relationship between deep structure and surface structure is determined by transformational rules. By changing, recording and modifying the deep structure elements. These transformational operations create the surface structure. A transformational rule can be represented by a formula. $NP_2 + \text{Verb Tense} + V (-ed) + \text{by} + NP_j$ For example: The cat was chased by the dog. Similarly the same sentence can be represented as: $NP_i + V + (\text{The dog chased the cat})$. Linguistically, every sentence is composed of subject and a predicate. A sentence in which a group of words are centered around people or objects are called noun or noun phrases. Similarly, if a group of words is centered towards actions or relationships in a sentence, they are called as verb or verb phrases. In a sentence, a noun is always predicted by a determiner called the noun modifier, which qualify, specify, or rank the noun. The determiners include pre- articles, articles, demonstratives, possessives, ordinals, quantifiers, comparatives and adjectives. Pronouns such as he/she/they are also used in a sentence instead of noun to convey the same meaning. In a sentence, the predicate is represented as a verb phrase. A verb can take various forms depending on the content and context of the sentence this can be: (i) Action verbs - Walking, Eating (ii) Process verbs - Hearing, Seen (iii) State verbs - Ball, Alone (iv) Grammatical verbs - is, are, was, were (v) Lexical verbs - Run, Sit, Write (vi) Transitive verbs - Heat, Heard (vii) Intransitive verb - Smiling A sentence in transformational structure thus can take various forms depending on the content and context of the sentence.

94 3.2.5 Language Content Language content refers to the meaning represented by language. Language components can be explained by the following tree diagram. Denotes an idea or concept or an arbitrary system for dividing reality into categories and units. These categories and units group similar object, actions, relationship and distinguish dissimilar one. Semantics is concerned with the relationship of language form with objects, events and their relationship, as well as word and word combination. Word/symbols do not represent reality but rather a concept. A concept is related to a whole class of experiences rather than to a single one. Semantics is the result of the cognitive categorization process (reference between object and events). Language content or semantics defines the way objects and action relationships are represented. The way objects and action relationships are represented by a person determines the language topic of that person. As experiences differ from others, language topic varies from person to person. However, language content is universal across cultures and languages and helps a person to use language form correctly according to situations.

Language content is general, depersonalized and independent of particular context where as language topic is particular, personalized and contextual. Language content can be categorized as based on representing and understanding of: (1) Objects (2) Relation between objects (3) Relation between events The understanding of .objects and their meaning can be represented as particular objects or classes of objects. Second category, i.e., relation between object can be defined the relation of one object to itself or relation of one object to another object. Third category, i.e., event relations includes relations between two different events or relations within a single event. Object relation refers to dimensional words such as big/little, high/low, etc.; spatial words such as behind, outside/inside, far/ near, etc. and kinship words such as son, daughter, grandfather, brother, father, mother, etc. Event relations includes temporal words such as after, before, since, until, etc.

95 The object, object relations and event relations are related to each other through word orders. These word orders are called as semantic relations. A children master, semantics during their language learning, the complexity of word order also increases. In English, the semantic relations normally include sentence construction such as: (1) Agent + Action + Object (2) Agent + Action + Locative (3) Agent + Object + Locative (4) Agent + Action + Object + Locative, etc. The semantic relations for objects and the relations are expressed in the form of semantic intentions.

3.2.6 Language Use Language use or pragmatics serves three major functions: (i) The use of language for attending different goals (ii) The use information from the context to determine what one must way to achieve the goals (iii) The use of the interaction between persons to initiate, maintain- and terminate conversations. Language use/Pragmatics has been described by Bloom and Lahey (1978) on the basis of communication function and communication context. Communication functions involve both personal and social goals that describe the interaction and the balance of control between speakers and hearers. Personal functions are served when one comments on himself, solves a problem or asks a question to gain information. On the other hand, social functions (interpersonal) refer to the behaviors one shows for getting things done. Socially mediated goals are served when one seeks and maintains the attention of others or gives a direction for someone to act. Pragmatics is also related to the context of spoken message. The idea about context helps for deciding which form of the message will serve the function of the message in different context.

96 The pragmatic rules governs sequential organization and provenance of conversation, repair of errors, and roll and speech acts. A speech act is a unit of linguistics communication and contains not only the forms of utterance but the meaning and the intention of the speakers as well. Organization and provenance of conversation include turn-taking, initiating, maintaining and closing a conversation, establishing and maintaining topic and making relevant contributions to the conversation. Conversation includes giving and receiving feedback. Conversational role skills include establishing and maintaining role and switching linguistic codes for each role. Pragmatics also includes the extra-linguistic aspect of language. These refers to the non-verbal features that accompany expressive language and serve to modifv. amplify, fine tune the actual meaning being expressed linguistically. Among the extra-linguistic aspects, pragmatics includes pre-dominantly the par a-linguistic codes used in a language. These para-linguistic codes are also known as supra-segmental aspects or prosody of speech. The supra-segmental aspects modify the meaning of the spoken message as it is produced in different context and includes mainly the stress, rhythm, intonation, pause, juncture, etc.

97 3.3 □□□□□ Normal Developmental Milestones of Speech and Language: ●●●● At birth-Birth Cry ●●●● 0-1 months - Reflexive Cry, Vocalization ●●●● 1-2 months - Differential cry, differential vocalization, i.e., caregivers can differentiate between hunger cry, pain cry, pleasure and happy sounds ●●●● 2-3 months - Cooing Stage In this period the infant develops the ability to start and stop oral movements and this stage is characterized by laughter and known distress pleasures, like cooing sounds which express happiness. During this time the infant produces consonants like [k] and [g], and vowels like [u]. Though they are not accurate and their resonance is not complete. The child's vocalization contains 2-3 different sounds. ●●●● 4-6 months - Babbling Stage During this time infants begin to exhibit marginal babbling which is described as the production of variety of vowels like sounds with occasional vocal tract closure. "Marginal babbling" may contain simple consonant vowel (CV) syllables or vowel consonant (VC) syllables. The vowels resonate more fully in this period, compared to the period between 2-4 months. Thus, the resultant tones in this period are called fully resonant nuclei (FRN). Speech is characterized by prolonged periods of vocalizations and strings of sounds. These sounds are mostly bilabial such as [b, p] or alveolar [d]. ●●●● 6-7 months - Reduplicated (canonical) babbling The infants start to playfully experiment with different sound combinations in this stage. Thus, this stage is known as vocal play. The child produces string sounds such as [p], [b], [t], [d], [m] and [n]. The infant uses long reduplicated strings of consonants and vowels such as jbabababa, jmamamama. ●●●● 7-9 months During this period, the child responds to mother by babbling like vocalization

98 and child also starts to babble whenever he/she is spoken. This is called as "Directed Babbling". During this period, the child starts to babble to communicate socially with the caregiver. This is called as "Socialized Babbling". In this stage the child also varies the strings of syllables, i.e., consonants and vowels change from one syllable to another. Hence, this stage is also called as the stage of "Non-reduplicated/Variegated Babbling". Example: [bagada]. ●●●● 9-11 months At this stage, the child tries to imitate adult like speech in a meaningful way, i.e., phonemic sequence, syllabic structure and intonational contours in the child's vocalizations follows that of adult's speech. These non-meaningful sequence of phonemes having intonation and stress patterns that sound appropriate for meaningful speech are called "jargon". Along with jargon, the child also uses proto words which have sound-meaning relation. (Example: 'bhow-bhow' for dog, 'meow-meow' for cat etc.). These proto words are also called "Vocables" or "ideomorphs". ●●●● 12-18 months - First word By 12 months of age, the child starts to acquire the first meaningful word. This develops directly with his ability to name different objects. By 18 months of age, most of the children acquire a minimum of 3-4 meaningful words involving the most basic relationships like father, mother and basic needs like milk, water, food, etc. By 18 months of age, normally children may have a word vocabulary of up to 50 to 100 words also along with use of ideomorphs as well as jargon. Development of Semantics : The ability to represent something in mind when it is not present (representational thinking) is important for development of language. A child in order to learn the conventional word associated with a concept must be able to represent the phonetic form of that word from past experience and must be able to represent the concept for its use, hence a mental schema or representation of an object or an associated event or the relationship between the event and the object. The development of jargon marks the development of semantics.

99 ●●●● 8-12 months At this age, the development of semantics begins and the child starts relating to persons and objects. However, the child is able to comprehend the meaning of objects and events but cannot represent them in expressive language. ●●●● 12-18 months The child has a vocabulary of about 35-100 words. Children begin to combined words basing on objects and the relationship with events. Child at this age develops various semantic intentions such as: (i) Possessions and possessives i.e., relating to own self. Example: mine, my ball, my dress, etc. (ii) Existence and non-existence i.e., objects being present or being absent permanently, (iii) Rejection and negation i.e., the child learns to stop activity if the adult says 'no' or uses the word 'no' to either reject or stop unfavorable activities. (iv) Disappearance/recurrence i.e., objects when taken out of sight, the child intends to see the disappeared objects. (v) Location - the child looks for objects located in certain places. The child also starts learning new words outside his/her routine conversation and tries to learn the meaning of it by taking cues of the situation. In this stage, nouns constitute 40% of the vocabulary followed by verbs constituting 10%, adjectives 10% and function words 10%. The 30% of the child's vocabulary consists of protowords and other grammatical classes. The child begins to form categorical concepts i.e., mental representation of events, objects and object-event relation. ●●●● 18-24 months The average vocabulary of a child is about 200 words. The child starts to comprehend two word relationships such as: (1) Agent + action (2) Action + object (3) Agent + object (4) Action + location

100 (5) Object + location (6) Possessor + possession (7) Entity + attribute (8) Demonstrative + entity The categorical representation increases and the child continues to extend new words to other members of the same category through fast mapping. The child continues to over extend items into a category (over extension error) or under extend items into a category (under extension error). Children learn to identify the different reference (object, events and object event relations) based on adult attentional and intentional states. The idea about how the word is organized into categories of objects, events, relations, states and properties develops very fast and thus this stage is called fast mapping. The child basing on increasing linguistic and world knowledge and understanding of disposed context use more varied and richer language. ●●●●● 24-30 months The child starts to understand questions and asks 'wh' questions related to object, people, action and location. Example: ggggg "What is this?" -for object ggggg "Who is he?" - for people ggggg "What is he doing?" - for action ggggg "Where are we?" - for location. ●●●●● 30-36 months "Why" related question start at this age. This improves with the improvement in reasoning skills for both comprehension and expression. More specialized concepts start to develop. In this stage the child acquires concept of preposition hence words like on, in, there, by, here, etc. start to develop. ●●●●● 36-42 months Children start to develop color concepts and can identify basic color like red, green, blue, etc. Children also develop knowledge of kinship i.e., they identified different family members according to their relationship. Children also learnt

101 concept of opposites and learns to use contrastive words like big/small, etc. A syntax development also occurs alongside; the children learn the concept of words like 'and/or' etc. with which they produce complex sentences. ●●●●● 42-48 months At this stage, the child starts to learn time concept, understands and expresses when and how and develops the concept of shapes, sequencing and size. ●●●●● 4-5 years Children develop the knowledge of alphabets and their corresponding phonetic sounds, learns the concept of counting numbers, uses advanced conjunctions like - because, so, when, etc. Children have an expressive vocabulary of around 2000-2200 words at this stage. ●●●●● 5-6 years Children during this period accumulate receptive vocabulary of around 14000 words, learning around 9 new words per day. It is at this stage, that a child masters the use of spatial words like - in front, behind, under, on' etc, and temporal words like - after, before, since, until, etc. ●●●●● 6-7 years The child starts to learn to expand meaning of various words and overall semantic development occurs as the child experiences new concept. The child during this period has an expressive vocabulary of around 5000 words. ●●●●● 8-9 years New words are learnt at school and both expressive and receptive vocabulary is increased. The child uses pronouns like he, she, they appropriately, especially in language composition, statements and conversations. The learns to define words and word definitions include synonyms and categories, the child also understand that some words have multiple meanings and meanings may change according to context and situation. The child also gains knowledge of figurative language. ●●●●● 9-12 years The child learns the meaning of abstract words and can explain the semantic

102 relationship of the words in sentence. Semantic development gets completed by 12 years. Syntactical Development: The development of syntax is marked by the production of single word utterances in which a string of utterances consisting of single meaningful words and ideomorphs are used to convey meaning. Syntax development is generally determined by measuring the MLU. Brown (1973) summarized the development of syntax based on 5 developmental stages. Brown further states that appearance and mastery of 14 grammatical morphemes is central to the development of syntax. These 14 grammatical morphemes are: 1. Present progressive inflection 2. Preposition - in 3. Preposition- on 4. Regular plural inflection 5. Past irregular 6. Possessive inflection 7. Uncontractible copula 8. Articles 9. Regular past tense 10. Regular third person singular 11. Irregular third person singular 12. Uncontractible Auxiliary 13. Contractible copula 14. Contractible auxiliary. These Brown Stages are as follows: 44444 Stage I (MLU 1.0-2.0) {12-26 months of age} Children acquire the first meaningful word and speech is characterized by the

103 use of single words and early multi word utterances. Semantic intentions and semantic relations are predominantly present and used by the child. 2 years old toddlers learn simple word orders. The utterances are often telegraphic i.e. they lack appropriate grammatical morphemes. Child uses semantic relations such as : (i) Agent + action (ii) Action + object (iii) Action + Location (iv) Entity + location (v) Entity + attribute (vi) Demonstrative + attribute 44444 Stage II (MLU 2.0-2.5) {27 TO 30 months of age} In this stage the child acquires and uses all the 14 grammatical morphemes. In this stage, the child learns to use, the subjects more consistently and begin to modify nouns occurring in the object phrases of longer utterances, even when subject phrases are also present "Tommy ate big cookie". The child also uses different words to convey meaning. The characteristic feature of this stage is the development of morphemes. 44444 Stage III (MLU 2.5-3.0) (31-34 months of age) The child acquires basic scheme and constituents consisting of a subject verb and an object Hence, this stage marks the development of sentence form. In this stage, modifiers appear in both subject and object phrases i.e. noun phrases are elaborated. Auxiliary-verbs like tense markers, interrogatives and negatives are predominantly used in this stage. The modulation or elaboration of sentences occurs during this stage. 44444 Stage IV (MLU 3.0-3.75) (35-40 months of age) This stage is marked by emergence of complex sentence forms and embedded sentence elements. For example: "I know what you did." In this T stands for subject; 'know'-verb and 'what you did' represents the embedded element of object.

104 This stage is marked by the child's ability embed elements of one sentence within another, as well as correct use of different verb classes. The child masters the concept of irregular past tense. Example: 'go?' 'went'. Use of articles (both definite and indefinite) - example: 'a', 'an', 'the', etc. As well as use of possessive markers - example: 'David's book'. 44444 Stage V (MLU 3.75-4.5) (age of 40 months and above) In stage V, the child masters the use of all 14 grammatical morphemes including 3rd person present tense (3PPT). This stage is marked by the emergence of compound sentences in which the child uses sentence connectors to conjoin two simple sentences. The child also masters the use of verb classes including 'wh' words. By stage V, the acquisition of syntax is almost complete. Disorders of Speech and Language in The Hearing Impaired Introduction: Hearing impairment results from a number of causes and is usually characterized by the type and degree of hearing loss. Type of hearing loss is related to the site of the disorder within the auditory system, and degree of loss is related to the extent that the disorder is infringing on normal function. Disorders of Language Content: Hearing impaired individuals ideas of the world, from which the content of- language derives, develop in the same sequence as that of a hearing person, but with a slight delay. A lot of research evidence have been cited and suggest that the deaf child who is learning sign language codes the same semantic notions as the hearing child who is learning to speak. Although the form of communication differs, the content is the same. Even, the acquisition of semantic relations is similar to that of a normal child. Disorders of Language Use: The hearing impaired individuals can communicate a wide variety of functions and intents using both verbal and non verbal means and is mostly similar to that of hearing individuals. However, deaf individuals are not able to fully comprehend metaphorical use of language and have a tendency to literally interpret embedded meanings.

105 Disorders of Language Form: Hearing impaired individuals know sentence forms and can determine the form class that should be inserted in a frame, but they do not know the use or meaning of specific functor words. Thus, the hearing impaired individuals learn the form of language as it is written, but do not learn language in terms of its content or use. Even in use of content words, hearing impaired individuals have restricted use of relational words. Specific Effects: Vocabulary: Vocabulary develops more slowly in children who have hearing loss. Children with hearing loss learn concrete words like cat, jump, five, and red more easily than abstract words like before, after, equal to, and jealous. They also have difficulty with function words like the, an, are, and a. The gap between the vocabulary of children with normal hearing and those with hearing loss widens with age. Children with hearing loss do not catch up without intervention. Children with hearing loss have difficulty understanding words with multiple meanings. For example, the word bank can mean the edge of a stream or a place where we put money. Sentence Structure: Children with hearing loss comprehend and produce shorter and simpler sentences than children with normal hearing. Children with hearing loss often have difficulty understanding and writing complex sentences, such as those with relative clauses ("The teacher whom I have for math was sick today.") or passive voice ("The ball was thrown by Mary"). Children with hearing loss often cannot hear word endings such as -s or -ed. This leads to misunderstandings and misuse of verb tense, pluralization, nonagreement of subject and verb, and possessives.

106 Speaking: Children with hearing loss often cannot hear quiet speech sounds such as "s," "sh," "f," "t," and "k" and therefore do not include them in their speech. Thus, speech may be difficult to understand. Children with hearing loss may not hear their own voices when they speak. They may speak too loudly or not loud enough. They may have a speaking pitch that is too high. They may sound like they are mumbling because of poor stress, poor inflection, or poor rate of speaking. Individuals with Hearing Impairment typically have a great deal of difficulty with articulation, because normal articulation depends to a large extent on hearing the sounds of a language. Clinical experience and research has shown that hearing impaired and deaf- speakers often have problems with various aspects of speech production, resulting in loss of intelligibility. The kind of distortion in speech can be easily recognized as 'deaf speech'. Speakers may have difficulty producing vowels and consonants and may also be unable to control the suprasegmental aspects of speech.

Segmental Problems

- Vowel problems, particularly neutralization (limitations in horizontal and vertical movements of tongue)
- Consonant errors - omissions and substitutions (voicing, place and manner of articulation errors).

Suprasegmental Problems Suprasegmental problems are another feature of deaf speech, including inappropriate, excessive or insufficient variations in Fo and intensity. Prosody-refers to pitch, intonation and rhythm and these aspects are of interest in a hearing impaired speaker. Prosodic errors, stem from situations such as intonation deficiencies caused by poor control of fundamental frequency (i.e. monotonous speech), inappropriate breath control, slow speech rate, abnormal uses of pauses, and abnormal uses of rhythm and stress (Girgin, 999; John&Howarrth, 1965; Lederet al., 1978; Markides, 1970).

107 Some of the prosodic characteristics of hearing impaired speaker are:

- Rate and Rhythm Hearing impaired children usually have difficulty maintaining suitable rate and rhythm of speaking (excessively slow rate and inappropriate rhythm). The amount of phonation time on syllables is a frequent problem among the hearing impaired; some children should increase their time and others shorten it for improved rhythm, rate and speech intelligibility. Others may have problem of continuous phonation, voicing unvoiced and voiced sounds. A child's slow rate of speaking may be related to lack of breath control. For example, he may need to take a breath every few words and not have enough breath to finish a complete phrase. The total time for the hearing impaired speakers averaged 8-10 sec per sentence and normally hearing speakers averaged 3-4 sec per sentence (Colton and Cooker, 1968). It is suggested that slower speaking rate of deaf speaker's results in perceived hyper nasality and that the hyper nasality is not caused by velopharyngeal dysfunction.
- Lacks typical intonation Incorrect production of intonation contours is a common phonatory problem among the hearing impaired. Intonation is often described as too monotonous or too jumpy, or, either irregular with some rise and fall or monotonous or insufficient or excessive intonation variability. Monson (1979) tested 3-6 year severely and profoundly hearing-impaired children imitating words. Duration of word and Fo contour of the word was examined. The children's task was to imitate a word with a smoothly falling declarative contour. However, most hearing impaired children did not produce smoothly falling Fo contour. Instead, they produced flat contour or changing contour (Fo may first rise then fall, then be level, then rise all over the course of a single syllable). Also, they did not produce enough variation in Fo to differentiate between declarative vs interrogative utterance. These atypical contour patterns can seriously degrade a speaker's intelligibility. Abnormal pause behavior/abnormal use of pauses. Pronovost (1977) stated many deaf individuals are likely to produce separate phonemes and words with many pauses as a result of having been taught to articulate speech sounds as precisely as possible.

108 Increased duration of speech sounds and segments. Whitehead and Jones (1976) studied vowel duration in three groups of male adults - hearing impaired, deaf group and normally hearing group. They found longer vowel durations in hearing impaired and deaf groups. Durational measures on the three groups led the authors to conclude that a hearing impaired population who receives some auditory input can learn the timing system in the same way a normally hearing population does, but a deaf population does not appear to learn these durational differences to the same extent. This suggests the importance of residual hearing. The first two groups sound as if they have more continuous phonation than the normally hearing person. Academic Achievement: Children with hearing loss have difficulty with all areas of academic achievement, especially reading and mathematical concepts. Children with mild to moderate hearing losses, on average, achieve one to four grade levels lower than their peers with normal hearing, unless appropriate management occurs. Children with severe to profound hearing loss usually achieve skills no higher than the third- or fourth-grade level, unless appropriate educational intervention occurs early. The gap in academic achievement between children with normal hearing and those with hearing loss usually widens as they progress through school. The level of achievement is related to parental involvement and the quantity, quality, and timing of the support services children receive. Social Functioning: Children with severe to profound hearing losses often report feeling isolated, without friends, and unhappy in school, particularly when their socialization with other children with hearing loss is limited. These social problems appear to be more frequent in children with mild or moderate hearing loss than in those with a severe to profound loss.

109 Impact of hearing loss on speech and language development

Hearing Degree	Type	Missed Sounds	Effect Level (dB)
16-25	Slight Conductive	10% speech signals	Misses fast paced Sensorineural peer interactions, fatigue in listening.
26-40	Mild Conductive	25% - 40% speech	Misses 50% of class Sensorineural signal, distant discussions, has sounds, unvoiced problems in consonants, plurals suppressing and tenses. background noise.
41-55	Moderate Conductive	50% - 80% speech	Articulation deficit, Sensorineural signal limited vocabulary, learning dysfunction.
56-70	Moderately Sensorineural	100% of speech	Delayed language Severe / Mixed information syntax, atonal voice, reduced speech intelligibility
71-90	Severe Sensorineural	All speech sounds	Speech not developed / Mixed can hear loud or deteriorates, environmental noises learning deficits
90	Profound Sensorineural	All speech sounds	Speech not developed / Mixed only feels vibrations or deteriorates, learning deficits

SEHI-31 - FINAL 23.08.2021.docx (D122369686)

Assessing communication and language: Developmental checklists, scales, standardized tools and assessing language samples using parameters of measurement (Productivity, Complexity, correctness and communicativeness)

Structure 3.4.1 What Is Assessment? 3.4.2 Purpose of Assessment 3.4.3 Types of assessment 3.4.4 How do I assess? 3.4.1 What Is Assessment? The processes of systematic collection, review, and use of information about educational programs undertaken for the purpose of improving student learning and development is known as assessment. Through the processes of assessment student's learning skill can be understood and also can be improved. In other words the processes of assessment can be defined as processes of systematic gathering, analyzing, and interpreting evidence to determine how well performance matches those expectations and standards; and using the resulting information to document, explain, and improve performance. 3.4.2 Purpose of Assessment Through the assessment procedure for communication, students are encouraged to be more active in their communication. The ultimate purpose of assessment is to create self-regulated communicators who can leave school able and confident to continue communicating throughout their lives. 3.4.3 Types of assessment There are two general categories of assessments: formal and informal. Formal assessments provide data which support the conclusions for the test. These types of formal assessments are also known as standardized measures. Formal tests are usually administered when student's communication skill is below average

111 his or her age. The data is mathematically computed and summarized. In formal assessment scores are on percentiles, stanines, or standard scores. Informal assessments are usually based on the content and performance and usually does not provide any data. The example of informal assessment can be a reading task. It indicates how well a student is reading a book. Scores such as 10 correct out of 15, percent of words read correctly, are given in this type of assessment. Whenever taking about the assessment of communication and language it is important to know about the communication and language in brief. Communication is mainly an active an intentional two way process of exchange of messages. Language is the main vehicle for communication. Language is a set of arbitrary symbols used by a group of people for the purpose of communication. There are examples of few formal tests: Name of the test Developed Target Age Domains by population Scales of Early Jean S. For the purpose of assessment first demographic data needs to be collected. The name of the client, age and gender of the client should be known. Speech development history is very important to know because without knowing speech developmental

113 history it is difficult to understand whether the student's speech and language skill is delayed or age appropriate, and if it is delayed from when this process of delay started. Under the developmental history whether the child vocalizes spontaneously and on demand, age of babbling, first word and first sentence should be included. Mode of communication of the child needs to be noted. The child can use verbal communication or nonverbal communication or both. The range, frequency, effectiveness and appropriateness of communication should be assessed. Under each mode of communication i.e., whether verbal communication or nonverbal communication; both comprehension and expression should be assessed. The details about language background and speech and language stimulation should be taken into account. Identification of communication needs and participation pattern: The subject of communication, with whom, when (times of day), where (location and position), why, how and about what topic and vocabulary the client communicates need to be known in detail. We know that sensory skills play very crucial role for speech and language development. Therefore, the status of visual skills whether the vision is normal or corrected, ability to focus and tract, colour blindness is there or not need to be assessed. Similarly, for assessment of auditory skills whether the client is hearing impaired or not, whether temporary hearing loss is there due to illness or not should be checked. Oral peripheral examination The structure and functions of all the oral peripheral mechanisms like lips, teeth, tongue, jaw, hard palate, soft palate need to be assessed. Articulation at phonological level and phonetic level of all the vowels, consonants and blends should be checked. For the production of speech, breath support is necessary. Therefore, breath control and phonation duration need to be assessed. Loudness, pitch and quality of voice should be checked perceptually as well as using perceptual scale for assessment. Suprasegmental aspects are the important parameter for assessment. Among the suprasegmental aspects accent, emphasis, intonation, phrasing and rate of speech are the area of assessment. Cognition is one of the primary pre-requisite for language development. Therefore, the cognitive skill of the client should be assessed. Among cognitive skills attention,

114 use of object, means end relationship, object permanence and stage of play development need to be assessed. Imitation skills for gross body movement and speech also should be noted. Letter recognition, word recognition, reading comprehension, copying, writing to dictation, spontaneous writing ability under reading and writing skills should be checked. Speech intelligibility of the client should be assessed based on the rating scale. Finally the communication and the language of the client should be provisionally diagnosed. Productivity : Productivity is the degree to which native speakers use a particular grammatical process for the formation of new structure, especially in word formation. The process of productivity generally concerns with which grammatical form would be used with newly coined word. For example, in standard English the formation of preterite (past form) and past participle forms of verbs by the means of ablaut (for example, run- ran-run) is no longer used. Mostly the form of "ed" is used at the end of the verb (for example, e-mailed) irrespective of any form to indicate the past form and past participle form. Similarly, in case of plural "s" is majorly used. The ending "en" is longer productive, being found in oxen, children because these old forms sound incorrect or irregular to modern ears. The plural form of the word brother has been replaced with brothers in place of brotheren because of its irregular sounding. During the transition from old English to modern English, many strong verbs have completely lost because they sound archaic or they are no longer truly understood. During the evolution over the last five hundred years or more, English has developed very different in ways from most world languages across history. With a long written past English has preserved many words that might otherwise have been lost or changed. Written language has many conventions for writing polite and formal prose than the spoken language. In other words, written language is often very different from how people normally speak. As English speakers are universally literate, it has become easy for people to bring back into life archaic words and grammar forms. This is often to create a comic or humorously old-fashioned effect. It is with the expectation that these new coining words will be understandable. These processes are rare for languages without a culture of literacy. English has borrowed

115 extensively many words from the other languages because of technology and trade. For example, the plural form of the word "radius" which is a Latin word, has not decisively settle between "radiuses" and the original Latin "radii", though the educated people prefer to use the Latin plural form. Based on the same rules (Latin plural) new words have been coined. Complexity of language : By comparing two Santo languages, Tolomako and Sakao , these two languages are very similar to each other and equally distinct from English, an English speaker is neither inherently biased as being seen as more easy or difficult. The complexity of language depends upon the parameters of language like phonology, morphology, syntax. When the two languages are closely related to each other based on these parameters, those two languages are said to be easier. Correctness: In prescribed grammar, correctness is the notion that certain words, word forms, syntactic structures follow the standards and conventions (that is the rules) prescribed by traditional grammarians. It is a misleading idea that whether a piece of language is right or wrong. Practically language may be better described as appropriate or acceptable to a given context. As per the classical model, the so -called rules of English are pieces of advice laid down by grammarians. Based on the intention of speaker, some of these rules may be proven as good for clarity of language whereas, others are considered as constraints on living language. In old English there are some rules like a sentence cannot be finished with preposition, cannot be started with and, are some examples of rules which are still followed by some language users but deliberately flouted by some other users. There are two main principles practically creating grammatical rules: Prescriptive rules describe the attitude that there are some conventional rules and everyone should obey them, on the other hand, descriptive rules describe the attitude of modern linguists that what is said by a natural speaker is normal and these real language should be described by the linguists to create a model of language. In spite of all these views, fundamental rules which make a language unique yet these are so embedded that the rules are rarely raised as an issue by the user or it is difficult to draw the line between good and bad language. Depending upon some factors like time, speaker, medium, audience, situation style, message, these differences usually follow the process of change and therefore flexible hard to define.

116 Communicativeness: Communicative Language Teaching is an approach of teaching second language and foreign language. It emphasizes both on means and the ultimate goal of facilitating language. The term communicativeness implies different meaning to different facilitators. To some facilitators, it simply means a great emphasize on the use of target language in the classroom particularly on orality. To other facilitators, communication implies the exchange of unknown information between interlocutors, and finally to other facilitators, as a cultural bond system for making meaning. Despite their variations in opinion, all the module facilitators seem to advocate for a communicate approach. References : Hedge, M.N. 117 3. 5. Identification of Needs Related to Communication and Language Communication through speech and language is the entity which differentiates humans from other species and this has become their paramount need. Children who find difficulty in talking and understanding what others are saying have speech language communication need. About one in every ten children has a probability of having some kind of speech language communication need¹. Hence many children with speech language and communication need will just look like any other child and they may show learning difficulty and problem in socializing leading to poor behavior. Their behavioral problem may again lead to, that they may be misinterpreted, misdiagnosed or missed altogether. The difficulties which they will encounter are; 1. Paying attention while listening to others. 2. Articulation difficulty, problem in movement of oral peripheral structures. 3. Difficulty in understanding use of language that is affected pragmatics. 4. They may have problem in recognizing difference between certain sounds or words. 5. They may have problem in memorizing what they hear due to poor, memory, so it is hard to learn new words and follow instructions. There are some frequently used words that are used to describe different types of speech language communication need: 1. Speech and language delay 2. Speech and language disorder 3. Specific language impairment 4. Comprehension (or receptive language) difficulty 5. Expressive language difficulty 6. Speech difficulty 7. Social interaction difficulties (sometimes called pragmatic difficulty) 8. Stammering/Stuttering/Dysfluency /Non-fluency 9. Selective mutism

118 10. Verbal dyspraxia While identifying a child's need of communication through speech and language, at the beginning, the questions which must be taken into consideration are: 1. Age - How old the child is? 2. What type of difficulty they have including the type of onset? and 3. What is the severity of their problem? Need of some children are expressed from a very young age, and others need may be identified until they are at school or even more lately until they become a Young adult. Diagnosis can be gradual or it unfolds overtime and can be a difficult process. People who will be at the first to realize that a child or young person has a problem: 1. Parent or family members 2. Any staff at school or nursery 3. A young person themselves Some children may find no difficulty at the primary levels of their schooling, but find problem on more complicated curriculum, at higher levels and on larger demands on their needs to communicate through speech-language. The possible warning signs of a young child, that they may have speech language communication need: 1. Does not respond to sound. 2. Regressing in terms of development. 3. Have little interest in communication. 4. Talks slowly than other children of the same age. 5. Has difficulty understanding simple instructions or requests. 6. Unusual speech and language compared to other children of the same age. 7. Problem in tasks like reading, spelling and mathematical problems. 8. Even family members may find difficulty to understand them. 9. Difficulty in making and keeping friends and participating in games.

119 The possible warning signs of an older child and young people who might have speech - language communication need; 1. They may be slow to answer or to follow an instruction. 2. They may need several repetition and simplification of instructions. 3. They might switch off when someone is talking to them, it seems they are not listening. 4. Their language may sound muddled and they may find difficulty in organizing their thoughts into words. 5. They may find writing or expressing verbally about some basic thing which they have managed, effortful. 6. They may not understand jokes, or complicated language like idioms. 7. They may find problem in joining and maintaining conversations. A health visitor, a general physician, a teacher or nursery staff and a family member may refer these children to a speech-language therapist. A Speech language therapist will assess and will tell whether the child has speech language communication need and its appropriate intervention.

Reference 4.1 Introduction Speech is a medium, used to convey message which is in a particular form called language. In other words, language is verbally expressed using speech in humans. Speech and language help in successful communication. Impairment of speech or language cause communication disorders which in turn affect the child's educational, social and personality development. Speech development starts at an early age and attains adult mastery by the age of 7-9 years. Speech production is an interesting and intricate process. It involves different systems of the human body. These systems are: 1. Respiratory System 2. Phonatory System 3. Articulatory system 4. Resonatory System The airflow from the respiration process is modified and produced by the other three systems. This is called speech production. As a prerequisite of age appropriate speech development, the intactness of all the above systems is essential. In this chapter we will learn about these systems, their role in speech production, need to assess these systems.

122 4.2 Objectives To learn about : 1. Respiration and phonation, the process, types and the need to assess these processes 2. Articulation & Phonology: speech organs as articulators, speech sounds and their description & classification. Assessment of articulation. 3. Various prosodic aspects of speech & their assessment 4. Normal development of speech in children from birth 5. Speech intelligibility and factors affecting it. Assessment of speech intelligibility. 4.3 Respiration and Phonation 4.3.1 Respiration ●●●● It is a process which is very essential for human life, it helps in breathing and exchange of air with the environment. Speech production is a secondary function of respiration. Respiration provides the power for the process of speech production. The respiratory process involves the following basic structures/parts: ●●●●● Bronchi ●●●●● Trachea ●●●●● Lungs ●●●●● Pharynx ●●●●● Larynx ●●●●● Oral and nasal cavities Other structures which provide the structural support are: ●●●●● Musculature ●●●●● Thorax ●●●●● Skeletal framework- spinal column, rib cage and pelvis

123 ●●●●● Thorax and abdomen and their muscles ●●●●● Muscles of neck, chest and shoulder Diagram of Respiratory System 4.3.2 Pre-requisites for Respiration All the above mentioned structures/parts should be anatomically intact and should be physiologically accurate that is have good function in order to carry out the process of respiration. Respiration involves inspiration/inhalation that is taking air in and expiration/exhalation that is breathing air out. All the structures function with each other to help in inspiration and expiration. The nerve supply and control of higher centres of human body over the process of respiration should be uninterrupted and appropriate for proper functioning of the respiratory system. The child should not have diseases of the respiratory system, for example upper respiratory tract infection, asthma or conditions of brain damage (cerebral palsy) which may cause disturbances of the respiratory system.

124 4.3.3 The Process The general process of respiration is vital for life. It consists of two sub processes namely inhalation/inspiration and exhalation/expiration. The cycle of inhalation followed by exhalation is also called breathing. This is carried out to get fresh air containing oxygen from the environment and removing impure air containing carbon dioxide from the human body. The air is inhaled through the nose/oral cavity, it passes through the pharynx, larynx and then reaches the lungs. It is in the lungs where exchange of oxygen with carbon dioxide takes place. When the lungs have taken in sufficient amount of air from environment, the body prepares for the next cycle of breathing that is exhalation. In exhalation air goes out via the same path. For speech production, the vocal fold vibrates during the exhalation phase. The whole process is controlled by information from the brain conveyed through nerve supply to the respiratory system. Speech breathing For speech production the process of general breathing or respiratory mechanism alters. The inspiration time increases or in other words we take in more air so that we can support our speech production especially if the utterance is long and loud. Moreover, we can time our inspiration and expiration—for example during singing or recitation we can decide on the times we want to breathe in and out. Moreover, the exhalation time is much longer as compared to quiet breathing.

4.3.4 Types of Respiration/Breathing There can be variations in the breathing pattern depending upon the structures involved. However the type of breathing used usually do not affect the speech production process. It can be of following types: 1. Diaphragmatic or abdominal breathing- It involves expansion of the abdomen. It is carried out in a relaxed state. It leads to deep breathing and is advisable in many respiratory diseases. Best for prolonged singing. 2. Thoracic breathing- It is a more shallow breathing. Usually very less amount of air is taken in the chest and exhaled out. 3. Clavicular Breathing- It is the shallowest type of breathing. In this the clavicle moves keeping the lower part inactive. Only upper part of lungs get involved during the breathing. This type is not suitable for speech production and can lead to a strained voice.

4.3.5 Need for Assessment Respiration is one of the vital supporting mechanism/process for speech production. Any disruption in the structures and function of the respiratory system will lead to speech disorders. Thus the physiology of the respiratory system needs to be assessed in case of speech disorders. Parameters such as air pressure, vital capacity, S/Z ratio, phonation duration are assessed on a routine basis. The needs can be as follows: 1. The assessment and measurement of the parameters related to respiratory system, gives us information about the intactness of the system. The obtained values can be compared with age and sex appropriate norms to check for any abnormality. 2. A general need is to establish normative data according to age, sex and other body statistics such as weight etc. Comparison with these values can help us identify disorders. 3. The measured values can act as baseline before the speech therapy sessions and can be measured in between sessions to check progress of therapy. 4. The assessment results help to differentially diagnose between pathologies or conditions e.g problem of respiratory system vs problem of vocal folds (phonatory system) 5. The measured values can give us idea about child's current capacity, this can help us to set speech therapy goals. 6. Assessment of respiratory function help to decide the therapeutic strategies or methods that can be used for remediation for example behavioural, or instrumental.

