Social Adjustment- Our social interaction depends upon communications. So deaf children have communication problems. That is why they should have a problem of social interaction. Such children live in a world of isolation and form a group of their own, an association of the deaf for their common interest and interaction. So Early Education Intervention service is most important factor of children with hearing impairment that should help scholastic achievement of the children with hearing loss and that can help to develop on adjustment of their social interaction. Behavioural problem- Deaf learners feel invariably inferior and helpless in adapting to circumstances that require verbal communication. So non-verbal communication is regarded absence of verbal. They have poor self-concept which damages the development of personality but with the help of Early Education Intervention service children with hearing impairment studying in mainstream education develop personality and the problem behavior is reduced regarding various social academic aspect. Socially handicapped - Learners with hearing loss cannot adjust with society because they suffer from communication difficulty and fail to understand what others hearing people say. But with the help of Early Education Intervention service they develop communication skill and mixing the oral social. Thereby reducing social handicapped ness. Problem in personal and social development- Language becomes a barrier for deaf learner for the purpose of communication with others. So this affects the socialization process and plays a vital role in the personal and social development of hearing loss learner. So with the help of Early Education Intervention they can be mainstreamed in regular class room it develops the normal peer acceptance and reduces the problem in personal aspect. Personality problem- Hearing difficulty may create personality problem. A deaf learner becomes more frustrated as he/she tries to reach the level of the normal and a totally deaf child seems reconciled to his fate. But given well provided adequate facility of language and communication with regard to literacy development in regular school they develop personal adjustment and well developed scholastic achievement in hearing impaired students. This happens only in Early Education Intervention services.

5.7.4-Family Outcomes of Education Intervention Children develop through the complex interlink of nature and nurture and the family plays a very important role in the development. In other words, children are born with some innate abilities. They have different levels of intelligence and they have different kinds of attitudes. The way they are brought up decides many of their achievement levels. The family can help in bringing up the children with the right attitude and develop their full potential. Every child needs to be nurtured with love and affection and guided by adults who have knowledge about the child. Deprivation and Rejection by the family can adversely affect any child, more so a child with disability. Deprivation of any kind due to poverty, wrong attitudes or ignorance will affect the nutrition, health and psychosocial development of the child. Rejection of any kind, for reasons of gender, unwanted, unplanned conception, poverty and disability in the child affect the growth and development of the child. Meaning of family Family does not mean just the mother and father of the child. The family includes the siblings, grandparents, uncles, aunts, caregivers, neighbours, doctors and any adult who comes into contact with the child.

175 5.7.5-Need and Importance Usually the family members do not have any information on the effect on hearing impairment on the child's progress. They either do not realize the importance of schooling or they tend to believe that schooling is not likely to improve the child. In most cases, the family members would rather transfer the responsibility of their child onto someone else. The participation of the family members in the education of the child with hearing impairment is very important. The family needs re-assurance that the child is going to learn and will benefit if the home is going to co-operate with the school and works. 5.7.6- Common Misconceptions of Family towards Hearing Impairment children Usually the family members do not have an exposure to the problems posed by the disabilities in children. In case of hearing impairment, the ignorance of the family is the highest. Hearing impairment is a hidden disability. The family members are not able to identify the disability as they would identify the visual impairment, mental retardation or cerebral palsy. The hearing impairment in the infant goes unnoticed for an unreasonably long time. When the mother is alert, she is able to identify that the baby is not responding to sound stimuli. Even then, the child is not taken for diagnosis due to 2 reasons: (a) The mother does not realize that the hearing impairment in the baby will stop the baby from acquiring speech skills. (b) The mother is not able to share her worry and concern with her husband and the in-laws as there is a possibility of them not taking it in the right spirit. It is only when the child is old enough to be talking in simple sentences and the child is not able to converse even in words, the family members realize that the child has a disability. At this stage also the child does not get help immediately due to several reasons like: poverty, the diagnostic facilities are not available, the family gets misguided by relative or friend or sometimes even the doctor that child is too young and that they can wait for the child to grow older, visiting some holy places or performing certain religious rites could restore the hearing for the child,

it is the result of some 'karma' of previous births and they have to bear it and there is no alternative, etc. The wrong attitude of the family results in the delay in looking for Early Diagnosis and Early Intervention and the children lose the most important years in their lives, without any useful inputs. 5.7.7- Family Intervention Process The professionals have a very important role in educating the family. The family members need to feel confident that they are doing the right thing for their child. Family members need guidance to recognize their strengths and skills in parenting. They need help to be able to handle the problems with maturity. The knowledge of the disability in the child changes the roles and dynamics of the entire family, including the siblings. The family members need counseling and guidance to realize the importance of their contribution to the welfare of the child with hearing impairment. The professionals need to include all the family members directly or indirectly into the intervention programme. The process of family intervention has two categories. These are Rehabilitation process and Educational Rehabilitation. 5.7.A - Role of Rehabilitation Process in Family There are three types of Rehabilitation Process in Family intervention process that can be conducted. These are Initial Feeling, Reaction and Adjustment of Family. Initial Feeling Family members always look forward to the arrival of a healthy child. When they come to know that the child may be suffering from hearing impairment, it is not easy for them to accept. Moreover, hearing impairment is a silent disability unlike visual impairment, mental retardation or cerebral palsy. The child with hearing impairment looks absolutely fine, he laughs and plays like any other child and yet the family members have to accept that the child suffers from hearing impairment. The initial feeling of disbelief and despair is difficult to overcome. Reaction The family members react differently. Some get into a depression. Some go from doctor to doctor, expecting a better verdict. Some feel that it is their fate and nothing could be done about it. Some are able to take courage and seek help.

177 Adjustment of Family The family needs to make a lot of adjustment. Once a child with hearing impairment is born in a family the psychology of the entire family gets affected. It reflects on the performance level of all the individuals. It also affects the interpersonal relationship with each other. Diagnosis, hearing aid fitment and intervention costs money. Many are not able to afford it. When help for diagnosis and intervention is not available in the hometown, the family members have to go to other places. This requires adjustments from all the members of the family. 5.7.8- Role of Family in the Educational Rehabilitation Process In Special School When a child is in a special school, the family can play a very active role in supplementing the efforts of the school. They can find out from the special school as to what kind of support they can provide so that the child will be able to make use of his potential to the maximum. In Inclusive School When the child is in an inclusive school, it is possible that the child may be missing out a lot. The caregiver from the family has to keep in close touch with the class teacher, Special teacher and as well as the other children in the class so that the child is able to progress at par with the others. The child requires a lot of emotional support and reassurance from the family members. In Day School The caregiver of the family can be of immense help to the child in a day school. He can keep close touch with the class teacher in class room activity. In Residential School When the child is in a residential school, the family is to bring home the child every weekend if possible or at least once a month. It is important that the child is in touch with the family members constantly. 5.10- References 1. American Speech-Language-Hearing Association. (2008). Early intervention (EI) is a system of professional services provided to children from birth until about five years of age who are disabled, have delayed development or are at risk of delayed development. To help children with disabilities, it is essential to focus on the earliest years of development, since this is a critically important time for early learning which powerfully affects the child's future life course. It involves planned professional intervention organized around relatively brief periods of time for the very young children so that they may receive sufficient adult attention. There are different ways in which training for intervention, and intervention itself, can be provided-in the home setting, in a centre, or by adopting an approach that combines the two. The rapid advances in medical technology have successfully increased the survival of high-risk babies, thus adding to the number of babies who might end up with developmental delays and disabilities. Therefore, special focus is required to address the existing deficiencies in providing early intervention services. Further, the major hurdle in the development of these services is lack of trained professionals. To reach out to those unreached, the vital step is human resource development and the need to develop a cadre of professionals who can provide services even in the rural areas through a single window service delivery system. This Unit also delineates Documentation, which helps in reviewing and evaluating a programme objectively. Thus leading to quality in the programme and a scope for improvement. Further, the services are not only provided in schools but also in varied settings. This unit is also intended to orient you the various aspects of record maintenance and documentation at the preschool level. In this context, it can be highlighted that inclusion is not merely a place, or an instructional strategy, or a curriculum' inclusion is about

11 belonging, being valued and having choice. The socio-political context in which children and families live and work also impacts inclusion. This is how our society should view high-quality early childhood care and education for all children. In other words, if providing high quality child care for typically developing children is not a societal priority, providing high -quality child care for children with disabilities will not be a priority either. 1.2.

Objectives: After going through this unit, you will be able to:

Understand the

concept of early intervention Understand the implication of early intervention for preschool inclusion Become familiar with the service delivery models Understand the steps of early intervention Understand the interventional services approaches Explain the various role of professional in early intervention Understand the meaning and importance of documentation Understand the concept of early childhood education Understand the implication of early intervention for preschool inclusion Understand the key experiences in preschool curriculum 1.3.

Concept, Significance, Rationale, Scope, Advantages of Early Intervention 1.3.1 Concept of Early Intervention (

EI) Early intervention is the first intervention strategy in the process of rehabilitation. Early intervention may focus on the child alone or on the child and the family together.

12 EI programs may be centre based, home based, hospital based or a combination. Services range from identification - that is, hospital or school screening and referral services to diagnostic and direct intervention programs. EI may begin at any time between birth to school age. Early intervention refers to the introduction of planned program, deliberately timed and arranged in order to alter the anticipated or projected course of development. (Siegel, 1972). EI services are specialized health, educational and therapeutic services designed to meet the needs of infants and toddlers, from birth through two, who have a developmental delay or disability, and their families (US Department of Education). 1.3.2 Who needs EI? Children with Biological Risk Developmental Environmental Disabilities Risk Low birth Cerebral Palsy poor nutritional status weight Epilepsy Poor Prematurity Autism Socio Birth Mental economic injuries Retardation status Prenatal and Children with Lack of stimulations Natal injuries Learning High risk Problems mothers Sensory Impairment 1.3.3 Areas to be covered by EI: Physical (reaching, rolling, crawling and walking etc.) Cognitive (thinking, learning, solving problems) Communication (talking, listening, understanding) Social/Emotional (playing, feeling secure and happy) and/ or Self-help (eating, dressing).

13 Professional involved in Early Intervention: The Early Intervention Program offers a variety of therapeutic and support services to eligible infants and toddlers with disabilities and their families, including : - family education and counselling, home visits, and parent support groups - special education - speech pathology and audiology - occupational therapy - physical therapy - psychological services - medical services - nutrition services - social work services - assistive technology devices-see 1.3.4 Rational for Early Intervention: Early periods of development are critical in nature. The rate of development of the preschool (especially 2-6 years) is so rapid that the child can given more learning experiences. As the developmental pattern follows cephalo-caudal and proximo-distal direction, EI can promote better development and control of the cortex to the bodily functions. Children are by nature very flexible and their growth and development can be modified extensively in a variety of directions. EI helps in proper-shaping the behavior. EI helps the mothers or caretakers to handle the child in a more scientific way. EI helps the professionals to prescribe the remedial plans at the right. Arguments relating to the child : EI also fulfils a remedial function. EI reduces the side effects of chronic illnesses and permanent functional impairments. EI helps in preventing the occurrence of disability.

14 Arguments relating to the parents: Early intervention is an effective way of helping parents to deal with their handicapped children. EI prevents the parents from being deprived of information. This information can relate to :- a) The diagnosis, the cause of the handicap and the prognosis; b) Knowledge about normal development and about how a retarded and/ or disturbed development needs to be stimulated c) The social system of provisions that are available to them EI can prevent brothers and sisters from acquiring an unfavorable or disadvantageous position within the family as a result of which their own development may be hindered and behavioral problems may arise. EI can ensure that the family as a system and the family as network (grandparents, uncles and aunts) learn to adjust themselves to the situation of coping with a handicapped child. Alleviation of the burden to the family, among other things by offering family assistance etc. Arguments relating to Society: EI makes society aware of the fact that there are also young children with developmental disabilities who are part of the community and have a right to support. EI enhances the opportunities of the children, since they go through school more successfully. 1.3.5 Early Intervention in Various Disabilities: The UNCRPD stresses the importance of habilitation and rehabilitation beginning at the earliest possible stage and being based on individual needs and strengths. Early identification, availability of services, trained professionals and information and support to families are all considerations of quality early intervention services. The demand for early intervention is expected to grow as the survival rate of high-risk babies is increasing with advances in medical technology, and consequently the number of babies who might end up with developmental delays and disabilities is increasing. Due to the absence of

15 a universal new born screening program coupled with the lack of awareness, majority of babies born deaf in India have been missing the opportunity of getting early intervention. The Early Intervention curriculum is indigenous and primarily focuses on language, audition and early literacy skills. The EI services for children with visual impairment is required to detect blindness and prevent further disabling condition early in life and hence reduce the impact of visual impairment. The services are provided to accelerate the rate of development in the child and to facilitate acquisition of new behaviour patterns and skills by the child that enhances skills for independent functioning of the child with visual impairment. Since children with autism find it difficult to work in large groups, the early intervention services for them should follow a structured program of one-on-one training or training in small groups to help attain individual goals. Early intervention services for children with 105 cerebral palsy comprise multiple interventions such as medical intervention for premature babies who might be 'at risk', family counselling, family training, physical, occupational, speech therapy and/or special education intervention for children below the age of three years of age. Early Intervention services are crucial for children with cerebral palsy, since the services can take advantage of the plasticity of the brain and provide opportunities for optimal development of the child's potential. It is important that early intervention services adopt a family centred approach, rather than a child- centred approach, since families are key to ensuring the best results for the child. Many children with Multiple Disability may require specialized intervention and environments for longer than other children receiving early intervention. 1.4 Types of Early Intervention The early interfvntion services are provided through various types of delivery system as described below— 1.4.1 Home-based Programme: Home-based Programme initially early intervention programmes where home-based, mainly for the benefit of rural families as they were far from health facilities. The key persons in a home based programme are the home visitors. They need not be

16 professionals. In fact, if they are SF passed and receive intensive training in early intervention and have good supervision and guidance, then they do equally well. The home visitor is the active agent who takes the planned system of skills based sequentially, to the home and fulfills the role of a counselor and friend to both mother and child. The mother teaches the suggested activities based on the skills to her child and reports the progress to the home visitor at each visit. She in her turn, reports back to the supervisor regularly. In this way, the child's progress can be constantly monitored and the skills adjusted as necessary. Advantages The child learns in a natural environment. The training is provided in the home setting, and therefore, what is learnt is directly applicable. There is no need for transferring the learning from a centre-based situation to home conditions. Parents are fully involved in their child's learning. It is convenient for them as there is minimal disruption, for example, with respect to looking after other children, making transport arrangement, etc. Materials needed for stimulating the child are available at home and easy to use. All family members can learn the interventions skills and carry them out with the child. Thus, the child receives the stimulation and the mother is relieved of full time responsibility of the child. Because of the home visits, the intervener has a good understanding the family and its strengths and problems. Through this, she/he is able to adapt the training procedures and activities on the basis of the strengths and resources of the family, and the needs and abilities of the child. The training programme is thus individualized. The method is cost effective as the only investment is remuneration for the intervener for her/his time, skill and expenses on transport. Home-based programmes are most appropriate for rural areas and in those places where transportation is a problem, making it difficult for the parent to bring the child with disability to a centre on a regular basis.

17 Disadvantages A home trainer can cover only a limited number of children due to the distances, travel time and individualization of the programme. Therefore, if he/she has more children to attend to, she /he might visit a child just once a week, or even less frequently than that. Parents who may lack skills are responsible for implementing much of the intervention. Teachers spend potential planning and instructional time traveling from site to site. No opportunity exists for peer interaction and socialization. The family will not have a chance to meet other such families and have an exchange, which is a very important process in accepting the child's disability and developing parents' self-help groups. The child may need the services of more than one expert, which a home trainer may not be able to provide.

1.4.2 Centre-based Programme:

Center-based early intervention is usually carried out in a children's hospital, a clinic or a center for children or a rehabilitation center for disabled children. If such programmes are in hospitals they are part of OPD services and are conducted daily. They are usually attached to a Department of Neonatology/ Pediatrics. In the latter case, they are offered daily on a full-time or part-time basis. In center-based early intervention, the services of units like physiotherapy, occupational therapy speech therapy are also available and are provided as part of the programme. In addition, a Children's Hospital has other units like Departments of Neurology Cardiology, ENT, Ophthalmology, etc., where center-based children can be referred for tests and consultation. For multiple disabled infants, a center-based programme becomes imperative. However, the effect of early intervention can only be gauged over a long-term, mothers who are overburdened, or have other young children or who have to travel over long distances, usually are unable to continue unless there is family support. Unfortunately, very few hospitals so far have undertaken such programmes as they involve additional expenses. In center-based early intervention, the supervisor can be a

18 pediatrician or a public health nurse, therapist or a special educator with knowledge in child development and experience in early intervention. Under her, she may have staff who are trained (equivalent to home visitors) and who give the planned system of skills sequentially to the mother individually. She works in the same way as a home visitor and guides the mother periodically in learning activities based on the skills. Advantages The major advantages of centre - based early intervention is that the child gets direct services from the experts using suitable aids, appliances and assistive devices. The parent/caregiver learns and clarifies doubt from the experts, and therefore, feels more confident about the intervention. All primary support services are housed in one location. Teachers have more time for planning and instruction. Situation promotes peer interaction and socialization. The children learn from other children and also develop social skills by playing with other children. Disadvantages Cost of providing facilities and range of services is high. Center may need to provide transportation and bus aides, which increases cost. Also parents have to travel with the child to reach the centre, which may mean a day's wages apart from the travel expenses. If not properly planned, having too many people to guide the parents may confuse them. All experts may not be available in all the centres. There is a likelihood of a lesser degree of parent and family involvement. 1.4.3 Mixed (Centre and home based) Intervention: There are some agencies which offer both home based and center based early intervention. It is offered to those families in urban areas who are far away from centers offering early intervention and where health services are lacking. The latter programme is offered to those families who live in districts and can come to centers on a fortnightly or monthly basis. The programme is also offered to those infants who are multiply disabled

19 and who need paramedical and other services (for instance, babies with convulsive disorders). 1.4.4 Direct strategy of home based and centre based intervention (a) The home visitor is introduced to the parents following the initial contact by the supervisor while the mother is still at the hospital. During the initial contact, the parents are given a brief account of the service. (b) The home visitor on his/her introductory visit, gives further information regarding the service and gathers basic information about the family in the initial interview. She also determines whether the parents wish to accept the programme. This is then followed by: - Weekly home visits by the home visitor allotted for a particular area or locality. - Giving weekly training goals set individually for each parent and child. - Demonstrating the target skills to the principal care of the child, mostly the mother. - Training by the 'Principal' carer during the course of the week. - Assessing the skill by the home visitor the following week. - Modification of the skill if need be, In case of any difficulty, or else teaching new skills sequentially. - Recording each of the home-visits made by the home visitors during the week. - Weekly supervision and reporting of the cases by the home visitors to their respective supervisors. Whenever babies do not respond to the training programme, they are brought to the center for examination. If on examination, the baby shows physical or neurological problems, then proper referral or treatment is undertaken, but these infants also continue in the programme. On referral, the Supervisor of the early intervention programme meets the mothers of the referred infants to ascertain their willingness to participate in the programme. The mothers' cooperation is crucial to the success of any early intervention programme, for she in turn influences the family's involvement.

20 1.5 Intervention Techniques 1.5.1 Steps of Early Intervention CASE HISTORY After completion of the registration, formalities and recording of demographic details of the clients, they are sent for the early intervention services. To begin with, the case history of the client is recorded by the professional concerned. The case history format consists of details regarding the chief complaints, prenatal, natal, neonatal, postnatal history, family history, immunization history and feeding history, developmental history and behavior problems. The chief complaints that are reported by the parents are recorded verbatim. This provides information about the child's developmental status as perceived by the parents and is significant for planning the right intervention. Information on prenatal / natal/neonatal and postnatal aspects will help to identify the probable risk and etiological factors. The immunization, feeding and family history of the child is taken to rule out any of the environmental and biological risk factors. ASSESSMENT The assessment forms an integral part of the intervention process, as it is a resource guide for devising the intervention strategies that are sensitive to the needs of the individual child. It is within this perspective that the developmental assessment gives the respective team members a comprehensive view about the child's all-round developmental areas where the child is delayed in development. The general examination and the systemic examination will enable the pediatrician to understand the health as well as the neurological status of the child. The information gathered can assist in knowing the cause, site of lesion, and effect of the pathology on the child, maturational status, and degree of deviation from normal, associated conditions and to a certain extent the prognosis. Its major contribution will be for intervention planning, strategies to be opted, frequency of visits, areas to be targeted, investigations to be ordered and referrals if any required and treatment of medical conditions. The

21 motor and sensory development of the child is well comprehended with Physiotherapy and Occupational therapy assessments. The assessment primarily consists of gathering information on reflex maturation, tone, voluntary control, muscle power, involuntary movement, gross motor, fine motor, oro- motor functions, sensory integration components, play and self-care skills. Other significant aspects of assessment includes speech, language and audiology assessment. The speech and language abilities of the child are recorded along with other or motor abilities that set limits to acquisition of language abilities. The family assessment comprises assessing the family support, family resources and family functioning. These aspects are essential for providing intervention that is context- specific. Assessment of behavior helps to understand the evolution of behavior problems if any that may be manifested due to any deficits in child's development. INTERVENTIONS The intervention strategies are devised in accordance with the assessment conducted by the multidisciplinary team. The Individualized Early Intervention Plan (IEIP) devised by the team focuses on using the assessment data for helping the child to overcome the deficits and mitigating the effects of risk factors through environmental stimulation through the transdisciplinary approach. Intervention related to medical aspects primarily aims at the use of medication for problems like epilepsy, hyperactivity, spasticity, general health problems and related concerns. It also focuses on nutrition, health, hygiene and immunization. Genetic counselling is given wherever it is deemed necessary, and anticipatory guidance on various health issues is also provided. Prior to intervention, the parents/caregivers are given information regarding the status of the child with reference to development, maturation, problems present, their effect and the requirement of the child. Provisional diagnosis is made and management strategies are explained. The role of parents and family in intervention is explained. The steps that are essential for successful program outcome are described. The limitations of predictive prognosis are briefed. Parent's general queries are answered. Information and guidance are given on request.

22 Interventions pertaining to child's development focus on fostering social, emotional and cognitive processing. The stimulation that helps to enhance these processes form an integral aspect of child development. The behavior of the child is also studied for understanding the evolution of behavioral problems that may arise due to deficits in neurological and environmental dysfunction. This kind of ecobehavioural analysis is essential for planning an appropriate behavioral management program. The importance of interactions for facilitating speech and language development is an essential component of speech therapy. It also includes identifying and facilitating the specific speech and language deficits in children. Auditory training for children with hearing impairment is also provided. Auditory training includes, awareness, detection and discrimination (Gross and Fine discrimination). Auditory training is given in order to make the child aware of all the environmental and speech sounds which help in the development of speech and language. Home training programs are also provided. Here, the guidelines are given to the parents to incorporate these home-based activities every day. Physiotherapy interventions foster motor development in the child using Neurodevelopmental techniques. The emphasis of this technique is on facilitating movement under a normal postural tone. Sensory Integration Therapy is provided for children with sensory problems, which are manifested due to early insult to the developing brain. Training in Activities of Daily Living caters to those aspects like feeding, bathing and dressing. These self-care skills are important to maximize the functioning and minimize the dependency. Occupational therapy enables a child to develop gross motor, fine motor and self-help skills using activity as a medium for fostering movement. Sensory Integration is useful in treating specific Learning disabilities, Emotional and Behavioral disorders, Attention deficit disorder, Speech and language disorder, Infants at risk, Autism and Hyperactivity. Specific interventions like behaviour management and anticipatory guidance are also being provided. Family intervention is targeted for improving the care giving environment. Potential stressors like lack of motivation in mother, time management strategies and referrals for further assistance are the likely interventions. All the above interventions are in accordance with the parent consultation model where the parent is advised, guided and

23 given practical demonstration about the intervention which can be carried out at home. They are given guidelines on observations and recording methods and therefore require the cooperation of family members. Information and guidance of all the above interventions is an added attribute. Follow-up services Follow-up services include evaluation on the progress of the child, information as recorded by the parents. Once the earlier set goals are achieved, necessary plans for further course of intervention are made. These activities are practically demonstrated to parents to follow-up at home. Regular follow up services are provided depending upon the need. The follow ups may be daily, weekly or fortnightly. However, for outstation cases efforts are made to identify local agencies giving early intervention and the cases are referred to them. The parents are advised on follow-up as per the requirement and convenience. Referrals Suitable specialists are of vital importance for providing interventions. Referrals to specialists for opinion and advice and investigations help in understanding and confirming the diagnosis, thereby assisting in planning appropriate individualized intervention. For some children with locomotor impairments, aids and appliances are recommended to correct and prevent the setting of deformities. Other referrals for family-related aspects are made when there are family problems like marital discord, alcoholism, financial crisis or mental illness in the family. 1.5.2 Early Intervention Service Approaches The growing acceptance and implementation of the team approach also reflect early intervention professionals' view of human development that regards a child as an integrated and an interactive whole, rather than as a collection of separate parts (Golin & Ducanis, 1981). The team approach also recognizes that the multifaceted problems of very young children are too complex to be addressed by a single discipline (Holm & McCartin, 1978). The complexity of developmental problems in early life (Fewell, 1983)

24 and the interrelated nature of an infant's developmental domains are prompting early intervention specialists to recognize the need for professionals to work together as a team. Although different team models are in use, most are composed of professionals representing a variety of disciplines: Medicine, Child development; Physical, Occupational, Speech and Language therapy, Special education, Social work, and Psychology. The teams also involve the family in varying ways and degrees. Team members share common tasks including the assessment of a child's developmental status and implementation of a program plan to meet the assessed needs of the child within the context of the family. What may best distinguish early intervention teams from one another is neither composition nor task, but rather the structure for interaction among team members. Three service delivery models that structure interaction among team members have been identified and differentiated in the literature: multidisciplinary, interdisciplinary, and transdisciplinary (Fewell, 1983; Linder, 1983; Peterson, 1987; United Cerebral Palsy National Collaborative Infant Project, 1976). A. The Multidisciplinary Approach The approach to early intervention now is multidisciplinary where each professional individually provides services to the child. In multidisciplinary teams, professionals from several disciplines work independently of each other (Fewell, 1983). Peterson (1987) compared the mode of interaction among members of multidisciplinary teams to parallel play in young children: "side by side, but separate". (Although multidisciplinary team members may work together and share the same space and tools, they usually function quite separately. Interaction among team members in the multidisciplinary approach does not foster services that reflect the view of the child as an integrated and interactive whole (Linder, 1983). This can lead to fragmented services for children and confusing or conflicting reports to parents. Another concern about the multidisciplinary model is the lack of communication between team members that places the burden of coordination and case management on the

25 family. In contrast, both the interdisciplinary and transdisciplinary approaches avoid the pitfalls of multidisciplinary service fragmentation by having the team develop a case management plan that coordinates both their services and the information that is presented to the family. B. The Interdisciplinary Approach Interdisciplinary approach defines a process where professionals from different but related disciplines work together to assess and manage problems by actively participating in mutual decision making. Team members share information with one another but independently implement their section of the plan. Interdisciplinary teams are composed of parents and professionals from several disciplines. The difference between multidisciplinary and interdisciplinary teams lies in the interaction among team members. Interdisciplinary teams are characterized by formal channels of communication that encourage team members to share their information and discuss individual results (Fewell, 1983; Peterson, 1987). Regular meetings are usually scheduled to discuss the shared cases. Representatives of various professional disciplines separately assess children and families, but the team does come together at some point to discuss the results of their individual assessment and to develop plans for intervention. Generally, each specialist is responsible for the part of the service plan related to his or her professional discipline. Although this approach solves some of the problems associated with the multidisciplinary teams, communication and interaction problems (e.g., influence of "professional turf") may impinge upon the team process. C. The Transdisciplinary Approach In the transdisciplinary approach, each professional provides a management plan to the case manager in consultation with the other team members. One of the members may be elected as a case manager who will deal with the child. The case manager may be a rehabilitation worker. This approach is holistic in nature and provides better case management and resource management (time & money). This approach provides services

26 to a greater number of children with less number of professionals and facilitates easy access to the community. Features of the Transdisciplinary Approach: ? It has a Holistic approach ? There is better case management ? There is better resource management (Time, Money) ? Greater Coverage of Services is ensured ? Less number of professionals required. ? It is a CBR approach Early intervention being at the rudimentary stage in our country, there is an urgent need for intervention in the rural areas. The few available services in the urban areas hardly percolate to the rural population. Transdisciplinary teams are also composed of parents and professionals from several disciplines. The transdisciplinary approach attempts to overcome the limitations of individual disciplines in order to form a team that crosses and recrosses disciplinary boundaries and thereby maximizes communication, interaction and cooperation among the team members. Fundamental to the Transdisciplinary Model are two beliefs: ? Children's development must be viewed as integrated and interactive, and ? Children must be served within the context of the family. Since families have the greatest influence on their child's development, they are seen as a very critical part of the transdisciplinary team and are involved in setting goals and making programmable decisions for themselves and their children. All decisions in the areas of assessment and program planning, implementation and evaluation are made with the consensus of the team. Although all team members share responsibility for the development of the service plan, it is carried out by the family and one of the team members, who is designated, acts as the primary service provider.

27 Another characteristic of a transdisciplinary team is that the team members accept and accentuate each other's knowledge and strengths to benefit the team, the child, and the family (Lyon & Lyon, 1980). Staff development in the form of mutual training may occur at three increasing levels of complexity: (1) sharing of general information; (2) teaching others to make specific judgments; and (3) teaching others to perform specific actions. The first two levels pertain to the sharing of information while the third level pertains to the sharing of roles. Implications of the transdisciplinary model Because the transdisciplinary team members are interdependent, all must commit themselves to assist and support one another. This commitment is demonstrated by the following behaviors: 1) Giving the time and energy necessary to teach, learn, and work across traditional disciplinary boundaries. 2) Working towards making all decisions about the child and family by team consensus—that is, giving up disciplinary control. 3) Supporting the family and one other team member as the child's primary service provider. 4) Recognizing the family as the most important influence in the child's life and including the family members as equal team members who have a role to play in their child's development program 1.5.3 Personnel and Their Role in Early Intervention PEDIATRICIAN i. Assessment ? Growth and development ? Nutrition ? Detailed systematic and neurological examination Investigation ? Diagnosis

28 ii. Intervention ? Nutrition Care Plan ? Comprehensive Healthcare services ? Genetic Counselling ? Treatment of Medical illness and associated abnormalities ? Anticipatory Guidance ? Referral iii. Teamwork ? Share Information ? Assist Other Team Members ? Health Education–Prevention, ? Early Identification ? Family Support ? Parent training programmes
Psychologist i. Assessment ? Psychological development of the child ? Behavioral characteristics/needs of the child and family ii. Intervention ? Psychological Counselling ? Family Counselling ? Behaviour Modification Referral iii. Teamwork Referral Awareness Programmes Parent Training programme

29 Master trainers programme Case Management Interdisciplinary Planning Physiotherapist 1. Assessment ? Motor Skills / development ? Motor Dysfunction ? Neuromotor ? Musculoskeletal ii. Intervention ? Design Adaptive Equipment and mobility devices ? Motor Intervention ? Gait Training ? Specific Therapies iii. Teamwork ? Interdisciplinary Planning ? Referral ? Awareness programmes ? 30 ii. Intervention ? Environmental modification ? Design assistive/orthotic devices ? Functional skill development iii. Teamwork ? Referral ? Awareness programmes ? Parent training programmes ? Master trainers programme ? Inter Disciplinary Planning ? Case Management
SPEECH THERAPIST AND AUDIOLOGIST i. Assessment ? Communication/Comprehension ? Expression/Auditory function ? Oral-Pharyngeal disorders/dysfunction. ii. Intervention ? Therapeutic Program ? Parent guidance ? Auditory training/Speech training ? Referral iii. Teamwork ? Interdisciplinary planning

31 CHILD DEVELOPMENT EXPERT i. Assessment ? Cognitive Development ? Needs and Resources of the child ? Child Behaviour ? Learning ? Mental Health ii. Intervention ? Play and Socialization ? Nutritional Plan ? Counselling parents to enhance overall child development ? Home organization ? Behaviour modification iii. Community and Teamwork ? Creating Awareness on child development ? Assisting other Team members ? Parent training programmes ? Master trainers programme ? Providing Information ? Social Worker i. Assessment ? Family needs/resources/support ? Family functioning style ? Community Resources ? Family conflicts ii. Intervention ? Individual counselling

32 ? Group counselling ? Environment modification ? Marital Counselling ? Family Counselling ? Family support ? Utilization of services iii. Teamwork ? Tap community resources ? Health education ? Environmental sanitation ? Research ? Referral
Psychiatrist i. Assessment ? Childhood disorders ? Attachment problems/anxiety ? Parental psychiatric problems ii. Intervention ? Prevention of disorders ? Educating and counseling parents iii. Teamwork ? Referral ? Interdisciplinary planning

33 1.6 Record Maintenance and Documentation 1.6.1 Concept of Documentation

Whatever is the educational facility in which the student is being educated; appropriate documentation is of utmost importance. Right from birth history and diagnosis to disability certification, school admission, assessment, curriculum planning, implementation and evaluation, future planning, vocational training and placement leading to economic independence - all have to have records at each stage.

Documentation simple means systematically storing information collected from various sources using appropriate procedures for predetermined purposes. 1.6.2 The Importance of Documentation Children's learning is enhanced Children become even more curious, interested, and confident when they think about the meaning of what they have done. The processes of preparing and displaying examples of the children's experience and effort provides a kind of debriefing or revisiting where new understandings can be clarified, deepened, and strengthened. Children also learn from and are stimulated by each other's work in ways made visible through the documents displayed. A display documenting the work of one child or of a group often encourages other children to become involved in a new topic and to adopt a new method of doing something. Children's ideas and work are taken seriously Careful and attractive displays can convey to children that their efforts, intentions, and ideas are taken seriously. These displays are not intended primarily to serve decorative or show-off purposes. An important element in the project approach is the preparation of documents for display by which one group of children can let others in the class working on other parts of the topic learn of their experience and findings.

34 Documentation encourages children to approach their work responsibly, with energy and commitment, showing both delight and satisfaction in the processes and the results. Children's learning made visible Documentation provides information about children's learning and progress. The focus is on how children making meaning, of how they come to understand. While teachers often gain important information and insight from their own first-hand observations of children, documentation of the children's work in a wide variety of media provides compelling public evidence of the intellectual capability and competence of young children. Documentation uncovers the learning process as it highlights children's theories, interests and relationships. Conversation or dialogue is used to present children's words as serious attempts to understand concepts and ideas. Teachers plan and evaluate with children Continuous planning is based on the evaluation of work as it progresses. As the children undertake complex individual or small group collaborative tasks over a period of several days or weeks, the teachers examine the work each day and discuss with the children their ideas and the possibilities of new options for the following days. Planning decisions can be made on the basis of what individual or groups of children have found interesting, stimulating, puzzling, or challenging. Experiences and activities are not planned too far in advance, so that new aspects of work can emerge based on children's interests and be documented. Teachers reflect on the work in progress and the discussion that surrounded it, and consider possible new directions the work might take. When teachers and children plan together with openness to each other's ideas, the activity is likely to be undertaken with greater interest than if the child had planned alone, or the teacher had been unaware of the challenge facing the child. The documentation provides a kind of ongoing planning and evaluation that can be done by the team of adults who work with the children.

35 Teacher research and progress As teachers examine the children's work and prepare the documentation of it, their own understanding of children's development and insight into their learning is deepened. Documentation provides a basis for tweaking teaching strategies, and a source of ideas for new strategies, while deepening teachers' awareness of each child's progress. Using information gained through documentation, teachers are able to make informed decisions about appropriate ways to support each child's development and learning. Documentation explains how one activity was pivotal in understanding an issue, connecting to previous learning, or provoking a new inquiry. Documentation helps teachers promote a positive exchange of ideas. Documentation highlights the issues or problems that emerge during a study or activity. Parents' appreciation and participation Documentation makes it possible for parents to become more aware of their children's experience in the school. Parents' comments on children's work can also contribute to the value of documentation. Through learning about the work in which their children are engaged, parents may be able to contribute ideas the teachers may not have thought of. The opportunity to examine the documentation of a project in progress can also help parents to think of ways they might contribute their time and energy in their child's classroom. There are many ways parents can be involved in documentation within the classroom: listening to children's intentions, helping them find the materials they need, making suggestions, helping children write their ideas, finding and reading books

36 1.7 Implication of Early Intervention for Preschool Inclusion 1.7.1 Definition of Early Childhood Education Early childhood inclusion embodies the values, policies, and practices that support the right of every infant and young child and his or her family, regardless of ability, to participate in a broad range of activities and contexts as full members of families, communities, and society. (National Association for the Education of Young Children Joint position statement) 1.7.2 Rationale for Inclusive Early Education The Ethical Issue The rights of children with disabilities to as full a life as possible is a major ethical force among advocates of inclusion. Dunn (1968) first brought the unfairness of segregated education for children with disabilities to the public consciousness. He asserted that special classes, for the most part, provided inadequate education. According to Derman-Sparks (1988-1989), the common goal is to gain acceptance in our educational system for children with noticeable different culture, intellectual or physical characteristics. The Socialization Issue Including young children with disabilities in the educational mainstream implies equal social status with children who are developing normally. Separating young children with handicaps from normal experiences creates distance, misunderstanding and rejection Separating these youngsters from real world means there must be re-entry problems. Re-entry problems can be avoided by not removing the child from normal settings. Developmental Issue Sensitive Periods Teachable Moments When a child is highly motivated and better able to acquire a particular skill It occurs during the daily routine and activities Imitation

37 The Cost Issue 1.7.3 Inclusive Programs for children from Birth to Age Two Relationships among caregivers and children Environment and Experiences accessing what is happening in the environment Making choices that respond to their overtures and also reflect their expressed intentions Engaging in experiences that evolve from simple to more complex Causing things to happen Playing alone and with peers Equipment Picture books Household items such as measuring cups and unbreakable bowls Vinyl-covered pillows to climb on Child proof mirrors Nesting toys Large beads that snap together Washable cloth of different colors and textures Dolls Balls Pull toys Music boxes and other musical toys Simple cause -effect toys Various types of containers etc.

38 Health, Safety and Nutrition Toys should be safe, washable, and too large for young children to swallow. Mouthed toys are replaced with clean ones so that the mouthed toys can be disinfected with a bleach solution. Electrical outlets are covered; extension cords are not exposed; hazardous substances are kept out of children's reach Personal items are labeled with the child's name. Diaper - changing areas are easily and routinely sanitized after each diaper change. Staff should be healthy and take precautions not to spread illness. Caregivers wash their hands before and after every diaper change and the feeding of each infant Adults are aware of the symptoms of common childhood illnesses, of children's allergies, and potential hazards in the environment. Infants always are held with their bodies at an appropriate angle ('head above the heart') when being fed from a bottle. Children who can sit up are fed with one or two other infants with a caregiver present to help if needed. Safe finger foods are encouraged. Only healthy foods are offered. Eating is considered a sociable, happy time. Reciprocal Relationships with Families Sharing important information with parents about their children Demonstrating respect for a family's culture, language, and life choices Having appropriate information that enables teachers to answer questions about child development and available community resources. Responding respectfully to parents questions, comments, and concerns. 1.7.4 Inclusive Programs for Children Ages three to Five Creating a caring community of learners Teaching to enhance development and learning

39 Constructing an Appropriate Curriculum Socio-emotional development Communication and literacy development Physical Development Aesthetic Development Assessing Children's learning and Development Reciprocal Relationships with Parents 1.7.5 Key Experiences in Pre School Curriculum Creative Representation Recognizing objects by sight, sound, touch, taste, and smell Imitating actions and sounds Relating models, pictures, and photographs to real places and things Pretending and role playing " Making models out of clay, blocks, and other materials Drawing and painting Language And Literacy Talking with others about personally meaningful experiences Describing objects, events, and relations Having fun with language: listening to stories and poems, making up stories and rhymes Writing in various ways: drawing, scribbling, letter like forms, invented spelling, and conventional forms Reading in various ways: reading storybooks, signs and symbols, one's own writing Dictating stories

40 Initiative and Social Relations Making and expressing choices, plans, and decisions Solving problems encountered in play Taking care of one's own needs Expressing feelings in words Participating in group routines Being sensitive to the feelings, interests, and needs of others Building relationships with children and adults Creating and experiencing collaborative play Dealing with social conflict Classification Exploring and describing similarities, differences, and the attributes of things Distinguishing and describing shapes Sorting and matching Using and describing something in several ways Holding more than one attribute in mind at a time Distinguishing between some and all Describing characteristics that something does not possess or what class it does not belong to Seriation Comparing attributes (longer/shorter, bigger/smaller) Arranging several things one after another in a series or pattern and describing the relationships (big/bigger/biggest, red/blue/red/blue) Fitting one ordered set of objects to another through trial and error (small cup-small saucer/medium cup-

41 medium saucer/big cup-big saucer) NUMBER Comparing the numbers of things in two sets to determine more,fewer, same number Arranging two sets of objects in one-to-one correspondence Counting objects Space Filling and emptying Fitting things together and taking them apart Changing the shape and arrangement of objects (wrapping, twisting, stretching, stacking, enclosing) Observing people, places, and things from different spatial viewpoints Experiencing and describing positions, directions, and distances in the play space, building, and neighborhood Interpreting spatial relations in drawings, pictures, and photographs Time Starting and stopping an action on signal Experiencing and describing rates of movement Experiencing and comparing time intervals Anticipating, remembering, and describing sequences of events Source: Reprinted by permission from Nancy Altman Brickman, ed., "Key Experiences in the Preschool Classroom," Supporting Young 1.8 Lets Us Sum up Early intervention is the first intervention strategy in the process of rehabilitation. The term Early Intervention refers to services given to very young children with

42 special needs, generally from birth to until the child turns five. For this reason, these programs are sometimes called "Birth to 5" or "Zero to 5". Early intervention may focus on the child alone or on the child and the family together. The principles of early intervention is to provide appropriate therapies for children with disabilities, to minimize these delays and maximize their chances of reaching normal milestones in development. Early intervention of children at risk is the most important and vital component in Rehabilitation of Persons with all disabilities recognized by WHO and all developed countries of the world. The UNCRPD stresses the importance of habilitation and rehabilitation beginning at the earliest possible stage and being based on individual needs and strengths. Early identification, availability of services, trained professionals and information and support to families are all considerations of quality early intervention services. EI programs may be centre - based, home based, hospital based or a combination. Each model has its advantages and limitation. In the home based model the trainer visits the house of the child with disability or developmental delay. The trainer interacts with the family members, observes their routine, practices, culture and social activities, available resources in terms of family members, finances, material resources and so on. A centre-based approach provides varied types of help at a central location. This is a system where the parents or care givers of the child take the child to a centre. At the centre, a group of experts, including a doctor, social worker, special educator and therapists for speech and motor aspects, attend to the child and train the parents/ caregiver to carry out tasks at home to foster the development of the child. The mixed intervention is simple a combination of home-based and centre based intervention strategies. Under this model, the parent and the child receive a combination of services. Children are the future citizens of the country. If the future citizens, the torch bearers of the country are grappling with such problems of disability and survival, then the future of the country is to say the least, grim. Disability in any form hampers normal development of children, and the challenge posed by disability in India is enormous. Despite the fact that so much has been done, there is still a much more to be done. The

43 crucial issues are to make services accessible, to involve parents and provide services to facilitate maximum development where children with disabilities reach their full potential. Governmental efforts, especially Ministry of Health should collect comprehensive data on children with disability and 5 year targets should be set for enrollment of children with disability and closely monitory action plans implemented. There is a need to establish adequate early detection and identification services in hospitals, PHC's community based health care services with referrals system to Early Intervention service. Routine screening for high risk pregnancies and babies will help in early detection of disabilities. All the above efforts must culminate to make our former President Dr. A.P.J. Abdul Kalam's dream project PURA (Provision of Urban Amenities in Rural Areas) a possibility. So the adage "Catch them young and watch them grow" best defines Early Intervention. Documentation is a vital process in any programme. It makes the programme more system dependent than a person dependent. Educators employ various methods for documenting evaluation data. They are IEP form, activity checklists, task analysis checklist, graphs, work samples and anecdotal records. Early childhood inclusion embodies the values, policies, and practices that support the right of every infant and young child and his or her family, regardless of ability, to participate in a board range of activities and contexts as full members of families, communities, and society. The reasons for inclusion are based on ethical, social, developmental and philosophical arguments. There are many benefits to participating in an inclusive early childhood program for children with developmental problems, including opportunities to interact with and imitate children who have acquired a higher level of language, play and social skills. For programs to be truly developmentally appropriate, the educators must think about children as individuals and design programs that meet the needs of individual children. Quality programs for infants and toddlers provide a safe, healthy, well-supervised environment filled with developmentally appropriate play materials and staffed by responsive caregivers,

44 For children from three to five years of age, a quality program provides many opportunities to learn by doing. Children acquire knowledge of the world through play. Child -directed and teacher -supported active learning is the key to quality program for children this age.

1.9 Check Your Progress

1. What do you understand by early intervention?
2. Explain the purposes of early intervention.
3. Write the scope of early intervention for children with disabilities
4. Explain the advantages and disadvantages of Home Base Intervention
5. Explain which model would be suitable for your locality
6. What are the stages of early Intervention Techniques?
7. Write in details the various approaches of early intervention?
8. Write the role of professional involved in team of early intervention
9. What is documentation? Discuss the importance of documentation.
10. Explain the concept of inclusive education
11. Write the roles of educator in promoting inclusive education for the preschoolers
12. Key curriculum for preschoolers in promoting inclusive education

5.1 Introduction Treatment of developmental disabilities can come in a variety of different forms. The best treatment regimens are the result of an individualized treatment plan formed by a team of health care multidisciplinary professionals. The plan will be based on the severity of the disability and should involve patients, families, teachers, and caregivers in all phases of planning, decision making, and treatment. The individualized treatment plan will take into consideration both the immediate needs of the patient, and the long term prognosis for development.

165 Occupational therapy, or OT for short, is a treatment therapy that helps people achieves independence in all facets of their lives. If a child has physical disabilities or developmental delays, occupational therapy can improve their cognitive (thinking), physical and major skills as well as address psychological, social, and environmental factors that impact the child's functioning. Physical therapy (PT), or sometimes called physiotherapy, focuses on improving gross and fine motor skills, balance and coordination, and strength and endurance. The child may be evaluated by a physical therapist to assess muscle and joint function, mobility, strength and endurance, oral motor skills such as feeding and talking, posture and balance, even the status of the heart and lungs. Speech therapy is a clinical program aimed at improving speech and language skills and oral motor abilities. This means talking, using sign language, or using a communication aid. Children who are able to talk may work on making their speech clearer, or on building their language skills by learning new words, learning to speak in sentences, or improving their listening skills. Dance and creative movement provide physical challenges in a structured, supportive environment for sensory integration. The intimate connection with music often makes dance feel less like exercise or physical therapy and more like leisure. Dance/Movement Therapy (DMT) has been used in the United States since World War II. Marian Chace, a dancer, choreographer, and teacher of modern dance in Washington D.C. during the 1930s and 1940s, first developed the mind body connection as a form of therapy for her dance students. She "questioned why pupils who had no intention of being professional came to take dance classes" and started gearing her classes toward the needs and interests of recreational dancers. In 1942, she was asked to work with returning soldiers from World War II at St. Elizabeth's Hospital in Washington D.C. Dance/movement therapy was seen as promising because it could so easily be a group treatment. Chace developed her methods working with institutionalized, often schizophrenic and psychotic, individuals. Music therapy enhances one's quality of life, involving relationships between a qualified music therapist and individual; between one individual and another; between the individual and his/her family; and between the music and the participants. These relationships are structured and adapted through the elements of music to create a positive environment and set the occasion for successful growth.

166 Music Therapy is a well-established, research-based profession in which music is used to accomplish therapeutic and educational goals. Recreational therapy is based on the idea of increasing a person's independence and ability to function through participation in creative arts, dance, sports, adventure programs and puzzles or logic games. It is a holistic approach to wellness. According to the American Therapeutic Recreation Association, recreational therapy "aims to improve an individual's functioning and keep them as active, healthy and independent as possible in their chosen life pursuits." In most cases, these goals are accomplished by combining a person's speech, fine motor or gross motor goals with community involvement, while engaging in the person's preferred interests. 5.2

Objectives After going through this unit you will be able to ?

Define the

different therapies like occupational, physio, speech, yoga and play, music, dance and movement. ? Discuss the aims and objectives of the different therapies. ? Narrate the scope and modalities of the therapies. ? Describe the intervention procedures of the therapies. 5.3 Occupational Therapy: Definition, Objectives, Scope, Modalities And Intervention. 5.3.1

Definition of Occupational Therapy Occupational therapy is a method of treatment for which the primary area of concern is the patient's ability to perform functions required in day to day life. This method of treatment is also concerned with the social, psychological and cognitive development of the patient. In the early years, occupational therapy was regarded as a means to keep long term convalescent patients occupied. It derived the name "Occupational therapy" owing to this. Its contribution was limited to the field of chronic illness - mental illness, tuberculosis, leprosy etc.

Occupational therapy is a client-centred health

profession concerned with

167 promoting health and well being through occupation. The primary goal of occupational therapy is to enable people to participate in the activities of everyday life. Occupational therapists achieve this outcome by working with people and communities to enhance their ability to engage in the occupations they want to, need to, or are expected to do, or by modifying the occupation or the environment to better support their occupational engagement. (WFOT 2012) "

Occupational therapy is the art and science of directing man's participation in selected tasks to restore, reinforce and enhance the performance, facilitate learning of those skills and functions essential for adaptation and productivity, to diminish or correct pathology and to promote and maintain health." (Council of Standards, American Occupational Therapy Association, 1972) 5.3.2 Aims of Occupational Therapy A person with intellectual disability is observed to have dysfunction in almost all performance components. The specific aims of occupational therapy for persons with intellectual disability are as follows. (a) To facilitate the development of performance components of the patients. (b) To enhance independence of the patients. (c) To provide sensory stimulation. (d) To improve hand functions. (e) To enhance gross motor functions. (f) To facilitate development of perceptual motor functions. (g) To reinforce social development. (h) To enhance independence skills. (i) To provide vocational training. (j) To correct mal adaptive behaviour. (k) To provide extrinsic adaptations.

168 5.3.3 Objectives of Occupational Therapy Occupational Therapists work with children who have difficulties with the practical and social skills necessary for their everyday life. An Occupational Therapist will aim to enable the child to be as physically, psychologically and socially independent as possible. Occupational Therapists work in close partnership with the child and their family, schools and other healthcare professionals. Together they have a shared responsibility for meeting the child's needs. In schools, for example, they evaluate the child's abilities, recommend and provide therapy, modify classroom equipment, and help the child participate as fully as possible in school programs and activities. A therapist may work with the child individually, lead small groups in the classroom, consult with a teacher to improve the functioning skills of the child etc. Occupational therapy is provided when there is a disruption in function in one or more of the following the areas: Gross Motor Skills: Movement of the large muscles in the arms, and legs. Abilities like rolling, crawling, walking, running, jumping, hopping, skipping etc. Fine Motor Skills: Movement and dexterity of the small muscles in the hands and fingers. Abilities like in-hand manipulation, reaching, carrying, shifting small objects etc. Cognitive Perceptual Skills: Abilities like attention, concentration, memory, comprehending information, thinking, reasoning, problem solving, understanding concept of shape, size and colors etc. Sensory Integration: ability to take in, sort out, and respond to the input received from the world. Sensory processing abilities like vestibular, proprioceptive, tactile, visual, auditory, gustatory and olfactory skills. Visual Motor Skills: A child's movement based on the perception of visual information. Abilities like copying. Motor Planning Skills: Ability to plan, implement, and sequence motor tasks. Oral Motor Skills: Movement of muscles in the mouth, lips, tongue, and jaw, including sucking, biting, chewing, blowing and licking. Play Skills: To develop age appropriate, purposeful play skills Socio-emotional Skills: Ability to interact with peers and others.

169 Activities of daily living: Self-care skills like daily dressing, feeding, grooming and toilet tasks. Also environment manipulation like handling switches, door knobs, phones, TV remote etc. Occupational therapists in schools collaborate with teachers, special educators, other school personnel, and parents to develop and implement individual or group programs, provide counselling, and support classroom activities. Occupational therapists design and develop equipment or techniques for improving existing mode of functioning. 5.3.4 Scope of Occupational Therapy Occupational Therapists work with parents/care givers and others to assess if a child has difficulties with practical and social skills. Occupational Therapists assess the physical, psychological and social functions of the individual identify areas of dysfunction and involves the individual in a structured programme of activity to overcome disability. Following assessment, the Occupational Therapist will design and implement programs with appropriate strategies in order to enable the child to maximize his/her potential. Occupational Therapists provide services to individuals often in conjunction with physicians, social workers, psychologists, and other therapists. Occupational therapists use qualitative and quantitative assessment methods, including standardized tests, as well as devices, to analyze and diagnose the nature and extent of dysfunction. Occupational therapists develop an individualized plan of care, tailored to each patient's needs. 5.3.5 Modalities of Occupational Therapy Occupational Therapy is a form of treatment which directs the patients to practice and

master human activities. Thus human activity is indeed the foremost modality of occupational therapy. The modalities of occupational therapy

are as 1. Human Activity. 2. Extrinsic adaptation: Extrinsic adaptation is a adaptation in the physical, natural or non human environment of the person. Here adaptation refers to the structural adjustment or change in factors in the environment.

170 3. Splints and pressure garments. 4. Therapist. 5. Environment 6. Teaching/ Learning Process. 5.3.6 The Intervention Process Occupational therapy intervention for people with intellectual disability is an on-going process that is both gradual and dynamic. Treatment is provided throughout the life cycle in accordance with the client's changing needs, desires and preferences in all areas of occupation. The intervention often requires repeated drills and practice to achieve internalization and learning, and performance in a variety of contexts to enable generalization. As is the case with respect to assessment, the intervention is preferably carried out in the client's various daily environments. This enables and encourages the client's participation in the many contexts of his/her life. Occupational therapy interventions for people with intellectual disabilities are specifically adapted to the client with respect to the degree and type of support needed as well as the context. Interventions may include direct treatment as well as environmental adaptations, guidance, monitoring and counseling (including of the family, the educational staff, the clinical staff, employers and others).

Examples of Occupational Therapy Intervention: Activities of daily living: including activities directed to the person's care of his/her bodily needs (ADL) such as personal hygiene, eating, dressing, and instrumental activities of daily life (IADL) such as preparing a meal or managing finances. This area represents a central focus of intervention in occupational therapy for this population. For example, with respect to activities related to eating, the intervention can range from adapting the feeding environment, choosing preferred food or bringing the food to one's mouth, to teaching more advanced skills such as organizing shopping, and meal preparation. Learning/Studies: These are activities necessary to be a student and to participate in a learning environment, including academic and non-academic activities. Intervention in this area covers a variety of educational settings such as day care centers for very young children, kindergartens and special education schools (ages 3-21 years), regular school settings and professional training facilities. The intervention is varied and may focus on

171 gaining basic learning-skills, such as understanding cause and effect processes and object permanence, or on more complicated skills, such as preparation for learning and writing, organization in time, in space and with accessories, adaptation to different learning environments, the use of information technologies and computers and gaining learning strategies. In addition, the intervention can include adapting various learning environments. Work: These are productive activities, whether for remuneration or not, that include preparing for work, producing a product and providing services. Intervention in this area covers a variety of work settings including: special educational settings in which students receive training to enter the work force, youth rehabilitation centers, adult sheltered-work facilities, an array of protected supportive community work systems, and placement-services for gaining open market positions. Intervention varies and may include basic work skills training (behavior norms, work routines), developing and practicing basic cognitive abilities, practicing motor skills, exposure to varied work opportunities, support and advice for developing areas of interest, identifying abilities and choosing suitable occupations, analyzing occupations and adapting them as needed, as well as supporting and assisting placement in various work settings in the community. Play: These are activities that are generally internally motivated and provide pleasure, entertainment and learning. Play-intervention, as an occupational therapy goal in this population, is directed towards the most basic experiencing of play as a source of pleasure, as well as providing the client with an opportunity to participate in play activities. The intervention includes drills in basic skills such as the use of equipment, recognizing rules and agreed-upon behavior patterns, or choosing suitable play activities. In addition, play represents a treatment method for learning and practicing a variety of social, motor and functional skills. Leisure: These are non-obligatory activities that are internally motivated and are performed at times that are not devoted to work, studies, self-care or sleep. Research reveals that people within this population have a relatively large amount of time to devote to leisure, whereas their participation in leisure activities is minimal (Buttimer & Teirney, 2005). Therefore, coping with leisure within this population is a central topic. Intervention in this area may focus on exposure to varied leisure opportunities, identification and choice of areas of interest, planning leisure time and participation in activities that lead to a perception of capability, pleasure, control and satisfaction.

172 Social participation: These are activities related to agreed-upon behavior patterns expected of an individual within a given social system (e.g. community, family or with friends). The intervention within occupational therapy encourages the person to gain skills in the various areas or occupation and thus supports and strengthens social participation. For this population, an emphasis is placed upon understanding acceptable social norms and as well as learning and practicing activities that lead to satisfactory social interactions. Accessibility and Environmental Modification: Occupational therapy practice relates to the person, the occupation and the

environment. The occupational therapist's broad knowledge base in the areas of function and limitation enables him/her to identify, through performance analysis in the different areas of occupation, environments and/or tasks that should be modified. The various limitations that characterize the population of people with intellectual disabilities require both general and client-specific environmental modifications to ensure accessibility. The characteristic difficulty in problem-solving, initiative and coping with unfamiliar situations, amplifies the need for accessibility modifications for this population. These accessibility modifications include changes in the environment (as in widening passageways, modifying playgrounds or adding symbol signs), in the equipment (such as adapting seating systems or adapting feeding aids), or in the task (such as changing the complexity of instructions or dividing a task into sub-stages). Assistive technology is one of the methods used to adapt the environment and includes modifications of hardware; software and various combinations thereof (such as a virtual keyboard, a touch screen, a motorized wheelchair, switch systems, computer programs and internet sites, adapted content amount, or voice output devices). Thus, for example, a switch can be modified to be activated through the person's head or hand. Other modifications of the switch may include size, colour, texture, or sensitivity (such as speed or pressure response). Assistive technology promotes a variety of functions related to the individual, the occupation and the environment. In addition, it allows for the modification of an individual's environment in the manner in which he/she requires, by relating to his personal abilities, wants, areas of interest and specific limitations and difficulties. Environmental modification is likely to significantly improve a person's ability to participate in all areas of occupation, his or her level of independence and the degree of supports required.

173 In summary, the occupational therapist, as part of a therapeutic, rehabilitative and educational profession plays a central role within the support system available to people with intellectual and developmental disabilities, throughout the life cycle. As such, occupational therapists hold key positions as leaders in this area. Working with people with intellectual and developmental disabilities requires consideration of function, independence and participation in the various areas of occupation, which enables the occupational therapist to utilize all the areas of knowledge and expertise included in the practice of occupational therapy. 5.4

Physiotherapy: Definition, Objective, Scope, Modalities and Intervention 5.4.1 Definition of Physiotherapy It is also called physical therapy. The treatment of physical dysfunction or injury by the use of therapeutic exercise and the application of physical modalities (like heat, light, cold, current, water, sound waves). Assistive devices are also used as a part of the treatment programme. They are intended to restore or facilitate normal function or development. 5.4.2 Aims and Objectives of Physiotherapy

Physiotherapy in the field of mental retardation is aimed at improving overall motor functions of the child to the maximum extent possible, so as to make the child independent in walking and carrying out activities of daily living. If it is not possible for the person to walk, and carry out activities independently, then aids and appliances are trained to the person to use it. (A) Objectives of physiotherapy in general 1. Reduces or relieves pain, muscle spasm, tenderness of muscles. 2. It helps to reduce or relieve swelling. 3. It helps to reduce or relieve inflammation (means the response of the body in the form of pain, swelling, muscle spasm and tenderness of the muscles etc. in the presence of any foreign body). 4. To improve ventilation of lungs, by giving, deep breathing exercises and postural drainage.

174 5. To encourage correct weight bearing and weight transference on both sides of the body. 6. Re-education of affected or paralysed muscles. 7. It is effective in healing of infected wounds. 8. It helps to check the abnormal growth of bone (bony spurs). 9. Breaking up of adhesion formation (gluing of joint structures by synovial fluid). 10. To keep the person physically fit. 11. To teach relaxation. 12. Stimulation of sensory and motor nerves if sensations are reduced or lost. 13. Post fracture and dislocation, management. (B) Objectives of physiotherapy in relation to Intellectual Disability 1. To facilitate the development of child gross motor and fine motor. 2. To prevent or correct contractures and deformities. 3. Prevent or correct wasting and atrophy of muscle. 4. To normalize muscle tone. 5. To maintain or improve the muscle power. 6. To maintain and improve the joint range of movement. 7. To emphasize the importance of handling and positioning the child. 8. To make the child independent in walking and activities of daily living. 9. Provide aids and appliances and to train the person and parents how to use assistive devices. 10. To improve posture, gait, balance coordination. 11. Inhibition of abnormal reflex activity, abnormal patterns of movement and abnormal muscle tone and facilitation of normal in place of abnormal. 12. To keep the children physically fit. 5.4.3 Scope of Physiotherapy Physiotherapy has scope in treating a wide range of conditions. It plays an important

175 role in all the branches of medical sciences, especially Orthopaedics, Paediatrics, Neurology, Cardio thoracic, Surgery, Sport Medicine etc. In set ups like leprosy, paraplegic and poliomyelitis after plastic surgery, burns clinics, spinal cord injury centres and in assistive devices manufacturing units etc. Physiotherapy has three major functions in the management of children with intellectual disability. 1. To facilitate motor development 2. To prevent and correct contractures and deformities. 4. To make the child as independent as possible and functional (locomotor function and activities of daily living). 5.4.4 Modalities of Physiotherapy 1. Hydrotherapy: Hydrotherapy, or water therapy, is the use of water (hot, cold, steam, or ice) to relieve discomfort and promote physical well-being. 2. Electrotherapy: Electrotherapy is the use of electrical energy as a medical treatment. 3. Exercise Therapy: Exercise Therapy is a regimen or plan of physical activities designed and prescribed for specific therapeutic goals. 4. Massage or Manipulation 5. Gait: Gait training is a type of physical therapy. It can help improve your ability to stand and walk. 5.4.5. Intervention of Physiotherapy Role of Physiotherapist in the field of Intellectual Disability ? Diagnostician: Here the physiotherapists assess the client and order for the necessary investigation, on the basis of this therapist arises at diagnosis. According to the diagnosis therapy will be planned. ? Interventionist: Therapist plays a role as interventionist in setting intervention goals, planning and implementation of therapy programme, giving follow - up and

176 regular evaluation of the client, modifying programme as per the clients need. ? Team member: Therapist treated as a team member as the team member in multidisciplinary approach, this is the most commonly seen approach in field of mental retardation. In Trans disciplinary approach therapist plays a role as a team member by gathering information and helps in planning intervention along with other experts of the team. In certain condition therapist become a case manager and given input. ? Providing Information and guidance: As the parents need information guidance regarding the condition of the child and therapy, the therapist gives proper information to parents and also to other professional whenever needed. ? Counsellor: Physiotherapist plays a counsellor role in the field of mental retardation. Parent counselling is an important aspect, which should be included in intervention programme. The parents of the clients may not be aware of the condition of child and the facilities available for their child. They will come to you in a state of confusion and anxiety to know what happening with their child. Before as part of planning and intervention programme therapist should give proper information to the parents regarding the following things: ? Condition of the child. ? Child's needs and abilities. ? How the therapy is going to help the child in improving his functional abilities. ? Proper instructions given to the parents. ? Training is given to the parents how to give therapy at home. ? What are the facilities and services available for the persons with intellectual disability. ? Trainer: Therapist plays a role of trainer, as the therapist will train the parents how to give therapy at home and conducts classes and workshops for parents and other professional, to make them aware of disability and affects of intervention on the clients. ? Researcher: Research is an important aspect in the field of intellectual disability. Therapist also plays a role as a researcher by doing research on different aspects

177 and population study. To innovate new techniques and equipment for making the intervention better and to get better outcome results. ? Leader: Therapist plays a role of leader of the team voicing on behalf of the client and by giving guidelines to the former self-help groups by the parents. ? As an administrative officer: Therapist plays a role of administrative officer by heading and organization and establishing an institution or center to serve the people better. ? Provider of referral: Therapist will give referrals to the concern professionals to obtain information of the clients and to related services outside the institute for investigations or for expert opinion. 5.5 Speech Therapy: Definition, Objectives, Scope, Types of Speech, Hearing and Language Disorders and Intervention 5.5.1 Definition of Speech and Language Therapy: Speech and language therapy provides treatment, support and care for children and adults who have difficulties with communication, or with eating, drinking and swallowing. Speech and language therapists (SLTs) are allied health professionals. They work with parents, carers and other professionals, such as teachers, occupational therapists and doctors. 5.5.2 Objectives of Speech Therapy A speech pathologist's narrow, well-defined objectives work toward achieving broad therapeutic goals. This professional develops an individualized treatment plan for each patient, which often includes time-based objectives. For example, his objectives may include helping a patient correctly say several new sounds by the end of a quarter, marking period or year. Other objectives can include helping a patient to understand and to explain a speaker's gestures, demonstrate newly learned conversation strategies, explain the perception of body language, speak for a period of time without stuttering and improve reading comprehension to a specific level. A speech language pathologist sets broad but specific goals for each of his patients. Specific goals can include helping patients develop clearer speech, learn to use alternate

178 methods of communication, develop better reading and writing skills, and strengthen throat and neck muscles. Goals also may include coordinating treatment programs with other professionals or referring patients for other treatments. For example, a patient with a swallowing disorder may benefit from the collaborative care of a speech language pathologist and a medical doctor.

5.5.3 Scope of Speech therapy

Speech Therapy is an Allied Health Science subject. Medical advancement in this field, awareness of the need for early intervention etc has increased the scope of Speech Therapy. A number of Speech Therapy courses are available now in India and abroad. Speech Therapy has its necessity in teaching and training children with intellectual disability.

5.5.4 Types of Speech, Language and Hearing Disorders

The most intensive period of speech and language development is during the three of life a period when the brain is developing and maturing. These skills appear to develop best in a world that is rich with sounds, sights, and consistent exposure to the speech and language of others. At the root of this development is the desire to communicate or interact with the world. The beginning sign of communication occur in the first few days of life where in infant learns that a cry will bring food, comfort, and companionship. Research has shown that by 6 months of age, most children recognize the basic sounds of their native language.

5.5.4 (a) Speech and Language Disorders

A speech disorder refers to a problem with the actual production of sounds. A language disorder refers to a problem understanding or putting words together to communicate ideas. Speech disorders include:

1. Articulation disorders: difficulties producing sounds in syllables or saying words incorrectly to the point that listeners can't understand what's being said.
3. Fluency disorders: problems such as stuttering, in which the flow of speech is

179 interrupted by abnormal stoppages, partial-word repetitions ("b-b-boy"), or prolonging sounds and syllables (sssssnake).

4. Resonance or voice disorders: problems with the pitch, volume, or quality of the voice that distract listeners from what's being said. These types of disorders may also cause pain or discomfort for a child when speaking.

Language disorders can be either receptive or expressive:

1. Receptive disorders: difficulties understanding or processing language.
2. Expressive disorders: difficulty putting words together, limited vocabulary, or inability to use language in a socially appropriate way.
3. Cognitive-communication disorders: difficulty with communication skills that involve memory, attention, perception, organization, regulation, and problem solving.

5.5.4 (b) Hearing disorders

There are four types of hearing loss: ? Auditory Processing Disorders ? Conductive ? Sensorineural ? Mixed.

Auditory Processing Disorders

Auditory Processing Disorders occur when the brain has problems processing the information contained in sound, such as understanding speech and working out where sounds are coming from.

Conductive Hearing Loss

Conductive Hearing Loss occurs when there is a problem with the Outer or Middle Ear which interferes with the passing sound to the Inner Ear. It can be caused by such things as too much earwax, Ear Infections, a punctured eardrum, a fluid build-up, or abnormal bone growth in the Middle Ear such as Otosclerosis. It is more common in children and indigenous populations. Surgery and some types of hearing technologies can be used to treat Conductive Hearing

180 Loss such as Bone Conduction Hearing Aids, Bone Anchored Hearing Devices and Middle Ear Implants.

Sensorineural Hearing Loss

Sensorineural Hearing Loss occurs when the hearing organ, the Cochlea, and/or the auditory nerve is damaged or malfunctions so it is unable to accurately send the electrical information to the brain. Sensorineural Hearing Loss is almost always permanent. It can be genetic or caused by the natural aging process, diseases, accidents or exposure to loud noises such as Noise-induced Hearing Loss and certain kinds of chemicals and medications. Auditory Neuropathy is another form where the nerves that carry sound information to the brain are damaged or malfunction. Technologies such as Hearing Aids, Cochlear Implants and Hybrid Cochlear Implants can help reduce the effects of having Sensorineural Hearing Loss.

Mixed Hearing Loss

A Mixed Hearing Loss occurs when both Conductive Hearing Loss and Sensorineural Hearing Loss are present. The sensorineural component is permanent, while the conductive component can either be permanent or temporary. For example, a Mixed Hearing Loss can occur when a person with Presbycusis also has an Ear Infection.

5.5.5 Speech and Language Intervention

In speech-language therapy, a speech language pathologist will work with a child one- to-one, in a small group, or directly in a classroom to overcome difficulties involved with a specific disorder. Therapists use a variety of strategies, including:

Language intervention activities: The SLP will interact with a child by playing and talking, using pictures, books, objects, or ongoing events to stimulate language development. The therapist may also model correct vocabulary and grammar and use repetition exercises to build language skills.

Articulation therapy: Articulation, or sound production, exercises involve having the therapist model correct sounds and syllables in words and sentences for a child, often during play activities. The level of play is age-appropriate and related to the child's specific needs. The SLP will physically show the child how to make certain

181 sounds, such as the "r" sound, and may demonstrate how to move the tongue to produce specific sounds. Oral-motor/feeding and swallowing therapy: The SLP may use a variety of oral exercises -including facial massage and various tongue, lip, and jaw exercises - to strengthen the muscles of the mouth for eating, drinking, and swallowing. The SLP may also introduce different food textures and temperatures to increase a child's oral awareness during eating and swallowing. General guidelines for interventions Selection of Specific goals Organizing all the gathered information Structure the environment Selection of relevant materials Transformation and adaptation of the material Use of object from the environment Maintenance of schedule Principles for therapy Highlighting new or relevant information Pre-organized information Trained rehearsal strategies Using over learning & repetition Training in natural environment Early Intervention Following proper schedule

5.6 Yoga and Play Therapy: Definition, Objectives, Scope and Intervention

5.6.1 Meaning and Definition of Yoga

The word yoga comes from the Sanskrit root 'Yug' meaning to join or yoke, implying the integration (or joining) of every aspect of human being from the inner most to the external. Yoga is practical philosophy that aims at uniting the body, mind, and spirit for

5.6.2 Objectives of Yoga

182 health and fulfillment. The father of modern yogashashtra Patanjali Maharshi defines yoga as 'Yogaschitta Vritti Nirodhaha' that is yoga is controlling the nature of the mind. The ultimate aim of this philosophy is to strike a balance between mind and body and attain self- enlightenment. To achieve this, yoga uses movement, breath, posture, relaxation and meditation in order to establish a healthy, lively and balanced approach to life. Though the exact origins of Yoga are unknown but Yoga is considered to be the oldest physical discipline in existence. Yoga, thus symbolizes balance in every area of life. Yoga is one of the six schools of ancient Indian Philosophy. It is the practice that enables one to achieve higher levels of performance, bringing out the hidden potentials from within. Systematic Yoga practice will increase the physiological and psychological well being. Yoga practice reduces tension, stress, anxiety, weakness, helplessness, fear, negative thoughts etc. Which are increasing day by day in this mechanical human life. It treats the prolonged diseases or deficiencies like diabetes, asthma, heart problems, pains, sprains, indigestion etc. and makes the body active and good looking. Yoga practice equips the practitioners with devotion, attention, and concentration and alertness in every activity that he does. He also discharges his responsibilities with dedication thereby get respect and honor at his work. Man can prove his life worth living by developing his self physically and psychologically that contribute for the development of spiritual instinct in him. As soon as one is habituated for yoga practice, there would be number of changes in his routine activities, habits, thoughts, food habits, behaviors etc. Improvement in balance is one of the major benefits of Yoga. Improved balance is referred not only to the sharp physical coordination but also to the balance between the left and right, front and back and high and low aspects of one's body. Along with a host of benefits, Yoga also helps in developing and attaining personal values. Yoga erases a variety of ills in human beings. These may range from feelings of frustration, persecution and insecurity. Yoga greatly helps in the development of personal values. Personal values are those values which an individual develops and lives by all through his life.

183 Yoga and social values are closely related to each other. Social values are a set of philosophy that an individual carries for all his life. Yoga possesses great power to inculcate those values that go a long way in making a man complete. Yoga helps an individual not only to realize his own self but also understand other issues around him/her. Yogic theory and practice lead to increased self-knowledge. Yogic practices like breathing and posture exercises help in attaining and maintaining health, physical and mental, and relaxation. The knowledge gained through Yoga is not simply that of the practical kind relating to techniques, but of a spiritual sort pertaining to grasping something about the nature self and other matters. 5.6.3 Scope of Yoga Therapy Yoga is certainly more than mastering its postures and asanas and increasing the strength and flexibility of body. It indicates towards healing of mind and body and attaining the state of self-enlightenment. It is said that in early periods when Yoga was just introduced, the main purpose was to heal community members and the practitioners act as religious mediators. Needless to say, practicing of Yoga includes the traditional aspects too such as practicing different poses, chanting of mantra, observing breathing habit and controlling thoughts coming to mind with the help of meditation. Today, it has been practiced for fitness, healthy body and mind, strength, flexibility, emotional well-being and much more. The main purpose of practicing Yoga is to taking control over the body, mind and emotional aspects. The cessation of bad thoughts creates a positive vibe around the person and makes him healthy overall. 5.6.4 Yoga Intervention Yoga is an ancient Indian practice which involves moving the body and training the mind to achieve balance and well-being. The purpose of traditional yoga is for each individual to be healthy, both physically and mentally, and able to reach his or her highest potential as a person. Yoga aim is to prepare the body for meditation through breathing and physical exercises. Yoga emphasizes body-mind wellness through postures or asanas which tone and strengthen our muscles and increase our flexibility. The different asanas, particularly the twists and inversions, stimulate internal organs, as well as the nervous system, and promote circulation in all the body's major organs and glands. Importance of yoga for children with intellectual disability 1. Helps to co-ordinate the activities of the mind and body.

184 2. Tends to reduce the distracted state of mind and helping the mind to deal on the present activity. 4. Helps to improve his adaptive behavior to a degree unobtainable before. 5. Actively increase the ability to concentrate on the present activity. 6. Aims at improving general health, concentration, self-reliance and social relationship of the persons with mental retardation. 6. Yoga has been tried as an adjunct in education of children with mental retardation and attention deficit hyperactivity disorder. 5.6.5 Definition of Play Therapy Play Therapy uses a variety of play and creative arts techniques (the 'Play Therapy Tool-Kit (TM)' to alleviate chronic, mild and moderate psychological and emotional conditions in children that are causing behavioural problems and/or are preventing children from realising their potential. The Play Therapist works integratively using a wide range of play and creative arts techniques, mostly responding to the child's wishes. This distinguishes the Play Therapist from more specialised therapists (Art, Music, Drama etc). The greater depth of skills and experience distinguishes a play therapist from those using therapeutic play skills. Play therapy utilizes play, children's natural medium of expression, to help them express their feelings more easily through toys instead of words. Association for Play Therapy (APT) defines play therapy as "the systematic use of a theoretical model to establish an interpersonal process wherein trained play therapists use the therapeutic powers of play to help clients prevent or resolve psychosocial difficulties and achieve optimal growth and development." In the textbook Play Therapy: The Art of the Relationship (2nd ed.), Landreth (2002) defined child-centered play therapy: A dynamic interpersonal relationship between a child (or person of any age) and a therapist trained in play therapy procedures who provides selected play materials and facilitates the development of a safe relationship for the child (or person of any age) to fully express and explore self (feelings, thoughts, experiences, and behaviors) through play, the child's natural medium of communication, for optimal growth and development.

185 5.6.6 Scope of Play Therapy Children are referred for play therapy to resolve their problems (Carmichael; 2006; Schaefer. 1993). Often, children have used up their own problem solving tools, and they misbehave. may act out at home, with friends, and at school (Landreth, 2002). Play therapy allows trained mental health practitioners who specialize in play therapy. to assess and understand children's pia). Further. play therapy is utilized to help children cope with difficult emotions and find solutions to problems (Moustakas, 1997; Reddy, Files-Hall, & Schaefer, 2005). l3y confronting problems in the clinical Play Therapy setting, children find healthier solutions. Play therapy allows children to change the way they think about, feel toward, and resolve their concerns (Kaugars & Russ, 200 l). Even the most troubling problems can be confronted in play therapy and lasting resolutions can be discovered, rehearsed, mastered and adapted into lifelong strategies (Russ, 2004). 5.6.7 Importance of Play therapy It is difficult for most children below age ten to eleven to sit still for sustained periods of time. Play therapy provides for children's need to be physically active. In play, children discharge energy, prepare for life's duties, achieve difficult goals and relieve frustrations. As children play, they are expressing the individuality of their personalities and drawing upon inner resources which can become incorporated into their personality. Virginia M. Axline (1974) who developed the child-centered play therapy asserted that: "A play experience is therapeutic because it provides a secure relationship between the child and the adult, so that the child has the freedom and room to state himself in his own terms, exactly as he is at the moment in his own way and in his own time. " Play therapy helps to actualize the ultimate objectives of elementary schools facilitating the intellectual, emotional, physical and social development of children from the learning opportunities and experiences offered in school.

186 5.6.8 Objectives of play therapy Develop a more positive self-concept Assume greater self-responsibility Become more self-accepting Become more self-directing Become more self-reliant Become more trusting of self Experience a feeling of control Become sensitive to the process of coping Develop an internal source of evaluation Engage in self-determined decision making 5.6.9 Intervention of Playas a therapy results in Developing a more positive self-concept Assume greater self-responsibility Become more self-accepting Become more self-directing Become more self-reliant Become more trusting of self Experience a feeling of control Become sensitive to the process of coping Develop an internal source of evaluation Engage in self-determined decision making 5.7 Therapeutic Intervention: Visual Arts and Performing Arts (Music, Drama, Dance, Movement and Sports) 5.7.1 Visual Arts and Performing Arts : Art reflects human emotions and human beings spontaneously express their frame of

187 mind through various art forms. Thus the intellectual mind merges with the artistic streak, giving birth to art. The visual arts are those creations we can look at, such as a drawing or a painting. For example Drawing, painting, sculpture, architecture, photography, film, printmaking. It also includes the decorative arts of: ceramics, furniture and interior design, jewellery making, metal crafting and wood working. The literature available for utilizing art education for exceptional students is generally addressed to art education teachers to use in their classroom. However, expanding the use of art in the education of children with special needs into general and special education is advantageous to these individuals. The art educator can evolve to be a resource and perhaps a liaison between the special and general educator. Thus, to improve the education afforded to students with special needs, art can act as a bridge between general, and art educators to enhance the communication and cooperation between these specialists. Creating a cohesive network between art educators, special and general educators, draws upon the unique perspective that each educator has that can help the others in bolstering special education programs. The visual arts are a powerful teaching tool that can enhance the cognitive, emotional and social development of children. Children in special education programs are particularly in need of the assistance that the arts can provide. The performing arts range from vocal and instrumental music, dance and theatre to pantomime, sung verse and beyond. They include numerous cultural expressions that reflect human creativity and that are also found, to some extent, in many other intangible cultural heritage domains. Music is perhaps the most universal of the performing arts and is found in every society, most often as an integral part of other performing art forms and other domains of intangible cultural heritage including rituals, festive events or oral traditions. 5.7.2 Music Therapy Music therapy is a well-established allied health profession similar to occupational and physical therapy. It consists of using music therapeutically to address behavioral, social, psychological, communicative, physical, sensory-motor, and/or cognitive functioning. Because music therapy is a powerful and non-threatening medium, unique outcomes

188 are possible. For individuals with diagnoses on the autism spectrum, music therapy provides a unique variety of music experiences in an intentional and developmentally appropriate manner to effect changes in behavior and facilitate development of skills. Music therapy may include the use of behavioral, biomedical, developmental, educational, humanistic, adaptive music instruction, and/or other models. Music therapy enhances one's quality of life, involving relationships between a qualified music therapist and individual; between one individual and another; between the individual and his / her family; and between the music and the participants. These relationships are structured and adapted through the elements of music to create a positive environment and set the occasion for successful growth. The interventions used in Music Therapy aid in fostering skills across the entire developmental spectrum for children with special needs. Music Therapists encourage a child's sense of exploration and wonder as they focus on the goals targeted in your child's Individualized Education Program (IEP). How Does Music Therapy Make a Difference with Young Children? Music stimulates all of the senses and involves the child at many levels. This "multi-modal approach" facilitates many developmental skills. Quality learning and maximum participation occur when children are permitted to experience the joy of play. The medium of music therapy allows this play to occur naturally and frequently. Music is highly motivating, yet it can also have a calming and relaxing effect. Enjoyable music activities are designed to be success-oriented and make children feel better about themselves. Music therapy can help a child manage pain and stressful situations. Music can encourage socialization, self-expression, communication, and motor development. Because the brain processes music in both hemispheres, music can stimulate cognitive functioning and may be used for remediation of some speech/ language skills.

189 5.7.3 Drama Therapy Drama therapy is the intentional use of drama and/or theater processes to achieve therapeutic goals. Drama therapy is active and experiential. This approach can provide the context for participants to tell their stories, set goals and solve problems, express feelings, or achieve catharsis. Through drama, the depth and breadth of inner experience can be actively explored and interpersonal relationship skills can be enhanced. Participants can expand their repertoire of dramatic roles to find that their own life roles have been strengthened. 5.7.4 Dance / Movement Therapy Dance/movement therapy, a creative arts therapy, is rooted in the expressive nature of dance itself. Dance is the most fundamental of the arts, involving a direct expression and experience of oneself through the body. It is a basic form of authentic communication, and as such it is an especially effective medium for therapy. Based in the belief that the body, the mind and the spirit are interconnected, dance/movement therapy is defined by the American Dance Therapy Association as "the psychotherapeutic use of movement as a process that furthers the emotional, cognitive, social and physical integration of the individual." Benefits of Dance and Movement Therapy: Dance Movement therapy can help children with special needs in varied ways and in all the areas of impairment. The benefits experienced are as follows: It helps in improving attention and concentration and thus helps in furthering education Dance as a way of expression of emotion enables children to express through movements It helps in forming better relation Due to liking towards repetitive movements, a therapist can repeat a movement pattern which the patient needs to learn and when they start imitating the movement vocabulary develops. This helps them in learning different patterns of movements required for daily life activities

190 Group sessions in dance movement therapy enables in developing social skills and communications of autistic person. Doing a choreographed dance movement sequence in a series of sessions in a row helps in improving memory and recapitulation skills. Touch therapy helps in developing trust on others as well as helps in reducing sensitivity to physical contact and touch. Dance movement therapy helps in improving body image of an autistic person. Dance/movement therapists work with individuals of all ages, groups and families in a wide variety of settings. They focus on helping their clients improve self-esteem and body image, develop effective communication skills and relationships, expand their movement vocabulary, gain insight into patterns of behavior, as well as create new options for coping with problems. Movement is the primary medium dance/movement therapists use for observation, assessment, research, therapeutic interaction, and interventions. Dance/movement therapists work in settings that include psychiatric and rehabilitation facilities, schools, nursing homes, drug treatment centers, counseling centers, medical facilities, crisis centers, and wellness and alternative health care centers. Dance/movement therapy can be a powerful tool for stress management and the prevention of physical and mental health problems. Dance/movement therapists integrate the dancer's special knowledge of the body, movement, and expression with the skills of psychotherapy, counseling, and rehabilitation to help individuals with a wide array of treatment needs. Social, emotional, cognitive, and/or physical problems can be addressed through DMT via group and individual sessions in many different types of settings from hospitals and clinics to schools. The fact that dance/movement therapists are immersed in the language of the body, rather than focusing solely on the verbal, lends characteristics to their work that set it apart from other types of therapy.

5.7.5 Sports Activities for Children with Special Needs All individuals benefit from regular physical activity and children with special needs especially. Children with special needs are benefitted in the following ways from physical or sports activities. We can see improvements in muscle strength, coordination, and flexibility. Improve exercise endurance, cardiovascular efficiency, and possibly increased life expectancy .

191 Experience better balance, motor skills and body awareness. Will show improvement in behavior, academics, self-confidence and building friendships. Will have positive changes in their health, quality of life and boost to their self-esteem. Gets to experience a sense of accomplishment and possibly the taste of winning or personal satisfaction. Experience increases in attention span, on-task behavior, and level of correct responding. Will increase appetite and improve quality of sleep. Will see a decrease in secondary health complications like obesity, high blood pressure, low HDL ("good") cholesterol and diabetes. Will find an outlet for their physical energy, will help them cope with stress, anxiety and depression. Sports and activities especially good for special needs children: Swimming Bicycling Soccer Football Handball Gymnastics Bocce (is a ball sport) Weightlifting Sports, especially fundamental and movement education based sports like gymnastics, provide tremendous benefits for children with special needs. Physical education programs can considerably improve the lifestyle of a disabled child and are highly recommended. These programs may help control obesity, promote activeness, increase a child's self-image and social skills, and increase motivation. The physical activity along with support,

192 rewards, and interaction can, among other benefits, be very helpful to these children and their families. Physical Improvements - Children suffering from cognitive disabilities are most likely going to suffer from physical impairments as well. These children have substantial problems with motor skills in areas such as hopping, skipping, and jumping. Involvement in gymnastics can help these individuals develop fundamental motor and physical fitness skills. Self-Esteem - Developing a sense of self-esteem and confidence is an extremely important part of special education. These children need to be involved in environments where they feel that they are contributing successfully to a group. Their abilities in all other skill areas will improve as a result of a positive self-image and confidence. Cognitive Benefits - The hands-on aspect of sports leads to cognitive skill improvement in children with disabilities and allows them to discover and access strengths that cannot be challenged in the traditional classroom setting. The inherent structure of sport, with its organization and rules, can be used as a learning tool for introducing and practicing self regulation and decision making skills. Additionally, children can learn verbal communication and interaction with peers through involvement in sport. Special Olympics The mission of Special Olympics is to provide year-round sports training and athletic competition in a variety of Olympic-type sports for children and adults with intellectual disabilities. This gives them continuing opportunities to develop physical fitness, demonstrate courage, experience joy and participate in a sharing of gifts, skills and friendship with their families, other Special Olympics athletes and the community. The Special Olympics is the only organization authorized by the International Olympic Committee to use the word "Olympics" worldwide. Athletes compete in 32 sports, including snowboarding, judo, cricket, soccer. The Special Olympics program Healthy Athletes offers 1.4 million free health examinations in more than 120 countries to athletes at Special Olympics competitions. Health professionals perform a full exam in the categories of podiatry, physical therapy, audiology, vision, dentistry, physical therapy and more and more. More than 3.1 million athletes from over 175 countries take part in the Special Olympics.

193 Special Olympics athletes are divided to compete in categories based on gender, age, and ability. The Special Olympics athlete oath is "Let me win. But if I cannot win, let me be brave in the attempt." Special Olympics World Games are held every two years, alternating with Summer and Winter Games. 5.8 Let us Sum Up 1. "Occupational therapy is the art and science of directing man's participation in selected tasks to restore, reinforce and enhance the performance, facilitate learning of those skills and functions essential for adaptation and productivity, to diminish or correct pathology and to promote and maintain health." (Council of Standards, American Occupational Therapy Association, 1972). 2. An Occupational Therapist will aim to enable the child to be as physically, psychologically and socially independent as possible. Occupational Therapists work in close partnership with the child and their family, schools and other healthcare professionals. Together they have a shared responsibility for meeting the child's needs. In schools, for example, they evaluate the child's abilities, recommend and provide therapy, modify classroom equipment, and help the child participate as fully as possible in school programs and activities. 3. Occupational therapy interventions for people with intellectual disabilities are specifically adapted to the client with respect to the degree and type of support needed as well as the context. Interventions may include direct treatment as well as environmental adaptations, guidance, monitoring and counseling (including of the family, the educational staff, the clinical staff, employers and others). 4. Physiotherapy has scope in treating a wide range of conditions. It play an important role in all the branches of medical sciences, especially Orthopaedics, Paediatrics, Neurology, Cardio thoracic, Surgery, Sport Medicine etc. In set ups like leprosy, paraplegic and poliomyelitis after plastic surgery, burns clinics, spinal cord injury centres and in assistive devices manufacturing units etc. 5. A speech language pathologist sets broad but specific goals for each of his patients. Specific goals can include helping patients develop clearer speech, learn to use

194 alternate methods of communication, develop better reading and writing skills, and strengthen throat and neck muscles. Goals also may include coordinating treatment programs with other professionals or referring patients for other treatments. For example, a patient with a swallowing disorder may benefit from the collaborative care of a speech language pathologist and a medical doctor. 6. Yoga is one of the six schools of ancient Indian Philosophy. It is the practice that enables one to achieve higher levels of performance, bringing out the hidden potentials from within. Systematic Yoga practice will increase the physiological and psychological well being. 7. Music therapists involve children in singing, listening, moving, playing, and in creative activities that may help them become better learners. Music therapists work on developing a child's self-awareness, confidence, readiness skills, coping skills, and social behavior and may also provide pain management techniques. They explore which styles of music, techniques and instruments are most effective or motivating for each individual child and expand upon the child's natural, spontaneous play in order to address areas of need. 5.9 Check Your Progress A.1.What is the difference between Occupational Therapy and Physiotherapy? 2. Explain the objectives of the different therapies applicable for children with special needs? 3. Discuss about Dance and Movement Therapy. B.1. Discuss about the importance of yoga for children with special needs. 2. Prepare a short note on Therapeutic Application of Drama. C. After going through the Unit you may like to have further discussions on some points and clarification on other.

Unit - 3

Teaching Strategies and TLM Structure 3.1 Introduction 3.2 Objectives 3.3 Stages of Learning 3.4 Principles of Teaching 3.5 Multi-Sensory Approaches–Montessori Methods, VAKT Methods, Orton- Gillingham Method, Augmentative and Alternative Communication 3.5.1

The Montessori Method (1879-1950) 3.5.2 Fernald's VAKT approach Grace Fernald (1879-1950) 3.5.3 Orton-Gillingham approach to mental 3.5.4 Alternative and Augmentative Communication 3.6 Teaching Strategies 3.6.1 Task Analysis 3.6.2 Behavioural Objectives 3.6.3 Chaining 3.6.4 Shaping 3.6.5 Modelling 3.6.6 Prompting 3.6.7 Rading 3.6.8 Reinforcement 3.6.9 Role Play Method 3.6.10 Play Way Method 3.7 Development and Use of TLM for ID 3.7.1 Teaching Material 3.7.2 Teaching Learning Material (TLM)

92 3.7.3 Types of TLM 3.7.4 Need for TLM 3.7.5 Effective use of TLM 3.8 Let Us Sum Up 3.9 Check Your Progress 3.10 Reference 3.1 Introduction It is observed that regular educator or special educator employs various strategies according to the content/ skills while teaching children in classroom. The children with Mental Retardation have less capacity to learn skills, to maintain and to generalise the learnt skill due to the intellectual impairment. Hence, special teaching strategies and techniques need to be used with the children with Mental Retardation for individualized or classroom teaching. The various teaching strategies such as task analysis, modelling, Errorless Discrimination Learning (EDL), shaping, chaining, prompting and fading are commonly used while teaching the children with Mental Retardation. In addition to this use of appropriate rewards and reinforcement is also essential for their learning. There are certain basic fundamental principles which may be followed when teaching children with mental retardation. The individual educational plan which is based on the need of the child is always based on these teaching principles. Based on these principles multi-sensory approaches are used that teaches all children regardless of their preferred learning style.

There are some special teaching strategies for children with mental retardation like; Montessori method; Fernald VAKT Approach and Orton-Gillingham Approach. Due to less capacity of intellectual functioning the teachers have to employ various teaching strategies and techniques for their teaching. In addition to reinforcement techniques (used for learning) are much effective for their skill development. To do so, development and use of proper TLM must be introduced by the teacher which will be helpful to achieve the objective of learning and the process to reach the goal desirably. 3.2 Objectives After completing the unit, you will be able to understand: • Importance of instructional hierarchy for teaching children with mental retardation

93 • Teaching procedure and Importance of different stages of learning • Different principles of teaching • The meaning, nature and concept of the multisensory approaches. • Need and importance of multisensory approaches for children with mental retardation. • Alternative and augmentative communication and its implication for the children with special needs. • The importance of various teaching strategies and their correct uses • The reinforcement techniques in teaching children with mental retardation. • The concept of TLM • Advantage of using TLM • TLM for different curriculum level 3.1 Stages of Learning Stages of Learning The instructional hierarchy of acquisition, fluency, maintenance and generalization is followed in special education for children with mental retardation. Understanding of these stages by the teacher helps in setting goals, maintaining learnt skills and generalisation of skills. Acquisition This is the stage of learning of the new task. The child is formally introduced to the task in this stage for the first time. With repeated errors in the beginning stage gradually the child masters with the high level of accuracy. The task is carefully analyzed for structured teaching. Consistency in the teaching pattern and repetition of the same prompt and environment is necessary at this stage. All this helps, the child in attaining the skills with conditioning. The higher interaction between teacher and student must be effective for learning Fluency When the child learns to perform the skill / activity with accuracy fluency of the skill learnt is emphasized. Plenty of opportunity for practice is provided. As the activity in

94 this stage are in repetitive; regular feedback and reward helps to sustain the motivation of the trainee. Fluency is an aspect that can't be ignored as it finally tells us that the child is performing the skills without experiencing any difficulty. Maintenance Learnt skill if not re-taught or practiced tends to be forgotten. We must ensure that children maintain the learnt skills with accuracy and fluency. At the end of this stage children need to complete the task independently with accuracy and fluency. Acquisition Stage is an antecedent to the stages of maintenance and generalization stage is subsequent stage to maintenance. In maintenance the child should be able to perform the task without applying the original task training procedure. Through over learning trials and distributed learning technique for appropriate practice can be given for maintenance. Over Learning Here half of learning work given at acquisition stage is given for repeated practice. When a task at acquisition stage is taught for one hour for one month; in over learning stage the task shall be taught for 30 minutes for 15 days only. Distributed Practice Across a designated period of time when the task is systematically distributed it is called distributed practice. It is targeted at long term memory and execution of generalization stage of learning. Here the task is practiced intermittently like twice a week for 30 minute and to be continued for several weeks. Generalization When a behaviour/skill is demonstrated in other circumstances than in which the child was trained is referred to as generalization. Under the same circumstances if similar behaviour occurs which is different from the learnt behaviour is also referred to as generalization. The two types of Generalization are :- (a) Stimulus generalization: Similar response to new stimulus having common characteristics of the previously learnt stimulus. E.g. student have learnt number 1-10 in his book / flash card. Identifying the number in any other place like buses, trains, house, calendar etc., shall be referred to stimulus generalization. (b) Response generalization: Learning to apply a learnt skill in other related activity

95 is referred to response generalization. Students who have learnt to stitch (hemming) in piece of cloth shall stitch (hemming) on the clothes or material requiring hemming. 3.4 Principles of Teaching Introduction : There are certain basic fundamental principles which may be followed when teaching children with mental retardation. The individual educational plan which is based on the need of the child is always based on these teaching principles. Objective : After completing the unit you will be able to understand • Different principles of teaching • Importance of the Principles for Teaching Children with Mental Retardation Teaching Principles : 1. Simple to Complex - Teaching always starts with these step where the child is able to do the certain skill successfully. The success of the child motivates him to learn more to reach the goal. The goal should be set as if the child is able to finish. Too high goal must be avoided in the first stage of learning. Simple steps lead to the gradual complex steps as for example while teaching common names of colour, the child at first learns to name one colour first then gradually other names of the colour should be added. 2. Known to unknown - While teaching child with mental retardation, the starting point should be where the child already knew. From the known level, the teacher will help him to go to the unknown level which is higher. The known level must be matched with the current level of the child. Assessment data will be helpful for this purpose. The child must be given the opportunity to indicate what he knew. A child must feel confident while going upper level. Viz. While teaching the number concept from 10 to 15, the lesson must be started from 1 to 10, then gradually move to 15 chronologically. 3. Concrete to abstract - The abstract concept is much higher than concrete one. The children with mental retardation can be able to handle concrete concept better than abstract one. So for teaching, the teacher must start from concrete to abstract direction. While teaching this concrete object along with the picture, can be helpful for teaching. Concrete objects must be present as far as possible while teaching. As for example, to teach the concept of evening, one must be refer to activities related to evening, pictures of evening etc. To teach the concept of evening.

96 4. Whole to Part - Another principle is whole to part where any concept must be started as a whole. The children must learn the concept as it is. Then the part of it can be given, For Example While teaching about Banana first the name of the Banana will be given then the other details such as peeling of skin, taste, texture can be taught. 3.5 Multi sensorial approach Introduction The word multisensory means "relating to or involving several bodily senses". Hence, multi sensory learning is the process of learning through the use of two or more senses. This may include combining visual, auditory, tactile- kinesthetic, and/or even olfactory and gustatory senses. (Scott 1993). A multi sensory approach is one that integrates sensory activities. The students see, hear and touch.

Activities such as tracing, hearing, writing and seeing represent. The four modalities of touch, auditory, kinesthetic, and vision respectively. For example, to teach spelling Graham and Freeman (1986) use a strategy that incorporates the four modalities. Students say the word, write the word, check the word, trace the word, write the word from memory and check, and then repeat the entire process.

In essence, a multisensory approach incorporates the learning styles for visual, auditory, kinesthetic, and tactile learners. This approach does not single out specific students. A

multisensory approach is an eclectic approach that teaches all children regardless of their preferred learning style. Most teaching in schools is done using either sight or hearing (auditory sensations). A child with mental retardation may experience difficulties with either or both of these senses alone due to their limited cognitive abilities. Therefore involve more senses, especially the use of touch and movement (kinetic). This will give the child's brain tactile and kinesthetic memories to hang on to, as well as the visual and auditory ones: Empirical studies support to multi sensory teaching. In a study executed across classrooms in Queensland, Australia, 'Morton, Jones and Toohey (1982) implemented a multi sensory teaching programmed, called Multi sensory Basic Fact Program (MBFP), into remedial classrooms for students in grades two through six. This programme incorporates visual learning through pictures as teacher provides oral prompts. Students are also involved kinesthetically when learning new concepts by tapping or finger tracing. To test the usefulness of this multi- sensory teaching program,

97 these students were given an addition — facts test before beginning the program and again after the 11- week instruction phase. All of the grade levels except grade two (possible because they were not yet at the stage in which the material could be absorbed) showed marked improvement from pretest to posttest. And, although the students had not reviewed the information before the follow up test, they retained their knowledge of the concept after a three week period. • Following are a few of the popular and well tested multisensory teaching methods that are found effective on children with mental retardation. • Montessori method • Fernald VAKT Approach • Orton-Gillingham Approach 3.5.1 The Montessori Method The Montessori Method derives its name from Maria Montessori (1870-1952), the founder of this method. Maria Montessori was an Italian doctor; she became the first Italian woman to get the status of Doctor of Medicine, who later on became one of the greatest educationists of the world. Dr. Maria Montessori developed Montessori Method as an outgrowth of her post-graduate research into the intellectual development of children with intellectual and developmental disabilities. Building on the work of French physicians Jean Itard and Eduard Seguin, she developed an environment for the scientific study of children with physical and mental disabilities. By 1906, Montessori was well- known enough that she was asked to head a day-care center in Rome's poor San Lorenzo district. She used the opportunity to observe the children's interactions with sensorial materials (developed to appeal to the senses), refining them, and developing new materials which the children could work. Hallmark of Montessori Method of education. Montessori, teachers observe children's exploratory attempts of behavior with an implication of the trust that a child will "know" and pursue what she or he most needs in order to become an adult. Montessori sensorial material 1.- The cylinder blocks:-There are 4 cylinder blocks. The purpose of the cylinder blocks are to provide various size dimensions so the child can distinguish between large and small, tall-and short, thick and thin, or a combination of the both. There are several activities that can be done with the cylinder blocks. The main activity involves removing the cylinders from the block and replacing them

98 2-The pink tower:- The pink tower work has 10 pink cubes. The smallest cube is 1 cubic centimeter and the largest cube is 10 cubic centimeters. The work is designed to provide the child with a concept of "big" and "small. The Child starts. With the largest cube and puts the 2nd largest cube on top of it. The work continues until all 10 cubes are stacked on top of each other 3- The broad stair:-The broad stair is designed to teach the concepts of "thick" and "thin." The broad stairs are 10 sets of wooden prisms with a natural or brown stain finish. The work is designed to provide the child with a concept of "big" and "small. The child starts with the largest cube and puts the 2nd largest cube on top of it. The work continues until all 10 cubes are stacked on top of each other 4-The red rods:-The red rods are 10 red rods with equal diameter. They vary only in length. The smallest is 10 cm long and the largest is one meter long. Each rod is 1 square inch thick. By holding the ends of the rods with two hands, the material is designed to give the child a sense of long and short in a very concrete manner 5-The colored cylinders :- There are 4 boxes of cylinders, yellow cylinders that vary in height and width. The shortest cylinder is the thinnest and the tallest cylinder is the thickest. Red cylinders are of the same height but vary in width. Blue cylinders have the same width but vary in height. Green cylinders vary in height and width. The smallest cylinder is the thickest and the tallest cylinder is the thinnest. The child can do a variety of exercises with these materials, including matching them with the cylinder blocks, stacking them on top of each other to form a tower, and arranging them in size or different patterns. When the yellow, red, and green cylinders are placed on top of each other, they all are the same height 6-The trinomial cube:-The trinomial cube is similar to the binomial cube, but has the following pieces: The binomial cube is a cube that has the following pieces: 1 red cube, 6 black and red prisms (varying in size) 1 blue cube and 6 black cube, blue prisms (varying in size) 1 yellow cube' and 6 black and yellow prisms (varying in size). The Montessori Method of teaching may be divided in to four parts as given below • Sensory training • Training in practical life activities • Motor training • Language and arithmetic teaching

99 Sensory training Madam Montessori gives much importance to sensory training as she regards senses as the gateways of knowledge. Different kinds of material are used to develop sensory training in children. You may be aware that there is exclusive teacher training programmes for Montessori approach. Montessori training materials are universally used. Given here (in the box above) is a sample description of the training material and their purpose. Training in practical life activities According to Dr. Montessori, exercises are called 'exercises in Practical Life' because in the children's everyday life on which all house work is entrusted to the little ones, they execute with devotion and accuracy their domestic chores, becoming singularly calmed and dignified. The students are required to sweep their rooms, dust and clean the furniture, and arrange it as they like. They learn dressing, undressing, and washing themselves. They are expected to hang up their clothes tidily. They lay their tables. The children take .tunas in various household duties and learn by imitation to conquer their difficulties in the process. Enthusiasm and delight, fellow feeling and mutual aid are characteristics of the children learning jobs. The students learn how to wash their hands, use their own soap and towels, comb their hair, cut their nails and brush their teeth. The main purpose is to give children training in self- reliance and independence and also to be independent. As teachers of children with mental retardation, you will see the relevance of Montessori Method in training in independent living skills. Motor training These practical life exercises are considered to be very helpful for motor education. Muscular education is imparted to enhance the movements of walking, sitting and holding objects. The care of child's own body, managing the house hold affairs, gardening and manual work and rhythmic movements provide motor education. Children also learn how to walk in straight lines and to balance properly. Language and arithmetic teaching Madam Montessori is of the opinion that muscular skill' in children is very easily developed and therefore, the teaching of writing should precede the teaching of reading. According to her, writing is a purely mechanical activity and reading partly intellectual. • Teaching writing. There are three factors involved in writing. i) Movements which help in reproducing the forms of letters. ii) Manipulation of the pen iii) the phonetic analysis of words in writing dictation. The letters of the alphabet are cut in sand paper and pasted on card- boards. The students are asked to pass their fingers on them. The students learn to establish the visual muscular images of the letters. At the same time, the phonetic sounds are also-taught stages-association, .recognition, and recall: There are certain exercises through which the students are taught the handling of the pen:

100 • Teaching reading. Montessori was not in favor of reading the sentence aloud. The child is handed over a card on which the names of the familiar objects are written and pasted. The child is asked to translate the writing slowly into sounds and then he is asked to read faster. After some practice, the child learns the correct pronunciation of the word. Then the child is asked to attach the cards with objects lying there. • Teaching of number. A 'long stair' is used in the teaching of numbers. It consists of a set of ten rods varying in length from 1 to 10 decimeters. It is divided into parts painted red and blue alternatively. The child learns first to arrange the rods of size and then he counts the red and blue divisions and names the rods as one, two three and so on. The signs of the numbers are cut in sand paper and the same procedures of the three stages- associations, recognition and recall is followed. Role of the teacher Traditionally, the Montessori teacher is called a Director or Directress, because the role is to direct rather than teach. The role of the directress includes: making the children the center of learning, encouraging the children to use the freedom provided to them and observing the children in order to prepare the best possible environment. This includes recognizing sensitive periods and diverting unacceptable behavior into meaningful tasks. Child without letting him feels her presence too much. The directress is there to "prepare the path and step aside and let the child walk." Although the Montessori directress believes in freedom for the child and in the child's ability to exercise that freedom, this does not mean the child is free to make unlimited choices. Within the framework of choices provided by the Directress, the student is free to choose. The child must know how to properly use the materials before he/she may work with them. Choice is a product of self-control and discipline. There is external order and rules to the environment which yield the internal order of control. Merits of the Montessori Method The chief merits of the Montessori Method are: • Reverence for small children To Madam Montessori "the child is god". Her school was the temple and duty of the temple was the recognition of the essence of the childhood. She further writes, "to-day there stands forth one urgent need_ the reform of the methods in education and instruction, and he who struggles towards this end is struggling for the regeneration of man".

101 • Scientific bases of the method is based upon scientific grounds. Madam Montessori was a scientist and she applied scientific principles based on experience and observation and not upon prejudice. • Individual teaching Individualism is the key- note of the Montessori Method. Her method is a reaction against collective teaching. As observed by John Adams, Dr. Montessoi "has rung the death knell of class teaching". • Freedom for Children She ranks among the forefront educators who want to give education in an atmosphere of complete freedom. In her method discipline is that of self-control and self directed activity. • Sense training The Montessori Method aims at educating the children through the sense training. It is based upon the maxims 'proceed from concrete to abstract', from 'general to specific'. • Unique method of reading and writing The focus is on the muscular movements in the process of writing. Properly graded and correlated exercises for reading and writing are provided. • Learning through living Practical exercises in school enable children to learn good habits of cleanliness and order. The students learn the lesson of dignity of labour and self help by attending to their needs themselves. • Training in Social Life Though this method is individualistic in nature, yet it is full of social values such as serving at the table, having lunch together, and cleaning plates and the students perform many other activities cooperatively. Compare Montessori method of teaching to the traditional approach used in teaching children with mental retardation and analyze. 3.5.2 Fernald's VAKT approach [Grace Fernald (1879-1950)] Fernald's VAKT approach Grace Fernald (1879-1950) was an influential figure in early twentieth century literacy education. VAKT refers to Visual, Auditory, Kinesthetic and Tactile sensory approach. Fernald established "the first clinic for remedial instruction in 1921 at the University of California, Los Angeles" (Smith, 2002, p.181). Fernald's kinesthetic spelling and reading method prompted struggling students to trace words. Fernald's notion of incorporating the physical with the auditory, verbal, and visual

102 elements of reading instruction, now known as VAKT multimodal learning, or multisensory imagery, continues to guide educators today. •

The same word may be written again in children's own stories. It may be important to learn spelling of words. The relevance of VAKT method to mental retardation and remedial instruction in resource settings This is one of the most effective methods in teaching children with mental retardation. As they often exhibit weak memory, they may have problem in remembering the alphabets and their sounds. Therefore it is difficult for they-i to read any particular language. This can lead to difficulties in leading an independent life for example. Reading sight words (toilet, bus stop, railway station and so on). Empirical evidence lends support to this approach for teaching word identification to students with severe reading disabilities (Berms and Eyer, 1970; Cotterell, 1972; Fernald, 1943; Kress and Johnson, 1970; Thorpe and Borden, 1985). Teaching a sight word A sight word is a word for which students can recognize the pronunciation and meaning automatically. When reading words by sight, words are accessed from information in memory, that is, from one's storehouse of words. For emergent readers, visual cues assist in recognizing familiar words when they are highly contextualized. Procedures: Write each word on a word card. The procedure for teaching these words is as follows: 1. Discuss the words with students to ensure that they understand the meanings of the words as the words are being used in the text. 2. Present the words to the students' one word at a time. Each word is exposed for five seconds, and the teacher says the word twice. 3. Ask students to identify the word on each card. Provide corrective feedback by verifying the correctly identified words, giving the correct word for any word that is miscalled. and saying the word if students do not respond in five seconds. 4. Present the words again, using the format given in step 2. 5. Have students identify each word, using the format given in step 3. Repeat this step at least two more times or until they can automatically recognize all the words.

103 Procedure- The sight word association procedure uses corrective feedback and drill and practice to assist students in associating spoken words with written form. Picture association technique-On a separate card, draw a simple picture, or find a picture and attach it to the card. In some cases, the students may want to draw their own pictures. Use the following procedure to teach the picture—word association: • The same word may be written again in children's own stories. It may be important to learn spelling of words. The relevance of VAKT method to mental retardation and remedial instruction in resource settings This is one of the most effective methods in teaching children with mental retardation. As they often exhibit weak memory, they may have problem in remembering the alphabets and their sounds. Therefore it is difficult for they-i to read any particular language. This can lead to difficulties in leading an independent life for example. Reading sight words (toilet, bus stop, railway station and so on). Empirical evidence lends support to this approach for teaching word identification to students with severe reading disabilities (Berms and Eyer, 1970; Cotterell, 1972; Fernald, 1943; Kress and Johnson, 1970; Thorpe and Borden, 1985). Teaching a sight word A sight word is a word for which students can recognize the pronunciation and meaning automatically. When reading words by sight, tjie words are accessed from information in memory, that is, from one's storehouse of words. For emergent readers, visual cues assist in recognizing familiar words when they are highly contextualized. Procedures: Write each word on a word card. The procedure for teaching these words is as follows: 1. Discuss the words with students to ensure that they understand the meanings of the words as the words are being used in the text. 2. Present the words to the students' one word at a time. Each word is exposed for five seconds, and the teacher says the word twice. 3. Ask students to identify the word on each card. Provide corrective feedback by verifying the correctly identified words, giving the correct word for any word that

104 is miscalled. and saying the word if students do not respond in five seconds. 4. Present the words again, using the format given in step 2. 5. Have students identify each word, using the format given in step 3. Repeat this step at least two more times or until they can automatically recognize all the words. The sight word association procedure uses corrective feedback and drill and practice to assist students in associating spoken words with written form. Picture association technique—On a separate card, draw a simple picture, or find a picture and attach it to the card. In some cases, the students may want to draw their own pictures. Use the following procedure to teach the picture—word association: 1. Place each picture in front of the students, labeling each one as you present it. Have the students practice repeating the names of the pictures. 2. Place the next to picture the word it represents, again saying the name of the word. Have the students practice saying the names of the words. 3. Have the students match the words to the pictures and say the name of the word while matching it. Repeat this process until students' easily match the pictures and words. 4. Place the words in front of the students, and have them identify the words as you say them. If they cannot identify the correct words, have them think of the pictures to aids in their recognition. If they still cannot point to the words, show them the picture that goes with the word. 5. Have students recall the words by showing the word cards one at a time. Again, if students can not recall a word, have them think of the picture. If they still cannot think of the world, tell them to look at the picture that goes with them world. 6. Continue this procedure until the students can identify all the words at an automatic level. 7. Have students review the words on subsequent days and, most important, give them plenty of opportunities to read the words in next. When a student is reading and cannot identify a words, encourage the students to think of the picture

105 Merits of Fernald VAKT approach:-

- Basic sight words fairly quickly, albeit one word at a time.
- Another benefit of this technique is that spelling of sight words is concurrently learned.
- Learners find it easier to learn to read and write when each sound has its own symbol.
- As learners are successful in reading in the very beginning stages of teaching reading. it creates a feeling of success and enthusiasm for the learner.
- The learner will be better at self-expression at an early stage

3.5.3 Orton and Gillingham approach The Orton-Gillingham method was introduced by Samuel Torrey Orton, (1879-1948), a Neuro psychiatrist and pathologist, and Anna Gillingham, (1878-1963), an educator and psychologist.

Dr. Samuel Torrey Orton and his colleagues began using multisensory techniques in the mid-1920 at the mobile mental health clinic he directed in Iowa. Orton was influenced by the kinesthetic method described by Grace Fernald and Helen Keller. He suggested that kinesthetic-tactile reinforcement of visual and auditory associations could correct the tendency of reversing letters and transposing the sequence of letters while reading and writing. Orton noted that each child presents an individual problem, not only because of the diverse influence of a considerable number of environmental conditions, but also because of the relative part played by each of the three major functions entering in to language faculty; vision, audition and kinesthetic varies, remarkably in different children as does the emotional reaction to his disability. Importance

- The Orton-Gillingham method is important to a student's reading development because it is systematic and also individually tailored to fit each child.
- Orton- Gillingham is an approach, not a method. This means that it is flexible and focuses on the needs of the individual student.
- While the tutor carefully constructs each lesson in advance, he is able to make appropriate changes in the moment when needed. This is also called "diagnostic teaching."

During his life time, Drton directed many research projects dealing with developmental reading disabilities. It was during one of these projects that he met

106 Anna Gillingham (1878-1963), a teacher and a psychologist in the field of language disabilities. Together they developed procedures and comprehensive materials for early identification and remediation of dyslexic. Their programme is known today as the Orton- Gillingham approach. Anna Gillingham and Bessie Stillman based their original 1936 teaching material for the "alphabetic method" on Dr. Orton's theories. They combined multisensory techniques with teaching the structure of written English, including the sounds (phonemes), meaning units (morphemes such as prefixes, suffixes, and roots) and common spelling rules.

- The Orton- Gillingham approach is a structured; multi sensory phonics approach.
- It is systematic; proceeding from simple to more complex and cumulative in that new information builds on that which has been previously learned.
- Multisensory reinforcement and practice cement new learning in to long- term memory.
- This comprehensive approach to reading instruction benefits all students.

Step 1 The educator shows a flash card with one letter on it. The educator says the name of the letter and the learner repeats the name. When the learner has mastered this, the educator says the sound of the letter and the learner repeats the sound. When this has been mastered, the educator shows the flash card, asks what the letter says and the learner gives the sound of the letter. Step 2 without showing the flash card, the educator now gives the sound of the letter and asks which letter makes that sound. The learner then gives the name of the letter. This helps the learner very much with spelling in future. Step 3 The educator now writes the letter and explains how it is written and in this manner teaches the learner how to form the letter properly — teaching writing skills. The learner then traces over the letter on the lines the educator wrote, copies it, writes it again from memory, or writes it in the air with eyes closed. Lastly the educator then makes the sound of the letter and the learner has to write the letter, which makes that sound. Once the first lot of letters has been mastered, learners learn to blend them into words by forming simple consonant-vowel-consonant words (mat, hit, jab). Once learners can blend, spelling is introduced. The educator says the word; the learner first repeats the word, then names the letters, writes them down and says the word once the whole word has been written down. Once the learner can write any phonetically pure three-letter word, the learner can start writing stories using these three letter words (simple consonant- vowel-consonant words such as cat, run).

107 The educator introduces non-phonetic words using lots of drill work. Once the learner can read, write and spell the short 3 letter words with ease, consonant blends are introduced. Syllabification, dictionary skills and more spelling rules are introduced afterwards. To be successful with the approach, it has to be followed rigidly. It does not include meaningful, interesting activities and puts little emphasis on comprehension, but it can be a successful method to use for learners who find it very difficult to learn to read. The relevance of Orton-Gillingham method to mental retardation and remedial instruction in resource settings This reading remediation method that built associations between the modalities such as "having the child trace [the letter] over a pattern drawn by the teacher, at the same time giving its sound or phonetic equivalent- (Orton, 1937, p. 159) or teaching spelling through analysis and writing of the sequence of sounds in words. It is very useful for children with mental retardation. as they difficulty in learning any second language. Both special education and general education teachers have found this practice an effective and efficient way to organize word identification instruction. Students report that they enjoy the activity and manipulating the letters (Cunningham, 1991; Schumm and Vaughn, 1995). However. Schumm and Vaughn (1995) found it necessary to develop simpler lessons and to focus more on teaching word families with less able readers, Teaching phonic generalizations Procedures: This method teaches students how to identify words by teaching phonic generalizations and how to apply these generalizations in reading and spelling. It is designed to be used as the exclusive method for teaching reading, spelling, and penmanship for a two-year period at minimum. Initially, students who use this method should read only materials that are designed to conform with the method. Other written information, such as content area textbooks, should be read to the students Teaching letters and sounds Procedures: The teaching of letter names and letter sounds employs associations between visual, auditory, and kinesthetic inputs. Each new sound— symbol relationship or phonogram is taught by having the students make three associations:

- Association I (reading). Students learn to associate the written letter with the letter name and then with the letter sound. The teacher shows the students the letter. The students repeat the name. The letter sound is learned by using the same procedure.
- Association II (oral spelling). Students learn to associate the oral sound

108 with the name of the letter. To do this, the teacher says the sound and asks the students to give its corresponding letter.

- Association III (written spelling). The students learn to write the letter through the teacher modeling, tracing, copying, and writing the letter from memory. The students then associate the letter sound with the written letter by the teacher directing them to write the letter that has the sound.

Merits of Orton-Gillingham approach

- Personalized: Orton Gillingham approach is highly personalized in nature. It caters to the individual needs of the learners. In this method, teaching begins with recognizing the differing needs of learners.
- Multisensory: It uses all the learning pathways: seeing, hearing, feeling, and awareness of motion, brought together by the thinking brain. The teacher engages in multisensory

3.5.4 Alternative and augmentative communication .

Definition The American Speech-Language-Hearing Association (ASHA, 2005) defines AAC as: "...Attempts to study and when necessary compensate for temporary or permanent impairments, activity limitations, and participation restrictions of persons with severe disorders of speech-language production and/or comprehension, including spoken and written models of communication." AAC methods provide a means of self-expression for individuals whose oral communication is severely restricted. AAC allows these individuals to express their wants, needs, ideas, and opinions. Quality of life and independence are often greatly improved when AAC is introduced as these individuals are able to participate in more and more daily communication exchanges. AAC methods supplement deficient oral communication, and so anyone with impairment in this area may benefit from their use. Populations commonly served by AAC include persons with

- mental retardation,
- autism,
- cerebral palsy, and
- Developmental aphasia of speech.

Some individuals with acquired impairments may also use AAC. These conditions include

- multiple sclerosis,
- amyotrophic lateral sclerosis,
- traumatic brain injury,
- stroke, and
- Spinal cord injury

may also use AAC.

Types of augmentative and alternative communication:

- AAC systems fall in to two major categories, namely Aided system and unaided system (Lloyd, 1985).

1) Aided system:-Aided system requires use of some sort of device, electronic or non-electronic, that is used to transmit or receive messages, such as communication books

109 or voice output devices using symbols such as photographs, line drawings, words or letters, a picture or wood board, a textbook, or a computerized aid. Since the skills, areas of difficulty and communication requirements of AAC users vary greatly, an equally diverse range of communication aids and devices exist to meet these demands. The aided system includes the following types of aids:—

- Communication Boards: Basically, a communication board is any type of flat surface containing written or pictorial symbols from which a student makes a selection to communicate a specific message. Communication board can take many forms, such as a single drawing for a card with the word placed on a table. Students learn to use these one symbol boards to obtain desired items. When more than one symbol is displayed, the student must choose among them. Initially a display may contain only few choices, such as one picture and two gross distracters (e.g., a blank card and a partial drawing). Later the complexity and number of target symbols and distracters may be gradually increased.

Single purpose displays: Small displays can be designed for specific situation or needs. Examples include,

- a) multiple — pocket plastic slide protector with pictures for specific activity such as bathing or dressing-
- (b) a page of pictures of items to be ordered in a fast food restaurant
- (c) a new information pocket to hold news papers clippings, photos or mementos of recent events to facilitate initiating conversation.

Multiple Displays: For general purpose, multiple displays can be combined in to one unit for multipage, or multiple sheet, display such as notebook or flip chart. Multiple displays can range in complexity, depending on the needs of the learner. When a student has learned to use a multiple display, organization of vocabulary across pages becomes important. One possibility to arrange the vocabulary by category, with the pages coded by color for each one (e.g. food on blue paper, leisure and recreation items on pink.).

- Conversation Aids: Some aids are designed specifically to enable conversation between peers. One such communication book is organized by topic according to home, school and community environment. First, the student, parents, teachers and other service providers for interest of the student. Then they select photo and drawing for places, people, objects, and activities for each topic. They place the photos and drawing in a small photo album and attach it to the student's belt. With training and frequent changes of photos, photos, the students learn to use the topic-setting album to converse with peers.

110 • Electronic Aids - Simple electronic devices such as tape recorder can serve some communication needs. In one such application, students used tape- recorded messages to gain teachers attention from across the room or to obtain a drink at a shopping mall. The students, who have multiple disabilities, including profound mental retardation, use' individually tailored micro switches to control the tape recorders., Other communication needs can be met through high- technology devices, including personal computers and microprocessors- based dedicated aids designed and programmed specifically for AAC. An example is the lapboard- sized Touch Talker, which has a display monitor, voice output, and a pressure- sensitive keyboard on which overlays of student- tailored symbols may be placed. Various peripherals are also available, such as the Dunamis Power Pad and the Unicorn Keyboard, which are pressure sensitive key boards that can use pictures or photos of various sizes. Usually the input mode for the device can be selected for the individual's motor or sensory needs. Input modes also, include standard keyboards, expanded keyboards, touch- sensitive screens, micro switches and voice recognition devices or software. There are also various output modes, such as screen displays, printed copy, and voice output communication aids (VOCAs). The output mode of synthesized speech offers several advantages, including greater conversational control, maintenance of normal eye contact. Speed can often be adapted for the student, as can variations such as row- column scanning and joystick- directed scanning. Even with such techniques, scanning is usually slower than direct selection. However ever, like the human- aided form, electronic scanning requires only one reliable motor response, so it can give an individual at least one independent means of communicating. An interesting way to teach electronic scanning is through a video- computer game. Encoding: The third general category of response mode is encoding. The technique in which each vocabulary item is written on a list or remembered (by the student or computer) with a code of two or more letters, numerals, or colors. The student uses this code to retrieve the vocabulary, there by having relatively rapid access to a large number of choices. Symbol system: Symbols for objects of some sort must be displayed on an aid so that the student can select or compose a message. Options commonly used by person who have limited language skills, include objects, photographs and pictorial symbols Objects: some students do not understand that pictures can be used to refer to

111 objects or events. When this is true, objects can be used. Students can use pointing or scanning to select objects placed in a sectioned display box, attached to a board in some way. Photographs: Mirenda and Locke (1989) found that individuals who had mental retardation understood miniature objects less often then they understood photos. Photos of a student's cup. Preferred game or a favorite snack may be useful as symbols. A photo may be identical to its referent a photo of the exact cup a student uses at snack time) or may he non-identical (a photo of any cup). Miranda and Locke (1989) found that when asked to match objects to photos, individuals who had mental retardation did equally well with non-identical and identical color photos. They also did as well with non-identical color photos as with identical; woman. black and white photos. To help students learn the relationship between a photo and its referent. Dixon (1981) found that cutting out the figure of the photo and training cutout- to- object matching was effective for three out of the four students with whom it was tried. She also found that the three students who learned to match cutouts with objects generalized this skill to matching whole photos with objects. Pictorial symbols: Whether drawn or purchased, pictures are commonly used symbols. Some students can recognize certain types of pictures and not others and so individualized screening is essential. Screening will also indicate the best size and position of pictures for the students. If a student can match non-identical pictures with their referent, standard symbol sets may be considered. A factor that appears to influence how easily various pictorial symbols are learned is their recognizability, or iconicity. Iconicity may be thought of as a continuum from transparent (obvious easy to guess, iconic), to opaque (not at all obvious or guessable). Symbols between these two extremes are translucent, that is, those for which the relationship between symbol and referent is understandable once both have been explained. Unaided AAC Unaided AAC systems are those that do not require any external device for their use. in which the individual uses only hand or body motions to communicate. It includes facial pantomimes are that they are always available to the user, usually understood by the listener, and are efficient means of communicating. Gestures are one means of referring to people, objects or events in the immediate environment. Used with or without accompanying vocalization, gestures can serve many purposes, including: a) Requesting objects (e.g., through pointing) b) Establishing or maintaining social contact (e.g.,

112 offering a toy to play with or pointing to a nearby chair to ask a friend to sit there) Rejecting or terminating an object or event (e.g., holding up hand in a “stop” motion or employing the time out signal used in some sports) d) Expressing a body state or an emotion (e.g., shivering and crossing one’s arms to indicate being cold or giving a high fives with a peer. These examples are conventional gestures, which “convey specific meaning according to conversation agreed upon by learner’s society and culture. Sign Language. While gestures are not language symbols, manual signs are. There are several different sign languages, such as Indian sign Language, American Sign Language, British Sign Language, and Japanese sign language. Each has its own signs and its own rules of grammar. Sign language is predominantly used with children with hearing impairment. Signing systems: Signing systems are also used generally for communication with persons with hearing impairment, since sign languages are quite different from spoken languages; signing systems have been designed to allow simultaneous signing and speaking. Each of these systems follows the grammar and word order of the spoken language it is designed to parallel. Thus, signing systems are not separate languages. Points to remember • The goal of AAC instruction is functional communication in a variety of natural settings, with a variety of partners and for variety of purposes. While this goal requires teaching technical aspects of AAC skills and assuming the individual will be able to use them when needed, interventionists teach the communication skills needed for daily interaction. • Given the goal of functional communication and concern for generalization and spontaneity, communication must be taught during daily routines and activities in the sites where it normally occurs. Analysis of natural context should point to actual and potential communication needs, partners and naturally occurring cues and consequences • Communication skills may be embedded within other activities, for instances, in a task analysis on playing grip ball, a step such as “say good catch” could be embedded. With the expected communication behaviors being thumbs- gestures, a brief vocalization, and a smile. Likewise, a task analysis on reporting to work could be expanded to embed a step such as “check to see if there are any special jobs today”. The student would be taught to approach the supervisor with wallet – sized card containing the written message Is there any change in routine today?”. Many daily routines provides 113 opportunities for embedded communication such as asking a peer to help open ketchup packet at lunch, • Whether embedded in to other tasks or made in to separate routines, communication skills must be learned in real and meaningful natural context. • Successful augmentative and alternative communication (AAC) services require a collaborative team approach, involving the individual who requires AAC, their families, and members from various professional disciplines ,It is often unrealistic to assume that all AAC services will take place with the client and all professionals present at the same time and location. Effective communication between team members is thus required, to enable this, AAC team members must not only be comfortable with their own roles but they must also become acquainted with the roles of other team members. This ensures that team members receive information pertinent to their specific roles in an appropriate, timely fashion, thereby maximizing the quality of AAC services. 3.6 Teaching Strategies: There are some special teaching strategies for children with mental retardation. Due to less capacity of intellectual functioning the teachers have to employ various teaching strategies and techniques for their teaching. Task analysis, prompting and fading, Chaining etc. are most common strategies for them-In addition to reinforcement techniques (used for learning) are much effective for their skill development. 3.6.1 Task Analysis All mentally handicapped children learn easily through small steps. Instead of teaching a behavioural objective as a whole, the teacher can split it into several small steps. Each step can be taught one at a time, until the child reaches the specified behavioural objective as a whole. Task analysis is simply the procedure of teaching a behavioural objective in small and simple steps to a child. The procedure of task analysis is especially useful in simplifying teaching activities of daily living and motor skills for children with mental handicap. How to decide about the steps for task analysis 1. Observe a competent person doing the task and note down the steps involved in performing the task.

114 2. The teacher can perform the task herself and note down all the steps involved in completing the task. 3. The teacher can think about the steps involved in the task and note down the steps. 4. The teacher can ask other competent persons and note down the steps. Characteristics of task analysis. The following are some of the important features in the procedure of task analysis for teaching children with mental handicap :- 1) In some ways, task analysis is a process of discovering the correct amount of physical prompts, verbal prompts, or clues necessary at each stage of teaching a behavioural objective for the given child. 2) Since each child is unique, it is not possible that all children will learn a given behavioural objective with the same number or sequence of steps in the task analysis to reach a given behavioural objective. Some children, for example, may require a few steps to reach the behavioural objective, while others may require more number of steps to learn the same target behaviour. It is important to individualise the task analysis separately for each child depending upon his or her special needs, abilities, and also the selected behavioural objective. 3) Another characteristic feature of task analysis is that it involves broad steps of split up activities in order to reach a behavioural objective. Each step within a task analysis is sequentially linked to one another. The performance of one step in the link will signal the performance for the next step. It is important to note that sometimes a sequence may not be followed too depending on the difficulty level and the needs of each child with mental handicap. Steps in task analysis The following steps are to be used in developing task analysis for any behavioural objective :- Step 1 - Identify the target behaviour or behavioural objective for teaching a child. Step 2 - Break up the behavioural objective into as many small steps as you feel appropriate for the specific child. Step 3 - Try and keep the break up of each step in the task analysis, simple and small enough to attain in short time by the child. Step 4 - Arrange the identified steps in the task analysis in a sequential order that the simple steps are placed before the more difficult ones.

115 Step 5 - Observe or make the child perform the various steps on task analysis and discover the step at which he can perform the specified task. Then, begin teaching the child from that step and gradually move further to train him in the remaining steps until he reaches the target behaviour as a whole. An example of task analysis for a typical behavioural objective is given. Example :- 3.6.2 Behavioural Objective :- "On instruction, Suraj will put on a shirt correctly eight out of ten times by himself before the end of this month". This task is analysed as follows :- Step 1 - will hold the collar of the shirt with left hand. Step 2 - Suraj will insert right hand into right sleeve. Step 3 - Suraj will hold the collar from back and bring it to the left side with left hand. Step 4 - Suraj will insert left hand in left sleeve. Step 5 - Suraj will insert left hand in left sleeve. Step 6 - Suraj will fold the collar. 3.6.3 Chaining :- Many complex behaviours can be taught to mentally handicapped children, if they are broken down into small and simple steps. These steps can then be sequentially linked with each other to form a chain. Where each step is taught separately and sequentially until the whole behaviour is learned, this method is called chaining. Chaining method can be used in two ways i.e. forward chaining and backward chaining. When the last step is taught first and the first step is taught last, it is called as backward chaining. When the first step is taught first followed by later steps being taught last, this procedure is called forward chaining. The steps in the forward chaining and backward chaining are explained for the following behavioural objective "put on elastic pant".

Forward Chaining Task: Puts on a pant with elastic waist Steps Sub-tasks Steps Sub-tasks

116 1 Holds the Pant by both hands 1 +2 Holds the pant with both hands and puts one leg through 1 +2+3 Holds the pant and puts through both the legs one after the other 1+2+3+4 Holds the pant, puts through the legs, pulls pants upto knee 1 +2+3+4+5 Holds the pant puts through the legs, pulls upto knee and then to the hip 1 +2+3+4+5+6 Holds the pant, puts through the legs, pulls upto knee, then to hip and waist. Backward Chaining 6 Pulls the pant up from the hip to the waist. 6+5 Pulls the pant up from knee to hip and then to the waist. 6+5+4 Pulls the upto knee, then to hip and then to the waist. 6+5+4+3 Puts one leg through pulls pants upto knee, then to hip and then to the waist 6+5+4+3+2 Puts both the legs through, pulls the pant upto knee, then to hip then and then to waist 6+5+4+3+2+1 Holds the pant with both hands, puts the leg through pulls it upto knee then to hip and then to waist. Guidelines for using chaining :- 1) Describe each step in the chain that are to be followed so as to reach the target behaviour. 2) Suppose a behavioural objective has been sequenced into five steps, initially begin teaching by establishing a link between the first two steps alone. Then, proceed to link the first two steps with third step. Still later, develop links between the first three and the fourth step until, eventually one can reach the behavioural objective. 3) Use rewards to strengthen the behaviour at each step or link in the chain towards the behavioural objective. 4) Preferably use backward chaining procedures when teaching self help skills to mentally handicapped children. 5) It is better to teach the child to perform the steps in the order in which they are listed in the chain.

117 6) Move to the next step in the chain of behaviours only after the child has learned the proceeding step in the link of behaviours towards the behavioural objective. 3.6.4 Shaping To teach a new behaviour to mentally handicapped children which they might have never performed before, the teachers should wait for target behaviours to occur on their own, then they may have to wait for a long time. Most behaviours in mentally handicapped children may occur only after a long time. Therefore, it is important to start teaching a new behaviour to the child in small steps and keep him moving closer to the target behaviours by rewarding even minor changes towards the final behavioural objective. Use of shaping method in teaching mentally handicapped children prevents frustration in the learner as well as the teacher. Teaching becomes more pleasurable for the child in particular as he is able to earn rewards even for minor success achieved by him. For example, if a child is unable to say "Water" and the closest sound he can make is "Wa-Wa", then shaping may be used change "Wa-Wa" through a sequence of steps into "Watah" and finally "Water". Similarly, to teach a child to kick a ball in the required direction, you may begin rewarding even if the child stands near the ball. Gradually, you can shape the child's behaviour by rewarding at the end of every step, such as, when the child gets closer to the ball pushes the ball with his foot in any direction, kicks the ball in any direction and eventually, kicks the ball in the specified direction. Steps in Shaping Process 1) Select the target behaviour. 2) Select the initial behaviour that the child presenting performs and that resembles the target behaviour in some way. 3) Select powerful rewards. 4) Reward the initial behaviour till it occurs frequently. 5) Reward successive approximations of the target behaviour each time they occur. 6) Reward the target behaviour each time it occurs. 7) Reward the target behaviour now and then.

118

Example of Shaping Process 1) Choose a behaviour that the child is already doing in some form or other. If the behavioural objective is to teach the child to draw circles and the child is able to hold pencil and scribble on paper then you can use shaping to teach the behaviour. 2) Begin by working with the child at the level he is able to perform and reward him. This will help child to learn that his behaviour leads to reward. For example, when the child scribbles, reward him. 3) In order to teach a small improvement over what the child can already do, you can now teach him to make circular motions. This is not a perfect circle, but it is at least closer to a circle. Do not reward the child for scribbling any more. Only reward him, when he makes circular movements. 4) When the child has consistently learned to draw circular movements, change it to the next closer step, such as, spirals. Stop rewarding him for circular movements. Reward him now when he draws spirals. 5) When the child has consistently learnt to draw spirals, then take him to the next step which is closer to the objective of drawing a circle. For example, reward him now only for drawing circles even though they are still not perfect circles. 6) Keep working at it until the child reaches the behavioural objective of drawing a circle.

Guidelines for using Shaping Techniques Effectively 1) Always use shaping techniques in combination with other techniques for teaching behaviours, such as rewards, prompting, chaining, modelling, fading. 2) The important feature about using shaping techniques is to build mini steps towards the final target behaviour. Plan the size of the steps carefully. They must be neither so large that the child will fail to reach one step after another, nor must they be so small that a lot of time is wasted by going through unnecessary steps. 3) At any time in the shaping process, be prepared to alter the size or distance between the steps depending on the actual performance of the child. 3.6.5 Modelling:- Either knowingly or unknowingly, most of us acquire many behaviours through modelling and imitation. Children learn many behaviours by observing others deliberately or by chance. They imitate behaviours of persons who are considered important in their view, such as, their favourite teacher, parents, friends, Film/TV star, etc. While teaching new behaviours to children, if teachers can use modelling in a

119 systematic manner, it can become an effective way of changing/teaching behaviours within the school/classroom settings. Begin teaching new behaviours by showing children how to perform that behaviour, and if the child imitates, you are using modelling. Modelling

can be used to teach new behaviours or to correct the performance of an already learnt behaviour to the child. Modelling does not mean comparing the performance of two or more children. Many children do not like themselves being compared with other children. It may even lead to negative feelings like jealousy, anger, etc. Teachers should never use instructions which mean to compare behaviours of children. Statements that teachers should avoid using, "Be a good boy, like your friend Rohit!" "Look at Sarita colouring the picture book. Come on, Anu! Why don't you do the same?" "Mohan! Can you copy down the numbers silently like Raju?" Modelling involves creating a situation in which the child naturally observes other children indulging in target behaviours

and getting rewards for that behaviour. This will make the child to repeat the same behaviour and earn rewards.

Guidelines for using Modelling Techniques :- 1) Make sure to get the child's attention on every detail of the model, possibly, even by using verbal prompts along with it. For example, Teachers can demonstrate the use of a pair of scissors by pointing (gestural prompt) to where the fingers go, how to grip tight or loose, etc. 2) Choose a model that is appropriate for the age, sex for the child. The children generally identify themselves better with the model's which are of their age and sex. The mode should be proficient in doing the task for which you are going to use him or her. 3) Provide opportunity for the child to observe the model's behaviour before he can imitate the same. Some children may need a long time or more number of trials to observe the model completely and clearly. 4) Get the model to show the target behaviours clearly in front of the child.

120 Demonstrate each part/step in the target behaviour slowly and clearly enough for the child to model it. 5) If the demonstration involves a series of steps, divide the model's performance into small and convenient parts. Each step or part can be modelled and taught separately until the child learns to perform all the steps. 6) Before beginning to use modelling techniques, ascertain if the child is developmentally and intellectually ready to imitate the model. There may be some behaviours which may not be easily imitated by some children. 3.6.6 Prompting Almost everyone requires guidance, instruction, assistance or help while learning an activity or skill. In case of mentally handicapped children, they need more help or assistance than normal persons of their own age. Types of Prompt Each child with mental handicap shows different levels of performance for any given behaviour. Based on the current level of performance, there are three broad categories of prompts that can be identified for use in teaching or training these children. a) Physical Prompt For completing a task some children require complete manual or physical assistance. The teacher may have to initially hold the child's hands, or other body parts to teach him specific behaviours such as buttoning, writing with pencil, skipping. Physically prompts are usually needed at the beginning of teaching a new behaviour. This procedure demands that the teacher is physically very close to the child, in order to provide physical help. Always combine physical prompts with the due of verbal prompts. b) Verbal Prompt Some children may need only verbal statements describing every step of the behaviour that is required to be performed in order to complete the task. For example, in teaching unbuttoning, the teacher may have to tell the child, "

Hold the button in your hand ... Hold the edge of the shirt with your other hand ... Pull away the button from the hole .. ", etc. In this case the teacher is using prompts before the occurrence of every step until it leads to the target behaviour. In using verbal prompts, the teacher needs to give verbal instructions. There is no direct physical contact between the child and the teacher during the teaching process. Usually

121 teachers can shift in using verbal prompts after the child has gone through the initial stages of learning the new behaviour with physical prompts. C) Clueing :- Some children require only verbal hints (example, "open", "close", "zip", "push", etc.) or gestural clues (example, pointing signals to stop, shaking fore finger to imply "no", etc.) to help them perform a behaviour. For example, a child can taught to name fruits from pictures. After showing the appropriate picture, the teacher may help the child by saying "Man..." or "pie ..." (meaning to prompt "Mango" or "Pineapple"), and leave it to the child to complete the naming of a fruit. Sometimes clues can be in the form of reminders or questions. For example, when the child is learning to name a list of five modes of transport and recites only four, the teacher can give a clue, "Remember, How did you come to school this morning?" (Meaning to help the child to say 'scooter' or 'motorcycle' .)

Towards the end of teaching a behaviour, the teacher usually reduces prompts whereby the child conducts the activity independently. Guidelines for selecting and using prompts :- 1) Make sure to secure the child's attention before giving or using prompts for teaching a behaviour. 2) Always provide prompts only before the child performs the target behaviour. 3) Use prompts only if the child is unable to perform the desired target behaviour in the manner it should be done. 4) Be brief. Always make prompts as short as possible. 5) Select as natural prompts as possible. Which ever type of prompts are used, it should be always in a language that the child can understand. This is more applicable while using verbal and gestural prompts. 6) Select prompts that will quickly lead the child towards independence in acquiring the target behaviour. 7) Wherever necessary combine use of different types of prompts to achieve maximum effectiveness in teaching. 8) Fade prompts as soon as possible.

Gradually decrease the use of physical prompts, as the child learns to perform a target behaviour, then verbal prompts and clues-in the same order, till the child becomes totally independent.

122 3.6.7 Fading :- While using prompts for teaching it is important to gradually decrease the amount of assistance or help being given to the child. The ultimate goal of teaching is to make the child independent in the performance of the specified behavioural objective/s. In the initial phase of teaching a new behaviour, the teacher may do more and more of the task as the child does less and less of it. However, as a child learns to perform the target behaviour, the teacher must do less and less and allow the child to do more and more of the task by himself. In the given example the child has to trace the alphabet 'A' on the dark line. Then slowly, the alphabet is faded and finally the child has to write by himself.

While teaching new skills, the teacher needs to use rewards continuously, i.e., every time the child completes the task such as, every time the child buttons his shirt with or without help the reward is given. Once the child has learnt the task, the rewards need to be gradually faded. In other words, the child does not receive rewards after completion of the task each time, but only now and then or occasionally.