4.3.6 Phonation Phonation occurs when the air flow from lungs causes the vocal folds in the larynx to vibrate. Usually phonation refers to a prolonged or sustained voice production. In order to achieve a sustained voice the air flow from the lungs during exhalation should be carried out in a controlled manner rather slowly and not abruptly.

126 4.3.7 Process The process of phonation involves laryngeal muscles, cartilages of the vocal cord, ligaments and nerve supply. The vocal folds are elastic in nature owing to their anatomical make-up. At rest they act as a valve which stops food particles to enter the larynx and prevent aspiration. However the secondary function of vocal folds is speech production, which occurs when they fall apart and close in a periodic fashion due to the process of exhalation. The pathway above vocal folds lead to vocal tract which has two openings oral cavity and nasal cavity. The air flow coming from the lungs passing through vocal folds can come out through oral or nasal cavity. The cycle of vocal fold vibration, that is periodic opening and closing, causes the air pressure beneath the vocal folds to fall or rise. When the air pressure from lungs builds up beneath closed vocal folds they are forced to open or fall apart. Again when the pressure falls below a certain level they again close or come together. Moreover the various muscles and other structures play together and bring changes in tension, length and mass of vocal folds. This leads to faster or slower vibrations and causes changes in the quality of voice produced. For example when the vocal folds are tensed and become thinner, the voice produced increases in pitch. The vibratory patterns vary among humans and gives identity to human voice along with other features.

4.3.8 Prerequisites

1. All the anatomical parts involved in phonation should have normal structure and function. In other words any anatomical anomaly will affect phonation.
2. All the structures involved in phonation should have appropriate working.
3. The respiratory system, which provides power for phonation should be working appropriately.
4. The vocal tract, vocal folds, larynx should not be affected due to any disease or disorder. E.g motor disorder like cerebral palsy.
5. An individual should have normal hearing sensitivity to monitor the act of phonation and regulate the air flow.
6. An individual should have normal cognitive functions and motor control so that the whole process can be regulated.
7. The individual should not use any faulty ways to produce voice or should not practice any vocal abuse to have a proper phonation.

127 4.3.9 Types of Phonation The space between the two vocal folds change in distance and shape depending upon the amount of opening and closing of the vocal folds. Depending upon the shape of this space called glottis, there can be following types of phonation:

- No Phonation/Voiceless sound - There is silent passage of airflow, the vocal folds remain far apart allowing air to pass freely. The sounds produced in this condition are called voiceless.
- Voiced Phonation - The vocal folds vibrate regularly, that is with complete closure on each vibration. The sounds produced in this condition are called voiced.
- Other types - the other types of phonation are breathy, falsetto and whisper, which are produced by different positions of vocal folds between no closure and regular closure.

4.3.10 Need for Assessment Phonation is the first step in voice/speech production. The presence of normal phonation indicates the initiation of an appropriate speech. Normal phonation is characterised by adequate loudness, age appropriate pitch and soothing quality of voice. Any abnormality of these characteristics will lead to speech disorders especially voice disorders. The detailed assessment of phonatory system is an important part of speech assessment. The parameters assessed are phonation duration, S/Z ratio, objective as well as subjective measurement of pitch, loudness and quality. The needs for assessment are as follows:

1. The assessment of phonation helps to trace the site of dysfunction. For example at the vocal folds, or below at the respiratory level.
2. The assessment results can be used by the medical specialist for medical diagnosis, to check treatment progress. For example assessment before and after some laryngeal surgery or voice rest.
3. The assessment results also help to check efficacy of certain devices used, for example devices used to remove hypernasality.
4. The results of assessment help to set the goals of speech therapy, help in deciding about the therapeutic procedures to be administered.

128 5. The assessment results act as a baseline measurement for speech therapy and help to monitor progress. 6. The results of assessment can be used to counsel the parents/child about the voice/phonation problem which helps them to get motivated for treatment. 7. Assessment can be carried out to establish normative data in a given population. This data can be used for comparison in case of dysfunctions.

4.4 Basics of Articulation and Phonology

4.4.1 Introduction

ARTICULATION It is the process where the air stream coming from the lungs through vocal folds is modified by the movements of speech organs in the vocal tract. These speech organs are the lips, the tongue, jaw, soft palate. The speech organs involved in articulation can be classified as active articulators and passive articulators. For producing a speech sound two articulators need to come in contact and modify the air stream. The point of contact is called the place of articulation and the way in which the contact is formed and released is called manner of articulation. The result of the air flow modification is production of speech sounds, or combination of speech sounds, which are recognised by the brain. Again these sounds can be classified as vowels, semivowels, diphthongs & consonants. Any errors in production of the speech sounds causes articulation disorder.

PHONOLOGY It is the study of speech sounds, how they are organised, used and combined to form language. In other words it is the study of sound system of a language. It includes all the sounds and their features. It also includes the rules which decide how these sounds interact with each other. For example the production of sound /l/ in the words /lal/ and /Balti/ differ from each other. A typically developing child's language is characterised by phonological processes. These are naturally occurring language patterns seen in a child's language. For e.g final consonant deletion /jo/ for /jol/. However they disappear at a certain age. When this does not disappear at that particular age, it causes phonological disorder.

4.4.2 Active and Passive Articulators

Active Articulators These are the speech organs which actively move and make contact with other articulator in order to produce a speech sound. The kind of speech sound produced depends on the articulators, the place and manner of articulation. The active articulators are as follows:

- Lips- the visible part of mouth. Owing to its muscular make up, it's very flexible and can take a variety of shapes like rounding, retracting, and opening. The lips usually make contact with each other and other structures to produce consonants. For example /b/ is produced when both lips come in contact. And vowels and semivowels are produced with changed shapes. For example lip retracting for /i/.

- Tongue- another muscular structure, one end is fixed and the other end moves freely. It can move side to side, move up, touch the part behind upper teeth, lower its body, raise its body. In the production of vowels the tongue's position is altered, resulting in air flow modification. In case of consonants, tongue may make contact with another articulator. For example for the sound /t/, it touches the alveolar ridge or palate.

- Lower Jaw - it's a highly movable structures and houses the lower teeth also. The movement of jaw is very crucial for speech sound production, it can lower and raise itself to varying extents which helps in production of different vowels and consonants. Moreover the lower teeth provides as an articulator for some consonants as /f/, /v/.

- Soft Palate- it's the muscular portion of palate after the hard palate. It end in the uvula, which acts as a gate between oral and nasal cavities. So when the soft palate and uvula rise and close the nasal path, the air flow has to pass through the oral cavity and the sounds are oral. When the palate moves down and allows air to pass through the nasal cavity, nasal speech sounds are produced. For example /m/, /n/.

- Teeth - divided into lower and upper teeth. Important for biting, grinding and chewing of foods. It act as a passive articulator for many speech sounds. It does not moves on its own, but an active articulator e.g tongue or lips, makes contact with it to produce a speech sound. For example /t/ in the Bengali

130 words /tala/ or /tal/ is produced by the contact of tongue and upper teeth. These sounds are called dental or labiodental.

- Alveolar Ridge- it is the part just behind the teeth. Usually the ridge behind the upper teeth is of importance for speech productions. The active articulator tongue make contact with this portion to produce sounds like /t/ in the word /tata/, /r/ etc. These sounds are called alveolar sounds

- Hard Palate- Just after the alveolar ridge, the rigid and immovable part called har palate starts and continues upto the end of buccal cavity. This portion separates the nasal and oral cavity as it lies between both. It helps to direct the air flow towards the exit of oral cavity. It acts as a passive articulator for many speech sounds. Speech sounds produced with the help of hard palate are called palatal sounds. For example /r/, /l/

4.4.3 Classification of vowels and consonants

All the speech sounds produced can be divided broadly into vowels and consonants. Some other descriptions include semivowels and diphthongs. All the speech sounds can be classified into some groups depending on the way they are produced. The classification of speech sounds is very important in every language, as it helps to understand the production of each sound. Moreover it also helps to analyse and remediate speech errors.

131 Vowels These sounds are produced when the air flow from the vocal folds can pass freely through the oral cavity. In other words the articulators do not make any constriction or contact with each other to block the air flow. However the active articulators change their shape and position to alter the air flow and result in different vowel production.

Classification of Vowels Based on lip shape ●●●● ROUNDED and PROTRUDED - when both the lips take a rounded or protruded shape, the vowels produced are called rounded. For example /o/, /u/. ●●●● UNROUNDED - when the lips do not assume any rounded shape, can stretch or retract, then unrounded sounds are produced. For example /a/, /i/

Based on Tongue Position ●●●● FRONT - these vowels are produced when tongue tip moves up or down. For example vowel /i/ ●●●● CENTRAL - these vowels are produced when tongue's middle part moves up or down. For example vowel /a/ ●●●● BACK - the back of the tongue rises or lowers compared to the resting position of the tongue. For example /o/, /u/. ●●●● HIGH - tongue moves and stays at higher place than the resting position. ●●●● MID - the height of the tongue remains unchanged

Based on duration ●●●● LONG VOWEL - longer duration taken to produce a vowel ●●●● SHORT VOWEL - short duration is taken to produce a vowel.

Classification of Consonants Consonants are produced by movement of active articulators and in some cases complete or partial contact with the passive articulators. The airflow is altered and modified during production of consonants.

132 Consonants can be classified based on the following aspects: ●●●● PLACE OF ARTICULATION ●●●● MANNER OF ARTICULATION ●●●● VOICING OR NO VOICING

PLACE OF ARTICULATION - This category describes the articulators whether active or passive involved in the production of a particular speech sound. It indicates the point at which the air flow is completely or partially obstructed. The consonants can be classified as follows:

Type of the Sounds	Description	Example in English
Bilabial	Produced by contact of both lips	/b/, /p/
Labiodental	Produced by contact of lower lip and upper teeth	/f/, /v/
Dental	Produced when tongue tip touches upper teeth	/th/, /dh/
Alveolar	Produced when tongue tip touches alveolar ridge (gums behind upper teeth)	/t/, /d/
Palatal	Produced when tongue touches the hard palate	/ch/, /j/
Velar	Produced when back of the tongue touches the soft palate	/k/
Retroflex	Produced when tongue tip twists and make rapid repeated movements and touches the hard palate	/r/
Glottal	Produced when there is simultaneous vibrations of vocal folds and release of puff of air	/h/

133 MANNER OF ARTICULATION - this category describes consonants based on the way they are produced. The air flow from the vocal folds can pass through a narrow passage between articulators or can be stopped abruptly by an articulator. The stoppage of air flow can be followed by release of air puff or no such release. The sounds can be described as follows:

Type of Sound	Description	Example in English
Plosives or Stops	Produced when air flow is /p/, /t/ completely and abruptly withdrawn causing sudden release of air	
Fricatives	Produced when the air /s/ flow passes through a narrow constriction causing a friction noise	
Affricates	Produced when air flow is /ch/ stopped abruptly and then released to cause a frictional noise	
Nasals	Produced when the air /m/, /n/ passes through the nasal cavity instead of oral cavity	
Aspirate	Produced when a greater /ph/, /kh/ amount of air is obstructed and suddenly released	
Laterals	Produced when the air /l/ flow is blocked in the centre of oral cavity and released through the sides	

Voiced Vs Voiceless - Voiced consonants are produced when vocal folds vibrate and release air stream in to the vocal tract. Voiceless sounds are produced when there

134 is no vocal fold vibration but the air from the lungs directly reaches the oral cavity. The sounds can be categorised as follows:

Type of Sounds	Voiced	Voiceless
Bilabial	b	p
Alveolar	d	t
Velar	g	k
Labiodental	v	f
Fricative	sh	s

All the speech sounds can be described by their place of articulation, manner of articulation and voicing characteristics. For example the sound /b/ is a bilabial, plosive and voiced sound.

4.4.4 Assessment of Articulation Abnormality

In any of the articulators lead to errors of speech production. These errors are characterised by phonetic/phonemic errors or articulation errors. The error in production of speech sounds can be specific for example in a particular position of word, or it can be in general erroneously produced all the time. Articulation errors can be caused by abnormality in the structure of articulators or functions of articulators. These abnormalities are present as a associated condition of many disorders like motor speech disorders (cerebral palsy), mental retardation, hearing impairment, structural abnormality (tongue-tie, cleft lip-palate).

Need for Assessment

The assessment of articulation is a part of routine speech assessment. It helps us to understand the underlying cause of disorder, helps to assess the awareness of individual and family thus their counselling about the disorder, to decide the treatment plan like medical vs therapeutical, indicates use of formal tests, helps to form a baseline for therapy, assess the progress of therapy, decide on time of discharge from therapy, and to decide on follow up design.

Assessment Procedure

Brief Case History - The complaint, its onset and nature is recorded in details. The informant can be parents, caregivers and the child himself. A note is taken about

135 the associated disorders. Brief history about the treatment availed till date is taken for example surgery, therapy etc. Assessment of Articulators- the articulators are assessed for their appearance and functions. These can be observed directly if the child is cooperative or can be assessed with the information provided by the parents. The following parameters are assessed: Articulators APPEARANCE FUNCTION lips Normal/abnormal Movements like rounding, retraction and protrusion present/absent/restricted Tongue Normal/Abnormal Movements like side to side, pulling up, rolling up Hard Palate Normal/Abnormal NA Soft Palate & Uvula Normal/Abnormal Movement during vocalisation Teeth Normal/Abnormal Chewing Jaw/Mandible Normal/Abnormal Opening & closing of lower jaw. The primary functions of the articulators are also assessed. These are blowing, swallowing, sucking and chewing. A note is taken about drooling (if present). Error Analysis-The speech sounds produced which are incorrectly are recoded, the frequency with which they are misarticulated is noted. The position at which they are misarticulated is noted for example final position of a word. The error patterns in word and sentence level is recorded. The consistency of the errors is assessed. Speech Intelligibility- The overall speech intelligibility is rated on a scale of 0 to 6, where 0 denotes normal speech and 6 denotes very poor speech intelligibility. Diadochokinetic Rate - the production of syllables /pa/ /ta/ and /ka/ in one second is recorded. This gives information about rate and range of movement of articulators (lips, tongue, mandible & soft palate) Stimulability - The stimulability of the child is assessed under two conditions with reinforcement and without reinforcement. The stimulus can be auditory, visual, audio-visual, graphic and motokinesthetic.

136 Formal Tests - Some formal tests can be used to specify the speech sounds erroneously produced, their position in the word level, consistency of their production and the pattern of the error like substitution by another sound, deletion or omission of the sound etc. Example of such tests are Bangla Articulation Test and Picture Articulation Test. In Bangla Articulation Test all the vowels and consonants are listed with words comprising these sounds at three positions initial, medial and final. The response is elicited mostly by using pictures or models for young children. For older children the written words can be used directly. For children who cannot read, the tester may produce the words and ask the child to repeat. In the last case factors related to tester like testers speech production skills, knowledge of the language and personal bias should be realised. Also the child's hearing status should be considered while performing the test using auditory stimulus. The child is usually given few trials and then the final response is recorded. The response can be either correct or incorrect. Further the incorrect response can be categorically recorded into four responses, substitution(s), omission (o), distortion (d) and addition (a). The error can be present in all the three positions or any one or two positions. A sample of the format used is as follows: Sl.No. Phonemes Position Item Correct S O D A 1 /a/(the Initial onsho first Bengali vowel) 2 Medial bol 3 /aa/ Initial Aam 4 Medial Mach 5 Final pa 4.5 Suprasegmental Aspects of Speech and its Assessment The speech sounds (segmental features- vowels & consonants) are connected to form phonemes and words. The words are connected to form sentences. The speech of human is characterised by lot of meaning conveyed by words and the way they

137 are produced in a particular context or environment. The way speech is produced conveys the emotional status of the speaker, his/her intent and also the process of communication is smoothly carried out. Words or segmental part of speech alone cannot convey the full message on its own. Suprasegmental aspects also called prosody of speech give colour and flair to segmental features and make speech production interesting. If suprasegmental features are removed human speech will become robot like. The same sentence can convey varied meanings or intentions with varying use of any of the suprasegmental features. The prerequisite for appropriate suprasegmental features is presence or acquisition of appropriate segmental features, adequate hearing and adequate psychological development. Suprasegmental features also get affected when rate and strength of movement of articulators is affected. 4.5.1 The various suprasegmental features of language are mainly as follows: ●●●● Stress ●●●● Intonation ●●●● Rhythm Let us learn briefly about each. Stress - It is that feature which is used to indicate or convey importance of a particular word or phrase in a sentence. It can be used on the whole word or on a part of the word. The part of speech which is stressed is produced with greater energy. Stress patterns also differ based on words/no of syllables. In single syllable words, the primary stress is usually on the whole word. In bisyllabic and multisyllabic words the stress can be on a single or multiple syllables. For example let us take a sentence THIS IS MY RED BAG. We can convey different information by changing the stress from one word to the other, like THIS is my red bag indicates the ownership of the bag among many similar bags. This is MY red bag indicates the ownership of the bag to a particular person Intonation- It is conveyed by variation in pitch pattern of voice production within a phrase or sentence. The pitch can be rising or falling or in any other manner to convey varying meanings. Intonation mark sentence ending. It also convey feelings

138 like anger, or sarcasm. The use of intonation differentiate a sentence as a statement or a question. For example, "This is your red bag" with not much pitch variation is a statement. And the same sentence becomes a question when the sentence ends with a rising pitch, 'This is your red bag?' Rhythm- This is the timing pattern between the successive units of speech. There is a periodicity or timing pattern while the speaker takes breath in between utterances. In one breath he may utter 2-3 or more words depending on the context. In music, this is usually repetitive, same timing is maintained in a full song, but for speech, the rhythm depends on the speaker, content and context. Another aspect called tempo can be understood here, it is the speed or rate at which a speaker speaks. It is dependent on the speaker. Juncture- It is the pause pattern used between words and leading to association of a particular syllable to a particular word. Moreover the placement of phrases at phrase juncture, the length of pauses is also very crucial. For example "peace talks" vs "pea stalks"

4.5.2 Assessment of Suprasegmental Feature The assessment of suprasegmental features is carried out as a part of routine speech assessment. The child or speaker under assessment needs to have a developed connected speech. The assessment lead to the understanding of deficits in expression of these features. Thus this helps to plan and carry out speech therapy program. Perceptual Analysis There is a lack of standardised tests. Mostly perceptual analysis is carried out to assess each feature. The analysis can be carried out by recording speech samples from the child while reading, talking or storytelling. The analysis can be carried out even during conversation with the child as a part of assessment. Some tests described in the literature describe the use of experienced listeners, for the perceptual analysis. The listeners should have adequate knowledge about the language, context and should be aware of the normal patterns of suprasegmental features. However the perceptual analysis can be carried out by the clinician alone. During reading activities, the features can be highlighted to help the child to produce them correctly. For example stressed words can be underlined. Moreover use of rating scales to rate overall speech intelligibility also gives us information about suprasegmental features. Use of

139 correct prosodic features is very important to obtain good speech intelligibility. Children using the suprasegmental features correctly are more intelligible. Instrumental Assessment Instrumental evaluation always gives direct and objective results. Many parameters of speech can be measured using spectrographic analysis. This gives information about durational aspects of speech, pitch variations, intensity, stress, intonation,rate of speech, and voice quality. The prosodic control can be objectively assessed section by section and analysed to get information on fundamental frequency, its parameters and intensity contours. The assessment can be carried out by downloading certain software in an advanced computer fitted with a high fidelity microphone. Examples Praat, Audacity etc. These analyses can also be carried out in standalone systems like Visi-Speech. The assessment of fundamental frequency between two utterances can be done easily to differentiate between question and statement. Similarly the peak fundamental frequency values and intensity values can be compared between stressed and unstressed words. However accuracy of instrumental measurements can be affected in case of impaired speech. For example presence of hypernasality may reduce the acoustic contrast between utterances, reducing the obtained values. Moreover there can be instrumental errors or lack of tester's knowledge which can affect the results. 4.6

SEHI-31 - FINAL 23.08.2021.docx (D122369686)

Milestones of Speech Development in Typically Developing Children Development of speech

sounds follows a particular pattern in typically developing children. All the speech sounds including vowels,consonants,semivowels, diphthongs and blends develop at different ages depending upon mastery of central control on motor speech organs,muscles and proficiency of articulatory movements.As a result speech sounds which can be produced with ease develop first followed by more intricate sounds. The speech development can be illustrated from birth as follows: Birth to 3 months The infant mainly has crying and comfort sounds at this stage. These sounds have rudimentary vowel like utterances, which cannot be specified.

140 3 to 6 Months The child starts cooing, gurgling and babbling. Speech sounds like /p/, /b/ and /m/ become prominent along with vowels like /o/, /u/, /i/ and /a/ in their speech production. 6 to 12 months Continue to use the above developed consonants and vowels with more efficiency. 1 Year to 2 years Few more consonants get added n, t, d in the child's speech production. At this stage the child starts to take a step towards developing production of more complex speech sounds. In this time the child experiences certain phonological processes, which might sound faulty to an adult but are very normal patterns found in the speech development of a typically developing child. The phonological processes are: Voicing- This is where sounds made with no voice are replaced with voiced sounds (e.g. "car" becomes 'gar', "tea" becomes 'dea') Stopping- This is where sounds made with a long airflow are replaced by sounds made with a stopped airflow (e.g. "sea" becomes 'tea', "shoe" becomes 'to') Final consonant deletion- The ends of words are often missed out (e.g. "tap" = 'ta') Velar Fronting- This is where sounds made with the tongue hitting the back of the mouth (e.g. /k/ and /g/) are replaced with sounds made at the front of the mouth (e.g. /t/ and /d/) so "car" becomes 'tar', "key" becomes 'tea' Palatal Fronting- This is where the tongue is moved forward in the mouth so the 'sh' sound becomes a /s/ sound Weak Syllable Deletion- This is where non-stressed syllables are deleted from words (e.g. "elephant" becomes 'ephant') Assimilation- The pronunciation of the whole word is influenced by the presence of a particular sound in the word (e.g. "dog" become 'gog') Consonant Cluster Reduction- This is where clusters of consonants in words are reduced by one or more consonants (e.g. 'brick' becomes 'bick', "clown" becomes 'cown')

141 De-affrication - This is where the affricate sounds 'sh', 'ch' and 'j' are replaced with fricative sounds ('sh', /s/, /z/) or the /t/ or /d/ sound. Gliding - This is where the /l/ and the /r/ sounds are replaced with the /w/ or the 'y' sound. The voiceless 'th' sound (as in 'thank you') is replaced with a /f/ sound The voiced 'th' sound (as in 'with') is replaced with a /v/ sound 2-4 years More speech sounds get included in the production list like /k/, /g/, /f/, /s/. The child also keeps repeating the phonological processes. The child's speech is still not very intelligible to unfamiliar person. 4-6 Years More difficult speech sounds start emerging like /y/, /h/, 'sh', 'ch', 'j', /z/, /l/, /v/. The child still uses the phonological processes and continues to make the normally occurring errors. By 6 years the child's speech becomes very distinct with few errors like in sounds /r/ and /th/. Even unfamiliar individuals start comprehending the child's speech. 6-8 years By 8 years the child is able to say almost all speech sounds with much clarity. The normal phonological patterns start to disappear and completely disappear by 8 years. 4.6.1 Chart of normal speech sound development sequence. The horizontal bars represent age. The speech sounds are mastered by the age where the bar terminates. For example the sounds k, g, d, t are mastered by 4 years of age.

142 4.7 Speech Intelligibility 4.7.1 Concept To carry out effective and smooth verbal communication, it is mandatory to understand what is being said. That is the speaker should have clear and intelligible speech. Speech intelligibility is a measure of how well a particular speaker's speech is comprehensible. The speaker should be understood by familiar as well as unfamiliar listeners. Age appropriate voice, articulation, normal fluency of speech, normal language development and good quality of speech production sum up to give rise to good speech intelligibility. Usually a child's speech starts to become intelligible even to unfamiliar listener by and after 4 years of age. Intelligibility to familiar listeners By 18 months = 25% intelligible

143 By 24 months = 50-75% intelligible By 36 months = 75-100% intelligible Lynch, Brookshire & Fox (1980) Intelligibility to unfamiliar listeners Dr Peter Flipsen Jr, (2006) By age 1 = 25% intelligible By age 2 = 50% intelligible By age 3 = 75% intelligible By age 4 = 100% intelligible 4.7.2 Factors affecting speech intelligibility In order to speak clearly the speaker should have the following characteristics: 1. Voice: The individual should have age and sex appropriate voice quality. The organs of the respiratory system, vocal tract should be structurally and functionally adequate to result in an acceptable voice quality. The child should not have any structural abnormality, motor speech disorder, intellectual deficiency and hearing impairment in order to be able to produce good quality of voice. The children have similar voice quality until puberty, after which male and female adolescents have different voice quality. The voice should be adequate in loudness, appropriate in pitch and should have a pleasing quality (not harsh, hoarse or nasal) 2. Articulation - All the articulators should have normal structural make up. The active articulators should have appropriate rate and range of movements. The child should not have any motor speech disorder, hearing impairment, structural anomaly (cleft lip/palate) and intellectual deficiency in order to have clear articulation. 3. Fluency - The rate at which the speech is produced should be age appropriate. It should be free from any non-fluencies like repetitions, blocks or hesitations. However up to an age of 4 years, the child might display a normal non-fluency pattern which should not be confused with fluency disorder. 4. Suprasegmental features- The use of stress, intonation, rhythm and pause should be timely and appropriate. A child having speech without these features

144 will sound robotic, and not pleasing to the ears, and will lead to disinterest, lack of motivation of the listener. 5. Knowledge of language- The child should have normal language development sequence. It is not only important the way speech is produced, but what content it has. 4.7.3 Assessment of Speech Intelligibility Assessment of speech intelligibility is a part of routine speech assessment. It provides information about the child's current speech intelligibility which can be used to counsel parents, decide treatment strategies and also curriculum for education. The measurement acts as a baseline before treatment/therapy and also helps to monitor progress of therapy. Perceptual Procedures Most of the clinicians use perceptual measures for assessing intelligibility. Rating scales are widely used in all set-ups. A speech sample, either live or recorded is presented to a listener or group of listeners for judging the intelligibility on a scale. For example a scale of 0 to 6 is used, where 0 denotes most intelligible and 6 denotes poor intelligibility. Unfamiliar listeners are best as the listener bias can be removed. However there can be some limitations of the perceptual measurements. The points on rating scales may not be clearly demarcated. The rating might slightly differ from one judge to another. Other Procedures: Write down Methods The listener/judge can write down the child's utterances as understood. Thereafter the number of words correctly produced can be calculated. The intelligibility can be calculated in percentage by using the simple calculation: $\text{Speech Intelligibility (\%)} = \frac{\text{No of words correctly produced}}{\text{Total no of utterances}}$ 4.8 Let's sum up Respiration provides the power for the process of speech production. The structures involved in respiration and their respective functions should be intact for adequate speech production. There is a need for assessment of 145 respiratory process as a part of routine speech evaluation. Phonation is the next step after respiration. It involves the vocal folds and vocal tract. The phonatory system is also evaluated as a part of routine speech assessment procedure. The assessment results are used for management of various speech disorders. There active and passive articulators which act in coordination to result in smooth speech production. All the speech sounds are classified based on manner, place and voicing characteristics. Articulation assessment provides important information for speech sound correction. The emotions/feelings of a speaker are conveyed with the help of suprasegmental features used in speech production. Intonation, stress and rhythm are the basic prosodic features. These features can be assessed perceptually as well as instrumentally. The development of speech sounds in a child follows a particular sequence. Any disruption leads to delayed speech or speech errors. It typically starts at birth and continues till 8 years of age. Speech intelligibility is obtained by the presence of many contributing factors. It is very important for effective communication. Assessment of speech intelligibility is a part of routine speech assessment. Mostly perceptual measure are employed to assess speech intelligibility. 4.9 Check Your Progress 1. What are the various systems of human body which are involved in the act of speech production? 2. What is speech breathing? 3. Why do we need to assess the respiratory system? 4. What are the sounds which are produced with the help of alveolar ridge and tongue? 5. What are the speech sounds you can expect to hear in the speech of a 4 year old child? 6. Frame a sentence in your language, change the intonation patterns and say the sentence.

146 7. At what age you can expect to hear intelligible speech from a familiar child and an unfamiliar child? 4.10 Reference 1. Speech Science Primer-Lawrence J. <p>the speech banana is a representation of different speech sounds on the audiogram depending on their frequency and intensity at typical conversation levels. Most speech sounds are within the 250 to 4000Hz range, with a few high frequency sounds between 4000Hz and 6000Hz. A plotting of the child's thresholds at each frequency on the speech banana will show the speech sounds which the child is able to hear. Any sound which is below the level of the child's threshold will be heard, and anything above this threshold line will not be heard. A child with a mild loss may not hear f, v and z in the low frequencies and f, s and th in the high frequencies. Thus, children with mild losses develop speech and respond to sounds, and the hearing loss is identified at a later age. These children will often have difficulties with pronunciation of words, depending on the sounds they are unable to hear. Difficulty will be experienced in noisy environments such as the classroom. A moderate loss will result in missing out on number of consonants in the speech banana, depending on the shape of the loss, while a severe (and greater) loss will result in all speech sounds being missed. However, environmental sounds (like the piano, dog barking,</p> <p>SA SEHI-31 - FINAL 23.08.2021.docx (D122369686)</p>

All rights reserved. No part of this work can be reproduced in any form

without the written permission from the NSOU authorities. Dr. Ashit Baran Aich Registrar(Actg.)

3 Netaji Subhas Open University From the Vice-Chancellor's Desk Dear Students, from this Academic Session (2015-17)

the Curriculum and Course Structure of B. Ed.- Special Education have been thoroughly revised as per the stipulations

which featured in the Memorandum of Understanding (MoU) between the Rehabilitation Council of India (RCI) and the

National Council for Teacher Education (NCTE). The newly designed course structure and syllabus is comprehensive and

futuristic has, therefore, been contextualized and adopted by NSOU from the present academic session, following the

directives of the aforesaid national statutory authorities. Consequent upon the introduction of new syllabus the revision of

Self Instructional Material (SIM) becomes imperative. The new syllabus was circulated by RCI for introduction in the

month of June, 2015 while the new session begins in the month of July. So the difficulties of preparing the SIMs within

such a short time can easily be understood. However, the School of Education of NSOU took up the challenge and put

the best minds together in preparing SIM without compromising the standard and quality of such an academic package. It

required many rigorous steps before printing and circulation of the entire academic package to our dear learners. Every

intervening step was meticulously and methodically followed for ensuring quality in such a time bound manner. The SIMs

are prepared by eminent subject experts and edited by the senior members of the faculty specializing in the discipline

concerned. Printing of the SIMs has been done with utmost care and attention. Students are the primary beneficiaries of

these materials so developed. Therefore, you must go through the contents seriously and take your queries, if any, to the

Counselors during Personal Contact Programs (PCPs) for clarifications. In comparison to F2F mode, the onus is on the

learners in the ODL mode. So please change your mind accordingly and shrug off your old mindset of teacher

dependence and spoon feeding habits immediately.

4 I would further urge you to go for other Open Educational Resources (OERs) - available on websites, for better

understanding and gaining comprehensive mastery over the subject. From this year NSOU is also providing ICT enabled

support services to the students enrolled under this University. So, in addition to the printed SIMs, the e-contents are also

provided to the students to facilitate the usage and ensure more flexibility at the user end. The other ICT based support

systems will be there for the benefit of the learners. So please make the most of it and do your best in the examinations.

However, any suggestion or constructive criticism regarding the SIMs and its improvement is welcome. I must

acknowledge the contribution of all the content writers, editors and background minds at the SoE, NSOU for their

respective efforts, expertise and hard work in producing the SIMs within a very short time. Professor (Dr.) Subha Sankar

Sarkar Vice-Chancellor, NSOU

Intellectual Disability (ID), once called Mental Retardation, is characterized by below-average intelligence or mental ability and a lack of skills necessary for day- to-day living. People with intellectual disabilities can and do learn new skills, but they learn them more slowly. There are varying degrees of intellectual disability

intellectual disability has limitations in two areas. These areas are Intellectual functioning. Also known as IQ, this refers to a person's ability to learn, reason, make decisions, and solve problems Adaptive behaviors. These are skills necessary for day-to-day life, such as being able to communicate effectively, interact with others, and take care of oneself. Historically, the person affected by Intellectual disability have experienced varied treatment ranging from abandoning them to providing them equal opportunities like non -disabled persons. The definitions have undergone changes based on the trend of the day.The various definitions also will be discussed.

Intellectual disability can be caused by any condition that impairs development of the brain before birth, during birth or in the childhood 11 years. Several hundred causes have been discovered, but in about one- third of the people affected, the cause remains unknown. There are varying degrees of intellectual disability,

depending on the extent of damage to the brain in the individuals. Here we will see how they are classified based on certain yard sticks .Medical classification, go by causes/etiology, psychological classification are made based on IQ. The educational goes by potentials of the persons with intellectual disabilities.

With the implementation of the Persons with Disabilities Act (PWD), 1995 intellectual disabilities has been recognized as a disability with an identity of its own. Earlier, data on mental retardation had been clubbed with data on mental illness. It is only in the recent years that early identification of persons with mental retardation has become possible. Systematic thinking on screening and identification emerged consequent to the National Policy on Education (NPE), 1986, even though working groups had been set up even as early as 1981 during the International Year of the Disabled Persons (IYDP) by the then Ministry of Welfare. Early identification includes screening, early diagnosis and parent counseling. 1.2

Identification of persons with mental retardation and affording them care and management for their disabilities is not a new concept in India. The concept had been translated into practice over several centuries as a community participative 12 culture. The status of disability in India, particularly in the provision of education and employment for persons with mental retardation, as a matter of need and above all, as a matter of right, has had its recognition only in recent times, almost after the enactment of the Persons with Disabilities Act(PWD), 1995.