3.6.8 Reinforcement Every action has some consequence. When our behavior results in desirable consequence, it serves as a motivating force for the behavior. The natural process of getting desirable consequence if not sufficient to maintain the desirable behavior more powerful consequences need to be provided for motivated learning. It is a very important component of attempt to teach new behavior and to increase occurrence of existing behaviour. It is also helpful in maintaining appropriate level of the behavior. There are two types of reinforcement. which are widely used in teaching person with mental retardation.

a) Positive Reinforcement In positive reinforcement the reinforce is provided after a particular desired response has occurred. Here the reinforcer increases the probability of occurrence of the behavior again in similar situation. Technically positive reinforcement refers to the process of presenting the stimulus as consequence of a response that result in an increased probability of that behavior in future. It is the contingent presentation of a stimulus, immediately following a response that increases the future probability of the response.

b) Negative Reinforcement Firstly, the stimulus is present prior to occurrences of the particular response. Secondly, the response removes or withdraws the stimulus, resulting in increase signs of the probability that the response will occur. Technically negative reinforcements refers in removing an aversive stimulus as a consequence of a response resulting in an increase in the rate of occurrence of a response. It can also be defined as contingent removal of an aversive stimulus following a response that future rate or probability of the response.

Types of Reinforcers a) Primary Reinforcers - Primary reinforcers have biological importance to the individual. They are highly motivating to the student and work very effectively with children having mental retardation. Food and drinks are very common primary reinforcers widely used for younger or low functioning student. They have high motivational value and quickly effect the behavior. b) Secondary Reinforcers - Primary reinforcers are temporary measure as we want students not to be dependent on them. There are various types of secondary reinforcers widely used in special education setting. Secondary reinforcers include social stimuli such as praise or favourite activities. Attention, words, smiles, gestures, a pat on the back are called social reinforcers which are most natural and readily available or enjoyable activities which a student may choose like playing a particular game, working on computer, painting etc.

Secondary reinforcers do not have biological importance, their value has been learnt or conditioned in due course of time. Most often secondary reinforcers are also called conditioned reinforcers. c) Tangible reinforcers are those which are of immediate use to the individual. Eg, pen, pencil, toys, objects which have achieved reinforcing properties such as stars are also tangible. d) Exchangeable Reinforcers - There are reinforcers like token, money stickers etc., which may be exchanged for other more valued secondary reinforcers. Primary and secondary reinforcers can be used in a combination and try to gradually reduce the dependency of the child on primary reinforce. This is called pairing. Through pairing we gradually condition the child to be reinforced by the secondary reinforce only. Privileges are also widely used as reinforcers. Display of good work, appointing student as monitor, appointing student as monitor, appointing team captain are widely used privileged rewards. e)

Generalized Conditioned reinforcers - When a reinforcer is associated with a variety of behaviours, it is termed as generalized conditioned reinforce. Another type of

124 generalized reinforcer includes those data exchangeable for something of the child's interest, like money which can give access to food, shelter, clothing, other materials etc. f) Token Reinforcer- Token can be used as a symbolic representation of money in various situations. Tokens are exchangeable for a variety of primary and secondary reinforcers. It can be effectively used with a single child or with a large group also. Token reinforcement system requires two components the tokens and backup reinforcers. The token is delivered immediately after the desired behaviour. Button, stars, paperclips, metallic pieces etc., can be used as tokens. Tokens should be portable, durable and easy to handle. Steps for Implementation of Token System

- Decide target behavior.
- Demonstrate target behavior clearly and ensure understanding by the student.
- Decide tokens
- Frame rules for receiving the tokens.
- Frame rules for the exchange of tokens
- Plan reward menu and display in the classroom
- Implement the token system with firmness.

Initially provide immediate tokens and allow immediate exchange. Slowly increase duration. Gradually shift to intermittent schedule of giving tokens. Re schedule and revise the reward menu after certain intervals. Selecting effective reinforcer - The selection of effective reinforce can be done by asking the child, observing the child, asking the parent. A list of reinforce, in order of preference, can be prepared. Basic principles of reinforcement delivery system :

- Reinforcement can be given only for desirable behaviour
- Provide reinforcement immediately after desirable behavior
- Reinforce target behaviour each time in the initial stages
- After achievement of the target behaviour use intermittent reinforcement
- Pair tangible reinforcer with social reinforce for other secondary reinforcers to fade tangible reinforcers gradually.

125 Schedule of Reinforcement 1. Continuous schedule of reinforcement : Schedule of reinforcement refers to the pattern of delivery of reinforcement. When a reinforcement is given on continuous basis, it is referred to as ("continuous schedule of reinforcement" where a student receives immediate reward after every target response / behavior. This is very necessary for learning a new behaviour. 2. Intermittent schedule of reinforcement : Following continuous delivery of reinforcers for prolonged periods may lead to dependency. Hence intermittent schedule has to be followed. Here reinforcement follows some appropriate response. Behaviours maintained for a longer period. Two types of intermittent schedules are used: Ratio Schedule: Here the number of times target behavior occurs decides the timing of reinforce delivery. In fixed ratio schedule, the child is reinforced for a specified number of correct responses.

In variable ratio schedule, the target behavior is reinforced on the average of a specified number of desirable responses.

Interval

Schedule: Here specific amount of time determines the delivery of reinforce. Under fixed interval schedule, the child is reinforced after some fixed interval of time. Under variable interval schedule, the duration / intervals are to different lengths. (The average length is consistent). 3.6.9 Role Play Method The popular teaching technique is Role Playing method. It is applicable in many form of education from the primary level of elementary school to the upper classes. Role play highlights elements of spontaneous or least extemporaneous reaction in education. Role Play may be defined as the way one behaves in a given position and situation. It is a teaching methodology is the conscious acting out and discussion of the in a group. In the classroom a problem situation is briefly acted out so that the individual student can identify the characters. It points up the dynamics which can accompany this teaching methodology. Small group in the class had been assigned to demonstrate various teaching method. The group in role playing set up a situation in which one member played a certain role and other have to react on the specific role or some definite role. It Can be used with students with most ages. A complexity of the role situations must be minimised in using the method with children. The responses and the dialogues create a dynamic learning situation which will not forget soon. Role-play allowing free scholar to make mistakes in a non threatening environment. It also fulfil some of the very basic principles

126 of the teaching learning process such as learning involvement and intrinsic motivation. The involvement in role playing can create both an emotional and intellectual attachment to the subject matter at hand. If a skillful teacher accurately matches the problem situation to the needs of his/her group solving of realistic life problem can be expected. It also create a sense of community in class. But some may react negatively to this situation and insecurity may occur. In-effective performance of the member or mishandling may create dissatisfactory outcome. This is also a time consuming method or process. Principles of Effective Roleplaying Role playing is based on the philosophy that a human being is best changed through direct involvement in a realistic life related problem situation rather than through learning about such situation from others. To change the said concept, a district organisational pattern is needed. 1. Preparation - a) Define the problem b) Create readiness for the role c) establish the situation d) Cast the character e) Brief and Warm up f) Consider the training 2. Playing- g) Acting h) Stopping i) Involving the audience j) Analyzing the discussion k) Evaluation The teacher must identify the situation clearly so that both the character and the audience understand the problem at hand. The audience is just as much involve in the learning situation as the actors are. In the analysis and discussion time the audience should provide possible solutions to the realistic problem situation.

127 It is important to evaluate the role playing in the light of the prescribed goals. Evaluation should proceed on both group and personal level. 3.6.10 Play way Method Play activity is an integrated part of the developmental process in young children. It occurs spontaneously in children and serve an important medium for informal learning. Dr. Lynn Barnett advocated play as a percussion to creativity and abstract learning The major aspects of play are 1. It is spontaneous and voluntary 2. Play gives enjoyment. 3. Most of the children actively involved 4. Passive involvement is also present 5. Less parental supervision is present. Stages of Play - 1. Pre symbolic play - In the first year of life transition from visual to manipulative exploration of objects and from stereo typical to functional play. At the age of 12 months the interest in object attract the child's interest. In this stage the play behaviour changes its characteristics. 2. Symbolic play - In between 18 months the use of of symbolic representation in play increases and shows the flexibility of child's thought process. 3. Elaboration of symbolic play - In between 2 years children acquire the capacity to use symbolic objects and begin to use imaginary object to symbolize absent objects. Play as a Learning Activity - There are three type of learning activities - 1. Sensory motor activity - Co ordination, Peg Boards, painting etc. 2. Socialization - Interaction between peers in early ages constitute the code of conduct 3. Self Actualization - They become fully functioning human being capable of awareness of environment and responsiveness to other human beings. Child can be able to make to feel effective in the family in the environment.

128 3.7 Development and Use of TLM FOR ID The children with mental retardation have less cognitive ability, poor motivation to learn. So for better learning experience multi sensory modalities can be used to make learning activity more interesting and purposeful. To do so, developing and use of proper TLM must be introduced by the teacher which will be helpful to achieve the objective of learning and the process to reach the goal properly 3.7.1 Teaching Material Teaching material is very much helpful for the student with mental retardation. Their learning can be meaningful and it remains in their mind for a long period of time with the help of TLM. Teaching material is a term used to indicate text books, lecture notes, lesson notes, and references and so on. It is prepared by experts in the field. Teaching aids are the materials that enhance the presentation of information using the visual and auditory input and sometimes the tactile input too. For example, charts, video clips. Audio cassettes or CDs, models, film strips, and so on. It can be prepared by the concerned class teachers any trained teacher, or can be purchased from commercial agencies. Teaching appliances are the materials like over head projector, rulers, stop watch, tape recorders, and so on. 3.7.2 Teaching learning material (TLM) TLMs are those materials other than the text books that the teacher uses to transact curriculum content so that the teaching by her and the learning by the students proceed smoothly, effectively and spontaneously. TLMs totally support the curricular transaction in all the classes right from preschool to higher education in general as well as special education, keeping the student in focus rather than the teacher in focus. 3.7.3 Types of TLM There are different types of teaching aids, which can be used by the special teachers in classroom. Some of them are as under : 1. Visual Aids a) Blackboard b) Charts, pictures

129 c) Models film strips d) Motion pictures e) Slides film strips d) Motion pictures g) Bulletin board 2. Audio-Visual Aids a) Slide projector c) Over head projector e) Film projector g) Radio i) Television recorder/ player 3. Activity Aids a) Museum c) Garden e) Workshop g) Fairs d) Motion pictures, f) Motion pictures, b) Magic lantern d) Epidiascope f) Gramophone h) Tape recorder j) Video cassette b) Aquarium d) Kitchen f) Laboratory h) Exhibitions

130 3.7.4 Need for TLM As the students with mental retardation have limitations in intellectual functioning, short attention span, concentration, and poor memory, the training which is heavily based on oral instruction does not support them in learning. They require a training which can provide input through various senses as much as possible. In addition to auditory and visual senses the other senses also should be included in the training process. It can be achieved through effective teaching learning materials because it provides multisensory learning experience to students with mental retardation. Advantages of using TLMs The major advantages of TLM are as follows

- It helps in creating interest in students with mental retardation in learning a particular skill. The attractive and appropriately coloured Teaching Learning Material catches the attention of the student with mental retardation.
- For the motivation of the students with mental retardation in learning TLM is also needed.
- With the help of teaching learning materials the learning become more meaningful and the learned concepts remained for long period of time in their memory.
- A large group of students can be handled easily by a teacher with the help of teaching learning materials.
- With the help of TLM abstract concepts can be concretized better.
- It helps in reducing the energy and time spent by a teacher in explaining the concepts verbally.
- TLM increases the participation of students with mental retardation in the classroom activity.
- It makes use of all sense organs of students. It also provides multisensory learning experience.
- The TLMs help in transfer of learning.
- It sustains the attention of the students for a relatively longer period of time.
- If well utilized, some of the TLMs can help in improving critical thinking and problem solving abilities which children with mental retardation lack.
- TLMs used for mathematics has a direct relevance and application to daily living and the transfer of training is minimized.

131 3.7.5 Effective use of TLM Effective use of TLM depends on the following factors Knowledge about hierarchy of concept development Teachers should be aware of the hierarchy of concept development, principles of teaching and the basics of all-round development of a child. For example, the steps in training any concept involves matching, identification and naming, It should be taught in the same order. Changing the order of steps will hinder the process of learning. The training should move from concrete to semi concrete, and to abstract. It can be done effectively with the help of TLM. Novel ways to use the TLM the children with mental retardation have less cognitive deficits due to which they learn at a slower pace, have poor retention ability and are unable to transfer the learnt skills easily to another situation, the TLMs must be carefully selected and used with them. In order to avoid monotonous teaching and students getting bored, teachers have to think of different ways to use the same teaching learning materials. The teacher needs to be innovative, be clear in the objective and be prepared in advance while using a TLM. It is proved that children with mental retardation learn better through games and activities. TLM should be used in the form of activities and games. For example, the colour flash cards which are used for teaching colour concept can be used to play card games and memory games. TLM for different curriculum levels We have seen that the TLM used should be age and level appropriate. Therefore, based on the curricular objective for the children in each group a range of material will have to be used to aid the curricular transaction effectively. Children who are in the age group of 3-6 years are in the preprimary level. The curriculum for pre primary level is mainly focused on the motor, self help, social and language skills. So the material prepared for training children in this level should be mainly aimed to improve the above said skills. As they are lower age group children the material should be colorful, attractive, soft in texture, and should be appropriate in size. (Children in the age group of 7-10 years are at primary level. The curriculum in this level basically focuses on personal skills, communication skills, social skills, functional academic skills, motor skills, and pre-vocational skills. It is an extension of pre-primary level; the skills are higher than pre primary level. The materials for training in functional academics are important at this stage. Many of them are learning aids as in flash cards, picture books and so on. The secondary and pre-vocational levels are the extension of primary level. As the children in these levels are of in the age group of 11-14 years and 15-18 years respectively the

132 material used in lower levels are not age appropriate for them. Also according to the changes in the curriculum content the material should vary. Learning aids and functional aids as its name indicates learning aids are used for 'learning' a particular concept and teacher uses it specifically for instruction. Once the students learn the concept, the utility of specific learning aids ceases. Example for learning aids are models, charts, pictures. A functional aid is one which enhances the 'functioning' of the child in daily living activities. A functional aid has use even after student learns the concept. Without functional aids a child with limitations in functioning will not be able to perform the particular activity. For example; grasping adaptations in utensils, dressing adaptations, and motor adaptations are functional aids. A picture album of common grocery used at home is used as one of the learning aids with students in the classroom. Once students learn to name common things, it may not be necessary to use picture album as an aid. But in case of non-verbal students, it is continued to be used as it facilitates their communication. Then the same aid becomes functional aid. Selection and development of teaching material and aids Selection and development of teaching material and aids is the primary responsibility of the teacher. It should be done by keeping the following principles. Age appropriate; Children with mental retardation need to be trained in age appropriate activities, irrespective of their mental age. For such training, material also should be age appropriately used. For example, in order to teach counting to a child in the primary class we may use beads. But with a child in the pre-vocational level we have to use the materials such as domestic items (cups, spoons, bottles, vegetables and fruits) or packaging items (number of cartons/boxes) may be more meaningful. Easily improvised by teacher: Depending on the situational demand teacher should be able to make the necessary modification and improvise the particular TLM. • Minimize transfer of learning: A child with average or above average intelligence does not require extra training for generalizing the learned concept to the life situations. But a child with mental retardation requires the extra training for this. A child with average or above average intelligence is able to use the arithmetic concept learned in the classroom to his daily life whenever he/ she is required to use it, like while shopping, or travelling. A student with mental retardation requires training in a shop or bus travel situation in order to use the same arithmetic concept learnt in the classroom. So the material selected should minimize the need for transfer of learning which prevents the wastage of time, and energy. For example, in order to

133 train a child in money skills instead of using duplicate rupee notes use the original money coins and rupee notes. Wherever possible the TLMs should be materials that are naturally used in the given situation rather than simulated ones. • Attractiveness: Attractive materials will help to get and maintain the attention of the child on the task and increase the motivation to learn a concept. In addition, depending upon the aid, where appropriate, the materials should be symmetrical; specially whenever materials are prepared to train on mathematical skills like shapes it should resemble the original one. For example, if you are making a TLM to teach shape 'square' the material should be exactly a 'square' with all angle at 90 degrees. If the aids have written script. it should all be of same size and uniform. • Suited to the level of learners: TLM should be appropriate to the ability, achievement and aptitude levels of the student. Children with mild mental retardation have higher cognitive abilities compared to children with moderate, severe and profound mental retardation. Therefore, the material prepared for all level should be appropriate to their need and the objective chosen. Materials for children with severe and profound mental retardation should represent the fact in simpler form. • Cost effectiveness: TLM should be worthy of the cost paid. For example, a TLM which can be used for training a number of skills, multiple utility, is cost effective than the one which can be used for training only one concept. Never the less, some aids are meant to be used for a learning single concept. So care must be taken to see if a concept can be taught using a material that is relatively cheaper and durable and will serve the purpose. The best way to do this is to make a market survey, be clear on what you wish to teach, look at varied material and choose the one that will help in achieving the objective and cost effective. • Novel: Every day there are new materials coming into the market. Novel material catches and maintains the interest and attention of children better than common ones, so a special educator should have novel thinking while preparing or selecting TLM. While selecting, the teacher has to think of its utility in the long run, usability by the student, maintenance related issues and affordability. Novelty should not be at the cost of quality. • Multi sensory utility: A TLM should provide opportunity to use as many senses of the student as possible to make the learning more meaningful. Audiovisual aids provide the multisensory learning experience to children. o Durability: A TLM which lasts for a long time without breaking or getting weaker is a durable one.

134 When children with mental retardation explore the material it may fall down or may twist or fold. If the material is made of breakable material like glass, and thermo cool sheets or with thin materials like papers: it may break or damage.

- Nontoxic: As children may put the material in the mouth, it is important to see to the quality of the product of which it is made. If it is a painted material, it should be nontoxic. Many materials are washable. It is good to buy them as after handling it can be washed and stored for future.
- Maintenance free: It is no use buying a material that needs frequent maintenance. Some times, some electronic items are stored in cup board as it is either to be repaired or does not have battery. It is a waste to possess such aids
- Accessible: A good TLM should allow the child to explore it freely and learn from it
- Role of Special Educator in Making Teaching Aids
- Waste and used material of the class, school, teacher's home, student's home etc., can be effectively used for making various teaching aids.
- The children of the class may themselves be motivated and involved in search of waste material and preparation of aids.
- Planning and preparing of teaching aids not only helps in learning the concept but also add to development of fine motor skills, eye hand coordination, prevocational, communication and cognitive skill.
- The person with mental retardation shall be motivated, develop confidence and have feeling of well-being by involving themselves in such activities. The teacher must be observant, keen, motivated, creative and have scientific and artistic temperament to make teaching aids and make it a habit or a regular affair of teaching learning program. Referral sources to procure teaching materials, aids and appliances Any shop selling educational material can be a good source of TLM. Nowadays there are various agencies which prepare teaching learning materials for children with disabilities. Most of them are attractive, durable, and novel ones. But it is the sole responsibility of the teacher to select the appropriate one by considering the factors which we have discussed earlier. A teacher has to make use of her creativity blended with the technical competencies in selection, preparation, and wise use of TLM for effective curricular transactions.

135 3.8 Let us Sum-up Students with Special and Exceptional needs are placed in inclusive learning environments more frequently than the past. For general education with a limited special education background, this can often be anxiety provoking and stressful. Every teacher wants to provide the best instruction and education to his students. The following five strategies may be made useful for working with students in the inclusive settings.

1. Get to know your Students' IEP: One of the most common accommodation for students with special needs is preferential seating.
2. Implement Universal Design for Learning(UDL): Universal Design is so much more than one of the hottest buzzwords circulating around education circles. It's an approach to curriculum planning and mapping that makes learning engaging and accessible to a wide range of learners with different strengths and needs.
3. Support Important Life Skills: Student must be exercised with the essential life skills in school environment and as teachers we have to extend support to the learners to acquire such skills. Practice like "Study Skills Thursday" may be very much effective when students clean out their backpacks, organize their binders and notebooks and focus on developing and self-reflecting on both short and long term goals. Even, locker checks with some students may be useful. The battle is half won if a student comes to school organized and prepared.
4. Engaged in collaborating Planning and Teaching: No class room is an island, especially in inclusive classroom. Opening up of classroom to service providers, paraprofessionals, special education teachers and parents give valuable opportunity to participants in collaborative teaching. Collaborative teaching looks differently depending on what school, level and setting one is working. So the teaching environments must be such when collaborative teaching is encouraged and celebrated.
5. Develop a strong Behaviour Management Plan: Having a successful inclusive classroom depends upon having control of the classroom. It is essential to have clearly communicated expectation and goals, that are accessible by all students. So classroom environment should be tailored to better suit diverse students' needs.

136 There are so many approaches and such approaches are in use globally and also discussed in detail in previous pages. Such practices and approaches need to be thoroughly understood and put in to use in the given situation. T.L.M. Teaching learning material is a generic term used to describe the resources teachers use to deliver instruction. Teaching materials can support student learning and increase student success. Ideally, the teaching materials will be tailored to the content in which they're being used, to the students in whose class they are being used and the teacher. Teaching materials come in many shapes and sizes but they all have in common the ability to support student learning. The need and usefulness of TLM do not require any further justification. A teacher may or not be so resourceful but can make his instruction effective by using T.L.M. So TLMs are in use across the globe and across the Subjects. In inclusive setting use of TLM becomes more effective. Previous discussion on TLMs and their uses must be helpful to the learners in classroom settings.

3.9 Check Your Progress 1. Define Learning. Write the different stages of learning. 2. Discuss different Principles of Teaching with suitable examples. 3. Write short note on (i) Montessori Method (ii) VAKT Approach of Teaching (iii) Alternative and Augmentative communication. 4. Define Task Analysis with Suitable example. 5. Discuss different teaching strategies for teaching children with Intellectual Disabilities. 6. Define Reinforcement, Discuss different types of reinforcement. 7. Write Short note on Schedule of Reinforcement. 8. Discuss Play way Method.

137 9. Define TLM. Discuss needs and importance of TLM. 10. Write different types of TLM with suitable examples. 3.10 References

Reference 4.1 Introduction The

behavior of living beings has always been a subject of curiosity and interest to the behavioral scientists. A behavior is considered as an aspect of the function of an organism. This may include the explicit expression of an action, thinking, emotional expression, physiological activities etc. These functions may or may not be visible or observable for another person. Sometimes the function of an organism could be due to the result of an external activity. Very many factors like genetic constitution, neurobiology, personality factors and environmental influences are attributed to the basic structure of

behavior. Behavior modification is based on the principles of operant conditioning, which were developed by American behaviorist B. F. Skinner (1904-1990). Skinner formulated the concept of operant conditioning, through which behavior could be shaped by reinforcement or lack of it.

Skinner considered his concept applicable to a wide range of both human and animal behaviors. The simplest form of behavior has relation between a stimulus and a response. The quality of the expressed behavior has an influence of the intelligence of the person. Though the function of the behavior is very much complicated, every individual is expected to behave in a manner, which is in tune with the accepted norms of the society or environment in which he /she lives. This expectation on the behavior is extended to the routine life pattern of everyday activity. This necessitates the individual to adapt himself to the requirements of present day functioning. This is termed as Adaptive Behaviour. Adaptive behavior allows individuals to adapt in a positive manner to various situations. It is a functional adjustment to a particular behavior. Adaptive behavior creates a condition where the individual can truly develop and grow. In our day to day life, if a particular behavior is constructive and productive it can be considered as adaptive behavior.

4.2 Objective
After going through this unit you will be able to ●

Define

adaptive and maladaptive behavior. ● Demonstrate understanding of maladaptive behaviour. ● Narrate strategies for management of inappropriate behavior. ● Management of maladaptive behavior at home and school.

4.3 Definition and Types of Maladaptive Behaviour

4.3.1 Definition of Maladaptive Behaviour

Maladaptive behaviors refer to types of behaviors that inhibit a person's ability to adjust to particular situations. Maladaptive behaviors are never good because they prevent people from adapting to the demands of life.

140

Many times, children with mental handicap show behaviours that are considered as maladaptive behavior

because of the harm or inconvenience they cause others, or to the child himself. The presence of maladaptive behavior interferes with learning in the school and classroom. Maladaptive behavior could be because of a number of reasons. From the behavioural point of view it may be due to lack of communication skills, cognitive skills or problem solving skills. It may also be due to

the wrong handling or the people in the environment of the child.

4.3.2 Types of Maladaptive Behaviour

Maladaptive behaviors in students can appear in countless ways. Some categories and examples are explained below. ● Stereotypical Behavior - repetitive movement, posture or utterance. Examples: hand play, rocking, echolalia (repeating words or phrases) ● Ritualistic Behavior - an attempt to regulate something concrete and controllable because the person cannot identify and control a problem - often manifests in compulsive behavioral. ● Self-Injurious Behavior - any behavior that can cause damage to the individual. Examples: head banging, self-biting, scratching. pica (consumption of inedible items) ● Tantrums - a combination of two or more maladaptive behaviors. Examples: screaming, crying, and

dropping to the ground. ● Aggression - an act of violence to another person or object. Examples: hitting, kicking, biting, slapping, pinching, grabbing, pushing. ● Transition Difficulties - Some students become easily upset when asked to transition to a new area or task. ● Running/Darting - Running out of the classroom, away from the area, or away from adults. ● Compliance/Following Directions/Opposition Lack of cooperation with

instructions/ demands. ● Verbally Inappropriate Behavior Disruptive to classroom, peers or individual learning/success. Examples: name calling, swearing, screaming, whining, cursing ● Hyperactive Behaviour

141 4.4 Identification of Maladaptive

Behaviour Before a functional behavioral assessment can be implemented, it is necessary to pinpoint the behavior causing learning or discipline problems, and to define that behavior in concrete terms that are easy to communicate and simple

to measure and record. If descriptions of behaviors are vague (e.g., poor attitude), it is difficult to determine appropriate interventions. Examples of concrete descriptions of problem behaviors are: Problem Concrete Definition Behavior Ravi hits other students Ravi is during recess when she aggressive. does not get her way. Sam makes irrelevant and Sam is inappropriate comments disruptive. during class discussion. Rita leaves her assigned Rita is area without permission. hyperactive. Rita completes only small portions of her independent work. Rita blurts out answers without raising her hand. It may be necessary to carefully and objectively observe the student's behavior in different settings and during different types of activities, and to conduct interviews with other school staff and caregivers, in order to pinpoint the specific characteristics of the behavior. 4.4.1 Steps in identification of Maladaptive Behaviour The behaviour modification technology for decreasing the undesirable behaviour

involves a detailed assessment of the child in tune with the principle of developing IEP. The following steps are involved in this process. I. Identification of Problem Behaviour: Once problem behaviour is brought to the notice of the teacher, it is his/her duty

to

identify it appropriately - by applying the guidelines given in this regard.

142 II. Behavioural Description of Problem Behaviour: In behaviour modification, symbolic terms of the behaviour has no value. Only behavioural terms are used for describing a behaviour. For example, the problem behaviour 'anger' can be viewed as, abusing somebody, shouting at others, beating others, or self-beating throwing things at others. Hence, by using the term 'anger' it is essential that the behaviour is described in an objective manner which could be observed and measured.

III. Principle for

Selection of Problem Behaviour: A child may possess more than one problematic behaviour. But only one or two problems at a time is

selected for

management since, selection of more problems would pose difficulty in controlling the environmental factors which has influence on behaviour is done by applying the following criteria. a) Choosing the problem behaviours which are easy to manage

as this will help the teacher to gain confidence in managing more difficult problem behaviour later.

b) Choosing problem behaviours which are dangerous in nature for self or to others

IV. Baseline Assessment (Observation Technique): Observation is the process in which one/more persons observe what is occurring in some real life situation and pertinent happenings are classified and recorded according to some planned scheme. There are four points for observation: a) What to observe, b) When to observe, c) How to observe, and d) Where to observe. Behaviour can be observed by direct observation or by automatic recording. Commonly used observation techniques are: a) Event or Frequency recording: In the event or frequency recording, the number of occurrences of the problem behaviour is documented after direct observation for a specified period of time in a given day, which is repeated for a minimum of three days. This will enable the teacher/person concerned to get more idea about the behaviour under observation. This will also enable to find out the average occurrence of the problem behaviours like, beating, pushing, not sitting at one place etc. (the occurrence of the behaviours which could be counted in numbers). It is not appropriate for behaviours, where it is difficult to count. b) Duration Recording: This is used to record behaviours which vary in its length of occurrence. For examples, not paying attention in the class (staring out, over active behaviour, rocking behaviour, etc. Recording of the behaviour is obtained by documenting for a specified period of time in given day, which is repeated for

143 a minimum of three days. The average duration of occurrence of the problem behaviour could be calculated for the specified period of time. This method is useful to record behaviours which vary in length. However, continuous attention is required for accurate assessment, which may not be always possible in group teaching set-up. c) Interval Recording: Occurrence of the problem behaviour is observed in short span of intervals like, observing the behaviour in everyone hour for five minutes. It can be used for recording both frequency and duration responses. However, even if the problem behaviour occurs in between, the recording will be done only during the interval chosen for the same. d) Time Sampling: The problem behaviour is recorded only at a predetermined time. For example, observing the behaviour of the child at every 30 minutes interval. This method is used when the frequency or the duration of the problem behaviour is more. It does not require continuous observation. 4.5

Functional Analysis and Behaviour Modification Techniques, Cognitive Behaviour Techniques. 4.5.1 Functional analysis

The term functional analysis was used by Skinner (1953) to denote empirical demonstrations of "cause-and-effect relations" between environment and behavior; however, the term has been extended by behavior analysts and psychologists in general to describe a wide range of procedures and operations that are different in many important ways. Functional Analysis is the process of understanding the complexity of the problem behaviour in its simpler or most elementary parts. The problem behaviours which are learnt may have various environmental influences. According to learning theories, learning occurs through association (classical and operant conditioning), and observation learning etc.

There are a number of models available for analysing behaviour problems. One of the simplest models is known as A-B-C model,

which is used commonly to analyse problem behaviours of mentally retarded children. This model helps to identify the factors, which contribute to the occurrence of the problem behaviours.

144 A stands for the ANTECEDENT factors. The analysis of antecedent will help the teacher to find the factors which contribute to the problem behaviour before its occurrence. The following factors have to be looked into to get more information in this regard: a) When does the problem behaviour generally occur, - during recess, or in the class room when the teacher is busy with another student, or during lunch break. b) Are there particular times of the day when the problem behaviour tends to occur more - for example, during morning hours or meal times. c) With whom

does

the problem behaviour occur - are there specific places or situation where the problem behaviour occurs. - in the school playground or classroom or at home or when the child is sitting alone.

d) Where does the problem behaviour occur, that is, are there specific place or situation where the problem behaviour occurs, Example-in the school playground or classroom or at home or when the child is sitting alone.

B stands for the BEHAVIOUR that is, what happens during the problem behaviour. Result from the base line assessment of the behaviour will help to analyse the 'during' factors contributing to the problem behaviour, that is, it will answer the following question: How many times does the problem behaviour occur, or for how long does the problem behaviour occur.

C stands for the CONSEQUENCES of the behaviour, that is, the factor which follow immediately after the behaviour.

Analysis of 'after' factors includes answering the following question: a) What is The Reaction of the people around the child immediately after the occurrence of the problem behaviour? b) What effect does the problem behaviour have on the given child or others? c) Does the child benefit or gain something by indulging in the problem behaviour? The analysis of consequences or after factors generally shows that most of the behaviours have a link with benefits (reward or reinforcement). As per the operant conditioning therefore,

if there were no benefits, the behaviour would cease to occur.

Thus functional analysis gives the complete details which would help in identifying the reasons for the behaviour. 4.5.2

Behaviour Modification Techniques ❖ It is based on thorough understanding of the antecedents and consequence of the behavior.

145 ❖ The same problem behavior of beating others may not have the same management technique if the antecedents and consequence are different. ❖ Technique to reduce the occurrence of problem behavior are broadly divided into two categories. ■ Direct punishment technique ■ Non-punishment technique * Punishment is the presentation of an aversive stimulus or withdrawal of reward to decrease the occurrence of the target behaviour. * Punishment should not be confused with negative reinforcement. * Non-punishment techniques are the first choice of management plan for reducing the undesirable behavior. Because - * No one has ethically right to physically hurt someone or deprive others of their rights. * Ideally it should not be used. * Punishment should be used only when the other techniques are failed.

Direct Punishment Techniques Environment restructuring * Here we are trying to search of the appropriate antecedents factors which leading to problem behavior. * We are removing the problem behavior by changing antecedents factors. Ex-Hair pulling. Poor concentration. Eating inedible things. * Usually this technique has to be used along with other technique for more effective results. Extinction / Ignoring It is required to don't pay attention to the child whenever, he is showing problem behavior. Indications This technique is mainly used in the case of attention seeking behavior which include- - Crying

146 - Making unnecessary noise. - Talking with friends during class hours - Interrupting other works - Asking the same question again and again - Repeatedly wanting to shake hand - Saying 'NAMASTE' every time when meet the teacher. - Asking to go to toilet too frequently. - Complaint about other children - Using mild abusive language. - Showing the new dress he has worn, again and again. Note: When this technique is used, initially there is increase in the problem behavior. However, in the long run they will gradually decrease. Whenever, this technique is used, then all others concerned with the child have to apply this technique. Otherwise, if attention is not given by one person the child may obtain it from others and problem behavior shall be maintained. Limitation Never use this technique when problem behavior is considered as dangerous to the child himself or others. Time Out Whenever, the child is showing problem behavior either the child is removed

from the reward or reward should be removed from the child for a particular period of time.

Example - - Standing the child in the corner of the wall immediately following problem behavior. - Sitting alone for few minute (usually 2 to 5 minutes) -

Insist the child to place his head on the desk in a head down position. *

Place the child outside the sphere of learning activities from where he can see or hear the activities of others but can't participate in it. Example - to tell the child to stand on the bench after following problem behavior

147 * It is important to note that whatever you take away from the child, it must be considered pleasant by the child. *

Application of timeout should be done immediately after a problem behavior. * Avoid to giving lectures before, during or after the use of timeout technique. * Place the child in the timeout only for short periods of time no more than 2 to 5 minutes after each occurrence of problem behavior. * Once the child is taken out from timeout room he should not be given any special treatment like. - Do you want to take water? - Avoid to telling him he should not do it again. * Bring the child out of the room, leave him and continue your own activities. * If the child indulgesun desirable behaviour after coming out from the time out, reward him, praise him. If not then again place him in timeout room. Seclusion Timeout- place the child in the isolated room from where he can neither see nor hear or participate in the activities of others.

Indications - This technique can be used in the case of aggressive and destructive behavior, which includes: - Pulling others hairs. - Kicks others/objects/utensils. - Break things. - Snatches books. - Throwing articles. - Hitting others. - Pinching others. Note Timeout only teaches the children what not to do. It does not teach the child what to do. In order to teach the child what to do we must combine the use of timeout by giving rewards for appropriate behavior. Response prevention Response prevention is a procedure where we are preventing the undesirable behavior even before its occurrence.

148 E.g. - holding the hand of the child before beating - for preventing to occur. Response prevention may elicit an immediate and forceful repetition of the undesirable behavior. Physical restraint Physical restraint is the restricting the physical activities of the child after the occurrence of an undesirable behavior. Whenever the child is showing problem behavior like pinching others, hold the child's arm as tightly as possible and maintained eye to eye contact in angry face with the child and say loudly 'no stop it'. Holds the child's arm for a sorter period of time, not more than 30 seconds.

Provide reward to the child when he is behaving properly. Over a number of trials this enable the child's to stop the problem behavior even to an emphatic 'NO'. Indication - this technique can be used 111 the case of self-injurious behavior, which includes - Head banging - Hair pulling - Biting self - Thumb sucking - Paper tearing - Hitting others

Response cost ❖ This method is generally used when tokens are being used for

increasing the desirable behavior. ❖ Following a particular problem behavior some ofthe tokens earned by the child is token back . ❖ Hence, the person has to pay the cost of doing a particular undesirable behavior. ❖ This technique is useful only when the child is able to understand the relationship between the problem behavior and his earned privileges being cost.

149 ❖ Specify and fix the rules in front of the child for which specific problem behavior what privileges are to be lost. ❖ Avoid nagging, threatening or giving warning to the child before, during and after the application of this technique. Indication - The child refuses to work on assignment. - Doing opposite whatever requires. - Not following the commands of parents/ teacher. - Always coming late. - Hits other children. - Uses 'bad' words. - Works off seat etc. Restitution/Restoration Restitution or restoration refers to a procedure that requires an individual to return the environment to its state prior to a behavior that changed the environment. That is, restoring the disturbed environment back to the normal condition. For example: if a child throwing rubbish paper on the floor is to pick up the same and put it in the waste paper basket. Over -Correction: It means restoring the disturbed environment back to more than normal conditions. For example: the person following a problem behavior, i.e., throwing food on the floor is to asked to clean not only that area but the entire room. After the occurrence of problem behavior, the child is required to restore the disturbed situation to a state that is much better than earlier (before the occurrence of problem behavior). For example: If the child passes urine in the class, he would be required to not only clean the dirty area but also mop the entire area of the floor. If the child refuse to restore the damage done by him-

150 He must be physically made to carry out to do so Withheld his preferred activities/food etc. Never reward the child after he has finished restoring the damage to a better position than it was before. This technique not only decreases the problem behavior but it increases the adaptive behavior also. Positive Practice: Positive practice refers to practicing an appropriate behavior as a consequence Cor inappropriate behavior. It means stopping all activities, whenever an error occurs and the carefully performed the correct behavior several times. No reinforcement is awarded after the positive practice is implemented. Aversive Therapy This is the last method of treatment to be used if other method fails to control a particular problem. Aversive therapy is techniques that reduce the frequency of the undesirable behavior by associating it with real aversive stimuli during a conditioning procedure. Indications • Severe head banging • Other stimuli type of self-injurious behavior • Touching genital area of the opposite sex. Non Punishment Techniques The aim of non-punishment techniques is to reduce undesirable behavior and the occurrence of a desirable behavior simultaneously. There are four types of differential reinforcement. DIFFERENTIAL REINFORCEMENT OF INCOMPATIBLE BEHAVIOR (DRI) OR DIFFERENTIAL REINFORCEMENT OF OPPOSITE BEHAVIOR (DRO) 151 Here, the teachers reinforce those appropriate behavior where is exactly opposite to the problem behavior for example: - in the case of hyperactive children who often shows 'out of the seat' behavior for this children can take every opportunity to reward its opposite i.e., 'on-seat' behavior. Do not talk to the child when he is out of his seat but praise him when he is sitting on his seat and attending to his work. In the long run, the child is more likely to attend to his work in future. DIFFERENTIAL REINFORCEMENT OF OTHER BEHAVIOR (DRO) Reinforce the child at the end or every pre-decided time-interval during which target problem behavior did not occur- for example: In the case of hyperactive child, to bring down 'out of seat behavior' decides to immediately reward the child at the end of each 5 minutes interval, if the child did not get up from his seat. A child who beat others for minor reason does not do that for a specific period of time and in engaged in some other activities which is not problematic, is reinforced. DIFFERENTIAL REINFORCEMENT OF ALTERNATIVE BEHAVIOR (DRA) It is the process involving the diversion of an undesirable behavior by presenting a desirable behavior and reinforcing it. For example: two children who fight frequently for trivial reason are given an opportunity to work together to make something. Both of them like very much, and are frequently reinforced for their joint effort. Over a period of time the frequent fighting behavior is replaced by a desirable behavior of joint completion of a task. DIFFERENTIAL REINFORCEMENT OF LOW RATE OF BEHAVIOR (DRL) This technique is used when a behavior in its low frequency is desirable but when occurs more frequently is undesirable. The technique involved reinforcing the behavior in its low frequency level and ignoring it in its high frequency level. e.g. A child who repeatedly asking the teacher whether tomorrow is holiday? Here this question once is reasonable and desirable behavior. But repeatedly asking the same question is undesirable. For solving this despite telling him every time that it is not a

152 holiday responding to his question only once and not paying attention to other time when it is repeated. Over a period of time will make the child to maintain the desirable behavior in its required frequency. (ii) If the child ask permission to go to the toilet too frequently. Solution: Reward if he goes to the toilet only once in three hours. Note: This technique only reduces the intensity of the misbehavior, not eliminate completely. 4.5.3 Cognitive Behaviour Techniques Cognitive behaviour techniques /therapy is an "active, directive, time limited, structured approach. Based on the underlying theoretical rationale that an individual's affect and behaviour are largely determined by the way in which he structures the world" (Beck et al. 1979, p.3). CBT is • Brief and time-limited, encouraging students to develop independent self-help skills. • Problem-oriented and focused on factors maintaining difficulties rather than on their origins. • Educational, presenting cognitive-behavioural techniques as skills to be acquired by practice and carried into the young person's environment through homework assignments. • Evidence-based and derived from learning theory. Cognitive Techniques involves: The identification of unhelpful, negative thoughts or beliefs using monitoring forms. The detection of distortions in thinking patterns, and The challenging of cognitive distortions and the development of a more helpful, adaptive way of thinking: 1. What is the evidence for the thought? 2. Is there an alternative, more helpful way of thinking?

153 4.6 Management of Maladaptive Behavior at Home and School

Behavior modification is based on the principles of operant conditioning, which were developed by American behaviorist B. F. Skinner (1904-1990). Skinner formulated the concept of operant conditioning, through which behavior could be shaped by reinforcement or lack of it.

Skinner considered his concept applicable to a wide range of both human and animal behaviors and introduced operant conditioning to the general public in his 1938 book, *The Behavior of Organisms*.

One behavior modification technique that is widely used is positive reinforcement, which encourages certain behaviors through a system of rewards. In behavior

therapy, it is common for the therapist to draw up a contract with the client establishing the terms of the reward system.

Another behavior modification technique is negative reinforcement. Negative reinforcement is a method of training that uses a negative reinforcer. A negative reinforcer is an event or behavior whose reinforcing properties are associated with its removal. For example, terminating an existing electric shock after a rat presses a bar is a negative reinforcer.

In addition to rewarding desirable behavior, behavior modification can also discourage unwanted behavior, through punishment. Punishment is the application of an aversive or unpleasant stimulus in reaction to a particular behavior. For children, this could be the removal of television privileges when they disobey their parents or teacher. The removal of reinforcement

altogether is called extinction.

Extinction eliminates the incentive for unwanted behavior by withholding the expected response.

A widespread

parenting technique based on extinction is the time-out, in which a child is separated from the group when he or she misbehaves. This technique removes the expected reward of parental attention. 4.6.1.

Management of Maladaptive Behaviour at Home

One of the biggest challenges parents face is managing difficult or defiant behavior on the part of children.

The first step in a good behavior management plan is to identify target behaviors. These behaviors should be specific (so everyone is clear on what is expected), observable, and measurable (so everyone can agree whether or not the behavior happened).

154

Positive Behaviour Tips for Parents 1. Will have to remember 5 positives to 1 negative 2. Will have to set the stage for success and reward the effort 3. Will have to give clear, specific directions 4. Will have stay calm and use a calm voice 5. Will have to set reasonable limits - Avoid using "always" or "never" 6. Will have to be consistent. 7. Will have to set the example - Actions speak louder than words 8. Will have to proactively anticipate situations 9. Should have patience - A little goes a long way. 4.6.2 Classroom Behavioural Strategies and Intervention

Unique and individual interventions are more important than any prescribed behaviour program. Some examples of useful interventions include building relationships, adapting the environment, managing sensory stimulation, changing communication strategies, providing prompts and cues, using a teach, review, and reteach process, and developing social skills. The classroom teacher needs to ensure acceptance for

all students in the classroom. Teachers' actions that can promote acceptance include • choosing learning materials to represent all groups of students • ensuring that all students can participate in extra activities • valuing, respecting, and talking about differences • celebrating cultural and ethnic differences • ensuring that learning activities are designed for a variety of abilities •

ensuring that all students are protected from name-calling or other forms of abusive language. • make the student aware of his or her timetable • post timetables (with pictures)

to show daily routines • prepare students for transitions or changes

155 • make special arrangements for recess and lunch time, if necessary • rephrase instructions, breaking them down into small steps • using visual cues • using pictures to illustrate steps in a process • using sign prompts (e.g., red traffic light or stop

sign) Effective feedback should be immediate and follow the demonstration of an appropriate behaviour, the use of a routine, or the successful completion of teacher instructions. Research has shown that positive reinforcement can lead to improved behaviour.

A- good

general rule is that positive feedback should occur three times as frequently as negative feedback. The positive feedback does not always have to be verbal - it can also include praise, hugs, smiles, handshakes,

nods, and eye contact. 4.6.3. Parental Counseling Parent counseling and training is one of the most effective and underutilized related services - Research demonstrates that parent counseling &/or training can have a dramatic and positive impact on student behavior; yet it's rarely delineated on IEPs. The effects of parent training in preventing and reducing conduct problems are most impressive when intervention begins early, during early childhood or the early school years. Early intervention also has more lasting effects when parent training incorporates an academic/ cognitive component. Effective parent counseling/training programs teach parents to break a coercive & punitive parenting approach by promoting the following parenting and/or teaching skills: 1. The use of social and tangible reinforcement techniques (e.g., attention, treats, praise, privileges, etc.) for pro-social behavior (s) with their children, including: a. Recognizing and reinforcing desired behaviors. b. Social and tangible reinforcement techniques (e.g., praise, differential-attention, encouragement, point systems, privileges, and treats) c. Problem-solving and negotiation strategies. d. Giving direct commands in such a way as to gain more compliance. e. Cognitive behavioral approaches such as mutual problem-solving strategies, self- management principles, and self-talk approaches to cope with depressive and self-defeating thoughts.

156 2. The use of less coercive discipline techniques and recognizing, tracking, and addressing problematic behaviors: a. Effective response to inappropriate behaviors. b. Setting limits effectively. c. Using nonviolent discipline procedures, such as time-outs, short-term privilege removal, response cost, work chores, and logical and natural consequences, and monitoring. d. The use of problem-solving and negotiation strategies. 3. Strengthening the parent and child relationship through a variety of techniques and strategies: a. Recognizing their children's positive qualities. b. Non-directive &/or child-directed play skills c. Responding to their children in a sensitive and genuine manner d. Teaching children and parents conflict management skills and self-control techniques e. Monitoring their children even when the children are away from home. 4.6.4 Individual, Group and Community Counseling Counseling's purpose is to provide help to those who need it. It embraces the adage that 'an ounce of prevention is equal to a pound of cure.' Counseling seeks to help people before the problem becomes heightened to a pathological level. Counseling comes in multiple ways depending on the nature of the problem it is concerned with. Individual counseling is counseling focused on the individual's immediate or near future concerns. Individual counseling is a one-on-one discussion between the counselor and the client, who is the person seeking treatment. The two form an alliance, relationship or bond that enables trust and personal growth. Group counseling is counseling with multiple individuals facing a similar concern. The strength in group counseling is that if you have 3, 5 or 10 people together all facing the same issue or similar issues, then they can work together. For example, group counseling is common for those in the midst of a divorce. The individuals in the group act as a

157 source of insight and support while reinforcing the idea that each individual is not the only one experiencing these problems. Community counseling services are often more specialized, allowing professionals to help their clients with a more particular set of skills. Community counseling is often located much closer to where patients actually live. This makes it easy for those with reduced mobility to attend their appointments without incident or delay. Community counseling takes the service outside of the setup and puts it directly into the community, and that's where this particular type of counseling gets its name.

4.7 Ethical Issues in Behaviour Management and Implications for Inclusion

The decision regarding what should be taught and how to teach children with mental retardation is very crucial. It is advisable to follow a team approach in the planning, programming as well as implementation of the techniques of behavior change. The team must necessarily include the concerned staff at school, specialist as well as parents of children with special needs. To the extent possible the child should be included in the team. The team approach has the greatest advantage that the child's need will be taken care of from all the aspects.

Classroom management involves encouraging students to change their behaviours. However, before and during any change process the following ethical issues must be considered.

1. Model appropriate leadership The student must see the educator's behavior as positive. To do this, the educator must develop a relationship of genuine caring, trust, and respect with the child. The child will then model her/his behavior after the educator's behavior.
2. Self-discipline Because self-discipline is the goal of behavior management, teachers should encourage it in the classroom. By building respect and trust, the child will begin to feel the need to control her/his own behavior. This respect and trust can be fostered by positive interactions.
3. Match experiences to the student Children should have positive experiences in school. An experience is usually positive if it is within the developmental stage of the child and has meaning for the child.
- 158 4. Show empathy The educator needs to consider the child's problems objectively to deal with them. Emotion inhibits objective thinking, while empathy allows us to view the problem from different perspectives.
5. High expectations Teachers must communicate to children their belief in each child's abilities and demand the highest achievement from them.
6. Freedom and independence to function Children should be allowed as much independence to function as possible. If limits need to be established to avoid undo failure or injury students should be allowed to experience the logical consequences of their actions. This must be done to develop self-reliance and independence.
7. Principle of normalization The child must be allowed to function in as normal an environment as possible.
8. Principle of fairness The intervention must be fair and allow the child to succeed in school. If consequences are applied they must be appropriate with regard to the degree of the offense.
9. Principle of respect for dignity and worth of the individual The intervention must provide the student an opportunity to learn or improve skills to master control over the student's environment without degrading the individual as a human being.
10. A continuum of behavior management interventions The educator should use the intervention which least restricts the child in the classroom, yet is still effective. Over-restricting the child imposes on the student's rights within the classroom.
11. Behavior change must be rational and well planned The behavior must be a behavior which hampers the child's performance in the classroom, the educator must have a rationale for changing the behavior, and follow a behavioral change procedure that will result in the implementation of a behavioral strategy that is prescriptive to the behavior and does not violate the ethical considerations or due process.
- 159 12. Consent. The educator should be sure to notify those involved with the child of the management procedures and obtain consent to proceed. This practice will help avoid conflict over the behavior intervention.

4.8

Let us Sum-Up 1. Behavior

modification refers to the techniques used to try and decrease or increase a particular type of behavior or reaction. This might sound very technical, but it's

used very frequently by all of us. Parents use this to teach their children right from wrong. Therapists use it to promote healthy behaviors in their patients. Animal trainers use it to develop obedience between a pet and its owner. We even use it in our relationships with friends and significant others. Our responses to them teach them what we like and what we don't.

2.

The purpose behind behavior modification is not to understand why or how a particular behavior started. Instead, it only focuses on changing the behavior, and there are various different methods used to accomplish it. This includes:

- Positive reinforcement
- Negative reinforcement
- Punishment
- Flooding
- Systematic desensitization
- Aversion therapy
- Extinction

3. Positive reinforcement is pairing a positive stimulus to a behavior. A good example of this is when teachers reward their students for getting a good grade with stickers. Positive reinforcement is also often used in training dogs.

Pairing a click with a good behavior, then rewarding with a treat, is positive reinforcement. 4. egative reinforcement is the opposite and is the pairing of a behavior to the removal of a negative stimulus. A child that throws a tantrum because he or she doesn't want to eat vegetables and has his or her vegetables taken away would be a good example.

160 5. Punishment is designed to weaken behaviors by pairing an unpleasant stimulus to a behavior. Receiving a detention for bad behavior is a good example of a punishment. 6.

In behavior modification, extinction eliminates the incentive for unwanted behavior by withholding the expected response.

A widespread

parenting technique based on extinction is the time-out, in which a child is separated from the group when he or she misbehaves. This technique removes the expected reward of parental attention. 4.9

Check Your Progress A. 1. What is maladaptive behaviour?

.....
.....
.....

..... 2. Explain the different behavior modification techniques?

.....
.....
.....
.....
.....

..... 3. Discuss about the A-8-C Model.

.....
.....
.....

Structure 5.1 Introduction 5.2 Objectives 5.3 Occupational Therapy: Definition, Objectives, Scope, Modalities and Intervention 5.3.1 Definition of Occupational Therapy 5.3.2 Aims of Occupational Therapy 5.3.3 Objectives of Occupational Therapy 5.3.4 Scope of Occupational Therapy 5.3.5 Modalities of Occupational Therapy 5.3.6 The Intervention Process 5.4 Physiotherapy: Definition, Objective, Scope, Modalities and Intervention. 5.4.1 Definition of Physiotherapy 5.4.2 Aims and Objectives of Physiotherapy 5.4.3 Scope of Physiotherapy 5.4.4 Modalities of Physiotherapy 5.4.5 Intervention of Physiotherapy 5.5 Speech Therapy: Definition, Objectives, Scope, Types of Speech, Hearing and Language Disorders and Intervention 5.5.1 Definition of Speech and Language Therapy 5.5.2 Objectives of Speech Therapy 5.5.3 Scope of Speech Therapy 5.5.4 Types of Speech, Hearing and Language Disorder. 5.5.5 Speech and Language Intervention 164 5.6 Yoga and Play Therapy: Definition, Objectives, Scope and Intervention 5.6.1 Meaning and Definition of Yoga 5.6.2 Objectives of Yoga 5.6.3 Scope of Yoga Therapy 5.6.4 Yoga Intervention 5.6.5 Definition of Play Therapy 5.6.6 Scope of Play Therapy 5.6.7 Importance of Play Therapy 5.6.8 Objectives of Play Therapy 5.6.9 Intervention of Play Therapy 5.7 Therapeutic Intervention: Visual Arts and Performing Arts (Music, Drama, Dance, Movement and Sports) 5.7.1. Visual Arts and Performing Arts 5.7.2 Music therapy 5.7.3. Drama Therapy 5.7.4 Dance and Movement Therapy 5.7.5 Sports Activities for Children with Special Needs 5.8 Let us Sum Up 5.9 Check your Progress 5.10 Reference 5.1 Introduction Treatment of developmental disabilities can come in a variety of different forms. The best treatment regimens are the result of an individualized treatment plan formed by a team of health care multidisciplinary professionals. The plan will be based on the severity of the disability and should involve patients, families, teachers, and caregivers in all phases of planning, decision making, and treatment. The individualized treatment plan will take into consideration both the immediate needs of the patient, and the long term prognosis for development. 165 Occupational therapy, or OT for short, is a treatment therapy that helps people achieves independence in all facets of their lives. If a child has physical disabilities or developmental delays, occupational therapy can improve their cognitive (thinking), physical and major skills as well as address psychological, social, and environmental factors that impact the child's functioning. Physical therapy (PT), or sometimes called physiotherapy, focuses on improving gross and fine motor skills, balance and coordination, and

strength and endurance. The child may be evaluated by a physical therapist to assess muscle and joint function, mobility, strength and endurance, oral motor skills such as feeding and talking, posture and balance, even the status of the heart and lungs. Speech therapy is a clinical program aimed at improving speech and language skills and oral motor abilities. This means talking, using sign language, or using a communication aid. Children who are able to talk may work on making their speech clearer, or on building their language skills by learning new words, learning to speak in sentences, or improving their listening skills. Dance and creative movement provide physical challenges in a structured, supportive environment for sensory integration. The intimate connection with music often makes dance feel less like exercise or physical therapy and more like leisure. Dance/Movement Therapy (DMT) has been used in the United States since World War II. Marian Chace, a dancer, choreographer, and teacher of modern dance in Washington D.C. during the 1930s and 1940s, first developed the mind-body connection as a form of therapy for her dance students. She "questioned why pupils who had no intention of being professional came to take dance classes" and started gearing her classes toward the needs and interests of recreational dancers. In 1942, she was asked to work with returning soldiers from World War II at St. Elizabeth's Hospital in Washington D.C. Dance/movement therapy was seen as promising because it could so easily be a group treatment. Chace developed her methods working with institutionalized, often schizophrenic and psychotic, individuals. Music therapy enhances one's quality of life, involving relationships between a qualified music therapist and individual; between one individual and another; between the individual and his/her family; and between the music and the participants. These relationships are structured and adapted through the elements of music to create a positive environment and set the occasion for successful growth.

166 Music Therapy is a well-established, research-based profession in which music is used to accomplish therapeutic and educational goals. Recreational therapy is based on the idea of increasing a person's independence and ability to function through participation in creative arts, dance, sports, adventure programs and puzzles or logic games. It is a holistic approach to wellness. According to the American Therapeutic Recreation Association, recreational therapy "aims to improve an individual's functioning and keep them as active, healthy and independent as possible in their chosen life pursuits." In most cases, these goals are accomplished by combining a person's speech, fine motor or gross motor goals with community involvement, while engaging in the person's preferred interests. 5.2

Objectives After going through this unit you will be able to

l
Define the different therapies like occupational, physio, speech, yoga and play, music, dance and movement.

l
Discuss the aims and objectives of the different therapies. l Narrate the scope and modalities of the therapies.

l
Describe the intervention procedures of the therapies. 5.3 Occupational Therapy: Definition, Objectives, Scope, Modalities And Intervention. 5.3.1 Definition of Occupational Therapy Occupational therapy is a method of treatment for which the primary area of concern is the patient's ability to perform functions required in day to day life. This method of treatment is also concerned with the social, psychological and cognitive development of the patient. In the early years, occupational therapy was regarded as a means to keep long term convalescent patients occupied. It derived the name "Occupational therapy" owing to this. Its contribution was limited to the field of chronic illness - mental illness, tuberculosis, leprosy etc.

Occupational therapy is a client-centred health profession concerned with

167 promoting health and well-being through occupation. The primary goal of occupational therapy is to enable people to participate in the activities of everyday life. Occupational therapists achieve this outcome by working with people and communities to enhance their ability to engage in the occupations they want to, need to, or are expected to do, or by modifying the occupation or the environment to better support their occupational engagement. (WFOT 2012) "

Occupational therapy is the art and science of directing man's participation in selected tasks to restore, reinforce and enhance the performance, facilitate learning of those skills and functions essential for adaptation and productivity, to diminish or correct pathology and to promote and maintain health." (Council of Standards, American Occupational Therapy Association, 1972) 5.3.2 Aims of Occupational Therapy A person with intellectual disability is observed to have dysfunction in almost all performance components. The specific aims of occupational therapy for persons with intellectual disability are as follows. (a) To facilitate the development of performance components of the patients. (b) To enhance independence of the patients. (c) To provide sensory stimulation. (d) To improve hand functions. (e) To enhance gross motor functions. (f) To facilitate development of perceptual motor functions. (g) To reinforce social development. (h) To enhance independence skills. (i) To provide vocational training. (j) To correct mal adaptive behaviour. (k) To provide extrinsic adaptations.

168 5.3.3 Objectives of Occupational Therapy Occupational Therapists work with children who have difficulties with the practical and social skills necessary for their everyday life. An Occupational Therapist will aim to enable the child to be as physically, psychologically and socially independent as possible. Occupational Therapists work in close partnership with the child and their family, schools and other healthcare professionals. Together they have a shared responsibility for meeting the child's needs. In schools, for example, they evaluate the child's abilities, recommend and provide therapy, modify classroom equipment, and help the child participate as fully as possible in school programs and activities. A therapist may work with the child individually, lead small groups in the classroom, consult with a teacher to improve the functioning skills of the child etc. Occupational therapy is provided when there is a disruption in function in one or more of the following the areas: Gross Motor Skills: Movement of the large muscles in the arms, and legs. Abilities like rolling, crawling, walking, running, jumping, hopping, skipping etc. Fine Motor Skills: Movement and dexterity of the small muscles in the hands and fingers. Abilities like in-hand manipulation, reaching, carrying, shifting small objects etc. Cognitive Perceptual Skills: Abilities like attention, concentration, memory, comprehending information, thinking, reasoning, problem solving, understanding concept of shape, size and colors etc. Sensory Integration: ability to take in, sort out, and respond to the input received from the world. Sensory processing abilities like vestibular, proprioceptive, tactile, visual, auditory, gustatory and olfactory skills. Visual Motor Skills: A child's movement based on the perception of visual information. Abilities like copying. Motor Planning Skills: Ability to plan, implement, and sequence motor tasks. Oral Motor Skills: Movement of muscles in the mouth, lips, tongue, and jaw, including sucking, biting, chewing, blowing and licking. Play Skills: To develop age appropriate, purposeful play skills Socio-emotional Skills: Ability to interact with peers and others.

169 Activities of daily living: Self-care skills like daily dressing, feeding, grooming and toilet tasks. Also environment manipulation like handling switches, door knobs, phones, TV remote etc. Occupational therapists in schools collaborate with teachers, special educators, other school personnel, and parents to develop and implement individual or group programs, provide counselling, and support classroom activities. Occupational therapists design and develop equipment or techniques for improving existing mode of functioning. 5.3.4 Scope of Occupational Therapy Occupational Therapists work with parents/care givers and others to assess if a child has difficulties with practical and social skills. Occupational Therapists assess the physical, psychological and social functions of the individual identify areas of dysfunction and involves the individual in a structured programme of activity to overcome disability. Following assessment, the Occupational Therapist will design and implement programs with appropriate strategies in order to enable the child to maximize his/her potential. Occupational Therapists provide services to individuals often in conjunction with physicians, social workers, psychologists, and other therapists. Occupational therapists use qualitative and quantitative assessment methods, including standardized tests, as well as devices, to analyze and diagnose the nature and extent of dysfunction. Occupational therapists develop an individualized plan of care, tailored to each patient's needs. 5.3.5 Modalities of Occupational Therapy Occupational Therapy is a form of treatment which directs the patients to practice and master human activities. Thus human activity is indeed the foremost modality of occupational therapy. The modalities of occupational therapy

are as 1. Human Activity. 2. Extrinsic adaptation: Extrinsic adaptation is a adaptation in the physical, natural or non human environment of the person. Here adaptation refers to the structural adjustment or change in factors in the environment.

170 3. Splints and pressure garments. 4. Therapist. 5. Environment 6. Teaching/ Learning Process. 5.3.6 The Intervention Process Occupational therapy intervention for people with intellectual disability is an on-going process that is both gradual and dynamic. Treatment is provided throughout the life cycle in accordance with the client's changing needs, desires and preferences in all areas of occupation. The intervention often requires repeated drills and practice to achieve internalization and learning, and performance in a variety of contexts to enable generalization. As is the case with respect to assessment, the intervention is preferably carried out in the client's various daily environments. This enables and encourages the client's participation in the many contexts of his/her life. Occupational therapy interventions for people with intellectual disabilities are specifically adapted to the client with respect to the degree and type of support needed as well as the context. Interventions may include direct treatment as well as environmental adaptations, guidance, monitoring and counseling (including of the family, the educational staff, the clinical staff, employers and others).

Examples of Occupational Therapy Intervention: Activities of daily living: including activities directed to the person's care of his/her hody needs (ADL) such as personal hygiene, eating, dressing, and instrumental activities of daily life (IADL) such as preparing a meal or managing finances. This area represents a central focus of i rtervention in occupational therapy for this population. For example, with respect to activities related to eating, the intervention can range from adapting the feeding environment, choosing preferred food or bringing the food to one's mouth, to teaching more advanced skills such as organizing shopping, and meal preparation. Learning/Studies: These are activities necessary to be a student and to participate in a learning environment, including academic and non-academic activities. Intervention in this area covers a variety of educational settings such as day care centers for very young children, kindergartens and special education schools (ages 3-21 years), regular school settings and professional training facilities. The intervention is varied and may focus on

171 gaining basic learning-skills, such as understanding cause and effect processes and object permanence, or on more complicated skills, such as preparation for learning and writing, organization in time, in space and with accessories, adaptation to different learning environments, the use of information technologies and computers and gaining learning strategies. In addition, the intervention can include adapting various learning environments. Work: These are productive activities, whether for remuneration or not, that include preparing for work, producing a product and providing services. Intervention in this area covers a variety of work settings including: special educational settings in which students receive training to enter the work force, youth rehabilitation centers, adult sheltered-work facilities, an array of protected supportive community work systems, and placement-services for gaining open market positions. Intervention varies and may include basic work skills training (behavior norms, work routines), developing and practicing basic cognitive abilities, practicing motor skills, exposure to varied work opportunities, support and advice for developing areas of interest, identifying abilities and choosing suitable occupations, analyzing occupations and adapting them as needed, as well as supporting and assisting placement in various work sights in the community. Play: These are activities that are generally internally motivated and provide pleasure, entertainment and learning. Play-intervention, as an occupational therapy goal in this population, is directed towards the most basic experiencing of playas a source of pleasure, as well as providing the client with an opportunity to participate in play activities. The intervention includes drills in basic skills such as the use of equipment, recognizing rules and agreed-upon behavior patterns, or choosing suitable play activities. In addition, play represents a treatment method for learning and practicing a variety of social, motor and functional skills. Leisure: These are non-obligatory activities that are internally motivated and are performed at times that are not devoted to work, studies, self-care or sleep. Research reveals that people within this population have a relatively large amount of time to devote to leisure, whereas their participation in leisure activities is minimal (Buttimer & Teirney, 2005). Therefore, coping with leisure within this population is a central topic. Intervention in this area may focus on exposure to varied leisure opportunities, identification and choice of areas of interest, planning leisure time and participation in activities that lead to a perception of capability, pleasure, control and satisfaction.

172 Social participation: These are activities related to agreed-upon behavior patterns expected of an individual within a given social system (e.g. community, family or with friends). The intervention within occupational therapy encourages the person to gain skills in the various areas or occupation and thus supports and strengthens social participation. For this population, an emphasis is places upon understanding acceptable social norms and as well as learning and practicing activities that lead to satisfactory social interactions. Accessibility and Environmental Modification: Occupational therapy practice relates to the person, the occupation and the

environment. The occupational therapist's broad knowledge base in the areas of function and limitation enables him/her to identify, through performance analysis in the different areas of occupation, environments and/or tasks that should be modified. The various limitations that characterize the population of people with intellectual disabilities require both general and client-specific environmental modifications to ensure accessibility. The characteristic difficulty in problem-solving, initiative and coping with unfamiliar situations, amplifies the need for accessibility modifications for this population. These accessibility modifications include changes in the environment (as in widening passageways, modifying playgrounds or adding symbol signs), in the equipment (such as adapting seating systems or adapting feeding aids), or in the task (such as changing the complexity of instructions or dividing a task into sub-stages). Assistive technology is one of the methods used to adapt the environment and includes modifications of hardware; software and various combinations thereof (such as a virtual keyboard, a touch screen, a motorized wheelchair, switch systems, computer programs and internet sites, adapted content amount, or voice output devices). Thus, for example, a switch can be modified to be activated through the person's head or hand. Other modifications of the switch may include size, colour, texture, or sensitivity (such as speed or pressure response). Assistive technology promotes a variety of functions related to the individual, the occupation and the environment. In addition, it allows for the modification of an individual's environment in the manner in which his/her requires, by relating to his personal abilities, wants, areas of interest and specific limitations and difficulties. Environmental modification is likely to significantly improve a person's ability to participate in all areas of occupation, his or her level of independence and the degree of supports required.

173 In summary, the occupational therapist, as part of a therapeutic, rehabilitative and educational profession plays a central role within the support system available to people with intellectual and developmental disabilities, throughout the life cycle. As such, occupational therapists hold key positions as leaders in this area. Working with people with intellectual and developmental disabilities requires consideration of function, independence and participation in the various areas of occupation, which enables the occupational therapist to utilize all the areas of knowledge and expertise included in the practice of occupational therapy. 5.4

Physiotherapy: Definition, Objective, Scope, Modalities and Intervention 5.4.1 Definition of Physiotherapy It is also called physical therapy. The treatment of physical dysfunction or injury by the use of therapeutic exercise and the application of physical modalities (like heat, light, cold, current, water, sound waves). Assistive devices are also used as a part of the treatment programme. They are intended to restore or facilitate normal function or development. 5.4.2 Aims and Objectives of Physiotherapy

Physiotherapy in the field of mental retardation is aimed at improving overall motor functions of the child to the maximum extent possible,

so as to make the child independent in walking and carrying out activities of daily living. If it is not possible for the person to walk, and carry out activities independently, then aids and appliances are trained given to the person to use it. (A) Objectives of physiotherapy in general 1. Reduces or relieves pain, muscle spasm, tenderness of muscles. 2. It helps to reduce or relieve swelling. 3. It helps to reduce or relieve inflammation (means the response of the body in the form of pain, swelling, muscle spasm and tenderness of the muscles etc. in the presence of any foreign body). 4. To improve ventilation of lungs, by giving, deep breathing exercises and postural drainage.

174 5. To encourage correct weight bearing and weight transference on both sides of the body. 6. Re-education of affected or paralysed muscles. 7. It is effective in healing of infected wounds. 8. It helps to check the abnormal growth of bone (bony spurs). 9. Breaking up of adhesion formation (gluing of joint structures by synovial fluid). 10. To keep the person physically fit. 11. To teach relaxation. 12. Stimulation of sensory and motor nerves if sensations are reduced or lost. 13. Post fracture and dislocation, management. (B) Objectives of physiotherapy in relation to Intellectual Disability 1. To facilitate the development of child gross motor and fine motor. 2. To prevent or correct contractures and deformities. 3. Prevent or correct wasting and atrophy of muscle. 4. To normalize muscle tone. 5. To maintain or improve the muscle power. 6. To maintain and improve the joint range of movement. 7. To emphasize the importance of handling and positioning the child. 8. To make the child independent in walking and activities of daily living. 9. Provide aids and appliances and to train the person and parents how to use assistive devices. 10. To improve posture, gait, balance coordination. 11. Inhibition of abnormal reflex activity, abnormal patterns of movement and abnormal muscle tone and facilitation of normal in place of abnormal. 12. To keep the children physically fit. 5.4.3 Scope of Physiotherapy Physiotherapy has scope in treating a wide range of conditions. It plays an important

175 role in all the branches of medical sciences, especially Orthopaedics, Paediatrics, Neurology, Cardio thoracic, Surgery, Sport Medicine etc. In set ups like leprosy, paraplegic and poliomyelitis after plastic surgery, burns clinics, spinal cord injury centres and in assistive devices manufacturing units etc. Physiotherapy has three major functions in the management of children with intellectual disability. 1. To facilitate motor development 2. To prevent and correct contractures and deformities. 4. To make the child as independent as possible and functional (locomotor function and activities of daily living).

5.4.4 Modalities of Physiotherapy

1. Hydrotherapy: Hydrotherapy, or water therapy, is the use of water (hot, cold, steam, or ice) to relieve discomfort and promote physical well-being.
2. Electrotherapy: Electrotherapy is the use of electrical energy as a medical treatment.
3. Exercise Therapy: Exercise Therapy is a regimen or plan of physical activities designed and prescribed for specific therapeutic goals.
4. Massage or Manipulation
5. Gait: Gait training is a type of physical therapy. It can help improve your ability to stand and walk.

5.4.5. Intervention of Physiotherapy

Role of Physiotherapist in the field of Intellectual Disability

- l Diagnostician: Here the physiotherapists assess the client and order for the necessary investigation, on the basis of this therapist arises at diagnosis. According to the diagnosis therapy will be planned.
- l Interventionist: Therapist plays a role as interventionist in setting intervention goals, planning and implementation of therapy programme, giving follow-up and 176 regular evaluation of the client, modifying programme as per the clients need.
- l Team member: Therapist treated as a team member as the team member in multidisciplinary approach, this is the most commonly seen approach in field of mental retardation. In Trans disciplinary approach therapist plays a role as a team member by gathering information and helps in planning intervention along with other experts of the team. In certain condition therapist become a case manager and given input.
- l Providing Information and guidance: As the parents need information guidance regarding the condition of the child and therapy, the therapist gives proper information to parents and also to other professional whenever needed.
- l Counsellor: Physiotherapist plays a counsellor role in the field of mental retardation. Parent counselling is an important aspect, which should be included in intervention programme. The parents of the clients may not be aware of the condition of child and the facilities available for their child. They will come to you in a state of confusion and anxiety to know what happening with their child. Before as part of planning and intervention programme therapist should give proper information to the parents regarding the following things:
 - l Condition of the child.
 - l Child's needs and abilities.
 - l How the therapy is going to help the child in improving his functional abilities.
 - l Proper instructions given to the parents.
 - l Training is given to the parents how to give therapy at home.
 - l What are the facilities and services available for the persons with intellectual disability.
- l Trainer: Therapist plays a role of trainer, as the therapist will train the parents how to give therapy at home and conducts classes and workshops for parents and other professional, to make them aware of disability and affects of intervention on the clients.
- l Researcher: Research is an important aspect in the field of intellectual disability. Therapist also plays a role as a researcher by doing research on different aspects 177 and population study. To innovate new techniques and equipment for making the intervention better and to get better outcome results.
- l Leader: Therapist plays a role of leader of the team voicing on behalf of the client and by giving guidelines to the former self-help groups by the parents.
- l

As an administrative officer: Therapist plays a role of administrative officer by heading and organization and establishing a institution or center to serve the people better. | Provider of referral: Therapist will give referrals to the concern professionals to obtain information of the clients and to related services outside the institute for investigations or for expert opinion.

5.5 Speech Therapy: Definition, Objectives, Scope, Types of Speech, Hearing and Language Disorders and Intervention

5.5.1 Definition of Speech and Language Therapy: Speech and language therapy provides treatment, support and care for children and adults who have difficulties with communication, or with eating, drinking and swallowing. Speech and language therapists (SL Ts) are allied health professionals. They work with parents, carers and other professionals, such as teachers, occupational therapists and doctors.

5.5.2 Objectives of Speech Therapy A speech pathologist's narrow, well-defined objectives work toward achieving broad therapeutic goals. This professional develops an individualized treatment plan for each patient, which often includes time-based objectives. For example, his objectives may include helping a patient correctly say several new sounds by the end of a quarter, marking period or year. Other objectives can include helping a patient to understand and to explain a speaker's gestures, demonstrate newly learned conversation strategies, explain the perception of body language, speak for a period of time without stuttering and improve reading comprehension to a specific level. A speech language pathologist sets broad but specific goals for each of his patients. Specific goals can include helping patients develop clearer speech, learn to use alternate 178 methods of communication, develop better reading and writing skills, and strengthen throat and neck muscles. Goals also may include coordinating treatment programs with other professionals or referring patients for other treatments. For example, a patient with a swallowing disorder may benefit from the collaborative care of a speech language pathologist and a medical doctor.

5.5.3 Scope of Speech therapy Speech Therapy is an Allied Health Science subject. Medical advancement in this field, awareness of the need for early intervention etc has increased the scope of Speech Therapy. A number of Speech Therapy courses are available now in India and abroad. Speech Therapy has its necessity in teaching and training children with intellectual disability.

5.5.4 Types of Speech, Language and Hearing Disorders The most intensive period of speech and language development is during the three of life a period when the brain is developing and maturing. There skills appear to develop best in a world that is rich with sounds, sights, and consistent exposure to the speech and language of others. At the root of this development is the desire to communicate or interact with the world. The beginning sign of communication occur in the first few days of life where in infant learns that a cry will bring food, comfort, and companionship. Research has shown that by 6 months of age, most children recognize the basic sounds of their native language.

5.5.4 (a) Speech and Language Disorders A speech disorder refers to a problem with the actual production of sounds. A language disorder refers to a problem understanding or putting words together to communicate ideas. Speech disorders include:

1. Articulation disorders: difficulties producing sounds in syllables or saying words incorrectly to the point that listeners can't understand what's being said.
3. Fluency disorders: problems such as stuttering, in which the flow of speech is 179 interrupted by abnormal stoppages, partial-word repetitions ("b-b-boy"), or prolonging sounds and syllables (sssssnake).
4. Resonance or voice disorders: problems with the pitch, volume, or quality of the voice that distract listeners from what's being said. These types of disorders may also cause pain or discomfort for a child when speaking.

Language disorders can be either receptive or expressive:

1. Receptive disorders: difficulties understanding or processing language.
2. Expressive disorders: difficulty putting words together, limited vocabulary, or inability to use language in a socially appropriate way.
3. Cognitive-communication disorders: difficulty with communication skills that involve memory, attention, perception, organization, regulation, and problem solving.

5.5.4 (b) Hearing disorders There are four types of hearing loss:

- | Auditory Processing Disorders
- | Conductive |
- | Sensorineural |
- | Mixed.

IIII Auditory Processing Disorders Auditory Processing Disorders occur when the brain has problems processing the information contained in sound, such as understanding speech and working out where sounds are coming from.

IIII Conductive Hearing Loss Conductive Hearing Loss occurs when there is a problem with the Outer or Middle Ear which interferes with the passing sound to the Inner Ear. It can be caused by such things as too much earwax, Ear Infections, a punctured eardrum, a fluid build-up, or abnormal bone growth in the Middle Ear such as Otosclerosis. It is more common in children and indigenous populations. Surgery and some types of hearing technologies can be used to treat Conductive Hearing 180 Loss such as Bone Conduction Hearing Aids, Bone Anchored Hearing Devices and Middle Ear Implants.

IIII Sensorineural

Hearing Loss Sensorineural Hearing Loss occurs when the hearing organ, the Cochlea, and/or the auditory nerve is damaged or malfunctions so it is unable to accurately send the electrical information to the brain. Sensorineural Hearing Loss is almost always permanent. It can be genetic or caused by the natural aging process, diseases, accidents or exposure to loud noises such as Noise-induced Hearing Loss and certain kinds of chemicals and medications. Auditory Neuropathy is another form where the nerves that carry sound information to the brain are damaged or malfunction. Technologies such as Hearing Aids, Cochlear Implants and Hybrid Cochlear Implants can help reduce the effects of having Sensorineural Hearing Loss. **5.5.5 Mixed Hearing Loss** A Mixed Hearing Loss occurs when both Conductive Hearing Loss and Sensorineural Hearing Loss are present. The sensorineural component is permanent, while the conductive component can either be permanent or temporary. For example, a Mixed Hearing Loss can occur when a person with Presbycusis also has an Ear Infection.

5.5.5 Speech and Language Intervention In speech-language therapy, a speech language pathologist will work with a child one- to-one, in a small group, or directly in a classroom to overcome difficulties involved with a specific disorder. Therapists use a variety of strategies, including:

Language intervention activities: The SLP will interact with a child by playing and talking, using pictures, books, objects, or ongoing events to stimulate language development. The therapist may also model correct vocabulary and grammar and use repetition exercises to build language skills.

Articulation therapy:

Articulation, or sound production, exercises involve having the therapist model correct sounds and syllables in words and sentences for a child, often during play activities. The level of play is age-appropriate and related to the child's specific needs. The SLP will physically show the child how to make certain

181 sounds, such as the "r" sound, and may demonstrate how to move the tongue to produce specific sounds.

Oral-motor/feeding and swallowing therapy: The SLP may use a variety of oral exercises -including facial massage and various tongue, lip, and jaw exercises - to strengthen the muscles of the mouth for eating, drinking, and swallowing. The SLP may also introduce different food textures and temperatures to increase a child's oral awareness during eating and swallowing.

General guidelines for interventions

- Selection of Specific goals
- Organizing all the gathered information
- Structure the environment

Selection of relevant materials

- Transformation and adaptation of the material
- Use of object from the environment
- Maintenance of schedule
- Principles for therapy
- Highlighting new or relevant information
- Pre-organized information
- Trained rehearsal strategies

- Using over learning & repetition
- Training in natural environment
- Early Intervention

5.6 Yoga and Play Therapy: Definition, Objectives, Scope and Intervention

5.6.1 Meaning and Definition of Yoga The word yoga comes from the Sanskrit root 'Yug' meaning to join on yoke, implying the integration (on joining) of every aspect of human being from the inner most to the external. Yoga is practical philosophy that aims at uniting the body, mind, and spirit for

182 health and fulfilment. The father of modern yogashashtra Patanjali Maharshi defines yoga as 'Yogaschitta Vrutti Nirodhaha' that is yoga is controlling the nature of the mind. The ultimate aim of this philosophy is to strike a balance between mind and body and attain self- enlightenment. To achieve this, yoga uses movement, breath, posture, relaxation and meditation in order to establish a healthy, lively and balanced approach to life. Though the exact origins of Yoga are unknown but Yoga is considered to be the oldest physical discipline in existence. Yoga, thus symbolizes balance in every area of life. Yoga is one of the six schools of ancient Indian Philosophy. It is the practice that enables one to achieve higher levels of performance, bringing out the hidden potentials from within. Systematic Yoga practice will increase the physiological and psychological well being.

5.6.2 Objectives of Yoga

Yoga practice reduces tension, stress, anxiety, weakness, helplessness, fear, negative thoughts etc. Which are increasing day by day in this mechanical human life.

It treats the prolonged diseases or deficiencies like diabetes, asthma, heart problems, pains, sprains, indigestion etc. and makes the body active and good looking.

Yoga practice equips the practitioners with devotion, attention, and concentration and alertness in every activity that he does. He also discharges his responsibilities with dedication thereby get respect and honor at his work.

Man

Man

can prove his life worth living by developing his self physically and psychologically that contribute for the development of spiritual instinct in him.

lllll

As soon as one is habituated for yoga practice, there would be number of changes in his routine activities, habits, thoughts, food habits, behaviors etc.

lllll

Improvement in balance is one of the major benefits of Yoga. Improved balance is referred not only to the sharp physical coordination but also to the balance between the left and right, front and back and high and low aspects of one's body. lllll Along with a host of benefits, Yoga also helps in developing and attaining personal values. Yoga erases a variety of ills in human beings. These may range from feelings of frustration, persecution and insecurity. Yoga greatly helps in the development of personal values. Personal values are those values which an individual develops and lives by all through his life.

183

lllll

Yoga and social values are closely related to each other. Social values are a set of philosophy that an individual carries for all his life. Yoga possesses great power to inculcate those values that go a long way in making a man complete. lllll Yoga helps an individual not only to realize his own self but also understand other issues around him/her. Yogic theory and practice lead to increased self-knowledge. Yogic practices like breathing and posture exercises help in attaining and maintaining health, physical and mental, and relaxation. The knowledge gained through Yoga is not simply that of the practical kind relating to techniques, but of a spiritual sort pertaining to grasping something about the nature self and other matters. 5.6.3 Scope of Yoga Therapy Yoga is certainly more than mastering its postures and asanas and increasing the strength and flexibility of body. It indicates towards healing of mind and body and attaining the state of self-enlightenment. It is said that in early periods when Yoga was just introduced, the main purpose was to heal community members and the practitioners act as religious mediators. Needless to say, practicing of Yoga includes the traditional aspects too such as practicing different poses, chanting of mantra, observing breathing habit and controlling thoughts coming to mind with the help of meditation. Today, it has been practiced for fitness, healthy body and mind, strength, flexibility, emotional well-being and much more. The main purpose of practicing Yoga is to taking control over the body, mind and emotional aspects. The cessation of bad thoughts creates a positive vibe around the person and makes him healthy overall. 5.6.4 Yoga Intervention Yoga is an ancient Indian practice which involves moving the body and training the mind to achieve balance and well-being. The purpose of traditional yoga is for each individual to be healthy, both physically and mentally, and able to reach his or her highest potential as a person. Yoga aim is to prepare the body for meditation through breathing and physical exercises. Yoga emphasizes body-mind wellness through postures or asanas which tone and strengthen our muscles and increase our flexibility. The different asanas, particularly the twists and inversions, stimulate internal organs, as well as the nervous system, and promote circulation in all the body's major organs and glands. Importance of yoga for children with intellectual disability 1. Helps to co-ordinate the activities of the mind and body.

184 2. Tends to reduce the distracted state of mind and helping the mind to deal on the present activity. 4. Helps to improve his adaptive behavior to a degree unobtainable before. 5. Actively increase the ability to concentrate on the present activity. 6. Aims at improving general health, concentration, self-reliance and social relationship of the persons with mental retardation. 6. Yoga has been tried as an adjunct in education of children with mental retardation and attention deficit hyperactivity disorder. 5.6.5 Definition of Play Therapy Play Therapy uses a variety of play and creative arts techniques (the 'Play Therapy Tool-Kit (TM)' to alleviate chronic, mild and moderate psychological and emotional conditions in children that are causing behavioural problems and/or are preventing children from realising their potential. The Play Therapist works integratively using a wide range of play and creative arts techniques, mostly responding to the child's wishes. This distinguishes the Play Therapist from more specialised therapists (Art, Music, Drama etc). The greater depth of skills and experience distinguishes a play therapist from those using therapeutic play skills. Play therapy utilizes play, children's natural medium of expression, to help them express their feelings more easily through toys instead of words. Association for Play Therapy (APT) defines play therapy as "the systematic use of a theoretical model to establish an interpersonal process wherein trained play therapists use the therapeutic powers of play to help clients prevent or resolve psychosocial difficulties and achieve optimal growth and development." In the textbook Play Therapy: The Art of the Relationship (2nd ed.), Landreth (2002) defined child-centered play therapy: A dynamic interpersonal relationship between a child (or person of any age) and a therapist trained in play therapy procedures who provides selected play materials and facilitates the development of a safe relationship for the child (or person of any age) to fully express and explore self (feelings, thoughts, experiences, and behaviors) through play, the child's natural medium of communication, for optimal growth and development.

185 5.6.6 Scope of Play Therapy Children are referred for play therapy to resolve their problems (Carmichael; 2006; Schaefer. 1993). Often, children have used up their own problem solving tools, and they misbehave. may act out at home, with friends, and at school (Landreth, 2002). Play therapy allows trained mental health practitioners who specialize in play therapy. to assess and understand children's pia). Further. play therapy is utilized to help children cope with difficult emotions and find solutions to problems (Moustakas, 1997; Reddy, Files-Hall, & Schaefer, 2005). l3y confronting problems in the clinical Play Therapy setting, children find healthier solutions. Play therapy allows children to change the way they think about, feel toward, and resolve their concerns (Kaugars & Russ, 200 l). Even the most troubling problems can be confronted in play therapy and lasting resolutions can be discovered, rehearsed, mastered and adapted into lifelong strategies (Russ, 2004). 5.6.7 Importance of Play therapy

lllll It

is difficult for most children below age ten to eleven to sit still for sustained periods of time. Play therapy provides for children's need to be physically active. lllll In play, children discharge energy, prepare for life's duties, achieve difficult goals and relieve frustrations. lllll As children play, they are expressing the individuality of their personalities and drawing upon inner resources which can become incorporated into their personality. Virginia M. Axline (1974) who developed the child-centered play therapy asserted that: "A play experience is therapeutic because it provides a secure relationship between the child and the adult, so that the child has the freedom and room to state himself in his own terms, exactly as he is at the moment in his own way and in his own time. " lllll Play therapy helps to actualize the ultimate objectives of elementary schools facilitating the intellectual, emotional, physical and social development of children from the learning opportunities and experiences offered in school.

186 5.6.8 Objectives of play therapy lllll

Develop

a more positive self-concept lllll Assume greater self-responsibility lllll Become more self-accepting lllll Become more self-directing lllll Become more self-reliant lllll Become more trusting of self • Experience a feeling of control • Become sensitive to the process of coping • Develop an internal source of evaluation • Engage in self-determined decision making 5.6.9 Intervention of Playas a therapy results in • Developing a more positive self-concept • Assume greater self-responsibility • Become more self-accepting • Become more self-directing • Become more self-reliant • Become more trusting of self • Experience a feeling of control • Become sensitive to the process of coping • Develop an internal source of evaluation • Engage in self-determined decision making 5.7 Therapeutic Intervention: Visual Arts and Performing Arts (Music, Drama, Dance, Movement and Sports) 5.7.1 Visual Arts and Performing Arts : Art reflects human emotions and human beings spontaneously express their frame of

187 mind through various art forms. Thus the intellectual mind merges with the artistic streak, giving birth to art. The visual arts are those creations we can look at, such as a drawing or a painting. For example Drawing, painting, sculpture, architecture, photography, film, printmaking. It also includes the decorative arts of: ceramics, furniture and interior design, jewellery making, metal crafting and wood working. The literature available for utilizing art education for exceptional students is generally addressed to art education teachers to use in their classroom. However, expanding the use of art in the education of children with special needs into general and special education is advantageous to these individuals. The art educator can evolve to be a resource and perhaps a liaison between the special and general educator. Thus, to improve the education afforded to students with special needs, art can act as a bridge between general, and art educators to enhance the communication and cooperation between these specialists. Creating a cohesive network between art educators, special and general educators, draws upon the unique perspective that each educator has that can help the others in bolstering special education programs. The visual arts are a powerful teaching tool that can enhance the cognitive, emotional and social development of children. Children in special education programs are particularly in need of the assistance that the arts can provide. The performing arts range from vocal and instrumental music, dance and theatre to pantomime, sung verse and beyond. They include numerous cultural expressions that reflect human creativity and that are also found, to some extent, in many other intangible cultural heritage domains. Music is perhaps the most universal of the performing arts and is found in every society, most often as an integral part of other performing art forms and other domains of intangible cultural heritage including rituals, festive events or oral traditions.

5.7.2 Music Therapy

Music therapy is a well-established allied health profession similar to occupational and physical therapy. It consists of using music therapeutically to address behavioral, social, psychological, communicative, physical, sensory-motor, and/or cognitive functioning. Because music therapy is a powerful and non-threatening medium, unique outcomes

188 are possible. For individuals with diagnoses on the autism spectrum, music therapy provides a unique variety of music experiences in an intentional and developmentally appropriate manner to effect changes in behavior and facilitate development of skills. Music therapy may include the use of behavioral, biomedical, developmental, educational, humanistic, adaptive music instruction, and/or other models. Music therapy enhances one's quality of life, involving relationships between a qualified music therapist and individual; between one individual and another; between the individual and his / her family; and between the music and the participants. These relationships are structured and adapted through the elements of music to create a positive environment and set the occasion for successful growth. The interventions used in Music Therapy aid in fostering skills across the entire developmental spectrum for children with special needs. Music Therapists encourage a child's sense of exploration and wonder as they focus on the goals targeted in your child's Individualized Education Program (IEP). How Does Music Therapy Make a Difference with Young Children?

- Music stimulates all of the senses and involves the child at many levels. This "multi-modal approach" facilitates many developmental skills.
- Quality learning and maximum participation occur when children are permitted to experience the joy of play. The medium of music therapy allows this play to occur naturally and frequently.
- Music is highly motivating, yet it can also have a calming and relaxing effect. Enjoyable music activities are designed to be success-oriented and make children feel better about themselves.
- Music therapy can help a child manage pain and stressful situations.
- Music can encourage socialization, self-expression, communication, and motor development. Because the brain processes music in both hemispheres, music can stimulate cognitive functioning and may be used for remediation of some speech/ language skills.

189 5.7.3 Drama Therapy Drama therapy is the intentional use of drama and/or theater processes to achieve therapeutic goals. Drama therapy is active and experiential. This approach can provide the context for participants to tell their stories, set goals and solve problems, express feelings, or achieve catharsis. Through drama, the depth and breadth of inner experience can be actively explored and interpersonal relationship skills can be enhanced. Participants can expand their repertoire of dramatic roles to find that their own life roles have been strengthened. 5.7.4 Dance / Movement Therapy Dance/movement therapy, a creative arts therapy, is rooted in the expressive nature of dance itself. Dance is the most fundamental of the arts, involving a direct expression and experience of oneself through the body. It is a basic form of authentic communication, and as such it is an especially effective medium for therapy. Based in the belief that the body, the mind and the spirit are interconnected, dance/movement therapy is defined by the American Dance Therapy Association as "the psychotherapeutic use of movement as a process that furthers the emotional, cognitive, social and physical integration of the individual." Benefits of Dance and Movement Therapy: Dance Movement therapy can help children with special needs in varied ways and in all the areas of impairment. The benefits experienced are as follows: ● It helps in improving attention and concentration and thus helps in furthering education ● Dance as a way of expression of emotion enables children to express through movements ● It helps in forming better relation ● Due to liking towards repetitive movements, a therapist can repeat a movement pattern which the patient needs to learn and when they start imitating the movement vocabulary develops. ● This helps them in learning different patterns of movements required for daily life activities

190 ● Group sessions in dance movement therapy enables in developing social skills and communications of autistic person ● Doing a choreographed dance movement sequence in a series of sessions in a row helps in improving memory and recapitulation skills. ● Touch therapy helps in developing trust on others as well as helps in reducing sensitivity to physical contact and touch. ● Dance movement therapy helps in improving body image of an autistic person.

Dance/movement therapists work with individuals of all ages, groups and families in a wide variety of settings. They focus on helping their clients improve self-esteem and body image, develop effective communication skills and relationships, expand their movement vocabulary, gain insight into patterns of behavior, as well as create new options for coping with problems. Movement is the primary medium dance/movement therapists use for observation, assessment, research, therapeutic interaction, and interventions. Dance/movement therapists work in settings that include psychiatric and rehabilitation facilities, schools, nursing homes, drug treatment centers, counseling centers, medical facilities, crisis centers, and wellness and alternative health care centers. Dance/movement therapy can be a powerful tool for stress management and the prevention of physical and mental health problems. Dance/movement therapists integrate the dancer's special knowledge of the body, movement, and expression with the skills of psychotherapy, counseling, and rehabilitation to help individuals with a wide array of treatment needs. Social, emotional, cognitive, and/or physical problems can be addressed through DMT via group and individual sessions in many different types of settings from hospitals and clinics to schools. The fact that dance/movement therapists are immersed in the language of the body, rather than focusing solely on the verbal, lends characteristics to their work that set it apart from other types of therapy.

5.7.5 Sports Activities for Children with Special Needs All individuals benefit from regular physical activity and children with special needs especially. Children with special needs are benefitted in the following ways from physical or sports activities. ● We can see improvements in muscle strength, coordination, and flexibility. ● Improve exercise endurance, cardiovascular efficiency, and possibly increased life expectancy .

191 ● Experience better balance, motor skills and body awareness. ● Will show improvement in behavior, academics, self-confidence and building friendships. ● Will have positive changes in their health, quality of life and boost to their self- esteem. ● Gets to experiences a sense of accomplishment and possibly the taste of winning or personal satisfaction. ● Experience increases in attention span, on-task behavior, and level of correct responding. ● Will increase appetite and improve quality or sleep. ● Will see a decrease in secondary health complications like obesity, high blood pressure, low HOL ("good") cholesterol and diabetes. ● Will find an outlet for their physical energy, will help them cope with stress, anxiety and depression. Sports and activities especially good for special needs children: ● Swimming ● Bicycling ● Soccer ● Football ● Handball ● Gymnastics ● Bocce (is a ball sport) ● Weightlifting Sports, especially fundamental and movement education based sports like gymnastics, provide tremendous benefits for children with special needs. Physical education programs can considerably improve the lifestyle of a disabled child and are highly recommended. These programs may help control obesity, promote activeness, increase a child's self- image and social skills, and increase motivation. The physical activity along with support,

192 rewards, and interaction can, among other benefits, be very helpful to these children and their families. Physical Improvements - Children suffering from cognitive disabilities are most likely going to suffer from physical impairments as well. These children have substantial problems with motor skills in areas such as hopping, skipping, and jumping. Involvement in gymnastics can help these individuals develop fundamental motor and physical fitness skills. Self-Esteem - Developing a sense of self-esteem and confidence is an extremely important part of special education. These children need to be involved in environments where they feel that they are contributing successfully to a group. Their abilities in all other skill areas will improve as a result of a positive self-image and confidence. Cognitive Benefits - The hands-on aspect of sports leads to cognitive skill improvement in children with disabilities and allows them to discover and access strengths that cannot be challenged in the traditional classroom setting. The inherent structure of sport, with its organization and rules, can be used as a learning tool for introducing and practicing self regulation and decision making skills. Additionally, children can learn verbal communication and interaction with peers through involvement in sport. Special Olympics The mission of Special Olympics is to provide year-round sports training and athletic competition in a variety of Olympic-type sports for children and adults with intellectual disabilities. This gives them continuing opportunities to develop physical fitness, demonstrate courage, experience joy and participate in a sharing of gifts, skills and friendship with their families, other Special Olympics athletes and the community. • The Special Olympics is the only organization authorized by the International Olympic Committee to use the word "Olympics" worldwide. • Athletes compete in 32 sports, including snowboarding, judo, cricket, soccer. • The Special Olympics program Healthy Athletes offers 1.4 million free health examinations in more than 120 countries to athletes at Special Olympics competitions. Health professionals perform a full exam in the categories of podiatry, physical therapy, audiology, vision, dentistry, physical therapy and more and more. • More than 3.1 million athletes from over 175 countries take part in the Special Olympics.

193 • Special Olympics athletes are divided to compete in categories based on gender, age, and ability. • The Special Olympics athlete oath is "Let me win. But if I cannot win, let me be brave in the attempt." • Special Olympics World Games are held every two years, alternating with Summer and Winter Games. 5.8 Let us Sum Up 1. "Occupational therapy is the art and science of directing man's participation in selected tasks to restore, reinforce and enhance the performance, facilitate learning of those skills and functions essential for adaptation and productivity, to diminish or correct pathology and to promote and maintain health." (Council of Standards, American Occupational Therapy Association, 1972). 2. An Occupational Therapist will aim to enable the child to be as physically, psychologically and socially independent as possible. Occupational Therapists work in close partnership with the child and their family, schools and other healthcare professionals. Together they have a shared responsibility for meeting the child's needs. In schools, for example, they evaluate the child's abilities, recommend and provide therapy, modify classroom equipment, and help the child participate as fully as possible in school programs and activities. 3. Occupational therapy interventions for people with intellectual disabilities are specifically adapted to the client with respect to the degree and type of support needed as well as the context. Interventions may include direct treatment as well as environmental adaptations, guidance, monitoring and counseling (including of the family, the educational staff, the clinical staff, employers and others). 4. Physiotherapy has scope in treating a wide range of conditions. It play an important role in all the branches of medical sciences, especially Orthopaedics, Paediatrics, Neurology, Cardio thoracic, Surgery, Sport Medicine etc. In set ups like leprosy, paraplegic and poliomyelitis after plastic surgery, burns clinics, spinal cord injury centres and in assistive devices manufacturing units etc. 5. A speech language pathologist sets broad but specific goals for each of his patients. Specific goals can include helping patients develop clearer speech, learn to use

194 alternate methods of communication, develop better reading and writing skills, and strengthen throat and neck muscles. Goals also may include coordinating treatment programs with other professionals or referring patients for other treatments. For example, a patient with a swallowing disorder may benefit from the collaborative care of a speech language pathologist and a medical doctor. 6. Yoga is one of the six schools of ancient Indian Philosophy. It is the practice that enables one to achieve higher levels of performance, bringing out the hidden potentials from within. Systematic Yoga practice will increase the physiological and psychological well being. 7. Music therapists involve children in singing, listening, moving, playing, and in creative activities that may help them become better learners. Music therapists work on developing a child's self-awareness, confidence, readiness skills, coping skills, and social behavior and may also provide pain management techniques. They explore which styles of music, techniques and instruments are most effective or motivating for each individual child and expand upon the child's natural, spontaneous play in order to address areas of need. 5.9 Check Your Progress A.1. What is the difference between Occupational Therapy and Physiotherapy? 2. Explain the objectives of the different therapies applicable for children with special needs? 3. Discuss about Dance and Movement Therapy. B.1. Discuss about the importance of yoga for children with special needs. 2. Prepare a short note on Therapeutic Application of Drama. C. After going through the Unit you may like to have further discussions on some points and clarification on other.

No part of this work can be reproduced in any form without the written permission from the NSOU authorities. Mohan Kumar Chattopadhyay Registrar

3 Netaji Subhas Open University From the Vice-Chancellor's Desk Dear Students, from this Academic Session (2015-17) the Curriculum and Course Structure of B. Ed.- Special Education have been thoroughly revised as per the stipulations which featured in the Memorandum of Understanding (MoU) between the Rehabilitation Council of India (RCI) and the National Council for Teacher Education (NCTE). The newly designed course structure and syllabus is comprehensive and futuristic has, therefore, been contextualized and adopted by NSOU from the present academic session, following the directives of the aforesaid national statutory authorities. Consequent upon the introduction of new syllabus the revision of Self Instructional Material (SIM) becomes imperative. The new syllabus was circulated by RCI for introduction in the month of June, 2015 while the new session begins in the month of July. So the difficulties of preparing the SIMs within such a short time can easily be understood. However, the School of Education of NSOU took up the challenge and put the best minds together in preparing SIM without compromising the standard and quality of such an academic package. It required many rigorous steps before printing and circulation of the entire academic package to our dear learners. Every intervening step was meticulously and methodically followed for ensuring quality in such a time bound manner. The SIMs are prepared by eminent subject experts and edited by the senior members of the faculty specializing in the discipline concerned. Printing of the SIMs has been done with utmost care and attention. Students are the primary beneficiaries of these materials so developed. Therefore, you must go through the contents seriously and take your queries, if any, to the Counselors during Personal Contact Programs (PCPs) for clarifications. In comparison to F2F mode, the onus is on the learners in the ODL mode. So please change your mind accordingly and shrug off your old mindset of teacher dependence and spoon feeding habits immediately.

I would further urge you to go for other Open Educational Resources (OERs) - available on websites, for better understanding and gaining comprehensive mastery over the subject. From this year NSOU is also providing ICT enabled support services to the students enrolled under this University. So, in addition to the printed SIMs, the e-contents are also provided to the students to facilitate the usage and ensure more flexibility at the user end. The other ICT based support systems will be there for the benefit of the learners. So please make the most of it and do your best in the examinations. However, any suggestion or constructive criticism regarding the SIMs and its improvement is welcome. I must acknowledge the contribution of all the content writers, editors and background minds at the SoE, NSOU for their respective efforts, expertise and hard work in producing the SIMs within a very short time. Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor, NSOU

1.10 References 1.1 Introduction Blindness is a disability caused by absence of sight. It is well known that more than 80%

of knowledge about the world is gained through the sense of sight. And 95% knowledg is received through vision and
hearing. This means that those who can't

10 see are deprived of the opportunity of gaining this knowledge. It is considered to be a myth as many people in the absence of sight have acquired a great degree of success in all spheres of human learning. But to test this success, an additional effort is required. Information can be gained several ways and many a time we can learn one thing in more than one ways. What is needed is that a teacher teaching children with visual impairment should acquire an understanding of providing visual concept into accessible experiences, strengths and limitation of various senses and principle of teaching the visually impaired children. An attempt in this lesson also has been made to discuss implication of blindness and theoretical perspectives of visual impairment. 1.2

Objectives After studying this unit students will be able to : State the meaning of methods, approaches and strategies. Explain the methods, approaches and strategies. State the concept and meaning of intervention. Explain the importance of interventions. Narrate the role of special teacher or special educators for lately blinded students in their intervention programmes. Explain the concept, need and procedure of mediated teaching learning. Describe the concept of development for visually impaired students. Explain the process of converting visual concepts into accessible experiences. 1.3 Difference among methods, approaches, and strategies. Meaning of Method: The mode or role of accomplishing an end, in other words the orderly procedure of achieving the desired objectives. Teaching

method is a procedure which a teacher follows to make learning interesting, easy and effective. It is

the process of planning, guiding, sharing and evaluating learning with a group of students. It is an orderly way of doing something. It is the logical and systematized organized way of doing a thing for effective control. It is an effective procedure of using experience. Ex: lecture method, source method, project method, discussion method 11 etc. Teaching Approach: The accesses or the means of access to the objectives. An approach is a theory about language learning or even a philosophy of how people learn in general. They can be psychologically focused such as behaviorism or cognitivism. Approaches are fuzzy and hard to define because they are broad in nature. An example of an approach that leads to a method would be the philosophies of scholasticism, faculty of psychology. Ex: correlation approach, coordination approach, integrated approach etc. Teaching Strategies: The plans for achieving the objectives. In achieving our objectives (i.c., the teaching of visually impaired children), we should first determine the appropriate and suitable procedure of teaching. But there are many ways of awareness to arrive at the proper teaching procedures. It involves elaborate planning. Stone and Morris have defined teaching strategy in the following words: "

Teaching strategy is a generalized plan for a lesson which includes structure, instructional objectives and an outline of planned tactics, necessary to implement the strategy",

Ex: story telling teaching strategy, narration teaching strategy etc. 1.3.1 Teaching Method A good method of teaching is based on multi-sensory approach, whether teaching disabled children or non-disabled children. While teaching, the teacher should bear in mind that children with disabilities have reduction in the range and variety of some learning experiences due to their disabilities. However, they should also have the conviction that such reduced experiences can be compensated through effective methods of teaching. In order to facilitate effective teaching-learning process, curricular adaptations are imperative. These are important for developing proper conceptual learning too by children with disabilities. As inclusive education is one of the most viable options to increase educational opportunities for persons with disabilities, a thorough curricular adaptation is needed for creating better learning environment. As far as possible, the curriculum need not be changed for disabled children since it would work as a criterion for segregation. Adaptations in terms of methods of presentation, display, content, etc., may be necessary to enhance the learning experiences of these children. This approach not only helps children with disabilities, but also helps the teacher to assist children who have learning problems. The National Institute of Open Schooling (NIOS) has

12 completed a major exercise of adapting secondary education curriculum for the benefit of blind children and such an exercise can be undertaken for other categories of disabilities wherever necessary. This would improve secondary educational opportunities for all disabled children. Curricular adaptations are mostly suggested for visually impaired children who need non-visual experiences. In adaptation of learning materials for the use of children with disabilities, it is vital to see to what extent the information provided is creating a near normal experience to them. Therefore, adaptation work should be done carefully taking into account the learning style as well as the capacity of the disabled child. In a text material, it is vital to break them into different sub-units and analyze each sub-unit and classify the items, which are visual oriented, and which are non-visual oriented. Further to this analysis, it is essential to indicate as to under what cognitive level the learning tasks fall so that the teacher can design appropriate strategies for the learning of the child. The cognitive tasks may be categorized as knowledge, understanding, application, analytic, synthetic, and evaluation tasks. Children with disabilities do not require a separate method of teaching. A good classroom teacher is expected to use approaches which would enable all children to study effectively irrespective of their disability. Therefore, the inclusive education setting emphasizes curricular adaptations rather than prescribing a new curriculum. Some methods of teaching useful for children with disabilities are: Play-way method of teaching: In this method the child is not kept in the classroom as a learner. The child is introduced the lesson through a number of play activities and in the process of such play, the teacher introduces specific concepts. Children who are learning through play-way method experience a sense of discovery. Providing concrete experiences: Children learn in three developmental stages. Firstly, they need concrete experiences involving three dimensional objects etc. Secondly they can learn through pictorial ideas, and thirdly they develop abstraction. As far as children with disabilities are concerned, providing concrete learning experiences becomes pertinent. A strong foundation developed through concrete experiences will help them to understand the higher order experiences, including that of, abstraction without much difficulties. Teaching in a step by-step way: Due to the loss of a specific faculty, children with disabilities are bound to loose the
13 sequence of learning experiences. They often experience mediated learning and as a result, they need well-defined learning strategies. Teaching in a step by step sequence becomes vital for children with disabilities. Though this type of incremental approach is helping all children, children with disabilities are very much benefited by this. They are able to overcome the loss of learning experiences which are forced by the absence of the senses, when teaching is done in a step-by-step way. Modifying method of teaching to suit the individual learning styles of disabled children: The teacher should ascertain whether the child is a visual learner or an auditory learner or a tactile learner for designing proper instructional strategies. Though classification of this kind is imperative in the general classroom too, its application with children with disabilities is of paramount importance because these children exhibit different skills at different levels. Facilitating learning by involving children with disabilities in groups: Cooperative learning approach is considered to be an effective teaching-learning process in the classroom especially when the class has children of different abilities. In a class consisting of children with disabilities, group learning can be planned by involving a child with disability in a group consisting of non-disabled children. This kind of activity not only develops the academic skills but also influences social integration of the child. Teacher assisted peer-group learning: Peer group learning is considered to contribute to effective learning in the case of non-disabled children and it is not less so in the case of disabled children. For adopting peer-group learning, a lot of preparation on the part of the teacher is needed. Activities for peer group learning, strategies for intervention, etc., are to be thoroughly planned by the teacher. A teacher in this process can become the facilitator of information sharing and see that the children (including disabled children) study in a harmonious way. Learning through field-trips and first hand experience: Since children with disability experience reduction in the range and variety of experiences in many aspects, they have to be compensated by alternative modes of information. Field trips are such alternative source of experiences which mostly contribute to the proper concept development of these children.

14 Use of supplementary teaching aids and appliances for developing appropriate concepts: As already indicated, concept development is vital for the disabled child to understand academic as well as non-academic areas. Sometimes a concept taught by the teacher using the normal mode of information may not be appropriate for the child with disability to understand. Therefore, it is essential to use additional teaching aids which may provide the needed concept development in the child. The supplementary teaching aids should not be considered as additional burden. In fact these are to be treated as essential for providing the substituted learning experiences to children with disabilities. Criterion based teaching as well as evaluation techniques: Usually evaluation in a regular classroom is norm based. The teacher makes an evaluation of the child on the basis of quantitative scores. However, this type of evaluation may not be proper for all activities in the case of children with disabilities. Since disabled children have to learn curricular as well as expanded co-curricular activities, mastery of the child over certain skills are more important than comparing the child with another child. Therefore, criterion based evaluation is appropriate, which will help to see the position of the child at various points of time. In criterion based evaluation, there is no pressure of comparative performance and therefore, the child can learn in a natural way. When the above aspects are addressed by the regular classroom teacher, teaching of any subject would become easier for the disabled child to understand. The methods described in this chapter are applicable to children with visual impairment. Therefore, practice oriented teaching approach would enhance the learning efficiencies of disabled children.

1.3.2 What are the approaches to learning

Approaches means the awareness or the means of assessing the objectives. An approach is a way of looking at teaching and learning. Approaches to learning are deliberate strategies, skills and attitudes that permeate the teaching and learning environment. It supports the learner's belief that a large influence on a student's education is not only what you learn but also how you learn. Teaching students how to learn has always been a part of teaching, but now the

15 special education is providing more explicit support for teaching these skills, aligning the Bachelor of special education and the career-related programme for visually impaired students. Focus on approaches to learning will improve the quality of teaching and learning across the programmes and may result in more engaged teachers and students. Clarity of instruction Instructional clarity has two components: cognitive clarity and oral clarity A link between teacher clarity and student achievement and satisfaction was identified by Hines, Cruickshank and Kennedy (1985). They identified 12 behaviours that contribute to instructional clarity: 1. using relevant examples during explanation 2. reviewing material 3. asking questions to find out if students understood 4. answering student questions appropriately 5. repeating things when students did not understand 6. teaching in a step-by-step manner 7. providing students with sufficient examples of how to do the work 8. providing time for practice 9. teaching the lesson at a pace appropriate to students 10. explaining things and then stopping so that students could think about it 11. informing students of lesson objectives or what they were expected to be able to do on completion of instruction 12. presenting the lesson in a logical manner. Clarity involves: knowing the subject matter being able to see the information from a learner's perspective, and the ability to explain things in simple terms.

16 1.3.3. Strategies for teaching students with visual impairment

There are two main functional categories of visual impairments: Low Vision and Blind.

Low vision students usually are print users, but may require special equipment and materials.

The definition of legal blindness covers a broad spectrum of

visual impairments. The extent of visual disability depends upon the physical sensory impairment of the student's eyes, the age of the student at the onset of vision impairment, and the way in which that impairment occurred. Vision also may fluctuate or may be influenced by factors such as inappropriate lighting, light glare, or fatigue. Hence, there is no "typical" vision impaired student. The major challenge facing visually impaired students in the science educational environment is the overwhelming mass of visual material to which they are continually exposed viz., textbooks, class outlines, class schedules, chalkboards writing, etc. In addition, the increase in the use of films, videotapes, computers, laser disks, and television adds to the volume of visual material to which they have only limited access.

To assist in overcoming a student's visual limitation requires unique and individual strategies based on that student's particular visual impairment and his/her skill of communication (

e.g., Braille, speed listening, etc.). General information for teaching strategies: Speak to the class upon entering and leaving the room or site. Call the student with visual impairment by name if you want his/her attention. Seat the student away from glaring lights (e.g. by the window) and preferably in front of the class. Use descriptive words such as straight, forward, left, etc. in relation to the student's body orientation. Be specific in directions and avoid the use of vague terms with unusable information, such as "overthere", "here", "this", etc. Describe, in detail, pertinent visual occurrences of the learning activities. Describe and tactually familiarize the student to the classroom, laboratory, equipment, supplies, materials, field sites, etc. Give verbal notice of room changes, special meetings, or assignments. Offer to read written information for a person with visual impairment, when appropriate. Order the appropriate text books for the students in their preferred medium.

17 Identify yourself by name; don't assume that the student who is visually impaired will recognize you by your voice even though you have met before. If you are asked to guide a student with visual impairment, identify yourself, offer your services and, if accepted, offer your arm to the student's hand. Tell them if they have to step up or step down, let them know if the door is to their left or right, and warn them of possible hazards. Orally, let the student know if you need to move or leave or need to end a conversation. If a student with visual impairment is in class, routinely check the instructional environment to be sure it is adequate and ready for use. When communicating with a student who has visual impairment, always identify yourself and others who are present. Be understanding of the little noise made by a portable translator. Also use an auditory or tactile signal where a visual signal is normally used. It is not necessary to speak loudly to people with visual impairment. Always notify changes of class schedule in advance. Teacher Presentation By verbally spelling out a new or technical word, you will be helping the student with visual impairment, as well as for other students.

An enlarged activity script, directions, or readings of a detailed lesson can be used for a low vision person and for use in describing tactile 3D models. Use an overhead projector to show step-by-step instructions.

Mask all the instructions except the one(s) that you want to present.

Use an opaque projector whenever possible to enlarge a text or manual. All coloured objects used for identification related to a lesson, experiment, or other directions should be labeled with a Braille label maker or otherwise tactically coded for most students with vision impairment. Describe, in detail, visual occurrences, visual media, and directions including all pertinent aspects that involve sight. Use a sighted narrator or descriptive video (preferably the latter) to describe aspects of videos or laser disks.

18

Describe, in detail, all pertinent visual occurrences or chalkboard writing. Where needed, have lesson or direction materials. Brailled, use an enlarged activity script, or recorded

ahead of time, for class handouts. Have tactile 3D models, raised line drawings, or thermoforms available to supplement drawings or graphics in a tactile format when needed. Whenever possible, use actual objects for three dimensional representations. Modify instructions for auditory/tactile presentation. Use

raised line drawings

for temporary tactile presentations. Use an overhead projector, chalkboard, graphs, or slides as you would normally, but provide more detailed oral descriptions, possibly supplemented with thermoforms where appropriate. Allow student to use a tape recorder for recording classroom presentations or the text.

Make all handouts and assignments available in an appropriate form: e.g., regular print, large print, Braille, or on a cassette, depending on the student's optimal mode of communication. Use a monocular or a private eye (electronic miniature television) or similar devices for long range observations of chalk board or demonstration table presentations. Text Reading Systems Paid or volunteer readers or writers can assist a student with visual impairment with texts, materials, and library readings. Offer to read, or arrange to have read, written information for a person with visual impairment, when appropriate. Arrange, ahead of time, for audio book acquisition of the text or other reading materials through the Talking Book Service, Recordings for the Blind, text reading systems, or audio output devices. Various Braille devices can be used to assist vision impaired students when reading.

19 Assessments: Make arrangements for tactile examinations. Place the student being tested close to the activity if tactile examination is necessary. Present examinations in a form that will be unbiased to visually impaired students. Ask the student for the approach he/she finds to be most accessible. One possible accessible method is to record test questions on tape and have the students record their answers on tape in an area which has minimal disturbance for other students. Use an enlarged activity script, directions, or readings to go along with the testing material. Allow more time. Allow calculators to be used during the test. Make use of larger print (e.g. 14 pt; 20 pt sized or as needed). Make use of visual magnification (magnifier or magnifying machine), audiocassette, Braille / Braille graphs / Braille device for written responses, large block answer sheet. Difference between method and approach: Method Approach 1. Method is—how to teach. 1. Approach is—what to teach. 2. Method is—where teachers' 2. Approach is—where stresses are on activities are emphasized. pupil's activities. 3. Method is—where many 3. Approach is—only one item is items may be taught at a time. taught a time. 4. Method is suited for seminar 4. Approach is—not suited for senior classes. classes rather it is fit for primary classes. 5. Method is—not situational. 5. Approach is—situational.

20 Difference between teaching method and teaching strategy: Teaching method is a macro approach, where as teaching strategy is a micro approach. Teaching method considers teaching as an art, where teaching strategy considers teaching as science. The purpose of teaching method is effective presentation of the subject matter, where teaching strategy is to create conducive learning environment in the class. Teaching method is based in the classical theory of human organization, where teaching strategy is based on modern theory of human organization. Work is important in methods, where strategies of teaching behaviour of teachers and students and their mutual relationship are important.

1.4 Interventions Intervention: A visually impaired child faces developmental and psychosocial difficulties in life. The parents, teachers/educators (or the society at large) have to understand the problems and help him/her to cope with those deficits, the help should be extended as soon as the problems/difficulties are noticed. This is called early intervention. Here intervention means understanding of the nature of the problems of visual disabilities, its social and psychological implications and training. It is to be remembered that intervention may be medical, educational, social and psychological. 1.4.1 Early Intervention Definition: The term early intervention refers to services given to very young children with special needs, generally from birth until the child turns six. Early Intervention Services are special services for infants and toddlers at risk for developmental delays. These services are designed to identify and meet children's needs in five developmental areas. These are physical, cognitive, communication, social, or emotional development. Early intervention includes provision of services

21 to such children and their families for the purpose of lessening the effects of the condition. Early intervention programme may be centre based, home based, hospital based or a combination of all. Importance of Early Intervention: There are three primary importances for intervening early with an exceptional child: 1. To enhance the child's development, 2. To provide support and assistance to the family and 3. To maximize the child's and family's benefit to society. Aims of Early Intervention Programmes : 1. Early identification of infants at risk 2. Early identification of developmental delays 3. Enhancement of normal development 4. Acceleration of rate of development 5. Acquisition of new behaviour or skills 6. Increase in independent functioning 7. Early detection and prevention of secondary handicaps 8. Minimizing the effects of the handicapping condition 9. Cost effectiveness 10. Psychological support to families Steps involved in this process: ? Identification ? Intervention ? Rehabilitation 1.4.2 Early Identification: Early identification of the child with visual impairment helPta a great deal in facilitating effective rehabilitation of the child. Some of the techniques for early identification of children with visual impairment are as follows.

22 Eye Hospital Eye camps Population centers Through anganwadi workers Voluntary organization 1.4.3 Classification of Intervention Programmes: Current practice of early intervention is viewed as a deficit model. The time to intervene is before the delay occurs; the goal is to prevent the delay, if possible. Early intervention programmes are classified as vision screening, medical intervention and educational intervention. All these programmes go simultaneously for prevention of eye deficit, restoration of vision, development of vision efficiency. Vision Screening: All children should be screened for possible vision problems, especially those under the age of three with a suspected or identified risk factor, regardless of severity. The initial screening should be conducted by trained personnel on vision screening procedures. The trained personnel may be low vision specialist, special teacher, rehabilitation workers and village nurses. Identified cases of visual problems are referred to the medical personnel who would attend to thorough eye examination. Medical Intervention: There are many possible defects or diseases of the visual system, but, fortunately, many of them appear after the first few years of life. There are still many malformations, defects, diseases, infections and disorders that can affect the visual system in infants and toddlers. As it is presumed that medical follow up to screening will identify and prescribe treatment. The medical professionals will take care of the treatment aspects for the diseases and defects of the eyes. After the medical treatment still the child may have visual defect, further intervention programme should be planned for the restoration of remaining sight and development of visual efficiency. Through medical intervention, diagnosis, eye treatment, eye surgeries and provision of glasses and low vision aids are done for the curable visually impaired. For incurable visually impaired persons, identification, eye check up certification of visual impairment and counseling are done by the medical experts. These incurable visually impaired persons are referred to the rehabilitation centers for further services Educational Intervention: Educational intervention includes the preschool training 23 such as development of daily living skills, mobility skills, visual skills, etc. and placement of the child into the formal school system. The trained teacher or rehabilitation worker who qualified on visual impairment takes the child with visual impairment for training on various skills required by the child. He develops the pre educational skills such as tactile discrimination, other sensory development, communication skills mobility, social interaction etc. All these training will be helpful for making appropriate placement of the child in the educational programme Vocational Intervention Vocational training is an important component of the vocational intervention. There are some disabled individuals who, after they are provided with physical restoration services, are capable of going back to their old jobs. But, there are unfortunately many, who are unable to do so, and, therefore, require training in new skills. Vocational training may not be so essential to an able bodied person, who can benefit by general education. Vocational training assists persons who are blind in preparing for, obtaining, and retaining employment. Applicants are made eligible based on their visual disability, their need for vocational training, and their intent to work. The vocational training counselor and the eligible individual work in partnership to jointly identify a realistic employment objective consistent with the individuals skills, abilities, capabilities, aptitude, particular interests, concerns and resources through informed choice, as well as the services needed to achieve that objective. Factors to be considered in determining a disabled person's suitability for vocational training: ? He must have the necessary level of intelligence, educational background, work experience or potential aptitude to be able to derive benefit from the particular course. ? He must have the capacity to match up to the physical requirements of the actual trade. ? He must have the interest, determination and necessary adaptability to absorb training and make good in a new occupation ? He must have reasonable prospects of placement in the trade on completion of training Steps involved in Vocational Training ? Help disabled persons gain or recover working habits ? Give help and guidance on social problems which may be impeding resettlement. 24 ? Providing physical reconditioning where necessary. ? Provide medical, psychological, and vocational assessment of capacity to work in particular types of jobs. ? Build up or restore morale and self-confidence ? Arrange for vocational training of the rehabilitee ? Find suitable employment for the individual Rehabilitation Rehabilitation centers for the visually impaired are run by government and non government organizations in several places of the state. The persons with visual impairment are referred to those centers which are nearer to the clients for getting service. The rehabilitation centers are taking care of visually impaired persons in the following ways: 1. Identification and diagnosis of visual defectiveness 2. Arranging treatment and follow up for restoring vision 3. Obtaining certificate of visual impairment 4. Individual assessment - visual and functional 5. Individual counselling and family counselling 6. Provision of training in : ? Orientation and mobility ? Activities of daily living etc. ? Social integration ? Education ? Economic rehabilitation ? Support services and obtaining concessions ? Bringing community awareness and involvement 25 1.5 Intervention for lately blinded students - Role of special educators or special teacher for lately blinded students.

The teacher of students with visual impairment is the central figure on the educational team for lately blinded student. He is the professional who has expertise in how visual impairment affects the

child development and learning, as well as the strategies and tools that can help the

child learn about the world, perform everyday activities and participate in the general curriculum and other activities in school. Therefore,

the

child is likely to be working with the teacher of lately blinded students on day to day basis. He or she will probably serve as the coordinator of the educational team and as a resource for the other team members.

Teachers of students with visual impairments provide guidance and counselling to youth with visual impairments and their families to:

- ? Interpret implications of visual impairment for overall development.
- ? Facilitate understanding of society's attitudes concerning visual impairment and to assist students and families to formulate their responses to misconceptions, lowered expectations, and prejudice.
- ? Explore similarities and differences in relation to all children.
- ? Develop social awareness of self, others, and the community at large.
- ? Encourage social interactions with peer groups.
- ? Identify functional, academic, and vocational potential.
- ? Encourage home involvement in programme objectives.
- ? Promote independence in infants, children, and youth with visual impairment.
- ? Plan for adult life by exploring options for college, technical or trade school, job coaching programmes, industrial enclaves, and other post-secondary placements, as well as identifying independent living arrangements in the community.
- ? Refer to other sources for additional guidance and counselling services.

The specific responsibilities of the teachers of student with visual impairments with the child may vary, depending on the child age and needs, the goals his educational team sets for him, the type of educational programme the child participates in, and the policies of the particular school.

26 The role of the teacher and special educators of the students with lately blinded may include some or all the followings. Conducting various assessments of the lately blinded children to determine his abilities and needs.

Meeting with family members, regular class teacher and other member of the educational team to discuss his progress and make suggestions for strategies to make his school work accessible and to include late blind student

to the greatest extent possible in all school classroom, and extracurricular activities.

Making referrals for additional service to the child may be needed, such as for orientation and mobility instruction.

Preparing or obtaining of learning materials, text books,

and examinations in the appropriate assessable format for lately blind student such as Braille, large print, audio materials, electronics materials. Analyzing the classroom and the other environments for access and safety related to students lately blinded students and advising other members of the team about how best to organize the classroom and materials.

Providing consultation and training for teachers Para educators and other school personnel on effective strategies for teaching students with lately blind students.

Consult with the classroom teacher on ways of making the general curriculum accessible to the impaired child. Creating a classroom climate that is compatible for all students.

Be responsible for preparing classroom materials in formats that are accessible to the child.

The teacher of students with visual impairments,

depending on the model(s) of service being utilized (residential school, special class, resource room, itinerant, or teacher consultant) has a variety of administrative roles. In a large programme, this may include supervision of other teachers of students with visual impairment, in addition to working with Directors of Special Education, principals, regular classroom teachers, and other educational and related services personnel.

Some of the most common activities in this area may include: Communication with Administrators: Teachers of students with visual impairment keep administrators informed concerning:

27 Student information (e.g., visual status, grade level, prototype). Programme goals and activities. Programme evaluation. Screening and referral procedures. Relationships between the programme for students with visual impairment and regular and special education programmes and support services. Funding requirements for consultation, instruction, salaries, travel time, travel expenses, instructional materials, preparation time, conferences, and benefits. In-service needs for teachers and consultants of students with visual impairments, as well as for other regular and special education personnel. Staff scheduling requirements, including adequate time for planning, preparation, report writing, travel, direct instruction, team meetings, and staff conferences. Physical facilities, including design and selection of classroom environments and office space, as well as adequate storage space for instructional materials and equipment. Student scheduling, including preparation of a master schedule to be given to the supervisor and principal(s) of the building(s) in which students are served. Equipment needs, particularly in the area of technology, but also including materials and technological devices.

Record Keeping Maintain records of student assessments, IEPs, IFSPs (and other planning documents), periodic reviews, progress reports, and signed parental release forms. Maintain material and equipment requests. Exchange information about students with visual impairments with appropriate personnel following school district or agency policies regarding confidentiality.

Case Finding and Student Referral Procedures Act as a vision consultant for system-wide screening, materials, follow-up and recommendations. Participate in school district's annual Child Find programme. Maintain a referral/communication system with nurses and other school staff.

28

when a person becomes blind (be he/she is a child or an adult), he comes face to face with the tremendous task of acceptance of visual loss (i.e. blindness) and adjustment to the new situation. Apart from the parents, the teacher plays the role of a counsellor more than that of an educator. He has to consider the age of on-set of blindness, the degree of loss of vision. The person's social positions (i.e. his relation with parents, siblings, neighbours, etc.) his educational status, his rehabilitation needs. The teacher is actually a mediator between the newly blinded person and the tasks to be learned/ to get adjusted to a non-visual world.

1.6 Mediated Teaching-learning Concept of Mediated teaching learning: Mediated learning is the subtle social interaction between teacher and learner in the enrichment of the student's learning experience.

Needs of Mediated teaching learning: i. Reflecting knowledge. ii. Concept formation. iii. Problem solving. iv. Removal error concept. v. Lack of text book and braille book, large print book etc. vi. Development of social skills, creativity, self-confidence, co-operation, collaboration etc. Procedure of Mediated teaching learning: Three stages of mediated learning. 1. Before mediated teaching learning: Lesson planning: Identify lesson objectives and accommodate IEP goals, link to prior knowledge, plan for additional assistance with students with needs, determine groups earlier, and consider how students can have more independent practice. Routines/ Expectation: establish rules, routines and arrangements with the students. Environment: classroom layout is important and students may need to be directed prior to the lesson to know what to do before they begin the lesson.

29 2 During mediated teaching learning: Discuss what the lesson will be about and what they are going to learn. Also want to link the information being learned to prior knowledge. Modeling, engagement, and guided practice done by the teachers and the students to grasp the key skills. Idea behind this is not to move on the independent practice until the students understand the skills. Set the students up for success. Give feedback through-out the lesson and give time for questions and active time to respond to teacher's question. Give praise and positive reinforcement for efforts and positive behaviour movement. 3. After mediated teaching learning: Lesson summaries reflect back on what was learned. Checklists or "exit slips" with actions to organize work and materials remind students what to do accomplish the task. Signal of time frame left or when class is over remind students to start wrapping up their task. Mediator learning: Mediator learning is method of instruction develop by Dr. Reuven Feuerstein. During mediated learning a mediator- a parent teacher, sibling or someone with a vested interest in the learners life provide a suitable stimulus (homework, test, assignment etc.) and then observe s the learners response to the stimulus. Mediator learning experience refers to the way in which stimuli experience in the environment are transformed a mediating agent, usually parent, teacher, sibling or other interested person in the life of the learner. The following process outlines the tasks involved in the teaching and learning process. It assumes a highly collaborative working relationship between the teacher and learner. In the sense that it is used here, the word 'learning' refers to a) the process of learning as used by the learner b) and the learning (outcomes) achieved by the learner In each step of the process both aspects of learning are considered. It is important that the learner is aware of his/her learning achievements and the

30 processes that he/she used in order to make these achievements. In the process of (mediated) learning the learner is the active agent. In less collaborative, more controlling teaching processes there is greater separation of functions, i.e., some of the tasks will be exclusively the responsibility of one party or the other. This tends to assume that the teacher is the active agent (contrary to most educational psychologists, including Piaget) and that the student is simply being processed in order to generate learning outcomes. For example, in a course based teacher directed programme, the selection of focus and content will have occurred elsewhere and by others before the teaching and learning begin the checking on prior learning may be ignored or left entirely to the learner observation, recording & reflection may be exclusively done by the teacher independent of the learner and so on ... Sight helps whole learning (Gestalt), while no visual persons learn part by part. It creates deficits in age-adequate experiences. To fill the gaps in his experience, he is to be helped in experiencing the visual ideas in his non-visual way. In childhood stage, concretization of experiences, as far as practicable is required. But in adolescence or in adulthood, he comes across move and more with abstract ideas, to understand which basic and proper concept formation is the master key.

The whole curriculum for children in school and community is centered around two significant aspects. "The opportunity" and "the experience". Often children are provided with opportunities but the mere provision of opportunities does not mean the acquisition of experience. The understanding of the self and the world is not a 'whole' when experience is denied.

The sighted children have an edge over visually impaired children in the acquisition of knowledge through experience. The vision, which brings an enormous amount of information in just a glimpse, enables sighted children to have rich experiences in a "NATURAL WAY". they learn the experiences as a "WHOLE". But the learning of visually impaired children is not "WHOLE" but in "PIECES" of information. Thus there is significant difference between the two groups, the sighted children having "NATURAL LEARNING" and visually impaired children having "MEDIATED LEARNING ". There is, therefore, a need for adaptation in curriculum for visually impaired children.

31 1. 7

Enriched teaching for concept development Concept development is fundamental in the education of children with disabilities, particularly for those who are visually impaired children. Loss of one sense of the child adversely affects the concept development of these children. Though specific concept development areas are applicable for specific types of children with disabilities, some concept development areas are general. They include body awareness, object and situation characteristics, time and distance awareness, spatial awareness, measurements, orientation of environment, etc. These have to be consciously developed in the child. As most of these concepts grow naturally in a non-disabled child, a disabled child living in the mainstreaming environment will be able to acquire these concepts in a natural way. Therefore, inclusive education setting is more conducive for the concept development of children with disabilities. Even in the special schools the children can be provided ample opportunities to develop their concept development skills. What is concept ? A concept is a mental image of some object, person or an idea. Concepts are formed by generalisations from particulars. Concepts are also formed due to the experience of the past, i.e. formation of new concepts are affected by the past experiences. Concept formation depends upon the ability of individuals to distinguish between objects so that they are classified as belonging or not belonging to a particular group of objects. Thus, a concept represents a class of stimuli, may be objects, animals or events. Thus, we have the concepts of 'table', 'chair', 'teacher', etc. According to Smith, "The process by which we organise and classify stimuli, by which we come to perceive sets of stimuli as unified wholes and by which we come to put a number of instance into one category such as 'Chair' is called concept formation or concept learning". An individual goes on learning new concepts and using old concepts in new situations throughout his life. These concepts act as the basic units of learning. But, the individuals differ in their concept formation according to their age, intelligence, and experience. For example, a layman's concept about a thing would be radically different from that of an educated and experienced person. A concept in fact means what we understand by a thing. A child's or a layman's understanding of a thing will certainly be different from an intelligent person's understanding about that thing. 32 Initially, concepts about concrete objects are formed, and gradually concepts like 'truth', 'beauty', and 'justice' etc. are formed alongwith the intellectual development of the individual. A concept is derived from the identification of common characteristics in an object, person or thought. As Munn describes, "A concept is a process which represents the similarities in diverse, objective, situations or events". Concepts are the basic units of learning and reasoning, and once developed, help further thinking: Formation of Concepts Concept formation undergoes two processes: Generalisation. Abstraction. Generalisation means to strike similarities among objects, events, individuals, situations, etc. belonging to the same class. Take for example, a child's first experience with a cat. By and by he begins to differentiate between a cat and other domestic animals, and notes the common characteristics of a cat. Thus, he forms a concept about a cat. Similarly, other concepts develop through generalisations. Abstraction is observing the similarities of otherwise different things, situations and ideas. Both abstraction and generalisation go side by side though abstraction requires higher mental processes. Generalisation is a process generally applicable to the formation of concepts about concrete objects, like table, chair, etc. Abstraction is applicable to the formation of concepts about abstract ideas like truth, beauty Justice, etc. and therefore, requires higher mental processes for their formation. Both abstraction and generalisation come from observation of similarities, in different situations having common characteristics. Attributes of Concepts Concepts have attributes and characteristics which each member of the concept class has in common. The main attributes are: Perceptibility. Learnability. Usability. Validity.

33 **Generality.** Perceptibility: This means that perceptions lead to the formation of concepts. Firstly the things are observed and perceived. This perception gets mixed with the previous perceptions leading to the formation of new concepts. Learnability: Concept formation is the result of learning. They are the products of observation, experience and thinking. The teacher can help the students in the formation of correct and positive concepts. Concept formation is essential because concepts are the units and basis of learning and thinking. Correct and positive concepts help in the development of the personality of an individual. Usability: Concept formation depends upon usability or the frequency of their use. That is why drill and practice are emphasized. Drill and practice help in fixing the concept in mind. Formulas and definitions should be over learnt to get them fixed in the mind. Validity: Validity means correctness. A concept is valid if it has a clear cut and definite meaning. Generally, a man's experience and maturity help him to form valid and correct concept. **Generality:** Concepts are the result of generalisation. Observation and perception of common characteristics lead to generalisations, and consequently to the formation of concepts. These are some of the main attributes or characteristics of concepts. **Teaching and Learning of Concepts depends on:** **Providing individual Instruction:** On account of the psychological fact that there are marked individual differences, it is suggested that individualised instruction should be provided to the children. Individuals differ in their capacity of concept-formation. Individual with low intellectual level can form concepts about concrete objects only; on the other hand, children with high intellectual level can also form concepts about abstract terms and ideas. The teacher, therefore, has to provide individualised instruction accordingly. **Providing Variety of Experiences:** Concept formation is the result of observation and experience. Concepts are formed and made clear through experience and maturity. Therefore, it is essential that the 34 children be provided with large experiences. **Presentation of Examples:** Examples provide experiences which can be better and are easily understood. Concepts must be developed on the basis of perception, which are provided by concrete objects and examples. **Using Inductive and Deductive Methods:** Inductive method implies firstly, the presentation of examples and then the formulation of generalisation on the basis of examples. Deductive method, on the other hand, implies the testing and application of the generalisation. Both the methods may be used in combination for the effective and successful formation of concepts. **Making use of Maxims of Teaching :** For clear and correct formation of concepts, the teacher, should make use of the maxims like 'Proceed from simple to the complex' and 'Proceed from concrete to the abstract'. The use of maxims of teaching will make the learning of concepts easy. **Active involvement of Students:** The students should be made active participants in the learning of the concepts. This, independent learning should be encouraged on the part of the students. The students should be provided with learning situations, and they should be made to observe and generalise themselves. This is a surer and lasting way of learning. **Adopting Integrated Approach to Learning:** Experiences and units of learning should be presented to the children in an integrated form. The 'whole' is more easily understood by the children because analyse of the whole, into "parts demands greater maturity and intellect on the part of the children. A combination of the whole method and the part method will give excellent results, as far as the learning and formation of concepts is concerned. **Making use of Audio- Visual Aids:** Personal and direct observation and experience is the best way of learning anything. But, if these are not possible, then the teacher should make use of audio-visual aids for the clear and correct formation of concepts. These are some of the effective ways of developing concepts. **Uses of concepts** Concepts reduce the complexity of the environment-

35 As we know, concepts always represent a class of stimuli, but not any particular stimulus. If we respond to each individual stimulus, it will unnecessarily take more time and energy. Instead of responding to thousands of particular but similar stimuli, we respond to a concept which embraces all these stimuli and thereby it reduces the complexity of the environment. The learning of concepts enables the children to grasp, in an array of stimuli, similarities and difference which he would otherwise have great difficulty copying with. Education in this sense, gives the student environmental mastery which he would otherwise lack. Concepts help us to identify the objects around - Identification involves placing an object in a class and therefore, reducing the complexity of the world of stimuli. For example, sound is a general concept. But we are able to identify and discriminate various sounds like sound of bell, sound of different animals and birds, sound of different musical instruments. Concepts reduce the necessity of constant learning - Concepts always represent a class. Therefore, when we learn a particular concept, we are not required to learn the individual objects constantly. For example, once we learn what is a mammal and the characteristics of mammals, we are not required to continue the learning of the characteristics of each member of this class. We always prefer to develop a general characteristic which will be all inclusive. Concepts provide direction for instruction - By using concepts and principles we know in advance the action we can take. The steps described for the teaching of concepts and principles are largely embodied in a set of verbal instructions. These instructions would not be possible without the learning of concepts. Concepts and principles can stand as barriers to instruction and to the teacher when the student has an inadequate grasp of them and does not know their relationship to the concrete environment. Abstract and more difficult concepts make the process of instruction more complex and strenuous. Concepts grow out of the perceptual process and become enriched as the child develops language. The breadth of concept development is dependent in large measure on the breadth of the perceptual experiences. Because the blind child lacks one source of sensory input, his perceptual processes are deficient. He may never grasp some concepts and may need more experience than the sighted child to grasp others. Abstractions such as a concept of color may never be formed, since the child has no possibility of acquiring a background of sensory input for this concept. The concepts of distance and time illustrate another group which eventually may or may not be grasped, depending on the variety and number of experiences designed to give them meaning. For example, the sighted child may acquire some meaningful concept of distance by visual input, that is, how far he can see, and later through an understanding of relative distances as shown on a map drawn to scale. While the blind child may reach some understanding of distance through his kinesthetic sense, he encounters difficulty in doing so. Walking a specific distance would be the most meaningful procedure, but a walk of sufficient length to give an idea of great distance would not be feasible. Further, his deficiency in grasping what distance is prevents his making maximum use of maps through his tactile sense in order to acquire a concept of relative distance. He needs many concrete experiences through his kinesthetic sense in order to use maps effectively. Lack of vision limits their perception and cognition. This causes knowledge gap between sighted and the children with visual impairment.

The visually impaired child

becomes aware of this world through senses other than sight - this is, through the senses of hearing, touch and smell. In understanding the world around him he cannot perceive objects as much as the sighted by dint of remaining senses either because of physical inaccessibility or of social restraints, for example. Hills and Mountains, Space and relationship to one another are abstract things to the visually impaired children. Most of those are to be explained to the child orally or by the experiences to what they can hear, feel and manipulate. So if he is to understand the reality around him, it is necessary that he be presented with concrete object which can be touched and manipulated, heard and discriminated, factual perception is highly helpful for him to understand the haptic world. Here we should understand that this may not be a complete substitution for the experience gained through visual perception. He should not be left incidental. When the presentation is a distortion to the child, the teacher should explain it to child. A model of a house, for example, can be easily understood by the child if its dimensions are explained to the child related to doors, windows and other parts of a house which he can touch and feel in reality.

37 As far as the materials are concerned, the special teacher should take special care in providing the materials which suit to the need of the visually impaired children, provide appropriate materials for the children the selection of the materials is imperative. The

process of concept formation is best on classification means noting similarities and disregarding insignificant differences. Classification depends on sensory experiences. And lack of this sensory experiences can't fail to produce a lack in concept formation. The visually handicapped child receives information through other senses like touch, smell, hearing etc. this is observed that concept received by remaining senses are defective. The information received by sight and touch are different. A sighted child can see anything to make his or her concept formation at a glance. But a visually handicapped child can't do the same for making his/her concept formation. Visually handicapped child makes his or her concept through part to whole. So visually handicapped children have some difficulty in formation of concepts. 1.8 Let us Sum Up A good method of teaching is based on multi-sensory approach, whether teaching disabled children or non-disabled children. Loss of one sense of the child adversely affects the concept of development of children with visual impairment. As far as the children with disabilities are concerned, providing concrete learning experience becomes pertinent. Teaching methods should be modified to suit the individual learning styles of disabled children. Since disabled children have to learn curricular as well as expanded core-curricular activities, mastery of the child over certain skills are more important comparing the child with another child. A number of strategies can be successfully employed for teaching the visually impaired children. For example giving as far as possible concrete and real experiences, giving opportunity to a child to explore an object bit by bit and then forming a meaningful whole by establishing relationship. Early intervention refers to planned and organized efforts to enhance the

38 development of children, who have a difficulty or are at risk of developing. The goals of early intervention programme are accomplished by providing developmental and therapeutic service for the children with disabilities and support and instruction for their families. Concept development involves sensation, perception, classification and image formation. Concepts are set to have been developed or formed when an individual can name describe an event or place in its absent. For example the description of a table even though the table is not there is the concept of a table. Sighted children learn the experience in a "natural way" as a "whole" but visually impaired children in a mediated way in a pieces of information.