As years passed by "the right to live received recognition and importance. However they were considered as menace to the society requiring segregation from the community and requiring close cutodial supervision. Thus came up the institutional care. The persons with mental retardation were segregated from family and community and put institution for 24 hours total care. History of intellectual disability in India ●●●●●

treat idiocy like other birth handicaps, arising through sin in an earlier incarnation .According to Manu, the Law Giver, that as a consequence of a remnant of the guilt of formar crimes , as persons are idiots ,dumb,blind, deaf and deformed,all despised by the virtuous. ●●●●● The Buddhist Mantalsi Jatakar recounts an early attempt to teach "the profound dullards" by activity methods and practical curriculum, but he did not succeed .Later some teachers did persevere so that the unfit rather than being weeded out might end up with more time at school than the clever ones. ●●●●● Arthasatra mentions treatment and care given to people with disabilities at mattas (monasteries) and in the time of Ashoka, at the hospital at Pataliputra.Sinhalese asylums for people with disabilities were set up by the century in what is now

SriLanka. History of special Education in western countries: Introduction from Ancient times to 1200AD The subject of mental retardation has been neglected in ancient writings but there is enough evidence in historical records to show it existed. The causes were then as now congenital, chromosomal, inter uterine damage, premature or protracted birth, or infections and accidents in infancy and childhood. Infant mortality was high and most children with Downs Syndrome, cerebral palsy or other disability where there was a weakened resistance to infection would have succumbed early to pulmonary infections, heart defects and gastroenteritis. However, some would have survived, like children who had a mental disability but no physical impairments. At a time when most people lived by agriculture, herding sheep and goats, or fishing, and reading and writing were unnecessary, moderate intellectual disability would not have been important. People with disabilities, whether physical or mental disabilities were treated in different ways according to

14 where they lived. Some parts of the Talmud advocated disability as a holy state and a means of getting to heaven and similar sentiments were expressed towards those who helped disabled people. At the heart of Jewish law was the idea that every human being newborn or adult, deformed or healthy, slave or free was made in the image of God. Abortion and infanticide were condemned while pagan religions sanctioned, condoned and encouraged the killing of malformed or sick infants. Plato stated that pregnant women over the age of forty years should have an abortion and Aristotle recommended both infanticide and abortion if there was a risk of a deformed child. He supported a law to ensure the compulsory exposure of all malformed babies who were abandoned with their ankles pinned together. The birth of a retarded child was interpreted by the Greeks as a punishment inflicted on its parents by the gods. Rearing a sick or disabled child was economically burdensome and unprofitable. In Sparta, racial homogeneity was prized. Citizens had to be physically strong and mentally able. There was a legal requirement to abandon deformed and sickly infants. Babies were left to perish on a mountainside or thrown into a chasm. If the disability was not obvious at birth, but the child was later found to be an "idiot" the child would be abandoned. And left to fend for itself, Meanwhile the Celts had a much more enlightened attitude. The social order was based on community, democracy and individual rights. Each clan or tribe occupied its own territory, and this was divided into three sections. The clan leader and his family had one section, another was set aside for the use of the poor, sick and disabled and the largest section was common ground for the whole tribe. Members working their own plots paid taxes which were used for the upkeep of the community and to support the poor, the sick and the aged. The Celts had hostels, orphanages and hospitals. Ancient Celtic laws show there was a well-developed medical service and that each individual tribe was responsible for caring for the sick, the wounded and those with mental handicaps. The Celts covered territory from Ireland to Hungary, from Sweden to Spain. Early Roman law gave power to the father to have absolute rights over his children. He could expose any female infant or a child of either sex who was deformed or disabled. Soranus a physician in the 1st and 2nd centuries AD wrote the earliest known treatise on gynecology and in it he had a chapter entitled How to recognize the Newborn that is worth rearing. He gave a quite scientific and detailed analysis of the various medical examinations which should take place. Some mentally retarded people would have received asylum in sanctuaries as

15 did other groups in the ancient world. However feeble minded and mentally disabled people had their political rights curtailed and would not have been granted Greek or Roman citizenship. As Christianity spread, a far more compassionate view was taken of people with disabilities of any kind. Charity towards people with disabilities and illnesses was preached and the Church set up orphanages for abandoned children in the 3rd and 4th centuries and the earliest hospital was founded by St Fabiola in Rome in 399 AD. St Nicholas, the Bishop of Myra showed particular compassion towards mentally retarded children and urged giving them tender care. In the Islamic world from the seventh century, feeble minded people were treated with respect. There was a belief that their minds were in heaven while their body moved around amongst ordinary mortals. Not all people we would think of as mentally disabled were thought to have any disability, but rather to be special individuals who were favoured by Heaven. Little was known about the causes of mental handicap, and medicine was based on "humours" and a close link between the body, mind and soul. Europe was still in the Dark Ages of science and medicine but in the Islamic world Avicenna (980- 1037) wrote a textbook the Canon of medicine in which he mentioned hydrocephalus, meningitis and other mental disorders. He recognized and defined various levels of intellectual functioning and knew that brain injury could affect memory and speech. There were mental hospitals in Cairo and Baghdad in the 11th and 12th centuries. Ibn Al-Baitar also wrote about mental disabilities during the first half of the thirteenth century. From the time of the end of the Roman Empire in Europe until the late middle ages, life remained very rural. By 1066 England had a population of less than one million. The majority lived in villages and hamlets surrounded by forests and marshes. Agriculture was the main occupation and the most powerful people were those who owned the most land. In a rural society literacy and intellectual ability were not important and every member of the family would have taken part in the daily grind of fetching water and fire-wood, ploughing the fields, or feeding the animals. Disabled people would have relied on relatives for their care but with poverty, malnutrition, poor hygiene and a feudal system life would have been hard. However city life was beginning again and St Bartholomew's hospital was founded in 1142 in London. In Prussia we have a record from the 12th century which said that mentally afflicted people were put in prison. As the medieval period continued, the population gradually increased and life became more sophisticated as more people moved into towns and

16 the generation of wealth meant that new phenomena such as urban beggars, some of them disabled became an issue and the importance of landed wealth led to the first law defining a distinction between mentally ill people and mentally disabled people. The Mediaeval period 1200-1450 Children with mental disabilities could be born to anyone rich or poor. Medieval society was based on the preserving and transfer of landed wealth. If the heir to property were mentally disabled, the King wanted to make sure that he was protected during his life time (or her lifetime) and that the property then went to the rightful successor. During the second half of the 13th century a law was passed. It distinguished between "natural fools", people who were mentally disabled from birth and those who had a mental illness and might recover or have periods of lucidity. The King used to "contract out" care of mentally disabled people to private individuals. In fact often private individuals would tell the king about a mentally disabled person so that they might get custody it was a private but monitored guardianship. They would pay the King a lump sum called a fine and annual rents and they would enjoy the revenue from the land and provide the person with the necessities of life until they died and the land passed to their heirs For a mentally ill person, especially one who had periods of lucidity they had to be kept at the economic level suited to his rank and the guardian could not have the surplus revenues. If they recovered the guardian no longer looked after the estate. A record of an Examination of Emma de Beston in Cambridge 1383.exists.Emma was asked whence she came, said she didn't know. She knew there were seven days in the week but could not name them. She said she had had 3 husbands but couldn't name one. She was asked how many shillings there were in 40 pence. She did not know. Asked if she would take 40 silver groats or 40 pence she said they were the same value. They found she was not of sound mind having neither sense nor memory nor sufficient intelligence to manage herself her lands and her goods. By inspection she had the face and countenance of an idiot .Because of this 80% of cases coming to the court described the heir as a fool rather than a madman because the guardian got more revenue from a fool. When the law was changed in the 16th century the number of people described as mentally disabled coming before Courts of Wards dropped to 30% in 1640. There was no dramatic decline in mental handicap. It is simply that when it was no longer advantageous to the guardian to have custody of someone who was disabled rather than mad, more people were recognized as mentally ill rather than mentally disabled. Another document from the thirteenth century clearly distinguishes mentally ill from mentally disabled people. It stated that "women, serfs, people under 21, open lepers, idiots, attorneys, lunatics, deaf-mutes, those excommunicated by a bishop and criminal persons" were all barred from becoming judges. In 1376 in Hamburg mentally retarded persons were confined to a tower in the city walls called the idiots cage. In Gheel in Belgium there was a saints shrine said to cure the mentally ill and afflicted. Many mentally handicapped and mentally ill people went there. Eventually an adult care scheme grew up where families fostered people with mental handicaps. This is still going on. Renaissance, Reformation and Beyond 1450-1800 Many paintings of the Renaissance, show infants and children with Downs Syndrome depicted as cherubs and the infant Jesus. Various explanation have been put forward. Some have said that people with mental or physical disabilities were all part of Gods order blessed infants of their good God, and had a special place alongside popes, bishops, king's noblemen and knights. People believed they would gain the favor of God by giving help and compassion to them. If this were true, it would have been a golden age where handicapped people were not only socially accepted but taken as models of divine and saintly beings. Unfortunately this theory is not entirely true. During the sixteenth and seventeenth century there are two views of disabled people ,either related to Satan or innocents unstained by normal and sinful human characteristics. In 1480, a book about witches. The Mallus Malificorum was published and read widely .In some areas where there was great superstition, women who gave birth to a disabled child were sometimes killed or exiled. They believed that a baby with a deformity or mental handicap was not the baby that was born to its mother but a replacement left by fairies and demons. This view was adapted from pagan folklore and Christianized explanations of the story were that the parents were guilty of some wickedness, or that the parents loved the child more than they loved God or that the mother had been seduced by the devil. Superstition held that a disabled, or deformed child was bad luck a curse divine retribution or that disability indicated possession by the devil or was the outcome of evil-doing. During the Middle Ages and into the 16th century people with physical defects, like hunchbacks or dwarfs, and people with simple minds were often kept as court

18 jesters and fools. There is a tradition that Tycho Brahe (1546-1601) the astronomer had as a close companion an imbecile to whose mutterings the astronomer listened to as divine revelations. Mentally disabled people would have been cared by many members of the family but if the breadwinner died, or the family fell on hard times they could claim relief from the parish. 17th and 18th century parish records mention people with learning disabilities describing them as idiot, stupid, innocent, witless. Different phrases like crazy or mad were used for mentally ill people. If the primary care died then person could be the legal obligation of parish and be looked after by the Parish nurse or other parishioners. Sometimes they would receive a clothing allowance. Bethlem or Bedlam Hospital was transferred to the City of London. In 1598 a committee appointed to inspect Bethlem found it "so loathsomely and filthy kept, not fit for any man to come into the said howse." there was an attitude that people who placed lunatics or idiots in Bedlam ought to pay for their upkeep. It was now felt that families who couldn't look after the mentally disabled person themselves should pay towards their upkeep and care elsewhere. Sometimes the mentally handicapped person was cared for in his own lodgings by a servant the beginning of private lunatic asylums. In early 16th century the majority of hospitals were almshouses and leper houses which did not provide medical care. During the seventeenth century hospitals providing care for the sick increased in number during the eighteenth century, specialist hospitals especially lying in hospitals became more common as did institutions into which the mad were detained since madness was not seen as a medical problem, these institutions were refuges rather than hospitals in the modern sense. 1615 in a legal dictionary, "an exposition of certain difficult and obscure terms States "Idiot is he that is a fool natural from birth and know not how to account or number 20 pence nor cannot name his father or mother nor of what age himself is or such like easy and common matters so that it appears that he has no manner or understanding or reason nor government of himself whether it is for his profit or disproof." In the 1650 's the managers of Bedlam tried to make a distinction between the curable mad and "those dangerous to be abroad" who should be in a hospital and harmless idiots who should not befit would be necessary to certify those who were lunatic .A subcommittee was set up to identify and eject those who were idiots and not lunatic. Bedlam was rebuilt in 1676. Segregation, Incarceration and Eugenics 1800-1945 The period from 1800- 1945 has been in many ways one of the worst for people

19 with mental handicaps and disabilities. Industrialization and scientific theories led to them being shut away from society and the legacy of prejudice is still with us today. This was also the period during which thousands of disabled people became the victims of mass murder by the Nazis. There were five categories of mental illness: melancholia or delirium, mania with delirium, mania without delirium, and dementia. - The fifth was, idiotism or the obliteration of the intellectual faculties. He described a defective perception and recognition of objects, partial and total abolition of the intellectual and active facilities, This disorder may originate in a variety of causes such as excessive or enervating pleasures, the abuse of spirituous liquors, violent blows on the head, deeply impressed terror, profound sorrow, intensive study, tumors of the cavity of the cranium, apoplexy, excessive use of the lancet in the treatment of active mania. The greatest number of idiots are either destitute of speech or are confined to the utterance of some inarticulate sounds. To be an idiot is almost levelled with an automaton to be deprived of speech or to Seguin a pupil of Itard founded in Paris the first school for idiots in 1837 .In 1846 the first private school for mental defectives in England was opened in Bath. In 1847 Park House in High gate opened by a philanthropist Andrew Reed and this had an annexed at Colchester which later became the Royal Eastern Counties hospital and newly built model asylum at Earl's wood which opened in 1855. It had 500 beds which set the pattern for many similar institutions and these 19th century hospitals lasted well into second half of the twentieth century. Retain that power merely of pronouncing inarticulate sounds, to be obedient only to the instructions one and sometimes to be insensible even to that to be incapable of feeling, attending to or gratifying without assistance their appetite for food, to remain motionless in the same place and position for several days together without discovering one single expression either of thought or expression. To be at other times subject to certain furious and evanescent outbursts of passion. Such are the characteristics of idiotism. Hence attention to their physical wants and comforts is the utmost that can be devised for these unfortunate beings ... education would not be appropriate owing to the natural indolence and stupidity of idiots they might be engaged in a manual occupation suited to their capacities. In 1867 the Idiots Act was passed. It was decided that "harmless paupers of the chronic or imbecile class should not be the responsibility of the workhouse, which was their only refuge. Instead they should be seen the 1860's the first large scale institution was built in order to incarcerate and segregate people then known as idiots

20 and the insane in Large numbers. Its chief physician was Down who was the first person to accurately describe the syndrome which bears his name The theories of Dr. Down. He believed that people with Downs Syndrome were a throwback to a more primitive racial type. He was impressed by the oriental appearance of their eyes and thought his patients looked like Mongolians whom he apparently believed to be primitive. Down may have thought that different ethnic races represented different evolutionary stages in man which meant that people with "mongolism" were throwbacks or representatives of arrested development at some earlier evolutionary stage. At this time there was a belief that the British race was superior to all others, a view we now know to be racist. Mental handicap appeared in all social classes the wealthy Victorians in Britain began to make residential provision for their own affected relatives and this provision was later extended to include the other social classes. In England small schools for the so called idiots began to open and pre occupation with education included those with disabilities. Unfortunately this only interested a minority and as industrialization gained momentum there was little room for the weak and incapable. The workhouses became full of social rejects. Until 1870 the majority of children in the UK received no formal education. Education was provided by voluntary bodies, the church and private fee paying schools. Most "mentally defective" children were confined to workhouses and institutions. Asylums were set up and "educable idiots and imbeciles" there received training and formal teaching. The Forster education act of 1870 established school boards to provide elementary education in those areas where there were insufficient places in voluntary schools. National Curriculum Elementary classes were large. Instruction was based on the "official code" with rote learning and memory tests. Teachers were paid by results. Some children were not able to learn in this environment. The 1899 Elementary Education (defective and epileptic children act) applied to children who "by reason of mental or physical defect are incapable of receiving benefit from the instruction in ordinary schools but are not incapable by reason of such defect of receiving benefit from instruction in special classes or schools. There was considerable reluctance however to set up such schools and by 1908 only 133 out of 327 education authorities were using their powers. In 1914 the power to provide education for mentally defective children became a duty and in 1918 for physically disabled children. These special schools and 21 private institutions were often run as charities supported by voluntary subscriptions. The main purpose was to provide training and discipline so that the disabled inmates became less of a public burden and didn't end up as beggars or living on poor law handouts or becoming a public nuisance. While the institutions was providing asylum(refuge) their inmates were expected to help run them. It was felt a healthy body encouraged a healthy mind and Satan made work for idle hands. Physical training and work therapy were encouraged. Social training including simple tasks like mending and cookery was given and instruction in whatever primary subjects could be learned such as telling the time and classes in Speech. They were not hospitals but therapeutic communities did not to care for the "helpless". In Ireland in the Late 19th and early 20th century religious orders began to take over country mansions, build residential centers, or take over disused sanatoriums Isolated by physical barriers spacious grounds, walls, busy roads. Nuns and monks intention to provide a high quality of devoted care for "children of God" emphasizing their role as protectors of a rejected population, these religious communities drew upon their own traditions of separation from the outside world. They catered for a wide geographical area. By the end of the 19th century the enthusiasm for education had given way to demands for the permanent segregation from the rest of society. Eugenics was based on a wrong interpretation of Darwin's theories of natural selection. Focusing on hereditary nature of defects it led to wholesale incarceration... Disabled people became segregated into institutions there was no welcome for disabled people in the community. The National Assistance Act of 1911 introduced the first welfare benefits. A Royal commission on the feeble minded estimated that there were 150,000 "mental defectives "in England and Wales. The care of the mentally handicapped was passing from educationalists to the medical profession who were thought to be able to provide answers to the problem. The government came under pressure to do something for mentally handicapped people... This pressure came from two opposing schools expressing compassion on one hand and fear on the other. The Mental Deficiency Act of 1913 laid on local authorities the duty of providing care for certain cases of mental deficiency. This was done partly by Guardianship paying for accommodation in certain voluntary institutions providing new premises. Inclusion, Civil Rights and a better life 1945-2000 The 1944 education act introduced Compulsory Secondary Education. It also

22 introduced the 11 plus segregating children into secondary modern and grammar schools and subdividing children with impairments into 11 categories including educationally sub normal, maladjusted and those with speech defects as well as blind, deaf and delicate. Seriously disabled children had to be educated in special schools more and more special schools were opened in the 50s 60s and 70s. In 1948 with the introduction of the National Health Service in Great Britain many institutions were nationalized and became hospitals. This led to more emphasis on the more helpless patients and on those with disturbed behavior being admitted to these hospitals to the exclusion of those only requiring accommodation and simple supervision. The National Assistance Act of 1948 imposed a duty on Local Authorities to arrange for the welfare of disabled persons. These include people who are "deaf, blind, dumb, and other persons who are permanently handicapped by illness, injury or congenital deformity or who are suffering from a mental disorder" Mental disorder covered both mental illness and mental handicap. In the 1950's and 60's it was recognized that environment plays an important part in the development of social and mental ability and in 1970 under the Education (Handicapped Children) Act the 70,000 children who had been considered uneducable under the terms of the 1913 MDA act got the right to education under a new category of "educationally sub normal-severe" and 400 new special schools were formed out of the old junior training centers. The Disabled Persons employment act of 1959 says a local authority must make provision for sheltered employment, training and assistance in finding work for registered disabled people. The chronically sick and disabled persons Act of 1970 put a duty on local authorities to provide services for disabled people such as practical assistance in the home, help with getting TV, radio, library and other recreational facilities, help with travelling to services arranged or approved by the local authority, assistance with adaptations to the home for greater safety or comfort, holidays, meals at home and elsewhere and help with getting a telephone training. But attitudes change very slowly and a leaflet from as late as 1973 published by the then National Society for Mentally Handicapped children states: "When informed by their doctor that their child is affected with mongolism and warned that it may show some mental backwardness, parents often imagine the worst and think that their child will never walk or talk. Although a few Mongol children are as handicapped as this and they can live at home when young, they will

23 probably later need permanent hospital care. Due to their slow intellectual growth most Mongols are precluded from making satisfactory progress in formal education of the type provided by Local education authorities. However they benefit from the less formal type of education which they receive at the special centers provided by the local Department of Health although these are not always yet available in the more sparsely populated areas of Britain. In addition to the two already mentioned there is a third considerably smaller group of children with mongolism who are even less backward and develop intellectually from a half to two thirds the rate of an average child. Many of this group can profit from formal education, particularly when given in the smaller classes with specially trained teachers in schools for the educationally subnormal" From a leaflet published by the National Society for Mentally Handicapped Children entitled The Child with Mongolism (under which is the strap line 80 to 90 per cent can learn to do simple tasks) Printed in 1973. In 1981 at the time of the trial where Dr. Leonard Arthur was accused of murdering a baby with Downs syndrome such children were described as "walking time bombs of disease and infection" In a different trial concerning Alexandra another baby with Downs Syndrome she was described as "an unfortunate pathetic creature", " a helpless and mindless Mongol" The Disabled Persons Act 1986 put a duty on local authorities to assess people for services. The 1981 education act and the 1989 Children Act, have helped to improve services for children. The 1993 Community Care Act took services away from Long stay hospitals and placed them in the community but without extra cash. The 1993 Education Act and the new Labour legislation are trying to increase choice for children to attend mainstream schools and the Disability Discrimination Act of 1995 hopes to ensure that disabled people have equal civil rights in some areas. It makes it against the law to run a service or provide goods and facilities in a way which makes it impossible or unreasonably difficult for a disabled person to use the service or goods. It is against the law to refuse to serve someone who is disabled. People will have to provide equipment or other helpful items to make it easier for disabled people to use their service. People will have to remove physical obstructions or provide other ways of letting disabled people use their services. The government is able to set minimum standards for new public transport vehicles and for new homes and buildings. The Community Care (direct payments act) 1996 gave local authorities the power to make cash payments known as direct payments to community care users for the purchase of their own support. However, the new code of practice

24 on Special Educational Needs and the education section of the disability discrimination act have both been weakened by pressure from people who see inclusion as expensive. In conclusion, how does life for an "intellectually impaired" person in 2000 compare with that of a "natural fool" in 1 000 AD? Their standard of living is much better. Almost everyone in Britain today lives more comfortably than the King lived in Norman times-they have flush toilets, gas and electricity, good transport, a variety of food whatever the season and 24 hour a day entertainment from TV. They have much better health care and education and a welfare system to protect them from starvation and destitution. However the legacy of segregation is still with us today. Many people coming into the community in the 80's and 90's have lived for more than 50 years in a mental handicap hospital. Many children are still educated in special school, and those in mainstream encounter prejudice and ignorance and a mindset of league tables while adults are still catered for in specialist day centers and residential homes. Nevertheless, public attitudes are slowly changing, the Disability Discrimination Act and legislation on inclusion though not going far enough recognize that people with learning disabilities have equal rights and their opportunities for education and employment are much better than 50 years ago. Let us hope that during the 21 st century the harm done in the 19th and early 20th centuries by eugenics can be put in the past and that just as the 20th century brought about civil rights for women and former slaves, the 21 st century can bring about equal rights and opportunities for people with learning disabilities.

1.4 Definition of Intellectual Disability—International and Indian perspective
1.4.1 Definitions as per ICD10 ICD-10 is the 10th revision of the

Intellectual disability means a significantly reduced ability to understand new or complex information and to learn and apply new skills (impaired intelligence). This results in a reduced ability to cope independently (impaired social functioning), and begins before adulthood, with a lasting effect on development.

Disability depends not only on a child's health conditions or impairments but also and crucially on the extent to which environmental factors support the child's full participation and inclusion in society. The use of the term intellectual disability in the context of the WHO initiative "Better health, better lives" includes children with autism who have intellectual impairments. It also encompasses children who have been placed in institutions because of perceived disabilities or family rejection and who consequently acquire developmental delays and psychological problems. 1.4.4 PwD Act 1995 "

Chapter -3 ID.docx (D155148857)

Intellectual Disability (Intellectual Developmental Disorder) is a disorder with onset during the developmental period that includes both intellectual and adaptive functioning deficits in conceptual, social, and practical domains.

Intellectual disability involves impairments of general mental abilities that impact adaptive functioning in three domains, or areas. These domains determine

63% MATCHING BLOCK 26/203

W

how well an individual copes with everyday tasks: The conceptual domain includes skills in language, reading, writing, math, reasoning, knowledge, and memory.

The

on self-management in areas such as personal care, job responsibilities, money management, recreation, and organizing school and work tasks. 30

Unit 1.5 □□□□□ Etiology, Causes & Prevention 1.5.1 Prenatal Hazards Infections The most common prenatal infections associated with intellectual disability are rubella, toxoplasmosis syphilis and cytomegalovirus. These infectious diseases are responsible for a small percentage of the population of intellectuality disabled persons. Congenital rubella This disease in new borns is caused by a virus that infects the pregnant woman during the first placental and then to fetel infection. The embryological timing of the viral insult is crucial as the fetus is especially vulnerable during the first 3 months of pregnancy. The symptoms are varied and unpredictable; rubella pregnancies may lead to spontaneous abortion to still birth to live birth with one or more abnormalities or to a perfectly normal child. Congenital Rubella is wholly preventable through a vaccme. The vaccination of children is of special concern because they often spread the viral infection to previously unexposed mothers. Vaccination of prospective mothers is also recommended. Congenital cytomegalovirus This is the most common of fetal infectionsand is found in about 1 percent of all new borns. Fortunately about 95 percent of affected infants are asymptomatic. Neonatal death is common and about 75 percent of survivors show neurological abnormality, blindness, deafness, spastic quadriplegia, orhypotonia, and variable degress of intellectual disability. Congenital Toxoplasmosis This is a protozoan infection that like rubella is typically non injurious to the pregnant woman but devastating to the fetus also as in rubella Fetal vulnerability is largely confined to the first of month of prenatallifecular and neurological lessons and brain calcification characterize the congenital form of the disease. The acutely ill new born usually dies in the first month of life and the great majority of survivors posses complete or partial blindness and psycho-motor disturbances. Treatment of the new born consists of chemotherapy which is desinghned to arrest the infectious process.

31 Metarnal Fetal blood incompabilities Intellectual disability may occur when the mother aquires what is in effect an allergic reaction to her new born baby blood. Rh disease is the well-known example of the phenomenon. ABO blood group in compability is also a potential though lesser cause of fetal central nervous system damage. Rh - incompability It occurs when mother and fetus have different Rh blood groupfactors. The Rh factors is an autosomal hereditary trait, Rh positive is dominant to Rh- negative. The maternal - fetal incompability arises only when an Rh negative mother bears a child of an Rh positive father. Where the father is homogenous, all of the children would be Rh-positive and potentially vulnerable the remainder, off the offspring shall be Rh-ncgative like the mother. Although the precondition to the Rh disease is an Rh-negative mother and an Rh-positive fetus problems arise only, if there has been some previous mixing of fetal and maternal blood. If this has Rh-positve blood will have responded to the baby's foreign blood by producing anti bodies that have the capability of destroying fetal blood cell. Such antibody effects are more likely to be found in later born children but fortunately only about 10 per cent of vulnerable mothers-react. Sensitization of the rh negative mother to rh positive blood usually occurs at child birth when some mixing of maternal and fetal blood into the maternal circulation or after an abortion. Following sensitization of the mother she begins to produce anti- bodies. If this occurs during the first pregnancy there are usually no ill effects on the fetus. But if during suceding pregnancies mixing recurs an enhanced maternal store of antibodies can destroy red blood cells, causing fetal anemia and setting the stage for possible post natal damage to the brain. It is the latter that has an implications for intellectual disability. Folic Acid Deficiency Neutral Tube defects are birth defects that occur in the brain or spinal cord. Spina-bifida is the most common NTD. Babies born with the NTD anencephaly can be still born or die soon after birth. Women, who take the vitamin -B and folic acid is also help\ful in preventing NTD. These foods include peas corn dried beans, white and whole wheat bread, fortified breakfast cereals and orange juice. The folic acid can be destroyed if these foods are over cooked.

32 Drugs alcohol and tobacco There are some 20 drugs that are known to produce adverse fetal effects so called teratogens. In the late 1950s and early 1960s we became aware of thalidomide, in the 1960s with the flourishing of hard drugs; we were alerted to the chromosomal breakage in connections with LSD and to fetal heart lungs skeleton, and central nervous system associated with the maternal use of amphetamines. an anti-nauseant used during pregnancy and a cause of limb malformations. In the 1960s it was found in drug-addicted. In the 1970s and 1980s, attention has been called to the adverse effects on the fetus of alcohol and tobacco during pregnancy. Narcotic Addiction The use of heroin and methadone throughout pregnancy appears to have two fetal effects. Babies tend to be similar and about 80 percent are born addicted. Addiction is seen in the appearance of withdrawal symptoms within 4 days after birth. In order of frequency, they involve the central nervous system looseness, in coordination of sucking and swallowing and seizures the gastrointestinal system and the autonomic nervous system. Marijuana The effect of marijuana smoking during pregnancy is unclear. Women who use marijuana during pregnancy are at greater risk for babies with low birth weight, shorter gestation periods and major malformations. Alcohol The most commonly abused drug alcohol has been clearly tied to fetal abnormalities including intellectual disability. The clinical picture in the neonate has been termed the fetal alcohol syndrome. Its symptoms are retarded physical development, microcephaly, micrognathia microphthalmia, cardiac defects and intellectual disability. Although there is no direct evidence of an adverse effect of maternal tobacco smoking during pregnancy on later mental development, research indicates increased pregnancy risks that could be associated with neurological abnormality and cognitive impairment. The initial study on the effects of cigarette smoking during pregnancy found an increased risk of pre-maturity in the newborn. Numerous studies reveal that birth weights are reduced in proportion to the number of cigarettes smoked. There is now evidence that maternal smoking related increase in several complications of pregnancy bleeding, abruption of the membrane.

33 Other teratogenic Drugs Drugs used for medical purposes may also damage the fetus. Reference was made earlier to thalidomide. Quinine can cause deafness, and anticovulsant drugs can produce abnormalities. The so-called fetal hydantoin syndrome occurs in about 10 percent of the offspring of epileptic women and like the fetal alcohol syndrome includes growth impairment at both the physical and intellectual levels. During pregnancy the mother must avoid smoking, taking alcohol, harmful medications poses some risks of lung disorders in neonates and drugs for giving birth to a healthy child. Radiation The teratogenic effects of radiation have long been known. Early studies found that women who were receiving therapeutic pelvic irradiation for cancer during early pregnancy have an increased risk of having children with microcephaly and intellectual disability. The same clinical picture was seen in pregnant woman exposed to first trimester, can be harmful. Since most of our radiation exposure is through medical treatment, prevention of these problems requires careful use of X-ray in pregnancy and throughout the child bearing years. Chronic Maternal Health problems A series of maternal infectious disorders, high blood pressure affects the circulation to the uterus and may either interface. But there are also some non-infectious and chronic health problems that can threaten the health of the fetus. Hypertension In hypertensive disorders, high blood pressure effects the circulation to the uterus and may either interfere with the development of a normal placenta or cause it to undergo degenerative change. In either case the fetus is deprived of adequate blood supply either causing in utero death or impairing general growth and development. Hypertensive disease is a particular problem in the last trimester of pregnancy and is a major cause of maternal death and fetal loss. Diabetes mellitus The diabetic mother whether the diabetes is chronic or gestational in nature also creates fetal risks. She is much more susceptible to hypertension and to its potential placental circulatory problems. Diabetic women also tend to bear babies who are very large and yet have physiologically immature lungs. Their large size and immaturity can lead to problems to brain damage.

34 1.5.2 Perinatal Hazards In terms of health, the first 28 days of life are the most important period in childhood. This is the time of greatest infant mortality but it is also a period during which sub-lethal damage from perinatal events is frequent. Brain injury suffered during labor, delivery or during the neonatal period causes a large proportion of neurological problems which later manifest themselves as cerebral palsy, deafness and/or intellectual disability. Pre-maturity It is one of the important factors associated with either neonatal mortality or chronic brain injury, abnormalities of birth weight and gestational age. The premature infant has been traditionally defined as either born before 38 weeks or having a birth weight of less than 2500 grams. About 7-10 percent of births are premature but its frequency varies with the sex of the child and with race and socioeconomic status of the mother. The health problems of the premature neonate tend to be proportional to the degree of pre-maturity. There are two primary causes of prematurity :- impairment of potential for normal growth associated with chromosomal abnormalities, exposure to toxins intrauterine infection and restriction of a normal potential due to such factors as multiple pregnancies or placental vascular disease as in diabetics or hypertension. Asphyxia While the roles of perinatal asphyxia and physical trauma as causes of brain damage have probably been exaggerated in the past, these hazards are still important. Asphyxia is a leading cause of death in very small infants, those with birth weights of 1000 grams. On the other hand, the healthy newborn is said to be remarkably resistant to it if there is no prior brain damage. If there has been no evidence, however prolonged perinatal asphyxia can produce either brain damage or death. Common causes are pre-mature separation of the placenta, prolapse of the umbilical cord, difficult labor, depression of the respiratory center due to excessive anesthesia and obstruction of the respiratory airway. Physical Trauma Physical trauma during the birth process can result in traumatic vascular injury. While it has been greatly reduced by modern obstetric procedures, it still occurs particularly in connection with prematurity or difficult labor. Massive brain hemorrhage is usually fatal, but small intra-cerebral hemorrhages can lead to motor abnormalities, seizures and intellectual disability. Herpes infections This is a viral infection of the geriatric that is occurring with increasing frequency in pregnant women. Following initial infection the virus is generally dormant within the maternal tissue until reactivated by a variety of stimuli and resulting in renewed infection. The herpes virus is generally contagious. It is transmitted from mother to infant during childbirth where about half of the newborns are affected. When the maternal infection is recognized close to the time of birth delivery may be by cesarean section. Because of the neonate's immature immunological system, spread of the infection is common, and results in death or serious consequences in about 80 percent of cases. 1.5.3 Postnatal Hazards Post-natal biological factors causing intellectual disability consist of infectious diseases, which affect the brain, cerebro-vascular accidents (most often from head injury), brain tumors, poisons, environmental toxins and severe dietary protein deficiency. Infectious Diseases There are two kinds of infections that can result in permanent neurological problems and intellectual disability - encephalitis and meningitis. Encephalitis is inflammation of the brain, and meningitis is inflammation of the three membranes that line the brain, the meninges. Encephalitis Inflammation of the brain leads to injury to nerve cells (neurons). This may result from an initial invasion of the brain by an infectious agent (primary encephalitis) or following the infection of another organ (secondary encephalitis). The major sources of primary encephalitis are the viruses of mumps, herpes simplex, and infectious mononucleosis. Mumps virus is the most common and can produce death or such permanent neurological deficits as intellectual disability, cerebral palsy and seizures. Among the secondary encephalitis, the most common is measles encephalitis, but it can also be associated with whooping cough. Measles encephalitis is a very rare complication of ordinary measles.

36 The course of the disease is unpredictable, with about 20 percent suffering permanent damage. Meningitis In meningitis, there is infection of the meninges with consequent inflation and symptoms of increased intracranial pressure (fever, bulging of fontanelles, projectile vomiting, alternating periods of drowsiness and irritability). In serious infections associated with high fever, one sees convulsions, stupor or coma. With the development of antibiotics and other drugs, there has been a major reduction in mortality rate in the most serious of the meningitis, bacterial meningitis, but a sizable proportion of children affected in the first year of life are still left with crippling neuromuscular problems, hearing and visual impairments, seizures and cognitive deficits. Cerebral Trauma Among children, accidental injuries are the greatest threat to life. About 40 per cent of all trauma cases in children involve head injuries. Most injuries to the head are simple concussions or mild contusions, and there is usually complete recovery without complications. The head injuries that are more serious are those that involve intracranial bleeding. Bleeding between the outermost membrane covering the brain (and spinal cord), the dural matter, and the brain itself, subdural hematoma, can result in cerebral atrophy and neurological deficit. Fortunately, neither organic dementia nor intellectual deficit, as such, is a common outcome of cerebral trauma. The main symptoms are enuresis, disturbance of sleep patterns, episodically aggressive behavior, and decline in school achievement. High percentage of injuries occurs in children who are tired, hungry or playing in unsupervised or unsafe areas. Risk is high when illness or emotional tension is there in the family. Poisons and Environmental Toxins In the earlier section on pre-natal factors, reference was made to the potentially adverse environment to which a fetus might be exposed through maternal use of drugs. There are also some post-natal dangers to the brain associated with drug use. Glue sniffing has been linked to brain damage, and barbiturate abuse has been related to impairment in cognitive functioning. The most important of the toxic dangers, however, are lead and mercury.

37 Lead Poisoning Lead encephalitis is a complication of lead poisoning. It usually results from prolonged ingestion by the infant or young child of flaking leaded paint, the kind found in dilapidated housing. Daily consumption of only a few small chips for 3 months can produce lead poisoning. Most cases of acute lead encephalitis occur in children ages 1 - 3 years, of whom about 5 per cent die and 50 per cent sustain permanent brain damage. Mercury Poisoning Dramatic evidence of the toxic effects of some metals has also been shown for mercury. Accidental consumption of mercury may cause serious neurological problems involving memory, skin sensation, vision, gait, and emotional stability, cerebral palsy and intellectual impairment. In addition to these effects, mercury consumption by pregnant women may lead to pre-natal damage. Malnutrition One of the most perplexing questions in intellectual disability has been the effect of malnutrition on mental development. It is estimated that at least half of the children in developing countries are moderately or severely undernourished - with basic caloric deprivation as the primary problem. Research efforts to relate malnutrition specifically to intellectual impairment have been continually confounded by the fact that malnutrition usually does not occur alone but rather in combination with other biological and psychological hazards to normal mental development. For example, infectious diseases may be the most important cause of malnutrition. The malnourished child has limited resistance to infection, and the infection itself aggravates nutritional stress by elevating calorie requirements. A study by the National Sample Survey, Government of India, has revealed that among the children, 31 per 1000 in the rural area and 9 per 1000 in the urban area are developmentally disabled. Malnutrition is one of the major causes responsible for higher number of developmentally disabled children in the rural India. This includes malnutrition of pregnant women, infants and young children. All women require good nutrition during pregnancy, especially adolescent girls whose own bodies are still growing. Nutritious meals consisting of items from the five major food groups eaten each day help the fetus grow. These food groups include: vegetables; fruits; breads, cereals and rice; milk, yogurt and cheese; and

38 meat, poultry, fish, dry beans, eggs and nuts. Since foods within each group vary somewhat in nutrition content, pregnant women should vary their choices within each group. A woman should consume about 300 extra calories a day when pregnant. Adequate drinking of water helps the body digest food and absorb essential nutrients. By eating a well-balanced diet, most women can get a good supply of vitamins and minerals needed for pregnancy. However, most doctors will prescribe a pre-natal multivitamin supplement to ensure the pregnant woman receives sufficient iron, calcium, folic acid and other needed nutrients. Poor nutrition and unbalanced diets during pregnancy can cause low birth weight or pre-mature births. Infants who service these conditions are more likely to have intellectual disability, cerebral palsy, epilepsy and respiratory disease.

1.5.4 Prevention of Mental Retardation

If taken suitable action and precautions in the right time, many a time, mental retardation IS preventable. Preventive services should be administered by the physicians, parents and the community and should be efficiently implemented. They should cover both mother and child health care. Child health care begins right from the stage of unborn child to its full development stage up to 18 years of age. Our efforts are towards producing healthy babies without physical defects or mental retardation. A good health delivery system, which has easy access to everyone and gives quality care at minimum cost is very essential.

Prevention Strategies at Various Levels

The old dictum "prevention is better than cure" is also applicable to intellectual disability. More knowledge on the causes of intellectual disability helps its prevention. Three levels of prevention of intellectual disability have been described. The levels of prevention are: ●●●● Primary prevention ●●●● Secondary prevention ●●●● Tertiary prevention

1.5.4.1 Primary Prevention

Primary prevention focuses on the developing fetus. The objective is to reduce the number of children born intellectually disabled or with conditions that could lead 39 to intellectual disability. One of the important strategy can be to provide good teaching to a pregnant woman regarding dangers of drugs, alcohol and smoking. Genetic counseling for couple~ whose children are at risk is another. Research is essential to find:g causes and possible treatments for conditions that can lead to intellectual disability. The effects of rubella, for example, have been largely eliminated through antibody screening and immunization programme.

1.5.4.2 Secondary Prevention

The objective of secondary prevention is to identify and change environmental conditions that could lead to intellectual disability. By screening newborns for PKU, we can begin treatment and prevent intellectual disability. By eliminating sources of lead, we can reduce brain damage from lead poisoning. by providing youngsters from disadvantaged homes with strong preschool programmes, we can begin to counteract the elements that can cause intellectual disability due to environmental factors.

1.5.4.3 Tertiary Prevention

Tertiary prevention focuses on arranging the educational and social environment so people who are born with or who develop intellectual disability can achieve their maximam potential and highest quality of life. Early intervention programmes–start with youngsters who seem to be at risk for intellectual disability at an early age and try to sharpen their perceptual abilities, encourage the use of expressive language, and give practice in classification and reasoning. Some programmes urge parents to continue and extend these activities at home. All attempt to strengthen the thinking processes of young children who are delayed in development, and all succeed to a degree. For prevention of intellectual disability, one must study the causes carefully and take appropriate preventive measures during pre-natal, peri-natal and post-natal period. Possible preventive measures have been suggested along with specific causes.

Steps for Prevention at different Stages of Development

Each developmental stage requires adequate attention to prevent mental retardation. For each stage the required preventive measures are described in a sequential manner.

40 1.5.4.4 Prenatal Prevention Inadequate pre-natal care has been linked to pre-maturity and low birth weight, which is in turn linked to mental retardation. Pre-natal care that will guard the foetus against damage from maternal illnesses and infections and other dangers should be assured for every pregnant women from the very start of the pregnancy. The Pregnant woman is advised: i. To go for regular anti-natal checkups for early detection of abnormalities, illnesses and infections so that prompt treatment and 11 good management plan for delivery can be provided. ii. To maintain good nutrition status: Poor nutrition for both the baby and the mother is linked with impaired brain development and retardation. Malnutrition in the mother can give rise to low birth weight baby who in turn is a high- risk infant for mental retardation. Therefore, anti-natal programmes and child health programmes should ensure good nutrition and health to both the mother and the child. A pregnant woman has to take sufficient amounts of nutritious foods to maintain her health and also supply nutrients to the growing foetus. Thus the food requirement of a pregnant woman increases greatly. The diet should contain adequate amounts of proteins, carbohydrates, fats and minerals to supply the required calories and body building substances. Therefore, the diet should contain adequate amounts of cereals, pulses, green leafy vegetables, milk, eggs, fruits and fresh foods. Lack of these nutrients can give rise to anemia and other nutritional deficiencies. Iron and vitamin supplements may be given in the form of tablets, syrups or injections, to avoid deficiency status in the II trimester of pregnancy. iii. To get preliminary investigations done (like blood and urine), pre-natal diagnosis is essential. This encompasses a number of procedures designed to assess the condition of the unborn baby. a) Ultra sonography. b) radiography. c) Amniocentesis. — to know chromosomal abnormalities — enzyme deficiencies — metabolic disorders — sex of the baby — alphafoeto proteins.