There is no need for special curriculum for visually impaired children who are in the general classroom but special approaches based on multi-sensory experience are needed. The guidelines for teaching method should develop based on the learning behaviours of the visually impaired children. Sighted children can easily learn many things just by seeing what is happening around him. But for the visually impaired children it is very difficult. A mere sight will bring lot of information in a fraction of second. So their way of learning is NATURAL, whereas learning of the visual impaired is MEDIATED learning. 1.9 Check your progress A. Write 'true' or 'false': a) Concept helps in forming mental maps. b) Reinforcements help one to learn. c) A child with visual impairment learns about an object as a part to whole. Fill in the blanks: 1. Learning of the visually impaired children is treated as.....learning. 2. Reduction in the range and variety of experience is an.....effect of blindness. 3. Mental pictures of the environments combining verbal description and sensory impressions is called..... Choose the correct answer:

39 Visually impaired children learn– a) in pieces b) the content as a whole c) like sighted children. d) the content with more omissions. B. Assignments: What is concept development? Taking a suitable example, describe various steps in concept development. Define concept development and learning. Mention the effects of blindness on concept development of visually impaired children. Enumerate the need and early identification and intervention in relation to children with visual impairment. 1.10 References Barnett, M.R.(1982). 42 2.1 Introduction

Mathematics cultivates child's thinking and reasoning skills. Child learns to seek and discover ideas himself. Mathematics lays the foundation for systematic thinking through the numerical and spatial aspects of the objects. Learning of mathematics is considered vital because of the complexity involved and its application value in day to day life. One of the major objectives of teaching mathematics is to develop computation skills, to emphasize logical thinking and to enable the child to participate in day to day activities of the family and community. The utility value of learning of mathematics is something phenomenal, considering the amount of application of mathematical concepts in one's life. The importance of learning mathematics has been emphasized

not only for the sighted but also for children with visual impairment in many forums across the world. For sighted and visually impaired children, modes of learning are different. Teaching to sighted children is through writing on the blackboard supplemented by oral instructions. While for a visually impaired child mathematical Braille code, appropriate material and devices are important, along with appropriate teaching techniques and strategies. Mathematics is often questioned by highlighting some of the areas in Mathematics that demand vision. The visual ideas could be converted to nonvisual experiences so as to enable children with visual impairment to get the required learning experiences. Research reveals that children with visual impairment can also learn mathematics when they are taught in an appropriate manner by making necessary adaptations in the curriculum without altering the learning outcomes. Therefore, special efforts, especially commitment of the teacher teaching mathematics and an effective application, would bring out useful adaptation techniques to enable children with visual impairment to achieve the same learning outcomes.

Evidently, learning of mathematics is considered to be a complex process even for the non-impaired children too. The skill of mental calculation is a valuable trait to possess and it is useful in mathematics as well as other educational areas. Mental calculation provides the foundation for the development of higher level thinking skills. It provides children with a new way to think about the number system and number relationships. Successfully performing efficient and effective mental calculations requires a thorough understanding of

43 mathematical principles. It is not a mechanical, rote method of solving problems. Instead, students learn the principles behind mathematics. Children will achieve an understanding that addition, subtraction, multiplication and division are simply methods to combine or separate numbers. The successful application of mental operations requires a person to be skilled at solving problems and not simply adept at memorization of mathematical formulae. There is a practical need for mental calculation strategies in everyday life. Evaluation is an ongoing process and its importance holds good for the education of visually impaired child too. Like any other child a visually impaired 1st child's education at development of mathematical concepts. Some very interesting factors need to be taken care during evaluation of mathematical concepts among visually impaired children.

2.2 Objectives After going through this lesson, students will be able to :

- Explain the various techniques to overcome the math phobia
- Explain the conceptualisation of mathematical concepts
- Describe the various factors that promote better learning of mathematics
- Appreciate the role of mental arithmetic and geometry in every day life
- Describe the need and importance of mental arithmetic
- To prepare tactile diagrams and vision oriented concept in tactile form with necessary modification
- Describe implication of visual impairment in learning mathematics
- Appreciate the needs of evaluation of learning mathematics by visually impaired students
- Understand the implication of visual impairment on evaluation in achievement in mathematical concept
- Prepare and use evaluation tools for mathematical concepts

44 2.3 Coping with Mathematics Phobias 2.3.1 Factors contributing to learning of mathematics

Learning mathematics is considered to be a complex process even for the non-impaired children too. Worldwide, mathematics has the highest failure rates, and lowest average grade achievements. Almost all students regardless of the school type or grade cannot perform in mathematics as per their intellectual abilities. While mathematics for the sighted children itself is in a mercurial state, the same for children with visual impairment is further compounded due to loss of vision. However, teaching mathematics to children with visual impairment has undergone transition over a period of time, resulting in optimistic views toward learning of mathematics by children with visual impairment.

What was considered as impossible for children with visual impairment is proved to be feasible and is gaining an optimistic momentum world over. Truly,

it is not the difficulty of the child with visual impairment to understand mathematical concepts, but it is the difficulty of the teacher teaching mathematics to make suitable adaptations in teaching the concepts. Days are gone when stereotypic attitudes existed in the society, that learning of mathematics is difficult for children with visual impairment. At the school level, especially for children with visual impairment, a number of factors contribute to effective learning of mathematics.

A good mathematics curriculum must possess carefully chosen objectives that stress a balance among cognitive, affective and psychomotor domains as parts of the instructional strategies. Following are the key factors considered important for effective learning of mathematics by children with visual impairment, among others (Mani, 1992).

1. Selection and teaching of suitable mathematical Braille Codes. The mathematical Braille Code must be introduced to children as and when they occur in the text. By doing so, children should develop knowledge of the Braille mathematical Code and their practical usage. Right from the first standard, the children should be exposed to the text material wherein Braille Mathematical Codes are incorporated. This will give them an idea regarding the format of presentation.
2. Adaptation of text material to children with visual impairment. Adaptation of the text material for visually impaired child without changing the learning outcomes. Darling (1985) states that the learning activities of visually impaired children can be created without changing the learning outcomes set forth for sighted children. She also states the mathematical aids are of paramount importance in developing the right type of concept in the child.
3. Teaching of mathematical devices such as Abacus, Taylor frame etc. Teaching of mathematical devices e.g. the Abacus, Taylor frame, geo-board etc. to the visually impaired child for making the necessary calculations and understanding diagrams. Abacus takes little time in calculation while linear equations are possible to be shown in Taylor Frame. For teaching mathematical diagrams, geo-board and relief sheets are useful.
4. Provision of appropriate mathematics text material. Provisions of suitable mathematics text-material after necessary editing of the content and format, Mathematics learning is not very difficult but it is a long process and makes the child and teacher feel that it is difficult. This cannot be achieved overnight, it needs continuous effort.
5. Preparation and use of appropriate teaching aids. Preparation and use of appropriate teaching aids for supplementing instruction in teaching Mathematics, Like any other child there is need to devise innovative material to give concrete ideas to visually impaired child too.
6. Provision of simulating experiences, creation of situational approaches etc.
7. Mental ability of the student. Hence a good and effective classroom, conducive for teaching of

mathematics to children with visual impairment must adopt a multisensory approach using a plethora of teaching learning materials with necessary adaptations in the curriculum and must include children with visual impairment as active participants. Children learn primarily by manipulation till the formal operational stage. If children are not taught mathematics with hands on methods up to the age of 12, their ability to acquire mathematics knowledge is disturbed at the point when hands on explorations were abandoned in favour of abstractions. Hence learning by doing, wherever feasible, is the right approach in teaching mathematics to children with visual impairment.

46 2.3.2

Problems of learning Mathematics for visual impairment children Due to lack of vision, the visually impaired child - finds it difficult to gain concrete ideas of form, size, colour, spatial relationships, and spatial qualities of objects; is unable to observe the objects in to; thus gains a partial knowledge of the objects; is unable to acquire incidental learning; faces problems in setting out long multiplication and long division; finds it difficult to construct desired geometrical figures; takes more time in learning and comprehending mathematical concepts; takes longer to feel along a line than to scan it visually; faces problem to make the graphs themselves. 2.3.3 What is math phobia? It may be defined as a feeling of anxiety that stops one from efficiently tackling mathematical problems. Many people think of math as an extremely tough subject that they cannot master. This negative attitude stops them from focusing on the subject/ problem which they are tackling. Just before tests or exams they start to get nervous as they are not prepared. Some even learn and understand math but during the time of the test fear clouds their minds and they are not able to perform well. This increases the speculation in their minds that math is too tough for them. In simple term phobia means fear. A Anxiety One definition of math anxiety is "the panic, helplessness, paralysis, and mental disorganization that arises among some people when they are required to solve a mathematical problem. Math anxiety is a serious and pervasive problem, especially for the visually impaired students who may experience math anxiety in many forms and degrees, from "freezing up" during a math exam, to attempting to avoid anything having to do with numbers. Symptoms may be physical or psychological and may include (but not be limited to) any of the following:

47 Physical: Nausea, shortness-of-breath, sweating, heart palpitations, increased blood pressure. Psychological: Memory loss, paralysis of thought, loss of self-confidence, negative self-talk, math avoidance, isolation (thinking you are the only one who feels this way). What are the causes of math phobia? Math phobia is due to : Poor math performance Poor preparation Negative math experience Math avoidance due to lack of vision Lack of confidence Passive behaviour of the students Inherited trait Community influence Low self esteem Lack of analogies Learning disorder Insufficient study materials for visually impaired children B. How to overcome mathematical phobia? The first step is to build confidence Recognize the symptoms of math phobia Start preparing early Start with small mathematical problem Combat negative thinking Do easiest problems first

48 Find a support group Reward for hard work Learn stress management and relaxation techniques Sign-up for the proper level of math course. Ask questions when you don't understand. Give enough time to study for a test. Make a test plan to reduce anxiety. Revise study habits. Reinforce the child's sense of intelligence and skill. Create a supportive environment for learning math. Schedule study breaks. Encourage the child to tackle math one problem at a time. Show your child the positive uses of math. Familiarize the teacher with improvised math teaching aids. Support the positive aspects of math with games, puzzles, and humour. Encourage the child to not compare abilities with their classmates. Play with math games to find the fun in mathematics Keep a positive attitudes Encourage creative approach Variation in approach Parents, guidance Strengthen students basic skill Use step by step approach Use multisensory approach Active role of the teacher

49 2.4 Conceptualization of mathematical ideas

The role of vision is so vital during the early years of life to learn concepts. Devoid of the sense of vision, it is an accepted fact that the children with visual impairment are in a disadvantageous position. However, teaching methodologies including multisensory approaches where in the remaining senses are utilized optimally to compensate the loss of vision comes in handy.

Learning of mathematical concept in parts logical thinking and numerical skills are besides reasoning. Evaluation of learning in mathematical concept aims at- Assessing. Understanding of the concept. Development of skills to do mathematical operations Ability to find solutions of mathematical problems Understanding the concept of time, distance, money measurement etc.

Mathematics is a deductive concept and proposition'. The basic concepts of any branches of mathematics have to be general and minimum possible.

For example the concept of natural number does not refer only pebbles or apples or coins or houses part to any and all entities which satisfy set of axioms. The axioms are propositions whose validity is considered to be self-evident. The visually impaired may lack in the incidental experiences which his sighted counter parts can make use of. Therefore, they need successive interactions with basic experiences and suggestion to arrive at the desire in intuitive grasp of the concept. For example, while teaching the concept of line to an eight year old sighted child it may suffice to draw a line on a black-board and say that this represents line. The line which you observe as edges of walls of rooms, rail tracks etc, it can be extended on either sight it has no thickness etc. but for a visually impaired child of same age we will have to put the learning activities in such an order that the desired learning of the concepts are effected. We may present to him concrete objects for manipulation to explore the edges, with his finger he may explore the extension of thread wire etc. subsequently embossed diagrams on cards can be used to fix the idea. The children should arrive at an intuitive grasp of the mathematical concepts through

50 experience with concrete and semi- concrete material adapted for their use. The order of complexity of arrangement of material should be conducive to a sequential learning of the concepts. The principle of mathematical variability should be followed in eliciting the grasp of the concept. For example, in teaching the concept of place value one should use counters, using a bigger or tactually different counter for every tenth object to be counted. Thereafter, a Spike Board with counters may be used. This can be followed by use of a ten base abacus and only after this the 'crammer abacus' should be used. The same idea of place value can be given by using apparatus . The flow of activities is from concrete exploratory activities leading to abstracting and intuitively grasping the concept to its application to other situations aided by language to generalising and use of notation and symbols. The four Arithmetical operations can be taught using concrete and structured material like number board, unifix cubes, marble, match stick etc. The structural properties and inter-relations among the four operations can also be conveyed by the use of these materials. The algorithms should be of few steps only and the reason behind their formulation should be clarified before they are used for drill work. There are situations when the algorithms which the sighted children use can't be applied by the Visually Impaired children. A case in point is the addition of fractions. As the notations of fractions in braille is such that the step of multiplying the denominators in the addition algorithm can't be done easily by the Visually Impaired children, an appropriate substitution will be using the notion of fraction as a denoted ratio and reformulating the algorithm. The idea of space, time, and derived concepts like speed etc. appear to be one of the major problem areas for the Visually Impaired children. This should be linked with the mobility training so crucial for their daily living. For example, the concept of graphical location can be given by pegging two ropes with knot at one pace interval placed perpendicular to each other on a ground. The children can locate an object like chair, another child etc., by starting from the origin. The teacher can give directions of movement along the axes. Subsequently, the same exercise can be done on paper and later on embossed graph paper can be made available to the children. The use of the magnetic board can also be made in giving the geometrical concepts particularly, those involving flexibility of movement and locus. A visually impaired person gains knowledge of the spatial qualities of objects only by tactual observations in which kinesthetic

51 experiences play an important role. Since touch requires direct contact with the object to be observed, visually impaired children often gain a partial knowledge of objects that they cannot observe in toto. Also, the sense of touch generally functions only if it is actively employed for the purpose of cognition. Whereas vision is active as long as the eyes are open. A visually impaired student needs to learn systematically what a sighted child can pick up incidentally from the environment. Thus, a visually impaired child is limited in the range and variety of his experiences and educational measures are necessary to overcome this limitation. Development of mathematical concepts among children starts with number concept. The curriculum for mathematical concepts is set up very carefully. Efforts are made that it has direct utility in day to day life. In secondary school mathematical concepts form an important part of academic skills.

Evaluation is essential to ensure that the objectives are being achieved and identify the areas of improvement.

The following factors have direct bearing on evaluation of mathematical concept among visually impaired children

The visually impaired child should be encouraged to master the skills of using abacus, Taylor frame and geometry kit effectively. At the time of evaluation they should be provided with the necessary equipment. Visually impaired children should be introduced with Braille

mathematical code as and when it appears in the textbook

Visually impaired children should be provided with Braille books in mathematics well in time. The question papers in Braille should use only those mathematical codes that have been taught to the child. The visually impaired children should be

exposed to all the mathematical concepts including geometry and trigonometry. Innovative methods should be used to make mathematics interesting for visually impaired child 2.5

Preparation and use of tactile materials: Mathematics text materials: The use of braille text materials in mathematics can't be overlooked for visually impaired students. The content in mathematics text books which

52 contain more of facts and procedures should be presented in tangible form to the visually impaired child to, enhance his learning. Mathematical text materials requires a lot of editing since it contains geometrical diagrams, mensuration diagrams, trigonometric figures. Under each lesson so on, presentation of text materials should not confined the visual impaired child when using the materials along sight his fellow sight counter parts. In case of modifications of the diagrams, instruction above the kind of modifications could be specified. Similarly in case of omissions of the diagrams or an exercise, it is very vital to explain the concept of text and the reasons for omitted portion. The adopted mathematics instructional materials should be presented and supplied in to regional language. Supplementary teaching aids should be given along in the instructional materials. In order to facilitate the visually impaired teacher should prepare the materials in braille. In adapted instructional materials one has to bear in mind following aspects.

Duplication as per possible Modification of the lesson without changing the concept Substitution of a model for giving the same approximate experience Omission under unavoidable circumstances

Truly speaking "The hand is the eye of the visually impaired". Tactile materials or diagram should be prepared in such a way that visually impaired children are able to explore, identify, discriminate and recognize it without much confusion.

Tactile materials should make the teaching effective,

quicken the pace of learning, help to overcome the burden in learning, provide first hand concrete experience and bring variety to the learning of visually impaired students. The sense of touch becomes more important media in learning process and also it provides enrich experience such as shape, size, texture, hardness, softness, weight, dry or moistness, hot and cold etc. hence the preparation and presentation of tactile materials should follow the following aspects: Tactile materials or diagrams should stimulate and motivate the visually impaired students. The size of the tactile diagram for the visually impaired students should be within two hands of the users, It should convey only central idea of the lesson supported by its components.

53

It should provide an appropriate tactile experience. It should be simple and clear in shape and size. It should make the teaching effective and the learning interesting. It should , quickness of pace of learning and overcome the hurdles in learning.

It should be strong and sturdy enough to have longer durability. Title of a diagram

should be placed at the top of the diagrams. Principle of leveling of the diagram should be maintained from left to right and top to bottom. Principles of tactile diagram may be "

make it cheap, use it well and change it often"

It should be

provide three dimensional and concrete experiences and bring variety to learning of the visually impaired students. It should follow principles of tactile tolerance. Must avoid tactile jumbling. Ratio of enlarged size should be maximized upon the visual competence. It should not overload be with information. 2.5.1

Improvisation of mathematical teaching aids for visually impaired Students: The

material for visually impaired children is prepared bearing in mind the suitable principles-the maximizing of the duplicated material, the modification of format and content for necessary adaptation, the substitution of ideas/ lessons for optimum learning experience of the child and rare omissions under unavoidable circumstances. Mathematics being an abstract subject, which involves the appearance of concrete, pictorial and abstract concepts, all the four principles should be used in preparing text material.

To supplement the use of mathematical text material, a small guidebook in Braille consisting of the model problems, certain diagrammatic illustrations, etc. can be provided to the child.

Davidson's (1988) study also highlights this need. This helps the child, especially during the examination time, to revise.

Even though it experienced that

54 Mathematics lessons could not be recorded into cassettes as whole,

certain steps such as formulae, methods of constructing a diagram in the case of geometry, etc. can be recorded in

a cassette. All possible alternatives have to be explored for making the teaching- learning in Mathematics more purposeful.

Mani (1993)

highlights the importance of three- dimensional aids and the need and nature of improvisation of aids in the teaching of Mathematics to visually impaired children.

Since vision plays a predominant role in the assimilation of ideas by observation, certain aids, which are commonly available for sighted children have to be adapted to suit the needs of the

visually impaired children. The concept of tactile attraction is to be emphasized in preparing teaching aids, so

that the child does not encounter any difficulty in understanding the concept.

In Mathematics, most of the teaching aids can be presented tactually because they are aiming at the development of certain concepts. Area, volume, height, weight, elevation, scale value, etc., are some concepts which can be effectively explained through three dimensional teaching aids.

Geometrical

devices can also be adapted to the needs of visually impaired children.

For example,

in the normal Protractor made out of plastic, big wholes can be made for every ten degrees and small whole's for every five degrees without breaking it.

Visually impaired children can have difficulties with Mathematics, as Clamp (1981) points out, this is likely to be due to underdeveloped mathematical concepts and not due to an inability to achieve. They can be good achievers in Mathematics if an emphasis on concrete experiences is given. According to Brown (1983), in his concept on systematic approach to instructional technology, the central focus is on the students, their needs, capabilities and achievements as they work towards desirable levels of competence and performance. There are four fundamental questions. First, what goals are to be achieved? Second, how and under what conditions students aim to achieve these goals. Third, what resources are required for necessary learning experience And fourth, how far the goals were achieved. This process also provides guidance for necessary improvements in instructions regarding what needs to his changed.

55 2.6 Mental Arithmetic Abilities 2.6.1 What is mental arithmetic? Mental Arithmetic Skills - Hall (1954) defines mental arithmetic as ... 1) Arithmetic problems which arise a) in an oral manner b) in written form, or c) "in the head" of the person who needs to solve the problem; 2) Problems in which pencil and paper and other mechanical devices, such as calculators, are not used to record the intermediate steps between the statement of the problem and its answer; 3) Problems in which pencil and paper are used, and problems in which they are not used, to record the answer; 4) Problems in which quick estimations are made which either mayor may not be verified by a written response.

Mental arithmetic is an ability to calculate and get a correct answer without using paper

and pencil or any other electronic devices. Mental arithmetic is an form of training which enhances a child's ability to calculate without the aid of any instrument, such as paper, pen, pencil, calculator or abacus. The child will be able to calculate with speed and accuracy using his/her own mental power and can surpass the speed of even a calculator. It starts with the use of an abacus and soon the child learns to calculate mentally without a physical abacus. Mental arithmetic is fun filled learning. When the mind gets constant exercise, mental power of the child gets a boost. Just like equipment at the gym is a medium of body building. So also for brain development, mental arithmetic is proven medium. In short, Mental Arithmetic + Practice = Brain Development. Mental arithmetic training will have several positive benefits.

These are: Greater concentration Keen Listening skills

56 Better reflexes Better application skills Improved analytical skills Better creative and imaginative skills Better Memory Sharper observation Self-confidence Better comprehension and calculation skills 2.6.2 Importance

and applications of mental arithmetic The important point that emerges about the nature of mathematical concepts is that the elementary and most general characteristics are most significant and so also the process of their generalization which may be abstract. The perception of these concepts can be achieved only intuitively. The visually impaired are no less competent in this

intuition, and

mental computation is not likely to cause any particular difficulties. Visually impaired children become adept at this since they are used to relying on their memories rather than referring to books for prompting. In order to develop the

mental ability of doing mathematical calculation, concentration and a mastery of

basic mathematical operations are required. As in the case of other activities, this too needs systematic instruction, practice and application. In visually impaired children, this exercise could start with the learning of the abacus. Calculations in the abacus require a mastery over the multiplication tables and ability in the abacus contributes to mental abilities in calculation.

Once the child is proficient in operations with the abacus, ranging from addition, subtraction, multiplication, and

division (especially long division involving many digits) up to the process of calculating square root, percentage etc., he/she can be trained to use short-cut techniques in computing

the values. For example, 642×123 can be divided into various steps such as 600×123 , 40×123 , 2×123 and even further depending upon the ability of the child to store the calculated values in his/her brain before making the sum total of the entire calculation. Training in remembering a set of numbers over a period of time, games for calculations, etc. can be performed by the student and teacher

in order to gain

sufficient practice. Prolonged training and practice in performing mental calculation & help the child to acquire a mathematical mind,

57 which is very essential for problem solving, analysis of information, a scientific approach in performing day-to-day activities, etc. After each exercise in improving mental calculations, it is necessary for the child to verify his/her answer with the help of

mathematical devices such as the abacus or Taylor Frame. The process of calculation in mathematical device helps him/her to discover where the mistakes were made during the mental calculations. Kalaiselvi (1985) studied the effect of the abacus and the Taylor Frame in teaching mathematics to visually impaired children. Thompson (1999), in an effort to support/advise teachers to meet the changing curricular demands of increased emphasis on the development of a child's mathematical mental calculation abilities, provided a comprehensive list of the most commonly used mental calculation strategies used for one digit number operations for primary school aged children. Thompson (2000) also produced a list of the most commonly used strategies for two digit number operations. Thompson (1997) used these strategies in his research study in which he attempted to determine if written methods could actually reflect mental calculation strategies. The focus of Thompson's work involved addition and subtraction operations only. The research of Hope and Sherrill (1987) revealed a number of calculation strategies. As previously noted, the study participants included 15 students skilled in mental computation and 15 who were considered unskilled. Analysis of the student reports indicated that 3 methods and 4 strategies per method were used to solve the calculation tasks. l) Mental pencil and paper - doing the same mental processes in one's head as he or she would conventionally do on paper. a) No partial product retrieved - i.e. 25×25 - "five times 5 is 25, carry 2, $5 \times 2 = 10$ plus 2 = 12 etc." b) One partial product retrieved - i.e. - " 5×48 is $5 \times 8 = 40$, carry 4, 24, 240. And 2×48 is 96, etc. NOTE: 240 was calculated digit by digit but 96 was retrieved as numerical equivalent. c) Two partial products retrieved as numerical equivalents. 12×250 . $2 \times 250 = 500$, 1×250 is 250, move over one, 3000!

58 $12 \times 250 = (2 \times 250) \times 6 = 500 \times 6 = 3000$ d) Stacking - each partial product was completed digit-by-digit and visualized as a stacked arrangement. i.e. 8×999 is 72,72 and 72 right across. $72 \times 72 = 7(2+7)(2+7)2 = 7992$ 2) Distribution-transforming one or more factors into a series of sums or differences. a) Additive distribution - each partial product is added successively to produce a running sum. i.e. $8 \times 4211 = 8 \times 4000 = 32000, 8 \times 200 = 1600$ and $8 \times 11 = 88$. Answer: 33688. b) Fractional distribution: applied when factor contained a "5" as a unit digit. i.e. 15×48 was calculated as $10 \times 48 = 480$ and half of that is 240 so the answer is 720. c) Subtractive distribution - used when students thought expressing the numbers as a difference made the calculation more tractable. i.e. 8×999 is the same as $8 \times (1000 - 1) = 8000 - 8 = 7992$. d) Quadratic distribution- The algebraic identity for the difference of squares $(x - y)(x + y) = x^2 - y^2$. So, students solved by the problem 49×51 by changing it to $50^2 - 1^2 = 2499$. 3) Factoring - one or more factors in the task were transformed into a series of products or quotients rather than a series of sums/differences. a) General- factoring one or more of the factors before applying the multiplication law. i.e. $25 \times 48 = (5 \times 5) \times 48$. 5 times 48 = $(5 \times 40) + (5 \times 8)$ and 5×240 is 1200. $25 \times 48 = 5 \times 5 \times 48 = 5 \times \{(5 \times 40) + (5 \times 8)\} = 5 \times \{200 + 40\} = 5 \times 240 = 1200$ b) Half and double - This strategy is used when one factor is a multiple of 2. i.e. 12×15 equals 6 times $(1/2) \times 30$ (double) = 180. c) Aliquot parts - transforming one factor into a quotient. d) Exponential factoring - used to calculate products of power through the exponential rule. i.e. 32×32 . 32 is 2 to the 5th power, squaring this is two to the tenth power, "which I just know is 1024." For this person 210 is a numerical equivalent of 1024 .

59 Some of these strategies have been described in the work of Hazekamp (1986) and Atweh (1982). However, these authors identified several strategies unique to their respective reports. Hazekamp discussed the rules of multiplying by 5, 50 and 100: By 5 - Divide by 2, multiply by 10. 5 is 10 $\div 2$ By 50 - Divide by 2, multiply by 100. 50 is 100 $\div 2$ By 100 - Divide by 2, multiply by 1000. 100 is 1000 $\div 10$ For example, the problem 364×50 is solved by dividing 364 by 2, yielding 182. Next, multiply by 100 to give 18,200. Atweh provided an interesting strategy for a multiplication calculation that can be performed assuming two criteria are met. First, the units digits must add to ten. Second, the tens digits must be the same. If both of these criteria hold true for a problem, the problem can be solved by multiplying the units digits to yield the last two digits of the product. Then, increase one of the tens digits by one, keep the other the same and multiply. The result is the first two digits of the product. i.e. $64 \times 66 \dots 6 \times 4 = 24$, the last two digits in the product. \dots and $7 \times 6 = 42 \dots$ is the first two digits in the product. Therefore, the answer is 4224. These studies reveal that most teachers working in residential schools are unaware of the use of the abacus. The study recommends that systematic instructions should be given to handle the abacus, and mental calculations can be developed in primary & elementary level children by the play way method. For

this reason, it becomes important to teach mental math to children in primary level. This in turn improves their ability to use four arithmetic rules in high speed to obtain solutions without the use of any tools.

One of the most important factors to consider in this process is the manipulation of numbers in the head. Creating number sense is one of the most important steps towards realizing this goal. This is for the simple reason it incorporates estimation, measurement and place value. This concept in turn makes it easy for students to memorize math facts easily. The best manner in which to teach mental maths is to string random numbers together and ask students to find the solution. In order to effect this with ease, it is therefore important to teach children how to conceptualize the mathematical process. As they learn how to carry out these calculations in the mind, speed to find solutions is also established.

60 As students become more accustomed to working with numbers, then it becomes easier to provide times tests. However, if they have not learnt the concepts, it is advisable to stay away from this strategy as it only serves to aggravate the students without delivering any results. At this point, it is important to state that teachers should not use any manipulative techniques to teach students. Rather, they ought to focus on teaching them how to think and reason in a mathematical manner. The most important way of ensuring that mental maths concept is accepted and ingrained in students is by incorporating it into the daily programme. 2.7

Evaluation procedures with special reference to the needs of children with visual impairment.

The goal of education is all round development of the child. Evaluation is a mirror, which, reflects the extent to which teaching objectives are achieved.

Evaluation is essential to ensure that the objectives are being achieved and identify the areas of improvement.

Through evaluation suitable modifications are incorporated from time to time to develop desirable skill among children. The remedial steps are possible only through effective evaluation procedures. Evaluation, therefore, has to be continuous and comprehensive. It implies that evaluation should encompass all aspects of teaching objectives. Evaluation is required to assess the pace of pupil's progress, identify learning problems, taking teaching related decisions. In this way evaluation can be a day to day, lesson to lesson, and unit to unit process. Evaluation data are collected through different sources, informal evaluation and formal evaluation. Informal evaluation is usually in progress when the teacher asks questions during the lessons or observes child behavior in some situations incidentally. For formal evaluation several systematic procedures are followed. The most important is achievement test. Several types of questions are used as tools in achievement tests. For example, very short answer type, short answer type, essay type, multiple choice type, matching type, true/false type, fill in the blank type, problem solving types, draw the diagrams types etc. Preparation of tools for evaluation of mathematical concepts among visually impaired children must be in accordance with the following guidelines:

- The tool should ensure equal opportunities to visually impaired children; therefore, they must be compensated with extra time to attempt their questions.
- The visually impaired children should be subjected to evaluation at regular intervals

61 rather than once or twice a year. The assessment report should reflect their regular performance in the class.

- There should be complete evaluation report consisting of information about their non-academic activities so that the same could be used for guidance and counselling.

Visual impairment among children needs to be understood very well during evaluation so that the basic objective is achieved. During evaluation following implications of visual impairment must be considered:

- Visually impaired child expresses through writing in Braille script or through use of typewriter or amanuensis. Suitable arrangements should be made during evaluation process.
- The said methods of expression consume more time. Therefore, visually impaired children should be allotted with extra time at the rate of 20 minutes per hour to ensure equal opportunity and compensate for time consuming procedures through which visually impaired child has to go through.

- For Mathematics, visually impaired child needs abacus or Taylor frame, Geo-board, The necessary arrangement should be made.
- The missing visual experiences in terms of diagrams and other exposure should be compensated through tactile experiences to a visually impaired child. Alternative questions should be provided in the question paper for graphs, geometrical construction and similar other visual based questions.
- Opportunities to build verbal description memories for visually impaired child. Suitable flexibility should be provided to give description of diagrams instead of drawing, to visually impaired child.

- Making educational material available in large print for low vision children. Evaluation system should ensure providing question papers in large print for low vision children. The adjustment and adaptation of evaluation and examination procedures should be viewed from the point of view of presenting the test questions and the modes of answering by visually impaired children. The guiding principle is that the procedures should be as close as possible to the practice with sighted children. The purpose of adaptation is that visually impaired children should not be at disadvantage in evaluation and examination

62 due to their impairment. Substitution and omission should be the last resort. Few ways in which questions can be communicated to visually impaired children and their answers can be elicited are given below:

Modes of questions

- Written in Braille basically elementary level.
- Written in print but read by a reader for the visually impaired child.
- Listening by the visually impaired children from audio cassette player.
- Oral questioning

is more stressful in primary level by the examiner. Combination of the above. Modes of answers Writes himself in Braille. The scribe writes for him basically secondary and above. Records on audio cassette. Give answer orally to the examiner. Combination of the above. Generally, Mathematical calculations are taught step by step so that a student has a sure way of arriving at a proper conclusion. The visually impaired child should know and understand these steps. However, for speed and simplicity, visually impaired students are taught mathematical calculations with an abacus, and present their answers in Braille on a separate answer sheet. This does not mean less work or less study for the visually impaired child it actually means more. Yet, in practical life situations, the abacus and Taylor frame is most functional as a substitute for pencil and paper for the visually impaired students. Abacus work must be done very carefully. For example $6542 + 2364 = 8906$. At times the student may write the answer 7906. In this case while the answer is indeed wrong, the error is most likely in the mere movement of one bead. The teacher should congratulate the student for the portion completed successfully, and bear in mind that the students need more time to learn to handle the abacus effectively. Teacher's flexibility in this aspect is highly appreciated.

63 The problems of teaching to visually impaired students of mathematics can't be treated in isolation from the problems of mathematics education prevailing in general. The paper has attempted to look at the situation in a holistic manner and identified problems- most of which are general in nature, and others specific for the visually impaired learners. Basically, the suggestions that have emerged are: ? Build a faith in the mathematical capabilities of children in general, and visually impaired children in particular; ? Provide concrete experiences to build mathematical concepts; ? Modify concrete materials for visually impaired children; it may be an enriching experience for others; ? Provide active and encouraging teacher-guidance for accommodation and assimilation of new mathematical meanings into the existing structures; ? Provide specific instruction and practice in neat precise, formatted presentations, and ? Provide better alternative materials for use by visually impaired children. Given an improved system of mathematics education in general and non-visual materials and experiences in particular, a child may not find learning mathematics a distant possibility simply because one has already suffered loss of vision. 2.8 Let us Sum Up ? Visually impaired students can also learn Mathematics if taught in an appropriate manner despite being questioned by highlighting some of the areas in Mathematics that demand vision. ? Various factors contribute to better learning of Mathematics, such as selection and teaching of suitable mathematical Braille Codes, adaptation of the text material; teaching of mathematical devices and preparation & use of appropriate teaching aids. ? Visually impaired students face certain problems in learning Mathematics due to lack of vision such as difficulty in gaining concrete ideas of objects, setting out long multiplication and long division Visually impaired students take longer to feel along a line and face problem to make the graphs themselves.

64 ?

Mental arithmetic is an ability to calculate and get a correct answer without using paper and pencil or any other electronic devices. ? For low vision children question paper in large print should be provided. Low vision children may write answers by themselves or with the help of scribe. ? There are important implications of visual impairment on evaluation in the achievement in mathematical concept. ? Evaluation is a continuous and comprehensive process and important component of teaching learning process. ? Learning mathematical concepts involves logical thinking and numerical skills besides reasoning. ? Evaluation of learning mathematical concepts aims at assessing, the concepts understanding, skills to do mathematical operations, ability to find solutions to mathematical problems, and understanding the concepts of time, distance, money, measurement, etc. 2.9 Check your progress A. Write the appropriate answer 1. Instructional objectives are based on a) Content to the cover b) Expected change in the behavior of the student c) Teaching methods d) Instructional environment. 2. Braille mathematical code for India was adopted in a) 1952 b) 1979 c) 1989 d) 1996 3. Remedial teaching is based on a) Mental mathematics 65 b) Teaching method c) Evaluation d) Diagnosis 4. Reading a mathematics braille book may be difficult for a visual by impaired student Because a) Lack of interest in mathematics b) Unawareness of Mathematical braille codes c) Bulkiness of the book d) None of the above 5. Learning of mathematical concepts means a) Development of logical thinking b) Numerical skills and reasoning c) Ability to find solutions of mathematical problems d) all of the above. 6. Algebra can be taught through a) Taylor frame b) Abacus c) Braille d) All the above 7. Geo-board is used to teach a) Geography b) Clock Concept c) Geometric figures d) All the above 8. Evaluation includes

66 a) Qualitative descriptions of student performance b) Students value judgment concerning the desirability of that performance c) None of the above d) Both (a) & (b) 9. In evaluating the braille answer sheets the child should be downgraded for a) More conceptual error b) More braille error c) Neatness d) None of these 10. The devices for mathematical calculations are b) Slate and stylus c) Abacus and Taylor frame d) Braille writer e) None of these B Activity i. Describe the major factors that affect the learning of mathematics among visually impaired students. ii. Enlist the factors that can cause difficulty in learning mathematics by visually impaired students iii. Explain the characteristics of tactile diagram while preparing for the visually impaired students. iv. How can braille mathematical symbols help in learning mathematics by visually impaired students? v. How can learning of mental arithmetic by visually impaired students help them in day to day life situations? vi. Write briefly about the implications of visual impairment on evaluation in the achievement of mathematical concept.

67 vii. Draw various types of angles, triangles, quadrilateral on relief sheets by using Geo-board

Science Sturcture : 3.1 Introduction 3.2 Objectives 3.3 Providing first-hand experience in the class and the school environment 3.4 Inclusive/collaborative learning for laboratory work 3.5 Science Teaching ' Learning' Materials and Equipment : i) Preparation and use of TLM ii) Locating and procuring Science equipment 3.6 Problem solving and Learning by doing approach for visually impaired students 3.7 Evaluation procedure with particular reference to Practicals and Adaptations in Examination Questions i) Evaluation

Procedure with reference to Practical ii) Evaluation Procedure for adaptations in examination questions 3.8 Let us Sum Up 3.9 Check Your Progress 3.10 References 3.1 Introduction: Teaching and learning of science implies a number of things. For some a science course implies definitions, formulae and classification. Some view it as development of scientific thinking methodological careful observation, accurate recording of data to assist in formation of judgements and conclusions. A science course covers a wide range of experiences- observation of scientific phenomenon in day-to-day life to laboratory experiments of simple to very complex phenomena. Method and media employed also vary from textbooks, to real life observation to stimulated experiments. Topics covered range from personal hygiene, weather conditions, astronomy to laboratory sciences like physics, chemistry and biology. But general opinion is that science is a tough subject, depends a lot on sense of vision, hence not convenient

70 for visually impaired children. But this is not the truth. As suggested in the first capsule of this module, adaptation of methods and materials can make it a subject of interest and mastery for younger visually impaired children to grownups. Science books can be brailled in the same manner as are brailled other textbooks and main reference books. Verbal explanation is always employed to clarify the concepts and phenomenon. They can be recorded or brailled and need very little editing except for diagrams and notations. The diagrams need to be translated into tactually perceivable form or description can be substituted. 3.2 Objectives : After completing the activities specified in this capsule, the reader is expected to realise the following objectives with reference to visually impaired children. i) Describe the importance of teaching science. ii) Identify the ways of teaching science. iii) State the role of experiment in learning scientific concepts. iv) Explain the usefulness of laboratory v) Understand the different methods of teaching vi) Understand the importance of uses of TLM and Equipments in teaching science. vii) Demonstrate the methods of evaluation and examination procedures with reference to visually impaired children. 3.3

Providing first-hand experience in the class and the school environment 3.3.1:

Ways of learning Science

One of the foremost methods by which children learn science is through first-hand experiences. Even in the primary standards, whenever a teacher is trying to demonstrate or explain a concept, it is useful for her to have materials trying demonstrate or explain a concept, it is useful for her to have materials which show or display that action or system or method. The visually impaired child sometimes needs special opportunities for tactfully

exploring or having careful, prior explanations of, or follow up information about.

But first- hand experiences should be correlated with helping

71 children to

recall what they have experienced, and making deductions from them. The second way is that very young children enjoy first- hand experience by undertaking field trips. A field trip to an industry, visits to the neighbourhood and community are useful in stimulating awareness of the environment. Visually impaired children can make collections of rock specimens, leaf collections etc. There are many things that primary level children can do in which they can be active during group excursions and field trips. During field trips, the children need to know what they are looking for; they need to be oriented to what to expect, during the field trip. On their return, they should be asked to correlate their experiences with the lessons. This will help visually impaired children to develop concepts through first hand experiences. The third way of instructing visually impaired children is through group study.

Often, children acquire more knowledge through study among a peer group than when by themselves. In project learning, the visually impaired child can be linked with a group of sighted

students. In these activities visually impaired children understand experiences. 3.3.2 Principles of Science Teaching An important prerequisite in science learning is motivation. Without interest and incentive learning does not become meaningful. Motivation may therefore be said to be the heart of the learning process. The teacher should introduce the topic of science in an interesting way and make the content presented meaningful so that the learners find their work interesting and do all activities willingly. It is the responsibility of the science teacher to evolve new patterns in his teaching to motivate the pupils to learn with zeal and eagerness. He should make use of incentives such as : providing scope to display pupils' work; providing opportunity to do independent work; giving responsibility and leadership in scientific activities; keeping the pupils informed of their progress in science; providing opportunity for pupils' demonstration; arranging for pupils' cooperative enterprise in science; organising field trips or visits and also science clubs and science fairs; creating a sense of healthy competition among the pupils. The learners should be actively involved in the learning experience. But in science, many concepts such as atoms, molecules, energy, etc. Are beyond the direct experience of pupils. Models and other audiovisual aids should be used to explain these concepts or principles. The teachers should be familiar with psychological principles of learning the law of readiness, the law of exercise. The effect of motivation and incentive have been discussed earlier, these are connected with these laws. Another important consideration

72 which the science teacher should know is that different pupils learn through different ways. Some pupils learn through actual handling and manipulation; others learn better through audio-visual aids and still others learn well through demonstrations. The science teacher is fortunate in this respect, because he can use a variety of resources or arrange a variety of activities for science teaching. Plenty of charts, diagrams, graphs, maps, or films are available for science teaching. It is also possible to find suitable places for field trips or visits. The availability of reference books, journals, pamphlets or illustrated booklets in regional languages varies from state to state. But such material is easily available in the English language. Demonstration may be given with the help of simple or improvised apparatus. The science teacher should resort to these avenues for teaching science, according to the circumstances. 3.3.3 Science learning at the Primary Stage The pupils at this stage are inquisitive and curious to know the things around them. They ask questions about the hows and why's of things and events that occur in their environment. They are fond of playing and always keen to do something. This is a period of rapid growth; they possess energy and are always restless. They like to spend more time with friends and take special interest in nature. They take pleasure in constructing things with simple tools and ordinary materials. They fascinate stories, fairy-tales or interesting life-stories; they are very imaginative. Brightness, sound, colour, animals or other natural phenomena immediately attract their attention. The science teacher should take advantage of these natural abilities of the pupils and provide them suitable experiences through doing something. This is the best stage to whet their interest in science. Care must be taken while providing experiences to teach them simple concepts of science. Because once a concept is wrongly conceived, it is very difficult to correct it at a later stage. It, however, cannot be expected that pupils of this stage will be able to understand the abstract ideas of science, or the various applications of science. But they can be trained to observe and develop physical skills. Pupils should be taken out for first-hand experience with nature. They may be taken to woods, river-side or lake-side, botanical garden, zoo, or public parks. They may be taken to a poultry-farm, fish-farm or an agricultural farm for first-hand experience there. In case of urban areas, the pupils should get the opportunity to experience the varied life of a modern community such as visiting a post office, a railway station, a sea-port or an air-port and see the working there. Each school should possess an aquarium, a vivarium and a garden. Gardening can be very useful in giving the pupils

73 knowledge of various facts and phenomena of nature. By working in the school garden, the pupils become familiar with the names of various vegetable and flowering plants, the process of manuring and of plant growth. Through gardening, they may be taught simple arithmetic and made familiar with simple plane geometrical figures; the different plots growing different types of plants may be made triangular, square, rectangular or polygonal in shape. Moreover, working in the school garden satisfies their desire for doing something and develops a sense of dignity of labour and a sense of co-operation. Manual labour is good for their health. The school should also have a science museum where the pupils can preserve their collections. The teacher should encourage them to collect interesting specimens to be preserved or displayed in the classroom. This satisfies their instinct of acquisitiveness. If the school possesses a small zoo, the pupils feel the school as the most interesting place. The science teacher can utilise the zoo for imparting to the pupils the knowledge of animal habits their behaviour and their relation to man. Interesting activities suitable for the primary level pupils are constructing bird-houses, keeping weather records, scrap-books or diaries, collecting various types of stones, seeds. Fruits, leaves, insects, butterflies, wild flowers, photographs or sketches of scientists, exploring fields and woods, rearing toads, frogs, insects, birds, rabbits, pigeons in the school, making models of care aeroplanes with cheap materials, experimenting with magnets, torch-cells, electric bells. The teacher should also collect interesting illustrated elementary books of science experiments, or biographies of scientists written in their mother-tongue, for the pupils and suggest them to read. He should also try to develop healthy personal and social habits. It is the time for moulding the pupils and to inculcate the good habits and attitudes. They should be provided with situations to apply and practise these good habits.

3.3.4 Science Learning at the middle school stage Growth is a continuous process with out sharply defined stages. One stage merges with the other through slow and continuous change. Therefore, the teaching at this stage should be linked with the primary stage, but, because of change in interest and expansion of experiences at this stage, the teaching of science should, however, take some definite form. It is essential that at this stage, marked for increase in physical strength and extreme gregariousness, appropriate activities be provided. Group activity is most suitable at this stage to satisfy their muscular ability and group loyalty. They also began to take interest in the people of the community and other affairs of the society the science teacher should plan activities through which

74 the pupils may feel the importance of science for the society. At this stage the pupils seem to be impatient to do things that interest them, but are careless in some of their habits and actions. the science teacher should therefore plan activities of interest to the pupils and also arrange suitable activities which demand exactness, care and precaution. The pupils may be asked to classify their collections and keep them in the appropriate place. They also show keen interest in reading. The science teacher should select appropriate books on elementary science for them to read. This stage is most suitable for training them in necessary mental and physical skills.

3.3.5: Science Learning at the secondary stage The Science teacher should try to exploit the adolescent characteristics for the purpose of teaching science. He should throw challenging problems from the field of science and ask them to solve them. This stage is most appropriate for training them in scientific method careful observation and unbiased judgement. Training in method is an important objective of teaching science in schools. The pupils should be given work in the special fields of their interest. The teacher should also arrange activities to acquaint pupils with the methods and procedures which the scientists follow to explore and exploit nature for our use. The pupils should be so engaged in scientific activities, that they may realise the impact of science on the modern society. They should be encouraged to investigate scientific problems individually or in groups. They should be placed in situations where they can generalise and deduce. Their thirst for undertaking responsibility can be met by engaging them in work of projects, science club, science fair, etc. They should be encouraged to take active part in arranging science exhibitions, discussions, or debates on science exhibitions, discussions, or debates on scientific topics, field trips or visits to places of scientific interest. Such experiences in the field of science enable them to learn science through activities appropriate to their age and ability. Due to maturity in skills, many pupils of this stage are keen to repair science apparatus and equipment or to improve apparatus. They should be given an opportunity to do so. The teacher's attitude towards them is an important factor which determines his ability to control these senior pupils. The teacher should work with them in the laboratory or in outdoor activities or engage some of the pupils to perform simple demonstrations before the class. Special talents in science should be given and guidance to flourish in the field of their interest.

75 Here the science teacher is in an advantageous position for the fact that the adolescents develop the characteristics of volunteering for individual responsibility. But at the same time they like to work with their friends. They begin to develop a liking for publicity of their success. The teacher should remember that the adolescents like freedom in their actions and resent interference. They like manipulative work and want to do something new by themselves. They eagerly accept project-work and their participation can be profitably used for repair work and improvisation of apparatus and other simple scientific appliances.

3.4 Inclusive/collaborative learning for laboratory work

Science teaching is different from the teaching of other subjects for the fact that here the theoretical lessons are accompanied or followed by practical work with apparatus and materials. The word 'laboratory' generally means a spacious room in which a group of students carry out practicals. Other rooms are usually essential if the science teaching of a school is to be efficiently organised. On laboratory side there is a large wall black-board provided. Six laboratory tables are arranged as shown. There is a sufficient space between the black-board and the opposite practical table. The tables measure 6'x3' -6'. Four students work at each table. The practical table opposite the black-board is a bit smaller in size and its top is covered with lead. It can be used for placing the common articles to be used by all the students during a particular experiment. As in the case of the double tables, the laboratory tables should be free from any dust lodging or ornamentations. The only addition to the ordinary type of table is a shelf along the working side just below the top for placing books and papers. No drawers or cupboard of the type used in college laboratory should be provided with the tables.

3.4.1 Advantages

The combined lecture room-cum-laboratory has the following advantages :-

1. It is more economical
2. It is compact and in spite of restricted space provides sufficient seating and storage accommodation.
3. It is furnished cheaply and easily
4. The seating accommodation provided is perfectly comfortable and of the type students find in their homes.
5. There is an atmosphere of science, and working in the same laboratory gives an idea of the unity of science.
6. It affords an opportunity for better control.

3.4.2 Role of Laboratory in learning Science Concepts

Laboratories are for the child's learning by doing. As a matter of fact, learning will never be complete if the child is just stuffed with the mere theoretical aspects of topics. Visually impaired children have the ability to perceive water boiling, evaporation of water and the like. The child has to start with this.

In a laboratory, once the child attains the ability to pour water into a test tube, he can be given the confidence to use diluted acids in experiments. By the time the experiments with such diluted acids are performed by the visually impaired child for himself, the student will be ready to start the examination of diluted acids. In all circumstances the earnest attempt should be made to explore the possibilities for the visually impaired children in laboratories, rather than to avoid such experiences. At the high school level, it is usual to group children for experiments in the laboratory. While one child performs the experiment, another child is engaged in recording the results; yet another is engaged in observing the experiment. Therefore, this is group learning. The children put all the facts together and present the experiment report. A visually impaired child can be made a member of such team and share the responsibility suitable to him.

3.5 Science Teaching Learning Materials and Equipment:

3.5.1 Introduction

Psychologists have found that 'learning by doing' the most effective method for learning science - has many advantages over other methods, such as reading about principles and concepts of science and their application, and observing others doing experiments. Experiments by pupils inside or outside the laboratory are first hand experiences. It is obvious that to live in this modern scientific world efficiently, first hand contact with the apparatus and materials of science is essential. Demonstrations also provide some direct experiences but not as effective as individual experimentation; because in a demonstration the teacher takes the leading part, whereas in an individual

77 experimentation, each pupil gets an opportunity to handle and use apparatus and materials of science. A modern school science programme cannot be conceived without practical experimentation by the pupils whose practical work in connection with the theoretical discussions of a topic should be considered an integral part of the science programme. We know that science is essentially a practical subject and that the young pupils always like doing something rather than listening or observing. Hence, practical experimentation of the principles or of the applications of science by the pupils can enable them to understand science properly. There are many facts and principles of science which are difficult for the pupils to believe or appreciate unless they themselves do the experiments and find the truth. To cite a simple example, formation of an inverted image of an object on the other side of a convex lens cannot be appreciated easily. The pupils remain wondering until they see that the image really appears on the other side of the lens. The pupils should be given the opportunity to find the truth themselves. It may not however, be possible to arrange experiments to find the truth of all the principles they ought to learn.

3.5.2 Nature of Science Teaching Aids

Teaching aids are vital tools to enhance the learning of basic concepts. The teaching aids play a significant role in the science

teaching learning of Visually Impaired children. The difficulties encountered by child in understanding a concept can be overcome by the correct use of science teaching aids.

The Teacher should fix his specific objectives for the task i) Teaching aids make teaching effective and simultaneously make the learning interesting and profitable.

ii) Teaching

aids quicken the pace of learning, foster its development and help to overcome hurdles in science learning. iii) Teaching

aids provide firsthand concrete experience to the child. One aid is equivalent to

a

thousand words when a child has difficulties in forming a concept.

iv) Teaching

aids brings

variety to the learning of the Visually Impaired child which is necessary for his/ her education.

78

v) A

good Collection of aids motivates the teacher to teach well.

The ideas involved in the aids evoke the

teacher's creativity. 3.5.3 Characteristics of Low- Cost Science Materials 1. These are easily available either free or at low cost in local environment. 2. These do not involve specialized skills and can be made by pupils, teachers or members of the community. 3. These can easily and effectively used by the teachers and pupils in clarifying the set objectives. 4. The process involved in their production is simple and inexpensive. 5. The material is simple, accurate and appropriate to age level of the users. 6. They stimulate thinking, reacting. Discussing, experimenting or further study. 7. They are free from distractions, conflicts or bias. 8. Their production is not time-consuming. 3.3.4 Steps in Developing Low -Cost Science Materials 1. Definition of objectives: The objectives of the materials are defined in the light of the needs of users in terms of knowledge, skills and attitudes to be developed. 2. Preparation of a design: A design for the development of different materials is decided in terms of the type of the materials to be developed, its cost, relevance, and the resources available in the local environment. 3. Development of materials: The materials are developed by students, teachers, specialists or community in cooperation with each other. 4. Pilot testing: This is done by the teachers or researchers with selected sample users. 5. Improvements: On the basis of the results of pilot testing necessary improvements are made in the materials. This also provides a feedback for modifying objectives and design of the materials if necessary. 6. Finalization: If the material is considered satisfactory after pilot-testing, it is finalized for production.

79 7. Production: Adequate number of copies of the final materials are produced. 8. Distribution: These are distributed to different schools if considered valuable to users. Classification of Science Materials 1. Free (no cost) and Easily Available Materials: These include things in the natural environment such as plants, animals and minerals as well as scraps/ waste from commercial and domestic use. 2. Easily Accessible Materials: These are available with very little cost such as masks, battery, bulbs, wire, cardboard, etc. 3. Large Scale Distribution Materials: Materials available for large scale distribution such as charts, models, etc. 4. Mechanical Materials: Materials which need use of machines such as projectors, tape recorders, cameras, record players, etc. 5. Mass Media Materials: Materials for mass media or distant learning systems such as radio, TV, etc. 3.5.5 Importance of Improvisation 1. Economic Value: The Economic value of home - made apparatus is in line with scientific traditions to use the minimum and the cheapest of the materials to the maximum advantage. 2. Self- Sufficiency: Improvisation of the apparatus also contributes a great deal in making the school self sufficient. 3. Head - hands Co- ordination: In the case of young children the understanding travels from hands to the head. The Co - ordination of hands and head is important for better understanding. This forms the basis of home -made apparatus. 4. Knowledge of Principles: The pupils handle the apparatus prepare models etc. and get a deeper and wider knowledge of the whole principle or working underlying a particular apparatus which would otherwise have been impossible to attain. 5. Creative Hobbies: The co - ordination of hands and head and the overall confidence that pupils acquire by constructing some model or apparatus may lead to develop some creative hobbies.

80 6. Creative satisfaction: The constructive and creative instincts of pupils are satisfied. The thrill and joy of having created something give them a sense of achievement. This may enthuse children to utilise their energies in the exploration of some new things. Their energies find fruitful channels of sublimation at the adolescent stage. 7. Exercise and development of Ingenuity and Resourcefulness: The pupils find a new media for the application of their knowledge. They learn to think critically and improve their work criticism and auto-suggestion. They form the habit of thinking scientifically. They are instilled with the spirit of emulation to find something new. 8. Use of Leisure: The problems of leisure and indiscipline are solved to a great extent. 9. Creating confidence: while improving the apparatus the pupils feel the difficulties that the scientists had faced in inventing some apparatus. This encourages the students to face the problems boldly and with confidence and develop independence of thought and self-reliance. It also provides for individual differences and the students work with their own pace. 10. Dignity of labour: When the pupils work with their own hands, they develop dignity of labour. They love to work with their own hands. This removes the barriers between the mental and manual labour and thus contributes much in placing the pupils on socialistic pattern of society. As a result of improvisation the habits and attitudes formed are applicable in the daily life of the child outside the school. ii) Locating and procuring Science equipment Apparatus and Materials The terms, principles, their applications and the materials of science become more meaningful by actual use. Hence the need for practical work in science. Many important principles, laws and generalisations of science will remain abstract to the pupils without practical demonstration or individual experimentation. They will simply learn to memorise them without understanding. Practical work thus makes science meaningful. A long talk, however interesting it may be becomes boring for the young pupils. They do not have the patience to listen or pay attention to a particular activity for 81 a long time. They need diversion. Practical work in science provides for this. The use of apparatus and materials for performing a demonstration experiment or doing individual and group practical work breaks the monotony of classroom teaching, introduces variety and provides motivation for learning science. A dramatic situation may be created in the classroom or in the laboratory by performing an interesting demonstration using scientific apparatus and materials. Many lessons can be made effective by starting lesson with an interesting demonstration. A well-planned use of the apparatus and materials of science can never make the science class dull. It is psychologically sound to provide for individual differences. One of the important advantages of using apparatus and materials is that there are possibilities for providing for individual needs and interests. All pupils are not equally benefited from reading books or attending class teaching. Some pupils have inborn abilities for handling scientific gadgets and doing experiments. The availability of apparatus and equipment provides them scope to exhibit their merit. It is a common experience that many pupils like to make radios, cameras, and simple machines. This attitude is strengthened when they see apparatus and equipment in the science room or the teacher demonstrating with apparatus or while the pupils themselves do experiment. Thus apparatus equipment contribute to the development of talent. Apparatus and equipment are necessary to train the pupils in scientific method. It is through the use of apparatus and materials that we can train the pupils in accurate observation, collecting data or evidence, analysing the data, making hypothesis and testing it, selecting useful and consistent evidences and drawing a conclusion. Setting up an experiment for a problem at hand or even sensing a problem, taking necessary precautions and care, and developing manipulative skill in handling apparatus and materials are possible only through actual use of apparatus and materials. To develop critical thinking or scientific thinking, experimentation with apparatus and materials is necessary. Performing experiments with the help of apparatus and materials at the school stage will help the future scientists to investigate difficult problems in their later career and enable them to undertake original work independently. Another purpose for which the use of apparatus and materials is advised is to provide an environment to pupils for exhibiting initiative, resourcefulness and co-operation. These qualities enrich their personality. Field trips, pupils' projects also given an opportunity to develop these qualities. But doing experiments using apparatus and materials is an essential means of developing these worthy qualities, students initiative and resource

82 fullness are necessary for handling apparatus and materials for setting up an experiment, arranging for a demonstration or a project. Sometimes pupils have to improve, adjust and repair parts of an experimental arrangement. Group work helps developed co-operations, friendship, mutual understanding and sociability among them. Advantages or value of Improvised Apparatus For demonstration and experimentation, a large quantity of materials and equipments are needed in a science Laboratory. The cost of this material and equipment is high and it becomes difficult to arrange for it from the nominal amounts available at the disposal of science teacher. However, a teacher with strong determination and necessary skills can go ahead with the task of improvising apparatus and equipments. Home - made or improvised apparatus are made from very low cost raw materials, with the help of students under the guidance of the teacher. The improvised apparatuses made by the students prove quite beneficial from so many angles summarized as below: 1 Economical Value. Improvised apparatuses are in fact low or no cost apparatuses as these are made by the students themselves with the help of costless waste material, household articles and low cost material. The finances of the institution to be spent on the purchase of the costly scientific apparatus and equipment thus can be saved or reduced with the help of improvisation task undertaken by the students. The day to day expenditure incurred in term of the repair and maintenance of the apparatus and equipments may also be saved as the improvised apparatus and equipments can be easily repaired and safely maintained by the students themselves involving almost no expenditure. 2. Psychological Value From psychological point of view also the task of improvisation prove quite beneficial to the students as it : * Satisfies their basic instincts and urges like instinct of curiosity, constructiveness, and inventiveness etc. * provides opportunity for self- expression and self- development meeting out their natural interests and aptitudes. * proves an appropriate means for the healthy canalization of their pent-up emotions and creative energy. 3. Educational value. Improvisation is also quite advantageous from the educational point of view on account of the following reasons:

83 * It provides opportunity for making best use of the principle 'learning by doing' and integration of the three H's. i.e. hand, heart and head. * It provides proper opportunity to make a practical and applied use of the theoretical knowledge of the scientific facts and principles. * The improvised apparatus besides proving convenient and simple in use has a strong psychological appeal in terms of emotional attachment and thus is able to create genuine interest in making use of it for the learning and exploring the scientific facts. 4. Inculcation of scientific attitude and abilities. - In case the students have devised and are using the apparatus made by them it is sure to lead them in the development of the following attitudes and abilities linked with the study of sciences: i) Development of scientific attitude and acquisition of scientific method of problem solving ii) Proper development of the mental faculties like reasoning, thinking imagination, analysis, synthesis and evaluation, etc. iii) Development of the faculty of self-criticism, self- appraisal and self improvement. iv) Development of independence of thought, self- reliance and self- confidence in one's abilities. v) Development of ingenuity, inventiveness, creativity, resourcefulness and constructive or designing faculty. 5. Entertainment value: The students derive great joy and happiness when they succeed in making, designing or inventing something by their own efforts. Moreover devising an apparatus may be taken as a hobby and thus may provide a lot of refreshing as well as recreational value especially in terms of utilising one's leisure hours. 6. Social Value. : By undertaking the improvisation activities students learn the habit of working with their own hands. It gradually helps them in realising the dignity of labour and developing a positive as well as healthy attitude towards manual work and also towards those who earn their breads by doing manual

84 work. These habits and attitudes so developed are very much useful to them in leading an industrious life and narrowing the cleavage between the intellectual and manual labour. 7. Proper upkeep of apparatus. : Everybody has a deep attachment for the things of his own creation. Therefore, when the students improvise their own apparatus for being utilised in the teaching and learning of science, they naturally develop an attachment and feelings for the safe use and proper maintenance. Gradually it is developed into a general habit of proper caring and maintenance of all the equipments and apparatuses whether improvised by them or otherwise kept in the laboratory. 8. Search for scientific talent. : When students start thinking about devising their own apparatus for conducting experiments, their creative faculties begin to function to such an extent that they do not only copy the original plan and technology for making some suitable and cheap apparatus but also invent and innovate many things quite new and original. In this way, the opportunity provided to the students for improvising science apparatus may be utilised for the search of scientific talent among them. 3.6

Problem solving and learning by doing approach for visually impaired students

If science is poorly taught and badly learnt, it is little more than burdening the mind with dead information, and it could degenerate even into a new superstition.--- Kothari Commission. The method of teaching science as prevalent today in our schools. Different methods of teaching have been proposed or profounded by different educational thinkers or schedule of thought in education. It is but desirable for the student to know about all of them. So that he can make a rational choice for himself. The knowledge of procedures, merits and demerits of all the methods will broaden the outlook of a would be teacher. The choice for him is not to be made narrow. It should be then left for him decide from his wide information.

85 Problem Solving Method: Problem solving method as a method of teaching represents a method which provides opportunity to the pupils for analysing and solving a problem faced by him on the basis of the previous stock of his knowledge enriched with the present means available to him. Definitions of Problem Solving 1) According to Woodworth and Marquis: Problem solving behaviour occurs in novel or difficulty situations in which a solution is not obtainable by the habitual methods of applying concepts and principles, derived from past experience in very similar situations. 2) According to Ausubel : * Problem solving involves concept formation and discovery learning." Steps (procedures) in Problem Solving The commonly used steps or procedure for finding a solution to the problem are as under: 1. Statement of the problem 2. Collection of relevent information or data 3. Analysis of the collected data or information 4.

Formulation of hypothesis or tentative solutions. 5. Selection and testing of a proper solution 6. Drawing Conclusions. 1. Statement of the Problem: The first step in problem solving should be selection or identification of a problem. The choice of a right type of problem which is related to the level and the needs of the students is most important. Students often come across numerous difficulties, questions, doubts and problems, the answer to which they do not know or cannot find out from the books. The problem should be stated in clear, simple, exact and unambiguous works.

86 2. Collection of relevant information or data: After statement of the problems the students are encourages to collect information relevant to the problem from available records or through consultation of books and literature from the library or through any other means available to them. Here the needs of the proper guidance and help from the teacher arises and it should be available to them in proper degree at the proper time. 3. Analysis of the collected data or information: The information or data collecetd is analysed in the light of finding out possible solution of the problem in hand. The data or information which is superfluous or irrelevant or not helpful in the solution of the problem is abandoned and the relevent or useful ones is taken for being used in the solution of the problem. 4. Formulation of hypothesis or tentative solutions: A hypothesis is the probable solution for the problem in hand. There can be a number of predictive or tentative solutions for a problem. After statement of the problem and collecting the relevent data, the important stage is to formulate some tentative hypotheses. 5. Selection and testing of a proper solution: Out of the possible tentative solutions or hypotheses, the attempts are made to search out the best. For this purpose all the hypotheses are taken by one by one discussed and weighed in terms of their validity and practicability. The selection of the most relevent hypothesis out of the so many hypotheses is made quite cautiously. 6. Drawing Conclusions: It is the last step of problem solving in which the given hypotheses are accepted, rejected or modified, if the experiments and observations made in the light of set predictions prove particular hypothesis, then that is accepted. In case there are negative results for a prticular hypothesis, it is rejected. If any hypothesis is neither proved nor disproved, rather some exceptional results are observed it is modified in the light of that observation. Merits 1. Problem solving method helps in stimulating thinking 2. It helps in developing good study habits. 3. It develops reasoning power

87 4. It helps in stimulating thinking 5. The students learn to be self-dependent 6. It helps to improve knowledge. 7. It affords opportunities for participation in social activities 8. The method provides opportunities to the teachers to know in detail their pupils. 9. Knowledge is easily assimilated as it is the result of a purposeful activity 10. It gives the power of critical judgement 11. It helps to learn how to act in a new situation 12. Students learn facts which are meaningful and which have been discovered by their own efforts. Demerits 1. It involves a lot of time and the teachers find it difficult to cover the prescribed syllabus. 2. There is a lack of suitable reference and source books for children 3. Problem method needs very capable teachers to provide effective guidance to students 4. Generally speaking problem-solving involves mental activity only. There is less of bodily activity. 5. Small children do not possess sufficient background information and therefore, they fail to participate in discussions. 6. Through this method, the teacher lays stress on experimentation at the cost of other important aspects of Science teaching. 3.6.1 Learning by doing Method Different methods of teaching have been proposed or performed by different educational thinkers or schemes of thought in education. It is but desirable for the student to know about all of them. So that he can make a rational choice for herself. The knowledge of procedures, merits and demerits of all the methods will broaden the outlook of a would-be teacher. The choice for him is not to be made narrow.

88 It should be then left for him to decide from his wide information. Most teachers and trainers seem to believe that pupils learn best by doing. But how is this rather general belief to be put into practice? In particular: What ideas or theories are there to help us to explain and justify the belief that we learn best by doing? Does everyone learn by doing in the same way or to the same extent? What teaching and learning methods are there for us to use which involve learning by like? If our courses are redesigned to involve more learning by doing, what might they look like? How is it possible to change our teaching to involve learning by doing when we are surrounded by constraints? 'Learning by doing', and the term 'experiential learning', are commonly used to refer to several different aspects of learning. This guide is not concerned with the assessment of 'prior learning' : learning experiences which have taken place before learners enrol on courses and which are taken into account in the assessment of the course or the granting of exemptions from course Components. 3.6.2 Learning by doing/ Experiential learning theory It is common for courses to be described as either practical or theoretical : as either involving doing or involving thinking. Learning is seen to take place either 'on the job' or in the classroom'. Even in courses which contain both elements they tend to be sharply divided. An academic teacher may present theory in a lecture in the classroom whilst a practical supervisor is in charge of the follow-up practical experience in a workshop. It is not sufficient simply to have an experience in order to learn. Without reflecting upon this experience it may quickly be forgotten or its learning potential lost. It is from the feelings and thoughts emerging from this reflection that generalisations or concepts can be generated. And it is generalisations which enable new situations to be tackled effectively diagram. Similarly, if it is intended that behaviour should be changed by learning, it is not sufficient simply to learn new concepts and develop new generalisations. The learning must be tested out in new situations. The learner must make the link between theory

89 and action by planning for that action. Carrying it out, and then reflecting upon it, relating what happens back to the theory. It is not enough just to do, and neither is it enough just to think. Nor is it enough simply to do and think. Learning from doing must involve links between the doing and the thinking. The four stage model of learning by doing which is elaborated below is that of Kolb. Quite a few theorists have proposed cyclical models to explain how people learn from doing, but they all share the important features of Kolb's Model which itself derived from Lewin. Learning from experience involves four stages which follow each other in a cycle, as in the following diagram. Concrete Experience Active Experimentation Reflective observation Abstract Conceptualisation Fig : 1.1 The terms used here as labels for the four stages come from Kolb's Experiential Learning Theory, and placed in this sequence they form the experiential learning cycle. 3.6.3 Learning style Just as courses may be seen to be either mainly practical or mainly theoretical, so individuals may have particular preferences in their learning. While one person might prefer to formulate plans and define potential problems, another might prefer to get on and carry out the plans. There are distinct learning styles associated with each of the stages of the learning by doing cycle. These differences in style were illustrated graphically in a computing course. At the start of this computing course the students were set an open-ended computing problem to work on alone over the next four weeks. They then met to compare solutions to the problem, but also to compare the different ways in which they went about working on the problem. Three of the students displayed dramatically different styles.

90 Student A went straight to a computer keyboard and started keying in segments of a program. She didn't analyse the nature of the problem. As soon as it became apparent that the programming routines being written didn't work, new routines were written out and immediately tested in a trial and error way: mostly error. This student had created dozens of programming routines, none of which got close to solving the problem. She seemed not to learn from her mistakes. Student B appeared to start off like student A, going straight to the keyboard. He selected a procedure which he knew and implemented it. He wrote an extensive, detailed and complete programme which ran successfully, but which solved a problem quite different from the one which was set. He was unaware that he had tackled the wrong problem because he was so busy getting on with the task. Student C became intrigued by the problem itself and its underlying features. She started reading about this kind of problem and the reading led her into related areas which also contained intriguing problems. She could talk animatedly about the topic in general in an abstract way but hadn't even started writing any programming code to produce a solution. In terms of the learning by doing cycle these students were stuck at one part of the cycle to the virtual exclusion of the other three.

3.6.4 Practical Methods to implement the learning by doing cycle

3.6.4.1 Planning for experience: This section is concerned with methods for preparing learners prior to experiences so that they make the most of those experiences: for example through action planning and the negotiation of learning contracts. Experience Experimentation Reflection Conceptualisation

3.6.4.2 Increasing awareness of experience: This section is concerned with methods for heightening learners' awareness of their experiences so that they notice more and have more material upon which to reflect afterwards: for example through the use of log books.

91 Experience Experimentation Reflection Conceptualisation

4.3 Reviewing and reflecting upon experience: This section is concerned with what happens after learning experiences and how learning points can be drawn out through structured reflection: for example through the use of video recordings and self-assessment. Experience Experimentation Reflection Conceptualisation

Fig 1.2 3.7

Evaluation procedure with particular reference to Practicals and adaptations in Examination questions

Evaluation is an integral part of teaching. It is as essential to the teaching process as the content and method of communicating the content. In fact, effectiveness of teaching among other things, depends on the quality of evaluation and its utilization for improving the teaching-learning process.

Concept of Evaluation

The goal of education is all-round development of the child. It is all-round development that makes a human being. It implies that education should contribute to cognitive (Knowledge), affective (feelings, emotions, attitude and values), and psychomotor (skills) development of the child. Teaching is the process through which this educational goal is realised. Evaluation is a mirror which reflects the extent to which teaching objectives are achieved. Evaluation therefore has to be comprehensive. Comprehensive evaluation, as envisaged in the NPE programme of Action, implies that it should encompass all aspects of teaching objectives.

92 Teaching is a continuous activity. So evaluation is required to assess the pace of pupil progress, identify learning problems, and taking teaching-related decisions. By implication, evaluation is also a continuous process. The continuity of evaluation is essential for evolving effective teaching. In this way evaluation can be a day-to-day, lesson-to-lesson and unit-to-unit process. It is also known as formative evaluation. It assesses immediate teaching outcomes. The evaluation at the end of a term, a grade or a stage of education is known as summative evaluation. The word summative represents cumulative evaluation.

i) Evaluation Procedure with reference to Practical (a) Way of learning science: Practicale

One of the foremost methods by which children learn science is through first-hand experiences.

Even in the primary standard, whenever a teacher is trying to demonstrate or explain a concept, it is useful for her to have materials which show or display that action or system or method. The visually impaired child sometimes needs special opportunities for tactually exploring or having careful, prior explanations of, or follow-up information about.

But first-hand experiences should be correlated with helping children to recall what they have experienced, and making deductions from them. The second way is that the young children enjoy first-hand experience by undertaking field trips. A field trip to an industry, visits to the neighbourhood and community are useful in stimulating awareness of the environment.

There are many things that primary level children can do in which they can be active during group

excursions and field trips. During field trips, the children need to know what they are looking, they need to be oriented to what to expect, during the field trip. On their return, they should be asked to correlate their experiences with the lessons. This will help visually impaired children to develop concepts through first hand experiences. (b) Teaching Laboratory Sciences to Visually Impaired Children Authentically and generally, it has been largely admitted by teachers in the field of education of the visually impaired that methods adopted in instructing normal sighted children can be applied to the teaching of visually impaired children with accurate and precise modifications of the material. But it is a stupendous task to make visually impaired children understand ideas of physical and biological sciences. However, it should not be ruled out for these children because they are blind. Classroom

93 teaching or laboratory methods which are often conventional, can partly or seldom be wholly followed by visually impaired children. (c) Role of Experiments in Learning Scientific Concepts Laboratories are for the child's learning by doing. As a matter of fact, learning will never be complete if the child is just stuffed with the mere theoretical aspects of topics. Visually impaired children have the ability to perceive water boiling, evaporation of water and the like.

In a laboratory, once the child attains the ability to pour water into

a test tube, he can be given the confidence to use diluted acids in experiments. By the time the experiments with such diluted acids are performed by the Visually impaired child for himself, the student will be ready to start the examination of diluted acids. In all circumstances, the earnest attempt should be made to explore the possibilities for the visually impaired children in laboratories, rather than to avoid such experiences. At the high school level, it is usual to group children for experiments in the laboratory. While one child performs the experiment, another child is engaged in recording the results, yet another is engaged in observing the experiment. Therefore this is group learning. The children put all the facts together and present the experiment report. A visually impaired child can be made a member of such team and share the responsibility suitable to him. ii) Evaluation Procedure for adaptations in examination questions. a) Functions of Evaluations Evaluation is purported to perform several functions in teaching. It helps in the assessment of pre-requisites of the new learning tasks available with the learner. For example, for the learning of addition, the pupil should already have developed the concept of numbers and their position on the number line. For teaching the law of gravitation, it is ensured that the pupils have learnt the concepts of mass, acceleration, force and the relationship among them. It is used to assess the progress of learning the extent to which a particular child has learnt the new task. The progress of learning is always in relation to the teaching objectives. There are times, when the criteria of performance of the new learning task are not achieved. In other words, the progress of learning is not satisfactory. In that event, it is imperative

94 to diagnose the cause of shortfall. It requires diagnostic evaluation. It helps in designing remedial measures to achieve the desired level of performance. Evaluation is used for the improvement of Teaching. The diagnostic evaluation is both for the teacher as well as the pupil. b) Evaluation Procedure and Tools Evaluation data are collected through different sources. Informal evaluation is usually in progress when the teacher asks questions during the lesson or observes child behaviour in some solutions incidentally. For formal evaluation several systematic procedures are followed. Test can be written, or oral or a combination of both. The tests can be normative which are standardised. Through these tests the child's performance is considered in relation to the group of children on which the test has been standardised. The tests can also be criterion referenced tests. These tests pertain to the performance of the child on the content covered. These tests are very important for feedback on learning and improvement of teaching procedures. Systematic observation of child's behaviour is required for evaluating his performance in setting up experiments and his behaviour in social situations. Testing of manipulative skills is done through evaluation of the child in practicals. For example, setting up of science experiments" physical education, etc. Several types of questions are used in evaluation tools. The questions can be considered from the point of view of length of the answers expected. Very short Answer Type questions require answers in one or two words. For example: where was Gandhiji born? Name the capital of United Kingdom. Short answer Type questions require answers in 20-25 words. For example: Define social stratification in about 25 words. Essay type question can require answers of any length depending on the nature of content and developmental stage of the learner. For example: Explain in about 200 words - water cycle in nature illustrating with a diagram. Compare the parliamentary form of Government in USA giving atleast four points of difference and four of similarities in the two systems. Write an essay on National Integration in about 500 words. c) Adjustment and adaptations for Visually Impaired Children The adjustment and adaptation of evaluation and examination procedures can be

95 viewed from the point of view of the

medium of presentation of test items and the modalities of answering by the visually impaired children. The issues and practice needs to be examined from the point of view of blind children; and low vision children. The guiding principle is that the procedures should be as close to the practice with sighted children as the handicap permits. As in the case of curriculum, in evaluation and examination procedures also; substitution and omission are the last resort. The purpose of adjustment and adaptation is that the visually impaired child should not be at disadvantage in evaluation and examination due to his handicap. This section though not prescriptive, presents alternative approaches and preferred modes for the two groups of children.

d) For Blind Children Blind children here are those children who can read print and use braille reading. What are the ways in which questions can be communicated to these children and how can they answer. The possibilities can be :

1. Question Mode
2. Answering Mode
3. 1. Written in Braille
4. 1. Writes himself in Braille
5. 2. Written in print but read
6. 2. The scribe writes for him by a Reader for the blind
7. 3. Listening by the blind child
8. 3. Records on audio cassette.
9. from Audio cassette player
10. 4. Direct questioning orally
11. 4. Tells orally to the examiner directly by the examiner.
12. 5. Combination of the above.
13. 5. Combination of the above.

e) Questions in braille and self answering in braille It is the ideal mode as there is no intermediary between the examiner and the examinee. The child feels responsible for the omissions and commissions. But there is a problem in this mode. Braille reading and writing takes more time print reading. Should the blind children be allowed more time for answering the questions in braille? The obvious answer is - yes. It is also being provided in some cases. Those who are well exposed to the practice of braille reading and writing, will agree 96 that it cannot be uniform across grades and subjects. It depends on the minimum level of competence of braille reading and writing. It also depends on the nature of the subject matter. For example, the answers requiring diagrams as in Mathematics and Science will require more time than simple explanatory braille. No empirical evidence is available about the period of extra time to be allowed for the blind student. Even if the empirical evidence is available and one likes to provide the desired extra time, the child will feel fatigued. The child be allowed a brief rest of 10-15 minutes during the test if extra time for writing in braille comes to about one and half time more than what is required by the sighted child?

f) Use of scribe The blind child is provided a writer in this modality. Here the scribe reads the question, the blind child dictates and the scribe writes the answer. The print and cursory writing scripts are used. This modality is also being followed in many cases. The blind child when scores low he attributes the cause to the failure of the scribe to write correctly. Then there are a lot of problems relating to the selection of the scribe. The blind child would like to bring a scribe of his choice. While some boards insist on providing a scribe of their choice to ensure that the level of knowledge of the scribe is not above than that of the child. The boards want to appoint a scribe one class below the level of the blind examinee. The blind child invariably finds himself at a disadvantage. Bright blind child remains at much disadvantage if the scribe fails to reproduce with the examinee's speed and correctness.

g) Audio-recorded questions and audio recorded answers This mode is not yet tried out, but seems to have a lot of potentiality. However this mode may not suit for language tests where spellings are also evaluated. For tests requiring evaluation of spellings, the first mode is ideal. This mode has another limitation. The questions and answers involving diagrams may not be amenable to this modality.

h) Oral Questions Oral Answers This modality is also in use. It is in use in informal evaluation in the class- room. It is also in use in oral examination and practicals. Its scope and purpose are limited. The modalities suggested in this subsection present alternative modalities. It is not desirable to conform to one modality. The modality is to be selected taking into

97 consideration the objectives, content and level of the pupils. In examination the modality using the scribe is the least desirable. A combination of other modalities should be preferred. The curriculum, evaluation and examination should be viewed from the angle. i) Low Vision Children Low vision children are those who need large print reading material. For reading, they need large print. They can write like other sighted children but can't read their own handwriting. This they can achieve through training. They need magnifying glasses or spherical lense for reading. These children can be provided question papers in large print or/and magnifying glasses. As there is little facility for education of these children in general schools, these children also find their way into schools for the blind where they are subjected to teaching, evaluation and examination procedures meant for the blind. They are also provided scribe. They are forced to reading and writing braille which they resist. j) Questions in large print and answers in cursive writing It is possible to provide the question paper 18 or 36 point. It will be costlier as the number of such children may be very small. If a photocopier, with enlargement is available, it is possible to prepare copies of the same questions papers. The child can write answers questions in large print are made available. But he will not be able to correct the mistakes like other children who glance through their answers, if time permits. It is possible if magnifying glass or/and spherical lense are available. The problem can then be offset. The low vision child may require extra time for reading and writing than children with normal sight. The extra time to be allowed can be worked out on the basis of empirical evidence. k) Audio recorded questions and answers in cursive writing The questions can be recorded on audio cassettes if large print facilities are not available. Enlarged diagrams, wherever required, can be got made and instructions regarding the placement of diagram provided in the audio cassettes. Answers can be in cursive writing. l) Audio recorded questions and audio recorded answers As indicated in the subsection relating to adjustment and adaptation of evaluation

98 and examination procedures for the blind, the content and objective not requiring emphasis in spelling can be evaluated through this modality. The evaluation and examination procedures can be adjusted for this group of visually impaired children through the use of alternative modalities. 3.8 Let Us Sum Up The aims of teaching and study Sciences are to encourage and enable students to develop inquiring minds and curiosity about Science and natural world, develop skills of scientific enquiry to design and carry out scientific investigations, think analytically. The objective of science education refers to enabling students to understand the interdependence between science and society. At the end of the Course and within local and global contexts students should be able to describe and discuss ways in which science is applied and used to solve local and global problems, recognize and recall scientific information, analyze it, carry out scientific investigations. So Science education at any class must not only depend on text books. Hands on training and experimentation are necessary so that learners can visualize the things, interpret it and understand. There is no role of mechanical learning. 3.9 Check your progress: i) Identify the needs of Visually Impaired children in Learning Science at Secondary stage ii) Explain the difference steps of Problem Solving Methods iii) What is Evaluations? Write in brief examination procedure for Evaluating Science for Visual Impaired children iv) Explain the importance of of TLM for teaching Science for Visually Impaired children. 3.10 References l) Sing S.P : Research Methods in Social Sciences 2) Suresh K.P, Joseph Celene: Teaching and Testing Science Process Skills

References 4.1 Introduction Visually impaired (VI) learners' needs and goals for learning and education are not different from those of the general learners. It is only the means of achieving these goals are different, though the content materials and subject matters are the same as those for the seeing learners. Lowenfeld (1959) has aptly said, "Education has aim at giving the blind child knowledge of the realities around him, the confidence to cope with these realities, and the feeling that he is recognized and accepted as an individual in his own right." In reality, if the VI children are exposed to the educational experiences and materials as used to the sighted children, they would not be able to satisfy their needs or to achieve the educational goals properly. Since normal educational experiences are approximately 85% visual, it may be easily imagined that the extent of difficulties the VI or blind children are to face only because of their visual problems. In order to make them capable

101 to receive educational inputs appropriately, the adapted alternatives, especially for the VI children should be developed. The obvious alternatives may be of many types. The special methods, materials and equipment can be employed utilizing the sense organs of touching, hearing, smelling and even tasting. Therefore, the curriculum for the VI students should include: Adaptations to the general teaching-learning materials, Use of some specialized models, Specially designed teaching skills with field trips for learning of the VI learners, Special evaluation planning for progression of concept and skill learning of the VI learners. 4.2 Objectives

After the completion of the Unit, learners would be able to- Acquire necessary techniques of preparation and presentation of adapted tactile TLM for Social Science; Adapt different types of models for teaching Social Science suitable for VI students; Organize field trips for VI students; Acquire different skills for teaching Social Science suitable for VI students; Evaluate concepts and skills in Social Science with Special reference to Geography. 4.3

Techniques of Preparation and Presentation of Adapted Tactile Maps, Diagrams and Globe

Tactile aids provide information to the VI individuals through the sense of touch. These may include Braille Materials, Braille marked tools or Adaptive aids like Tactile maps, Diagrams and Globe. Like printed materials, Braille materials are read with the fingertips reproduced by transcribers, publishers and printing houses. Braille markings are found on adaptive aids such as rulers, measuring cup and clocks in place of printed letter or numbers. A Braille-writer is six-key typewriter for typing Braille. It produces raised dots onto specially designed, heavy Braille paper.

102 4.3.1 Preparation of Adapted Tactile Maps, Diagrams and Globe The slate and stylus are writing tools used to write on Braille. The user places a sheet of Braille paper between the two metal plates of the slate. The stylus, a short metal prong fastened to a handle is held to the palm and pressed downward onto a paper within an open window. A raised dot is formed on the reverse side of the paper. The writing is read when the paper is turned over and dots are facing upward. Templates and writing guides are frames used in writing on lines or in specified spaces. Window openings in the templates serve as a guide for signing checks or writing letters. Raised line paper is writing paper with embossed lines to enable the user to follow a straight writing path. Paperless Braille or cassette Braille is an information system that is stored on audio cassette tapes and accessed in Braille. The user runs his/her fingers over display cells to read the text and pushes a button to access the next segment of recorded material. The user can produce, edit and record Braille with the system. It can be adopted for use with computer terminals, calculators and type writers. The raised line drawing kit is a board covered with a soft underlay of rubber. The user places a sheet of acetate over the board and draws on it, creating raised lines and an embossed picture. Tactile colour is a standardized system of 12 distinctive colours; each is assigned a specific texture. This allows visually impaired persons to better participate in creating or enjoying visual artwork. It is also useful in map-making, for labelling and as an educational resource. A Thermoform machine is a device that heats a sheet of plastic paper so that it may be moulded to whatever shape is placed beneath it. Thermoform machine can produce copies of Braille and also be used to create raised line maps or graphs. Tactile maps and globes are three-dimensional maps that are used as an orientation aid. They contain raised surface, textures, and Braille markings and are designed to be read with the fingertips, in a manner similar to Braille.

Tactile Graphics, including tactile pictures, tactile diagrams, tactile maps, and tactile graphs, are images that use raised surfaces so that a VI person can feel them. They are used to convey non-textual information such as maps, paintings, graphs and diagrams. Tactile graphics can be seen as a subset of accessible images. Images can be made accessible to the visually impaired in various ways, such as verbal description, sound,

103 tactual feedback. One of the most common uses for tactile graphics is the production of tactile maps. (

i) Basic Principles for Preparing Tactile Graphics Tactile graphics are essential components of Braille materials transcribed for use in educational and professional fields. Guidelines and standards for inclusion, design, and presentation of tactile graphics are found more necessary today with the advent of electronic text production and the proliferation of diagrams, illustrations, and graphs in educational texts: A tactile graphic is a representation of a print graphic designed in a manner that is the most meaningful to the reader. It is not an exact reproduction. The Braille code and format used in preparation of the tactile graphic must be consistent with the transcription of the main body of text. Many frames or image outlines found around print diagrams should also be omitted if they add extra lines without purpose. At times, image outlines are required to indicate containment such as water or land areas on a map. The tactile graphic should be positioned near the left margin of the page or indented according to the Braille code in use, rather than cantered. A blank line is required before and after the tactile graphic. A print graphic may be simplified as far as the original intent not being compromised. If the task does not involve measurement, modifications to size, position, or layout may be made to an illustration to clarify presentation. If the concept of depth is not required, a 3-dimensional view should be changed to a 2-dimensional view. If the reader is required to measure a line or an object, the line or object should not be lengthened or enlarged and must be raised and designed in a way that permits measurement with a Braille ruler. If the reader is required to measure an angle, the rays should be extended. If the reader is required to measure distance, the scale and graphic must be revised proportionately. Use transcribers notes to explain changes made to the print format.

104 A combination of symbols, keys, and words may be used to convey information. Since the use of a key involves an extra step for the reader to interpret the graphic, use a Braille label (word) instead of a keyed symbol when it will fit in the available space. Maintain consistency throughout a transcription when assigning alphabetic keys and/or textures to a particular item. The age and experience of the reader must be considered when designing a tactile graphic. Based on the student's skill level, it may be necessary to limit the number of key symbols when assigning areas, lines, and points.

Consider placing the tactile graphics on a separate page with limited text so that the graphic may be used with electronic text (e-text), as a tactile graphic supplement, or added to a collection for future use. Tactile graphics should be developed as distinct as possible keeping in mind the Braille reader's point of view. It is up to the teacher to present the information in a clear and concise manner for the VI student. If the original shapes and textures are necessary to convey the concept, or can simple geometric shapes or Braille signs be used to illustrate the concept omitting the unnecessary parts of the diagram (i.e. unreferenced or irrelevant sections of a map) so that the original shapes and textures can be presented on a larger and clearer scale. If the text requires measurements to be made or an operation to be performed: or if the original shapes, textures and total form are necessary to convey the concept, the lines and angles are reproduced retaining a proper scale. Edit! proofread the graphic with fingers, not with eyes and if someone says the graphic is 'pretty' or 'beautiful', take a second look, students may not be able to understand it. (ii)

Tactile Maps The use of maps is an important skill for all children to learn. For students who have visual impairments, learning to read a map is an important step towards his/her

independence, as well as a way to participate more fully in the regular geography and social studies curriculum.

This section offers suggestions on how to teach students to use

tactile maps, from the most basic object books to more complex tactile graphics.

According to Jacques Bertin, "Tactile map variables can help in determining how visual maps are to be produced; tactile maps have a formula as well. Although researchers have not standardized tactile map variables, these are usually included depending on the substrate - vibration, flutter, pressure, temperature, size, shape, texture/grain, orientation, and elevation."

105 (

a) Attaching Objects on Paper:

The types and forms of tactile maps began with the oldest and most rudimentary or a mixed media format. This tactile map is produced by simply attaching objects to a substrate to represent different items or symbols. More recent tactile maps are produced by computers through different means such as ink-jet printers. (

b)

Thermoform is one of the most common methods of producing tactile maps. This process is also known as vacuum forming. Thermoform maps or plans are created from a process where a sheet of plastic is heated and vacuumed on top of a model or master. The master can be made from many substances, although certain materials are more durable than others. Since this process involves creating a mould, it is somewhat time consuming. (c) Swell paper has a special coating of heat-reactive chemicals. Microcapsules of alcohol implanted in the paper fracture when exposed to heat and make the surface of the paper inflate. Placing black ink on the paper prior to a heat process provides control over the raised surface areas. This type of map is not as robust as the Thermoform map, but can be produced with less effort and expense. (

d) Modified Braille Embossers can also be used to produce tactile paper maps. (

e)

Ink-jet Tactile Maps are made by layering a specially designed ink. Each layer is cured by UV irradiation before the next layer is added. This technology is an offshoot of other industries, such as circuit board manufacturing and biomedical applications. (j) The substrate for Tactile Map is a very important attribute, since different materials can enhance or reduce legibility and durability. Several types of substrates can be used to produce a tactile map. These include rough or smooth plastic, rough or smooth paper or micro capsule paper, Brailing, or aluminium etc.

Many factors should be considered when choosing a substrate; these are included according to their respective function, durability, and portability. (g)

Typical Tactile Elevations: Thermoformed maps usually have an elevation of at least 1 mm. Swell Paper averages 0.5 mm and Braille embossers have a range from 0.25-1 mm. Ink-jet printers can be controlled to vary elevation as needed. [A study conducted by Sandra Jehoel (2009) tested various height levels and estimated that preferred tactile elevations fall between 40 and 80 micrometres depending on the substrate background, shape of the object and smoothness of 106 lines. Symbols such as a triangle, square and a circle should have a minimum base line length of 6.4, 5.0 and 5.5 mm respectively for proper recognition.] (h) Audio-tactile Maps or Graphic Tablets are interactive devices. Electronic tactile talking touch pad instruments use

Macro'media

Flash software with audio files to convey information to the blind or visually impaired user. As the user's finger engages a feature or symbol a recording provides information about the object, symbol or area. For example the sound of splashing water can be used for areas such as rivers or oceans. This format has great potential for transmitting information over the Internet which can be downloaded to a computer or hand-held device. [

A great deal of hardware already exists that can also be used by the VI students, if available, to interact with computer screen graphics. A vibrating mouse or other force feedback device can be adapted to turn any visual software generated map into a hybrid tactile map. The interactive signal to a device can be varied when crossing a boundary or symbol. High resolution refreshable Braille displays containing 1,500 to 12,000 pixels are already available in market. Graphic Braille display available in the market is DV -2 (from KGS) with 1,536 pixels, Hyperbraille with 7,200 pixels and TACTISPLAY Table/Walk (from Tactisplay Corp.) with 2,400x12,000 pixels respectively. TACTISPLAY table has total 12,000 pixels arranged in 120x 100.] (i) Zoom maps are a recently developed concept of

tactile map. These maps are designed specifically for those who can read Braille and have had no previous interaction with tactile maps. The term zoom is comparable to a zoom-able visual raster internet map. A country is divided into regions on the first map then the next zoomed map will have a breakdown of the regions and so forth until a city level is reached. These successive maps rely on a dependable texture as the map zoom progresses. This produces a familiarity as one zooms from the proceeding map. This is achieved in many instances with line orientation, area and consistent shape.

The Braille text on the map is placed next to a rectangular textured legend for area identification. (iv) Tactile Diagrams Pickles (1966) has advocated both the value and viability of drawing for the VI, even for totally and congenitally blind pupils. At the higher stage of school level, he claimed that after such a child has learnt to recognize objects by exploring their shapes and

107 dimensions through touch he/she should be given the means of making his own diagrams. Since this process is time consuming and offers difficulties in execution, its value can be questioned, but Pickles believes that it is an activity helpful both to those relying on touch alone, as well as for those using touch and slight vision in their understanding of embossed diagrams. The ability to use touch in this way is a skill which cuts across the curricula areas of the secondary school. The child with too little vision for making use of illustrations and visually presented diagrams is specially in need of training in understanding diagrammatic work in embossed relationships and connections, such as in the layout of a piece of laboratory apparatus. Furthermore, in justifying his emphasis on undertaking surface representation for diagrammatic work, Pickles claims that executing diagrams can be one way of learning to understand their implications. With a rubber mat providing a resilient base, a sheet of aluminium foil can be sued to take a negative (downward indented) line made by a ball point pen. The Sewell apparatus (RNIB) embodies a thin film of transparent plastic sheeting stretched over a rubber-surfaced board, and again, a special ball- point pen, an ordinary biro, or a spur wheel which cuts small dot-like indentations can be used for lines. Manilla paper used for Braille writing can take imprints from a spur wheel and the specialized geometry set available for the RNIB enabled user to make raised geometric figures on paper. Vincent (1970) has constructed a special drawing board which enables the student to prepare perspective drawing, but it is important that the pupil's understanding of what he/she is attempting to do is not superseded by devices that help him to produce work only understandable in sighted terms. Enthusiasm to make the map or diagram as informative as possible can lead to overcrowding of symbols, whilst the addition of Braille words in the body of the diagram causes confusion. A tactile diagram needs to have enough information to encourage exploration and interest but not so many raised lines, Braille labels, and varied textures that clarity is lost. A series of maps or diagrams, each displaying a particular aspect of what is to be presented, provides a more comprehensible illustration. For example, several basic raised outline maps of a country can be made with additions on one version to indicate climate, on another indications of vegetation, on another population or geological features etc. To crowd all this information on to one map by using different raised symbols likely to be confusing. The information received from such presentations needs to be discussed so that misapprehensions can be cleared up, and the pupil will also need training in interpreting the symbols used. Teachers will need to draw attention

108 verbally to the information represented and even to ensure that the map or diagram is being used the right way. 4.3.2 Presentation of Adapted Tactile Maps, Diagrams and Globe Children who are visually impaired can do virtually all the activities and tasks that sighted children taken for granted, but they often need to learn to do them in a different way or using different tools or materials. For instance, child may need reading materials in Braille rather than in print or may need to examine a live rabbit with his/her hands to understand what it is, rather than learning from a picture in a book. Other examples might be arranging a classroom to let the child sit close to the science teacher who is demonstrating an experiment or allowing him/her extra time to complete a test that the whole class is taking. Depending on the child's abilities and needs, he/she may need some adaptations to participate in the curriculum and various activities in school, as well as to make use of instructional materials. The child learns about such adaptations from his/her special/ inclusive teacher or orientation and mobility (O&M) instructor. Such adaptations in school are usually referred to by the terms 'accommodation' and 'modifications'. Different school systems attach different meanings to these terms, but 'accommodation' usually refers to a change in the way the child is taught or tested without changing the standard of learning or performance or the requirements that she needs to meet. Some examples include having extra time to complete assignments, using Braille or large-print materials, using different types of models, having assignments or tests broken into smaller parts, or completing assignments in a quiet setting away from other students. 'Modification' commonly refers to a change to what your child is learning or tested on that changes the standards or requirements she needs to meet. Being taught material at a lower gradelevel or having to complete fewer items on a test is examples of modifications, because these terms are not used in the same way in all schools. The VI students often cannot perceive information directly from their environment, but 'accommodations and modifications' help them do so. Something as simple as the 'flexibility' to sit closer to the chalkboard may meet your child's needs, or it could be necessary to alter the physical arrangement of the environment by providing additional furniture, shelving, or access to electrical outlets for the operation of specialized equipment.

109 Instructional materials need to be put into an accessible format for VI. It is important that all materials be considered—not just textbooks but also worksheets and all supplemental reading materials. It is also important to receive the VI child equally as his/her sighted classmates who read in print. (i) Materials Materials Explanation and Examples Braille Textbooks, Worksheets, all materials used in instruction provided in Braille; Tactile Graphics Printed Maps, Diagrams, Illustrations provided in tactile format; Audiotape Materials Books and other printed materials provided in audio-tape; Electronic Access Materials provided in an electronic format for access with a computer or electronic note-maker, for example, using an online encyclopaedia for studying for completing a term paper or reading a textbook in digital format; Print Book for parents If your child reads in Braille, he/she also receives a print copy of that textbook parental use; Highlighting Markers and highlighting tape are used to enhance the important parts of a text; Large-print Large-print books are used for instruction or portions of a book, such as a map, enlarged as needed; Manipulative Physical items (such as small toys, buttons, or beads) are used to demonstrate mathematical concepts or used in art classes to complete a tactile drawing. (ii) Tactile and Kinaesthetic Input Students with visual impairments use tactile and kinaesthetic input to learn about their environments. Such input should not be thought of as 'lesser senses' to use in the absence of vision, but as another system through which learning takes place (Klatzy & Lederman, 1988). Tactile and kinaesthetic input can provide students with information about objects they come in contact with and use. Any visual materials used in classrooms need to be adapted for use by students who do not have the visual skills required for the task.

110 Charts, models, maps, and graphs will have greater educational value for students with VI, if they can 'read' using the sense of touch. For example, outlining map boundaries with string enables students with VI to use their sense of touch to read maps. Whenever teachers use manipulative models, or other equipment, students with visual impairments need the opportunity to use their tactile and kinaesthetic senses to become familiar with the objects to benefit from their use in lessons. Teachers should introduce students with VI to materials and equipments used in activities such as science experiments before the activity. If students have the opportunity to learn about the materials or equipments before the activity begins, they will be more able to concentrate on the concept being taught rather than on what equipment they are using. Toward this end, a specialist will assist students and teachers in inclusive classrooms with adaptations as needed. (iii) Auditory Learning and Accommodations Auditory input provides another way of gaining information by the VI students.

Teachers should not assume, however, that students will understand verbal input in the same way and at the same depth as other normal students understand visual input.

Auditory language triggers the creation of mental images that correspond with words. Images are recalled to assist students in comprehending verbal language (Barraga & Erin, 1992). A student with VI is likely to have fewer and less detailed mental images to correspond with verbal language. Such images may differ according to a student's individual experiences and verbal input he/she has received from others (Whitmore & Maker, 1985). General teachers should observe and interact with students with VI in an effort to determine whether individual students can understand the verbal inputs. The teacher must check for comprehension during class discussions and when giving directions. If VI students are having difficulty in understanding what the teacher says, the teacher may need to clarify or expand on their background knowledge or vocabulary. Organizations providing services for people with VI offer audio-taped textbooks. Classmates can be designated as note-takers for students with VI. Class notes can then be audio-taped or transcribed using an enlarged font or Braille. General teachers may also develop verbal or other auditory cues as signals for attending important information or particular events. Teaching 'listening skill' is also very important. Efficient listening is crucial to classroom success for students with visual impairments. Improved listening skills help students with visual impairments increase their spoken and written communication and reading skills (Heward, 2000). Teachers can consult vision specialists to determine appropriate auditory accommodations for each student.

111 (iv) Visual Learning and Accommodations Most students with VI have some usable vision. Their visual learning can become more efficient if they can enhance their skill to use their vision through training or the use of assistive devices. Observe students to determine that they have visual skills sufficient for locating and tracking visual materials. Vision specialists can offer assistance in developing students' visual skills and in making accommodations necessary for helping students use their vision in productive ways. Such services include making maps, adapting reading materials, and assisting in general accommodations. Many options are available for teachers selecting reading and writing materials for students with VI. According to their needs and preferences, students may use printed or Braille materials. Printed materials should be clear and be printed using an easily readable font. Providing an easel to hold reading materials can help students with VI do close work more easily (Barraga & Erin, 1992). Black felt-tip pens and soft lead pencils are useful writing utensils for students with VI because of the increased amount of contrast they create against white writing paper (Koenig, 1996). An extra light source at the student's work area can also be helpful for some students (Heward, 2000). If a VI student is benefitted from an additional light, the light's placement should be determined in collaboration with the vision specialist. Some simple strategies for using printed materials can help students with VI learn visually without requiring huge adjustments to the classroom environment. Simply holding books or other materials closer is enough to help some students with visual impairments (Heward, 2000). Using magnification devices or large-print materials are two accommodations that are often implemented in the classroom (Barraga & Erin, 1992). Such equipments and materials should be available for VI students who need them. There are some other considerations for general teachers to remember during lessons and when preparing materials for use in the classroom: a. The student's position in the classroom in relation to visual presentations should allow for an unobstructed view! If necessary, allow the student to move to a position with a better vantage point when visual materials are being used. b. Information written on the chalkboard should be large. Dry erase boards are good alternatives to regular chalkboards. The bright background strongly contrasts with the colours (especially black) are used for them. c. All visual aids should have clear, sharp images. Materials with high contrast are easier for students with VI. For example, handouts should have very dark black or navy blue print on bright white paper.

112 4.4 Procuring, Adapting and Use of different types of Models Each student who is VI or blind has their own unique learning needs. The type of service should reflect a student's need for specialized instruction at a specific time in his/her development process. This may change as the special need student progresses through his/her education. Some students may require a residential or special school specifically designed for students who are blind. The majority of students with VI can be best served within their local school system. Depending on the students needs, they may need a consultation model, an itinerant model or to receive more intensive services in a resource room at a magnet school for students with VI. In order to help students reach their fullest potential, schools should provide a full array of options to assure appropriate placement of each student. 4.4.1 Need Assessment and Placement of VI Students The assessment of VI students has a very crucial role in identifying appropriate level of severity and to place them for educational support system scientifically. Widely used two techniques of need assessment techniques are given below: i) The VISSIT: The Visual Impairment Scale of Service Intensity of Texas (VISSIT) is designed to guide teachers of students with VI in determining the type and amount of itinerant services to recommend for students on their caseload. The individualized education programme (IEP) experts will take decision on the basis of the result of the Scale. This Scale supports the teachers in quantifying information for the IEP of the VI students. The goal of VISSIT is to provide guidance so that all students with VI get the benefit of an appropriate amount and type of service. (ii) The VSRS: The Vision Severity Rating Scale (VSRS) was developed by the Michigan Department of Education through a task force of the State of Michigan, USA. The scale is very useful for determining amount of services a VI student needs due to his/her additional impairments. This assessment should be done once in every three years since needs and levels of support changes over time to determine the appropriate amount of service a VI student requires at a particular phase of his/her developmental process. It has also been further developed to assess the Orientation and Mobility Severity Rating for students with additional disabilities.

113 4.4.2 Models for VI Learners Three such models are discussed below: (i) The Consultation Model The students who receive consultation require minimal or no direct services from a teacher of students with visual impairment (TVI). In this model, the service is provided to the adults who work with the students on behalf of the student with VI. It provides itinerant observations of the student within their educational environment to determine if they are receiving the most appropriate adaptations to their materials, environment and instruction and to collaborate with teachers and therapists. Possible scenarios where the consultation model is appropriate include: A student with a progressive vision loss whose visual function is still within the normal range may not need direct services. They may, instead, need to consult with the teachers and family about potential changes in the student's vision and ways to prepare the student for future. A student who is making adequate academic progress, is not lacking any disability - specific skills, and has appropriate natural supports that facilitate the ongoing development of skills related to functioning in all areas. The student may only need accommodations for testing, or the student's general education teachers and parents may benefit from 'consultation with the TVI A student whose multiple disabilities include VI may get frequently benefit best when the special education teacher embeds vision specific skills, activities and strategies into the routine and daily plan. The student in this model may require extensive consultation for team members planning, explaining the unique learning needs of the student. When providing consultation, the TVI should: a. Observe the student in a variety of contexts, c. Provide suggestions on material, environmental and curricular applications, d. Have frequent contact with the teacher(s), paraprofessionals, and therapists to support their goals! objectives and help them understand the student's visual needs. (ii) The itinerant Model: Students in the general education programme or those assigned to a self-contained classroom for multiple disabilities may require Itinerant direct services from a teacher

114 of the VI. The time that the Itinerant TVI spends with the student should be based only on the time required to meet the special education goals identified in the IEP and may vary from daily instruction to biweekly or weekly instruction. While some skills are best address in the general education classroom, others require privacy or a quiet environment. The teaching techniques to enhance vision should not be taught in isolation. It is important to look at what the needs and activities of the student are in

the

school and in their everyday life that are affected by their visual performance, and teach to those tasks. The TVI will make suggestions for appropriate environmental and mental adaptations. (c) The Resource Room model The Resource Room Model is designed for students who require daily support from a TVI. In this model, students attend' a school that has been designated as 'magnet' school for students of their similarly aged with VI, who need daily contact with TVI. A TVI is based at the Magnet School in order to be accessible to the students and their teachers throughout the school day. Students are assigned to a general or special education classroom for most of the school day. Students attending Magnet Resource Classrooms have intensive instructional needs related to their visual impairments. The amount of time spent in the VI classroom will vary among students, based on their unique needs. They will typically spend part of each day receiving instruction in the areas of the core curriculum and support that facilitates their academic progress. Although the TVI is not an academic tutor, the TVI may spend time ensuring that students understand concept introduced in the academic courses. Some students will receive instruction in ways to access academic subjects, such as reading or basic mathematics, to build a strong foundation upon which future learning can occur. Advantage: the TVI has more opportunities in this model to observe students in a variety of situations, including classrooms, bus lines, the tea-stall, the playground etc. providing them with more opportunities to assess the student's skills and areas of needed instruction throughout the day. Since they are available to students and general education teachers throughout the school day, they can provide immediate assistance to teachers who are uncertain how to include students with VI in the curriculum by helping these teachers adapt materials or modify instruction or by teaching classroom activities that cannot be easily adapted in other ways. Students in a VI Magnet School have more opportunities 115 to meet and frequently interact with other students who have visual impairments. Through planned and unplanned activities, they can discover issues they may have in common and solutions to problem related to their visual impairments. This model allows older and more fluent Braille readers the opportunities to mentor younger students.

Disadvantages: vantage of the VI Magnet School Model is that students may not attend their home schools and therefore may not attend school with their siblings and other children in their neighbourhoods. Because of the geographic distances between their homes and the school, students may find it impossible to attend planned or impromptu after-school or evening activities, and parents may be challenged to feel part of the school commun ity and to participate in parent-teacher activities or school advisory committees. 4.5 Organizing Field Trips

Children learn what others expect of them and thus develop their own expectations for themselves through daily experiences with their communities. Visually impaired

pre-schoolers

need enhanced, planned opportunities to learn about their communities through firsthand experiences. Community field trips can be important and help career development opportunities. They give

pre-schoolers

the chance to learn about what workers do in fire stations, physician offices, bakeries, post offices, or restaurants.'

Here are 5 tips for making the trip a positive learning experience from the book "

Skills for Success: A Career Education Handbook for Children and Adolescents with Visual Impairments "]: 1.

Hands-on learning opportunities are essential for children with visual impairments. Let the contact person at the community site know that children will need to touch equipment and explore the environment. Make arrangements for them to handle and explore selected items at the site. 2. Prepare children for the trip by discussing where they will be going. Ask, "What do you think will be there?"; "Who will be there?"; and "What will we see?" 3. Provide verbal labels and descriptions of the objects as the children examine them, for instance, "The fire truck is a big red truck" and "The fire-fighter

wears a hard hat and black rubber boots." 4. Use field trips to help children integrate concepts being introduced in other 116 activities. A trip to the petting zoo to learn about zookeepers or to the humane society to learn about veterinarians is a natural component of a unit on pets and the classification of animals. 5. Provide opportunities for children to meet adults with similar disabilities to theirs and to notice these people doing work or carrying out activities. Emphasize similarities in their adaptive tools and the adults' tools-for example, "Mrs. Daugherty's hearing aid is the same as yours." With field trips one can provide a broad range of experiential learning opportunities that are developmentally appropriate, from unusual places such as a pottery studio to traditional community sites such as a police station or farm. Every experience helps a child think more about "what do I want to be when I grow up?" Science educators today face the challenge of improving thinking skill, interest and success in science learning. They typically do this through the science curriculum which is taught in the formal classroom setting. 4.6 Teaching Skills: Role Play & Dramatization, Narration & Explanation, and Story-telling Schellin (2006) claims that simulation, role play and drama are three very useful learning techniques. According to him, simulation is longer than role play, and students keep their own identities instead of playing a role. In role play, on the other hand, students assume a role and play a part in a specific situation. 4.6.1 Role Play and Dramatization In drama, students are supposed to act out exactly what is written in a script. Schell in (2006) illustrates how the three tools can be combined, and demonstrates a model for a teaching method in which students practise simulation, role play, and drama in combination. Role plays a teaching method has many points in common with dramatization. He indicates, therefore, that it is preferable if teachers use the two synthetically. Even though there are some differences in length, creativity, and flexibility, all of these techniques can serve beneficially for learners as a rehearsal for real life, and inspire learners to acquire the target language in a comprehensive manner. The difference can be the length of the play, as well as the time needed to prepare, but they have many characteristics in common at the fundamental level; role play and

117 dramatization can be practised with almost the same procedure and they have similar effects on developing language skills. A very simple role play of a prepared dialogue and a creative drama might not be aimed to the same level of learners. Accordingly, we use the term 'role play' for a short sketch based on prepared scripts, 'short drama' for a drama which is inventive and contains just one scene, and 'creative drama' for a long, creative, and comprehensive type of drama. We can use the term 'dramatization' as a category which embraces all 'role-play', 'short drama' and 'creative drama'. The impact of dramatization in foreign language classes is quite remarkable, and students tend to enjoy themselves and learn many things including language skills from this activity, both as an actor and as an audience. The short dramas in classroom activities can be extended to long creative dramas to make it as a teaching method to learn the culture and civilization of the target language in an inclusive way. Very short drama or role-play activities are suitable even for beginners, if appropriate dialogues as a reference and teacher's help are provided. Moreover, there are definitely advantages for VI learners from the beginning to practise dramas in order to improve their communication skills for the following reasons: Right from the beginning the VI students can practise their pronunciation while having fun, as they practise their lines repeatedly. The fear of using a new language in front of others is diminished through the repeated performance. Repeating and using the target language from the beginner's level, the VI student will naturally acquire a living language, grasping and experiencing the meaning of the target language's world-view. The activity of dramatization is just a possible way to gain a sustainable, long-term effect in acquiring language. Kawakami may be right, as he said the effectiveness of dramatization activity is not something we can perceive immediately. Nevertheless, the language itself has a characteristic that we learn in the long term, while accumulating experiences of communication in many situations. Thus the successive activities of dramas must serve as a repertory of simulation of exemplified situations. (i) Procedure The whole class is first instructed about the activity of role-play and dramatization and its procedures. Then the students form pairs. Each pair get the worksheet with the 118 situations and is asked to choose one situation about which they will write a script for a short drama. They are supposed to think about the characterization of the drama characters and write a script cooperatively. The students are allowed to use freely consult dictionaries, reference or the textbook, and can ask questions to the teacher. The teacher shall collect all the audio or written scripts and give them back to the students with some grammatical corrections and some suggestions for expressions in the following week. Then the VI students will practise the modified script for about ten minutes. Finally, each pair will play the short drama. While a pair is acting out their original drama, other students carefully watch/ observe/ listen their plays. They are applauded at the end of each short drama. Therefore, the class has a spirited and friendly atmosphere, and students seem to quite enjoy writing a script inventively instead of just memorizing the dialogues in the textbook. (ii) Advantage Role play and dramatization can be classified as communicative methods of foreign language learning. In this section, we point out the problem of the tenet of the communicative approach that a top priority should be given to create meaning and that grammatical correctness is considered less important. In everyday conversation, it might be possible that we put a greater emphasis on conveying meaning than speaking correctly. Nevertheless, in classroom instruction, correctness of forms should be also respected, as long as it is a part of the education program. This article claims that the activity of the dramatization is one of the best and most appropriate methods for improving one's communicative skills as well as paying attention to the grammatical accuracy suggested by one's teacher. As the result of Question 2 demonstrates, error correction would not work as a deterrent for their creating drama in a short drama activity. Students memorize the modified scripts for performing a play, and as a result, they can acquire grammatical accuracy, while performing a role in a communicative way. (ii) Difficulties Sano (1989) points out one of major difficulties with conducting the activity of drama in a class that psychological pressure is a burden for students who are introvert in nature. Moreover, some VI students may feel nervous when making an oral presentation in front of an audience, even though they are not introvert or shy. The picture-story shows and puppet plays may be the solutions for these problems. However, they would not be fundamental solutions if students feel uncomfortable in the first place to speak in front of many people. Furthermore, one of the advantages of drama activities, reciting with natural gesture and facial expressions, would be ignored in picture-story shows and

119 puppet plays. Habituation to oral presentation in front of the class would be the best method to handle the anxiety of speaking in public by the VI students. This kind of accustomation permits students to fight against the fear of oral presentation and may serve them in their future experiences as well as in their drama activities in the class. Although several studies have been done to demonstrate the effectiveness of dramatization, few have been done for the VI students. 4.6.2 Narration and Story-telling Oller (1981) mentions the importance of meaningful communicative settings especially for the VI students. It is clear that the analysis of episodes and linking them up with semantic categories can constitute a central process in learning. Richard-Amato (1988) also indicates that presentation of episodically organized materials can indeed be an effective language teaching approach. Through materials that do not violate the logic of normal discourse, the student can receive optimal input which can enhance the ability to reproduce, understand, and recall the target language. This view of putting language learning into meaningful and comprehensive situations corresponds to the perspective of cognitive linguistics that we experience and cognize the world as a gestalt. It also conforms to one of the major theories in cognitive semantics, frame semantics, which claims that in order to understand the meaning of a word, encyclopedic knowledge concerning the word is indispensable. People have always told stories; it is the oldest form of remembering. In ancient times, long before written language was developed, people told stories to preserve the history, traditions, desires, and taboos of their social groups. Each generation told their stories to the next, which in turn told the stories to the youth of the generation that followed them. Since prehistory, all cultures have passed along such tales through the oral tradition, and they have always been an essential part of our humanness. Some stories were told just for entertainment. Others were used to share the history of a group of people and also to teach lessons and transmit values and beliefs. Still others were intended to explain natural phenomena-such as the changing of the seasons and the cycle of night and day- and usually involved the people's gods and other religious beliefs. Certain stories were accompanied by music and were sung instead of recited. These stories remained in a constant process of variation, depending on the memory, talent, or purpose of the storytellers (Anderson, 2005, 81).

120 Story-telling, the art of narrating a tale from memory rather than reading it is one of the oldest of all art forms, reaching back to prehistoric times. Storytelling involves two elements - selection and delivery. Many English and Foreign Language (EFL) teachers are interested in storytelling as a resource in teaching. A successful story-teller chooses adequate stories and must be a good performer, for the delivery is crucial and requires both preparation and rehearsal. Story-telling is the original form of teaching and has the potential of fostering emotional intelligence and help the child to gain insight into human behavior. Story-telling also promotes language learning by enriching learners' vocabulary and acquiring new language structures. Moreover, storytelling can provide a motivating and low anxiety context for language learning. The story-telling tips given in this article are meant to help the teacher-as-storyteller as he/she prepares for a storytelling 'performance' for students. Story-telling is the original form of teaching. There are still societies where it is the only form of teaching the beginners with VI, though attempts have been made to update it. A simple narration will always be the cornerstone of the art of teaching. Colloquial or literary, unaffected or flowery - the full range of language is present in stories developed in a unique way. The listeners may also be benefitted from observing non-polished speech created on-the-spot. While listening to stories, children develop a sense of structure that will later help them to understand the more complex stories of literature. In fact, stories are the oldest form of literature. Through traditional tales, people express their values, fears, hopes, and dreams. Oral stories are a direct expression of a literary and cultural heritage; and through them that heritage is appreciated, understood, and kept alive. Through a story, listeners experience a vicarious feeling for the past and a oneness with various cultures of the present as they gain insight into the motives and patterns of human behaviour. However, many storytellers feel that cognitive enrichment is not the primary aim of their art. Stories have numerous affective benefits for social and emotional development. A story session is a time to share feelings. A relaxed, happy relationship between storyteller and listener is established, drawing them together and building mutual confidence. Stories help children to know themselves and to know others so they can cope with the psychological problems of growing up. Story-telling is also a living art. Like music and dance, it is brought to life in performance. A story will be altered by the storyteller's background: his/her choice of setting and detail, and the rapport established with the audience. The storyteller's building materials are words, sounds, and language patterns. The tools are the voice, face, and hands. The

121 product is the creation of a shared human experience based on words and imagination. Storytelling is an individual art, and an imposed method or ready-to-use plan will prove inadequate. Beginning storytellers must go beyond the rules. They must know their personal strengths and develop their own unique style. (i) Advantages: The most important advantages of storytelling may be summarized as follows: Stories are motivating and fun and can help develop positive attitudes towards the foreign language and language learning. They can create a desire to continuum of language learning for VI students.. Stories exercise the imagination. Children can become personally involved in a story as they identify with the characters and try to interpret the narrative illustrations. This imaginative experience may develop VI learners' own creative powers. Listening to stories in class is a shared social experience. Reading and writing are often individual activities; storytelling provokes a shared response of laughter, sadness, excitement and anticipation which is not only enjoyable but can help build up VI child's confidence and encourage social and emotional development. Children with VI can enjoy listening to stories over and over again. This frequent repetition allows certain language items to be acquainted with while others are being overly reinforced. Many stories also contain natural repetition of key vocabulary and structures. This help children to remember every detail, so they can gradually learn to anticipate what is about to happen next in the story. Repetition also encourages participation in the narrative. Listening to stories allows the teacher to introduce or revise new vocabulary and sentence structures by exposing the VI children to language in varied, memorable and familiar contexts, which will enrich their thinking and gradually enter their own speech. There are three main dimensions in which stories can add to learning in the whole school curriculum: 1. Stories can be used to reinforce conceptual development in children (for example, color, size, shape, time, cause and effect, and so on). 2. Stories are means of developing learning. This major category covers - (a) 122 Reinforcing thinking strategies (for example, comparing, classifying, predicting, problem-solving, hypothesizing, planning, and so on). (b) Developing strategies for learning English (for example, guessing the meaning of new words, training the memory, self-testing, and so on). (c) - Developing study skills (for example, making, understanding and interpreting charts and graphs, making and learning to use dictionaries, organizing work, and so on). 3. Carefully selected stories can also be used to develop other subjects in the Curriculum, III particular:- Geography and the Environment in the local area, neighborhood parks, sports and games, using a map, using the atlas, the weather and climates around the world, cultural studies etc. (ii) Story Selection Selection requires an ability to evaluate stories and to discriminate between those that meet your learners' needs and those that do not. Although learning stories directly from other story-tellers is the traditional method, one learns most stories from books. Many publishers produce simplified storybooks especially for children learning English. However, there are many authentic storybooks written for English-speaking children which are also suitable for those learning English. As they have not been written specifically for the teaching of English as a foreign language, the language is not selected or graded. Many, however, contain language traditionally found in most beginner syllabuses. The advantage of using authentic storybooks is that they provide examples of 'real' language and help to bring the real world into the classroom. Very often simplified stories represent a watered-down version of the English language and can deceive both teacher and learners about the true nature of language. Authentic can also be very motivating for a child as they experience a strong sense of achievement at having worked with a "real" book. Furthermore, the quality of illustration is of a high standard, appealing to the young learner, and it plays an important role in aiding general comprehension. Wide reading gives authority to your telling. Teachers can choose from a wide range of storybooks: those that children are already familiar with in their mother tongue, such as traditional stories and fairy-tales; picture stories with non text, where the children build up the story together; rhyming stories; cumulative stories with predictable endings; humorous stories; stories with infectious rhythms; everyday stories; fantasy stories, animal stories, and so on.

How Children Benefit from Listening to Stories?

123 Hearing stories: 1. Stimulates the imagination. 2. Improves listening skills. 3. Instills a love of language, reading, and creative writing. 4. Improves language skills, such as vocabulary, comprehension, sequencing, and story recall. 5. Builds community by providing a common experience and collective language of story catch words and phrases. How Children Benefit from Telling Stories? Story-telling: 2. Increases self-esteem by building confidence in speaking before groups. 3. Improves expressive language skills and stimulates inventive thinking. 3. Promotes greater cooperation and stronger relationships among children and between students and teachers. If we know others' stories, we are less likely to judge or misunderstand them. 4. Encourages personal growth through risk-taking. 4.6.3 Explanation Explanations are integral to the learning process and can be used as an effective elementary social science teaching strategy when combined with opportunities for student activity. Effective explanations may involve the following: The use of clear language. Good teacher delivers the subject knowledge in simplified chunks, An awareness of what the students already know, The use of memorable examples. Ongoing questioning to check the level of understanding, Actively engaging all the students of a class. Pupils process information in different ways. Visual learners have a preference for reading words and looking at diagrams and images; auditory learners have a preference for

124 listening: tactile or kinaesthetic learners have a preference for touch and movement. Small modifications to the explanations can address each of these learning styles, thereby improving the educational experience more effectively to all the students. What makes an explanation effective? The teachers will be required to provide scientific explanations that engage all the students in a classroom irrespective of their special needs. Some of the following activities may encourage the students to start thinking about the respective learning process. Activity for giving a clear explanation: 1. What is the core information that the students need to know about a given topic? 2. What do the students already know? 3. What scientific vocabulary needs to be used? Does this need to be explained too? 4. How will the explanations be made engaging and memorable to the students? 5. What questions will be asked to check the students' understanding? 4.7

Evaluation of Concepts and Skills in Social Science with reference to Geography 4.7.1

Geography skills Students' Geographic skills under several categories need to be evaluated after the learning process being completed. Just like the normal students, VI learners also be evaluated using the slightly modified techniques. The basic Geographic skills are: (i) Geographic resource interpretation skills These include using maps, photographs, diagrams, cartoons, Images, statistics, keys, graphs, text, models, internet, speeches, surveys, films, TV, video clips and GIS to explain geographic information. a. Geographic resource construction skills include presenting spatial data which may include, but is not limited to, drawing sketch and precise maps, using GIS layering and/or other multi-media to present specific geographic information. b. Presenting statistical data may include, but is not limited to, constructing graphs, tables, performing calculations based on data.

125 c. Presenting visual data that may include, but is not limited to, taking photographs or drawing pictures, cartoons, multi-media. d. Complex presentations like multiple forms of data for example Visual, spatial and statistical combined. (ii) Communication skills It includes that being able to present geographic information in a variety of forms such as essays, paragraphs, poems, visuals, models, films, Powerpoint presentations, speeches, games, puzzles, blogs and graphic organisers. (iii) Social skills These include that being able to work in groups and being empathetic, appreciating different values, perspectives and viewpoints on different aspects of geography, establishing and justifying personal value positions, contributing and participating in the community. (iv) Fieldwork skills These include being able to gather information from the field using a variety of techniques Such as surveying, questionnaires, field sketching, measuring, photographing, interviewing and observing. (iv) Resources for Skill Evaluation In the examination a resource booklet is provided which is used to assess the students' understanding of the concepts and application of geographic skills. This may include a variety of resources such as maps, tables, diagrams, photographs, opinions. These will generally be about a particular geographic issue in a setting which could be from India or overseas. The resources provided at level I are more straight forward than those at levels 2 and 3. For example a topographic map at level I will be relatively easy to interpret. At level 3 topographic maps will be in their original state and be more complex, to interpret. Complex satellite imagery will only be used at higher levels. a. Mapping Distance, use of six figure grid references, use of latitude and longitude, compass direction, bearings, scale, area calculation, location of natural and cultural features, determination of height, cross sections, use of a key, precis map construction, recognition

126 of relationships, application of concepts, interpretation of other geographic maps like weather maps, cartograms. choropleth maps. b. Visuals Interpretation of photographs, cartoons or diagrams including pyramids and models such as a wind rose: interpreting and completing a continuum to show value positions. c. Graphing Interpretation and construction of bar graphs (single and multiple). line graphs (single and multiple), pie and percentage bar graphs, scatter graphs, dot distribution, picrograms. and climate graphs. d. Tables Recognition of patterns, simple calculation such as mean. mode. and conversion to percentages. At level III. the intention is for students to select and apply skills. This means that while the same skills are assessed as at level II students need to be able to select appropriate skills to answer questions. For example, students may be asked to give the location of a feature which requires them to use a combination of skills such as grid references, latitude and longitude, or direction and distance from another feature. They may be asked to describe the physical geography of a region which would draw on skills such as interpreting contour lines. cross sections. climate graphs and wind roses. e. The complexity of the examination questions Questions at level I are related to the use of a specific resource only. At level II, one or two resources may have to be used to answer questions. At level 3 several resources from throughout the resource booklet may be used to apply a skill. Instruction words will also differentiate the levels where longer written explanations are required. At level 1 most of the questions will be based around describe or describe and explain. At levels II and III, terms such as justify and evaluate may be used. f. Guidance given to students in the examination Candidates are given more direction at level 1 with less guidance at level III. For example, at level 1 a candidate will be told which type of graph to construct and be provided with 127 axes or asked to complete a graph that has been partially done, for example, complete the rainfall for a climate graph where the temperature is given. At level II. candidates will be told the type of graph to construct within a given space, whilst at level 3 candidates will have to select which is the appropriate graph to construct using more complex resources. At level III candidates will have to locate major features on a precis map: at level 2 to locate features where some outline is provided; and by level 3 only a minimal outline is provided for guidance.

4.7.2 Assessing geographic concepts

Conceptual understandings underpin the knowledge and skills assessed by the achievement standards (NCEA level I to III) and scholarship performance standards. Students are required to understand how these concepts can be applied to new settings, as well as applying them to the contexts they have studied specifically. Differentiation of concepts applies across the levels. A student's understanding of a concept at level I will be at a more basic level than an understanding at levels II or III. As students build geographical knowledge and skills, they will approach these concepts in different ways. By revisiting them in different contexts, they will come to refine and embed understandings. (i) The key concepts or big ideas in geography Geographic concepts allow for the exploration of relationships and connections between people and both natural and cultural environments. They have a spatial component. They provide a framework that geographers use to interpret and represent information about the world. The development of understanding of these concepts will allow VI students to participate as critical, active, informed and responsible citizens. The geography achievement objectives are based on conceptual understandings. A concept is a general idea, thought, or understanding. Conceptual understandings are what learners know and understand about a concept. When the concepts are elaborated 128 into generalisations, they become conceptual understandings. The key concepts are all derived directly from the Level VI to VIII achievement objectives for geography.

a. Local Environment It is expected that VI students will develop their understanding of concepts through time. Teachers may also choose additional concepts that may connect with the local environment or the circumstances of their students. Such concepts must be geographic in nature: they must have a spatial component. b. Spatial components relate to how features are arranged on the Earth's surface. For example, an understanding of 'environments' will be supported by students also developing an understanding of additional concepts such as location, distance and region. Other concepts may apply to specific contexts, for example, rehabilitation and mitigation for extreme natural events or natural increase and dependency ratio for population. c. Natural and Cultural Environment They have particular characteristics and features which can be the result of natural and/ or cultural processes. The particular characteristics of an environment may be similar to and/or different from another. A cultural environment includes people and/or the built environment. d. Perspectives Ways of seeing the world that help explain differences in decisions about, responses to, and interactions with environments. Perspectives are bodies of thought, theories or worldviews that shape people's values and have built up over time, they involve people's perceptions (how they view and interpret environments) and viewpoints (what they think) about geographic issues. Perceptions and viewpoints are influenced by people's values (deeply held beliefs about what is important or desirable), e. Processes It is a sequence of actions, natural and/or cultural, that shape and change environments, places and societies. Some examples of geographic processes include erosion, migration, desertification and globalisation.

Environmental Influences 5.7.2 Classroom Management 5.8 Let us Sum Up 5.9 Check Your Progress 5.10 References 5.1

Introduction: Low Vision is significant impairment of vision, but not blindness. It is important to identify children who have impaired Vision. There will be Psychological problems

133 associated with a diagnosis of low vision. One of the primary problems for low vision child is that there is very little which he can pick up just incidentally through his visual sense. He needs to be taught the process of discrimination between the forms, outlines, pictures and symbols which have never been brought to his/ her attention. So the purpose of any low vision education programme is to encourage and help each child with low vision make best use of vision. There are three aspects in training effective use of vision such as stimulation of vision, visual efficiency and utilization of vision. Use of vision in children having minimal amount of vision needs stimulation. Encouraging the use of vision is vital for children with low vision as it enhances their development, education and experiences. When an infant has severe visual impairment, to help him to learn to see, stimulation must be simple. The visual efficiency can be developed by training but cannot be measured or predicted clinically with any accuracy by medical, psychological or educational personnel. A variety of activities should be given for vision stimulation and visual efficiency. 5.2

Objectives After studying this unit the learners will be able to : Explain the meaning and importance of vision training. To carry out the activities for vision stimulation and visual efficiency training. Select and use the appropriate learning medium for low vision children. Plan programmes for training in reading and writing skills. Acquire the techniques of teaching Orientation and Mobility skills. Manage Class-room situations for low vision children. Provide necessary environmental modification in home and school. 5.3 Visual stimulation : Concept and procedure 5.3.1: Meaning and Importance of Vision Training Vision training, also known as vision therapy consists of a variety of programmes to enhance visual performance. It includes treatments for focusing, binocularity and eye movement problems.

134 Vision therapy can increase reading efficiency because the goal of vision training is to improve visual efficiency and visual processing. Children rubbing their eyes while reading, avoiding reading, or getting headaches while reading should be evaluated. Problems with focusing (accommodative insufficiency) or problems keeping words single (convergence or divergence problems) may be present. A full eye - health evaluation and vision training workup may reveal problem. Vision training is also appropriate for people learning how to coordinate the eyes after surgery for squint. Vision training can also be used in lazy eye (amblyopia) and includes patching the eye and doing various exercises. 5.3.2 : Aims of Vision Training The aims of vision training include the following : To encourage and help each child with low vision make best use of vision. To provide a variety and a number of opportunities for the child to learn about and understand his environment. There are three aspects in training for effective use of vision: 1. Stimulation of Vision Children who have very little vision or have not used vision need to know that they can use their vision. They may also need encouragement to do so. 2. Visual Efficiency How residual vision can be improved through vision training? Measures of vision do not change after training- visual acuity, visual fields will not change because of the training. 3. Utilization of Vision : How to use vision leads to knowing how to change the environment/ lighting choosing suitable materials and using low vision devices if needed. 5.3.3 Visual Stimulation: Concept and Procedure What is visual Stimulation? Encouraging the use of vision is vital for children with low vision as it enhances their development, education, and experiences. Use of vision in children having minimal amount of vision needs stimulation. Visual stimulation is the use of strong visual stimuli

135 to make an infant or child aware of the vision. These children usually have very limited visual capabilities and no visually guided functions. Smith and Cote (1982) stated that the area of brain, which is responsible for vision, would remain underdeveloped unless stimulation and visual experiences are provided. How efficiently the child functions visually is the direct result of the quality of sequential presentation of visual stimulation experiences. For visually impaired children, the use of vision is not an automatically learned process. Visual Stimulation Serves Multiple Purposes for children Who have residual vision. Who have vision but don't use the vision for visually oriented behaviours or for incidental learning. Who have vision but not learned to interpret what they see. The definition of blindness is based on measurements of visual acuity and visual field. These visual functions cannot be measured in young children with the techniques used in the assessment of adult persons. Many children in our country do not receive early intervention because of the present testing system. Visual impairment affects many areas of development. In infancy vision is very important in interaction - visual communication between the child and the parent, motor development, object permanence, spatial concepts etc. In pre school age visual communication is the dominant way of communication and visual impairment may effect social contacts, orientation & mobility etc. There is need to stimulate the existing vision to use and to develop assessment of functional vision and define related functions at different age levels. Activities for Stimulation of Vision When an infant has severe visual impairment, to help him to learn, to see, stimulation must be strong and simple. Playthings Toys are more effective for vision stimulation because they are more interesting and easy to use. Many usual playthings are useful. Contrast can be enhanced by adding colours to the surfaces of the play items. Bottle with Stripes Bottles with bright stripes on white background attract the infant to look. Sounds with the water in the bottle may give the child the other source of information - auditory, and

136 may attract the child to look at farther distances. By using different yarns on the surface can give different tactile qualities. Tactile information will be a compensatory source of information. The other source of information can be trained together with the use of vision. Shiny Objects Shiny surfaces that reflect light are strong stimuli for grasping, Plastic balls covered with shiny papers, shiny rattles etc., which have both visual and auditory stimulation can be used. String of Beads The string of beads can be kept in a holder. When the string is brought closer to the child's face the child can grasp it easily. The movement of the beads, its soft sound and the various colours of the beads will be an effective activator in early stimulation. Illuminated Toys Illuminated toys and ball or fluorescent ball that glows in a dimly lit room will activate a visually impaired infant. Flickering Lights When nothing else seems to work, one may try to use flickering lights at close distance. Because of flicker, the toy can be used by many children with very limited residual vision. The child expresses for the first time the joy of seeing light. Stimulation during the first month of life and certainly before age six is important for preventing visual deprivation. The presentation of visually interesting stimulus items will motivate a child to become visually attentive. The child might attain visual attention more rapidly provided with an opportunity to experience natural consequences

of using vision. 5.4 Selection of an appropriate medium of reading and writing

The ability to communicate effectively through speaking, listening, reading and writing to the extent of one's abilities is of fundamental importance in achieving assimilation into society. The most vital component of the total communication process is reading. Reading and writing is of equal importance and value for individuals with visual impairments. An efficient reading medium facilitates education and integration into school, learning and work environments.

137 5.4.1.

Choice of Reading Medium For sighted, print medium is the universal method of expressing language. However, for children with low vision the decision regarding the appropriate learning medium is not straightforward or predetermined in any way. Since literacy is measured by the ability to demonstrate effective reading and writing medium, much attention must be devoted to making decisions by which each person with visual impairment will read and write. 5.4.2. Visual Process in Print Reading Reading is not performed through continuous eye movement but through sudden changes of fixation, fixing a given point in a space, encompassing the surrounding letters. The speed limit of the eye to shift from the fixation to another is determined by the time that brain takes to process the information input. Faster reading is not achieved by quicker eye movement but an expansion of visual field. Visual process plays an important part in print reading. Reading speed is a factor specially affected by visual deficits. The reading speed is influenced by factors like visual functioning, cause of low vision and type of optical help etc. For many young people with low vision the inability to read is the most serious consequence of their eye disease because of the input it may have on learning process. Low vision persons have some differential characters that sometimes teachers may not be aware to evaluate. Textual information is processed differently by foveal and peripheral regions of retina. 5.4.3. Superior Medium Print or Braille? There has been ample discussion among the professionals in the field as to the superiority of one medium over another medium for students with low vision. However such discussion does not reflect a full appreciation of the complexities and differential characteristics of children with low vision. There can be no predetermined reading medium for all students within an arbitrary category and still uphold the principles of educating each child to his or her individual capabilities and needs.

The children who show a preference for gathering information visually can develop efficient reading skills through the visual channel, the primary consideration should be given to instruction in reading in print. For students who do not have sufficient visual functioning to develop efficient reading in print, the consideration can be given to instruction in reading Braille.

138 Some children may need both print and Braille for their education and life situations. The value of one medium over other is not a matter. The important factor is the degree of care that is taken in matching the appropriate reading medium with the child's individual sensory and learning capabilities and needs. The task of the teachers is to provide instruction learning medium or mediums which will allow the child to become a literate adult, not to restrict opportunities for achieving literacy by failing to match a child's existing abilities with the appropriate learning mediums. 5.4.4 Principles in Determining the Reading Medium The determination of the appropriate learning medium is but one of critical decisions. The appropriate learning medium is based on a set of fundamental principles that reflect the individuality and unique learning characteristics of each low vision child. These are:

Individual needs and abilities. The teachers should know the child's unique abilities and needs. Students with low vision possess a wide range of learning characteristics that are unique in themselves (e.g. reading with central vision, reading with peripheral vision etc.). So no global statement can be made for the total population. It should be based on the individual learning characters. The students who show a preference for gathering information visually can develop reading skills in print. The students who do not have sufficient visual functioning can be given instruction in Braille. Instruction in both print and Braille may be appropriate for some students as he may need very large print for some educational purposes and majority of his educational aspect he may be using Braille. Some children may use print in day time for short duration and Braille for night time. Some students

may read print but cannot write print. They can be allowed to use both methods. The decision should be based on the student's unique sensory capabilities - ability to receive information through sensory channels, stability and prognosis of the

139 eye condition. The decision should not be on arbitrary criteria such as visual acuity or legal blindness. Each student

with low vision should be assured that decisions regarding the learning medium are based on the sensory/overall visual functioning. The teacher who determines the medium should have professional training and professional judgement. The professional involved in the education of the children with low vision should realize that the children should learn to communicate effectively. The teachers and educational team should have professional judgement in matching the appropriate learning medium with the child's individual sensory and learning capabilities. 5.5 Techniques

and Procedures for developing reading and writing skills The children with visual problems can be identified with some simple techniques. Vision may be improved with spectacles, treatment and operation. Children and youth with low vision have unique educational needs. The functional vision assessment should state the child's primary mode of reading, whether it is regular print, large print or braille. 5.5.1 Programme for developing reading and writing skills Visual Reading/ Writing

In low vision services, print reading is the specific goal of the low vision persons.

Near acuity is measured in the functional assessment of near vision. A simplified near vision chart with a few print/ symbol (illiterate E card) is currently used by teachers.

When a low vision person considers reading as a task that may occur even as close as half an inch from the eyes. The test is to differentiate between : 1. Those people who can see normal print. 2. Those people who can read large print without aids 3. Those people who require magnification devices or

are

able to read very large print.

140 4. Those unable to read print with magnification devices or need Braille. Independent Visual Reading A child who is ready to begin reading will still need visual training in addition to techniques used in reading. 1. Activities to promote association of word symbols with objects and action pictures.

Use pictures of previously recognized objects accompanied by appropriate words.

141 (

b) Affix labels to things in the Classroom:

142

Action words can be written on individual cards for the child to choose and act out. 2. Activities to promote

discrimination, recognition and identification of individual letter and word. a) Match letters: Present letter in unlike configuration

Present letter in like configuration b) Match words: Unlike words

143 Like Words : eat dot Cat cat ate

144

Match letters in work pages n q o g q n g o 3.

Activities to foster and encourage visual reading of simple materials (a) Use known songs, verses and stories which children can read from memory. (b) Make flash cards of words taken from the song/ story and make the child build sentence. Crow Thirsty Forest Pot water

e.g. The Crow was thirsty. (C) Begin using textbooks. (d) Provide a story time. Children listen to a short story told by teacher or by an audiocassette. When they have completed listening, the child can follow reading the same

story. 4. Activities to increase reading speed The slow reading rate attained by most children with impaired vision is a major frustration. Speed reading techniques must be started early - before bad habits have already been formed. The aim of reading is not the single words which combine to

d a d k o a c e d m d o d

145

express these reading. Reading speed a minimum of 20/25 words per minute is needed for comprehension. Therefore:

a)

Systematic Scanning techniques which develop the ability to spot key words. Phrases, sentences and paragraphs need to be devised. b) Teach children to use principles of continuity and context to make intelligent guesses.

c) Encourage use of configuration clues. d)

Teach children to avoid sub - vocalization which concentrates attention on single words and parts of words rather than ideas expressed. e) The use of line marker/ typoscope offers help to reduce glare and increase contrast and readability f)

Develop good listening

skills

for more effective use of recorded materials and reader service. g) If visual aids are available, develop skill in the use of the devices. Activities to Develop Independent writing Skills Activities for writing can be given simultaneously along with reading activities. All eye-hand coordination activities prepare children for writing. These activities should be continued throughout the writing programme. Reinforce pre - writing activities before actual writing letters start. Some of the writing devices which improve contrast and facilitate writing are: Bold - tipped/ Fibre- tipped pen Black Ink Line Guide

Bold Line Paper

Writing slate used by sighted children and chalk Neck magnifier Closed Circuit Television Type writer Computer
146 5.6

Orientation and Mobility for Low Vision Children Orientation means an awareness of position in space. Mobility means the ability of

moving around through the environment safely, efficiently, and independently. Not all persons with low vision need orientation and mobility training but those who are unable to move with ease, independent mobility is achieved by gradually exposing them to increasingly complex situations. Successful mobility depends of effective use of visual information rather than a visual acuity. Even minimal visual function such as light perception can be useful. The important in visual functions are influence of visual field, visual acuity, lighting and contrast sensitivity. Of these four variables, peripheral field defect, light levels and contrast sensitivity are more closely related to mobility than is acuity. 5.6.1

Assessment Strategies The mobility assessment is the first step designing a mobility programme. Instruction may be brief or extended over a period of months depending on the age, goals and abilities. First the mobility Instructor/Special educator can conduct an interview to uncover problems in mobility related to eye condition and psychological difficulties. 5.6.2 Functional Assessment in Mobility A functional assessment is very important which is to be conducted indoors and out- doors under actual travel conditions. The functional assessment is to evaluate the child's use of visual information and ability to draw on previous experiences. The functional assessment includes the following areas: Identification and avoidance of obstacles Estimation of distances. Negotiation of steps, curbs and uneven surfaces. Ability to explore from one point to another. Lighting needs, and adjustment to variable light condition Discrimination of contrast Scanning skills Use of aids.