41 If these tests prove that the foetus is normal, the parents can be reassured. If found to be abnormal, the parents are given options for medical termination / treatment, which will prevent the occurrence of a child with mental retardation. Treatment of illness and timely immunization: a) to get prompt treatment for illnesses and infections. b) To get immunization at appropriate time: during the 7th', 8th' and 9th' months of pregnancy a pregnant woman should take injection of tetanus toxoid (TT) to avoid the tetanus infection during delivery and immediate post-natal. It also gives immunity of the fetus and the new born child as the maternal antibodies pass to the fetus via the placenta. 1.5.4.5 Natal and Perinatal Prevention A trained person should conduct delivery under hygienic conditions. Unnecessary meddling of the fetus should be avoided. The baby should be handled gently with care. The umbilical cord should be cut with a sterile knife. In cases of difficult or abnormal labour or delivery, the woman should be taken to the nearby hospital without delay. Ensure the delivery of placenta and control of the uterine bleeding after the delivery of the baby. Mother should be allowed to rest for few hours immediately after delivery. The following suggestions are to be followed: ●●●● Good perinatal care is an important factor in prevention of mental retardation. ●●●● Pregnant woman should be advised to get delivery conducted by trained personnel at home under hygienic conditions or at a health center. ●●●● For all complicated pregnancies and labours the delivery should be conducted at hospitals in order to bring down injury and infection, which are the causative agents of mental retardation in the child. At present survival rate of babies is very good especially the premature and low birth weight babies with good peri-natal care. They also survive as normal healthy babies thus bringing down the percentage of mentally retarded cases. ●●●● All high-risk infants should be well taken care of and should have a long-term follow up for early detection of handicapping conditions and delays in development.

42 1.5.4.6 Postnatal Prevention Neoriatal screening: Some of the conditions of mental retardation like PKU and Hypothyroidism can be prevented from progressing into mental retardation by early treatment. Therefore, it is highly important to detect these at the earliest. This is possible with simple tests of blood and urine examination in a new born and treated immediately. Other metabolic errors also can be detected during the neonatal screening and parents should be counseled regarding mode of inheritance and recurrence risks in avoiding further occurrence of mental retardation due to these causes. High risk infants care and follow up: Intensive care should be immediately available to babies who are at high risk for mental retardation such as pre-maturity, low birth weight, birth asphyxia, babies born of prolonged difficult labour and other complications. There is a need for well-equipped neonatal intensive care units to cater to such services. Even after discharge from hospitals such babies need

SEID -31 PDF.pdf (D127037695)

a close follow up to identify delays and abnormalities in development.

This helps us in giving the earliest interventions and corrections, which reduce the severity of handicap. Early stimulation and intervention programmes: These programmes are for children with handicap or developmental delays. The two main components of these programmes are: 1. Directly stimulating the child with enriched environment to enhance development. 2. Teaching the parents the techniques that can be used at home and helping them to have better parenthood. They cover the child's health, nutritional, psychological and educational needs. These programmes prevent further complication and reduce the severity of handicap. Immunization: Mental retardation caused by infections like Diphtheria, Tetanus, Whooping cough, Typhoid, Measles and Poliomyelitis and Rubella can be prevented by active immunization programmes. Immunization confers protection against the specific viral and bacterial infections. To prevent the negative effects of Rh-incompatibility an injection of Rh- immunoglobulin (Rh-IG) must be given to susceptible pregnant women within 72 hours after each delivery, abortion or miscarriage. Early identification and appropriate treatment of infections lessens the complications. Proper environmental and personal hygiene, clean water supply, destruction of insects and animals which carry infections all help in reducing the occurrence of infections and thereby the occurrence of mental retardation.

43 Prevention of accidents and poisoning: Accidents and poisoning can injure the brain and cause irreversible damage and mental retardation. This is one of the preventable causes of mental retardation. However the following steps should be followed. ●●●● People should be made aware of the potential causes of accidents and poisoning and the methods of avoiding them through various "public awareness programmes". ●●●● Safety principles, safety equipment and safety requirements should be made known to general public. ●●●● More rigorous identification and eradication of toxic substances in the environment, such as lead paint, airborne or water borne mercury compounds should be perused. ●●●● Screening programmes to identify the affected children should be emphasized upon for early treatment and prevention of mental retardation. ●●●● Use of alcohol, drugs and teratogens is another major cause of retardation as they have adverse effect on the developing foetus. Therefore, these have to be avoided specially during pregnancy to prevent the occurrence of mental retardation in babies. Nutrition: As mentioned earlier, poor nutrition for both the baby and the mother is linked to impaired brain development and retardation. Malnutrition in the mother can give rise to low birth weight baby who in turn is a high-risk infant to mental retardation. Therefore, antenatal programmes should ensure good nutrition and health to birth the mother and the child. Family planning: The best age the mother is between 20 and 30 years. Having children when younger or older increases the risk of having a mentally retarded child. Pregnancies at very short intervals drawings on the health of the mother leads to complications therefore family size should be restricted and children should be properly spaced. Dissemination of the information: The information regarding prevention of mental retardation should be disseminated to the general public and the various professionals involved creating awareness. Research is needed to frame further developmental strategies for facilitating progress in prevention of mental retardation and developmental delays.

44 Unit 1.6 □□□□ Classification of persons with Intellectual Disability Classification of Intellectual disability 1.6.1 Psychological classification A psychologist measures the intelligence quotient through psychological testing to make a psychological classification of an individual. The intelligence quotient of a person can be calculated by the given equation: $I.Q = \frac{MA}{CA} \times 100$ I.Q = Intelligence quotient-Actual intellectual ability of a person MA= Mental retardation- Mental age of the person as per test finding. CA= Chronological Age -Actual age of a person. Based on the 1980 APA definition, the operational classification for persons with mental retardation is as follows: Level of Retardation

57%	MATCHING BLOCK 30/203	SA	Effect of Vocational Training on Behavioural S ... (D29288122)
IQ Range Mild Mental Retardation 50-BELOW 70 Moderate Mental Retardation 35-49 Severe Mental Retardation 20-34 Profound Mental Retardation BELOW 20 1.6.2 Medical classification Mental Retardation			

has been characterized according to medical symptoms and factors.

It can be classified based on the following causes and symptoms- 1. Infection and Intoxication 2. Mental and physical problems 3. Metabolism and nutrition 4. Mental diseases 5. Unknown factors from birth 6. Genetic disorders 7. Diseases during pregnancy

45 8. Psychosis 9. Environmental factors 10. Other factors **

supports (E.g. Time limited employment training or transitional supports provided during the school to adult period. Extensive Supports characterized regular involvement (e.g. Daily) In at least some environments (such as work or home) and not time limited (e.g. Long term support and long term home living support) 1.6.5 ICF INTRODUCING THE ICF The International Classification of Functioning, Disability and Health (ICF) are a framework for describing and organizing information on functioning and disability. It provides a standard language and a conceptual basis for the definition and measurement of health and disability. The ICF was approved for use by the World Health Assembly in 2001, after

47 extensive testing across the world involving people with disabilities and people from a range of relevant disciplines. A companion classification for children and youth (ICF-CY) was published in 2007. The ICF integrates the major models of disability. It recognizes the role of environmental factors in the creation of disability, as well as the relevance of associated health conditions and their effects. This overview provides a brief introduction to the ICF – its structure, contents, purposes and applications. Aims The ICF is a multipurpose classification system designed to serve various disciplines and sectors – for example in education and transportation as well as in health and community services – and across different countries and cultures. The aims of the ICF (WHO 2001:5) are to : ●●●● provide a scientific basis for understanding and studying health and health- related states, outcomes, determinants, and changes in health status and functioning; ●●●● establish a common language for describing health and health-related states in order to improve communication between different users, such as health care workers, researchers, policy-makers and the public, including people with disabilities; ●●●● permit comparison of data across countries, health care disciplines, services and time; and ●●●● provide a systematic coding scheme for health information systems. The ICF 'has been accepted as one of the United Nations social classifications ... and... provides an appropriate instrument for the implementation of stated international human rights mandates as well as national legislation' (WHO 2001:5- 6). Hence, the ICF provides a valuable framework for monitoring aspects

100%

MATCHING BLOCK 34/203

W

of the UN 48 Convention on the Rights of Persons with Disabilities (

UN 2006), as well as for national and international policy formulation. Underlying principles Four general principles guided the development of the ICF and are essential to its application. Universality. A classification of functioning and disability should be applicable to all people irrespective of health condition and in all physical, social and cultural contexts. The ICF achieves this and acknowledges that anyone can experience some disability. It concerns everyone's functioning and disability, and was not designed, nor should be used, to label persons with disabilities as a separate social group. Parity and etiological neutrality. In classifying functioning and disability, there is not an explicit or implicit distinction between different health conditions, whether 'mental' or 'physical'. In other words, disability is not differentiated by etiology. By shifting the focus from health condition to functioning, it places all health conditions on an equal footing, allowing them to be compared using a common metric. Further, it clarifies that we cannot infer participation In everyday life from diagnosis alone. Neutrality. Domain definitions are worded in neutral language, wherever possible, so that the classification can be used to record both the positive and negative aspects of functioning and disability. Environmental Influence. The ICF includes environmental factors in recognition of the important role of environment in people's functioning. These factors range from physical factors (such as climate, terrain or building design) to social factors (such as attitudes, institutions, and laws). Interaction with environmental factors is an essential aspect of the scientific understanding of 'functioning and disability'. THE ICF MODEL In the ICF, functioning and disability are multi-dimensional concepts, relating to:

49 ●●●● The body functions and structures of people, and impairments thereof (functioning at the level of the body); ●●●● The activities of people (functioning at the level of the individual) and the activity limitations they experience; ●●●● The participation or involvement of people in all areas of life, and the participation restrictions they experience (functioning of a person as a member of society); and ●●●● The environmental factors which affect these experiences (and whether these factors are facilitators or barriers). The ICF conceptualizes a person's level of functioning as a dynamic interaction between her or his health conditions, environmental factors, and personal factors. It is a bio psychosocial model of disability, based on an integration of the social and medical models of disability. Ethical use Every scientific tool can be misused, and the ICF is no exception. For all uses of ICF--clinical, research, epidemiological, health and social policy-it is essential that information gathered and analysed must respect the inherent value and autonomy of the individuals from whom the information is gathered. Standard rules about informed consent apply, but more importantly people with disabilities must participate in all aspects of the use of ICF and the application of the data produced. Full participation and transparency of use are most important in the social applications of ICF and, in particular, with the anticipated use of ICF for the development of indicators for monitoring the implementation

100% MATCHING BLOCK 35/203

W

of the UN Convention on the Rights of Persons with Disabilities.

This important human rights document- which embodies precisely the same conceptual refinement of functioning and disability as the ICF-is our moral compass towards the development of social policy and political change needed to achieve the full participation of persons with disabilities. The ethical application of ICF seeks to support and further this mandate for the future.

50 Unit 1.7 Screening, Identification, Characteristics and Needs of PWD 1.7.1 Early Identification and

94% MATCHING BLOCK 38/203

SA

SEID -31 PDF.pdf (D127037695)

Screening Screening is a procedure for an initial identification of persons with mental retardation and for a follow up with assessment. Screening Procedure Many of the screening techniques collected National Institute for the Mentally Handicapped (NIMH), Secunderaba, appeared in RCI. A more systematic process and procedure has been the pooling of a battery of tests on clinical investigations by the NIMH, for identification and screening of persons with mental retardation. They include pre-natal, neonatal and post-natal diagnostic procedures: i) Pre-natal Procedures

A number of prenatal testing procedures such as testing of maternal serum AFP, multiple marker screening, chorionic villous sampling, amniocentesis, and ultrasound and fetoscopy are available to detect the disorders of the fetus. On the basis of the results of screening appropriate corrective steps to prevent intellectual disability should be taken on the advice of a qualified physician. The following screening should be done. ●●●●● Blood tests for the pregnant mother

●●●●●

Hemoglobin levels (Hb %) to detect anemia. ●●●●● Blood glucose levels to detect diabetes. ●●●●● Blood VDRL to detect syphilis. ●●●●● Blood group and Rh typing for blood group incompatibilities. ●●●●● Blood antibody titers to detect neural tube defects in the foetus. ●●●●●

Alpha foeto-proteins to detect neural tube defects in the foetus. ii) Ultrasonography(during pregnancy) Many types of foetal pathology including those associated with intellectual impairment later one can be identified during the second trimester of pregnancy

to detect such disorders as - neural tube defects, abnormal child.

51 iii) Maternal serum AFP (Alpha-fetoprotein) Maternal Serum AFP (Alpha-fetoprotein) screening test is used to detect spina- bifida, Down syndrome and other disorders. It is specially targeted to women under age 35. The test, which measures the amount of alpha-fetoprotein from fetal urine, takes place at 16-18 weeks of pregnancy. A sample of the mother's blood is taken and analyzed for certain chemicals that, together with her age, will determine the individual risk of having down syndrome child, spina-bifida and other disorders. Those found to have an increased risk would be offered an amniocentesis. Results of AFP test take only one weekend the test is safe for both the mother and fetus. iv) Multiple Marker Screening Multiple marker screening measures alpha (AFP) and human chorionic gonadotropin (UE3). It enhances the effectiveness of screening for neural tube defects, trisomy 21, trisomy 18. It is done by a blood test that is offered to women between the 15 and 20 week of pregnancy. v) Fetoscopy Fetoscopy

100% MATCHING BLOCK 37/203

Neonatal and Post-natal Screening and Diagnostic Procedure Blood and urine examinations are conducted in the neonatal period in all suspected cases and with a previous history of mental retardation in the family. Cretinism is 52 another condition which can be diagnosed in the neonatal period and necessary treatment given. ●●●● Apgar Score at one minute after delivery is an index of asphyxia and the need for assisted ventilation. ●●●● Urine screening for metabolic errors - PKU (Phenyle Ketoneuria) ●●●● Blood biochemistry tests for cretinism, rickets, jaundice. ●●●● Blood antibody titres to detect infections. ●●●● Chromosomal analysis for Down Syndrome, deletion of syndromes. ●●●● Neonatal neurobehavioural assessments. ●●●● EEG electroencephalogram for seizure disorder. ●●●● Screening for visual impairments (visual acuity, fundus examination, retinoscopy). ●●●● Screening for hearing impairments(Tympanogram, BERA.) ●●●● Ultra sonogram. ●●●● CT scan (computerized tomography). ●●●● MRI (Magnetic Resonance Imaging) for intra-cranial pathology and structural abnormalities.

APGAR Score APGAR has devised a method of scoring which is of practical value. The score is more accurate index of likelihood of death or neurological residue if it is taken at 5 mins. At one minute after delivery it

100%

Ultra Sound Examination : The technique can be used to detect displacement of brain midline structures, thickness of brain substance, pathological cavities in the brain. Real-time ultrasound examination of the head can reveal intracranial haemorrhage in the newborn. Biochemical Tests in neonatal screening ●●●●

Biochemical Tests in neonatal screening for identifying metabolic disorders. Blood and urine examinations are conducted in the neonatal period

for identifying metabolic disorders. It is not done as a routine examination but in all suspected cases and with previous history of the intellectual disability in the family. ●●●●●

96% MATCHING BLOCK 43/203 **W**

Electro Encephalography (EEG): EEG is useful not only in epilepsy, but in many other cases of mental retardation and organic brain lesions. In certain cases it also helps in localization of lesions and the severity of a cerebral damage. Incidence of abnormal EEGs is higher in cases of mental retardation associated with epilepsy, encephalitis, severe degree of mental retardation and brain damage sustained before birth or during birth or in the early period of infancy.

●●●●● Computerised Tomography (CT): There are many abnormalities which can be detected by CT scan of the CNS such as, anoxia of tissue, intracranial haemorrhage, hydrocephalus and congenital anomalies like holoprosencephaly, agenesis of corpus callosum, Arnold chiari malformations, congenital cysts, calcifications, etc.

●●●●● Magnetic Resonance Imaging (MRI): This screening helps in identifying a large number of persons with suspected disability in a limited time period. Screening Tools

The NIMH has developed quick Screening Schedule I (Below 3 years) and Screening Schedule II (3 to 6 years) shown in Table 1. Table 1: Screening Schedule I (Below 3 years) SI

If the child is found to be delayed in any one of the items given from 1-11 and if he has fits or physical disability then

suspect intellectual disability. Table II : Screening Schedule II (3 to 6 years) SI Item no 1 Compare with other children. did the child Yes No have any serious delay in sitting-:Standing, or walking? 2 Does the child appear to have difficulty in Yes No hearing? 3 Does the child have difficulty in seeing? Yes No 4 When you tell the child to do something, Yes No does he seem to have problems in understanding what you are saying? 5 Does the child has weakness and/or Yes No stiffness in the limbs and/or difficulty in walking and moving his arms? 5 6 Does the child sometimes have fits, become Yes No rigid, or lose consciousness? 7 Does the child have difficulty in learning to Yes No do things like other children of his age? 8 Is the child not able to speak at all? Yes No 9 Is the child's speech in any way different Yes No from normal? 10 Compared to other children of his age, does Yes No the child appear any way backward, dull or slow? If any of the above items is answered "Yes", then suspect intellectual disability. Table III: Screening Schedule III (7 years and above) SI item no 1 Compared with other children, did the child have Yes No any serious delay in sitting, standing or walking? 2 Can the child not do things for himself like Yes No eating, dressing, bathing and grooming? 3 Does the child have difficulty in understanding Yes No when you say do this or that? 4 Is the child's speech not clear? Yes No 5 Does the child have difficulty in expressing without being asked what the child had seen/heard? 6 Does the child have weakness and/or stiffness in Yes No the limbs and/or difficulty in walking and moving his arms? 7 Does the child sometimes have fits, becomes rigid, Yes No or lose consciousness? 8 Compared to other children of his age, does the Yes No child appear any way backward, dull or slow?

56 If any of the above items is answered "Yes", then suspect intellectual disability. 1.7.2 Characteristics of Intellectual Disability Intellectual disability occurs before age 18, and is characterized by delayed development in intellectual functioning and adaptive behavior. The intellectual disability may vary from mild to profound. Adaptive behavior includes skills that people learn so that they can function in their everyday lives.

96%

MATCHING BLOCK 48/203

SA SIDDHI SOOD.docx (D46667599)

This delayed development is reflected in low performance across academic and other skill areas, as well as significantly lower scores on measures of intelligence and adaptive behavior, when compared with students who are not identified with intellectual disabilities.

A score of approximately 70 or below in an intelligence test is considered to be "below average" intellectual functioning. Students with intellectual disabilities have a measured IQ that is lower than 98% of the school-age population. A standardized test of adaptive behavior is used to determine if the child has deficits in conceptual, social, and practical skills that are significantly below average. Attention and Concentration ●●●●● Difficulty focusing and maintaining attention on academic tasks. ●●●●● Short, but intense attention span; tasks will either bore or hold attention of student for long periods of time; student can seem off task. ●●●●● Easily distracted by even a minimal level of noise. ●●●●● Disorganization accompanied by snap decisions; often loses things; careless errors. ●●●●● Difficulty juggling multiple task demands or abrupt change in direction. ●●●●● Distorted sense of time; unaware how long it will take to do something. ●●●●● Get tired or overloaded quickly; need frequent breaks when studying. ●●●●● Hyperactivity and excessive movements may accompany the inability to focus. Memory ●●●●● Cannot quickly retrieve names from memory ●●●●● Difficulty memorizing strings of numbers or letters ●●●●● Frequently lose or forget things

57 ●●●●● Often will forget basic information such as the year, their age, friends' names, or names of places. Oral Language ●●●●● Difficulty with sequencing when telling a story ●●●●● Difficulty with oral directions ●●●●● Difficulty pronouncing words ●●●●● Difficulty expressing ideas orally, even when they seem to understand ●●●●● Difficulty comprehending while reading aloud ●●●●● Unable to concentrate on and to comprehend spoken language when presented rapidly, which causes great difficulty in taking class notes. Language Skills ●●●●● Difficulties associated with short-term memory, syntax, and auditory discrimination ●●●●● Decoding and encoding difficulties ●●●●● Difficulty reading aloud; slow in oral performance ●●●●● Difficulty producing comprehensible responses ●●●●● spelling difficulties Social Skills ●●●●● Difficulties in interpreting social cues that may result in lowered self-esteem or cause students to have trouble meeting people or working cooperatively with others. ●●●●● Unable to distinguish subtle changes in tone of voice. ●●●●● Difficulty in recognizing the difference between sincere and sarcastic comments. Categories of mild, moderate, severe and profound levels of intellectual disability are defined on the basis of IQ scores. Mild Intellectual Disability A mild intellectual disability is defined as an IQ between 50 and 70. ●●●●● Can independently participate in most leisure activities within their communities

58 ●●●●● May have important relationships with the people in their life ●●●●● May struggle in certain social situations ●●●●● May marry and raise a family with support ●●●●● May have a job suited to their skills ●●●●● May live and travel independently with support ●●●●● May need help to handle money and to plan and organize their daily routine ●●●●● May learn to read and write in appropriate educational setting ●●●●● Likely to develop reading, writing, and math skills at a basic level Moderate Intellectual Disability A moderate intellectual disability is defined as an IQ between 35 and 50. ●●●●● Will have important relationships with the people in their life ●●●●● May learn to navigate their community and travel with support ●●●●● Will have difficulty planning trips and handling money independently ●●●●● Will recognize environmental print (e.g. signs, logos, sight words) in daily life ●●●●● Will need visual prompts such as daily schedules and pictures of routines ●●●●● Will need support in their daily lives ●●●●● May display independence in certain daily living activities, such as dressing and bathing Severe or Profound Intellectual Disability A severe intellectual disability is defined as an IQ between 20 and 35. A profound intellectual disability is defined as an IQ below 20. ●●●●● have important relationships with the people in their life ●●●●● May have little or no speech and will rely on gestures, facial expressions, and body language to communicate needs or feelings ●●●●● Will require functional communication systems (e.g. low or high tech augmentative communication devices) in order to express their wants and needs ●●●●● Will need visual prompts such as daily schedules and pictures of routines

59 ●●●● Will require extensive support with daily living activities throughout their life. 1.7.3 Needs of PwID People have different abilities and develop at different rates. Some people find learning new skills or information difficult. This could be because they have an intellectual disability. A person has an intellectual disability if they have both the following before they are 18 years of age: An IQ below 70 (average IQ is 100) Significant difficulty with daily living skills including looking after themselves, communicating and taking part in activities with others. Intellectual disability can be mild, moderate or severe and factors such as personality, coping strategies and the presence of other disabilities (motor, social or sensory) will influence a person's requirement for support with daily living. Needs depend on individual factors Arbitrary categories of mild, moderate, severe and profound levels of intellectual disability are defined on the basis of IQ scores. These levels give some guide to the level of support someone might need but the way a person functions in their life also depends on other factors including: ●●●● Personality, ●●●● Coping skills, ●●●● Other disabilities - for example, physical, social or sensory, ●●●● The amount of support offered by family, friends and the community, ●●●● What is demanded of them in different situations. People with a mild intellectual disability A mild intellectual disability is defined as an IQ between 50 and 70. Generally speaking, a person with a mild intellectual disability: ●●●● participates in and contributes to their families and their communities, ●●●● has important relationships in his/her life, ●●●● works in either open or supported employment,

60 ●●●● may live and travel independently but will need support and help to handle money and to plan and organize their daily life, ●●●● may marry and raise children with the support of family, friends and the service system, ●●●● May learn to read and write. People with a moderate intellectual disability A moderate intellectual disability is defined as an IQ between 35 and 50. Generally speaking, a person with a moderate intellectual disability: ●●●● has important relationships in his/her life, ●●●● enjoys a range of activities with their families, ●●●● friends and acquaintances, ●●●● understands daily schedules or future events if provided with pictorial visual prompts such as daily timetables and pictures, ●●●● makes choices about what s/he would like to do, eat, drink etc. ●●●● may learn to recognize some words in context, such as common signs including 'Ladies', 'Gents' and 'Exit', ●●●● may develop independence in personal care, ●●●● will need lifelong support in the planning and organisation of their lives and activities. People with a severe or profound intellectual disability A severe or profound intellectual disability is defined as an IQ below 35. Generally speaking, a person with a severe or profound intellectual disability: ●●●● recognizes familiar people and may have strong relationships with key people in their lives, ●●●● has little or no speech and relies on gestures, facial expression and body language to communicate, ●●●● Requires lifelong help with personal care tasks, communication and accessing and participating in community facilities, services and activities.

61 Remember A person with an intellectual disability may need assistance with daily living skills such as self-care, communication and community access and participation. Categories of mild, moderate, severe and profound levels of intellectual disability are arbitrarily defined on the basis of IQ score and factors such as personality, presence of other disabilities and social support also play important roles in how the person functions in his/her daily life you're not sure whether a person is able to understand you, assume they and then monitor their understanding and adjust your language communication style accordingly. Always demonstrate respect for person and communicate in ways that acknowledge the age of the person and the value of their contribution. 1.8 Check Your Progress 1. Define Intellectual disability.

..... 17. Describe characteristics of [persons with
intellectual disability.

.....

64 18. Explain the needs of PWID.

..... 1.9 Let Us Sum Up In this unit, we have seen the historic perspectives of the concept of intellectual disability... Intellectual disability is mistaken for mental illness or varied social perceptions ranging from devil to godchild. In early centuries, they were killed or abandon, later they were looked after in institutions, simply meeting their survival needs. Training them to live independently, recognizing their potentials was a development in 1700s initiated by Itard on the "wild boy of Aveyron". Later various acts for the disabled persons came about and normalization processes were initiated. Persons with intellectual disability are classified based on degree of retardation. Medical classification takes into account etiological factors, psychological classification consider IQ scores and educational classification includes current level of functioning 1.10 References 1. 100% MATCHING BLOCK 53/203

SA SEID -31 PDF.pdf (D127037695)

Assessment, in general, refers to a systematic process of gathering information about an individual'

s

100% MATCHING BLOCK 54/203

SA SEID -31 PDF.pdf (D127037695)

level of performance in order to prepare a programme plan. Assessment can be formal

and informal. Perhaps one of the most valuable tools available to the special education teacher is assessment, the process of using tests and other formal and informal means of measurement to make educational decisions. Special educators need a wide variety of information about their students. Regular education is designed to meet the needs of average learners, while special education services are designed to meet the individual needs of students with severe school performance problems. Their instructional plans must be highly individualized, which means that their teachers must have precise information about what the students needs in instructional terms and that is where assessment comes in. Special education teachers need a working knowledge of assessment to effectively and efficiently address student needs and to provide a full range of appropriate educational services. Assessment is technically different from evaluation and measurement. Evaluation involves decision making about student performance and teachings strategies whereas, measurement is evaluation expressed in quantitative terms (Woolfolk, 2001). Assessment is needed at the beginning of the programming and sometimes during and after the programme implementation.

69 We

have discussed the concept of assessment and also the purposes of assessment, but it is also essential to know means and modes of assessment. Precisely information comes from the methods and tools. The methods indicate how to conduct the assessment. Let us recall the example of arithmetic competency. A teacher might gather information about a student's arithmetic competency by observing classroom performance, surveying the notebooks, by asking certain questions, by assigning specific worksheets. All of these procedures indicate that assessment can be done in different ways. Let us now study the various modes

of

assessment. Educational assessment helps to find out abilities of the student and plan teaching programme accordingly. To plan the educational programme we have to collect various data using various methods. There are various types and approaches of assessment like Norm referenced tests, Criterion reference tests, Curriculum bases assessment and teacher made tests so on. We need to know the assumptions and scope of each type of test otherwise we may tend to overuse or under use. and thus jeopardizing the very purpose of assessment. This unit is going the present the various types and approaches of assessment.

We have discussed the purposes for which assessment is carried out. To call a child mentally retarded, ie., for the purpose of diagnosis, a comprehensive assessment is to be done which consists of medical assessment, psychological assessment, educational assessment, behavioural assessment and finally ecological assessment. After the diagnosis, the child is referred to an appropriate educational programme for intervention. So educator should be aware about the areas of assessment. Documentation is a vital process in any programme. It makes the programme more system dependent than a person dependent. It helps in reviewing and evaluating a programme objectively, thus leading to quality in the programme and a scope for improvement. In the area of special education it is all the important as the children have unique needs and the programming requires multidisciplinary team involvement. Further, the services are not only provided in schools but also in varied settings. All these need to have systematic records and plans for action. In this unit we will see the important of documentation and methods of documentation. This unit is also intended to orient you the various aspects of result interpretation and report writing. 2.2

Objectives: After going through this unit the reader should be able to: ●●●● Demonstrate the understanding of meaning of assessment ●●●● Explain the purposes of assessment

70 ●●●●

Apply the various methods of assessment in their practical work. ●●●●

Explain the rational and relative merits and demerits of CRT & NRT ●●●● Explain the various aspect of CRA and Teacher made test ●●●● Understand that there is a need for carrying out different areas of assessment depending on the purpose. ●●●● Understand that a comprehensive assessment which includes medical, psychological and educational assessment is required for diagnostic purpose. ●●●● Understand the various tools for assessing various areas like medical, psychological and educational. ●●●● Understand the importance of ecology for programme planning. ●●●●

Demonstrate the understanding of meaning of documentation, its important and methods of documentation. ●●●●

Know about the interpretation and its levels ●●●● Explain the significance of report writing for different purposes ●●●●

Identify the points to be kept in mind while writing reports for educational planning ●●●● Tell the kinds of administrative decision to be taken at the context of children with mental retardation ●●●● Explain the meaning of inclusive education and changing trends in assessment in inclusive set up ●●●● Discuss the adaptation of assessment in inclusive education

2.3 Concept, Meaning, Definition and Purpose of Educational Assessment 2.3.1 Definitions of Assessment Assessment involves the systematic collection, organization and interpretation of information about an individual to decision to be made about him/her (Sundberg and Taylor, 1962).

71 Assessment as the me of various instruments (test, inventories, observation and so on) utilized in identifying skill levels and ascertaining progress (Logan, 1977). Educational

Assessment is the process of gathering information to monitor progress and make educational decisions if necessary (

Overton, 2004). There will be abundant definitions of assessment but all agree that it is a systematic process, which requires gathering of information, and it has purpose. The purpose is to make a diagnosis and programme planning. In the context of education the purpose is to make an educational management. 2.3.2 Purposes of Educational Assessment
 Anyone who is involved in the assessment process should know clearly the purpose for which he is conducting the assessment. This is very important as it decides the type of assessment tools and means of gathering information for decision making. There are many purposes of assessment. They are: ●●●● Initial screening and identification, ●●●● determination and evaluation of teaching programmes and strategies (pre- referral intervention), ●●●●

84%

MATCHING BLOCK 56/203

W

Determining eligibility ●●●● determination of current performance level and educational need, ●●●● decisions about classification and programme placement, ●●●●

Development of educational programmes (including goals, objectives and evaluation procedures). ●●●● Evaluation of the effectiveness of the Individualized Educational Programme. ●●●● Monitoring Student Progress
 72 Initial screening and identification ●●●● The students who require special attention or special educational services are initially identified through assessment procedures. The procedures involve either informal procedures such as observation or error analysis or formal procedures such as achievement or intelligence tests. In other words, assessment is used to identify the children who warrant further evaluation. ●●●● Assessment is also used to screen children who are considered to be "high risk" for developing various problems. These children would not have yet developed deficiencies requiring special education, but they do exhibit certain behaviours that suggest problems in future. Identifying such children allows continuous monitoring of problem areas and designing of stimulation programme if required to prevent the problem. Assessment for initial identification purpose therefore is used to identify individual who might need further detailed assessment or who might develop problems in future. Further, it identifies individuals who with some type of immediate remedial programme might be able to cope with the problem. Evaluation of teaching programme and strategies (pre-referral) One of the important roles of assessment is to determine appropriate programme and strategies. For this purpose, information is used in four ways. ●●●● First, prior to the referring of a student to special education programme, it can assist regular teacher in determining what to teach and the best method to teach. ●●●● Second, it serves as a method of evaluating the effectiveness of the particular teaching programme or strategy. Many a time a formal referral for special education can be avoided if assessment information is used in this way. That is assessment information can be used to develop and evaluate pre-referral intervention programming. For example, a student X is getting poor marks in subjects as he makes a lot of spelling mistakes. Before making a formal referral to special education services, thinking that the student may be learning disabled, the regular teacher may assess and analyze the work product (spelling errors) of the student and provide a remediation programme. If student shows progress, further referral to special education services can be avoided.

73 ●●●●● Third, in determining appropriate programmes and strategies, assessment can provide pre-referral information to document the need for a formal referral. As explained above, if pre-referral intervention fails to remediate the spelling problem, then there is a need for referring the student for special education programmes. ●●●●● Fourth, the pre-referral intervention information can be incorporated into the individual education programme for student who are eligible for and who ultimately receive special education. Determining Eligibility Educational assessment is performed to establish whether a student qualifies for special education, to determine whether the student has a school performance problem related to a handicap. To receive special services, student must meet eligibility requirements established by state department of education, USA, based upon P.L. 94-142. A Student's intellectual, academic, sensory, and other abilities are analyzed to establish the severity of any disability. If the student's performance and other data meet the standards, the student is eligible for special services. In addition, the school may receive federal and state government support to help pay for the provision of services. Assessment at this level is more in depth than that done for screening. Individual tests are given in major areas of school achievement, in social skill development, in intelligence, and in other related areas. Useful information is collected in various settings and from a variety of sources. Determining of current performance level and educational need The assessment of current performance level of a student in subjects or skills is essential to state the need for special education programme. This information helps the teacher or examiner: ●●●●● to identify subject(s) or skill(s) that need special assistance. ●●●●● to identify strengths and weaknesses of students. ●●●●● to select appropriate strategies and procedures. ●●●●● to identify general areas in which the student needs additional help. ●●●●● To determine possible remedial approaches for the students.

74 Decision about classification and programme placement The assessment data is used for classification and placement of students with special needs in appropriate special educational programmes. Theoretically, individuals are classified to indicate similarities and relationships among their educational problems and to provide nomenclature that facilitates communication within the field (Taylor, 1993). Based on assessment information students are classified and suitable placement decisions are made. For example, a 6 year old child who is diagnosed to have mental retardation needs a placement in special education programme which provides education to children with mental retardation. Development of Educational Programme (Individual or Group) The most important use of assessment information is to determine the goals and objectives, and strategies to teach children who are identified to have special educational needs. As each individual child's needs are different, we have to plan educational programme that meets the needs. A systematically planned individualized educational programme is a blueprint for teachers to follow. The plan also outlines the duties of special and regular educators and support personnel Evaluation of the effectiveness of the Individualized Educational Programme Evaluation procedures are also specified in Individualized Educational Programme along with goals, objectives, methods and materials. Using these procedures, the teacher has to periodically monitor the progress made by the student. The monitoring of the programme gives feedback (positive or negative) to both teacher and student. Based on the type of feed back, the teacher either changes her plan or continues the same plan or select a new activity. For example, on periodic evaluation if the child shows improvement, the teacher will continue with her plan, if no improvement is shown she may have to make changes in 1EP. Monitoring Student Progress The reason for assessment is to monitor the progress of the exceptional student during the program. Information is gathered about the immediate effects of instruction. A variety of procedures documented the level and kind of achievement of states goals and objectives. Of particular interest is any information used to make programme modification. Informal assessment procedures and a blend of assessment and teaching are particularly helpful at this level.

75 2.4 Methods of Assessment - Observation, Interviews and Rating Scale Methods

of Assessment The assessment process involves collection of data through various modes. This is essential as the assessor or teacher aims at collecting information in all the areas of development of a child, which helps the teacher/assessor in making appropriate decisions. The assessment information can be collected from primary sources and secondary sources. Primary sources are those which give us direct information. The information given by the student, the teacher's observation are the primary sources. Gathering information from any sources other than observing and interviewing the individual is secondary sources, e.g. parents, teachers, family members, case files, test reports etc. Primary sources are more reliable, as they provide direct immediate information. Secondary sources augment the information gathered from the primary sources. Whether both are required it depends on the situation. Therefore, they are not mutually exclusive but complimentary to each other. Common methods of assessment are as given below: ●●●●● Observation ●●●●● Interview ●●●●● Rating Scale ●●●●● Testing ●●●●● Experimentation ●●●●● Clinical Investigations ●●●●● Case Study 2.4.1

Observation Observation, as a fundamental technique of data collection, refers to watching and listening to the behavior of other persons over time without manipulating and controlling it and record findings in ways that allow some degree of analytical interpretation and discussion. Thus, observation includes broadly selecting, recording and encoding behavior for empirical aims of description. (a) Purpose of observation Mehrens and Lehman (1984) suggest the following advantages:

76 1) Frequent observation of a student work can provide a continuous check on progress and can detect errors as they arise and take corrective action quickly 2) Observational techniques are not so time consuming or threatening for the student as are achievement tests and 3) Observational data provide teachers with valuable supplemental information much of which could not be obtained in any other manner. 4. One major purpose of observation is to capture and study human behavior as it actually happens. 5. Another purpose of observation is to provide a graphic description of real life that cannot be acquired in other ways. 6. Another purpose of observation is exploration. When the investigator observes human behavior in a real life setting, he gets a good chance to explore those variables which were important but overlooked. (

b) Types of observation On the basis of the ability of observational data to generate useful and researchable information, 1. Systematic observation: Systematic observation is one which is done according to some explicit procedures as well as in accordance with the logic of scientific inference. 2. Unsystematic observation: Unsystematic observation is a type of causal observation made by the investigator without specifying any explicit objective inference. On the basis of role played by the investigator: 1. participant observation: As its name implies, in participant observation the investigator actively participates in the activities of the group to be observed. Here the investigator already be the member of a group or organization and decide to observe it under one or more situations. 2. Non-participant observation: Non-participant observation is the observation in which the investigator observes the behavior of the other persons in a natural setting but does not remain a

77 participant in the activities being observed. Non-participant observation is usually structured and therefore the observer preplans the likely nature of the natural setting. 2.4.2

Interview: Information is also gathered regarding the student's social skills, and the management of student in various environments and situations through interviewing parents, family members and others and the student himself. The procedure for interview is different from that for the questionnaire, but both have the same aim, and it is to obtain data regarding the respondents with minimum bias and maximum efficiency. Interview is a face to face situation or over telephone between the interviewer and the respondent, which intends to elicit some desired information from the latter. Thus an interview is a social process involving at least two persons, the interviewer and the respondent. 2.4.2.1 Types of Interview There are 2 types of interview, namely, formal interview and informal interview. A formal interview may be defined as one in which already prepared questions are asked in a set order by the interviewer and answers are recorded in a standardized form. It is also known as structured or patterned interview. An informal interview is one where there are no pre-determined questions nor is there any pre set or of the questions and it is left to the interviewer to ask some questions in a way he likes regarding a number of key points around which the interview has to be built up. As most things depends upon the interviewer, the situation remains unstructured and therefore such an interview is also known as an unstructured interview. 2.4.2.2

Advantages of Interview 1. An interview allows greater flexibility in the process of questioning. 2. It facilitates the investigator in obtaining the desired information readily and quickly. 3. It facilitates the investigator in being sure that interviewees are themselves interpreted and answered the questions. This increases the validity of the conclusion arrived.