147 Use of inputs in other senses Ease and speed of travel. The best assessment is to hear what the Low vision person is telling about their needs, desire, problems etc. The Instructor should also observe the person in the environment. But keeping those in mind and record, it is more important to analyze actual performance Discrepancies may exist between the answers to interview questions and actual performance that could give the evaluator a basis for discussing realistic limitations with the low vision person and designing a practical programme around those limitations. 5.6.3 Training for Adult and Children The adult does not have to be "taught" to see because spatial concept is usually intact, visual memory and previous experiences are stored. A typical programme for an adult includes training in efficient use of vision and hearing, travel skills in the neighbourhood and using public transportation, sighted guide techniques, the use of long cane and use of visual aids. Children, particularly those whose low vision is congenital or of early onset, need intensive training. A typical programme for a child or young person includes visual simulation, body image, concept development, body movement, sensory training of non- visual senses, independent travel in the known environment, use of visual aids for example use of hand magnifiers to read maps, addresses, telephone numbers etc., and use of mobility techniques such as cane travel and sighted guide. 5.6.4 Mobility Aids and Techniques 1. Conventional Glasses Conventional spectacle is first prescribed by the eye care specialists to provide the best possible base line visual acuity. 2. Aids that control Light The visual aids that modify light, increase contrast or reduce glare includes visors, wide brimmed hats, sunglasses, frames with side shields and telescopes. For persons who are night blind, a bright light source from flash/ torch light may enable the person travel without cane.

148 3. Magnification Aids Monocular telescopes or head-borne bioptic telescopes may enable the low vision persons to localize, focus and track. 4. Minifiers A person with peripheral field loss can see the effect of minification by reversing a low- power monocular telescope. Minifiers are specially designed to reduce the image size horizontally, which expands only the lateral periphery of the field of vision. 5. Fresnel Prism A Fresnel prism is a series of prisms compressed into a flat plastic membrane. These are accurately placed on a pair of glasses in the area of a non- functional field of view. Do not interfere with the person's regular vision. The person who is using this, however, with a quick movement into the prism can see objects at the side without any head movement. The prism in effect, deflects light rays and cause those objects at one's side to appear in front of the person for easy viewing. This visual mobility aid is useful for those with severe constricted visual field caused by Retinitis Pigmentosa, Advanced Glaucoma, and less severe case like hemianoptic (half vision) field defects. Non - visual Aids and techniques Some low vision persons may have to use non- visual technique to supplement vision under some conditions such as absence of light, unfamiliar place or uneven terrain etc. Some of the non- visual aids and techniques are : 1. Sighted Guide A sighted guide technique allows the low vision person to travel comfortably with a companion. Person with peripheral field loss appreciate a sighted guide in poor lighting and a new situation. Older people are often more comfortable with sighted guide. 2. Long Cane The long cane, traditionally associated with blindness, can be used by persons with low vision. A person with night blindness who is able to get about easily during the day needs a cane in dim light or at night. A person with a limited visual field may more freely use residual vision for general orientation and a cane for obstacle and curbs detection.

149 Protective Arm Technique The protective arm technique is used to avoid injury to the upper and lower body. This technique is to be used if the person's acuity is insufficient for the occasional situation when no sighted guide or cane is available. Trailing Trailing is following a wall or other surface with the back of the hand. Trailing allows a person to remain in contact with physical guidelines to avoid becoming disoriented. Adaptations for optical visual functioning 1.

2. Illumination - the amount, direction and changes in lighting conditions are crucial for optimal visual functioning. 2. Wearing absorptive sun lenses which block ultra-violet and infra-red light rays significantly increases functional acuity. In addition it reduces the amount of time it takes to adjust from indoor to outdoor lighting and vice versa. 3. Wearing wide - brim hats or visors, or even using umbrella in the sun help to increase functional acuity and protect one's eye from glare. 4. When trying to discern an object, person or sign, position oneself in such a way that the sun comes from behind the person. Change angle of viewing to facilitate best position. 5. In dim light situations such as some rooms, restaurants and cinemas, use a portable light source such as a penlight or flashlight for spot checking. Appropriate sighted guide or cane techniques are also recommended in these situations where a person is rendered functionally blind. 6. Depth perception - judgement of presence of drop-offs such as curbs, steps and uneven terrain - is affected not only by the person's reduced visual acuity or fields, but by changes in lighting and contrast. 7. A cane is particularly helpful in these situations as it frees the persons in front of you is helpful especially if that person suddenly appears higher or lower in one's visual field or moves sharply to the right or left, indicating the presence of up and down steps, curbs or uneven terrain.

150 8. A broken shadow in one's line of path may be indicative of stairs. (E.g. the shadow of pole on a flight of stairs will appear as uneven and broken, not as a straight line.) Bumping into Obstacles If vision is always directed downward for safety purposes, using a cane allows freedom to scan more effectively and cover a wider path. Following the shoulder line of a person with distinctly contrasting or vivid colour clothing provides movement clues to avoid possible objects Learning to visually scan is a systematic search pattern as opposed to random, inefficient use of visual skills for visual cues in the environment. 5.7 Classroommanagement -

Seating arrangement, adjustable furniture, illumination, non-reflecting surfaces and colour contrast.

Low vision is a complex area within the field of visual impairments. Individuals with low vision can have very different amounts of vision and ways of seeing. Therefore, some environmental modifications are required. In case of low vision children extra care is required. Environmental modifications are used to improve the independent functioning of children with low vision. The environmental modifications should be provided within the environment where they will be, including home, community, and workplace. The low vision devices help the low vision children to use their vision more effectively. 5.7.1 Environmental Influences : A child with low vision may experience difficulty in acquiring concepts. Vision is an organizing sense that allows us to perceive objects at a distance and to make connections between these objects. Many concepts developed in childhood are learned incidentally through vision. If the visual sense is impaired, concepts may be incompletely developed or missed entirely. Because of this, it is important for children with low vision to directly experience as much of their world as possible and to receive augmented instruction in making connections between objects and processes.

151 5.7.2 Classroom Management (A) Lighting : Due to age- related changes in the cells of the lens and retina, most older adults require up to three times as much light as a 25 year old. Without adequate lighting, it may be difficult for an older adult to see doorsill in dim light or read the fine print on a medicine bottle. Unfortunately, many older adults, accustomed to conserving energy in the depression years, still live in minimally lit surroundings. Adding the correct type of lighting is one of the easiest and yet most powerful home changes we can make. Most of the products suggested below are available through local hardware, home remodeling centers or specialty stores. The simple addition of extra light fixtures or higher wattage bulbs, can make all the difference in a person's visual acuity. A 100 or 150 watt incandescent light, shining directly on the task at hand, may be appropriate for a reading lamp. More lighting is required in some cases i.e. Retinitis pigmentosa To increase the amount of overall lighting, a torchere, an upright which bounces light off the ceiling to other parts of the room, is an excellent solution. Until recently, torchere lamps were only manufactured with halogen bulbs which, due to the bulb's high temperature, posed serious fire risks. Today torchere lamps are available with colourcorrected fluorescent bulbs, a safer alternative to halogen. Reduce fumbling around in the dark during a power outage by installing a plug - in emergency light : the battery back - up unit turns on automatically during a blackout. If there is no light switch at the entrance to a room, add a wireless wall switch at the doorway. Use nightlights to light the pathway from the bedroom to the bathroom. In recreation and reading areas , provide plenty of floor lamps and table lamps. Advise people who are visually impaired that light should always be aimed at the work they are doing, not at the eyes. Place mirrors in such a way so that lighting doesn't reflect off them and create glare.

152 For window coverings, use adjustable blinds, sheer curtains or draperies, because they allow for the adjustment of natural light. Keep a few chairs near windows for reading or doing hand crafts in natural light. The light should come behind and to one side of the person. Dim or appropriate light is required in some cases i.e. Albinism (B) Seating Arrangement : The children can be placed in the middle of the front row. Not all low vision children prefer the front row. Children with tunnel vision will be comfortable when they sit little back and on the sides depending on the dominant eye. The children can sit where light comes more- near the window or door to use light. (C) Colour contrast: Colour, used as a visual identification system, can be a valuable tool in helping adults who have either low vision or difficulties with depth perception. Use strong colour contrasts to highlight where one surface begins and another ends : a dark wooden toilet seat against a white floor or a red plate against a white tablecloth are examples. Contrasting colours can be used for a wide range of household items and architectural features including doors, doorknobs, counters and tabletops, chair fabrics and bedspreads. Low- cost solutions include highlighting on/off controls with red nail polish and using glow- in - the - dark tape around the edge of tables and light switches. Place light objects against a dark background, a dark table near a white wall, for example, or a black switchplate on a white wall. Install doorknobs that contrast in colour with doors for easy location Paint the woodwork of the door frame a contrasting colour to make it easier to locate. Mark the edges of all steps and ramps with paint or tape of a highly contrasting colour.

153 (D) Furniture : Blackboard The blackboard should be cleaned regularly. Writing should be clear, large and uncluttered. White or yellow chalks provide the best contrast. Arrange furniture in small groupings so that people can converse easily. Make sure there is adequate lighting near furniture When purchasing new furniture, select upholstery with texture when possible. Texture provides tactile clues for identification. Avoid upholstery and floor covering with patterns. Stripes and checks can create confusion for people who are visually impaired. Use brightly coloured accessories, such as vases and lamps, to make furniture easier to locate. (E) Elimination of Hazards Remove electrical cords from pathways or tape down for safety. Do not have polished floors ; use nonskid, non glare products to clean and polish floors. Keep desk chairs and table chairs pushed in. Move large pieces of furniture out of the main traffic areas. (E) Hallways and Stairways In hallways , make sure that lighting is uniform throughout. Place drinking fountains and fire extinguishers along one wall only throughout hallways to allow individuals who are visually impaired to trail the other wall without encountering obstacles. Install grab bars or contrast tapes where they may be needed. Light stairways clearly

154 5.8 Let us Sum Up

Approximately 90% of individuals with visual impairments have functional low vision, just 10% are functionally blind. However, students with low vision are often an over looked

majority in the population of children who are visually impaired. Difficulties of students with low vision are often not as apparent as they are for students who are blind.

None the less,

students with low vision require direct instruction in literacy, visual efficiency, accessing the core curriculum, compensatory skills and more

there are many approaches for instructions. Teacher of students with visual impairment has a bigger role to play. They can beyond individualized education programme (IEP).

One of the principal concerns for students with low vision is their ability to access the visual environment.

Specific assistance is essential to negotiate such issues. Access to information is another important area where specific attention is required. Access to the core curriculum is the next issue which require specific. Providing optical device, preferential seating and handouts containing pertinent information are always helpful. In science subjects' hands on activities are very much useful and effective. Some specific interventions to achieve expanded core curriculum areas are very much significant; such areas may be

compensatory or functional academic skills, social interaction skills, independent living skill, recreation and leisure skill, career education

skills, use of assistive technology skills etc. All such issues and others aspects which are pertinent for teaching of children with low vision have been addressed here adequately. 5.9 Check your progress 1) Write down the importance of early identification and intervention programme for children with low vision. 2) Briefly explain the clinical evaluation of low vision using the equipment in Clinic. 3) Explain the procedure for screening of impaired vision with the commonly adapted test. 4) What is functional vision? How do you assess the visual skills? 5) Describe the method of selecting items/materials for the functional assessment

155 and enumerate the points to be borne in mind while administering the test. 6) What is visual stimulation? 7) Explain the role of teacher in managing the class with low vision children. 8) What is visual tracking? Explain with an example. 9) Write down the use of aspheric lens for vision training. 10) Describe the concept development of the Visually Impaired Child. 11) State a few modifications needed in the home environment to facilitate visual task of low vision child. 12) List the mobility aids and techniques used for effective movement of low vision persons. 13) What are the procedures followed to develop writing skills for low vision children. 14) Describe the procedures of selecting appropriate learning medium of low vision children

3 Netaji Subhas Open University From the Vice-Chancellor's Desk Dear Students, from this Academic Session (2015-17) the Curriculum and Course Structure of B. Ed.- Special Education have been thoroughly revised as per the stipulations which featured in the Memorandum of Understanding (MoU) between the Rehabilitation Council of India (RCI) and the National Council for Teacher Education (NCTE). The newly designed course structure and syllabus is comprehensive and futuristic has, therefore, been contextualized and adopted by NSOU from the present academic session, following the directives of the aforesaid national statutory authorities. Consequent upon the introduction of new syllabus the revision of Self Instructional Material (SIM) becomes imperative. The new syllabus was circulated by RCI for introduction in the month of June, 2015 while the new session begins in the month of July. So the difficulties of preparing the SIMs within such a short time can easily be understood. However, the School of Education of NSOU took up the challenge and put the best minds together in preparing SIM without compromising the standard and quality of such an academic package. It required many rigorous steps before printing and circulation of the entire academic package to our dear learners. Every intervening step was meticulously and methodically followed for ensuring quality in such a time bound manner. The SIMs are prepared by eminent subject experts and edited by the senior members of the faculty specializing in the discipline concerned. Printing of the SIMs has been done with utmost care and attention. Students are the primary beneficiaries of these materials so developed. Therefore, you must go through the contents seriously and take your queries, if any, to the Counselors during Personal Contact Programs (PCPs) for clarifications. In comparison to F2F mode, the onus is on the learners in the ODL mode. So please change your mind accordingly and shrug off your old mindset of teacher dependence and spoon feeding habits immediately.

I would further urge you to go for other Open Educational Resources (OERs) - available on websites, for better understanding and gaining comprehensive mastery over the subject. From this year NSOU is also providing ICT enabled support services to the students enrolled under this University. So, in addition to the printed SIMs, the e-contents are also provided to the students to facilitate the usage and ensure more flexibility at the user end. The other ICT based support systems will be there for the benefit of the learners. So please make the most of it and do your best in the examinations. However, any suggestion or constructive criticism regarding the SIMs and its improvement is welcome. I must acknowledge the contribution of all the content writers, editors and background minds at the SoE, NSOU for their respective efforts, expertise and hard work in producing the SIMs within a very short time. Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor, NSOU

9 Unit-1 q Introducing Educational

and Information Communication Technology Structure : 1.1. Introduction : 1.2. Objective : 1.3. Educational Technology– Concept, Importance & Scope 1.3.1 Concept of Educational Technology 1.3.2 Importance of Educational Technology 1.3.3 Scope of Educational Technology 1.4. Difference Between Educational Technology and Technology in Education 1.5. Special Significance and Goals of Technology for the Education of Children with Visual Impairment 1.5.1 Significance of Technology for the Education of Children with Visual Impairment 1.5.2 Goal of Technology for the Educational of Children with Visual Impairment 1.6. Information and Communication Technology (ICT)–Concept and Special Significance for Teaching–Learning of the Visually Impaired 1.6.1 Concept of ICT 1.6.2 Significance of ICT for Teaching-Learning of the Visually Impaired 1.7. ICT and the UN Convention on the Rights of Persons with Disabilities 1.8. Let Us Sum Up 1.9. Check Your Progress 1.10. References 1.1 Introduction Technology in the form of adaptive and assistive devices, plays a crucial role in the education of the visually impaired. This course brings into sharp focus the need and importance of such technology both for the practicing teachers and the visually

10 impaired learners. While highlighting the significance of addressing the users point of view/feedback and involving mainstream professionals in developing required technologies, the course also dwells upon how best students with visual impairment get access to the printed text/material. The course also acquaints the student-teachers with various devices for making the teaching-learning process for important school subjects meaningful, exciting and rewarding for all concerned. The educational needs of children with low vision and related technological perspectives are addressed, too, along with critical contributions of computer-aided learning and interventions. 1.2. Objective :

After the completion of the Unit, learners would be able to–

- Acquire knowledge

- about the Importance and Scope of Educational Technology.
- Differentiate between Educational Technology and Technology in Education.
- Understand the importance of Technology for the Education of children with Visual Impairment;
- Relate the Concept and Nature of Educational Technology and ICT to the Education of Children with Visual Impairment;
- Evaluate concepts of ICT on the basis of the UN Convention on the Rights of Persons with Disabilities.

1.3. Educational Technology–concept, importance & scope

Modern age is the age of science and technology. The world of today is very dynamic. The life of man in the primitive age was altogether different from his life in the

sputnik age. There have been tremendous changes in the life style of human beings which may be attributed to the contribution of science and technology, science has extended the frontiers of our knowledge in various ways and directions. Science is considered to be a blessing to the

mankind. Nothing better has happened than the advent of science in man's life. The contribution of science and technology has been experienced in almost all the spheres of human life including education.

Before understanding the meaning of educational technology, it is essential to know the meaning of technology. The word 'Technology' derived from Greek word (techniques) which means an art which is related with skill and dexterity.

11 1.3.1

Concept

of Educational Technology Education

technology cannot be taken as a synonym to audio-visual aids,

and technology in education emphasizes the concept of service, i.e. the use of different equipment, gadgets and mass media.

It must mean technology of education presenting itself as a system for bringing improvement in the total process of teaching-learning by carefully analyzing its problems and obtaining the optimum results. Educational technology cannot be viewed in terms of

its part of processes.

Instructional technology, teaching technology, behaviour technology, programmed learning, micro-teaching, system analysis, management of teaching-learning, teacher or pupil's behaviour, etc. are all its constituents and resources. ●

Definitions :

Educational Technology is the systematic application

of scientific knowledge about teaching-learning and condition of learning to improve the efficiency of teaching and training. (

Leith, 1967).

Educational Technology can be conceived as science of techniques and methods by which educational objectives could be realized. (

Mitra, 1968)

Educational Technology can be defined as the application of the laws as well as the

recent discoveries of science and technology to the process of education. (Kulkurni, 1969) Educational Technology is concerned with the application of modern skill and techniques to requirements of educational training. This includes facilitation of learning by manipulation of media and methods, and the control of environment is so far as this reflects on learning. (Unwin, 1969) Educational Technology is concerned with

problems

of education and training context and it is characterized by the disciplined and systematic approach to the organization of resources for learning. (

Davis, 1971)

Educational Technology is concerned with providing appropriately designed learning situations which, holding the view of objectives to teaching or training, brings to bear the best means of instruction. (Richmond, 1979) Educational Technology

has to be seen as a part of a persistence and complex endeavor of bringing pupils, teachers and technical means together in an effective way. (Ford Foundation Team, 1971)

These definitions initially encompass the whole range of educational technology activities from the analytic methods of psychology of learning and teaching the audio-visual communication and mass media technology. The view propagated by these definitions may help us

to

conclude about the meaning and nature of educational technology as follows :

12 • Educational technology is concerned with the systematic application of science and technology in the field of education and thus maybe defined as the application of technology to education in order to further the case of the latter.

- Just as science and technology help in carrying out the practical task in general, educational technology helps in providing efficiency to the task of teaching and learning.
- Educational technology provides technical guidance and solution to the problems of education.
- Teaching is communication and educational technology can play an effective role in the communication between teacher and student.
- Educational technology encompasses the total teaching and learning process involving the elements like the following :
 - ▶ Specification of goals and behavioral objectives.
 - ▶ Analysis of the characteristics of learner.
 - ▶ Selection and organization of the content or subject matter to be learned.
 - ▶ Methods and strategies of the presentation of the content.
 - ▶ Use of aid-materials, software and hardware, mass media and communication techniques.
 - ▶ Effective arrangement of learning situation and learning environment.
 - ▶ Effective classroom control and management.
 - ▶ Continuous feedback and evaluation of the result.
- Educational technology is not limited to the use of audio-visual and does not symbolize merely educational hardware such as sophisticated gadgets and mechanical devices used in education. For the effective management of the total teaching learning process it tends to utilize the results of all goods, experiments and researches in the field of human learning and the art of communication and employs a combination of all possible human and non-human resources to achieve the desired educational objectives. In brief, educational technology should stand for a wide application of the available human and non-human resources for providing appropriate solution to the educational problems and to improve the process and products of education. •

Characteristics

Of Educational Technology : Characteristics of Educational Technology

are as follows : •

It

is based on scientific and technological advancements.

13 • It is more a practical discipline and less a theoretical one. • It

is a fast growing modern discipline. •

It makes use of the research findings of psychology, sociology, engineering, sciences and social psychology etc. and applies the same to the field of education. • It

brings

pupils, teachers and technical means together in an effective way. •

It

is the science of techniques and methods. It locates the problems in the field of education, remedies them and ultimately aims at improving the education system. ●

It is bound to improve the teacher, the learner and the teaching learning process. ●

Nature of Educational Technology : ● The basis of educational technology is science. ●

Educational Technology studies the effect of science and technology upon education. In other words, science and technology are used under educational technology. Hence, it is the practical aspect of science. ●

Educational Technology is a continuous, dynamic, progressive and effect-producing method. ●

New conceptions are possible only due to educational technology such as programmed learning, micro-teaching, simulated teaching, interaction analysis, video-tape, tape-recorder, projector and computer, etc. ●

Educational Technology accepts schools as a system. In this system, the school-building, furniture and teachers act as input while various methods, techniques,

strategies and the

teaching and examination with the help of audio-visual aids function in

th from of a

process. Lastly, the output is in of form of ability of the pupils. ●

Audio-visual aids cannot be termed as educational technology. It is because its concern is only with the process-aspect of educational technology and not with the input and output

aspects. But if these A.V. aids are used to achieve educational objectives, then

it can be

put in the category of Educational Technology. ●

Programmed

Instruction is also different from Educational Technology. Its main causes are that the student learns himself during the programmed instructions. It does

not allow

interaction between pupil and teacher. Hence, it can be used only for limited objectives and limited subject-matter.

Therefore, programmed instruction is merely a part of educational technology. ● Engineering Technology is not the educational technology

because the engineering technology has manufactured radio, tape-recorder, video-tape and T.V., etc., which are used in teachers as audio--visual aids, but still engineering technology

14 is different from educational technology. In education, it is accepted as hardware approach only. ●

Educational Technology cannot solve each and every problem of education. It can be used successfully in teaching and instructional

system only. ●

Some people assume that educational technology will replace the teacher which will make the teacher unemployed one day. It is their mistake. Educational technology can never replace the teacher. It is because of three aspects of educational technology.

These are 1. Input, 2. Process and 3. Output. Input is the teacher's job and therefore, educational technology cannot snatch the place of a teacher. In spite of this, educational technology develops cognitive domain only and not the affective domain. Affective domain can only be developed when an interaction between teachers and pupils takes place. Hence, educational technology cannot replace the teacher. ●

Objectives of Educational Technology :

Educational technology,

in the capacity of technology of education, provides valuable help in the total teaching-learning process for achieving the possible results in an economic way through the available human and non-human resources. In this respect, the major objectives of education technology can be summarized as follow : Objectives at the Macro Level In view of the broad educational goals. i.e., the macro level,

the objectives of educational technology can be listed in the following way : ● To identify educational needs/aspiration of the community. ● To determine the aims of education,

broad strategies and structure of education. ● To develop a sustainable curriculum with interaction with science, at and human values. ● To identify man-material resources and strategies for achieving the stipulated aims of education. ● To develop certain models leading to improvement of the process of teaching and learning. ● To develop the appropriate aids and equipment to meet the educational purposes. ● To identify the major constraints in the environment and the ways and means to tackle those. ● To help in extending educational opportunities to the masses especially the neglected section of the community. ● To manage the whole educational system covering planning, implementation and the evaluation phases. Objectives at the Micro Level

15 In view of specific classroom teaching i.e., the micro level, the objectives of educational technology are as follows : ● To identify and analyze the characteristics and educational needs of the pupils. ● To determine the specific classroom objectives and state them in behavioural terms. ● To analyze the contents of instruction and organize it in proper sequence. ● To identify the available teaching-learning materials and resources. ● To identify the nature of the interaction of the sub-systems like students, teachers, teaching-learning materials, content of instruction and methodologies. ● To plan the teaching strategies and utilize the man-material resources for achieving specific classroom objectives.

Approaches of Educational Technology : Educational Technology or hardware approach This type of educational technology

has its origin in physical science and engineering and is based on the concept of service, i.e., using technology in education (Silverman 1968).

While teaching in a big hall, teacher uses a microphone for making his voice audible, he may be said to approach such type of education technology for making his teaching effective. Such type of mechanical and teaching revolution has almost mechanized the teaching-learning process. Almost all the materials and equipment of hardware approach originally belong in

areas other than education and are being borrowed and utilized for educational purposes. Educational Technology II. or Software approach

Psychology of learning provided solid technology for bringing the desirable behaviour changes in the students and thus serves the cause of education by laying down definite instructional procedure, teaching behaviour and behaviour modification devices.

The

second type of educational technology is

sometimes referred to as instructional technology, teaching technology or behavioural technology. This type of technology tries to adopt a process-oriented technique for production of suitable teaching learning material, teaching-learning strategies, and evaluating techniques for the optimum results in the process of teaching and learning.

Educational technology basically stands for the techniques of developing and utilizing software and, that is why, it is referred to as the software approach. The materials, such as programmed material and teaching-learning strategies based on psychology of learning are usually known as software and the equipment and gadgets are called hardware.

16 Distinction between hardware and software technologies :

Educational Technology

III. or System Approach This type of educational technology is related

to the concept of system engineering which owes its origin to computer science. It represents the latest concept in educational technology of education. This

systems approach takes education as a system having a set of inputs which are subjected to a process, design to produce certain outputs which are intended to meet the stipulated objectives of the system.

Thus, in system approach, one has to make a continuous comparison of the different roles played by man, machine and media in a system of education and develop an appropriate instructional design and strategy in relation to the stipulated objectives. 1.3.2 Importance of Educational Technology Keeping an eye over such broad concepts of educational technology, one is able to map out the areas of its operation in terms of topic or aspects covered through its study or application. In brief, they may be summarized

as below : ●

Analysis of the process of teaching and learning : Educational technology tries to discuss the concept of teaching, analysis of the teaching process, variable of the teaching, phases of teaching, levels of teaching, theories of teaching, principles and maxims of teaching, the concept of learning, relevance of the theories, the relationship between teaching and learning.

Hardware
technology

Hardware

technology has its origin in physical sciences and applied engineering. It is more concerned with the production and utilization of audio-visual aid material and sophisticated instruments, and mass media learning for

the

helping the teacher and learners in their task.

It tries to adopt product-oriented approach. What is produced through software technology in the shape of teaching-learning material and strategy gets utilized by the hardware instruments and gadgets for effective teaching-learning.

Software technology

Software technology has its origin in behavioural sciences and their applied aspects concerning psychology of learning.

It makes

use of psychology of learning for the production and utilization of software techniques and materials in terms of learning materials, teaching learning strategies, and other devices for smoothing the task of teaching learning. It tries to adopt process-oriented technique or approach for the production of teaching- learning material.

What is produced here is made available for beign used by the hardware appliances.

17 ●

Spelling out the educational goals or objectives : Educational technology tries

to discuss the topics such as identification of education needs and aspirations of the community, survey of the resources available for satisfaction of these needs. ●

Development of curriculum : This aspect of educational technology is concerned with the designing of a suitable curriculum for the achievement of the

stipulated objectives. ●

Development of teaching – learning material : This area of educational technology is concerned with the production and development of the suitable teaching-learning material in veiw of stipulated objectives, design curriculum and available resources. ●

Teaching

preparation or teaching – training : Teacher is a key figure in any process of teaching and learning. Educational technology, therefore, takes care of the proper preparations of teachers for exercising their complex responsibilities. ●

Development and selection of the teaching learning strategies and topics : This aspect deals with the central problems of teaching learning act. Here educational technology tires to describe the ways and discovering, selecting and developing suitable strategies and tactics of teaching. ●

Development, selection and use of appropriate auido visual aids:

Teching- learning is greatly influenced and benefited by the use of appropriate audio-visual aids. Educational technology covers this aspets by discussing various types of audio-visual used for educational purpose, their proper select suiting to a particular taching-learning situation. ●

Effective utilization of the bardware and mass media : Various sophisticated instrument, equipment, gadget and communication devices through mechanization ane electronics revolution playing

an

effective role in the attainment of educational objectives by helping the teachers and learners in their respective roles. ●

To work for the effective utilization of the subsystem of education : Educational technology considers education as a system operating, in a systematic and scientific way, for the achievement of educational objectives. ●

To provide essential feedback and control through evaluation: Educational technology is essentially concerened with the task of exercising appropriate control over the process of teaching and learning by planning and devising suitable tools and devices for the continuous evaluation of the process and products of the teaching-learning activities.

18

Thus, educational technology

is concerned with all variables, phases, levels, and aspects of the teaching-learning process. In brief, it works for overall planning and organization of the system or subsystem of education. In above discussion, an attempt has been made to identify the importance of the subject educational technology by mapping out its field of operation, but in true sense, it is unwise to put hedge and boundaries around such a developing and fast growing subject. 1.3.3

Scope of Educational Technology

Educational Technology is as wide as Education itself. Educational Technology implies the use of all educational resources—Men, Materials, Methods and Techniquis, Means and Media in an integrated and systematic manner for optimized learning. Educatioal

Technology is comprehensive. It is associated with all aspects of educative process-methods, teaching strategies, learning materials, handling of various euqipment etc. The following 4M's

are the major components of Educational Technology : ● Methods : It is concerned with the devices such as Programmed Learning Team Teaching, Micro Teaching and

Personalized System of Instruction in Teaching Learning situations. ● Materials : Instructional materials such as Programmed Text book the material of this type may be handwritten or printed. ● Media : The media used here are audio, or visual or audiovisual. A few examples are radio, tape recorder, charts, films, educational television etc. ● Man Power : Man power controls educational technology in every way. Educational Technology without man is zero.

The

technologies included in it are mentioned below : ● Behavioural Technology : Behavioural technology is the important component of Educational Technology. It puts emphasis on the use of psychological principles in learning and teaching so that the behaviour of the teacher and pupils may be modified in accordance with the teaching objectives. ●

Instructional Technology : Instrucitional Technology means a network of techniques or devices employed to accomplish certain defined set of learning objectives. Instructional technology implies the application of psychological, sociological and scientific principles and knowledge to instruction for achieving the specific objectives of learning. ● Teaching Technology : Teaching is the social and professional activity. It is a process of development. Teaching

is

a

system of actions which induce learning

19 through interpersonal relationship. Teaching technology is the application of philosophical, sociological and scientific knowledge to teaching. ● Instructional Design : In order to bring desired changes in the pupils' behaviour, the teaching

situatios, working tools and new approaches were considered important in addition to the learning principles. The composite form of all these is instructional design. ● Training Psychology : Training Psychology is an important method of teaching and learning. Its development resulted out of the research work carried out on the complicated training problems and situations. Training psychology

emphasizes that the whole training task should be divided into three parts. These are : Preparing outline of the task. Task analysis Putting the task in sequence. The main role of training psychology is in Teacher Education. ●

Cybernetic Psychology : It's part of training psychology. Cybernetic psychology accepts human beings as machine.

Cybernetic psychology emphasizes the fact that all the methods of feedback bring the desired changes by controlling the behaviour of the pupil. ● System Analysis : System Analysis is a problem solving process in which the

needs of

the management are diagnosed and by using an appropriate method for solving the problem, evaluation is carried out. If you consider

the working areas, Eductional Technology includes the following : Curriculum Construction,

Teaching-Learning Strategies, Audio-Visual materials, Determining Educational Objectives, Training the teachers,

Feedback, Hardware and Software etc. In short, the scope of Educational Technology extends to all resources (human and non-human) for the augmentation and development of education.

Thus Educational Technology has a wide scope.

Use and Significance of Educational Technology (in the Indian context) :

In India, before the 1960's the term educational technology was almost unknown to the educational system. It was used as synonym to audio-visual teaching aids. The role of educational technologist in India, today, is not merely that of an audio-visual aid master, hardware expert, media expert or programmed text writer, but of one who is concerned with the information of an overall design to carry out an evaluation of the total process of education in terms of specific objectives.

Educational technology, as we find it today, has a meaningful present and promising future in our country. Some of the significant development in this direction may be summarized as follows :

20 •

There has been a wider and more effective utilization of radio for broadcasting educational programmes throughout the country.

These well planned programmes are now broadcast throughout the country for both in-school and out-of-school groups. •

Another significant development in the use of educational technology is concerned with the development of television programmes. • The third important area where educational technology has been useful is the problem of training and re-training a large number of school teachers in an effective way. • Another application of educational technology is being used in our country relates to language instruction. • Another field of operation of educational technology in our country is concerned with the correspondence education. • Another use

of which education

technology is being put in our country is concerned with preparation, development and utilization of audio-visual material, and handling as well as maintenance of the hardware appliances and sophisticated gadgets. • In the latest trend, educational technology is providing its worth by utilizing the services of computers and advanced form of ICT technology in the field of education.

Thus educational technology has been providing its worth in our country by guiding, planning, implementing and evaluating various programmes of formal as well as non-

formal education. 1.4. Difference Between Educational Technology

and Technology in Education The term "technology in education" refers to the use of technological advancement such as various equipment, materials and machines for educational purpose.

It invokes the increasingly complex range

of

audio-visual equipment, hardware and sophisticated electronic devices like projectors, films, radio, television, tape recorder, recording machines, tele-text and computer aided instructions for individualized and group learning.

The term technology in education is thus a service concept like technology in the service of farming and

agriculture or science in the service of mankind.

In this sense, educational technology can provide its services to the teachers of the following grounds :

21 • For explaining the purpose and functions of different forms of appliances, equipment and audio-visuals materials and mass media. • For providing training

and

acquiring the material and handling the equipment to overcome their reluctance to use new media and materials. • For showing the relevance to the use of equipment and material in the context of individualized and group learning for achieving the goals of formal or non- formal education.

Educational Technology

The term "technology of education" or "educational technology" cannot limit itself to the role of service as confined in the case of technology in education. The term, technology of the education, does not represent something added or helped from outside as sounded in the case of technology in education. It signifies a system of technological

approach to the problems of education. Emphasizing on this point of view, T. K., Robinson (1976) writes". The strongest protagonist for educational technologies are not, however satisfied with a role limited to technology in education and the provision of audio-visual aids. They see themselves as crucially involved in the design and evaluation of systems of learning involving an understanding of the psychology of learning and communication and information theory to be used to establish a rational for a good teaching practice which uses a variety of media and modes and which enables the teachers to deploy his skills more effectively and apply them more widely. This is technology of education.

In view of the discussion carried out in the above pages, the following conclusion can be drawn about the concepts of educational technology : ●

Educational technology cannot be taken as a synonym to audio-visual aids, and technology in education emphasizes the concept of services, i.e. the use of different equipment, gadgets and mass media. ● Educational technology must mean technology of education presenting itself as a system for bringing improvement in the total process of teaching-learning by carefully analyzing its problems and obtaining the optimum results. ●

Educational technology cannot be viewed in terms of its part or processes. Instructional technology, teaching technology, behaviour technology, programmed learning, micro-teaching, system analysis, management of teaching-learning, teacher or pupils behaviour, etc.

are all its constituents and resources.

22 1.5.

Special Significance and Goals of

Technology for the Education of Children with Visual Impairment 1.5.1 Special Significance of

Technology for the Education of Children with Visual Impairment 1.5.2 Goals of Technology for the Education of Children with Visual Impairment

In order to guarantee equal opportunities to all students, the accessibility of ICT educational tools is worldwide considered a major issue. Nowadays, visually impaired students can take advantages of a large number of effective assistive technologies but, while using electronic material for learning purposes, they often encounter a number of different accessibility and usability problems. The variety of obstacles they may find on their way is quite large mainly because the term "visually impaired" encompasses a wide range of deficits,

ranging from blindness to a number of other multifaceted, although less severe, visual impairments.

The accessibility requirements for e-learning products established by the laws in force can be considered an important step onwards; further measures, nevertheless, are still needed to foster the actual "usability" of such products by sight impaired people.

The Charter of Fundamental Rights of the European Union [2000] states that : "Any discrimination based on any ground such as gender, race, colour, ethnic or social origin, genetic features, language, religion or belief, political or any other opinion, membership of a national minority, property, birth, disability, age or sexual orientation shall be prohibited." In the field of education, the basic concept of "Non-discrimination" entails the ability of all people to have "equal opportunity in education, regardless of their social class, ethnicity, background or physical disabilities" [Klironomos et al., 2005].

Students with disabilities have, then, the right to expect the same standard of education as their schoolmates and, in this view, they also have the right to access and use mainstream educational tools, including ICT based ones, which are generally referred to as "e- learning tools". Such tools are worldwide considered powerful tools to foster teaching [Hitchcock et al., 2003] but, at the same time, it is well known that, due to the widespread use of technological tools, "disadvantaged or excluded groups, including the unskilled, disabled and the elderly, face the danger of further marginalization [...]", in fact, "with the advent of the digital computer, and its broad penetration [...], disabled and elderly people face serious problems in accessing computing devices" [Stephanidis and Savidis, 2001] Anderson [2006] underlines that, in the field of education,

23 “while...technologies are beneficial and have been shown to help with educational tasks, their design and usability are an issue”. Students with disabilities may, in fact, face relevant difficulties both in “accessing and in “using” e-learning tools and, depending on the type of impairment, the types of obstacles encountered may vary considerably. In the following, the issue of the accessibility and usability of e-learning tools by visually impaired students is tackled, taking into account the fact that in almost all the developed countries they represent a significant part of the school population. In recent years, the World Health Organization [2004] has emphasized that “childhood blindness remains a significant problem, with an estimated 1.4 million blind children below age 1.5”, the problem appears even more relevant if we consider also the students with visual impairments other than blindness (the incidence of low vision being generally estimated three times greater than blindness). In the same report, in fact, it was found that, in 2002, there were 161 million (about 2.6% of the world population) visually impaired people in the world, of whom 124 million (about 2%) had low vision and 37 million (about 0.6%) were blind. Data of the World Health Organization seem to confirm, then, that sight impaired students are a relevant percentage of the overall population of the students with disabilities [Viisola, M., 1999]. Such students, in principle, could highly benefit from using ICT for educational purposes but they actually, despite the availability of a growing number of technology-enhanced and sophisticated assistive devices, face a number of accessibility problems [Burzagli et al., 2004]. The task of listing all such problems is not easy, mainly because students with visual disabilities are a highly heterogeneous category showing a wide range of different specific abilities, disabilities and needs; blind and low vision students, for instance, despite the fact that they are both often simply referred to as “visually impaired”, present very different visual problems, find different obstacles and ask for different kinds of help and support. What’s more, even the category of low vision students is a highly heterogeneous one : it encompasses a wide variety of different visual characteristics. In this perspective, the different instructional tools (those ICT based, as well as others), may meet or not to the needs of each single user, depending on her/his specific impairment. After a brief review of the e-learning tools that are widely used for educational purposes, examples are provided of some problems encountered by students with visual disabilities in accessing and using e-learning material. Such problems often result into obstacles for the effective use of the tools and may also have a negative influence on the overall learning process. In the end, a glance is taken to the accessibility requirements addressing the specific

24 needs of visually impaired people established by the Italian law in force, which directly recalls the Section 508 Rehabilitation Act 1. Different E-learning Tools for Different Visual Needs : While affording the choice of the e-learning tools to be used in concrete educational settings by visually impaired students, from one side, it is important to consider the nature, the specific features and the functionalities of the technological tools at hand; from the other side, it is necessary to take into account the actual, specific needs of the potential user/s (which are, of course, related to their impairments). To this end, in the following, an overview and a basic classification of the main tools used in the field of e-learning is proposed; subsequently, a quick look is taken to the different needs of the different categories of visually impaired students and to the main obstacles that they may encounter. • E-learning tools : Anohina, [2005] defines “e-learning” as a learning process that “takes place via any electronic medium”. In a global perspective, such a term refers, then, to any educational process making use of technological/electronic media and applications such as : “web-based teaching materials, hypermedia in general, multimedia CEFOMs, web sites, discussion boards, collaborative software, e-mail, wikis, computer aided assessment, educational animation, simulations, games, learning management software, etc...” [Wikipedia] in this view, the term “e-learning tools” encompasses at least those tools used for : □ Online learning : those educational resources made available through interconnected computer networks, comprising also synchronous and asynchronous communication tools, when used in an educational perspective. □ Computer-based learning : those learning materials locally available on the user’s PC and used when the computer is not connected to a network. □ M-learning : those educational tools made available through “mobile devices” such as palmtops (or handhelds), Personal Digital Assistants (PDAs), tablet PCs mobile or smart phones; such tools, may also take advantage of the connection to the net via “wireless transmission” [Hoppe et al, 2003]. The concept of “e-learning tool” is, then, linked both to the media (hardware devices) employed and to the programs (software applications) used to support the educational process. Such software applications can be roughly divided into : □ E-learning platforms : those internet-based environment expressly addressed to the delivery of integrated electronic educational contents and to the management of a variety of educational activities aimed at fulfilling specific

25 educational objectives 1 Section 508 of the Rehabilitation ACT Subpart C- Functional Performance Criteria § 1194.31) [Lin and Kuo, 2005]. All the digital contents made available by and through such platforms, are generally called "learning objects".

- Web based applications : those applications (both designed for educational purposes and used to fulfil educational objectives) which are directly accessible using any available browser and which don't need to be installed on the user PC.
- Stand-alone applications : those products (both "educational" and "used for education") which cannot be used directly via browser but that need to be installed locally, on the user machine; this category includes also products "downloadable" from the Web, but that still need to be installed on the computer.
- E-learning tools and the needs of visually impaired students : Examples of what kind of accessibility and usability problems can be found in the different categories of software applications are provided in the following, keeping aside, for the moment, all the possible problems linked to the use of computers in their standard configuration and of other specific hardware devices. While considering such obstacles, it is important to reflect on the fact that they are strictly related to the type of user impairment. Blind and low vision students encounter different types of obstacles : in order to fully access the contents, in fact, the first category needs necessarily to rely on screen readers, while the second category, thanks to optical aids and/or to specific customization options, may access a much wider variety of software applications, including, often, those with graphic interface. Other significant differences can be found among the needs of the different categories of low vision students due to the wide variety of their visual impairments [Dini et al, 2006].

1.6. Information and Communication Technology (ICT)-Concept and Special Significance for Teaching-Learning of the Visually Impaired

1.6.1 Concept of ICT

Information and Communication Technology (ICT) is an extended term for information technology (IT) which stresses the role of unified communications and the integration of telecommunications (telephone lines and wireless signals), computers as well as necessary enterprise software, middleware, storage, and audio-visual system, which enable users to access, store, transmit, and manipulate information. The term ICT is also used to refer to the convergence of audio-visual and telephone networks with computer networks through a single cabling or link system. There are large economic incentives (huge cost savings due to elimination of the telephone network) to merge the telephone network with the computer network system using a single unified system of cabling, signal distribution and management. However, ICT has no universal definition, as "the concepts, methods and applications involved in ICT are constantly evolving on an almost daily basis. The broadness of ICT covers any product that will store, retrieve, manipulate, transmit or receive information electronically in digital form, e.g. personal computers, digital television, email, robots. For clarity, Zippo provided an ICT hierarchy where all levels of the hierarchy "contain some degree of commonality in that they are related to technologies that facilitate the transfer of information and various types of electronically mediated communications". Skills Framework for the Information Age is one of many models for describing and managing competencies for ICT professional for the 21st century. The phrase information and communication technology has been used by academic researchers since the 1980s, and the abbreviation ICT became popular after it was used in a report to the UK government by Dennis Stevenson in 1997, and in the revised National Curriculum for England, Wales and Northern Ireland in 2000. But in 2012, the Royal Society recommended that ICT should no longer be used in British schools "as it has attracted too many negative connotations", and with effect from 2014 the National Curriculum uses the word computing, which reflects the addition of computer programming into the curriculum.

Information and Communication Technology can contribute to universal access to education, equity in education, the delivery of quality learning and teaching, teachers' professional development and more efficient education management, governance and administration. UNESCO takes a holistic and comprehensive approach in promoting ICT in education. Access, inclusion and quality are among the main challenges they can address. The Organization's Intersectoral Platform for ICT in education focuses on these issues through the joint work of three of its sectors : Communication & Information, Education and Science. In modern society ICT is ever-present, with over three billion people having access to the Internet. With approximately 8 out of 10 Internet users owning a smartphone, information and data are increasing by leaps and bounds. This rapid growth, especially

27 in developing countries, has led ICT to become a keystone of everyday life, in which life without some facet of technology renders most of clerical, work and routine tasks dysfunctional. The most recent authoritative data, released in 2014, shows "that Internet use continues to grow steadily, at 6.6% globally in 2014 (3.3% in developed countries, 8.7% in the developing world); the number of Internet users in developing countries has doubled in five years (2009-2014), with two thirds of all people online now living in the developing world". However, hurdles are still at large. "Of the 4.3 billion people not yet using the Internet, 90% live in developing countries. In the world's 42 Least Connected Countries (LCCs), which are home to 2.5 billion people, access to ICTs remains largely out of reach, particularly for these countries, with many developing countries dearth of any type of Internet. This also includes the availability of telephone lines, particularly the availability of cellular coverage, and other forms of electronic transmission of data. The latest "Measuring the Information Society Report" cautiously stated that the increase in the aforementioned cellular data coverage is ostensible, as "many users have multiple subscriptions, with global growth figures sometimes translating into little real improvement in the level of connectivity of those at the very bottom of the pyramid; an estimated 450 million people worldwide live in place which are still out of reach of mobile cellular service". Favourably, the gap between the access to the Internet and mobile coverage has decreased substantially in the last fifteen years, in which "2015 is the deadline for achievements of an UN Millennium Development Goals (MDGs), which global leaders agreed upon in the year 2000, and the new data show ICT progress and highlight remaining gaps." ICT continues to take on new form, with nanotechnology set to usher in a new wave of ICT electronics and gadgets. ICT newest editions into the modern electronic world include smart watches, such as the Apple Watch, smart wristbands such as the Nike + Fuel Band, and smart TVs such as Google TV. With desktops soon becoming part of a bygone era, and laptops becoming the preferred method of computing, ICT continues to insinuate and later itself in the ever-charging globe. Information communication technologies play a role in facilitating accelerated pluralism in new social movements today. The internet according to Bruce Bimber is "accelerating the process of issue group formation and action" and coined the term accelerated pluralism to explain this new phenomena. ICTs are tools for "enabling social movement leaders and empowering dictators" in effect promoting societal change. ICTs can be used to garner grassroots support for a cause due to the internet allowing for political discourse and direct interventions with state policy as well as change the way complaints from the populace are handled by governments.

28 1.6.2 Significance of ICT for Teaching-Learning of the Visually Impaired For many blind or partially sighted learners, information and communication technology (ICT) computers can enable access to the curriculum by providing alternative methods of reading and recording work. It is likely that pupil with visual impairments may need to use ICT across most of the curriculum and that they will be following the same curriculum as their peers. There is range of different ways in which ICT can provide support for these learners. These include : ♦ Tools to support communication ♦ Improve access to information ♦ Curriculum tool to develop concepts in subject areas ♦ A means of production of learning materials in alternative formats. Key to effective learning is assessment of a large of factors. This may involve input from a range of professionals in order to assess : ♦ The learners functional vision. ♦ Mobility needs ♦ Curriculum needs ♦ Whether it is appropriate to use ICT. The success in the information society demands computer literacy. It is more or less impossible to complete an education let alone get and maintain a position on the job market without IT skills. Likewise, the ability to utilise information technology is important in most other aspects of life. Consider email for correspondence, home- banking, access to public services, access to library services, e-commerce, access to traffic information, the ability to book theatre tickets-just to name a few examples. As such, information technology, computer literacy and information access is important to everyone in information society, the visually impaired not excluded. In fact, these competencies may be even more important to people with visual disability. To some extent, IT competencies may eventually resolve some of the issues of underemployment and unemployment amongst the visually disabled. Information technology offers a range of possibilities to the blind and partially sighted : The computer can be used as an intelligent interface between the visually impaired and the sighted; information that would otherwise be inaccessible or require manual processing to become accessible can be automatically transformed into formats better suited for the visually impaired; as technologies emerge and mature, technologies

29 that were used solely as enabling technologies in the past are becoming mainstream, thus affecting price as well as quality; and finally, the ability to establish a virtual framework through the use of computers, geography and physical location matters less, hence increasing the opportunities in terms of employment and education. At the same time, however, information technology and the ways in which the technology is deployed represent an equal range of challenges. Although the Internet- in theory-makes information available to anyone who can use a computer, poor web-design raises new barriers. Furthermore, the short learning curve combined with relatively inexpensive solutions based on speech synthesis may further erode basic skills such as Braille literacy. Visually impaired have been able to command the user interfaces of computers using screen readers, speech synthesis, Braille displays and screen magnification systems. Furthermore, the visually impaired have access to the vast majority of all business applications, personal productivity tools, office applications, email system and web-browsers. Using enabling technology in combination with general-purpose computer system, the blind and partially sighted have been able to transform information from formats aimed at the sighted into formats more suitable to meet the needs of the visually impaired. Enabling technologies for such automatics transformation include Braille translation system, screen magnification system and text-to-speech engines. Today, all information is produced electronically and is-at least in theory-available directly from the publisher. A number of issues still remain, especially in the areas of copyright and copy protection. In addition to information published in print, vast amounts of information are available directly on the Internet and on CD ROM and DVD. Finally, electronic books (or eBooks) are emerging in the mainstream market. A recent survey estimated that, by 2005, electronic books will account for as much as 10 percent of the total American market for published books.

1.7. ICT and the UN Convention on the Rights of Persons with Disabilities

The Convention on the Rights of Persons with Disabilities (CRPD)

is the first international human rights treaty to place an obligation on States Parties to focus on mechanism for monitoring-Article 33(2). The provision does not seek to replace international monitoring, however, but rather to complement the work

of the U.N. Committee on the Rights of Persons with Disabilities-

whose mandate and functioning are set out in Articles 3, 4, 34, 36 and 37 of the CRPD and in the Optional Protocol.

30 The report by the Global Initiative on Inclusive Information and Communication Technologies (G3ict) and Disabled People's International (DPI) is but one example of how voluntary monitoring can be effected. This third edition of the CRPD ICT Accessibility Progress Report covers 76 countries including 74 ratifying countries, South Sudan (formerly part of ratifying country-Sudan) and the United States as a benchmark country. Those 76 countries represent 72 percent of the world population and 81 percent of the total population of ratifying countries. This report offers disability advocates, governments, civil society and international organizations monitoring the progress of the implementation of the CRPD by States Parties, a unique benchmarking tool that collects data on country laws, policies, and programs pertaining to accessible and assistive information and Communication Technologies (ICTs) around the globe. Based on the findings from the 2010 and 2012 editions of the CRPD ICT Accessibility Progress Report, it was clear that digital accessibility is not merely about greater use of technology by persons with disabilities. It is about transforming information-based policies and the ICT ecosystem. Addressing the ICT arena is part of a larger effort to build an information society based on ensuring people's right to communicate, use knowledge for their own ends, and overcome barriers on freedom to use, share and modify ICTs and information content. This comports with the theme of this year's High-Level Meeting on Disability and Development of the General Assembly on the realization of the Millennium Development Goals and other internationally-agreed development goals for persons with disabilities. The 2010 and 2012 editions of the CRPD ICT Accessibility Progress Report described how a disability inclusive development agenda is possible only if the multiple actors in the ICT arena commit to work in coordination, cooperation and collaboration. Developing a shared vision of a world information society that contributes to human development based on agreed upon principles, including persons with disabilities' right to access information, is a long-term undertaking. Strategic wisdom needs to inform future action, particularly in the negotiation of the empowerment of persons with disabilities through ICTs. ICT policies and programs should be seen not as one-time interventions, or solely as check-offs to demonstrate compliance with global treaties, but as processes which promote learning and human development from trial and error, and create spaces for the engagement of different social groups. Civil society actors, including NGOs and DPOs need to build their own capacities, develop perspectives, lobby with government and business, participate in national and international ICT policy-making processes, and

31 build constituencies among a wide cross-section of society on the role of ICTs for the promotion of equity for persons with disabilities. In 2013, the two sets of surveys from the CRPE ICT Accessibility Progress Report (3rd edition) were filled out by 86 local correspondents in 76 countries. Data collection for the third edition of the Progress Report was completed in cooperation with Disabled People's International (DPI) and various disabled person's organizations and experts in countries where DPI correspondents were not available. Convention on the Right of Persons with Disabilities 2013 ICT Accessibility Progress Report Where do we stand on CRPD implementation and disability-inclusive development in 2013? The data and information in the chapters ahead reflect the : • Degree to which each of the dispositions of the CRPD on Assistive Technologies (ATs) and ICT is actually enacted by ratifying countries in local laws, policies and regulations and their actual impact. • Nature and type of disability inclusive practices used by ratifying countries in local policies and programs. The report concludes with a brief set of recommendations that CRPD ratifying countries, DPOs and NGOs, national, regional and international development agencies could take to ensure increased progress in CRPD implementation and digital accessibility. These three recommendations are to : • Provide a legal foundation for ICT accessibility and reasonable accommodation in the country legislation which then can support and legitimize specific policies and programs; • Promote disability-inclusive policies and programs identified as priority areas by key stakeholders; and • Address gaps in capacity building through disability-inclusive cooperative development practices. • Introduced to ICT Accessibility in the CRPD : The significance of ICT accessibility for persons with disabilities is best described by the language found in paragraph (v) of the Preamble

of the convention on the Rights of persons with Disabilities (CRPD), which recognize "the importance of accessibility to the physical, social, economic and cultural environment, to health and education and to information and communication, in enabling persons with disabilities to fully enjoy all human rights and fundamental freedoms".

32 While the Preamble clearly defines accessibility as an enabler for persons with disabilities to exercise their rights, Article 3(f) of the Convention also identifies accessibility as one of its eight "General Principles". Article 9 is dedicated to accessibility and stipulates : "

To enable persons with disabilities to live independently and participate fully in all aspects of life, States Parties shall take appropriate measures to ensure to persons with disabilities access, on an equal basis with others, to the physical environment, to transportation, to information and communications, including information and communication technologies and system, and to other facilities and services open or provided to the public, both urban and in rural areas". Furthermore, Article 2 describes reasonable accommodation and the lack thereof as discrimination. In the case of information and communication technologies, because many accessibility and assistive solutions are available and already implemented, it can be inferred that the CRPD dispositions on reasonable accommodation apply in most cases. For example, an inaccessible website may not allow persons with disabilities to obtain information or use a service on an equal basis with others. Yet, methods to create accessible websites are well documented and if implemented correctly, do not cost more nor constitute a disproportionate or undue burden. Therefore, while the CRPD does not define accessibility as large as a right, it carries language which establishes the accessibility of information and Communication Technologies ("ICTs") as an obligation of States Parties and society at large. The notion that discrimination occurs when an ICT based service is inaccessible is consistent with emerging jurisprudence in the United States and the United Kingdom : inaccessible websites or inaccessible ATMs for instance do constitute discrimination against persons with disabilities because equal access is not provided while it could. The obligation to provide accessible ICT based products and services and ensure equal access is also reflected in many advanced policies and programs launched or promoted by States Parties around the world. Examples of such programs include : • Captioning or signing of television programs (implemented to some extent by 71 percent of the countries); • Offering relay services for deaf and speech impaired users of telephony (implemented by 26 percent of the countries); • Implementation of computer-based Assistive Technologies in schools and universities (52 percent of the countries have some level of implementation); • Providing accessible government websites (implemented by 45 percent of the countries); and, • Accessible public electronic kiosks or ATMs deployed (implemented by 39 percent of the countries).

33 While the above list cannot be exhaustive in the context of this introduction, it confirms that State Parties have in some areas acknowledged and acted upon the obligation to provide equal access to information and communication technologies and services, setting benchmarks for what constitutes reasonable ICT accommodation for persons with disabilities. • Treaty Implementation and the G3ict CRPD ICT Accessibility Progress Report : The G3ict CRPD ICT Accessibility Progress Report (3rd edition) is uniquely suited to address key aspects of treaty implementation, as well as serving as a path finding framework for the U.N. to adopt or adapt within its disability-inclusive development agenda towards 2015 and beyond. The G3ict CRPD Progress Report identifies the degree to which each of the dispositions of the CRPD on accessible ICTs and Assistive Technologies is actually enacted in local laws, policies and regulations and their impact. It includes 57 data points relative to the status of ICT and AT accessibility for each country surveyed. Data is collected and presented within the following three clusters of data points : • State Party CRPD legal and programmatic commitments; • State Party capacity for implementation; • Assessment of the State's implementation and actual results for persons with disabilities. By drawing links between State's commitments and implementation/impact on persons with disabilities and comparing data from various countries including from other international information and research sources. 16 significant findings, benchmarks and recommendations may be derived from the G3ict CRPD ICT Accessibility Progress Report for policy makers, international institutions business and industry, nongovernmental organization, disabled person's organization, and others. Results may be used by ratifying countries in order to improve their compliance with the CRPD. For example, governments may use the results to improve the consultation and participation process of Non-Governmental Organizations (NGOs) to the development and implementation of legislation. Furthermore, States could use CRPD results to request targeted training and support from their Institutions of Higher Education (IHE). Those IHEs could provide training to government entities on critical ICT and AT issues in which the country was deemed to be out-of-compliance.

34 The data may also be used by international bodies as a baseline against which those bodies can estimate or judge, in part, the adequacy and focus of their own CRPD responsibilities and commitments. International organizations can use the data to foster international cooperation and monitor existing needs for ICT and AT accessibility in communities. Furthermore, and in keeping with the conceptual framework and capacity building approach for the U.N. human rights treaty body system, G3ict has standardized its global survey using a structure-process-outcome data collection strategy. Convention on the Rights of Persons with Disabilities 2013 ICT Accessibility Progress Report For example, U.N. agencies such as UNDP, UNESCO, ILO, ITU or WHO in their role of providing technical assistance may use the data to identify policies and programs required by the CRPD and determine how to best engage State Parties in the implementation of those policies. On a regional level, DPOs and NGOs can also use the data to gauge the lack of CRPD compliance by governments in order to raise the awareness of the challenges and opportunities of ICTs and ATs for persons with disabilities and facilitate the sharing of lessons learned, good practices, tools and products. Results could also help DPOs and NGOs to determine which actions need to be taken to facilitate the implementation of the CRPD. What further steps can CRPD ratifying countries, DPOs and NGOs, national, regional and international development agencies take to ensure increased progress in CRPD implementation and digital accessibility? G3ict offers the following three recommendations : (a) Establish a legal foundation for successful CRPD implementation (of the ICT and AT provisions of the CRPD) (b) Promote disability inclusive policies and programs identified in priority areas by key stakeholders; and (c) Address gaps in capacity building through the use of disability-inclusive cooperative development practices. 1.8. Let Us Sum Up It is absolutely essential for any person to take appropriate decision in life. Subsequently access to information becomes essential for leading a meaningful life. ICT have revolutionized the manner in which access to information is provided to the

35 citizen. Technology advancements have also permitted disabled persons reach out and gain access to information through the computer equipped with specific provisions. Traditionally ICT has been a great boon to the disabled persons, having providing them with reading aids, audio books and other communication methods. Technology can also be used to reach out to a large number of persons with disabilities who are currently deprived of any educational and vocational opportunities. At present, the technological innovations have made the mode of communication effective, and the process and dissemination of information faster and opened up large avenues for successful employment. The purpose of assistive technology is to enable persons with VI, HI, loco motor difficulties, MR, etc. to achieve greater participation, choice and self-reliance in roles and activities that are important to them. The success in the application of assistive technology has many parameters. Firstly, the persons with disabilities should know what types of adaptation in technology are available in the field. Secondly, he/she should know in what ways it would empower him/her in mainstreaming, and thirdly, the individual should also understand his/her own potential for the better use of the technology.

1.9. Check Your Progress 1. What do you mean by educational technology? 2. State the basic natures of educational technology? 3. Discuss the importance of educational technology? 4. What are the scopes of educational technology? 5. What do you mean by technology in education? 6. State the differences between educational technology and technology in education. 7. What do you mean by technology in education? 8. State the differences between educational technology and technology in education. 9. What do you mean by information and communication technology? 10. What is the significance of ICT for teaching learning of visually impaired Students? 11. What is UNCRPD? 12. Write a short note on ICT accessibility in the UNCRPD.

Advantages of Universal/ Inclusive Design 2.7.3 Limitations of Universal/ Inclusive Design 2.8 Let Us Sum Up 2.9 Check

Your Progress 2.10 References 2.1 Introduction This chapter describes the developmental efforts related to adaptive

technologies, which can be combined with other technologies and processes to form an adaptive system. The goal of an adaptive system, is to create an instructionally sound and flexible

38 environment that supports learning for students with a range of abilities, disabilities, interests, backgrounds, and other characteristics. After defining key terms and establishing a rationale for adaptation, we present a general framework to discuss about adaptive technologies. 2.2 Objective

After the completion of the Unit, learners will be able to - • Acquire

Information about the Concept and Purposes of Adaptive Technology; • Acquire Knowledge about the Basic

Considerations of the Adaptive Technologies; • Understand User's Perspective for the Development of Adaptive

Technologies; • Consider the Role of IIT's and the other Scientific Community to Promote Adaptive Technologies; •

Evaluate the Concepts of Universal/ Inclusive Design. 2.3 Adaptive Technology - Concept and Purposes

Adaptive Technology is a broad term often used to describe both the products and services for people with special needs. It enhances the vocation, recreation, education, and independence of the user.

Any item, piece of equipment, or product system, whether acquired commercially off the shelf,

modified, or customized, that is used to increase, maintain, or improve functional capabilities of individuals with disabilities.

The

next thing that comes to mind is the question of who, how, where and when does one require and should be entitled to adaptive/assistive technology as well as to what extent and at what cost should it be available?

Adaptive

Technology can provide equality between visually impaired individuals and their sighted peers within the emerging information society. With the aid of the appropriate technological devices, visually impaired persons can independently access, process, store and transmit the same information handled by sighted people. Both use computers to manipulate this information. The only difference lies in the form in which the information is displayed. The vast proportion of employment, education and daily living activities require access to electronic information. Technology can, in innumerable instances, assist individuals who are blind or visually impaired to become active participants in their societies.

There are essentially five methods of output that can render computers and printed materials accessible for individuals who are blind or visually impaired:

39 Screen Reader, Braille Printer, reading device, electronic Braille displays, and text magnification. 2.3.1 Concept of

Adaptive

Technology

The term adaptive technology is often used as the synonym for assistive technology; however, they are different terms.

Assistive technology refers to "

any item, piece of equipment, or product system, whether acquired commercially, modified, or customized, that is used to increase, maintain, or improve functional capabilities of individuals with disabilities",

while adaptive technology covers items that are specifically designed for persons with disabilities and would seldom be used by

non-disabled persons. In other words, "assistive technology is any object or system that

increases or maintains the capabilities of people with disabilities," while adaptive technology is "any object or system that is specifically designed for the purpose of increasing or maintaining the capabilities of people with disabilities." Consequently, adaptive technology is a subset of assistive technology.

Adaptive technology often refers specifically to electronic and information technology access.

Adaptive

technology is

any item, piece of equipment, software program, or product system

that is used to increase, maintain, or improve

the functional capabilities of

persons with disabilities. ●

It can be low-tech:

communication boards made of cardboard or fuzzy felt. ● It can be high-tech: special-purpose computers. ● It can be hardware: prosthetics, mounting systems, and positioning devices. ● It can be computer hardware: special switches, keyboards, and pointing devices. ● It can be computer software: screen readers and communication programs. ● It can be inclusive or specialized learning materials and curriculum aids. ● It can be specialized curricular software. ● It can be much more-electronic devices, wheelchairs, walkers, braces, educational software, power lifts, pencil holders, eye-gaze and head trackers, and much more. Adaptive technology helps people who have difficulty speaking, typing, writing, remembering, pointing, seeing, hearing, learning, walking, and many other things. Different disabilities require different assistive technologies.

40 2.3.2. Purpose of Adaptive Technology An adaptive system adjusts itself to suit particular learner characteristics and needs of the learner. Adaptive technologies help achieve this goal and are typically controlled by the computational devices, adapting content for different learners' needs and sometimes preferences. Information is usually maintained within a learner model (LM), which is a representation of the learner managed by an adaptive system. LMs provide the basis for deciding how to provide personalized content to a particular individual and may include cognitive as well as noncognitive information. LMs have been used in many areas, such as adaptive educational and training systems (e.g., intelligent tutoring systems), help systems, and recommender systems. Adaptive systems may consist of hard or soft technologies (e.g., devices vs. algorithms). Hard technologies are devices that may be used in adaptive systems to capture learner information (e.g., eye-tracking devices) and thus can be used to detect and classify learners' performance data or affective states such as confusion, frustration, excitement, and boredom. Hard technologies also can be used to present content in different formats (e.g., tactile tablet to accommodate visual disabilities). Soft technologies represent algorithms, programs, or environments that broaden the types of interaction between students and computers. For instance, an adaptive algorithm may be employed in a program that selects an assessment task or learning object most appropriate for a learner at a particular point in time. The effectiveness of adaptive technologies hinges on accurate and informative student or learner models. For the remainder of this paper we use the terms student model (SM) and learner model (LM) interchangeably. Because this focuses on the educational functions of adaptive systems, we limit our modeling discussion to the context of students or learners, rather than more broadly defined users. Four-Process Adaptive Cycle is the success of any adaptive technology to promote learning requires accurate diagnosis of learner characteristics (e.g., knowledge, skill, motivation, persistence). The collection of learner information then can be used as the basis for the prescription of optimal content, such as hints, explanations, hypertext links, practice problems, encouragement, metacognitive support, and so forth. Our framework involves a four-process cycle connecting the learner to appropriate educational materials and resources (e.g., other learners, learning objects, applications, and pedagogical agents) through the use of a LM . The components of this four-process cycle are (a) capture, (b) analyze, 41 (c) select, and (d) present. Capture - The capture process entails gathering personal information about the learner as he or she interacts with the environment, depicted by the larger human figure. Relevant information can include cognitive as well as noncognitive aspects of the learner. This information is used to update internal models maintained by the system. Analyze - The analyze process requires the creation and maintenance of a model of the learner in relation to the domain, typically representing information in terms of inferences on current states. This is depicted as the smaller human figure (i.e., the SM). Select - Information (i.e., content in the broadest sense) is selected according to the model of the learner maintained by the system and the goals of the system (e.g., next learning object or test item). This process is often required to determine how and when to intervene. Four-process adaptive cycle. Present - Based on results from the select process, specific content is presented to the learner. This entails appropriate use of different media, devices, and technologies

42 efficiently to convey information to the learner. This model accommodates alternative scenarios. It describes some of these scenarios that involve different types of adaptation, starting with a completely adaptive cycle and continuing to a nonadaptive presentation. 2.4 Basic Consideration - Access, Affordability and Availability Before we begin our discussion on adaptive technologies that support learners in educational settings, we briefly define relevant terms. Most generally, to adapt means an adjustment from one situation or condition to another (e.g., software programs and persons are capable of adaptation). Technology refers to the application of science (methods or materials, such as electronic or digital products or systems) to achieve a particular objective, like the enhancement of learning. A system in this context refers to a network of related computer software, hardware, and data transmission devices. 2.4.1 Access as the Basic

Consideration of Adaptive Technologies Accessibility and usability of adaptive technology are closely related. Their goals, approaches, and guidelines overlap significantly. In most situations, such as when designing and developing websites and applications or other uses of technologies, it is most effective to address them together. There are a few situations when it is important to focus specifically on one aspect, such as when addressing discrimination against people with disabilities and when defining specific accessibility standards. Accessibility Accessibility addresses discriminatory aspects related to equivalent user experience for people with disabilities, including people with age-related impairments. Accessibility means that

people with disabilities can perceive, understand, navigate, and interact with technologies, and that they can contribute equally without barriers. Usability Usability and user experience design is about designing products to be effective, efficient, and satisfying. Specifically,

ISO defines usability as

the "extent to which a product can be used by specified users to achieve specified goals effectively, efficiently and with satisfaction in a specified context of use" (in ISO 9241-11). Inclusion Inclusive design, universal design, and design for all involves designing products, such as websites,

to be usable by everyone to the greatest extent possible, without the need for adaptation.

Inclusion addresses a broad range of issues including access to and quality of hardware, software, and Internet connectivity; computer literacy and skills; economic situation; education; geographic location; and language - as well as age and disability. Accessibility and Usability While accessibility focuses on people with disabilities, many accessibility requirements also improve usability for everyone. Accessibility especially benefits people without disabilities who are in limiting situations, such as using the web on a mobile phone when visual attention is elsewhere, in bright sunlight, in a dark room, in a quiet environment, in a noisy environment, and in an emergency. Accessibility includes both:

- Requirements that are more specific to people with disabilities - for example, they ensure that websites work well with assistive technologies such as screen readers that read aloud web pages, screen magnifiers that enlarge web pages, and voice recognition software that is used to input text. Most of these requirements are technical and relate to the underlying code rather than to the visual appearance.
- Requirements that are also general usability principles - which are included in accessibility requirements because they can be significant barriers to people with disabilities. For example, a website that is developed so that it can be used without a mouse is good usability; and use without a mouse is an accessibility requirement because people with some physical and visual disabilities cannot use a mouse at all. In defining accessibility requirements, care is usually taken to not include aspects that impact all people similarly, and only include aspects that put person with a disability is at a disadvantage relative to a person without a disability. Usability and user experience design significantly overlap with accessibility when "specified users" includes people with a range of disabilities and "specified context of use" includes accessibility considerations such as assistive technologies. However, the needs of people with disabilities are often not sufficiently addressed in usability practice and research. Additionally, accessibility includes a technical aspect that is usually not a focus of usability. In practice, basic accessibility is a prerequisite for usability. Accessibility and Inclusive Design Several accessibility requirements also benefit people and situations that are a focus of inclusive design. For example, Web Accessibility Benefits People With and Without Disabilities describes accessibility benefits to:

- people with low literacy or not fluent in the language
- people with low bandwidth connections or using older technologies
- new and infrequent users

However, accessibility focuses on disability and does not try to address broader issues. Other efforts, such as internationalization, address other inclusion issues. While people with disabilities are generally included in the scope of inclusive design, it is important to also maintain a specific focus on people with disabilities through accessibility so that the needs of people with disabilities are not diluted or overshadowed in the broader scope of inclusion. Keeping accessibility focused on disabilities encourages research and development on the specific needs of people with disabilities, and solutions that are optimized for these specific needs. Accessible

Design The goal of web accessibility is to make the web work well for people with disabilities. Accessible design has both a technical component and a user interface component. There are guidelines, standards, and techniques, such as the Web Content Accessibility Guidelines (WCAG), which is the international standard ISO/IEC 40500. If designers, developers, and project managers approach accessibility as a checklist of meeting accessibility standards, the focus is only on the technical aspects of accessibility, and the human interaction aspect is often lost. Combining accessibility standards and usability processes with real people ensures that web design is technically and functionally usable by people with disabilities. This is referred to as usable accessibility or accessible user experience. Usable Accessibility Web designers and developers can use usability processes, methods, and techniques, such as user-centered design (UCD) process and user experience design, to address the user interface component of accessibility. While the considerations of people with disabilities are not always included in common practices, they can be easily integrated into existing usability processes, methods, and techniques. Key aspects incorporating real people in design, including:

45 • Ensuring that everyone involved in web projects understands the basics of how people with disabilities use the Web, • Involving users with disabilities early and throughout the design process, and • Involving users in evaluating web accessibility. Accessibility standards also have an important role in accessible design. For example, understanding the basic Accessibility Principles and using the guidelines for developing early prototypes helps the development team provide basic accessibility so that when users do evaluations, they are able to use the prototype enough to provide useful feedback. Usability processes and user involvement alone cannot address all accessibility issues. Even large projects cannot cover the diversity of disabilities, adaptive strategies, and assistive technologies. Accessibility guidelines, standards, and techniques ensure that the wide range of issues are adequately covered. Accessibility practitioners and researchers can incorporate usability techniques to improve 'usable accessibility'. User experience designers and researchers can incorporate accessibility to make their designs work better for more people in more situations. Addressing accessibility, usability, and inclusion together can more effectively lead to a more accessible, usable, and inclusive web for everyone. Resources to help are linked throughout this page. The role of accessibility in a universal web is a related resource that: • provides a more in-depth exploration of the importance and benefits of accessibility as a distinct discipline continuing to focus on people with disabilities, • encourages increased communication and coordination between accessibility, usability, and inclusion research and practice in the design and development of guidelines, websites, browsers, assistive technologies, and other web tools. One of the largest problems that affect people with disabilities is discomfort with prostheses. An experiment performed in Massachusetts utilized 20 people with various sensors attached to their arms. The subjects tried different arm exercises, and the sensors recorded their movements. All of the data helped engineers develop new engineering concepts for prosthetics. Assistive and adaptive technology may attempt to improve the ergonomics of the devices themselves such as Dvorak and other alternative keyboard layouts, which offer

46 more ergonomic layouts of the keys. Assistive technology devices have been created to enable people with disabilities to use modern touch screen mobile computers such as the iPad, iPhone and iPod touch. The Pererro is a plug and play adapter for iOS devices which uses the built in Apple VoiceOver feature in combination with a basic switch. This brings touch screen technology to those who were previously unable to use it. Apple, with the release of iOS 7 had introduced the ability to navigate apps using switch control. Switch access could be activated either through an external bluetooth connected switch, single touch of the screen, or use of right and left head turns using the device's camera. Additional accessibility features include the use of Assistive Touch which allows a user to access multi-touch gestures through pre-programmed onscreen buttons. For users with physical disabilities a large variety of switches are available and customizable to the user's needs varying in size, shape, or amount of pressure required for activation. Switch access may be placed near any area of the body which has consistent and reliable mobility and less subject to fatigue. Common sites include the hands, head, and feet. Eye gaze and head mouse systems can also be used as an alternative mouse navigation. A user may utilize single or multiple switch sites and the process often involves a scanning through items on a screen and activating the switch once the desired object is highlighted. 2.4.2 Affordability as the Basic Consideration of Adaptive Technologies

Students with visual impairment face unique challenges in the educational environment. Not only must they be able to access text information across all curricular areas, but they also need to be able to participate fully in instruction that is often rich with visual content. Adaptive technology is one way of supporting them in that process. "

Adaptive

technology" refers to a range of tools, devices, and strategies that allow a student to accomplish a task that they would otherwise be unable to do, or would have difficulty accomplishing effectively. Adaptive technology can be simple or complex. Examples of low tech tools for students with visual impairment might include enlarged text or raised line paper, while high tech tools may encompass digital tools that "read" to the student, connect to a braille display, or even incorporate GPS. The term "visual impairment" describes a broad range of visual abilities and needs. Because each child is unique, what works well for one student may not work well for another. Selection of adaptive technology should be the result of a team process that takes into consideration feedback from family, educators, paraprofessionals, and the 47 student. It is important to remember that "high-tech" is not always the best solution for a student. Selected tools should reflect the student's unique strengths and needs, the activities he needs to be able to accomplish, and the environment in which he will be working. A student's need for assistive technology will likely change and evolve throughout his or her education, and in most cases, no single tool will meet all of a student's needs.