78 2.4.2.3 Disadvantages of Interview 1. Validity and dependability of verbal responses: In an interview, the interviewees verbally answer the questions asked by the interviewers. Social scientists have grave doubts whether a person actually behaves the way he processes to behave. 2. Time: The interview takes much time in its completion because each respondent or interviewee is interviewed individually and the records of the verbal interaction of each respondent is kept individually. 3. Recording information: How to record information being given by the interviewee is also a problem in interviewing. No foolproof system of recording has yet been worked out to every body's satisfaction. 2.4.3 Rating Scale In observation or in other techniques of data collection, as well the researcher needs to assess the attributes of individuals or objects. Rating scale is helpful tool in this regard and is much used. Barr, David and Johnson have defined rating scale as a "term applied to an

100%	MATCHING BLOCK 58/203	SA	EDU 293Introduction To Neuro Developmental Dis ... (D165064915)
expression of opinion or judgment regarding some situation, object or character".			

According to Lokesh Koul, it can be defined as

100%	MATCHING BLOCK 59/203	SA	EDU 293Introduction To Neuro Developmental Dis ... (D165064915)
a "Scale with a set of points which describe varying degrees of the dimension of an attribute being observed".			

Ratings can be done across a scale that may be 3 point, 5point, 7point or more. Experienced researchers opined that too narrow a range may fail to reflect inter- individual differences whereas rating across too wide a range may be complicated. That is why most researchers construct their scale in 5 point or 7point continuum. 2.4.3.1 Types of Rating Scale A Rating Scale can be categorized into several types depending on the mode of rating. Guildford has classified it according to the following categories: Ø Numerical Scale Ø Graphical Scale

79 Ø Standard Scale Ø Rating by cumulative points Ø Forced choice rating Numerical Scale: Numerical Scale is one in which rating is done according to a set of numerates or a set of descriptors. In the later case the rater need not use numerals in rating. The researcher assigns the appropriate numbers afterwards. In that case no number is presented to the rater. Example : Response Category Assigned Number Strongly Disagree 1 Disagree 2 Indifferent 3 Agree 4 Strongly agree 5 It is advisable to avoid 0 or negative numerals (-1, -2 etc.) for case of scoring and for avoiding confusion in the rate. Graphic Rating Scale: In a graphic rating scale, various cues were presented to the rater graphically along a line or line segments placed either vertically or horizontally. The cues correspond to different degrees along a continuum. The rater ticks at the place which he thinks appropriate. The rater need not deal with numbers which makes the task easy for some raters. The appeal of visual presentation is better as well as the example: How effective was the presentation of the teaching learning material in the class:

80 Standard Scale: Standard scale is one in which the rater is presented with some standards with pre - established scale values. These standards usually consist of objects of the same kind. As an example the Man-to -Man Scale and Portrait Matching, which are based upon the principles of the standard scale. Rating by Cumulated Points Rating scales based upon cumulated or summated points are the most common. Here the person's total score is the sum of individual ratings or points assigned to all items of the scale, Such points may be weighted or un-weighted. Forced Choice Rating Scale In the forced choice rating scale the rater is given a set of attributes in terms of verbal statements for a single item and he decides which one or ones represent the individual being rated most appropriately and accurately. The items of the force choice scale may have several alternatives -two, three, four or five. 2.4.3.2 Advantages 1. Rating Scales have a much wider field of application like teacher ratings, personality ratings, -classroom transactional analysis etc. 2. It is quick, interesting and easy to apply. 2.4.3.3 Limitations 1. Error of Central Tendency: It is the general tendency of the raters to avoid the marginal terms and to rate near the average. 2. Error of leniency: Most of the raters rate inappropriately for a person whom he likes and vice- versa. Very effective Effective Average Ineffective Very ineffective

81 3. Halo effect: It is almost a universal tendency to rate the specific trait of a person in terms of the general impression about him. 4. Reliability and validity of rating scale is low. 2.4.4

Testing Testing the child and knowing the ability of a child yourself is always recommended as it provides first hand information. For example, instead of asking a parent whether her child can read and write words, or numerals, you test the child yourself using appropriate materials to check. If we depend on parents for information, we may miss out on identifying specific problems/content which in turn hinders further learning. To explain further, the parent may say that her son is able to read and write numerals upto 10. When you ask the boy to read the numerals by pointing not sequentially, he may read incorrectly, but, he could say orally 1-10 in sequence. If we had taken the parents information on face value, we would have selected the content for teaching numerals from 11 to 15 or 20 as an objective, which is inappropriate as per the child's ability. On the other hand, what is required is that, the boy should be taught to read the numerals independently when presented not sequentially upto 10. Hence, it is necessary always to test the child directly by the teacher/assessor to know the current performance level of the child. However, there may be some activities, for which the teacher may not be able to test the child directly (eg. Taking bath, behaviour of a child during social functions in the family, in the community, interaction with friends and neighbours) and has to collect information from family members. While selecting a test it is important to see whether it is valid for the purpose it is being used, reliable, objective, simple, cost- effective and ecologically valid or not. Lastly but most importantly, the test should be compatible to the child's abilities.

2.4.5 Experimentation Sometimes, we may not get information either from observation, interview or testing. For example to understand the efficacy of social rewards and material rewards, the teacher may observe the student's performance under two conditions- one, involving contingent presentation of social rewards and the other with material reward. Finally the teacher may draw necessary conclusions depending on the student's performance. However, experiments are not as simple as exemplified here. They require systematic

82 planning and stringent analysis of the information. If properly planned, experiments provide information on cause - and -effect relationships.

2.4.6 Clinical investigation This method generally refers to medical investigation. Therefore, it has got less relevance in special education. Examples of this are CT scan, EEG, MRI, Thyroid Profile, Chromosomal Analysis, Serum Estimations, Hearing and Vision Tests etc. However, the data provided by these investigations may have indirect bearing on certain classroom activities. Report on vision will certainly help teachers making decisions on the seating arrangement, colour and presentation of the teaching- learning material: illumination of the class. Similarly, student's EEG indicating epilepsy will help the vocational instructor protect the child from accidents in work area.

2.4.7 Case Study Case Study utilizes all or some of the above methods to record the significant events and put them in a chronological order. It is the method of behaviour investigation in which we try to study the behaviour of an individual in all the essential aspects by analyzing the past record,, present position and future possibilities regarding his felt problem or otherwise guidance functions. The data arranged so will give meaningful information about the causality of specific conditions and problems with reference to the individual. The preparation of a case study is not the work of a single individual but the combined venture of social worker, teacher, parents, medical professional, psychologist and others professional as required.

2.5 Types and Approaches of Assessment-NRT, CRT, CBA & Teacher Made Test 2.5.1

Types and Approaches of Assessment Assessment has assumed lot of importance in key areas of life, as they have the potential to provide comprehensive and systematic information about the individual along a given dimension of behavior. Assessment is done for various purposes including estimation of intelligence, profiling aptitude, behavior and specific skills and so on. Following are the types of assessment.

83 ●●●● Norm Reference Tests (NRT) ●●●● Criterion Reference Tests (CRT) ●●●● Curriculum Based Assessment (CBA) ●●●● Teachers' Made Tests (TMT)

2.5.1.1 Norm Referenced Tests (NRT) Norm Referenced Assessment or Norm Referenced Testing (NRT) is the more traditional approach to assessment. These tests and measurement procedures involve test materials that are standardized on a sample population and are used to identify the test takers ability relative to others. It is also known as formal assessment. Norm referenced assessment is defined as a procedure for collecting data using a device that has been standardized on a large sample population for a specific purpose.

Every standardized assessment instrument will have certain directions that must be followed. These direction specify the procedure for administering the test and ways to analyze and interpret the results and reporting them. Examples of the more commonly known formal assessment devices are the Wechsler Intelligence Scales for children Revised (WISC-R), The Illinois Test of Psycholinguistic Ability (ITPA), The Stanford-Binet Intelligence Test and the Peabody Picture Vocabulary Test — Revised (PPVT-R) and Peabody Individual Achievement Test (PIAT). (

a)

Advantages of norm-referenced assessment Norm referenced tests are widely used in special and remedial education for many reasons. ●●●● The decision of categorizing the children as exceptional or special is mainly based on the test results of NRTs. ●●●● It is easy to communicate test results to parents and others unfamiliar with tests. ●●●● Norm-referenced tests have received the most attention in terms of technical data and research. They are specifically useful in problem identification and screening. ●●●●

To get a reliable rank ordering of the pupils with respect to the achievement we are measuring. ●●●● To identify the pupils who have mastered the essentials of the course more than the others.

84 ●●●● To select the best of the applicants for a particular programme. ●●●● To find out how effective a programme is in comparison to other possible programme. (b)

Disadvantages of criterion referenced assessment The use of norm referenced tests data for the purpose of educational programming is questioned in many instances for the following reasons. ●●●● Information obtained from norm-referenced testing is too general to be useful in everyday classroom teaching. Many educators disregard the prognosis and interpretative types of data provided by standardized tests because the information is often not directly applicable to developing daily teaching activities or interventions. What does knowing a child's WISC-R score or grade equivalent in reading specifically tell a teacher about what and how to teach? For instance, what is important is to know whether the child needs to learn initial consonants or is he having difficulty with comprehension. ●●●● NRTs tend to promote and reinforce the belief that the focus of the problem is within the child. It is because the primary purpose of NRTs is to compare one student with another. However, although a child may differ from the norm, the real problem may not be within the child but in the teaching, placement or curriculum. Educators must begin to assess teacher behaviours, curriculum content, sequencing and other variables not measured by norm referenced tests. ●●●●

It is a mechanical process ●●●● It cannot help assessing the other required aspect as it failed during assessment. ●●●●

It failed to collect information in totality as individual may not respond in good. ●●●● There is a chance of exaggerated or sub average information. 2.5.1.2

Criterion-referenced assessment (CRTs) Criterion-referenced assessment is concerned with whether a child is able to perform a skill as per the criteria set, or not. In contrast to norm referenced assessment, which compares one persons performance to others, criterion referenced assessment compares the performance of an individual to the pre-established criteria.

In criterion-

85 referenced test, the skills within a subject are hierarchically arranged so that those that must be learned first are tested first.

Glaser introduced the term criterion reference test (CRT) and defined it is a measure which assess student achievement in terms of a criterion standard thus provide information as to the degree of competence attained by a particular student which is independent of reference to the performance of others (Glaser, 1963),

In maths, for example addition skills would be evaluated (and taught) before multiplication skills. These tests are usually criterion referenced because a student must achieve competence at one level before being taught at a higher level. (a)

Advantages of criterion referenced assessment The criterion-referenced test results are useful : ●●●● To identify specific skills that need intervention. ●●●● To determine the next most logical skill to teach as the implications for teaching are more direct with criterion referenced tests. ●●●● To conduct formative evaluation, that is, the performance of the student is recorded regularly or daily when the skills are being taught. ●●●●

It permits direct interpretation of progress in terms of specified behavioural objectives. ●●●● It facilitates individualized instruction ●●●● It enables the teacher to check on the student's progress at regular intervals. ●●●● It eliminates pressures on the teacher to " teach to the test." ●●●● It enables teachers to compile a comprehensive record of each child's development. ●●●● To identify the master learners and non- master learners of a class. (b) Disadvantages of criterion-referenced assessment ●●●● CRT tells only whether a learner has reached proficiency in a task area but does not show how good or poor is the learner's level of ability. ●●●● Task included in the criterion referenced test may be highly influenced by a given teachers interest or biases, leading to general validity problem.

86 ●●●● It is important for only a small fraction of important educational achievements. On the contrary promotion and assessment of various skills is a vary important function of the school and it requires norm referenced testing. ●●●● CRTs are difficult to obtain as they require detailed specification of objectives or out comes in behavioural terms. 2.5.1.3 Curriculum-Based Assessment (CBA) The concept of curriculum based assessment is not new and has been employed for a number of years. CBA has been developed as a means to cope with low- achievers and children with special needs in regular schools. Further, it fits into the non-categorical model that is assessment is focused on testing curriculum-based skills and not on testing for labeling purpose. The CBA aims to identify children’s educational needs and the most appropriate forms of provision to meet those needs. Sality and Bell (1987) describes educational needs as “behaviours which a person lacks which are necessary in order to function effectively and independently both in the present and in the future”. The starting point for conducting CBA is the child’s classroom. It is the suitability of this environment and the child’s interaction with it that is assessed and not the child. (

a)
Definition CBA has been defined by Blankenship and Lilly (1981) (quoted in Sality and Bell. 1987; pg.35) as the practice of obtaining direct and frequent measures of a student’s performance on a series of sequentially arranged objectives derived from the curriculum used in the classroom. It helps in finding out the current level of a student in terms of the expected curricular outcomes of the school. In other words, assessment instrument is based on the contents of the student curriculum. Some types of CBA are informal, while others are more formal and standardized. (

b)
Procedure followed in developing CBA ●●●● The first stage in the process requires that the curriculum be defined as series of tasks which are sequenced and expressed in the form of behavioural objectives.

87 ●●●● Placement in the curriculum helps to identify which skills have been learned and those which need to be taught in the future. It pinpoints exactly where a child is on the curriculum. ●●●● Selection of suitable teaching methods, materials and patterns of classroom organization for teaching. ●●●● Evaluating children’s progress - relates to the selection of teaching methods, patterns of classroom organization and choice of curriculum. ●●●● Curriculum Based Assessment can therefore, be seen as a procedure which sets up situations where links are established between various teaching approaches and pupil progress. (

Souree: Sality and Bell (1987) pg.36) (c)
Relationship between CRT and CBA Curriculum based measures are a kind of CRTs but they differ from the core CRTs by having direct link with the curriculum taught in the classroom. In other words, the items that constitute the CRTs are taken directly from the curriculum. For example, both the Madras Developmental Programme System (MDPS) and the Grade Level Assessment Device (GLAD) are CRTs but only the latter is a curriculum based measure, as it provides a direct link to the curriculum taught at a specific grade. Curriculum expressed in the form of behavioural objectives. Selected teaching methods and patterns of classroom organization Placement on the curriculum Evaluation

88 2.5.1.4
Teachers’ Made Tests (TMT) While formal intelligence and achievement tests can be useful for gaining extra finding for students with diverse abilities, and in some instances for assisting with programming, they often do not help teachers discover what a child already knows and what a child needs to learn in relation to the curriculum. In order to successfully program for any student, teacher must first know the ‘starting point’ fro which they can teach. The best way for teachers to discover what their students know and can do is through teacher- based assessment/tests. There are some

commercially produced assessments available for teachers to use: however, the most effective assessments for the classroom are often those developed by individual teachers themselves. The basic philosophy of the teacher made tests is that the teacher’s decisions are important in deciding the criteria. Defined this way, all the informal measures could be teacher made CRTs. Teacher-made tests are written or oral assessments that are not commercially produced or standardized. In other words, a test a teacher designs specifically for his students. Teacher-made tests can consist of a variety of formats, including matching items, fill~in-the-blank items, true-false questions, or essays. (

a)

Advantages of TMTs ●●●● Provide teachers with the means to gather evidence about what their students know and can do. ●●●● Help instructors identify students' strengths and weaknesses. -Keep tabs on student learning and progress. ●●●● Help teachers plan and conduct future instruction. ●●●● Motivate and shape learning and instruction. ●●●● Guide students toward improving their own performance. ●●●● Gauge whether students are mastering state level educational standards. ●●●● Determine if students are prepared for the high-stakes tests.

89 (b) Limitation of TMTs ●●●● They are often ambiguous and unclear ●●●● They are either too short or too lengthy ●●●● They do not cover the entire content ●●●● They are usually hurriedly conducted Inclusive classrooms are those which primarily compare a child's progress with his/ her own past performance in a variety of different areas across the curriculum. In that case these are the most helpful types of assessments for teachers. A combination of curriculum based assessment and intelligence assessment can be helpful in giving teaching and learning some appropriate direction. 2.6 Areas of Assessment - Medical, Psychological, Educational, Behavioural & Ecological 2.6.1 Medical Assessment Clinical assessment is a part of assessment in the process of diagnosis of persons with mental retardation. It is carried out to identify the cause of mental retardation, refer to further investigations to confirm the cause and other anomalies and to plan and evaluate treatment.

The individual's current health, vision and hearing status are generally assessed by medical members of the assessment team. Medical assessment may include a health history, physical examination and any necessary laboratory tests. For example, if it is suspected that a person may have mental retardation due to genetic problems, to confirm he is referred to necessary laboratory tests. Following medical can be done to diagnose the mother and child as 'at risk'. 2.6.1.1 Prenatal Stage i.

Blood Tests in the Mothers ●●●● Hemoglobin levels (Hb%) to detect anemia. ●●●● Blood glucose levels to detect diabetes. ●●●● Blood VDRL to detect syphilis.

90 ●●●● Blood group and Rh typing for blood group incompatibilities. ●●●●

Blood antibody titers to detect specific infections. ●●●●

Alpha foeto- proteins to detect neural tube defects in the foetus.

ii. Ultrasonography (During Pregnancy) iii. Maternal Serum AFP (Alpha- fetoprotein) iv. Multiple Marker Screening v. Chorionic Villous Sampling vi. Amniocentesis vii. Ultrasound viii. Fetoscopy 2.6.1.2 Neonatal and Post-natal Screening and Diagnostic Procedures ●●●● APGAR Score. ●●●●

Urine screening for metabolic errors- examples. PKU (phenyl ketoneuria). ●●●● Blood biochemistry test for cretinism, Rickets, Jaundice etc. ●●●● Blood antibody titers to detect infections. ●●●● Chromosomal analysis for Down Syndrome, Deletion syndromes etc. ●●●● Neonatal neuro-behavioural assessments. ●●●● EEG (Electro-encephalogram) for seizure disorder. ●●●● Visual Screening for visual impairments (visual acuity, fundus examination, retinoscopy etc.). ●●●● Auditory screening - for hearing impairment (Tympanogram, BERA etc.) ●●●● Ultrasonography. ●●●● CT Scan (Computerized tomography). ●●●● MRI (Magnetic Resonance Imaging) for intracranial pathology and structural abnormalities. 2.6.2

Psychological

Assessment Psychological assessment is the process of systematic collection, organization and interpretation of information about a person and situations, and the prediction

91 of the person's behaviour in a new situation. Psychological assessment

encompasses assessment of the three major aspects of the mind namely, cognition, conation and affection.

Psychological assessment involves understanding of the causes of the problem and the potential solutions for the problem. The purpose of psychological assessment is to evaluate an individual or group of persons in relation to a specific issue or problem. These may include intellectual functioning, learning disabilities, special abilities, scholastic achievement, personality functioning, emotional and social areas and questions of normality and abnormality. The psychologist develops hypotheses based upon information or past behaviour, present behaviour and prediction for future behaviour as defined by given situations incorporated in assessment information. Two major criteria are considered for the assessment of children with mental retardation : i) Level of Intelligence ii) Adaptive Behaviour 2.6.2.1 Level of Intelligence Definition: The widely accepted and most commonly used definition of Intelligence is as follows: "

Intelligence is the aggregate or global capacity of an individual to act purposefully, to think rationally and to deal effectively with the environment" - David Wechsler (1975). Level of intelligence is assessed by intelligence test (whether it may be individual or group test) is psychological in nature. Intelligence test provides IQ (Intelligence Quotient) which is the index of mental maturity and cognitive functioning. Intelligence assessment has an important role in mental retardation,

as sub-average intellectual functioning is one of the criteria of diagnosis. Intelligence is estimated only by applying intelligence scales. Based on its content intelligence scales are divided into verbal and performance / non verbal scales. Though there are group tests that can be administered on many at ones, individual tests are preferred for intelligence

92

testing, which requires observations of the individual characteristics such as attention, problem solving skills, motivation. Some of the commonly used tests are shown below:

Showing commonly used intelligence scales in India Verbal Scales Non- Verbal Scales Performance Tests • Binet - Kamat Test of • Raven's Progressive • Seguin From Board Intelligence (Kamat, Matrices Test - norms Three normative data 1967) by Deshpande et. al. arc available (Bharat (2002) Raj, 1971; Verma et. al. 1973; Ramachandran, 1985). • Stanford Binet • MISIC – Performance • Gessell's Drawing Test Intelligence Scale Scales (Malin, 1971) (Verma et al. 1972; (Kulshreshtha, 1971) Venkatesan, 2002). • Malin's Intelligence • Draw – A-Man Test Scale for India (Pathak, 1951) Children (MISIC) – Verbal Scales (Malin, 1971) 2.6.2.2

Adaptive Behaviour Definition The adaptive behaviour in general refers to the way in which an individual functions in his or her social environment. The American Association on Mental Retardation defines adaptive behaviour as, "the effectiveness or degree with which the individual meets the standards of personal independence and social responsibility expected of his/her and culture group."

Assessment of Adaptive Behaviour The behaviour of an individual changes regularly, depending on the types of social situations to which the individual has to respond. Many behaviours which are appropriate in one setting could be totally inappropriate in another. The time and place and some times the age determines the appropriateness of a behaviour. The behaviour by itself is not 'good' or 'bad'. For example, sleeping in the bedroom versus classroom. Sleeping, which is an essential biological need becomes an inappropriate behaviour in the classroom, whereas, the same behaviour in the bedroom becomes an appropriate behaviour. The mentally retarded persons are known to exhibit inappropriate behaviour due to skill deficits or inability to perceive the appropriate behaviour for a given situation. Hence, the purpose of measurement is to determine what areas need special help, or special training in a particular situation. Adaptive behaviour assessment determines the current level of functioning of the individual. It reflects the strengths of the individual as well as the weaknesses. Hence, the primary reason for measurement is an effort to help the individual to learn to improve themselves and to function within the socially acceptable norms. Adaptive behaviour assessment, which is based on the direct reporting of observable behaviours gives specific information on the assets and deficits of the individual. The reason for the deficits or not doing a task may fall into the following categories. a) The individual may never have had the experience or opportunity to carry out those particular tasks or behaviours. b) The individual may have certain physical limitations which prevent the performance of those behaviours. c) The individual may be totally under-motivated for those particular behaviours because

of certain cultural patterns or experiences. Adaptive behaviour scales / Tools for assessment of adaptive behaviour the adaptive behaviour, which projects our behaviour in the personal and social areas, reflects our ability to respond to the environment. Thus adaptive behaviours come under the broad domains of functional independent skills, personal and social responsibility, and independent living skills. These elements combine to form an organized behavioural pattern of the individual. Some of the popular adaptive behaviour scales used for assessing the mentally retarded persons are:

94 SI. No. Name of the Scale Approach Age Group Remarks 1 Vineland Social Maturity Normative Applicable for 0- Yields social Scale (VSMS; Malin, 15 years; but is quotient (SQ). 1968; bharatraj, 1992) used with any Provide a profile age group of of adaptive suspected cases behavior of mental domains retardation Indicates just the target areas. 2 Madras Developmental Criterion Not defined from One of the first Programming System age point of view- test of its kind in (MDPS) – (Jeyachandran but appears to be India. Useful for & Vimala, 1975) applicable for Individualized age 3 years and Programme above, as the Plan. items reflect content from primary level and upwards. 2.6.3 Educational Assessment Educational assessment is a central aspect of evaluation of special education. Educational assessment is the measurement of student performance before and after instruction and includes reading, mathematics, spelling, writing and scholastic subjects in the school curriculum or skills required for independent living. The information coming from psychological test reports will only tell us whether certain prerequisites necessary for academic achievement are present or not. But to know the exact level of academic level, processing error if any. we need details educational reports.

95 2.6.3.1 Need for Educational Assessment ●●●●● To determine strengths and weaknesses in academic achievement ●●●●● To screen students who may have deilcits in academic achievement ●●●●● To identify, classify, and place students with deficits in achievement ●●●●● To plan instructional programmes and develop intervention activities ●●●●● To develop IEPs ●●●●● To evaluate student progress ●●●●● To monitor program effectiveness. To assess a child, two major types of testing are done i) Norm Reference Test (NRT) and ii) Criterion Referenced Test (CRT). Both has been discussed earlier. 2.6.3.2 Tools for Educational Assessment Some of the Western Achievement Tests used for children with learning problems include; ●●●●● Peabody Individual Achievement Test (PIAT) ●●●●● Wide Range Achievement Test (WRAT) ●●●●● Kaufman Assessment Battery for Children (K-ABC) ●●●●● Brigance Diagnostic Inventories ●●●●● Bender Visual Motor Gestalt Test ●●●●● Developmental Test of Visual Motor Integration ●●●●● Peabody Picture vocabulary Test ●●●●● Woodcock Johnson Psycho educational Battery. Some of the suitable screening and assessment tests for use by teachers developed in India include: ●●●●● Diagnostic Test of Learning Disabilities (S. Swarup & D. Mehta) ●●●●● Behavioural Checklist for Screening the Learning Disabled (Swarup & Mchta) ●●●●●

Grade Level Assessment Device for Children with Learning Problems in Primary Schools (J. Narayan) ●●●●●

Arithmetic and Diagnostic Test for Primary School Children (Ramaa, S.)

96 2.6.4

Behavioural Assessment It facilitates understanding of whole range of behaviours including the skill behaviours and problem behaviours. The assessment explains the behavior as a function of environmental conditions (e.g. stimulus, positive and negative consequences). and provides a meaningful link between the skill behaviours and problems behaviours. Example, taking others 1 objects without permission (i.e. problem behaviour) may be due to lack of language skills (i.e. skill deficit). Restlessness in class may be linked with inability to follow instructions.

At milder level they interfere with teaching- learning, in extreme cases they a potential reason for stigmatization, institutionalization. Taken together, profile of skill behaviours and problem behaviours also suggest possibility of associated developmental disorders such as autism, ADSH etc. Therefore, assessment of both skill behaviours and problems behaviours is required for programme planning. 2.6.4.1

Rational of Behavioural Assessment ●●●●● This approach postulates that behaviours are learned. It means every behavior develops with practice and experience. For example, shelf help skill, academic skills, academic skills are learned in informal and formal situations, respectively. ●●●●● Behaviours are likely to increased when they are rewarded. Fro example, when a child is appreciated for taking bath of doing his homework, he is more likely to repeat that particular behavior. ●●●●● Behaviours are likely to decrease when they are not rewarded or punished. ●●●●● Behaviours occur with various intentions, for example, certain behaviours fetch us materials, attention/ social approval of others, or keep us occupied, or let us escape from a situation. ●●●●● The key to change the behaviours is to study what triggers the behaviours (i.e. antecedents) and what maintains or reduces the behaviours (i.e. the consequences wuch as rewards, punishment procedures), and what benefit (i.e. the function) the child derives through this behavior. ●●●●● Antecedents provide information on the reason, time, place and person triggering the behaviours. While consequences include the present ways of management of the behavior.

97 2.6.4.2

Assessing Behaviours Behavioural assessment can be done through informal methods such as observation and interviewing and formal methods such as rating scales. The main problem with informal method is comprehensive assessment is not possible. Secondly, the observer's presence might change the course of the behaviours. Lastly, particular behavior may not occur when we want to observe. Otherwise, observation is the convenient, inexpensive method. Formal assessment can be done using the following scales given below:

Sl. No.	Name of the Scale	Approach	Age Group	Remarks
1	Behavioural Assessment Criterion Meant for 3-18	Designed to	Scales for Indian Children	years older assess both skill with Mental Retardation – persons with MR and problem (BASIC – MR; Peshawaria & Venkatesan, 1992). in older groups Indicates in case of sever corresponding retardation. age for groups of skill behaviours
2	Behavioural Assessment Criterion Meant for	Designed to	Scales for Adult Living persons with	assess both skill Mental Retardation – mental and problem (BASAL-MR; Peshawaria et al., 2000) 18 years old
3	Problem Behaviour Checklist Criterion	Age group not	Assess problem (Arya et al., 1990)	specified behavior in hme and school setting.

98 2.6.5

Ecological Assessment This approach stresses the importance of curricular items based on environment - instead of the "watered down curriculum" This approach emphasizes the inclusion of those content areas necessary for independent living in his/her environment. It gives emphasize the assessment of environment of the CWSN rather than child with mental retardation. An ecological inventory involves analysis of multiple levels of environments before functional skills are identified. The first level of analysis is to identify the curriculum domain(s). Domains are settings rather than content areas. There are four curriculum domains: (a) vocational, (b) leisure/recreational, (c) domestic, and (d) community utilization. The next level is to identify natural environments with each domain, followed by identification of sub environments within each natural environment. As a next step, the planner identifies activities within each sub- environment and then skills within each activity. These include such areas as language, motor, arithmetic, self-care, and social skills. However, their occurrence is measured within a social ecology (ie., within the four domains). Domestic Environments: The team considers the student's life in and around his / her actual home. Team members identify specific areas within and around the home (e.g. bedroom, bathroom, yard) where greater students participation is desired. Vocational Environment: For young children the vocational domain is usually in the home and school environments where children may have chores and class or school jobs. Community Environments : These include transportation system, streets and sidewalks, and all businesses, services, and facilities in the community. For young children, school environments would have priority over other community environments. Therefore, children might receive instruction related to riding the bus and crossing streets. Others would be based on family needs. Leisure Environments:

99 This will often overlap with environments previously identified because leisure activities occur in all these environments. Selection would reflect student interests and preferences. It may also be highly dependent upon interests and priorities of family members and typical peers, since they ultimately enable the student to access the environments. This would lead to the decision making on what the retarded child - ●●●● Can already do ●●●● What can be done by him with training and/ or adaptation ●●●● What he cannot do at all Once environments in which the student will participate are identified, the next steps in designing an individualized, ecology curriculum are to identify priority activities and routines and to identify priority skills.

Relevance ●●●● Assessing the large group students within very short time ●●●● To develop functional curriculum ●●●● Activity based IEP ●●●● Helps in normalization process ●●●● Make positive awareness among the community members ●●●● Community involvement ●●●● To select appropriate vocational skills for training or independent living

Documentation of Assessment, Result Interpretation and Report Writing - Implication of all the above for Inclusion 2.7.1			

Concept of Documentation

Whatever is the educational facility in which the student is being educated; appropriate documentation is of utmost importance. Right from birth history and diagnosis to disability certification, school admission, assessment, curriculum planning, implementation and evaluation, future planning, vocational training and placement leading to economic independence - all have to have records at each stage.

Documentation simple means systematically storing information collected from various sources using appropriate procedures for predetermined purposes. 2.7.1.1 The Importance of Documentation Children's learning is enhanced Children become even more curious, interested, and confident when they think about the meaning of what they have done. The processes of preparing and displaying examples of the children's experience and effort provides a kind of debriefing or revisiting where new understandings can be clarified, deepened, and strengthened. Children also learn from and are stimulated by each other's work in ways made visible through the documents displayed. A display documenting the work of one child or of a group often encourages other children to become involved in a new topic and to adopt a new method of doing something. Children's ideas and work are taken seriously Careful and attractive displays can convey to children that their efforts, intentions, and ideas are taken seriously. These displays are not intended primarily to serve decorative or show-off purposes. An important element in the project approach is the preparation of documents for display by which one group of children can let others in the class working on other parts of the topic learn of their experience and findings.

101 Documentation encourages children to approach their work responsibly, with energy and commitment, showing both delight and satisfaction in the processes and the results. Children's learning made visible Documentation provides information about children's learning and progress. The focus is on how children making meaning, of how they come to understand. While teachers often gain important information and insight from their own first-hand observations of children, documentation of the children's work in a wide variety of media provides compelling public evidence of the intellectual capability and competence of young children. Documentation uncovers the learning process as it highlights children's theories, interests and relationships. Conversation or dialogue is used to present children's words as serious attempts to understand concepts and ideas. Teachers plan and evaluate with children Continuous planning is based on the evaluation of work as it progresses. As the children undertake complex individual or small group collaborative tasks over a period of several days or weeks, the teachers examine the work each day and discuss with the children their ideas and the possibilities of new options for the following days. Planning decisions can be made on the basis of what individual or groups of children have found interesting, stimulating, puzzling, or challenging. Experiences and activities are not planned too far in advance, so that new aspects of work can emerge based on children's interests and be documented. Teachers reflect on the work in progress and the discussion that surrounded it, and consider possible new directions the work might take When teachers and children plan together with openness to each other's ideas, the activity is likely to be undertaken with greater interest than if the child had planned alone, or the teacher had been unaware of the challenge facing the child. The documentation provides a kind of ongoing planning and evaluation that can be done by the team of adults who work with the children.

102 Teacher research and progress As teachers examine the children's work and prepare the documentation of it, their own understanding of children's development and insight into their learning is deepened. Documentation provides a basis for tweaking teaching strategies, and a source of ideas for new strategies, while deepening teachers' awareness of each child's progress. Using information gained through documentation, teachers are able to make informed decisions about appropriate ways to support each child's development and learning. Documentation explains how one activity was pivotal in understanding an issue, connecting to previous learning, or provoking a new inquiry. Documentation helps teachers promote a positive exchange of ideas. Documentation highlights the issues or problems that emerge during a study or activity. Parents' appreciation and participation Documentation makes it possible for parents to become more aware of their children's experience in the school. Parents' comments on children's work can also contribute to the value of documentation. Through learning about the work in which their children are engaged, parents may be able to contribute ideas the teachers may not have thought of. The opportunity to examine the documentation of a project in progress can also help parents to think of ways they might contribute their time and energy in their child's classroom. There are many ways parents can be involved in documentation within the classroom: listening to children's intentions, helping them find the materials they need, making suggestions, helping children write their ideas, finding and reading books.

2.7.1.2 Methods of Documenting Results

Various methods of documenting evaluation results are in practice in education of children with special needs.

103 IEP format The IEP form has a provision to document evaluation results after a specific duration or time period. The teacher indicates the evaluation procedure and the criteria to be achieved in IEP. As specified in the plan, the student is evaluated, then the performance of the student is compared with the set criteria indicated in specific objective to measure the progress made by the student. Checklists used for assessment and programming Activity checklists are used as an alternative method to document progress in students by the educationists. The teachers who use the checklists as basis for selection of content for teaching students, also can use them to note the mastery of activities. Task analysis checklist Task analysis checklists are extensively used in pre and post instructional assessment of students with mental retardation. The task analysis checklist is a blue print of content of a task to be taught. It pinpoints objectively the performance level of a student and guides teacher in planning instruction systematically. Daily/weekly recording of the progress of student can be noted which helps in summarizing the results at the end of instruction. Also, it depicts the progress of a student at a glance. Graphs Graphing provides a visual representation of student progress and may take many forms. Progress towards a goal may be checked daily or weekly by the teacher or student. The following are some of the advantages of maintaining graphs. a) Graphing the progress provides a continuous visual indication of progress made by the student towards a specified objective. b) They are so sensitive that they indicate small changes, which were not apparent to teacher or student. d) Apart from indicating the progress made by student, it shows the rate of achievement. Constructing graphs for daily recording for all students is time consuming for teaching. However, cumulative records may be developed by teachers.

104 Work samples Samples of student's work during instruction can also help in comparing the performance of a student. Areas such as handwriting, written work in language, arithmetic, and work samples are better evaluative devices to decide the mastery of learning. Anecdotal records Anecdotal records are brief written records of students' behaviour or incidents. They should be factual descriptions of student behaviour or incident and should be used for recording information about unanticipated behaviour. We keep hearing from special educationists making remarks that "X" spoke a word to call the attention of other child which he did not do earlier, picked up on his own tiffin box before going to the dining place, etc." Such kind of descriptions will make teachers think and understand the student better in providing instruction. Progress Report: Progress report is another format used for recording the achievement of students periodically. A class teacher generally records the performance/ achievement of students for giving feedback to parents/family members.

2.7.2 Interpretation

Giving meaning to different outcomes of the training programmes is essential to perceive the training package. Interpretation is

a process of perceiving the pros and cons of training programmes. Interpretation helps the educative, the parents and other professional associates with the training programme to understand are relevant factors influencing the training programme.

2.7.2.1 Level of Interpretation of Assessment

■■■■■ Level-I: Interpretation during the initial assessment
■■■■■ Level-II: Interpretation during the training programme
■■■■■ Level-III: Interpretation after the completion of training programme

Level-I: Interpretation during the initial assessment When an individual training programme is decided for a student, it is essential to collect information about the student's

background, student's present performance,
student's ability and resources to be mobilized to accelerate the training programme.

105 Information collected from all the above factors must be interpreted to see all possible positive factors that could be integrated for the training programme. ●●●● Interpretation of Personal Data ●●●● Interpretation of Student's Ability ●●●● Interpretation of Student's Performance ●●●● Interpretation of Resources Interpretation of Personal Data ●●●● Prenatal, Natal, Post-natal History ●●●● Education History ●●●● Medical History ●●●● Immunization Details\ ●●●● Developmental History Interpretation of Student's Ability It is essential to understand the student's ability in terms of intelligence and aptitude. Assessment also should focus to understand the interest and attitude of the student for different training programmes. The student's

overall ability and specific ability must be assessed and interpreted to decide specific task for training. Interpretation of Student's Performance Student's performance must be understood from different angles. Usually the performance is elicited by using a behavioural scale during assessment. Other than the result of the behavioural scale, the past opportunity given to the student must be noted. The background information of the student like the family income, education, involving in training, and exposure and socio-cultural background must be understood for giving a conclusive statement on performance. Interpretation of Resources Data must be collected to understand the resources

available for development of the student and training to the student. For example, toilet training to a ten years mentally retarded boy, it is essential to know a few aspects like:

106 ●●●● The type of toilet used by the family ●●●● The person would be involved in training ●●●● The cultural believe for toileting ●●●● Cleaning system after toileting etc. Developing teaching materials for the student must be based on the resources of the parents, if the parents are affordable to purchase highly costly materials then it will be worthwhile to prescribed such materials. On the other hand, the poor people could be advised to develop teaching materials in local available materials with less expenditure. Level-

II:
Interpretation during the training programme " It is essential to see the speed of training, and other relevant factors influencing training during different phases of the programme. " Understanding the result, the methods, the efficiency of materials, and the usefulness of techniques is essential to enhance the training programme. " Hence, it is essential to interpret the intermittent improvement, and other associated factors for training programme. "

It must noted that, interpretation during the training programme would help to bring changes in

the training programme as per the requirement. Level-III: Interpretation after the completion of training programme After the completion of training programme, it is essential to review and understanding the various factors influenced the training programme. Interpretation of the overall result, specific result i.e. result in each skills, the methods used form training programme such as: a) play way method, b) structured method, c) project method and techniques used for training programme. It is essential to understand the whole scenario of the training programme. It also give idea for deciding the further training programme to be given to the student. 2.7.3

Report Writing

The

dictionary meaning of 'report' is to give a spoken or written account of something providing official information or evidence (Oxford Dictionary, 2005). A report can be defined as a testimonial or account of some happening. Report is a

107 self-explanatory statement of facts relating to a specific subject and serves the purpose of providing information for decision making and follow up actions. It is a systematic presentation of ascertained facts about a specific event / subject. Report is a summary of findings and recommendations about a particular matter / problem. Report is for the guidance of higher authorities. Reports facilitate timely decisions and follow up measures. In today's world, reports play a crucial role.

2.7.3.1 Purpose of a report: writing to be read A key thing to keep in mind right through your report writing process is that a report is written to be read, by someone else. This is the central goal of report-writing. A report which is written for the sake of being written has very little value. Before you start writing your report, you need to have in mind the intended audience. In the narrowest of possibilities, your report is meant for reading by yourselves, and by your advisor/instructor, and perhaps by your evaluation committee. This has value, but only short-term. The next broader possibility is that your report is readable by your peers or your juniors down the line. This has greater value since someone else can continue on your work and improve it, or learn from your work. In the best case possibility, your report is of publishable quality. That is, readable and useful for the technical community in general. In special education, there are number of reports written for numerous purposes by varied professionals. Writing report for administrative decision ●●●●● Diagnosis and certification ●●●●● IQ assessment ●●●●● Placement in appropriate schools ●●●●● Eligibility to various benefits and concessions offered by the government ●●●●● Access to suitable adaptive devices for independent mobility, communication and learning ●●●●● Establishing rights. Writing reports

for educational programming This report is solely done by the teacher at the initial stage, formative stage and summative stage for promotion to next level or for future use.

A report that is periodically written by all the teachers in regular or special school is the progress

108 report. For a student with special needs, make sure that your report is not only quantitative (percentage or other form of numerical values) but also qualitative, narrating the progress in each domain/subject as the case may be.

Writing reports for alternative

placement As notated by Raymonds (2008), the law demands that every child should have a careful assessment of strengths and needs with respect to participation in general education curriculum., goals and objectives set to enable the student to show progress in that curriculum and finally decisions on where the services are to be provided for maximum benefit to the student. These placement decisions are very carefully made by the team and reviewed periodically.

Writing reports for referral

A child may come to you referred by a professional or others or you may have to refer the child for further assessment or programmes. When

cases are referred for certification or services, there should be a proper format and system so that the efforts are documented. This will also ensure receiving feedback from the referred agency.

Referrals are made in the beginning at the time of initial team assessment, during the implementation of the educational programmes and later on the completion of school

admission. Proper reporting is required for referring the child to the other professional. 2.7.3.2 The essentials of good/effective report writing

are as follows- 1.

Know your objective, i.e., be focused. 2. Analyze the niche audience, i.e., make an analysis of the target audience, the purpose for which audience requires the report, kind of data audience is looking for in the report, the implications of report reading, etc. 3. Decide the length of report. 4. Disclose correct and true information in a report. 5. Discuss all sides of the problem reasonably and impartially. Include all relevant facts in a report. 6. Concentrate on the report structure and matter. Pre-decide the report writing style. Use vivid structure of sentences.

109 7. The report should be neatly presented and should be carefully documented. 8. Highlight and recap the main message in a report. 9. Encourage feedback on the report from the critics. The feedback, if negative, might be useful if properly supported with reasons by the critics. The report can be modified based on such feedback. 10. Use graphs, pie-charts, etc to show the numerical data records over years. 11. Decide on the margins on a report. Ideally, the top and the side margins should be the same (minimum 1 inch broad), but the lower/bottom margins can be one and a half times as broad as others. 12. Attempt to generate reader's interest by making appropriate paragraphs, giving bold headings for each paragraph, using bullets wherever required, etc. 2.7.4 Inclusive Education and Assessment The Individuals with Disabilities Act Amendments of 1997 (IDEA 97) defines inclusion as the participation of children and youth with disabilities in the general education classroom and the general curriculum with appropriate aids and services. Inclusion means full inclusion of children with diverse abilities (that is, both giftedness and disabilities)

in all aspects of schooling that other children are able to access and enjoy. It involves 'regular' schools and classroom genuinely adapting and changing to meet the needs of all children as well as celebrating and valuing differences (Loreman and Deppeler 2011). The related concept of full inclusion refers to full membership in the general classroom with the full supports necessary to make inclusion successful (Sailor et al., 1993). The term full supports describes the importance of providing necessary support services in general education classrooms to ensure a quality educational programme. Why do we modify assessment for students with disabilities in inclusive settings? ●●●● Experts expect that inclusion will result in school classrooms composed of much more diverse groups of students (Putnam et al., 1995). As a result teachers need to develop new instructional methodologies and assessment procedures that respond to the greater diversity of student needs.

110 ●●●● Although assessment in inclusive settings requires changes, many current evaluation practices work equally well in inclusive and noninclusive educational settings. For ego Many curriculum based assessment procedures such as teacher made testing, grading of homework assignments, grading of classwork already occur in the same way in most classrooms. In fact, teachers should use established assessment procedures whenever possible as long as they meet the increasingly diverse needs of the students. 2.7.4.1 Assessment Issues in General Education ●●●● When asked about inclusion, many general education teachers may feel that required modifications for students with special need lead to a watered-down curriculum. ●●●● Special education teachers often express concerns about the emphasis in general education on testing as a means of accountability. This causes pressure on general educators to make sure that their students perform well on tests. Because students with special needs tend to perform poorly on tests, general educators may be hesitant to accept inclusion due to fears about a negative impact on the testing performance of the total class. Educators who are teaching students with special needs in inclusive settings are still in the process of developing the best possible solutions to these issues and concerns. 2.7.4.2 New approaches to assessment in inclusive settings (a)

Team assessment: One of the most useful assessment approaches in inclusive classroom is team assessment, which is a process that involves all teachers in the evaluation process, not just special education teachers in particular who concern about testing and grading students with disabilities are. ●●●● Successful inclusion depends in part on the willingness of teachers to modify their measurement procedures are all different (Tiegerman-Farber & Radziewicz, 1998). ●●●● If most of the teachers are willing to collaborate as coteachers in developing and implementing new assessment techniques that benefit all students while accommodating the needs of students with disabilities.

111 ●●●● One of the team assessment elements that teachers should consider is how well the members of the assessment team work together. ●●●● Active participation of all team members in gathering and interpreting assessment data is a key element. All the team members should help interpret assessment data. The benefit of team assessment is more complete evaluation of student needs within the most appropriate educational environment. ●●●● Team assessment requires a substantial amount of time, professional commitment and interpersonal communication (Coufal, 1993). (b) Cooperative learning assessment Cooperative learning is an instructional strategy that works well in inclusive settings. Research studies by Pomplan (1997) and Carlson et al. (1988) provide further evidence to support the use of cooperative learning in inclusive classrooms. These studies suggest that nonroutine, open ended tasks maximize the participation of students with disabilities in heterogeneous cooperative groups. When teachers use cooperative learning, they are responsible for ensuring that appropriate assessment takes place. The steps in assessing cooperative learning are as follow: ●●●● Specify the objectives ●●●● Develop the assignment ●●●● Determine grading criteria ●●●● Explain the assignment and share the grading criteria with the students ●●●● Monitor the efforts of the cooperative groups ●●●● Interfere and provide support as necessary ●●●● Evaluate the results Teachers may use several assessment strategies to evaluate results, including the following: ●●●● Observing group performance as it occurs ●●●● Interviewing individual students and groups of students ●●●● Evaluating individual and group performance on class work and homework. ●●●● Grading teacher-made tests given to individuals or groups.

112 (c)

Peer assessment of class presentation: Any activity done by a student can be evaluated by peers as well as the teacher. One way to encourage group interdependence and to foster peer assessment is to structure classroom activities / presentations so that all members must learn the activity / material being presented. ●●●● The rating system should include items for assessing the quality of the presentation, the interest generated by the presentation, the organization, creativity, originality and peer participation. (d) Group assessment: ●●●● In real life the success of an organization many a time depends upon the team performance rather than the success of an individual. For this reason, cooperative learning assignments in school should require group reports, exhibits, performances and presentations in which the students work together and are graded as a group. ●●●● Group celebration should occur at the end cooperative learning lessons after completion of assessment and grading. Group celebrations give students the opportunity to salute their success and reflect on how well they collaborated to achieve their learning goals. ●●●● Recognizing the learning efforts of group members and their contribution to the learning of others is an important element in rewarding group interdependence. (e) Peer tutoring assessment: ●●●● Peer tutoring is an instructional strategy in which a student tutor teaches another student in a tutor-tutee relationship designed to promote academic learning and social skill development. ●●●● Successful peer tutoring involves planning, tutor training, teacher support and assessment. Some teachers assess the progress of tutees by having complete daily progress sheets. (f) Play-Based assessment: This method is highly recommended for assessing all the developmental areas and there is a highly likelihood that the child will demonstrate his/her true abilities in this setting. Play-Based assessment yield information to develop a plan for intervention to make the recommendations for goals or out-comes for the child and family and assessment team.

113 Psychologist Diane Ashton describes the following categories of play: ●●●● Solitary play (all ages): The child plays alone. This type of play is not necessarily an indicator of immaturity. High-level play may occur. ●●●● Onlooker play (all ages): The child watches other people play. This type of play appears to be a passive process whereby the child observes the play levels of other children. The examiner should use caution in interpreting this type of play. ●●●● Parallel play (1-3 yrs.): Two children pursue similar activities but do not always engage in eye-contact or social behavior. Children play alongside each other. ●●●● Associative play (2-3 yrs.): Children engage in same or similar activity and may exchange toys or make occasional comments to each other. This type of play lacks organization. ●●●● Cooperative play (4-5 yrs.): This type of play is organized play with cues, rules and individual functions well defined. There are specific play assessment instruments that might be used by the practitioner. Eg.- play observation scale (Rogers, 1986) which describes a 10-step hierarchy that focuses on language, cognitive and social aspects of play. (

g) Portfolios and assessment: A student portfolio is a systematic collection of student work and related material that depicts a student's activities, accomplishments and achievements in one or more school subjects. Performance assessment: It is an ongoing process that captures the many activities and accomplishments associated with reflective teaching and learning that occur in portfolio-based instruction. By evaluating progress using a collection of authentic samples of student work, portfolio assessment provides an ongoing record of student performance and mastery of specific competencies (Vavrus, 1990). Usefulness of portfolios for the students with special needs: ●●●● Portfolios encourage individualization in response to the special learning needs of each student.

114 ●●●● Portfolio assessment enhances student motivation. ●●●● It promotes mastery learning. ●●●● It is an ideal way to evaluate the skills of students with special needs. Process & Product portfolios: ●●●● A process portfolio documents the stages of learning and provides a progressive record of student growth. ●●●● A product portfolio demonstrates mastery of a learning task or a set of learning objectives and contains only the best work. Advantages of portfolio assessment: ●●●● Providing flexibility in measuring how students accomplish their learning goals. ●●●● Enabling teachers and students to share the responsibility for setting learning goals and for evaluating progress toward meeting those goals. ●●●● Providing a process for structuring learning in stages. ●●●● Enabling measurement of multiple dimensions of student progress by including different types of data and materials. Disadvantages of portfolio assessment: ●●●● Requiring extra time to plan an assessment system and conduct the assessments. ●●●● Gathering all of the necessary data and work samples can make portfolios bulky and difficult to manage. ●●●● Scoring portfolios involves the extensive use of subjective evaluation procedures such as rating scales and professional judgments and this limits reliability. (h) Performance assessment: ●●●● Performance assessments provide greater realism of tasks in the following forms: 2. Solving realistic problems. 3. Oral or psychomotor skills without a product. 4. Writing or psychomotor skills with a product.

115 ●●●● Restricted performance tasks are highly structured and limited in scope. Extended performance tasks are typically poorly structured and broad in scope. Strengths 1. Provides a more natural, direct and complete evaluation of some types of reasoning, oral and physical skills. 2. Provides greater motivation for students by clarifying goals and making learning more meaningful. 3. Encourages the application of learning to "real life" situations. Limitations 1. Requires considerable time and effort to use. 2. Evaluation must frequently be done individually, rather than in groups. (i) Modifying Teacher-Made Tests: Teacher made tests frequently fail to give students with behavior and learning disabilities the opportunity to demonstrate what they have learned. This occurs because students with disabilities may have deficit in attention, memory, organization, reading or writing that hinder performance on teacher-made tests. For these reasons teachers need to incorporate test design accommodations that minimize the effect of attention and memory problems. Test design accommodation includes the following: Test Directions- In some situations, students with special needs may receive poor marks on a test due to difficulty in following the test directions rather than lack of competency to perform the test content. Teachers can minimize this problem by using cues include color coding, using symbols etc. Response Modes- Teachers may need to modify the response modes of test items for students with written or verbal communication difficulties. For ego Students can record responses on an audiocassette or can give oral exam.

116 Test items- Teachers can improve student performance by doing these things: ●●●● Keeping the response choices as brief as possible. ●●●● Avoiding potentially confusing choices such as all of the above or none of the above. ●●●● Limiting the number of choices to no more than four items. 2.7.4.3

Some Adaptations during Assessment: ●●●● Avoid long talks before tests. ●●●● Provide an example of expected correct response. ●●●● Seat students in a quiet place for testing ●●●● Place a testing sign on the classroom door to discourage interruptions. ●●●● Avoid threatening to use a test to punish students for poor behavior. ●●●● Give a practice test. ●●●● Give a retest if needed. ●●●● Do not threaten dire consequences for failure. ●●●● Grade on percentage of items completed. ●●●● Have students regular test with the class and the adapted test in resource room or in a separate room. 2.8 "Check Your Progress" 1. What do you understand by assessment?

117 2. What are the key components in the definition of assessment?

----- 3. Explain the purposes of assessment.

----- 4. How do you collect assessment data?

----- 5. Testing is the part of assessment process? Explain.

118 6. Develop a observation checklist for assessing the classroom behavior of the children with mental retardation.

----- 7. Explain the rational of CRTs and NRTs in special education.

----- 8. Differentiate the CRTs and NRTs

----- 9. Mention briefly the group of informal assessment measures in special education.

119 10. How can you develop a curriculum based assessment in inclusive setup?

----- 11. Define Intelligence. Name two intelligence tests commonly used for children with mental retardation.

----- 12. Make a list of various educational assessment tools.

----- 13. Write the different pre natal and post natal medical screening procedures.

120 14. Write the rationale of behavioral assessment

----- 15. What is documentation? Discuss the importance of documentation.

----- 16. How will you interpret at the initial assessment?

----- 17. List out the principles of report writing.

121 18. Write some adaptations could be followed during the assessment in inclusive setup.

----- 2.9

Let us Sum up ●●●● Each child with mental retardation

is unique in nature. Special education can identify the unique need of each child through proper assessment and plan intervention activities as per the requirement. Assessment is a pivotal and the first step of rehabilitation programme for the children with Mental Retardation. ●●●● Assessment is collection and organization of information for making administrative and instructional decisions. ●●●● Assessment is carried out for various purposes such as (a) screening and identification, (b) determining and evaluation of teaching programmes and strategies, (c) determination of current level performance and educational needs, (d) classification and programme placement, (e) development of IEPs and (f) evaluation of the effectiveness of intervention programme. ●●●●

Assessment

will utilize several methods ranging from observation to testing and experimentation. Observation is the most inexpensive method. Testing and clinical investigations are relatively costly and provide more objective information. Sometimes, external tools such as screening measures, schedules and scales are necessary to conduct assessment. ●●●●

There are different types of assessment. Based upon the manner of data collection it is formal and informal assessment and based upon the construction of test assessment could be Norm Referenced Assessment (Test) (NRT) and

Criterion Referenced Assessment (Test) (CRT). ●●●● NRT helps more in administrative decisions whereas the CRT helps more in instructional purpose. ●●●●

Most of the psychological test such as Developmental Test, Intelligence Test

122 and Aptitude Test are NRT in nature whereas most of the behavioural scale used in Special Education are CRT in nature. ●●●●

The different areas of assessment are clinical assessment, psychological assessment, educational assessment behavioural assessment and ecological assessment. ●●●● Clinical assessment is a part of assessment in the process of diagnosis of persons with mental retardation. It is carried out to identify the cause of mental retardation, refer to further investigations to confirm the cause and other anomalies and to plan and evaluate treatment. ●●●●

Psychological assessment is the process of systematic collection, organization and interpretation of information about a persons and his situation. It encompasses assessment of the three major aspects of the mind namely, cognition, conation and affection. ●●●●

Intelligence is the aggregate or global capacity of an individual to act purposefully, to think rationally and to deal effectively with the environment. Intelligence tests, developmental schedules and adaptive behavioural scales are used in measuring the intelligence. ●●●● Educational assessment helps to find out abilities of the student and plan teaching programme accordingly. Norm referenced tests and criterion referenced tests are used in educational assessment. ●●●●

Behavioural assessment is

systematic repeated recording of predefined behavioural parameters of individuals, with a purpose of either identifying functional stimuli that maintain certain behaviours or demonstrating systematic behavioural changes as a function of planned intervention. ●●●● Ecological Assessment

stresses the importance of curricular items based on environment - instead of the "watered down curriculum". This approach emphasizes the inclusion of those content areas necessary for independent living in his/ her environment. It gives emphasize the assessment of environment of the CWSN rather than child with mental retardation. ●●●●

Documentation is a

vital process in any programme. It makes the programme more system dependent than a person dependent. Educators employ various methods for documenting evaluation data. They are IEP form, activity checklists, task analysis checklist, graphs, work samples and anecdotal records.

123 ●●●●

Interpretation is

a process of perceiving the pros and cons of training

programme. There are 3 levels of Interpretation ●●●● Level-I: Interpretation during the initial assessment ●●●● Level-II: Interpretation during the training programme ●●●● Level-III: Interpretation after the completion of training programme ●●●●

Reports are generated for various purposes. Some of the important purposes for which reports are generated include administrative decisions, educational programming, referrals and for alternative placement. ●●●● Experts expect that inclusion will result in school classrooms composed of much more diverse groups of students (Putnam et al., 1995). As a result teachers need to develop new instructional methodologies and assessment procedures that respond to the greater diversity of student needs. 2.10

areas of development and identify appropriate services; secondly, a family directed assessment of resources, priorities, and concerns

47% MATCHING BLOCK 68/203

SA CHAPTER 1.2 assessment tools.docx (D155146787)

of the family and identification of resources and support system to meet them. Further the assessment should be able to predict the expected outcome for both the child and family, and precisely state what intervention programmes are required to achieve the outcome. In this context it is pertinent to note that preschool assessment should gather information on both the child and the family.

Within the existing resources, early childhood assessment can be conducted if the teacher had the following competencies : ●●●● Basic understanding of causes and prevention of disabilities in general and mental retardation in particular. ●●●● Knowledge of human growth and development including the stages of development, facilitating factors, inhibiting factors, hazards of development, and intervention. ●●●● Knowledge of existing developmental, (e.g. GDS, DST etc.), educational (e.g. Arambh) and other assessment tools (e.g. Portage, Upanayan) meant for this group. ●●●● Knowledge of family functioning models and relevant assessment scales (Persha & Rao, 2003; Peshawaria et. at., 1995). ●●●● Awareness about existing Policies, Provisions and Service Providers as applicable to the region to which the child belongs.

128 School level This group comprises of children between 6 to 15 years. Hence assessment is required on the following :- 1. Intelligence assessment on standardized scales. This information will be helpful from the point of diagnosing mental retardation, estimating disability so that appropriate social benefits are extended to. 2. Adaptive behaviour assessment on norm-referenced scales (preferably, on

50% MATCHING BLOCK 69/203

SA CHAPTER 1.2 assessment tools.docx (D155146787)

VSMS) and / or criterion scales (e.g. MDPS). 3. A detailed educational assessment, preferably based on the functional approach (e.g. the functional assessment checklists for programming). 4.

Assessment of problem behaviours, as indicated (e.g. BASIC-MR, BASAL-MR). 5. Depending on the need and educational setting,

72% MATCHING BLOCK 70/203

SA CHAPTER 1.2 assessment tools.docx (D155146787)

assessment can be conducted formally (e.g. grade level assessment tool by Narayan, 1994) or informally (e.g. teacher made curriculum-based tests). At school level,

particularly when it comes

68% MATCHING BLOCK 71/203

SA CHAPTER 1.2 assessment tools.docx (D155146787)

for placement in regular schools, the assessment should go beyond the individual with disabilities. It is also important to

understand the environmental variables such as, attitudinal barriers, physical barriers, peer support, attitude and enthusiasm of the teachers and administrators. 3.4 Developmental and Adaptive Behaviour Assessment From the information about the pattern of development of any individual, early identification can be possible. Screening tools are also helpful to identify person with a specific condition within a large population. The screening procedure is less costly and less time consuming to determine the pattern of development in a child within his developmental stage or not. More over

it is important to note that being positive on screening does not necessarily mean that the same result should come on assessment.

Suppose developmental screening has indicated general developmental delay suggestive of mental retardation but the same result may not come up on IQ

assessment. There are several screening tools meant for identification of mental retardation, which are as follows :-

NIMH development screening schedule : This tool was developed by Saroj Arya (1991) to screen preschool children for disabilities in general and mental retardation in particular. The schedule consists of ten key items on development that are passed by 90% of the children between the specified age group. The tool is established to have sound validity, reliability, and predictive power. The tool is meant for use in rural areas as well as in urban setting. NIMH screening schedules (National Institute for the Mentally Handicapped, 1989) : There are three schedules under this group meant for age group below 3 years, 3 to 6 years, and 7 years and above. The number of items / questions on which information has to be obtained varies from 8 to 13 per schedule. Administration of each schedule may not take more than five minutes. Though the psychometric properties particularly the predictive power of these schedules is not known, they are widely used in mass screening and the feedback is satisfactory. Developmental screening test (DST) : This test was developed by Bharatraj (1977).

83%	MATCHING BLOCK 72/203	SA CHAPTER 1.2 assessment tools.docx (D155146787)
This provides a measure of mental development based on social adaptive behavioural skills, communicative skills and motor skills		

from birth to 15 years.

35%	MATCHING BLOCK 73/203	SA CHAPTER 1.2 assessment tools.docx (D155146787)
This can also be used with any age group of suspected cases of mental retardation. This tool shows good correlation with standardized IQ measures; therefore it is used whenever standard intelligence testing is not		

possible. Administration of this screening takes thorough training, and is primarily used by psychologists and developmental therapists. Gessell's drawing test : Verma et al. (1972) adapted this test in Indian setting. This test consists of some simple geometrical shapes, which the student has to draw. This test is applicable from 1½ year to 8 years. Very recently some more items have been added which has enhanced

75%	MATCHING BLOCK 74/203	SA CHAPTER 1.2 assessment tools.docx (D155146787)
its applicability up to the age of 12 years (Venkatesan, 2002). It takes about ten minutes to apply and interpret the test		

provided the child is cooperative Developmental assessment tools Other than the screening tools, early identification can be done by acquiring information about the development pattern of the individual. We know that development follows a specific pattern, which means that there is an expected age range for every developmental task. When we compare the individual's development with that of the expected norms, we can answer the following questions : whether development was normal, or any deviations were indicated; if the developmental deviation was specifically restricted to one area or generalized. This information can be attained by observation of the child, and also by interviewing the parents. Some of the important developmental milestones are shown in Table 1.

130 Table 1 : Normal Milestones of Development S. No. Developmental Milestone Mean age by which it is attained
 1. Smiles at others 4 months
 2. Holds head erect 4 months
 3. Puts objects into mouth 4 months
 4. Rolls from back on to stomach 6 months
 5. Makes sounds "anna", "da da da" etc. 7 months
 6. Sits without support 8 months
 7. Responds to name 10 months
 8. Stands by holding on to an object 10 months
 9. Holds object with thumb and index finger 10 months
 10. Stands without support 10 months
 11. Walks without support 15 months
 12. Tells own name 18 months
 13. Drinks by self from glass 21 months
 14. Shows body parts when named 24 months
 15. Speaks in small sentences 30 months
 16. Unbuttons clothes 36 months
 17. Differentiates big and small 36 months
 18. Can button clothes 40 months
 19. Combs hair 48 months
 Source : National Institute for the Mentally Handicapped, Secunderabad. A careful analysis of the developmental tasks will indicate that whether the child is having specific delay or a generalized delay suggestive of mental retardation. However, sometimes it may more areas of development it usually suggests mental retardation. However, sometimes it may not be possible to remember all necessary milestones hence we may miss some while observing of interviewing. Therefore, it is better to use developmental scales for they contain all necessary questions about development and also provide normative comparisons. Besides the developmental scales mentioned above, Developmental Assessment Scales for Indian Infants (DASII), an Indian adaptation of Bailey's Infant Scales for Development by Pramila Pathak (1970; 2009), are also widely used for assessment and intervention.

131 Developmental assessment is mandatory in assessing mental status because it is one of the criteria of any diagnostic system. That is, it is essential for both intellectual and adaptive behavioural deficits should be during the the developmental period (i.e. before the age of 18 years). Further, intelligence testing cannot be done accurately at younger age groups (i.e. below age 3 years), and in very severely and profoundly retarded children. Sometimes, sensory-motor, communication deficits, lack of formal training and education etc. will also interfere with intelligence testing. Therefore, it is a common practice that wherever intelligence testing is not applicable or feasible, developmental assessment is done to estimate developmental quotients did interpreted the same way as intelligence quotient (IQ) to ascertain the severity of mental retardation. Another reason why developmental assessment is preferred that developmental tasks are not influenced by formal education or lack of it unlike the tasks given under intelligence testing. Lastly need for developmental assessment is also indicated by the fact that internationally the construct of mental retardation is changing to reflect it also as a developmental and intellectual disability. However, it must be noted that developmental assessment is not a substitute to intelligence testing, as both depend on entirely different assumptions. Assessment of adaptive behaviours :- Adaptive behaviour is defined as the effectiveness or degree with which the individual meets the standards of personal independence and social responsibility expected of his age and cultural group (Grossman, 1983, P-159). This expectation differ from age to age. According to the American Association on Mental Retardation (AAMR) the deficits in adaptive behaviour during the childhood years may reflect deficit

92%

MATCHING BLOCK 75/203

SA

CHAPTER 1.2 assessment tools.docx (D155146787)

in academic learning, judgement and reasoning in dealing with the environment and social skills in group activities and interpersonal

relationship. So it can be considered as a feature of mental retardation. Classification of persons with mental retardation based on the support system required with reference to the adaptive behaviour deficits is an emerging trend globally. Therefore, assessment of social and adaptive behaviour is an important aspect in assessment of mental retardation. Similarly, behavioural problems and communication deficits are common to mental retardation. Therefore, assessment of all these aspects is important for a comprehensive plan. AAIDD recognizes adaptive behaviour as a collection of three skill areas explained below, and a significantly sub average functioning in the following three areas is necessary identify mental retardation (Luckasson et. al. 2002) :

132 ●●●●●

Conceptual skills -

language and literacy; money, time and number concepts; and self-direction. ●●●● Social skills - interpersonal skills, social responsibility social problem solving and the ability to obey laws and to avoid being victimized. ●●●●

Practical skills -

activities of daily living (personal care), occupational skills, healthcare, travel/transportation schedules/routines safety, use of money, use of the telephone.

Assessment of

adaptive behavior to determine the support system is not common in India, where IQ levels are transformed into disability percentages. But now globally the trend is to define support system based on the extent of deficits in adaptive behaviors. Then the question comes what are supports? Supports are resources and strategies necessary to promote the development, education, interests, and personal well being of a person with intellectual disability. Supports can be provided by a parent, friend, teacher, psychologist, doctor, or by any appropriate person or agency. The AAIDD views that providing individualized supports can improve personal functioning, promote self- determination, and enhance the well being of a person with intellectual disability. Supports also lead to community inclusion abilities. Focusing on supports as the way to improve education, employment, recreation, and living environments is an important part of a person-centered approach to provide care to people with intellectual disability. To extend the support system, an individual's need for supports be analyzed in at least nine key areas, which are

75%

MATCHING BLOCK 76/203

SA

SIDDHI SOOD.docx (D46667599)

human development, teaching and education, home living, community living, employment, health and safety behavior, social behavior and protection and advocacy.

Between intelligence problems and adaptive behaviour deficits, credit is given to the latter in conceptualizing mental retardation as it directly reflects quality of independent living. To Give the importance of adaptive behaviour as a diagnostic criterion and its role in independent living, assessment is done to obtain two questions : 1) whether the adaptive behaviour is significantly below average? 2). If yes, what are the relative strengths and deficits of the individual? Answer to the first question comes from norm- referenced assessment, while criterion - references and behavioural tools are for the other. Answer to the second question emphasizes the fact that measurement of adaptive behaviour is a nonbiased assessment of culturally different students, as it recognizes cultural and ecological influences on daily living activities. Some of the commonly used scales are listed in Table 2.

133 Table 2 : The adaptive behaviour scales used in India S. No. Name of the Scale Approach Age Group Remarks 1. Vineland Social Normative Applicable for 0-15 years; Yields social Maturity Scale (VSMS; But is used with quotient (SQ) Malin, 1968; any age group of Provide a profile of Bharatarj, 1992) suspected cases of mental adaptive behaviour retardation domains. Indicates just the target areas 2. Madras Criterion Not defined from age the One of the first tests Developmental point of view of age but of its kind in India. Programming System appears to be applicable Useful for (Jeyachandran & for age 3 years & above, individualized Vimala, 1975) as the items reflect programme plan content from preprimary level and upwards.

Adaptive behaviour scales / Tools for assessment of adaptive behaviour The adaptive behavior, which projects our behavior in the personal and social areas, reflects our ability to respond to the environment. Thus adaptive behaviors come under the broad domains of functional independent skills, personal and social responsibility, and independent living skills. These elements combine to form an organized behavioral pattern of the individual. Some of the popular adaptive behavior

scales used for assessing the mentally retarded persons are :- The Adaptive Behaviour Scales (ABS) : The scale was developed in 1969 by Nihira et. al. to be used for client assessment and

78%

MATCHING BLOCK 77/203

SA

CHAPTER 1.2 assessment tools.docx (D155146787)

individual program planning and assessing the total programming needs of groups of clients for research purposes. It can be used to

make assessment of mentally retarded, emotionally maladjusted and developmentally disabled persons of all ages from childhood for

60% MATCHING BLOCK 78/203

SA CHAPTER 1.2 assessment tools.docx (D155146787)

adulthood. It is divided into two parts : Part-I, is concerned with matters described as adaptive behaviour and comprises ten domains with a total of 66 items.

The domains

79% MATCHING BLOCK 79/203

SA CHAPTER_-_1.pdf (D38635105)

are independent functioning, physical development, number and time, domestic activity, vocational activity, self direction, responsibility, and socialization,

Part-II of the scale is concerned with what are called maladaptive behaviours. These are grouped into 14 domains. They include violent and destructive

82% MATCHING BLOCK 80/203

SA CHAPTER_-_1.pdf (D38635105)

behaviour, untrustworthy behaviour, withdrawal, stereotyped behaviour, inappropriate interpersonal manners, unacceptable vocal habits, unacceptable 134 habits, self abusive behaviour, hyperactive tendencies, sexually aberrant behaviour, psychological disturbances and

use of medication. . The ABS is designed for use by someone who knows the individual being assessed. Thus it can, for example, be completed by a case worker or teacher. The assessor records responses to the item on the questionnaire, and no special training is necessary to complete it. The Vineland Social Maturity Scale (VSMS) : This was developed by

62% MATCHING BLOCK 81/203

SA CHAPTER 1.2 assessment tools.docx (D155146787)

Edgar A. Doll in 1935, and has been revised several times since its first publication. It was

intended to be used

70% MATCHING BLOCK 82/203

SA CHAPTER 1.2 assessment tools.docx (D155146787)

for program evaluation and research. The scale was designed to assess the social competence of

individuals of ages from birth to 25 years and above. The Indian adaptation of VSMS, by Fr. A. J. Malin, has an age range of birth to 15 years.

70% MATCHING BLOCK 86/203

SA CHAPTER 1.2 assessment tools.docx (D155146787)

There are eight domains with 89 items, grouped age wise self-help general; self help eating, self help dressing, self direction, occupation, communication, locomotion, and socialization.

The

information is collected by a trained examiner from an informant who is familiar with the client. Scoring of the items gives the information on social age from which the social quotient could be calculated. 3.5 Assessment Tools at preschool level : The age of three to four years is the time when the child attends a preschool, thus, a mentally retarded child with higher chronological years may educationally fall in the preschool years (3-4 years). The child is showing skills exhibited by a preschooler and, therefore, needs educational instruction appropriate for a preschooler. There are several assessment tools available at preschool level. a) Upanayan

Upanayan is a systematic, structured, early-intervention programme for the training of children with developmental delays and / or mental retardation. It was developed at Madhuram Narayanan Centre for Exceptional Children, Chennai. The programme was developed and designed to suit the Indian socio-economic conditions and cultural milieu. The programme has been developed considering diverse needs of children with any developmental delay besides mental retardation. This approach provides early intervention irrespective of the diagnostic labeling. Upanayan programme are designed for two groups of children : (1) birth to two- years; (2) two-years to six-years. Upanayan enables the family members particularly the mother to be the trainer or educator of the child. Another unique feature of this programme is that it combines traditional wisdom of child-care from India and other parts of the world with intervention. Programme for babies from birth to two-years of age comprises five developmental 135 areas; motor, self-help, language, cognition, and socialization. Under each of the above areas, 50 discrete behavioral skills have been identified as the optimal ones to cover the daily activities of a child of this age group. The activities have been planned to train children in the various skills in the household setting of an average Indian home. Programme for children from two to six years includes advanced skills set under each

50%

MATCHING BLOCK 83/203

W

of the 12 areas, which are as follows : gross motor, fine motor, mealtime activities, dressing, grooming, toileting, receptive language, expressive language, socialization, reading, writing

and number work. As part of the Upanayan Programme the centre has also developed a computer-aided programme of development training for children with mental retardation (0 to 2 years) in making friends, reaching out teaching how to clap, learning to blow, learning to balance and standing on one's own legs. b) Aarambh Current research on education of persons with mental retardation indicates that children with mental retardation can be part of the inclusive education system provided curriculum adaptation, evaluation methods are compatible to the individual needs. Even when the resources are available, children with special needs do not adjust to the inclusive setting they are not prepared for it. By the time it is realized valuable time, which was important for preparing base for future learning, is lost. Research directed towards early detection and intervention confirms that early-learning is very influential on later-learning. Precisely in this backdrop, "Aarambh", a package

for inclusive education at preschool level was developed at The National Institute of

Mentally Handicapped (NIMH) (Rao & Narayan, 2002) with funding support from UNICEF. It provides a customized curriculum, instruction for adaptation in teaching method each content and disability at preschool level. This package is meant to provide early childhood special educational inputs between 3 to 6 years i.e. before entering into the school system. The package consists of the following :- 1. Curriculum calendar 2. Teacher manual 3. Policy maker booklet 4. Activity cards The curriculum calendar specifies what objectives of learning to be involved in its monthly activities. Teacher manual helps the teacher to make programme plan in regular school so that the existing infrastructure and resources are well utilized.

136 An information booklet for the policymakers is added to draw a roadmap for making

the inclusive model of covering the children with special needs. There are 225 activity cards to cover the knowledge required daily; and information for a child to interact with parents, family members and the community. The cards indicate the process of various activities through conversation, games, songs, story-telling, creativity and finally prepare the child for skill demonstration. Field studies indicate that this scale is being widely used in early childhood special education in India. c) Portage Guide

David EL Shearer found the Portage Project in 1969 to provide services to young children identified with disabilities within a rural community (Shearer and Shan; 1972). By early 70's the project offered home-based services that supported parents as their children's first, most valuable and influential teacher. This family-guided model supports parents and family in implementing an individualized educational plan and through basic routines and activities that the parent and child engage in on a daily basis. Specific play-based activities offered and utilized to meet child's goals and to improve parent-child interactions. Developmental assessment tools are also used for targeting skills, behaviors and progress. The outcomes ultimately helped children to prepare for school and overall success. The ultimate goal of this project is to create and enhance quality programme which promote the development of education of all children with disabilities and their families through a home or relationship-based early intervention programme.

This project is guided by the following four core values :- 1) Strength-Based : a focus on the strengths of children, families, and programmes. 2) Ecological : consideration of the larger environment in which children, families and programs exist. 3) Family Focused : families and programs are the decision makers. 4) Relationship Based : most effective work is through relationships based upon trust that supports each individual and forms the basis of the program implementation (CESA 5, 2003).

This project has been adapted widely across the developing countries including India. Commonly known as Portage, "The

Portage Basic Training Course for Early Stimulation of Preschool Children in India"

was adapted in India by Tehal Kohli in 1987. This adaptation is an outcome of UNICEF supported pioneering project of its kind titled, "impact of home-centre based training programmes to 137 reduce developmental deficits of disadvantaged young children under ICDS scheme in Chandigarh". Portage as a tool provides age norm references besides giving the flexibility to choose programme as per the child's condition.

Components of the Portage Material are as followed :- 1) Portage Checklist by Bluma et al (1976) lists sequential behaviours from birth to six years of life. The Indian version, adapted by Kohli, contains 575 checklist items encompassing infant stimulation, socialization, language, self-help cognitive and motor domains. 2) Curriculum cards to observe each of the behaviours on the checklist. Each card includes a behavioural description of skill and suggests material and curriculum ideas for teaching it. 3) Activity charts. 4) Reactions of mothers towards portage training : It notes the mothers' satisfaction level

with the programme. d)

Madras Developmental Programming Systems (MDPS) This scale earlier know as "Madras Scale" was developed by Jeyachandran and Vimala (1968). It underwent three editions including a revision before it acquired its present

form

and the

name, "Madras Developmental Programming Systems" (MDPS) in 1975. The scale was revised five more times till 1992.

The scale is first of its kind in India in

individualized programme planning in training persons with

mental retardation. It consists of 18

domains with each containing 20 times. The 18 domains encompass the following broad areas :-

73%

MATCHING BLOCK 84/203

W

Motor : (Gross Motor, fine motor) Self-help skills : (Eating, dressing, grooming, toileting) Communication skills : (Receptive language, expressive language) Social interactions Functional academic skills : (Reading, writing, arithmetic, time, money) Domestic behavior Community orientation Recreation and leisure time activities Vocational activities 138 Each

item is scored with alphabetic code ('A' means performs; 'B' means yet to perform), and a colour code ('Blue' means performs; 'Red' means yet to perform). Specific patterns are also used to indicate if a skill, which was not performed at baseline, is achieved after training. The patterns vary depending on which quarter the assessment was done. Being a criterion-referenced scale it provides scope for periodic assessments and evaluation. Items from each domain are also identified to represent different educational levels including preprimary, primary, secondary and prevocational. Some salient features of the scale are as following :- ●●●● Item selection is based on developmental stages and life situations. ●●●● All the 360 items are positive statements which are observable and measurable. ●●●● All the items have functional relevance. ●●●● The items proceed from simple to complex. ●●●● The scale has sound psychometric properties such as reliability, validity and practicality. e) Functional assessment checklist for programming (FACP) Latest among the approaches to curriculum development, the functional approach emphasizes that educational goals should be functional, age appropriate and community - referenced. Need for his approach arises in the context that curricular content, at times, does not provide a meaningful link between learning situation and practical situation. Functional curriculum ensures that the activity taught is directly applicable in real situation. Suppose a teacher may decide to teach spellings only for those words that require reading and writing in general correspondence. Accordingly, the teacher shall teach the spellings for name of the student, grocery items, sign boards than typically beginning with alphabet. Similarly, training for holding food is done with real food than holding beads and blocks. Thus, a functional programming aims at leading the student towards reduced dependence on others and provide maximum personal, social and occupational competency. The following checklists, based on functional curriculum, are extensively used in India in both individualized training and group teaching :-

Functional Assessment Checklists for Programming (Narayan et. al., 1994) This checklist is developed by the Department of Special Education, NIMH. There are separate checklists for different age groups - Preprimary (3-6 years), Primary-I (7-10 years), Primary-II (9-14 years), Secondary (11-14 years), Prevocational-I and Prevocational-II (both 15-18 years), and Care Group (those who are profoundly retarded). The items vary from one checklist to another. The domains covered are, personal, social, 139 academics, occupation and recreational. The checklist provides the guidelines as how to promote children from one class to another. If the curriculum is mastered the individual will have necessary competency to undergo vocational training and function independently in adult life. 3.6 Assessment Tools at school age : The years between five to ten are the years of primary schooling. During this period, significant changes in the sphere of physical, intellectual, emotional and social aspects takes place. Language, communication, reasoning thinking, problem solving capacities develops rapidly. The various assessment tools at this age are :- i) MDPS - Mentioned earlier ii) BASIC MR -
The

iii) GLAD -

Grade level assessment device for children with learning problems in schools (Narayan, 1994) :

This tool was the first of its kind in India, which was developed in the backdrop that there were no wholesome scales to assess the learning problems. Even those existing did not meet the variation across State and Central schools syllabi. Some of the main objectives with which this tool was developed are as following :- ●●●● Development of a schedule for assessing children to find out their class equivalence in academic performance in India. ●●●● Developing a manual for use by the teacher. The tool has two formats : Format-I and Format-II. Format-I contains test booklets of class I to IV given in the form of worksheets.

Each class contains worksheets in

Hindi, English and Mathematics. Item include tasks requiring verbal and written responses to questions.

Analysis of students performance gives clue to the teacher regarding the student's style of learning and problem solving. The salient feature of this scale is that the test items are based on minimum levels of learning (MLL) prescribed by the National Council on Educational Research and Training (NCERT). Further, items have the uniform endorsement of syllabi of various Central Boards and a State Board where MLL was taken the standard. But wherever MLL were not prescribed as in the case of LKG and UKG, item endorsed by different boards, and published books were considered in the same order. Thus this tool satisfies the assessment needs of children coming from different school syllabi across India. Since the test items reflect the standard curricula, it is also an example for curriculum based assessment tool. The tool has established criterion validity, content validity face validity, test-retest reliability. Format-II is meant for teacher's observation regarding the student's performance on Format-I and certain personal details of the student.

It contains three sections. Section- I deals with personal details, family history, school history etc. Section-2 requires the teacher to note information on sensory-motor skills, which will be useful for medical referral. Section-3 indicates the possible errors for each subject so that when they are noted the teacher can understand the processing deficits involved in specific

subject. Finally the summary sheet provides for a brief overall picture of the child, which includes matrix that shows the child's class of functioning in terms of independent, functional and frustration levels. Coding facilities are provided so that the class levels in which the student is tested can be noted in terms of his or her performance. The salient features are as follows :-

142 ●●●● Overall information can be used to identify learning problems with reference to curriculum. ●●●● It is possible to ascertain the grade levels in Hindi, English and Mathematics. ●●●● Information obtained can be used in diagnosis and management of specific learning disabilities in primary class levels. ●●●● It is reliable, valid, and easy to administer and interpret. ●●●● Has relevance to all parts of India, as it is based on MLL, and also the Central and a State Board

Syllabi. iv) Support Intensity Scale :- It is a unique scientific assessment tool designed to measure the level of practical support required by the people with mental retardation in order to lead a normal, independent life in society. The scale has two components :- ●●●● A manual explains how to administer the instrument. ●●●● A set of pre printed forms rate the respondent on the intensity of supports required in medical, behavioural and life activity areas. The support means resources and strategies - including individuals, money or tangible assets, assistive devices, of environments that enable people with developmental disabilities live normal lives in regular community settings. The Supports Intensity Scale measures supports required by an individual in 75 life activities

79%

MATCHING BLOCK 94/203

SA

SEID -31 PDF.pdf (D127037695)

in the areas of home living; community living; life-long learning; employment, health and safety; social interaction; and protection and advocacy. The

Supports Intensity Scale also measures 15 exceptional medical needs and 13 behavioural support needs of the individual being tested. The rationale here is that certain medical conditions and challenging behaviours predict that a person will

70%

MATCHING BLOCK 95/203

SA

SEID -31 PDF.pdf (D127037695)

require increased levels of support, regardless of his or her relative intensity of support needs in other life areas. The

Supports Intensity Scale is conducted as a semi-structured interview by a qualified interviewer with preferably two or more respondents that know the individual well. The interviewer should be a professional who has completed at least three months and have had recent opportunities to observe the person function in one or more environments for substantial periods of time.

143 The Supports Intensity Scale has been normed on a sample of 1306 people between the ages of 16 and 70+ identified with mental retardation or other developmental disabilities. The SIS sample was drawn from 33 states and 2 Canadian provinces and the data was collected between spring 1999 and fall of 2002. Benefits of SIS Scale :- ●●●●● Provides direct, reliable, and valid measurement of supports requirements in 57 life activities. ●●●●● Ranks results by frequency, daily support time, and types of support needed. ●●●●● Evaluates impact of 15 medical and 17 behavioural conditions on overall support needs. ●●●●● Presents percentile ranking of persons needs based on national field test data. ●●●●● Provides graphic plot of information recorded, including visual display of areas of high intensity vs. low intensity of supports needs. ●●●●● Supplements adaptive behavior measures by revealing exactly what practical supports are required to perform a task (Adaptive measures identify the skills of an individual has to do a task). The authors of the Supports Intensity Scale are :- James R. Thompson, Brian Bryant, Edward M. Camplell, Ellis M. (Pat) Craig, Caroyln Hughes. 3.7

76%

MATCHING BLOCK 97/203

SA

SEID -31 PDF.pdf (D127037695)

Documentation of Assessment, Result Interpretation and Report writing : Implication of class level assessment

and its relation to inclusion with resources support. Different assessments can be used for further recommendation and further action. There are various assessment result which alone or combinations of different result is needed for decision making. The comprehensive report leads to evaluative purpose. Ø Writing report for administrative decisions alike. ●●●●● Diagnosis and certification. ●●●●● IQ assessment.

144 ●●●●● Placement in appropriate school. ●●●●● Eligibility to various benefits and concessions. ●●●●● Establishing rights. ●●●●● Access to suitable adaptive devices for independent mobility, communication and learning. Ø Writing reports for educational programming.

The teacher must remember following points for writing educational programming :- ●●●●● Objectivity ●●●●● Use ●●●●● Clarity ●●●●● Authencity ●●●●● Unbaised ●●●●● Uptodate ●●●●● Simplicity ●●●●● Precise ●●●●● Provision of support documents where applicable. Ø Writing report for referral :- ●●●●● Referral at the time of initial assessment ●●●●● Referral during the educational programme ●●●●● Referral for admission to regular / special school ●●●●● Referral on completion of school educational.

Interpretation of educational assessment has two major purposes :- ●●●●● Placement decision ●●●●● Programme planning

Placement decision :- Due to intellectual impairments coping in regular classes is difficult. In the light of inclusive education, placement of the child should be with the childs pear and be based on chronological age.

145 According to Salvia and Ysseldyke (2007), general educators believe that children with developmental delay needs more support or special assistance to achieve desired outcome with the help of class level assessment or grade level assessment, - the teacher has to take into account the consistency of responses over a period of time and select the right recommendations for referral and amount and nature of support needed. Programme Planning :- The assessment by the teacher is continuous and it reflects current level of functioning at a given time and progress as a result of instruction. Recently the model of class level assessment or curriculum based assessment for monitoring progress is response to instruction (Horner, Sugai and Horner 2000). It basically focuses on effective instruction. In inclusive settings, it helps the teacher to decide, how much the student benefits from core instruction (which is provided to all students), how much enhanced instruction is needed in addition to the core instruction and in what near intensive instruction is to be planned. The assessment data which will include - preliminary assessment, specific assessment to plan annual god, individualized educational programme (IEP), date of behaviour analysis, record of parent teacher meetings, visits to inclusive classes as a resource teacher, team meeting with principal, detail information of the students profile like learning style, rate of learning, interests, needs, supportive classmates or teachers give a clear picture of the student in the class. So, to achieve the goal of education, perfect recording of assessment, supporting parents, cooperation of teachers, proper referral, modified instructions, innovative teaching strategies, alternative evaluation system can be used as a support system for the child in inclusive set up. 3.8 "Check Your Progress" (i) What are the importance of assessment at preschool and school level?

.....
.....
.....

146 (ii) Why developmental assessment is necessary in mental retardation?

.....
.....
.....

..... (iii) What is adaptive behavior? Reason out the importance of assessment of adaptive behaviour in the field of mental retardation?

.....
.....
.....

..... (iv) Describe two important assessment tools in preschool level.

.....
.....

..... (v) Describe one curriculum based assessment tool used in school level assessment. Define its importance in inclusive educational set up.

.....
.....
.....

..... 3.9 Let Us Sum Up The needs of individual vary with the age thus different methods of assessment are needed. During preschool age the basic skills such as cognitive, motor, sensory perceptual skills develop at rapid speed. So, the pre-requisites for most of the adaptive behaviours and conceptual skills are still in progress. The assessment tools should be like that to evaluate these pre-requisites of a child.

147 The assessment of school level is to impart for diagnosis and placement in proper educational set up. So the tools at this level are to assess the overall academic and adaptive skills which are necessary for independent living. Developmental assessment is an important aspect of early identification of mental retardation. Assessment of adaptive behavior is needed to define effectiveness of the person to

meets the standards of personal independence and social responsibility expected according to the age and culture. Assessment tools used in preschool level are

63% MATCHING BLOCK 96/203

W

Upanayan, Arambh, Portage, MDPS, FACP and assessment tools in school level is MDPS, BASIC-MR, GLAD and Support Intensity Scale. Documentation of assessment

is important for evaluative purpose, educational programming purpose and referral purpose. The educational assessment has two major purpose – placement decision and programme planning. So, for overall development of a child depends upon had perfectly the date of assessment is used through analysis and what types of modification is needed for his educational upliftment in inclusive educational system. 3.10

Check Your Progress 4.9 Let us Sum up 4.10 References 4.1 Introduction

Assessment in special education is the most crucial step towards planning the programme for a person with intellectual disability (PwID). Assessment aims at assessing the potentiality of an individual with intellectual disability and helps at preparing him/ her towards independent living following the result of assessment.

The information gained through the assessment process have to be utilized meaningfully for the programme planning for independent living of PwIDs.

Education is a mean to independent living and economic independence to everyone including persons with disabilities. To achieve this, vocational training and placement is imperative.

The persons with intellectual disability have also the right to get meaningful employment for their livelihood. Special Educators asses and plan a training programme which focus on transition from school to work. Transition from school to work means scientifically plan transfer of a student from school to world of work with requisite 151 skills.

MATCHING BLOCK 105/203

SA

Effect of Vocational Training on Behavioural S ... (D29288122)

Comprehensive transition from school to work planning and implementation require participation from all relevant school, parents and the children with intellectual disability Very often, comprehensive transition planning requires restructuring and rethinking of professional roles. Refining professional roles is not enough, participation of

the family members of the persons with intellectual disability and the community must also be encouraged. Service delivery of persons with intellectual disability is typically initiated by a referral, subsequently screening tests are conducted and a rigorous assessment process follows using standardized tools, which are appropriate to the culture and society. National and International tools are used to assess different domains of adaptive behavior and independent living of people with intellectual disabilities. Rehabilitation has gained the due importance on the agenda of the Central Government. The Government has planned and implemented a lot of schemes, programmes and projects which are supported by an 'infrastructural network' of the Disability Division in the MoSJE. MOSJE assure several provisions and schemes for vocational competency development of these people on behalf of government. Finally a comprehensive report is necessary to mobilize the community. Collecting information through assessment report is necessary to make the community more accessible in resource mobilization. 4.2

outcomes for community living. 152 4.3 Significance of Assessment for Independent living of		

PwIDs. Assessment: Concept

100%	MATCHING BLOCK 106/203	SA	EDU 293Introduction To Neuro Developmental Dis ... (D165064915)
Assessment is a process of collecting data for the purpose of making decisions about			

learners. Assessment information is used to make decisions about what learner have learned, what and where they should be taught, and the kind of services they need. Assessment is an integral part of the learning process, required in order to:

- Judge performance, measured against intended learning outcomes.
- Determine whether progression to the next level is appropriate.
- Provide useful feedback, which indicates attainment and also areas for improvement.
- Identify what has not been understood, thus helping to inform evaluation of teaching methods and approaches.

An

assessment in special education is the process used to determine a child's specific learning strengths and needs, and to determine whether or not

a child is eligible for special education services. Assessment in

special education is a process that involves collecting information about a student for the purpose of making decisions.

Assessment,

also known as evaluation,

can be seen as a problem-solving process (Swanson & Watson, 1989) that involves many ways of collecting information about the student. According to Gearheart and

Geatherat (1990' cited in Pierangelo and Giuliani, 2006),

assessment is "a process that involves the systematic collection and interpretation of a wide variety of information on which to base instructional/intervention decisions and, when appropriate, classification and placement decisions.

Assessment is primarily a problem-solving process."

Considering independence, independent living, rehabilitation as our primary goals; assessment of adaptive behavior/functional abilities becomes very important as this is the first step in the process of planning a programme for a person with special needs.

The importance of assessment should never be underestimated.

In special education, you will work with many professionals from different fields. You are part of a team, often referred to as a multidisciplinary team

that tries to determine what, if any, disability is present in a student. The team's role is crucial because it helps determine the extent and direction of a person's personal journey through the special education experience.

153 Consequently, the skills you must possess in order to offer a person the most global, accurate, and practical assessment. The development of these skills should include

a good working knowledge of the following components of the assessment process

in order to determine the presence of a suspected disability. ●●●●

Collection : Process of tracing and gathering information from many sources of background information on a person. ●●●●

89%

MATCHING BLOCK 107/203

SA

SEID -31 PDF.pdf (D127037695)

Analysis : Processing and understanding of patterns in person’s educational, social, developmental, environmental, medical, and emotional history. ●●●● Evaluation : Evaluation of person’s academic, intellectual, psychological, emotional, perceptual, language, cognitive, and medical development in order to determine areas of strength and weakness. ●●●● Determination : Determination of the presence of suspected disability and the knowledge of the criteria that constitute each category. ●●●● Recommendation : Recommendations concerning educational placement and program that needs to be made to the school, teachers and parents.

Functional Abilities and Its Assessment Comprehensive assessment of functional ability is the basis for developing a rehabilitation programme. Functional ability measures a person’s ability to perform ADL’s as well as instrumental activities of daily living. ADL’s include activities performed to meet basic needs, such as personal hygiene, dressing, and toileting, eating and moving. ADL’s also include activities that are necessary for independent living, such as the ability to shop for and prepare meals, use the telephone, clean, manage finances and travel, as one grows older. The significance of assessment is much more than merely testing an individual. It involves gathering information in many ways like testing the individual directly, observing him/her in various environments and interviewing family members and others significant in his/her life. Informations collected through these means are analyzed to make decisions related to the purpose for which the assessment is carried out. Vocational Assessment has very important role to guide the PWIDS in rehabilitation process which is the ultimate goal. A PwID becomes independent only through proper rehabilitation.

154 Through vocational assessment the special educator finds out the skills, performance and interest of the persons with Intellectual Disability which helps in planning and executing the planned vocational training programme in individual and group setup. Vocational assessment can be broadly defined as the “Process of obtaining information about worker’s skills and performance in order to make appropriate training decisions” (Bellamy, Horner and Inamn, 1979).

Vocational assessment is a comprehensive process that systematically utilizes work in

real or simulated as the focal point for assessment and vocational exploration, the purpose of which is to assist individuals in vocational development.

It also incorporates medical, psychological, social, educational, vocational, cultural and economic data in selecting goals for vocational training and rehabilitation. To enhance the independent living of PwIDS the mode of assessment should be functional in nature. Purposes of functional vocational assessment for persons with intellectual disability are : ●●●●

74%

MATCHING BLOCK 109/203

SA

SEID -31 PDF.pdf (D127037695)

Provides information on work readiness skills. ●●●● Helps to identify suitable jobs in the community. ●●●● Provides information on jobs selected. ●●●● Identifies areas in which training is needed. ●●●● Emphasizes on-the-job training. ●●●● Evaluates work related skills and work behavior. ●●●● Targets employment for all trainees who are assessed. ●●●● Extends support for job retention Aim of Vocational Assessment The main aim of vocational assessment is to

help in assessing the individual’s skills and capacities and in pin-pointing the strengths and weaknesses for eventual vocational programming. Vocational assessment needs to address four major issues namely: a) Eligibility for services. b) Vocational potential - which involves assessment of intellectual ability, academic achievement, aptitudes and interests.

155 c) Social adaptation and level of psychological and emotional functioning, and d) Evidence of problems that require treatment. Principles of Vocational Assessment Some of the important principles of vocational assessment are as follows:

●●●● The vocational assessment must be ecological. ●●●● Vocational assessment must be carried out in settings where in individuals' response can be evaluated in relation to naturally occurring environmental cues in a situation. ●●●● The assessment instruments should have predictive validity for determining the individual's ability. ●●●● Vocational assessment must include both quantitative and qualitative components. ●●●● Vocational assessment should focus on work related skills and behavior that could impede the employment opportunities. ●●●● Vocational assessment must proceed from global to specific measures as the individuals prepare for gainful employment. Initially, a baseline assessment should be done using criterion referenced norms to obtain information about the individual's vocational potentialities. Then, formative assessment should focus on information related to vocational training Programme. The final stage encompasses on-the-job evaluation. Relevance of

Vocational Assessment Education is a means to independent living and economic independence to everyone including persons with disabilities. To achieve this, vocational training and placement is imperative. When a student is around 15 years of age, preparation for suitable vocation should be the focus of curriculum planning so that when he is 18 years, he will be ready for a vocation. The various

assessment relevant to vocational training and placement include. ●●●● Adaptive behavior ●●●● Ability and current level of functioning ●●●● Aptitude ●●●● Occupational ●●●● Transition

156 ●●●● Ecological ●●●● Life skills ●●●● Family resources and concerns Choice of vocation is dependent on abilities, interests and aptitude. Psychologists play a major role in finding out aptitude of the persons with intellectual disability. There are also tools for occupational assessment and life skill assessment and life skill assessment. As school curriculum focuses on academic and functional skills, transition assessment to vocational training is also a development in recent years. Transition assessment focuses on adaptive behavior, life skill measures, knowledge and skill related competencies. (Cronin & Patton, 2007). What is important is how the test results are interpreted. For a person with intellectual disability, one should consider, job skills, job related skills and generic skills. For example, job skill may be the direct job to be performed, say 'lift operator' in a public building. This will include operating of the lift as required by the users and managing/reporting problems if and when it occurs, maintaining log book and relevant register and so on. The job related skill may be to be on time, related social skills of routine pleasantries and courtesy with people who use the lift, maintaining will groomed, acceptable appearance, and so on. The generic skills refer to prerequisites such as time, travel and money management skills. The assessment report should generate this information systematically so as to appraise the abilities of the candidate in reference and plan a programme to groom him suitably. The vocational assessment profile will include the aptitude of the candidate and will list more than one job skill that he may be suitable for. It is imperative that the vocational assessment report holds information on the health issues if any, about the candidate, benefits and concessions that he is receiving and details regarding registration in employment exchange/special employment exchange. Interpreting the vocational assessment should be with the vocational options in perspective. The avenues may be open employment, sheltered employment or supported self employment, depending on the ability of the student, family resources and plans for the trainee and the ecological details. The vocational training may be through regular vocational education programmes such as the industrial training institutes (ITI), vocational rehabilitation centers (VRCs) or special institutes meant for persons with mental retardation, both, Government and non-government, community based rehabilitation (CBR) programmes is another major avenue for vocational training. Therefore the teacher has to carefully interpret the assessment information by assembling all pertinent information to fit the person in the correct vocational setting for training.

157 As rightly noted by Polloway, Patton and Serna (2007), students must be provided with opportunity to become aware of and explore various occupational options that are potentially available to them. This is possible only by wish interpretation of the assessment reports by the teachers. Approaches of Vocational Assessment Since vocational assessment greatly influences vocational training and rehabilitation, professionals have become increasingly concerned about the use of appropriate assessment strategies. Broadly there are two types of assessment approaches; namely: the traditional and contemporary assessment approaches. Traditional assessment approach measures abilities and prior learning assuming that already learned traits can predict subsequent learning and performance. Traditionally, vocational assessment relied upon standardized techniques, like, intelligence test, measures of aptitudes, interests and norm-referenced instruments to obtain profiles of vocational potential. Contemporary Approach to Vocational Assessment Contemporary approach include three newly developed areas to vocational assessment of intellectually disabled persons. These are assessment of adaptive behavior, survival skills and process assessment approach. Adaptive behavior refers to a wide range of appropriate behaviours in diverse social contexts. The survival skills refer to those vocational and social behaviours which facilitate to obtain and maintain employment. Process approach emphasizes the importance of direct assessment of actual competencies in contrast to product approach of relying on measures to infer performance. Future Perspective The successful placement of Intellectually Disabled individuals into an integrated work setting depends upon a multitude of inter-related personal and situational variables and hence it is imperative to assess a wide range of personal skills and vocational attributes. Professionals are faced with the task of devising vocational assessment package 158 that adopts the best of both traditional and contemporary approaches. The package should provide information that is maximally useful for : a) Identification of target population. b) Programme planning for vocational training. c) Placement and gainful employment. d) Monitoring worker progress. e) Programme evaluation. The vocational assessment package should be simple and time and cost effective. Some of the important areas which can be used as framework for vocational assessment of intellectually handicapped persons include general mental ability, skill levels, language and communication, adaptive behavior, daily living skills, social competence, level of independence and level of integration. These parameters can be measured by use of relevant assessment techniques which would serve the purpose of vocational planning, monitoring progress and evaluating programme effectiveness, information about occupational interests and aptitudes will be useful in matching a person with job that is not only feasible but is also of interest to the employee. In this way vocational assessment can be sensitive to the interaction between skill level and job requisites, thus providing more relevant information for vocational training and vocational rehabilitation. Improving quality of life for handicapped individuals should be overriding concern all of human service programmes and measures of life-style satisfaction should be the prime yardstick to evaluate success in vocational rehabilitation. 4.4 Assessment

Comprehensive transition from school to work planning and implementation require participation from all relevant school, parents and the children with intellectual disability Very often, comprehensive transition planning requires restructuring and rethinking of professional roles. Refining professional roles is not enough, participation of

the family members of the persons with intellectual

159 disability and the community must also be encouraged. Transition for any children with Intellectual disability involves several key components such as: ●●●● An appropriate school programme. ●●●● Formalized plans involving parents and the entire array of community that are responsible for providing services and. ●●●● Multiple, quality options for meaningful post-school training and gainful employment.

91%

MATCHING BLOCK 111/203

SA

Effect of Vocational Training on Behavioural S ...
(D29288122)

Transition plans may begin with a parent, school or an agency responsible for providing post school vocational services.

There are several models of transition from school to work. They are : ●●●● Office of Special Education and Rehabilitation Services (OSERS) model of transition. ●●●● Wehman, Kregal and Barcus - 1985 Transition model. ●●●● Pathways model of transition. ●●●● Halpern's revised transition model (1985). ●●●● NIMH Vocational Transition model for persons with Mental Retardation (Intellectual Disability) The most practiced transition model in Indian context is NIMH Vocational Transition model for persons with Mental Retardation (Intellectual Disability), developed by National Institute for the Mentally Handicapped, Secundrabad. This model states that transition plan is very important stage and role of special educator is also essential in planning and exhibiting the proper transition programme for the overall development of the persons with intellectual disability. The flow chart of NIMH Transition Model has focused on four stages of vocational transition and employment of persons with intellectual disability. The stages are :
160 Ø School Instruction Stage Ø Planning for Transition Ø Placement in Employment Ø Ongoing Support Services
School Instruction

52%

MATCHING BLOCK 113/203

SA

Effect of Vocational Training on Behavioural S ...
(D29288122)

Stage Systematic school instruction is the foundation of vocational training and related employment. The children with Intellectual Disability are being taught daily living skills through functional curriculum from pre-primary to pre-vocational levels. The functional curriculum

equips the children with intellectual disabilitywith related/required work readiness skills.

81%

MATCHING BLOCK 114/203

Effect of Vocational Training on Behavioural S ...
(D29288122)

The main objectives of school based curriculum are : ●●●● It develops work habits, positive attitudes, value toward work and daily living skills. ●●●● It provides instructions and guidance for establishing and maintaining relationship at home, school and at work. ●●●● It develops the work

related skills among the persons with Intellectual disability to be placed in the community. ●●●● The students with intellectual disabilitycomplete their education through functional curriculum from pre-primary to pre-vocational with the age range from 3 years to less than 18 years. After completion of stipulated training in particular class/group, decision will be taken for promotion (After achieving more than 80% task prescribed in the

100%

MATCHING BLOCK 112/203

W

particular group the student could be promoted to the higher class).

Planning for Transition - This stage consists the community assessment, vocational assessment and individualized transition plan. Community assessment consists of : (i) Analysis of community (SWOT analysis i.e. Strength, Weakness, opportunity and threat analysis), (ii)

84%

MATCHING BLOCK 115/203

SA

Effect of Vocational Training on Behavioural S ...
(D29288122)

Identification of employment opportunities, (iii) Working out strategies to enlist jobs in community,

and (iv) Job identification within their own community (if possible).

162 Vocational assessment involves : (i) Family assessment of persons with mental retardation, (ii) Generic skill assessment, (iii) Specific skill assessment of the persons with intellectual disability.

Individualized transition plan focus mainly on : (i) Job analysis, (ii) Job matching, and (iii) On job training of the persons with intellectual disability. Placement in Employment The students with intellectual disability are prepared for a job

86% MATCHING BLOCK 116/203

SA Effect of Vocational Training on Behavioural S ... (D29288122)

right from the beginning of their schooling. As they reach the final stage, the search for the real job starts. The training continues in simulated job setting and job sites. By the end of the training, as they leave school, the students with intellectual disability are placed in actual sites. It can be in one of the following types of employment

such as open employment, supported employment, sheltered/group employment and self/home based employment. Ongoing Support Services The role of special educator does not get over once the persons with intellectual disability placed in the actual job site. Even the role gets more important as the persons with intellectual disability who has been placed on real job setup where he/she has to face the new challenges such as expectations of the employer, getting involved with the co- workers etc. Hence, ongoing support services is very essential for

89% MATCHING BLOCK 117/203

SA Effect of Vocational Training on Behavioural S ... (D29288122)

the new employees to continue on-the-job are given importance in this model.

the special educator should observe the persons with intellectual disability on the real job sites and provide additional support as and when it is required to cope up with the new situation. The special educator should also provide necessary skill training to succeed in the carrier through proper counseling to special employee, employer and the co-worker. Gradually reduce the level of support to make the persons with intellectual disability/special employee independent at their work setup/job site, which will enhance the quality of life of the persons with intellectual disability and become an earning member of the family and society.

97% MATCHING BLOCK 118/203

SA SEID -31 PDF.pdf (D127037695)

Planning for Vocational Transition : the Process This is the important phase of a transition model. Transition programme would have no meaning without specific planning. 163 Formal individualized student plans It is essential to develop a formal, individualized transition plan for every student with intellectual disability. Formal plan should specify the objectives to be acquired. The plan should include annual goals and short term objectives that reflect skills required to function on the job, at home and in the community. Transition plan should be comprehensive in scope. In addition to specific job skill training, students must also be prepared to use community services effectively, manage money, and travel to and from work place independently. Plans must take care of all these skill areas to meet the comprehensive needs of the students and at the same time should be individualized. Each individual requires a different set of post-school services. Transition plans must also be longitudinal in nature. Participation of all individuals and agencies involved in the transition process during the initial development

and

91%

MATCHING BLOCK 119/203

SA

SEID -31 PDF.pdf (D127037695)

the plan is required till the final placement. The plan initially should be for a longer period and should then be modified once in a year. ☐☐☐☐ Consumer input Wherever appropriate, the person with ID should be consulted for his views and options as he is the consumer of the plan proposed. When the person with intellectual disability is not capable of making decision, the parent or primary caregiver becomes the consumer to represent the student concerned, Therefore, parental involvement in vocational transitional plans is important. They should be made aware of the employment alternatives available to their children. They must acquire knowledge and skills required to participate effectively in transitional planning. Systematically planned parent education programs will improve the effectiveness and duration of parent involvement. Parent education meeting should be conducted by the school personnel for the purpose of enhancing parental involvement. The meeting should. ●●●● Orient the parents to the community agencies providing post-school services to handicapped youth. ●●●● Familiarize parents with specific responsibilities of special education, vocational education and vocational rehabilitation in the vocational transition process. ●●●● Prepare parents to work with various agencies to develop transition plans and to apply for future services. 164

☐☐☐☐

94%

MATCHING BLOCK 121/203

SA

SEID -31 PDF.pdf (D127037695)

Inter-agency co-operation It refers to coordinated efforts across different agencies like schools, rehabilitation services and vocational training centers so as to ensure the delivery of appropriate, non-duplicated services to each student (Morton et al. 1983) However, it is a difficult attempt. Since agencies differ widely in their opinion, services continue to be duplicated. Solutions to these problems are yet to come up. ☐☐☐☐ Employment outcome Employment outcome is the outgrowth of appropriate secondary special educational programme and a meaningful transition plan. As a result of the implementation of individualize transition plan the trainee should be in a position to work in open employment, supported employment, sheltered employment or self-employment setup. It is essential that communities should provide different vocational alternatives, in order to make transition programme a success. ☐☐☐☐ Necessity of follow-up services Though outcome stage is the final stage in the transition model, the responsibility of the special educator does not end with this. In order to monitor the transition effectively, it is the essential to follow-up the individuals-who are placed on jobs in regular interval. It is also essential to ensure job retention by the person concerned. Here, we have to collect information about the student's perception of his/her present job status, parents' satisfaction and the employer's evaluation of his/her work performance. The follow up services in addition to helping the students in retaining the job will help the professional in gathering information about the effectiveness of the transition programme. 4.5

Assessment Tools for Independent Living - BASAL - MR, V APS

98%

MATCHING BLOCK 120/203

W

Assessment Tools and methods vary depending on the purpose for which assessment is to be carried out and the type of the data that has to be gathered.

Service delivery for the persons with intellectual disability is typically initiated by the referral, subsequently screening tests are conducted and a rigorous assessment process follows using standardized tools, which are appropriate to the culture and the society. Each tool has

165 its strengths and benefits, and potential utility depending upon the assessment criteria and subject eligibility. Assessment in special education is the most crucial step towards planning and programme for adult. Tools to assess different domains of adaptive behavior are widely used across all countries including India. BASAL-MR - Behavioural Assessment Scale for Adult Living-Mental Retardation.(ReetaPeshawaria, D.K. Menon, Don Bailey et al., 2000) This scale has been developed at National Institute for the Mentally handicapped Secunderabad. This tool is developed for assessing the adaptive and maladaptive behavior of the adult persons with Intellectual Disability (Mental Retardation) above 18 years old. BASAL-MR gives a profile of skill behaviours and problem behaviours, while the problem behavior checklist is meant to measure only the problem behaviours of the adult person withIntellectual Disability. The tool is a standardized assessment tool and used widely in country. The underlying assumptions of BASAL-MR are the same, they recognize that certain skill behaviours and problem behaviours are unique to specific groups. BASAL-MR contains the following domains/areas :

169 Administration of BASAL-MR (Part B) The BASAL-

100%	MATCHING BLOCK 132/203	SA	Suman Madan (19-BMU-6111) EDUCATION.docx (D148140404)
MR (Part B) is to be administered individually on each			

person withIntellectual Disability. The trainers/user should go through the entire scale and familiarizes with the meaning of each item before beginning to administer the scale. The following points need to be considered while administering the scale ; 1. Administer BASAL-MR (Part B) as also the (Part A) on the adult withIntellectual Disability. Do not presume or assume whether a particular person has or does not have behavior problems. 2. Read

68%	MATCHING BLOCK 133/203	SA	Research Work Suraj.pdf (D30233331)
each item within every domain in the scale and assess whether the given person with Intellectual Disability has or does not have, the stated			

problem behavior. 3. As far as possible, use direct observation techniques rather than interview techniques to determine if the client has or does not have the stated problem behavior. 4. It is not essential to complete the behavioural assessment of the person using BASAL-MR (Part B) within a single session. Depending on the nature of problem behaviours observed or reported, adults may have to be assessed over few sessions of observation. In some cases, where direct observation of problem behaviors is not possible, information can be elicited using interview method and supplemented from key informants such as parents/caretakers. 5. Enter the performance of the individuals and the score obtained as you administer the scale for all four occasions that you assess and evaluate the client during the year. Scoring

87%	MATCHING BLOCK 136/203	SA	SEID -31 PDF.pdf (D127037695)
of BASAL MR (Part B) The following is the criteria of scoring which need to be used for BASAL-MR (Part B) 1. For			

the

72%	MATCHING BLOCK 134/203	W	
given person with Intellectual Disability, check each item of the scale and rate them along a three point rating scale, viz. never, occasionally or frequently.			

a) If the stated problem behaviour has "never" been observed or reported in the person, then give a score of 0. b) If the stated problem behavior occurs sometimes, that is,

64%	MATCHING BLOCK 135/203	W	
once in a while or now and then, it is rated "Occasionally" and given a score of 1. c) If the stated problem behavior occurs quite often or, habitually it is rated as "frequently" and given a score of 2. 170 Thus, for each item on the BASAL-MR (Part B) an adult with Intellectual Disability may get any score ranging from 0 to 2 depending on the frequency of that problem behavior. Enter the appropriate score obtained by the person for each item in the			

appropriate boxes. 2. The maximum possible score for a person on BASAL-MR (Part B) is 240. 3. Add

69% MATCHING BLOCK 137/203 SA Research Work Suraj.pdf (D30233331)

the individual scores of the person on each item within a domain and express it as 'obtained score' for that domain. Convert it into percentage for each domain. 4.

Calculate the total 'obtained score' for all the twelve domains and express it as Grand Total 'obtained score' for BASAL-MR (Part B). A lower score indicates fewer/less behavior problems. 5. Convert the total obtained score into percentages by

75% MATCHING BLOCK 140/203 SA Suman Madan (19-BMU-6111) EDUCATION.docx (D148140404)

dividing the total obtained score with the maximum possible score i.e. 240 and multiply by 100. 6.

Administer the BASAL-MR (Part B) according to the above procedure on four occasions each time along with BASAL-MR (Part A). a) The first or initial assessment of the person is done before starting the teaching or training/management programme. This is called as baseline assessment. b) Repeat the next three assessments at the end of every three months i.e. one quarter or after a predetermined interval as per policy. 7. Enter the obtained scores, percentages, grand total scores and percentages attained by the person at the end of each assessment of evaluation in the appropriate boxes. NIMH - VAPS (

100% MATCHING BLOCK 138/203 W

NIMH Vocational Assessment and programming system for persons with Mental Retardation) -

In Indian content the first assessment tool for vocational assessment was developed by the National Institute for the Mentally Handicapped, Secundrabad. The name of the scale is "

100% MATCHING BLOCK 139/203 W

NIMH Vocational Assessment and programming system for persons with Mental Retardation.

This vocational assessment tool was developed by A.T. Thressia Kutty in 1991. By using this tool conducting the vocational assessment is simple, easy and cost effective. Here assessment of the persons with Intellectual Disability is conducted in systematic manner.

171 NIMH VOCATIONAL ASSESSMENT AND PROGRAMMING SYSTEM (VAPS) FUNCTIONAL VOCATIONAL ASSESSMENT MODEL

172

95% MATCHING BLOCK 141/203 SA SEID - 31 PDF.pdf (D127037695)

There are two aspects in trainee's skills assessment in the functional vocational assessment: • Generic assessment. • Specific skills assessment. Generic skills are the pre-requisite skills/work readiness skills for a specific job selection and training.

Generic skills include personal, social, academics, domestic, safety, hand functioning and mobility skills. NIMH has developed an 80-item generic skills checklist to assess the pre-requisite skills. Based on the job selected, a criterion-referenced checklist can be developed for assessing the pre-requisite skills for specific job training. Specific skills are the information gathered from the community assessment, interviews, the job analysis. The skills identified as required for success on community jobs should be the same skills on which trainees are assessed. Both work skills and work related skills should be considered in relationship to actual jobs available in the community. When trainees reach 18 years of age, vocational trainers should consider specific placements. NIMH Vocational Assessment and Programming System (VAPS) has the following parts: •

73% MATCHING BLOCK 142/203 SA SEID -31 PDF.pdf (D127037695)

Vocational Profile • Generic Skills assessment Check list • Job Analysis Format • Work Behaviour Assessment Check List • Vocational profile consists of trainees identification data, family history, socio- economic status, readiness skills assessment, associated condition, training received, daily routines, employment experiences (if any), possibilities of employment,

required area of guidance and selection of suitable job. • Generic Skills assessment Check list contains 80 items under 8

83% MATCHING BLOCK 143/203 SA SEID -31 PDF.pdf (D127037695)

domains. The domains are personal, communication, social behavior, functional academics, safety skills, domestic behavior, mobility and hand functioning and occupational skills.

Tick (v ') means the trainee is able to perform the activity independently without any help or support whereas cross (X) means the student with Intellectual Disability is not able to perform the activity or required kind of support such as physical prompt, verbal prompt and gestural prompt.

173 • Job analysis format consists title of job, Job site, job trainee, job programmer along with main working areas, additional duties, and work-related activities. The

76% MATCHING BLOCK 144/203 SA SEID -31 PDF.pdf (D127037695)

work related activities include personal, functional academics, sex education, recreation and independent living.

The independent living include the following areas- safety, travel, family and community living, • Work behaviour assessment

92% MATCHING BLOCK 145/203 SA SEID -31 PDF.pdf (D127037695)

checklist consists physical appearance, personal interaction, regularity and punctuality, communication and social manners, quality and quantity aspects of work.

In this assessment checklist 3 for always, 2 for often, 1 for rare and 0 for never is the norm of scoring. Vocational assessment should be conducted considering the students background by using VAPS in simulated environment (parents also should be included and involved during the assessment) in the generic skill area. Special educator then conduct the work behavior assessment of the trainee. After conducting detail vocational assessment, the special educator/vocational instructor will get assets and needs of the persons with Intellectual Disability. Considering the assets of the persons with Intellectual Disability and job identification through job survey, an individualized vocational training programme should be planned and implemented first in the simulated environment followed by the actual job site. During the training, evaluation should be conducted to find out the learning outcomes of the student with intellectual disability. At the initial level the special educator should provide the different level of support as and when required for the persons with intellectual disability. Gradually the level of support should be reduced to make the persons with intellectual disability independent in the particular task.

4.6 Provisions & Schemes of MoSJE for Vocational Skill Development India is a welfare state that is specially committed to the welfare and development of its citizens in general and of the disadvantaged in particular. It is the Ministry of Social Justice and Empowerment (MoSJE) which is responsible for all round development of persons with disabilities. As the name suggests the MoSJE is to ensure equitable treatment to such sections of the society who have faced and suffered injustice, social inequalities, discrimination and exploitation.

Approach to Rehabilitation: Rehabilitation has gained the due importance on the agenda of the Central Government.

174 The Government has planned and implemented a lot of schemes, programmes and projects which are supported by an 'infrastructural network' of the Disability Division in the MoSJE.

i. National Action Plan - A National Action Plan for Skilling the Persons with Disabilities has been prepared by the Department of Persons with Disabilities (DEPwD) with the following main components:-

- A Project Monitoring Unit (PMU) to be set up in the Department of Empowerment of Persons with Disabilities. The PMU would have the following components : • Training need assessment unit • Content Generation unit • Training Monitoring and Certification unit • Employer Connect unit • IT Unit to provide support for creation of E-learning modules, monitoring of training, E-certification and training centres / creation and maintenance of a job portal.
- The vocational / skill training would be provided by a network of skill training providers led by NGOs, private training institutions and Public Sector/Govt. Sector training institutions like VRCs. The vocational training would be provided by a cluster of training providers scattered over the country, having an established track record of providing skill training with high employability ratio. These training partners would be provided outcome based financial support by Deptt. Of Empowerment of Persons with Disabilities (DEPwD) and Ministry of Skill Development & Entrepreneurship (MSDE). Synergistic support would be provided to these training providers by the National Institutes of DEPwD, training institutions of Ministry of Human Resource Development, Ministry of Micro, Small & Medium Enterprises, other Central Ministries and State Governments.
- A separate cross cutting Sector Skill Council for PwDs is being created in collaboration with Ministry of Skill Development & Entrepreneurship and the private sector. Rehabilitation Council of India (RCI), in consultation with the Sector skill council and various National Institutes of the DEPwD would help generate a homogenous course curriculum and certification mechanism for the training providers.
- DEPwD would help these training providers by connecting them with various private

175 sector organizations and PSUs for providing employment connect as well as for obtaining CSR support. • DEPwD will coordinate with State Governments to support proactively by offering infrastructure and resource support to these clusters of Vocational Training Providers. Targets of the National Action Plan: • The DEPwD, in collaboration with NSDC, has set a target of skilling 5 lakh persons with disability in next 3 years (1 lakh in first year, 1.5 lakh in second year and 2.5 lakh in third year). After achieving the target for three years, we would have achieved a momentum and would have created a robust online-skill training platform enabling us to skill 5 lakh PwDs every year, thus skilling 2 Million more PwDs during 2018- 2022. Thus, till the year 2022, the National Action Plan will lead to skilling of 2.5 Million PwDs (with 70% target employment). This would be a major contribution to "Skill India" initiative of Hon'ble Prime Minister. • The skill training will be provided by a network of more than 200 clusters of Training Partners', thus setting a target of skilling about 500 PwDs in the first year for each of the cluster. The lead NGO may empower and take the help of small NGOs in the rural areas for the skill training but every such training centre will be monitored by the PMU. The network of training providers and capacity thereof will keep increasing every year. Objective & Coverage of the scheme 1) The Scheme aims at providing financial assistance for skill training for persons with disabilities. 2) The scheme will cover Persons with Disabilities (PwDs) with not less than 40% disability and having a disability certificate to this effect issued by a competent medical authority. 3) 30% reservation for women candidates: As an endeavour to encourage women, 30% of the total intake of each training program shall be earmarked for women candidates. 4) The scheme will operate through training institutions recognised by this Department as per the eligibility conditions contained in this scheme. Title of the Scheme and Date of Commencement The title of the scheme is "Financial Assistance for Skill Training of Persons with Disabilities". The scheme is effective

176 from the date of notification of the scheme or from 1st May, 2015 whichever is later. Conditions of Eligibility a. Eligibility of the Trainees (a) A citizen of India (b) A person with disability with not less than 40% disability and having a disability certificate to this effect issued by any competent medical authority. ii) The National Skill Development Corporation India, (NSDC) is a one of its kind, Public Private Partnership in India. It aims to promote skill development by catalyzing creation of large, quality, for-profit vocational institutions. NSDC provides funding to build scalable, for-profit vocational training initiatives. Its mandate is also to enable support systems such as quality assurance, information systems and train the trainer academies either directly or through partnerships. NSDC acts as a catalyst in skill development by providing funding to enterprises, companies and organisations that provide skill training. It will also develop appropriate models to enhance, support and coordinate private sector initiatives. The differentiated focus for the 21 sectors under NSDC's purview and its understanding of their viability will make every sector attractive to private investment. iii) The National Handicapped Finance and Development Corporation (NHFOC) was set up by the Ministry of Social Justice & Empowerment, Government of India on 24th January 1997 as a company not for profit under section 8 of Companies Act 2013 with the objective of serving as a catalyst in the economic development of PwDs. NHFDC functions as an apex financial institution of the country and provides financial assistance, in the form of concessional loans, to Persons with Disabilities for self-employment ventures, higher education and other activities. The fund is channelized through the State Channelizing Agencies (SCAs) nominated by the respective State/ UT Government(s) Also, the concessional loan of NHFDC is made available through some Public Sector Banks (Punjab National Bank, Andhra Bank, IDBI Bank and Bank of Baroda) for self-employment and higher education. NHFDC provides Self Employment Loan ; Upto Rs. 25 lakh (Interest rate of 4-8% p.a); Education Loan : Study in India (Rs. 10 lakh), Rs. 20 lakh (abroad) interest rate @ 4% p.a; Skill Training to PwDs : Free of cost and stipend of Rs. 2000 per month; Scholarships : 3000 scholarships for professional courses.

177 iv) The Government of India has set up 17 Vocational Rehabilitation Centres (V.R.C's). The main purpose of these centres is to evaluate the capabilities of disabled clients. They also sponsor candidates to potential employers. There is acute shortage of sheltered workshop for severely disabled persons. The Ministry of Social Justice and Empowerment is therefore exploring the production centres manned largely by disabled persons on the pattern of welfare factories in China. The main objectives of V.R.C's are: • Vocational evaluation and adjustment of disabled persons • Assessment of the medical, psychological, rehabilitation needs • Assist in developing rehabilitation plans depending upon the specific needs • Sponsor disabled registrants against notified/identified vacancies • Act as distribution centre's for various schemes like scholarship/aids and appliances • Make referrals to financial institutions for funding self-employment ventures v) National Awards for People with Disabilities : On the International Day of Disabled Persons on 3 rd December each year, the MoSJE has been giving Nationals Awards since 1969 in different categories including best employer of the disabled, outstanding employee, best individual, institutions, creative disabled persons etc. it has served the aim of creating awareness amongst the disabled persons and brought them in the mainstream. vi) District Disability Rehabilitation Centres (DDRC) -Background During 1985-1990, District Disability Rehabilitation Centres (DDRCs) started as outreach activity of the Ministry of Social Justice and Empowerment of Government of India for providing comprehensive services to the persons with disabilities at the grass root level and for facilitating creation of the infrastructure and capacity building at the district level for awareness generation, rehabilitation and training of rehabilitation professionals. Suitable changes as were deemed necessary for the PwD Act have been effected accordingly. The District Disability Rehabilitation Centres are set up under the Plan Scheme . "

Documentation of Assessment, Result Interpretation and Report Writing-Implications of Assessment, Outcomes for Community Living. Documentation of Assessment

The assessment process involves collection of data through various modes. This

may involve collection of data from various sources such as parent, caretaker, teachers, therapist, psychologist, social workers, and observation of child, testing informal and formal setting etc. Further the data may be collected in one setting or over a span of time.

This is essential as the assessor or teacher aims at collecting information in all the areas of development of the child with mental retardation by using the appropriate and standardized special education assessment tool. Information should be collected through observation, interview and direct testing. The assessment data is used for the classification and placement decisions of students with mental retardation. The checklist should be kept properly for the documentation of the assessment report. Depending on the need of the child, age, ability, level etc different checklist may be used. Every standardized tool have data collection formats and specific scoring system to record the assessment. Initially case history format is used as a basic documentation tool for assessment. Psychologist, therapist and others involved in the assessment process may use different self-developed or standard formats to document assessment information. The assessment documentation process must be able to elicit and document every relevant information regarding the child, family, community etc those may be even distantly be related to making decisions about the child's educational programme. Result Interpretation

Interpretation is

a process of perceiving the pros and cons of assessment report or evaluation report. Interpretation helps the educator, the parents and other professionals' associated with the training programme to understand the assessment report. It is a

relevant factor influencing the training programme. Interpretation must be done at three levels of assessment. Level - 1 Interpretation during the initial assessment. Level - 2 Interpretation during the training programme Level - 3 Interpretation after the completion of training programme.

180 Level - 1 Interpretation during the initial assessment. When an individual training programme is decided for a student, it is essential to collect information about the student's

background, student's present performance,

student's ability and resources to be mobilized to accelerate the training programme. Information collected from all the above factors must be interpreted to see all possible positive factors that could be integrated for the training programme.

• Interpretation of Personal Data • Interpretation of Student's Ability • Interpretation of Student's Performance • Interpretation of Resources Interpretation of Personal Data

During history taking to understand the personal data such as pre-natal, natal, post- natal, education, family, social, medical, immunization and developmental data ; it

is essential to conclude the factors responsible for the student's condition, considering the above factors to understand the student helps in developing training programme for the student.

Interpretation of

Student's Ability It is essential to understand the student's

ability in terms of intelligence, and aptitude. Assessment also should focus to understand the interest and attitude of the student for different training Programmes. The

student's

overall ability and specific ability must be assessed and interpreted to decide specific task for training. Interpretation of

student's Performance Student's performance must be understood from different angles. Usually the performance is

elicited by using a behavioural scale during assessment. Other than the result of the behavioural scale, the past opportunity given to the student must be noted. The background information of the student like the family details,

education, involvement in training, and exposure and social-cultural background must be understood for giving a conclusive statement on performance. Interpretation of Resources Data must be collected to understand the

resources

available for development of the student and training to the student. For example, toilet training to a ten year by the Intellectual disability.

93%

MATCHING BLOCK 148/203

SA

SEID -31 PDF.pdf (D127037695)

Before deciding the training place, nature and training programme, it is essential to know a few aspects like:- 181 • The type of toilet used by the family • The person would be involved in training • The cultural belief for toileting • Cleaning methods after toileting etc. Developing teaching materials for the student must be based on the resources of the parents; if the parents are affordable to purchase highly costly materials then it will be worthwhile to prescribe such materials. On the other hand, the poor people could be advised to develop teaching materials

with locally

available materials with less expenditure. Level - 2 : Interpretation during the training programme It is essential to see the speed of training, and other relevant factors influencing training during different phases of the programme.

Understanding the result, the methods, the efficiency of materials, and the usefulness of techniques is essential to enhance the training programme. Hence, it is essential to interpret the intermittent improvement, and other associated factors for training

programme. For example, brushing skills is decided for training a eight years trainable child with Intellectual disability.

88%

MATCHING BLOCK 149/203

SA

SEID -31 PDF.pdf (D127037695)

The period decided for training was three months. After two months of training, it was observed that, the student has achieved the task. But, the parents are still continuing the training as because the period was decided for three months.

There may be other instance wherein a particular strategies or a particular teaching aid may not be effective for a long time; however the training is continued with same strategy and materials due to absence of intermittent interpretation.

Here, it must be

noted

that, interpretation during the training programme would help to bring changes

in

the training programme as per the requirement. Level - 3 : Interpretation after the completion of training programme

After the completion of training programme, it is essential to review and understanding the various factors those influenced the training programme. Interpretation of the overall result, specific result i.e. result in each skills, the methods used for training programme

such as - a) play way method, b)

structured method, c) project method and techniques used for training programme. It is essential to understand the whole scenario of the training programme. It also give idea for deciding the further training programme to be given to the student.

The interpretation

of level - 3 is also helpful for modification in existing programme in case the goals were not achieved and also for further planning.

182

89%

MATCHING BLOCK 150/203

SEID -31 PDF.pdf (D127037695)

Report writing The interpretation and reporting of assessment results are guided by a set of general principles. Using Structured format : When analyzing and reporting assessment result, remember the reasons for referral and work toward answering the main assessment questions. Whether the interpretation and report are verbal or written, you must proceed in an orderly fashion to present a cohesive picture of the student's learning problems. The

major components of an assessment report are :-

- Identification Data—All essential demographic information about the student : name, gender, address, birth date, and so forth.
- Reason for Referral - The basis for and source of the referral.
- Relevant Background - Significant information about the student’s medical, developmental, educational, and socio-cultural background.
- Behavioural observations - Description of the student’s behaviour during assessment.
- Assessment Result and Discussion - Scores and other results in pertinent areas, such as personal, social, communication,

94%

MATCHING BLOCK 151/203

SA

SEID -31 PDF.pdf (D127037695)

reading, mathematics, and so forth.

- Summary and Conclusions - A brief statement of the level of performance and strengths and weaknesses in the areas assessed.
- Recommendations - The goals and objectives, special service, and service delivery model(s) appropriate for the student’s educational needs.
- Data Sheet - All the formal and informal results for independent analysis and reference.

Some important tips for report writing :

-

97%

MATCHING BLOCK 152/203

SA

SEID -31 PDF.pdf (D127037695)

Report only relevant data - Choose the most pertinent data to answer the assessment questions and disregard the rest.

- Report information once and then mention it only as needed avoid making the same point again and again. For example, distractible behavior has bearing upon all the results. Discuss it once in the appropriate place and then clarify its significance at a crucial point.
- 183
-

88%

MATCHING BLOCK 153/203

SA

SEID -31 PDF.pdf (D127037695)

Report facts and data accurately and simply-avoid making unfounded statements or inferences.

- Insert sensitive information tactfully-when information may be offensive or unpleasant to someone (for example, information about student abuse, a recent death in the family, or teacher-parent disagreements) and significant for interpreting the data, choose diplomatic language to make the point.
- Note the source of any information and report the data accurately - When appropriate, attribute statements to the parents, teachers, and other people who made them. Useful phrases are “As his mother reported...” or “From an interview with her teacher...”
- Use similar references in the case of tests and informal procedures, including observations and task analysis, “As measured by the WISC- R...” or “From observations in the classroom...”
- When reporting data from previous assessments do so briefly and with full reference to the source -

For example, a useful phrase may be. “The results of a recent psychological examination at Children’s Clinic ...”

- If appropriate, similarities or differences with the data to be reported can be noted in the discussion of results.
- Mention the absence of critical data, such as recent vision and hearing assessments - such data may be necessary for a full interpretation. When unavailable, it may be one of the recommended areas for further assessment.
- Report any test administration errors or problems and reservations about the findings. This should also be done only once and at the most significant point. Of course, if there were major problems in the administration of tests and the results are highly questionable, you should discard and not report them.
-

100%

MATCHING BLOCK 154/203

SA

SEID -31 PDF.pdf (D127037695)

Consider information about instructional factors in the classroom and non- instructional correlates (medical, social,

and cultural) - Test results must be interpreted in relationship to many factors. Among instructional variables are past educational experience and current conditions in the classroom. For example, a teacher may be using a particular procedure that enhances or limits good achievement. • In addition, the student’s medical, social, and cultural background may have bearing upon school performance. For example, a vision problem may be compounding reading difficulties. • Address discrepancies between data and present possible explanations. For example, there may be disagreement among test results, or between test results and a teacher’s

184 opinion. It may be possible to explain these discrepancies by referring to test construction, student behavior, classroom procedures, and so forth. • When interpreting test results, remember that there are two levels of analysis : statistical and clinical-interpret tests and other procedures individually and statistically first. Statistical analysis is computing the scores, identifying the important scores for interpretation, and perhaps arranging them on a profile. Clinical analysis establishes whether the performance is average, what the strengths and weaknesses are, and how the performance on the tests relates to other factors. Placing values on and the making judgments about test performances fall into the clinical analysis category. • Selectively use theoretical constructs - Their use in interpreting and reporting results may be considered part of a description of the pattern of learning problems or an attempt to unify the results of assessment. However, these efforts may lead to unwarranted statements of cause and effect. • Reports are written keeping in mind different implication. Different implications of report writing are given below : A)

Writing report for administrative decisions • Diagnosis and certification. • IQ assessment. • Placement in appropriate schools,

Vocational training institute. •

Eligibility to various benefits and concessions offered by the governments. • Access to suitable adaptive devices for independent mobility, communication and learning. B) Writing reports for educational programming / vocational

general terms, a community is a sub-set of society but larger than a family. It constitutes a group of people, living together in social context generally with a common goal, common cause and develop a sense of belongings. Using assessment information for Community support for Individual with Intellectual Disability : Collecting information through assessment report is necessary to make the community more accessible in resource mobilization. Resource mobilization is a philosophy of offering services to disabled persons in their own communities. The persons with intellectual disability face direct and indirect discrimination in society ; assessment result gives authentic information of not only their weaknesses but also their strengths, hence helps to create a positive attitude of the society towards them. vhis or her strengths and weaknesses, abilities and interests along with demographic profile, these data facilitates the community resource to be mobilized to promote the education and rehabilitation of people with intellectual disabilities. The society can make itself more accessible by the help of a compact assessment report. Community Mapping - This means preparing a list of all those resources in the community, which can help the education of children with intellectual disability.

186 Networking - for developing community awareness and resource mobilization for rehabilitation of persons with intellectual disability lays in establishing networks i.e. linkages, among those who are directly and indirectly responsible for social change. 4.8 "Check Your Progress" 1. CHAPTER_-_1.pdf (D38635105)

The information gained through the assessment process have to be utilized meaningfully for

the programme planning for independent living of PwIDs. Vocational Assessment has very important role to guide the PWIDS in rehabilitation process which is the ultimate goal. A PwID becomes independent only through proper rehabilitation. Through vocational assessment the special educator finds out the skills, performance and interest of the persons with Intellectual Disability which helps in planning and executing the planned vocational training programme in individual and group setup. Initially, a baseline assessment should be done using criterion referenced norms to obtain information about the individual's vocational potentialities. Then, formative assessment should focus on information related to vocational training Programme. The final stage encompasses on-the-job evaluation. Choice of vocation is dependent on abilities, interests and aptitude. The avenues may be open employment, sheltered employment or supported self employment, depending on the ability of the student, family resources and plans for the trainee and the ecological details. Since vocational assessment greatly influences vocational training and rehabilitation, professionals have become increasingly concerned about the use of appropriate assessment strategies. Broadly there are two types of assessment approaches; namely: the traditional and contemporary assessment approaches. ●●●●●

(D29288122)

Transition plans may begin with a parent, school or an agency responsible for providing post school vocational services.

The most practiced transition model in Indian context is NIMH Vocational Transition model for persons with Mental Retardation (Intellectual Disability), developed by National Institute for the Mentally Handicapped, Secunderabad. This model states that transition plan is very important stage and role of special educator is also essential in planning and exhibiting the proper transition programme for the overall development of the persons with intellectual disability. ●●●●● BASAL-MR–Behavioural Assessment Scale for Adult Living- Mental Retardation. (Reeta Peshawaria, O.K. Menon, Don Bailey et al., 2000) .This scale has been developed at National Institute for the Mentally handicapped Secunderabad. This too! is developed for assessing the adaptive and maladaptive behavior of the adult persons with Intellectual Disability (Mental Retardation) above 18 years old. BASAL-MR gives a profile of skill behaviours and problem behaviours, while the problem behavior checklist is meant to measure only the problem behaviours of the adult person withIntellectual Disability. In Indian content the first assessment tool for vocational assessment was developed by the National Institute for the Mentally Handicapped, Secunderabad. The name of the scale is “

There are two aspects in trainee’s skills assessment in the functional vocational assessment: Generic assessment, Specific skills assessment. ●●●●●

The Government has planned and implemented a lot of schemes, programmes and projects which are supported by an ‘infrastructural network’ of the Disability Division in the MoSJE. i) National Action Plan - A National Action Plan for Skilling the Persons with Disabilities has been prepared by the Department of Persons with Disabilities (DEPwD). The Scheme aims at providing financial assistance for skili training for persons with disabilities. ii) The National Skill Development Corporation India, (NSDC) is a one of its kind, Public Private Partnership in India. It aims to promote skill development by 190 catalyzing creation of large, quality, for-profit vocational institutions. iii) The National Handicapped Finance and Development Corporation (NHFDC) was set up by the Ministry of Social Justice & Empowerment, Government of India on 24 th January 1997 as a company not for profit under section 8 of Companies Act 2013 with the objective of serving as a catalyst in the economic development of PwDs. iv) The Government of India has set up 17 Vocational Rehabilitation Centres (V.R.C’s). The main purpose of these centres is to evaluate the capabilities of disabled clients. They also sponsor candidates to potential employers. v) On the International Day of Disabled Persons on 3 rd December each year, the MoSJE has been giving Nationals Awards since 1969 in different categories including best employer of the disabled, outstanding employee, best individual, institutions, creative disabled persons etc. it has served the aim of creating awareness amongst the disabled persons and brought them in the mainstream. vi) During 1985-1990, District Disability Rehabilitation Centres (DDRCs) started as outreach activity of the Ministry of Social Justice and Empowerment of Government of India for providing comprehensive services to the persons with disabilities at the grass root level and for facilitating creation of the infrastructure and capacity building at the district level for awareness generation, rehabilitation and training of rehabilitation professionals. ●●●●●

The assessment process involves collection of data through various modes. This

may involve collection of data from various sources such as parent, caretaker, teachers, therapist, psychologist, social workers, and observation of child, testing informal and formal setting etc. Result Interpretation Interpretation is

a process of perceiving the pros and cons of assessment report or evaluation report. Interpretation helps the educator, the parents and other professionals' associated with the training programme to understand the assessment report. It is a relevant factor influencing the training programme.

193 5.8 Check your progress 5.9 Let us Sum up 5.10 References 5.1. Introduction Family is the smallest unit of the society in which members are held together by marriage of two person of opposite gender of all human groups, family is the most important primary group which consists of with or without children.

78% MATCHING BLOCK 173/203

SA THESIS Vaniaritakula Social Work.docx (D19105024)

The benefits of family centered interventions are being greatly recognized now more than before. Efforts are being directed towards involving parents and other family members in the training and rehabilitation of the individuals with intellectual disabilities precisely for the reasons that such approaches results positive in both parent, family and child outcomes. It helps in enhancing child development, reducing stress in the family, increasing family coping strategies and also leads to improve relationships within the family. For strengthening the family having children with intellectual disabled the intervention need to be directed towards meeting the needs of the index child ,of parents, siblings and extended family members as also recognize ,promote and utilize the existing strengths of the families.

What is needs ? Needs can be defined as the gap between what is and what should be. A need can be felt by an individual, a group, or an entire community. It can be as concrete as the need for food and water or as abstract as improved community cohesiveness. An obvious example might be the need for public transportation in a community where older adults have no means of getting around town. More important to these same adults, however, might be a need to be valued for their knowledge and experience. Examining situations closely helps uncover what is truly needed, and leads toward future improvement. What is Resouce? Resources, or assets, can include individuals, organizations and institutions, buildings, landscapes, equipment — anything that can be used to improve the quality of life. What is Family? "Family is a group of persons united by the ties of marriage, blood or adoption, constituting a single household interacting and inter-communicating with each other

194 in their respective social roles of husband and wife, father and mother, son and daughter and hence creating a common culture." (Buigess and Locke). It is of different types like Joint, nuclear, extended. What is extended family?

89% MATCHING BLOCK 174/203

SA SEID -31 PDF.pdf (D127037695)

An extended family is a family that extends beyond the nuclear family, consisting of grandparents, aunts, uncles, and cousins all living nearby or in the same household. An example is a married couple that lives with either the husband or the wife's parents.

All_Chapter_Final_DKT_Ph.d_Thesis_Revised.docx
(D143306060)

To enhance the effectiveness of the family it is important to identify the needs of

individual family members, locate resources for meeting those needs and help by guiding the family members in utilizing these identifying resources. Such a realization has already led to the amendment of the U.S. Education of Handicapped Act of 1986(PL. 99-457)In the revised version of PL 99-457 necessitates by law to develop individualized family service plan(IFSP) for families who have children with developmental delays or those who are at risk for developmental delays. The law includes IFSP only for the families having children below 3 years, for reasons best known to the people involved in such decision making. What is IFSP?

100% MATCHING BLOCK 175/203

W

An Individualized Family Service Plan (IFSP) is a working document produced collaboratively by program staff and family members that contains the agreed upon Early Intervention services for an eligible child and family. Based on a multidisciplinary eligibility evaluation and any completed assessments, the plan includes services necessary to enhance the development of an eligible child, and the capacity of the family to meet the child's needs 5.2.

Objectives After going through the unit you will be able to: - Understand

about significance of psychosocial needs and its assessment in the family. - Describe IFSP - Describe different types of parental, sibling, extended family needs.

195 - Distinguish between the various types of needs felt by the family members. - Describe the implications of different

68% MATCHING BLOCK 178/203

SA

SEID -31 PDF.pdf (D127037695)

needs and its implication in planning IFSP. - Understand the assessment of family and community resources for inclusion. - Describe the process of documentation, recording and reporting. -

Discuss the General principles of the interpretation and reporting of assessment results 5.3 Significance of Psychosocial Needs and its Assessment in Family Learning is a very important phenomenon of human life and it occupies a central position in shaping human behaviour. A child begins his career as a learner at the time of birth and perhaps even before. Learning plays a crucial role in his development, it is through learning that he adopts the habits, customs and values the characteristics of the culture in which he is reared. 5.3.1. Psychosocial needs: Significance Integration of any child with disability into the society, as far as practicable, is one of the basic objectives of any civilized country. In order to maximize his social integration the child has to be equipped with his potentials which will lead to societal gains by avoiding individual loss and avoiding living of a parasitic life on his family. In order to achieve this objective it is of primary importance to 1. Understand different kinds of disabilities. 2. Different psycho-social aspects,i.e; self and social understanding ,thinking about the self, emergence of self -recognition and early emotional and social development involved in them. 5.3.2 –Assessment of psycho-social needs in family It would, therefore, be appropriate to assess the different psycho-social aspects including cognitive, personality, emotional, motivational and other socio-cultural factors separately. Other than these societal institutional level and group interaction level also can be assessed.

196 The assessment of - Cognitive - Personality - Emotional - Motivational and - other socio-cultural factors will be done by using daily routine assessment schedule and environmental assessment format .These assessment will be done based on criterion referenced test. 5.4

THESIS Vaniaritakula Social Work.docx (D19105024)

Parents having a child with intellectual disabilities experience a variety of stressors and stress reactions related to the child's disability. (Orr et,al;1993) 5.4.1.

Need of the Parents – Parents have various needs after getting

87%

MATCHING BLOCK 181/203

SA

THESIS Vaniaritakula Social Work.docx (D19105024)

impacted in may ways because of having a child with intellectual disability.

The needs are as follows – 1. Information Needs – It includes the various information condition such as the condition and level of the disability, information regarding assessment reports and outcomes, what will be expected achievement from the particular child, information needs regarding repetition of dangerous sequences and incidence like before. The parents should have proper information regarding materials related to the disability. There should also be a need of information regarding diet and nutrition. 2. Child Management – The parents should have the following need during and regarding the management and intervention of the child with disabilities:- - Child rearing practice - Discipline - Problem behaviour management - Make the child co-operative - Training regarding the child i.e; Individualized Family Support Plan (IFSP)

197 and Individualized Educational Programme (IEP). - Regular parent and teacher interactions - All round development of a child irrespective of disability. 3. Service – This will include all the facilities, services and training procedures like: - Services availability - Making decision about school - Training materials making and arrangement of ingredients. - Home based training programme. - Both positive and negative effect of regular and special school. 4. Facilitating Interaction – Parents are informed and counselled about the following daily interaction: - Explaining about the child's condition - Explain about the priority need of the family involvement. 5. Hostel – Parents find hostel or residential unit for their disabled child during their job time and after their life time .So there are following needs regarding hostel needs : - Nature of hostel - Making decision regarding staying and keeping at hostel. 6. Personal –Emotional - This need is most important for the parents having child with disability. This includes: - Time to self both the parents. - Talk about personal problems. - Helping others and asking help when sad or depressed. - Physical health problems. - Planning and discussion about another child. 7. Personal –Social - Due to having a child with disability the parents become rigid, sometime depressed and they become very contracted within themselves. For this reason the personal – social needs are aslo important for these parents.

198 - Discussion with friends. - Discussion with other parents. 8. Physical Support - Support may be of physical, social, moral, financial matter. Physical support includes human resource support along with appropriate physical structure because these parents's own physical health is reported to be a greater risk. To overcome it following points is considered: - Manual support for transportation - Domestic support for child care. - Transportation for child's training. 9. Marriage - Every parent have a dream about a new social and emotional life of their children. There is various misconceptions also exist regarding the cure of mental retardation just being married. Parents think about its solution through marriage of their children. 10. Sexuality - Sexual need and urge also include an important need of every human being according to Maslow's hierarchy (Physiological need which include sexual need).and it cannot be denied also. Parents also become tensed about the sexuality and sexual needs of their children. They become tensed about the non fulfillment or expression of those needs in any situation. There should be proper guidance about this matter to the parents having disabled child. 11. Financial - Financial burdens may mount on the parents having children with intellectual disabilities. This includes - Financial help for services and service providers - Financial help to buy and maintenance of training materials. - Financial help for other intervention facilities and appointment of human resources. 12. Government Benefits - Parents should be aware about various central and state government policies regarding concessions and benefits i.e.; getting disability certificate, transportation facilities, educational, financial facilities, awareness about grievance readdresses. Parents should also have a need to know about various national acts and policies regarding disability. The main acts include PWD Act, 1995, National Trust Act, 1999, Right to Education Act, 2009 which will give them opportunity to avail all 199 types of facilities and concessions. 13. Vocational Planning- Vocational efficiency is one of the important aim of special education .To fulfill this aim the parents should know about the vocational rehabilitation, job survey, various employment models etc. Vocational rehabilitation makes a person with intellectual disability functionally independent in the community. 14. Future Planning- Irrespective of the disability as well as any human being every parents have a dream about their child and accordingly they plan for it.It becomes life long responsibility oriented programme for those parents who have a child with intellectual disability. For this future planning parents need to do: - Financial Planning - Prepare and mention the appropriate inheritance for their property. - Financial and physical structure planning about social security of the child. 15. Family Relationship -

100% MATCHING BLOCK 182/203

The presence of a child with intellectual disability in the family calls for a lot of adjustment on the part of the parents and the family members.

Interpersonal relationships with in and between

91% MATCHING BLOCK 185/203

SA MA Dissertation.pdf (D26388436)

the family members get affected. Marital harmony gets disturbed owing to various child related reasons such as meeting extra child-care responsibilities and burden, affecting sexual relationship between parents due to less privacy, more fatigue and fear of producing another child with disability. 5.4.2

Assessment of parental need A semi-structured interview schedule NIMH-FAMNS (Parents) is used to elicit the needs of parents having children with intellectual disability. It consists of total 19 main area and 60 items /needs. The score of each item on the schedule ranged from (no need) ; 1 (Not sure) ; 2 (Little a need) and 3 (Very much a need). 5.4.3 Implications in planning IFSP

100% MATCHING BLOCK 183/203

W

The IFSP is the written plan that lists services and supports to eligible children and families.

At Early Intervention, we believe that no one knows the

82%**MATCHING BLOCK 184/203****W**

child as well as parents. Parents are a partner in developing the IFSP, and it is important for them to be part of the process.

In this intervention programme parents will identify the assests, needs, choices of their children and also set the hope about their child which have a great implication in all over family life which are as follows: - Individualized need based intervention programmes must be carried out with parents and goals for intervention should always be set in consultation with the parents.

200 - In order to seek greater co-operation from parents, it is essential to meet identified parental needs along with the child's specific training needs. - Understanding and knowledge related to the functioning of the families, group dynamics and also skills in counselling, supportive psycho-therapy are essential for working effectively with families having individuals with disabilities. - Service providers need to equip themselves with the necessary knowledge and basic counselling skills to communicate diagnosis and needful information to parents in an empathetic and sensitive way. - Irrespective of the age of the child with intellectual disability, parents are concerned about the future planning for their child; they are eager to learn about his /her expected achievement and progress, vocational rehabilitation and issues related to sexuality and even marriage. Professionals need to counsel parents on such issues rather than postpone it for future consultations. It is important that professionals provide parents with honest and needful information before the parents shape their own thoughts and behavior toward meeting the needs of their child. - Parent during the initial contact generally convey child related needs to professionals and are guarded to state needs related to personal –emotional aspect. However, a skillful professional through effective counselling skills should be able to tap the personal –emotional needs as well as also the needs related to family relationships, if required. Intervention programmes designed to meet family needs facilitate effective coping. - Service providers need to have update information on state and central government benefits, legislation and the availability of services to meet this pressing need of many a parent. - To strengthen the family unit and facilitate healthy interactions and relationships among family members, need based family counselling should be provided. - Most of the available services resolve around child skill training, at the most involving the mother; the focus of intervention however continues to be the child. Efforts must be made to stretch the services to involve fathers and other family members to build support for the mother. - Parent support groups need to be encouraged to help meet various needs for the parents such as sharing information and building parent to parent support.

201 - Indigenous and culture specific models of care which are acceptable to Indian parents need to be developed to meet physical support, needs of parents as also the financial needs. - Efforts nedd to be made to set up need based services in non-urban areas. However need for expansion of services in urban areas cannot also be over-looked. - Efforts should begin early to strengthen the families by meeting their identified needs.This will help retain children with intellectual disability with their families providing them with a better quality of life. - Culturally relevant materials in print, audio or visual must be provided early to the parents and families for building awareness, right knowledge and correction of misconceptions, if present. - Need based training workshops should be conducted for parents to empower them with the necessary knowledge and skills related to child management needs. - Programmes for parents need to be conducted which could help clarify issues on sexuality, marriage and future planning related to financial and social securities of their child.