The purpose of this resource guide is to provide an introduction to the types of adaptive technology that may benefit students with visual impairment. Specific products and their features are not described here. Instead, a general overview of tools will help raise your awareness so that you are able to determine what tools to investigate further. A list of additional resources and vendors is provided at the end of this guide if you'd like to learn more. There is also a glossary of terms if you are unfamiliar with some of the terminology related to adaptive technology and visual impairment.

2.4.3 Availability as the Basic Consideration of Adaptive Technologies
Technology for Reading Reading is not only an essential part of the English Language Arts curriculum, but is also a key component of all other subject areas. Students rely on textbooks in science and social studies, complete word problems in math, and complete assessments that are often text-based.

Assistive technology tools

to support reading should reflect the student's level of visual functioning, their literacy development, as well as the environmental and task demands.

Environmental Considerations consider lighting and positioning of materials

for optimal visual function. For students with some existing visual function, providing text information in enlarged format may be the simplest strategy. As a general rule

of thumb, 18

point or 24 point font size is good, but enlarging beyond that may not be efficient. Enlarged text can be acquired through a variety of sources, including publishers and vendors, or materials modified through the magnification feature of copy machines, while text size of most digital materials can be easily adjusted to a user's preference. Handheld Magnifiers :

These

handheld magnifiers low-tech, portable tools allow students with some vision to access not only text, but other objects in their environment as well. They are available in a range of magnification power, are relatively inexpensive, and eliminate some material modification. However,

selection of

magnification power

48 should be based on the recommendations of a low vision specialist. A video magnifier can be used

for other objects as well. It may be in the form of

handheld device, a stand- alone device, or work with a computer, TV or projection system. Braille

for students who requires so : Braille is an essential tool for teaching literacy skills

and will serve as a lifelong skill. Learning Braille allows students to

experience

aspects of written language such as spelling, grammar and sentence structure, and will provide a valuable foundation for written language. Braille products can be obtained commercially or

can be created using

specialized software and a braille embosser. Braille Labelling items throughout the student's environment will not only reinforce vocabulary, spelling and reading but will also promote independence and assist with orientation. Audio books are generally recorded using human voice, and can be accessed

through the use of specialized computer software, devices, or mainstream tools like MP3 players. The various devices allow options in

features such as searching and navigating an audio file. While many students will find

the use of

audio books useful, educators warn not to rely solely on audio books for access

to

text. Students who are still developing literacy skills need continued access to print or braille,

while preferences of

older students vary. The use of digital text provides one of the widest ranges of options

to students with varying needs. Visual aspects of documents

and text can be customized, a variety of supports can be easily integrated, and digital text can be obtained through numerous resources. Digital text materials can be obtained commercially, through

providers of

accessible instructional materials, or created by instructors and students themselves, and can be accessed through a variety of tools including computers, mobile devices, or specialized devices such as braille notetakers. 1. Digital text generally allows user to adjust the visual display including font size, color, and contrast. 2. Digital text can be viewed on an enlarged monitor. 3. Computer magnification software can be used to view digital text, and can be customized by magnification level, area

of the display being magnified, and visual qualities of display. 4.

Text-to-speech software allows the computer to "read" digital text to the student in a digitized voice. Some programs will

highlight words as they are read, allowing students to follow along.

49 5. Refreshable braille displays can be connected to the digital text source, providing students

with the option to read the text tactually. 6. Scanners with optical character recognition (OCR) can be used to create digital text that

can then be used with any of the above tools. OCR scanners can be handheld or freestanding.

Technology for

Writing Writing Tools: Using bold felt-tip markers or soft lead pencils can provide greater contrast

on paper, allowing students with low vision to read with greater ease. Adaptive Paper: Specialized paper with darkened lines, raised lines, or using colour can significantly improve the writing of students with low vision. A slate and stylus can be equated to paper and pencil for individuals who are blind. This simple low tech tool allows students to quickly and efficiently complete simple tasks like creating labels or writing notes to themselves. The slate and stylus is not practical for longer writing tasks. A handheld digital recorder allows the student to record lectures, dictate assignments, or make notes to self.

Writing with traditional paper and pencil under a video magnification camera allows the student to view their work in real time

through the use of

a large monitor. Word processors are readily available and are highly adaptable. Text size and font can be customized or built-in operating system accessibility features can be used

to enhance the visual display. The use of adaptive keyboards with high contrast or enlarged keys can also be utilized.

Text-to-speech software can create a "talking word processor"

which provides feedback to

the student about what they have typed, while speech recognition software allows the student to dictate into a microphone, which the computer translates into text. Screen magnification software can enlarge the entire display or only selected portions and may or may not provide audio feedback. For students with no vision, a refreshable braille display can be used in conjunction with

the word processor, which will

display the text tactually allowing the student to reread and edit their own work. This strategy can be used with or without audio feedback,

which supports multisensory learners and allows the student to choose the

access method. The incorporation of braille has the potential to significantly improve the editing process.

50 A manual braillewriter is similar to a typewriter and is a simple, yet rugged device that is often introduced to students who are emergent readers and writers. As students progress, they may transition to an electronic braillewriter before beginning to use a

braille notetaker. A braille notetaker is a portable word processing device that utilizes the eight key braille input system and has

an integrated refreshable braille display. This tool encompasses many functional areas in addition to writing. Students can use a braille notetaker to complete assignments, read textbooks, and navigate the Internet. Although products and their features vary, many are available with speech output, Wi-Fi connectivity, access to e-mail, calculators, calendars and other personal organizational tools, or GPS navigation systems. The braille notetaker is a lifelong tool

and

should be introduced as soon as the student demonstrates readiness. A braille embosser

allows the student to print out their completed work in braille format.

Technology for Computer Access Skills and competence in computer use are essential to every student in the 21st century, and will significantly increase a student's success in their pursuit of higher education, vocation and independent living after graduating from high school. Instruction in basic keyboarding and word processing skills should begin early. As students grow older, use of social media tools should also be explicitly taught as key to participation and inclusion in higher education, many vocational settings, and society in general.

Adaptive Hardware - Hardware such as enlarged, large print or high contrast keyboards, as well as enlarged monitors may provide adequate supports to students with low vision, allowing them to use the computer independently.

Operating System - Accessibility Whether using a Mac, PC, desktop or mobile device, all operating systems have built-in accessibility features that may make the device easier to use. These include changes to visual display (i.e. high contrast, colour scheme, font size), enlarged icons, screen magnification, enlarging the cursor or pointer, or a built-in screen reader.

Specialized Accessibility Software - When built-in accessibility features do not provide adequate support, specialized software can be used to create a highly customized computer environment. This may include features such as text-to-speech feedback with and without text highlighting, the ability to customize what is magnified on the screen, greater customization of visual displays, voice navigation, and advanced screen reading features.

Refreshable Braille Display - A refreshable braille display can be used as a peripheral device with a desktop, laptop or mobile computing device, providing braille translation of documents, websites, and other text information.

In conclusion, we can say that to ensure that adaptive technologies enhance users' quality of life, future emphases should focus on consumer involvement in the selection and evaluation of appropriate assistive technology, and ways to make technologies more widely available and affordable.

2.5 Addressing User's Perspective in Developing Adaptive Technologies

Technology-particularly multimedia and ubiquitous computing-can help to enrich life, enhance productivity and promote independent living for people across the entire spectrum of abilities. People with visual impairment rely heavily on their sense of hearing. If an adaptive device provides auditory feedback, it could drown out important situational information. In the case of missed conversation, this would be inconvenient. In a situation like a traffic crossing, it would be hazardous. As a result, developing a wearable device that uses tactile cues such as pattern of vibrations to convey information. Truly revolutionary technologies require engagement with users throughout the design and development process. While it's helpful to get feedback and ideas from focus groups on users' needs, short sessions don't give a full understanding of the challenges and opportunities in developing adaptive technology solutions. It is imperative that people with disabilities play a leading role in envisioning, conceptualizing, developing, implementing, deploying, testing, and validating potential solutions, tools, and technologies.

David Hayden was a freshman double-majoring in math and computer science, and he also was visually impaired. Even sitting at the front of the class couldn't get him the access to the board to understand the process being enumerated in solving math problems or designing an algorithm by his professors. In his sophomore year, he began working at the CUbiC lab, developing an application on a tablet connected to a camera with a pan-tilt-zoom feature. He could take the device to his classes and have the video of the blackboard piped into his laptop. Then he did something even more clever-he split the screen into two halves. One side of the screen

52 showed the video of the blackboard while the other was used to design a "notes" interface. He linked sections of the class notes to individual frames from the video. David took the prototype to the classroom and shared it with other visually impaired students for obtaining their feedback, which he then used to further improve the device. At the end of his junior year, he submitted his invention to the worldwide Microsoft Imagine Cup competition in the "touch and tablet" category. He won both the national and world competitions in that category. After graduation, David received an internship opportunity at NASA and is now pursuing a Ph.D. at MIT. He's also manufacturing his Note-Taker prototype for use by others. Once visually impaired students started using Note-Taker in classrooms, something truly remarkable happened. Sighted students began asking for the technology for their own use. This is not actually uncommon among well-designed adaptive devices. For example, the first commercially successful typewriter, the Hansen Writing Ball, was designed to help blind people write through touch-typing. The QWERTY keyboards we use with our computers today are descendants of this accessibility tool. In reality, we are all looking for ways to enhance our abilities. For instance, a soldier on the battlefield needs better access to information at night or in stressful environments. One could argue that blindness is not only a disability but a concept. We are all blind from a touch perspective to distant environments like exploring the surface of Mars. Assistive technologies have the power to transcend our limitations and enrich our lives. There are the components of user's perspective: PURPOSE: The purpose of this work was to contribute to a better understanding of challenges and solutions to equitable provision of assistive technologies in resource limited environments by (i) describing sources of awareness, types of providers and costs of adaptive technologies; (ii) describing common reasons for not possessing adaptive technologies; and (iii) comparing these sources, providers, costs and reasons among younger and older men and women living in urban and rural settings. RESULTS:

Major sources of awareness, types of providers and costs paid varied between users of different types of adaptive technology. Lack of affordability was the main reason for not possessing adaptive technology. Outcome differences were found between younger and older groups, men and women, and literate and illiterate respondents, while no differences related to place of living were identified. Age, gender, type of impairment and socioeconomic status need to be considered when planning and implementing equitable provision of assistive technologies. Implications for Rehabilitation Provision of assistive technologies needs to be made affordable as lack of affordability was the major reason for not possessing such technologies. To ensure equitable provision of assistive technology, services ought to consider age, gender, impairment and socioeconomic status of their target groups. This includes offering a range of products of different sizes provided by culturally appropriate personnel at affordable cost, which to many may be at no or reduced cost. To cater to the assistive technology needs among the most vulnerable groups, assistive technology providers may learn from CBR strategies, such as, awareness raising and service delivery at community level, the use of local resources, collaboration and coordination, and the consideration of cultural factors. 2.6 Role of IIT's and the Scientific Community 2.6.1 Role of IIT's in Developing Adaptive Technologies The Indian Institutes of Technology play a vital role in India's social and economic development. IITs are apex institutions for engineering education and research. At present, there are twenty three Indian Institutes of Technology (IITs) viz. at Bombay, Delhi, Kanpur, Kharagpur, Madras, Guwahati, Roorkee, Hyderabad, Patna, Bhubaneswar, Ropar, Jodhpur, Gandhinagar, Indore, Mandi, Varanasi, Tiruppati, Palakkad, Goa, Jammu, Dharwad, and Bhilai. All are governed by The Institutes of Technology Act, 1961 which has declared them as "Institutions of national importance", and lays down their powers, duties, framework for governance etc. The main objective of IITs is to impart world class education in engineering and technology; to conduct research in the relevant fields, and to further advancement of learning and dissemination of knowledge, to develop, apply and transfer the required concepts and skills to solve problems and to design and develop technology-enhanced learning systems to promote students' pan-domain thinking skills. It deals with engineering and science domains, using disciplinary content as a vehicle to develop the relevant thinking skills. These Institutes are also contributing significantly to education and research in basic sciences and humanities.

54 The Goals and Objectives were derived from the Sarkar Committee Report and embodied in the IIT Act. In addition to the Sarkar Committee report, the IIT act and the Statutes of the IITs indicate the lines along which IITs should develop. According to these documents IITs are expected: • to be higher technical institutions and research in some branches of Engineering; • to provide for instruction and research in some branches of Engineering and Technology, Science and Arts for the advancement of learning and dissemination of knowledge in specific branches. • to ensure the advancement of knowledge through education and research, in both Pure and Applied Science, in engineering, Social science and Humanities; • to serve the community and nation (which are referred to as Extension activity) through the use of their resources both intellectual and material, particularly through Continuing Education for professionals working in Industry. The Science Policy Resolution (SPR) of the Government of India (1958) is a basic document of relevance to the IITs. The SPR resolves: • to foster, promote and sustain scientific research in all aspects - pure, applied and educational; • to ensure adequate supply of research scientists of higher quality; • to recognize the work of research scientists as an important component of the strength of the nation; • to encourage programmes for the training of scientific and technical personnel to fulfill the country's needs in science and education, agriculture and industry, and defense; • to encourage dissemination and discovery of knowledge in an atmosphere of scientific freedom. IITs also constitute a major source for research scientists of high caliber; they also are expected to serve the people of India and provide the country with benefits of application of their discovery and knowledge and as such are entitled to academic freedom and research support as implied in the SPR. Much in the same manner as IITs are part of the successful implementation of the SPR, they now have a greater responsibility for fulfilling the relevant goals of the Technology Policy Statement as well. As Institutes of Technology, their charter, is to resonate the expectations spelt out in the Technology Policy Statement.

55 The Technology Policy Statement (1983) affirms that, technology must relate to our people's aspirations and to our local needs to cover both manufacturing and servicing sectors. The Statement affirms that the base for this consists of trained manpower, which IITs are charged to develop. It envisages special attention to the promotion of newly emerging and frontier areas and encouraging research in these areas. IITs have a specific role to implement these avowed objectives of the Technology Policy Statement within their general charter of education, research and extension. Such goals require that IITs must • excel in all aspects of academic activity and produce a high quality science based engineering students; • survive on specialization, work increasingly in front-line areas that transcend disciplines; • have a perception and a value system appropriate to the pursuit of high science and high engineering science to meet the critically evaluated needs of the society in terms of products and processes using indigenous resources in close collaboration with manufacturing service sectors; • programme into their activities the emerging technological needs with a futuristic outlook; • accept extension and public services as a third dimension to their role in addition to education and research; • attain a stature that enables them to provide leadership with credibility. They should be the "think tanks" for higher education and research; • aim at preparing more of "creative engineers", "innovative thinkers" and "engineer entrepreneurs"; • develop a special nexus with rural development mainly by way of involvement in technology based solutions for problems in rural areas; • maintain and foster interactive linkages with leading technological institutions and centers of research in India and abroad • to develop in each student mastery of fundamentals, versatility of mind, motivation for learning, intellectual discipline and self-reliance which provide the best foundation for continuing professional achievement;

56 • to provide a liberal; as well as a professional education so that each student acquires a respect for moral values, a sense of their duties as a citizen, a feeling for taste and style, and a better human understanding. All these are required for leadership; • to send forth men and women of the highest professional competence with a breath of learning and a character to deal constructively with issues, and problems anticipated in the next decade relevant to the programmes of development of our country. IITs must seek through their research activities to create an atmosphere of intellectual excitement, a climate of inquiry and innovation in which a student develops a consuming interest for understanding issues of his own volition. • should not the IITs mainly concentrate on forging links with organized industrial sector for import and diversification of its technology? • should IITs commit their resources for developing appropriate rural technology for mass impact? • should not the Institutes strive for an optimal blend of a limited number of objectives in order that they do not spread their resources thinly? As Indian Institutes of Technology, they must recognize their inherent obligation to serve students and alumni, the profession of engineering, the world of scholarship, the nation and the society at large. IITs should seek to serve the community directly through the use of their facilities, wherever there is a need, to which they can respond easily. These objectives are derived from the original goals and not construed de-novo. The Report of the Committee on Post Graduation Engineering Education lays stress on the thrust areas such as Fibre Optics, Micro-electronics, Materials Science, Reliability Engineering, Robotics, Ocean Engineering, Computer Science etc. IITs have a significant role to build a superstructure in the form of Postgraduate Programmes in such thrust areas that go to influence the quality of Undergraduate Curriculum. In order to develop a curriculum they need to interact and develop linkages with their surroundings specially within the manufacture and service sectors. We are clear in our minds that the Technology Policy Statement and the Science Policy Resolution demand a conscious integrated approach covering technology assessment, technology acquisition, absorption, utilization and diffusion. This responsibility cannot be solely placed on the IITs. But IITs cannot escape participation in one or more aspects

57 of Technology development along with others. Technology policy studies may be initiated in or more IITs to enable them to to have a proper appraisal of modern technologies, and arrive at an assessment of their relevance to the needs of our society. Such studies will help orient research and curriculum to produce engineers alive to the needs of the nation. IITs would no longer be accused of training to the needs of the developed.

2.6.2 Role of Scientific Communities in Developing Adaptive Technologies

Rehabilitative and adaptive technology refers to tools, equipment, or products that can help a person with a disability to function successfully at school, home, work, and in the community. Disabilities are disorders, diseases, health conditions, or injuries that affect an individual's physical, intellectual, or mental well-being. Rehabilitative and adaptive technologies can help people with disabilities to function more easily in their everyday lives and can also make it easier for a caregiver to care for a disabled person. The term "rehabilitative technology" is sometimes used to refer to aids used to help people recover their functioning after injury or illness. "Adaptive technologies" may be as simple as a magnifying glass to improve visual perception or as complex as a computerized communication system. Some of these technologies are made possible through rehabilitative engineering research, which is the application of engineering and scientific principles to study how people with disabilities function in society. It includes studying barriers to optimal function and designing solutions so that people with disabilities can interact successfully in their environments. The NICHD houses the National Center for Medical Rehabilitation Research (NCMRR): The NCMRR has helped to advance scientific knowledge about disabilities and rehabilitation, while also providing vital support and focus for the field of medical rehabilitation to help ensure the health, independence, productivity, and quality of life of all people. Within the overall goals outlined some specific goals should be spelled out. It is that the scientific communities must continue to engage in manpower development. The students must be an agent of change of Technology practice in the country, and initiate a new working culture in our industry, with a view to increasing productivity and bringing to industry the capacity to innovate. Some technical graduates should, therefore, become entrepreneurs themselves for starting new science based, technology

58 oriented industries. They are thus to be so trained to build into their value system, a sense of responsibility to their country and a desire to serve for the society. Their perception should preclude Hi-Tech. as an important tool to solve ground level problems especially for the child with different needs. Some of the institutes, who have locational advantages, can involve themselves in the tasks related to the development of CWSN by means of supplying competent technical manpower and by offering laboratory solutions to the problems faced by them. Their method of instruction should be innovative and qualitatively different. For instance, Micro-electronics may be taught in other colleges as an educational programme, but who have research excellence in their proximity, on the other hand, would bring in a practical bias and illustrate a number of case studies relevant to their curricula. Their functions of teaching, research and extension would be perceived as an integrated block and not as separate identities. Without such an integration, a teacher cannot develop the personality of the taught in a wholesome fashion, relating what is taught to actual experience. The teacher's activity in extension activity will improve the quality of his research, in turn improving his teaching content. The students will then see him as the leader in research whose work is relevant. Some of the alumni settled abroad while responding to our questionnaire mentioned that a major cause of their migration abroad is the baseness of academic and research leaders. As the information Age is ushering in, thanks to the technological advancements in the area of Microelectronics, Materials Engineering and Bio-technology etc., the country will look towards to be lead-agents for promoting training, research support and technology development in many such thrust areas. The goals of these institute, therefore, must specifically include helping such changes happen in this country in a programmed manner and faster. It is for each institute to decide on what priority areas they need to emphasize, from time to time to plan for them.

2.7 Universal/ Inclusive Design - Concept, Advantages and Limitations

2.7.1 Concept of Universal/ Inclusive Design

Universal Design (close relation to inclusive design) refers to broad-spectrum ideas

59 meant to produce buildings, products and environments that are inherently accessible to older people, and people with disabilities. The term "universal design" was coined by the architect Ronald L. Mace to describe the concept of designing all products and the built environment to be aesthetic and usable to the greatest extent possible by everyone, regardless of their age, ability, or status in life. However, it was the work of Selwyn Goldsmith, author of "Designing for the Disabled" (1963), who really pioneered the concept of free access for people with disabilities. Universal design emerged from slightly earlier barrier-free concepts, the broader accessibility movement, and adaptive and assistive technology and also seeks to blend aesthetics into these core considerations. As life expectancy rises and modern medicine increases the survival rate of those with significant injuries, illnesses, and birth defects, there is a growing interest in universal design. There are many industries in which universal design is having strong market penetration but there are many others in which it has not yet been adopted to any great extent. Universal design is also being applied to the design of technology, instruction, services, and other products and environments. Curb cuts or sidewalk ramps, essential for people in wheelchairs but also used by all, are a common example. Color-contrast dishware with steep sides that assists those with visual or dexterity problems are another. There are also cabinets with pull-out shelves, kitchen counters at several heights to accommodate different tasks and postures, and, amidst many of the world's public transit systems, low-floor buses that "kneel" (bring their front end to ground level to eliminate gap) and/or are equipped with ramps rather than on-board lifts. The Center for Universal Design at North Carolina State University expounds the following principles: 1) Equitable use 2) Flexibility in use 3) Simple and intuitive 4) Perceptible information 5) Tolerance for error 6) Low physical effort 7) Size and space for approach and use Each principle above is succinctly defined and contains a few brief guidelines that can

60 be applied to design processes in any realm: physical or digital. These principles are broader than those of accessible design and barrier-free design. Inclusive Design The British Standards Institute (2005) defines inclusive design as "The design of mainstream products and/or services that are accessible to, and usable by, as many people as reasonably possible ... without the need for

special adaptation or specialised design." The UK government has defined inclusive design as '...a process that ensures that all buildings, places and spaces can be easily and comfortably accessed and used by everyone. Every design decision has the potential to include or exclude customers. Inclusive design emphasizes the contribution that understanding user diversity makes to informing these decisions, and thus to including as many people as possible. User diversity covers variation in capabilities, needs and aspirations. Inclusive design focuses on the diversity of people and the impact of this on design decisions. However, the complete set of performance indicators should consider a wider set of aspects concerned with People, Profit and Planet. The performance indicators should examine how the different aspects have an impact across the whole life-cycle of the product. This life-cycle typically involves the stages: 1. Develop it 2. Make it 3. Distribute & sell it 4. Use it 5. Pass it on 6. Reprocess it. For most current products, the user 'Passes it on' by throwing it in the bin, and 'Reprocess it' involves storage in landfill. However, recycling and refurbishment represent other alternatives for these stages.

Definition of inclusive design The British Standards Institute (2005) defines inclusive design as:

61 'The design of mainstream products and/or services that are accessible to, and usable by, as many people as reasonably possible ... without the need for special adaptation or specialised design.'

Inclusive design does not suggest that it is always possible (or appropriate) to design one product to address the needs of the entire population. Instead, inclusive design guides an appropriate design response to diversity in the population through: Comparison with 'Universal design' 'Design for all' and 'Universal design' philosophies both have the same literal meaning. These philosophies originated from design of the built environment and websites, and were initially applied in the context of government provision (Design for All Foundation; Preiser and Ostroff, 2001). In the context of product design, both 'Design for all' and 'Universal design' approaches pragmatically accept that it is not always possible for one product to meet the needs of the entire population. Nevertheless, these approaches maintain that all mainstream products should be accessible to as many people as technically possible (Preiser and Ostroff, 2001). In contrast, inclusive design originated with product design, and focuses on choosing an appropriate target market for a particular design, and making informed decisions to maximise the 'Product performance indicators' for that target market. While inclusive design intends to extend the reach of mainstream products, it acknowledges the commercial constraints associated with satisfying the needs of the target market.

2.7.2 Advantages of Universal/ Inclusive Design

The case for making our society more universally accessible and usable to all is a compelling one on many fronts. Universal/ Inclusive Design proposes a progressive and evolving approach to the development of inclusive environments that can be accessed, understood and used to the greatest extent possible. Not only does Universal/ Inclusive Design make good business sense, it also has many compelling social and legal drivers. The human-centered approach to design that Universal Design supports is user-friendly and convenient, but is also respectful of user dignity, rights and privacy. The degree of difficulty that people experience when using a product, service or environment can vary, Such as: A person who has no significant problems but who would appreciate a well-designed accessible and usable product, service or environment;

62 1) A person who has little difficulty with all features; 2) A person who has difficulty with some features; 3) A person who has trouble with most features; 4) A person who is unable to use the product at all. The degree of personal benefit will vary accordingly. Therefore, if a product, service or environment is well designed, with accessibility and usability in mind, all of the people in the categories above will benefit. The age-distribution of the world's population is changing dramatically. People are living longer as a result of medical developments in the last century and healthier lifestyle changes. The number of people living with physical, sensory, mental health or intellectual impairments is increasing, as is the life expectancy of people with particularly severe or multiple impairments. Universal design/ Inclusive Design improves access and outcomes for everyone in a variety of situations. The goals of it are: 1. Equal Access - In order for a design to be truly universal, it must be useful to people with all kinds of conditions and abilities. This includes people with disabilities or activity limitations. 2. Flexibility - It's important that the design is flexible enough to apply to all different kinds of people who have a huge variety of different abilities or disability. An example might be providing information in Braille underneath signs so that people who are blind can read them. 3. Simplicity - The design should be easy to understand so that people with varying levels of education and experience can use it. 4. Effective communication - The design must convey the needed information to the user, even if they have limitations in their sensory capabilities or ability to process this information. 5. High tolerance for error - If a user accidentally makes a mistake while using the design, it's important that they are not harmed or their situation is not made more difficult as a result. 6. Minimal effort required - A person should be able to apply the design easily, even if they have limits to their physical or mental capabilities. 7. Suitable space and size for use - No matter what size a person is or how mobile they are, they should have enough space and the ability to effectively use the design. It

63 is by considering each of these seven principles that we help our clients ensure that they attain universal design on all types of projects. Other things that help the person to deal with: Independent Living Universal Design creates inclusive design solutions and promotes accessibility and usability, allowing people with all levels of ability to live independently. The ability of a person to remain as independent as possible can be influenced by how accessible and usable products, services and environments are. Factors that promote independent living, such as universal design, have a key role to play in dealing with this global phenomenon. Ability as a Continuum No two people are the same and no two people have exactly the same ability. The considerable variation that exists between people can be influenced by both external and internal factors. Ability can vary according to the type of activity in which a person is participating or the environment in which that person is carrying out the activity. Every person experiences reduced functioning at some stage during his or her lifetime. For example "noisy environments impair anyone's hearing; A Universal Design approach therefore requires an appreciation of the varied abilities of every person and to design in such a way that the resulting product, service or environment can be used by everyone regardless of age, size, ability or disability. Participation in Society In this technological age, the skills required to participate in society are becoming increasingly complex. As each technological innovation is adopted the risks to people who do not adopt of being excluded from accessing a whole range of financial, state, social or cultural services or amenities increases. Technology is increasingly embedded into the built environment and products so that the lines of what is specifically product, ICT or building design have become blurred. In order to facilitate people with differing abilities, of differing ages and sizes within society, systems and building must be designed with the user at the center of the design process. A universally designed environment promotes equality and makes life easier and safer for everyone. 2.7.3 Limitations of Universal/ Inclusive Design 1)

There is still pressure to prepare students for success on standardized tests.

64 2) Standardized tests are not differentiated. 3) Students and teachers are evaluated based on how well students are able to read random passages, make sense of them, and write their responses all within a given time limit. The content itself is often not engaging, the format is even less engaging, and the stakes are high, which create stress for all. States and districts are having trouble in attempting to retrofit existing tests to be more inclusive. However, this difficulty will be eliminated or reduced if tests are developed from the beginning to be inclusive of all students.

Inclusive design is nothing new but designing to accommodate the widest possible range of users in using fundamental principle of ergonomics and has been an integral part of our user-centered philosophy from the start. It is also not just aimed at older or disabled users. People of all ages and abilities can benefit from a more inclusive approach to design, for example those at a temporary disadvantage, such as mothers with prams, people travelling with luggage, tourists and non-English speakers. However, the two main drivers in universal/ inclusive design are undoubtedly the ageing population and the desire to better integrate into society those with disability. Inclusive/ universal design addresses accessibility to products, services and the built environment and the need to do this is enshrined in legislation. The term Universal/ Inclusive Design emphasizes the special purpose of learning environments-they are not created to provide information or shelter but to support and foster the changes in knowledge and skills that we call learning. While providing accessible spaces and materials is often essential to learning, it is not sufficient. Success requires that the components of pedagogy- the techniques, methods, scaffolds, and processes that are embedded in classrooms and curricula-are also accessible, and that the measure of their success is learning. Its framework is based in the neuroscience of learning, and its principles emphasize three key aspects of pedagogy: the means of representing information, the means for the expression of knowledge, and the means of engagement in learning (Rose & Meyer, 2002).

2.8 Let Us Sum Up Overall, adaptive technology aims to allow people with disabilities

to "participate more fully in all aspects of life (home, school, and community)" and

increases their opportunities for education, social interactions, and potential for meaningful employment. It creates greater independence and control for disabled individuals. For example, in one study of 1,342 infants, toddlers and preschoolers, all with some kind

65 of developmental, physical, sensory, or cognitive disability, the use of adaptive technology created improvements in child development. These included improvements in cognitive, social, communication, literacy, motor, adaptive, and increases in engagement in learning activities.

It has been found to lighten caregiver load. Both family and professional caregivers benefit from adaptive technology.

The time needed caring for a patient significantly decreases for a family member or friend with the use of adaptive technology. Studies show that care time for a professional caregiver's increases when adaptive technology is used, however their work load is significantly easier with adaptive technology taking over some of the jobs that a care giver would have to provide.

2.9 Check Your Progress

1. What do you mean by adaptive technology?
2. State the basic natures of adaptive technology.
3. Discuss the purpose of adaptive technology.
4. What are the basic consideration of Adaption Technologies?
5. Name some adaption technologies for Complete Access?
6. What do you mean by adaptive technology in the view point of users?
7. What are the components of user's perspective in developing adaptive technologies?
8. Point out the major notes on of IITs in the development of adaptive technologies?
9. What are the Primary notes of scientific communities for teaching learning of visually impaired students?
10. What do you mean by Universal Design?
11. What am the advantages of Inclusive design?
12. What are the significance of Universal/ Inclusive Design for visually impaired students?

References & Suggested Readings 4.1 Introduction

Assistive technology

refers to a range of tools, devices, and strategies that allow a student to accomplish a task that they would otherwise be
unable to do, or would have difficulty accomplishing effectively. Assistive technology can be simple or complex.

Examples of low tech tools for students with visual impairments might include enlarged text or raised line paper, while
high tech tools may encompass digital tools that "speak" to the student, connect to a Braille display, or even incorporate
GPS.

As we are aware that

students with visual impairments face unique challenges in the educational environment. Not only must they be able to
access text information across all curricular areas, but they also need to be able to participate fully in instruction that is
often rich with visual content. Assistive technology is one way of supporting them in that process.

This is to ensure that students with visual

disabilities have the tools necessary to fully access and participate in the curriculum, with the greatest possible level of
independence. Even more important, use of assistive technology helps prepare students for independent living,
vocational pursuits, or higher education.

A student's need for assistive technology will likely change and evolve throughout his or her education, and in most
cases, no single tool will meet all of a student's needs

for any learning concepts of a particular subject. This unit

is to provide an introduction to the types of assistive technology that may benefit students with visual impairments.

Subject specific

assistive technologies are also being discussed in this unit. Some low vision aids are more specific to the job or task at hand, including the features and equipment options provided by the devices to perform visual tasks. Individuals with specific low vision needs might prefer certain visually supportive features such as

98 stronger magnification, additional lighting options, and portability of device. Therefore, this unit also explores the assistive technologies for students with low vision. 4.2 Objectives: When you will complete this unit, you will be able to: | Sensitize about need of assistive technologies for children with visual impairment to complete various academic activities. | Demonstrate general techniques of using assistive technologies designed for children with visual impairment. | Explain importance and significance of various assistive technologies for children with visual impairment. | Illustrate how assistive technologies could compensate the limitations imposed by the visual impairment to complete various subject specific tasks at school as well as at home. | Understand different optical, non-optical and other electronic aids and appliances meant for students with low vision. 4.3. Assistive Technologies for Mathematics Learning mathematics has

been always being found crucial for learners with visual impairment. There are two essential concerns related with learning mathematics. The first is a comprehensive system of notation, capable of expressing all mathematical relationships neatly and concisely. The second is apparatus (also including paper pencils), which enables the students to draw the picture (mathematical signs and notions) of the problem, and so to have something concrete before him. Students with visual impairment faces challenges in both above said concerns. First problem is being resolved through mathematical sign, symbols and notations in braille etc. Whereas second concern mainly resolved through assistive technologies. Here we are going to discuss various assistive technologies related with learning support to students with visual impairment while learning Mathematics. 4.3.1 Taylor Frame & Algebra and Arithmetic Types The Taylor Frame or, Taylor Mathematical Slate is a device used to teach Mathematics to blind students. Developed by William Taylor in England in the mid 19th century. It

99 was in common use until the early 1970's. The main purpose of this device is to aid in the teaching and working of problems of long division, multiplication of large numbers, subtraction, and addition. The Taylor Frame or Taylor Mathematical Slate consisted of an aluminum frame and a set of metal pegs or type with the patterns. Set of types are used that are moulded from hard yellow vinyl plastic, or are made up with lead. The frame has rows of opening each set out as an eight pointed star. The pegs could therefore be placed in the frame in one of eight orientations which could be used to represent numbers, letters or signs. Math can be composed in linear, vertical or in algebraic notation. At one end of arithmetic type, there are two dots placed along one side, at the other a solid raised bar along one side. By placing the type into the octagonal holes in the frame, the digits 0-9 and the mathematical signs of operation can be represented.

The surface of this aluminum frame is divided into star shaped holes with eight angles, thus allowing the double-ended metal types to be placed in different positions according to a set system.

With the help of these two types of type or, peg, there are total thirty two orientations (each peg has 16 orientation; 8 from each side) are available as follows:

100 Algebra types are symbols made up of metal to represent algebraic variables like x, y, z, a, b, c, d and others like, brackets, square root and index. These are used in Taylor frames. Similarly, arithmetic types are symbols made up of metal to represent numbers like 1, 2, 3, 4, 5, 6, 7, 8, 9, 0 along with comparison signs like =, +, $\frac{\circ}{\circ}$, decimal point etc. 4.3.2

Abacus Abacus is a device used by visually impaired children for doing basic mathematical calculations. Abacus is rectangular in shape. Abacuses with varied columns are used in different countries. This instructional material is written specifically for the abacus

generally

with 13 columns. The common operations for this abacus are same with those of the abacuses with fewer columns, but the number of columns matters especially when fraction problems are solved. A bar is separating the abacus horizontally cutting across

all

the columns, leaving $\frac{2}{3}$ rd of the area below and $\frac{1}{3}$ rd of the area above. The lower portion is known as lower abacus and the upper portion is known as upper abacus. Each column in the lower abacus has four beads, each bead assumes the value

of

one. Each column in the upper

101 abacus has one bead and assumes the value

of five. It is a simple instrument for performing rapid arithmetical calculations. In the early 1960s, T.V. Cranmer, then director of the Division of services for the blind, Kentucky Department of Education, adapted an abacus that blind individuals could use. He added a foam backing to put tension on the beads and keeping them stable. He also increased the length of the rods to give more distance between beads and make them easily read by touch. Abacus generated enthusiasm among blind people and teachers of those with visual impairment. The Hadley School, USA also offers a correspondence course in the use of the abacus for blind people throughout the world. The abacus is an efficient and accurate tool that enables persons with visual impairment to perform mathematical calculations. It affords more speed and ease of manipulation than Braille writers, Taylor slates, pegboards and other cumbersome tools. But, in abacus one cannot retain the intermediate steps of the sum. 4.3.3

Geo Board The geo-board is a multi-purpose board for children with visual impairment.

This can be used for showing geometrical figures and graphs. It is a peg board, square or rectangular in shape with nails at equal distance, both lengthwise and width wise. The distance between the nails can be determined according to the levels of the students. The distance can be brought down

when a child entered to higher classes in the school. It is suggested that it should be at least one inch in the case of primary school children. It is a amazing tool for the teachers of visually impaired children for teaching of mathematical concepts. Rubber bands are used to show various shapes; eg. Triangle, rectangles,

102 square, etc. If

the distance between the nails is smaller, even circles can be shown. 4.3.3

Geometric Kit Geometry kit is available with many sellers which consist a draw board, different geometrical shapes, compass set to frame angles and shapes, spur wheels etc. Spur wheels are serrated wheel revolving in a plated metal handle. It is used for making continuous embossed lines on the reverse side of the paper.

Geometry mat may also be included in the kit which is

a sheet of rubber for use as a base in conjunction with the spur wheel and Braille paper for making geometrical drawings. Compass set may include

a foot ruler, a protractor and a set square in nylon. It enables visually impaired students to use the same techniques as his sighted counterpart. The foot ruler and set square have embossed markings for their convenience. The compass has a removable component fitted with a toothed wheel for drawing embossed dotted lines on the reverse of the Braille paper.

Comprehensive or extended part of kit also includes different three dimensional shapes to get proper concept of shapes in space or three-dimension. 4.3.4 Measuring Tapes and Scales Measuring tape is designed to indicate measurements by touch. An adapted measuring tape could be of any size. Generally it is available in sixty inches size (Five feet). It is a plastic coated fabric (as in other measuring tape) to reduce wear and tear. The measuring tape has different tactile marks for . inch, 1inch and 1 foot increments. This adapted measuring tape is known as tactile measuring tape. Similarly, Metal scales are also available for mathematical school

103 work; eg. Drawing a line of specific size etc. 4.3.5 Soft-wares for teaching Mathematics There are several mathematics learning software packages are available for strengthening of mathematical concepts among students with visual impairment. Few are listed as below: lllll Scientific Notebook Scientific Notebook (SN) is a software package. When installed on a laptop, the student has a very portable device, which is more than just a graphing scientific calculator.

It is also a math/text processor, so the student can do all assignments, calculations, and graphs in one document directly on the laptop. It has onscreen magnification up to 400%, or additional magnification software may be used.

With the right techniques, it is also possible for a blind student to work with matrices using Scientific Notebook and a screen reader to solve systems of equations and find regression lines. Furthermore, math teachers can enter all their worksheets, tests, etc. on this software,

and the teacher of the visually impaired can easily translate them into Nemeth code.

llll Graph-It PC Graph-It PC is designed for use with PCs and this is a product by Freedom Scientific. The student can type in an equation and produce a tactile graphic on most embossers. An audio representation of the graph can also be played through the speaker for a quick, sound-picture of the graph. The software is quite limited, however, and the tactile graphics and audio graph lack precision. llll Accessible Graphing Calculator (AGC) The Accessible Graphing Calculator (AGC) from ViewPlus Software Inc. is a self-voicing graphing scientific calculator software program. Unlike a hand-held calculator, it displays results through speech and sounds, as well as visually presenting numbers and graphs. This program is intended to have capabilities comparable to a full-featured hand-held scientific and statistical graphing calculator. The onscreen graphics are easily seen by a low vision student via an enlargement feature, and the graph can be listened to by using the sophisticated audio wave feature.

104 4.4. Assistive Technologies for Science Student with visual impairment

typically need some accommodations in order to safely and fully access to

the science curriculum. It is important to meet with the Teacher of Students with Visual Impairments to discuss the curriculum and objectives and content that will be covered during the school year. This is important for students following the standard course of study as well as those following a modified curriculum. The student's unique visual needs should be taken into consideration when determining how to make materials accessible. Science materials may include measuring devices, charts, reading materials, and equipment.

Following are few important science related assistive technologies to facilitate the learning of science concepts among students with visual impairment: 4.4.1

Tactile Thermometers The tactile demonstration thermometer allows students to independently read, set, and compare temperatures.

Popular tactile thermometer by APH, USA has

a two-textured, two-colored adjustable mercury column with an easy-grip tactile indicator. It usually

includes both Fahrenheit and Celsius scales presented in both large print and braille. Tactile degree markings every 5 and 10 degrees. The mercury column slides up and down to demonstrate temperature reading.

Usually talking clinical thermometer makes temperature-taking fun and easy for kids and adults. It's also an indispensable tool for the blind or visually impaired individual. This model's two-button design makes it extremely easy to use. Simply press the left button to turn the unit on, wait for the confirming beeps, then press the right button to begin taking your temperature. In about thirty seconds, you'll hear four beeps, followed by your body temperature announced in a very clear voice. The temperature will then be repeated once more, and the unit will automatically shut off after eight minutes, if you forget to turn it off yourself, that is. The thermometer is intended for oral or underarm use, and

announces and displays your temperature in either Fahrenheit or Celsius. 4.4.2 Colour probes Colour probes or colour detectors can be used by person with visual impairment or

105 those with little colour perception to distinguish colours. This may assist them to identify the colours. With the help of this device the affected person may be able to identify the colour of clothing or furnishings, distinguish between items such as food or check the ripeness of fruit. 4.4.3 Scientific and Mathematics Talking Calculators Talking calculator is a

very useful device for various calculation by students with visual disabilities. A talking calculator is an inexpensive and invaluable device for students with disabilities struggling with math at school. A talking calculator can verify the accuracy of keys pressed and give feedback to the user while making calculations. Talking calculators look and function like common calculators. However, this assistive technology devices has a built in speech synthesizer so that each key pressed is spoken out loud. This can help the user to verify that the numbers and operands have been entered correctly. The calculator also speaks the answer to the math problem. Talking calculators can be used at home, for everyday

calculations such as balancing a checkbook, grocery shopping, or calculating a recipe. For these uses, a basic model may be all that is needed. Talking calculators are capable of advanced mathematical operations, making it possible for the blind or visually impaired to perform these operations without the use of pen and paper. Various models are available for learning basic adding and subtracting operations at school to enabling students to complete more advanced subjects such as trigonometry. 4.4.4 Light probes Light probes or light detectors can be used by person with visual impairment or those with little light perception to get informed about how light or dark it is. The light probe is a handy device used for detecting of

lights are on or off, from ceiling lights to small LED lights on appliances. It does this by emitting different tones. It can also be used to detect which side of the paper writing is on when scanning, faxing or photocopying. 4.4.5 Weighing scales A talking scale announces weights and are available in a variety of sizes and styles. Kitchen scales may be the most valuable for science education, although bathroom scales and other types of scales are also available in talking formats.

106 4.4.6 Software and web resources for teaching Science Access STEM: AccessSTEM is the Alliance for Access to Science, Technology, Engineering, and Mathematics Disabilities, Opportunities, Internetworking & Technology (DO-IT). The AccessSTEM website is a space where K-12 teachers, postsecondary educators, and employers learn to make classroom and employment opportunities in science, technology, engineering and mathematics (STEM) accessible to individuals with disabilities, and share promising practices. Independence Science Independence Science provides talking and sensory products to increase accessibility in the science lab. This is a robust portal of technological and tactile solutions or experimentation and modeling. National Science Teachers Association (NSTA) NSTA "is the largest organization in the world committed to promoting excellence and innovation in science teaching and learning for all." The site contains resources for parents and information on teaching students with visual disabilities. EntryPoint! ENTRY POINT! is a program of the American Association for the Advancement of Science offering outstanding internship opportunities for students with apparent and non-apparent disabilities in science, engineering, mathematics and computer science. This association has developed unique partnerships with IBM, NASA, Merck, Google, Lockheed Martin, CVS, NAVAIR, Pfizer, Infosys, Shell, Procter & Gamble and university science laboratories to meet their human resources needs. Working with its partners, this association identifies and screens undergraduate and graduate students with disabilities who are pursuing degrees in science, engineering, mathematics, computer science, and some fields of business, and places them in paid summer internships. 4.4.7

Models Three-dimensional models are beneficial to all students when learning about science. This is particularly true for students with visual impairments. Students with visual impairment should be provided with models that they could be touched, explored, examined and communicated real concept. For students with visual impairment, it is

107 better to start with either the real object or, when this is not possible, it should be facilitated by a three dimensional model or object. There are abundant resources related with tactile models and diagrams in science. Tactile Astronomy is a web resource from Amazing Space, is a downloadable tactile image library for microcapsule paper. The

tactile graphics consists of vacuum-formed raised-line drawings that are intended to supplement the graphics in a students adapted textbook. It depicts objects, concepts, and relationships that are covered in nearly all elementary science textbooks. The drawings use several types of lines and textures, as well as different heights. 4.5.

Assistive Technologies for Social Science In inclusive setting, it is essential for classroom teachers and the special education teacher to collaborate and work together closely. Special education teacher to engage himself/herself in creating or developing accessible maps and materials. Materials need to be ready in a timely manner so they will be ready when classmates are presented with similar materials. The special education teacher may also need to provide models (eg. a model of a volcano, historical objects, etc.), depending on the topic. It is important that students first receive instruction in reading maps and other materials such as pie charts, bar graphs, and timelines. 4.5.1

Tactile/Embossed Maps The use of maps is an important skill for all children to learn. For students who have visual impairments, learning to read a map is an important step towards independence, as well as a way to participate more fully in the regular geography and social studies curriculum.

Teaching could be stimulated by using tactile maps, from the most basic object books to more complex tactile graphics.

It should be also remembered that apart from assistive technologies fieldtrips are also very helpful in teaching social science. 4.5.2 Charts & Diagrams Tactile resources are essential component, while teaching students with visual impairment. Teacher should be competent enough in developing tactile chart and diagram to elaborate social science concepts. Learning to use tactile diagrams is a skill which should be overtly taught, with plenty of time for practice.

Exploring a tactile

108 diagram systematically is the key to making sense of it. It is a very crucial task to cover whole concept in a single diagram. Teacher should encourage the students with visual impairment to explore a tactile chart (bar, pie, etc.). The student should read the data represented from each bar. Sticking to a routine method helps students to make sense of their tactile diagrams. 4.5.3 Models of Different Types Models in two dimension and three dimension are important tool to facilitate concept formation among students with visual impairment. While producing diagrams and handouts, teacher should think about whether all the information is necessary. He/she may be able to simplify the diagram and cut out some of the text, making it easier for a visually impaired students to access. Make sure that the work is printed on the correct colour paper, some students may prefer things on a certain paper or in a certain type face. Making models or presenting the same increase a visually impaired students understanding and appreciation. 4.5.4 Auditory Maps Human beings navigate through their environment by developing an orientation or, mental understanding of spatial relationships known as a spatial cognitive maps. Spatial cognitive maps for most people involves using visual information to development an understanding of the spatial relationship between the person and other objects. For mobility of persons with severe visual impairments, scope of taking visual clues and landmark is restricted. Other senses such as hearing, are used to collect information in order to build a spatial cognitive map. Therefore, an auditory maps could be a wonderful tool to get comprehension of geographical concepts among persons with visual impairment. 4.5.5 Talking compass Talking compass is a hand held device mainly helpful for getting around and taking physical measurements by persons with visual impairment. It is a compact and easy-to-

109 use talking compass. User simply points in the required direction, press the button, and the unit will speak the compass point. It includes

the four major compass points, as well as the four interim compass points.

Compass also features clear, digitized speech and ceramic piezoelectric speaker. 4.5.6 GPS system Survival and success depend on good orientation skills. This is an especially challenging fact for people who are blind, because they must use only auditory and tactile queues to determine their position in relation to other objects or places. For thousands of years, people used landmarks and line-of-sight to return home after a long day on the hunt, but these techniques became less effective the further they travelled. Eventually, explorers discovered consistent heavenly bodies that could aid with orientation. For example, early sailors kept a constellation to the left side of the ship to help with navigation. They could use this technique to reliably travel hundreds of miles. With the introduction of the Global Positioning System (GPS), the power to quickly and accurately determine one's place on earth) is available to anyone. It does not require any training. When combined with an accessible interface, and customizable and current information about points of interest, the tools provide a compelling picture of the locality and its characteristics. 4.6. Low vision Devices: Low-vision devices are designed to improve visual performance in children or individuals with low vision, thus enabling academic and social adaptation and providing enrichment of daily experiences. These devices could be categorized into following categories:

a. Optical

110 b. Non-optical c. Projective d. Mobile & Computer based 4.6.1 Optical Devices Low vision optical devices are devices which basically support vision through lenses. We can say these devices are based on magnification done by magnifiers. Optical devices could be grouped into two categories: 1) supporting near vision tasks, eg. Handheld magnifiers, stand and hand-held magnifiers, strong magnifying reading glasses; 2) supporting distance vision tasks, eg. small telescopes. Because these devices can provide greatly increased magnification powers and prescription strengths, along with higher-quality optics, they are different from regular glasses and commercially available magnifiers. These devices are also available with light source to support further. 4.6.2 Non-Optical Devices Non-optical devices are low vision aids that do not use magnifying lenses to improve visual function. They can improve the other visual aid's function or can even replace

111 optical aids. They enhance visual function by: | Lighting control | Enhanced contrast | Reduction of glare | Improving physical comfort Low vision non-optical devices can include a number of adaptations, such as reading stands, supplemental lighting, absorptive sunglasses, typoscopes, and tactile locator dots. They are often recommended as part of a low vision examination, and can be used in combination with magnifiers and other low vision optical devices that can help with reading and a variety of tasks. Few non-optical low vision devices are listed below: | Adjustable Reading Stand | Typoscope | Bold Pen | Reading Lamp | Absorptive Glasses | Writing Guide 4.6.3 Projection Devices Projection devices include Close Circuit Television (CCTV) and other projection based magnifier system. CCTV consists of a monitor and a camera that projects the enlarged image on the screen. Advantages are higher reading speed and greater working distance when compared to other aids. The larger working distance makes it easy to use for writing, drawing, or painting. It provides additional visual field, brightness, contrast, and polarity control, making it the choice for 112 diseases with low contrast and glare. It may allow magnification of 2 to 60 times with several features including black and white or color, and fixed-focus or autofocus, allowing objects to be seen at various distances. 4.7. Technology for developing Tactile Diagrams

Tactile graphics, including tactile pictures, tactile diagrams, tactile maps, and tactile graphs, are images that use raised surfaces so that a visually impaired

person can feel them. They are used to convey non-textual information such as maps, paintings, graphs and diagrams. Tactile graphics can be seen as a subset of accessible images. Images can be made accessible to the visually impaired in various ways, such as verbal description, sound, or haptic (

tactual) feedback. One of the most common uses for tactile graphics is the production of tactile maps.

The types and forms of tactile maps began with the oldest and most rudimentary or a mixed media format. This tactile map is produced by simply attaching objects to a substrate to represent different items or symbols. More recent tactile maps are produced by computers through different means such as an ink-jet printers. 4.7.1 Thermoform

and Swell Paper technology | Thermoform Technology

Thermoform is one of the most common methods of producing tactile maps. This process is also known as vacuum forming. Thermoform maps or plans are created from a process where a sheet of plastic is heated and vacuumed on top of a model or master. The master can be made from many substances, although certain materials are more durable than others. Since this process involves creating a mould, it is somewhat time consuming.

| Swell paper

Technology

Swell paper has a special coating of heat-reactive chemicals. Microcapsules of alcohol implanted in the paper fracture when exposed to heat and make the surface of the paper

113 inflate. Placing black ink on the paper prior to a heat process provides control over the raised surface areas. This type of map is not as robust as the Thermoform map, but can be produced with less effort and expense. 4.7.2

Software for developing tactile diagrams Drawings produced by computers can turn into raised lined (embossed) graphics for the visually impaired. The effective software applications for computer generated tactile graphics should contain scalable vector graphic components; e.g.- lines, shapes, freeform drawing tools, arrows, patterns, shapes fill, and line weight etc. Softwares that contain these components are the best tools to use when producing computer generated tactile graphics. Drawing that look like a picture are called bitmaps. Third-party software containing mainly scalable vector graphic tools. Corel Draw, Adobe Illustrator, and Microsoft Office (Word and PowerPoint) are the examples of these kind of software. With the help of this application software one can produce tactile graphic illustrations for science, maths and geography. These drawing applications may not have scalable vector graphic drawing components, however, they can be used to produce tactile graphics if a swell (encapsulated) paper device is doing the embossing. Few dedicated tactile graphics production software are as follows: | TactileView - Tactile Graphics The TactileView Software is a tactile graphics tool from house of Index embosser. TactileView's Design Software | Import complex graphics | Create tactile street maps | Draw custom graphics |

Add audio tags to tactile diagrams | Web catalog | Image and text combination | In addition compatible with learning environment

it is able to create subject wise support;

Math - Charts and graphs; Science - Diagrams for anatomy, geology, and other visual subjects; and Art & Mobility - tactile maps for mobility, raised art & drawings.

114 4.8 Let us sum up Learning Mathematics has been always being found crucial for learners with visual impairment. The Taylor Frame or, Taylor Mathematical Slate is a device used to teach Mathematics to blind students, Developed by William Taylor. The main purpose of this device is to aid in the teaching and working of problems of long division, multiplication of large numbers, subtraction, and addition.

Abacus is a device used by visually impaired children for doing basic Mathematical calculations. Abacus is rectangular in shape. Abacuses with varied columns are used in different countries.

Measuring tape is designed to indicate measurements by touch. There are several Mathematics learning software packages available for strengthening of Mathematical concepts among students with visual impairment including Scientific Notebook, Graph-It PC, etc.

Science materials may include measuring devices, charts, reading materials, and equipment.

Following are few important science related assistive technologies to facilitate the learning science concepts among students with visual impairment.

The tactile demonstration thermometer allows students to independently read, set, and compare temperatures.

It usually

includes both Fahrenheit and Celsius scales presented in both large print and Braille.

Talking calculator is a very useful device for various calculation by students with visual disabilities. A talking calculator is an inexpensive and invaluable device for students with disabilities struggling with maths at school. A talking calculator can verify the accuracy of keys pressed and give feedback to the user while making calculations. Talking calculators look and function like common calculators. The special education teacher may also need to provide models (ex., a model of a volcano, historical objects, etc.), depending on the topics of social sciences. It is important that students first receive instruction in reading maps and other materials such as pie charts, bar graphs, and timelines.

The use of maps is an important skill for all children to learn. For students who have visual impairments, learning to read a map is an important step towards independence, as well as a way to participate more fully in the regular geography and social studies curriculum.

Auditory maps could be a wonderful tool to get comprehension of geographical concepts among persons with visual impairment. With the introduction of the Global Positioning System (GPS), the power to quickly and accurately determine one's place on earth is available to anyone. It does not require any training. There are several low vision assistive technologies available to support use of remaining vision. These assistive technologies could be grouped into optical aids (using lens or

115 magnifier for magnification); non-optical aids (using environment control to make better lightening condition) and projective aids (using magnification based on projective devices).

Tactile graphics, including tactile pictures, tactile diagrams, tactile maps, and tactile graphs, are images that use raised surfaces so that a

visually impaired

person can feel them. They are used to convey non-textual information such as maps, paintings, graphs and diagrams.

121 5.1 Introduction Technology in the form of adaptive and assistive devices, plays a crucial role in the education of the visually impaired. This course brings into sharp focus the need and importance of such technologies both for the practicing teachers and the visually impaired learners. While highlighting the significance of addressing the users point of view/feedback and involving mainstream professionals in developing required technologies, the course also dwells upon on how best students with visual impairment get access to the printed text/material. The course also acquaints the student-teachers with various devices for making the teaching-learning process for important school subjects meaningful, exciting and rewarding for all concerned. The educational needs of children with low vision and related technological perspectives are addressed, too, along with critical contributions of computer-aided learning and interventions. 5.2 Objectives: In this unit we will explore the need, importance and components of computer-based teaching-learning processes. When you will complete this unit, you will be able to: | Sensitize about use of social media, teleconferencing and other tools in education of children with visual impairment. | Demonstrate understanding of computer-based teaching- learning processes. | Explain importance and components of social media, tele-conferencing and other tools of distance education for computer aided learning among students with visual impairment. | Illustrate how e-classroom could be useful for the children with visual impairment. | Understand the role of computer mediated learning among the children with visual impairment. 5.3 Computer Aided Learning: Concept & Need It is widely accepted that the integration of modern Information and Communication Technologies (ICT) into the teaching learning process has great potential. In fact, it

122 could be the most important way by which schools and institution can meet students' educational aspirations within reasonable time and resources. The use of computers in schools is basically vision as a teaching and learning aid besides to develop computer literacy amongst the children. Computer aided learning will help us to make the present teaching learning process joyful, interesting and easy to understand through audio-visual aids. Teachers resourced with multimedia contents to explain topics better are being widely appreciated by students. Overall it helps to improve quality of education in long term. Computer Aided Learning is an integrative technology, which describes an educational environment where a computer programme is used to assist the user in learning a particular subject. It refers to an overall integrated approach of instructional methods. Computer aided learning is a device as well as a learning strategy to make teaching more interesting, joyful and sustainable. Any use of computers to aid or support the education or training of people may be considered under computer aided learning. Computer aided learning can test attainment at any point, provide faster or slower routes through the material for people of different aptitudes, and can also maintain a progress record for the instructor.

5.4 Social Media

Social media are forms of electronic communication (such as websites for social networking and microblogging) through which users create online communities to share information, ideas, personal messages, and other content (such as text, pictures and videos). Social media has gained credibility over the years as a trusted source of information and platform where individuals or organizations can interact with other individuals. Social media infuses today's society with millions of us engrossed, some would argue to the point of unhealthy addiction, in the latest happenings via apps such as Facebook and Twitter. The use of social media in education provides students with the ability to get more useful information, to connect with learning groups and other educational systems that make education convenient. Social network tools afford students and institutions with multiple opportunities to improve learning methods. Students can benefit from online tutorials and resources that are shared through social networks. There is valuable knowledge to be gained through social media such as analytics and insights on various topics or issues for study purposes. Social media is also a medium where students can establish beneficial connections for their careers.

5.4.1 Advantage of using social media in Education

- 1) Connecting with experts: The great thing about using social media is that you soon learn who the experts are in particular fields and subjects. When you start following these experts you learn more and gain useful content from them, this empowers you to produce great results. Social media has the ability to broaden your perspective on various subjects and gives illuminating, instant content that is new. You have the opportunity of engaging experts to get answers on topics that you may need help in. Many institutions communicate with students via YouTube and Facebook.
- 2) Connect with Students: Learning colleges have the ability to connect with students through social media networks such as Facebook, Google Plus groups, and YouTube. These channels can be used to communicate campus news, make announcements and provide students with useful information. This builds engagement between the College and students which help tackle many student issues through the group interactions.
- 3) Institutions Resource Sharing: Institutions can share supportive and positive posts that reach all students that are connected to the networks and pages. You can initiate hashtags on social media to engage students and online

124 discussions that are helpful. Video is a prominent tool in social media trends that are effective and you can use it to share useful videos that inspire students and help them in their course subjects. Through social mediums such as YouTube, Facebook or Instagram live video the engagements between students and the institution can be sustained. It is advisable to be selective about which social platforms to use for the best practice. 4) It helps in Research process: Social media offers audience and subject monitoring tools that are useful and it is one of the best platforms to extract data. You can find out how the majority people feel about a particular topic or how experts perceive and advice on specific issues. This can help students compile and produce useful content for research. Whether students are working on an assignment, working on a project or trying to gain more insight on a subject, some of the best information and results can be extracted from social media. 5) Educational Tool: Today's students arrive at school, fluent in Web and social networking technologies. Teachers can make use of this knowledge to enhance opportunities to learn. With social media, teachers can promote cooperation and discussion, create meaningful conversation, exchange ideas, and boost student interaction. 6) Enhance Student Engagement: Social media is an effective way to increase student involvement and build better interaction skills. Learners who hardly ever raise a hand in class may feel more comfortable on Facebook, Twitter, or YouTube. Social media systems enable instructors to identify "back channels" that promote conversation and surface ideas that students are too shy or nervous to speak out in class. 7) Improve Communication among Students and Teachers: Facebook and Twitter can improve interaction among learners and teachers. Teachers can respond to student's, questions via a Facebook page or Twitter feed, post homework assignments and lesson plans, send messages and updates, schedule or announce upcoming events, and share interesting Web sites and multimedia content. Students can

125 use Twitter to get help from teachers or other students. A great way for teachers to give participation points in addition to in class participation is by having students tweet about something that was discussed in class. 8) Preparing Students for Successful Employment: Students entering the workforce can use social networking sites to network and find employment. With various social media, older students or alumnus can establish a professional connection with other students. Students could make web presence, post a resume, research a target company or school, and connect with other job seekers and employers. Career centres and alumni associations are using different social media (eg. Facebook & Twitter) to broadcast job openings and internships. Students could follow businesses or professional organizations on social media to stay updated on new opportunities and important developments in their field. 126 9) Social Media as a Tool to Develop Students s'

Voices: One of the major benefits of using social media with students is teaching them to communicate openly, honestly, and, above all, kindly with their peers. The perceived privacy or anonymity of being online is especially freeing for boys, who may otherwise feel it is uncool to engage in class discussions or to show their emotions. Therefore, it is imperative to use this teachable moment to promote empathetic communication. 10)

Work More Effectively: Social media allows you to change the paradigm from teacher as expert to group as expert. Rather than asking around between classes or sending and tracking emails to multiple people who may know answers, you can ask a global community via social media. 5.4.2

Disadvantage of using social media in Education Any

school and classroom need to have solid guidelines in place before you introduce technology. This keeps everyone safe and ensures your students only harness the power of social media for good.

Some challenges are also associated with the use of social media, which can affect children with visual impairment and others significantly. Following are few major disadvantages of using social media in education: a) Social Media can be a Distraction: A common issue among teachers is that social media is distracting in the classroom. These teachers maintain that resources like Facebook and Twitter divert students' attention away from what's happening in class and can disrupt the learning process. With the possibility that the use of social media tools can be an invitation for students to play truant, teachers should make sure they won't be abused. b) Cyberbullying: While social networking sites provide a way for students and teachers to link up, they can be a tool for harmful behaviour- even at school. Teachers who use social media as part of their teaching should be wary of possible risks and plan to intervene on minor

127 incidents before they become more serious. c) Discouraging Face-to-Face Communication: Some educators are worried that while real-time digital stream may create a safe situation for students who are uncomfortable expressing themselves, learners are missing valuable lessons in real-life social skills. Students may find themselves at a disadvantage during university admission or job interviews when they need to command attention and deliver a coherent message. At public events and in personal relationships, they need to be able to effectively express themselves and connect with others. Ultimately, while the debate continues over what role social media should play in the classroom, no one can argue the influence that social networking has on today's students. The new generation is tech-savvy generation and they conduct much of their life through social media including sharing of emotions and achievements. They are already using various social networking sites (viz. YouTube, Facebook, Twitter etc.) as tools for learning and collaboration. They expect that their education will follow suit. With this in mind, it seems practical and sensible for today's institutions to get on the social media and explore ways to successfully integrate these tools into the learning of students with visual disabilities.

5.4.3 Few Social Media Sites used in Education

We do have several social media platforms to connect and interact with educational purposes. Followings are few important social media platforms (other than popular Twitter and Facebook) through students and teachers could connect and interact with each other:

a) Twiducate: The Twiducate platform is a free resource for educators. Objective of Twiducate is to create a medium for teachers and students to continue their learning outside the classroom. It is

easily accessible and allows teachers to create a class community online using a class code rather than an email address. It also allows teachers to have total control over who is a member and what gets posted.

b) Blackboard: This is a popular course management system as well as academic social media for 128 school community. It allows multi stage restricted permission to access, create and edit the content. The decision to use Blackboard is usually made at the top tier. Blackboard is an incredibly powerful, safe and comprehensive platform.

It is not a free application. Rather, it is a very expensive platform. Again, it also lacks flexibility at higher extent. c)

Wikispaces Classroom: Wikispaces Classroom is a free social writing platform for education. It is easy to create a classroom workspace where a teacher and students can communicate and work on writing projects alone or in teams. Various assessment tools allow teachers to measure student contribution and engagement in real-time. Wikispaces Classroom works great on modern browsers, tablets, and phones. Wikispaces Classroom is free for teachers and students. Over ten million registered teachers and students are available on the platform. Teacher can assign, collaborate on, discuss and assess projects all within the site. It can even handle multimedia.

d) Edmodo: Edmodo is an excellent and free classroom management system. It includes news feeds, assessment tools, communication capabilities and security features.

It connects teachers students and others for educational purposes. e) Skype:

It is the one site that can bring the outside world right into your classroom. You can host authors, visit science labs or talk to resource persons from across the globe.

It allows two way tele- conferencing among resource persons and students. f) Academia.edu: Academia.edu is a social networking website for academics. The platform can be used

129 to share papers, monitor their impact, and follow the research in a particular field. It was launched in September 2008. The platform website allows its users to create a profile, upload their research or academic works, select areas of interests and then the user can browse the networks of people with similar interests. As of January 2017, there were 47 million users from around the world. g) Researchgate: ResearchGate is a social networking site for scientists and researchers to share research papers, ask and answer questions, and find collaborators. It is believed to be the largest academic social network in terms of active users. People that wish to use the site need to have an email address at a recognized institution or to be manually confirmed as a published researcher in order to sign up for an account.

Members of the site each have a user profile and can upload research output including papers, data, chapters, negative results, patents, research proposals, methods, presentations, and software source code. Users may also follow the activities of other users and engage in discussions with them. Users are also able to block interactions with other users.

5.5. Creation of Blogs A blog or, weblog

is a discussion or informational website published on the World Wide Web consisting of discrete, often informal diary-style text entries.

These text entries or multimedia entries are known as posts. Posts are typically displayed in reverse chronological order, so that

the most recent post appears first, at the top of the web page. 5.5.1

Blog: Concept & Classification The emergence and growth of blogs in the late 1990s coincided with the advent of web publishing tools that facilitated the posting of content by non-technical users who did not have much experience with HTML or computer programming. Previously, a knowledge of such technologies as HTML and File Transfer Protocol had been required to publish content on the Web. Having a blog and making posts on blog

130 could be termed as blogging. Blogging can be seen as a form of social networking service. Indeed, bloggers do not only produce content to post on their blogs, but also often build social relations with their readers and other bloggers.

Many blogs provide commentary on a particular subject or topic, ranging from politics to sports or education. A typical blog combines text, digital images, and links to other blogs, web pages, and other media related to its topic. The ability of readers to leave

publicly viewable comments, and interact with other commenters, is an important contribution to the popularity of many blogs.

However, blog owners or authors often moderate and filter online comments to remove hate speech or other offensive content. In education, blogs can be used as instructional resources. These blogs are referred to as edublogs. There are different types of blogs, differing not only in the type of content, but also in the way that content is delivered or written:

lllll **Personal blogs:** The personal blog is an ongoing online diary or commentary

written by an individual, rather than a corporation or organization. While the

vast majority of personal blogs attract very few readers, other than the blogger's immediate family and friends, a small number of personal blogs have become popular, to the point that they have attracted lucrative advertising sponsorship. A tiny number of personal bloggers have become famous, both in the online community and in the real world. lllll

Collaborative blogs A type of weblog in which posts are written and published by more than one author. The majority of high-profile collaborative blogs are based around

a single unifying theme, such as politics, technology or advocacy. In

recent years, the blogosphere has seen the emergence and growing popularity of more collaborative efforts, often set up by already established bloggers wishing to pool time and resources, both to reduce the pressure of maintaining a popular website and to attract a larger readership. l **Microblogging** Microblogging is the practice of posting small pieces of digital

content;Xwhich could be text, pictures, links, short videos, or other media on the Internet. Microblogging offers a portable communication mode that feels organic and spontaneous to many users. Examples of these include Twitter, Facebook, Tumblr etc.

131 l **Corporate or organizational blogs** Blog is generally personal or private in most cases. But, it can be for business or not-for-profit organization or government purposes. Corporate or organizational Blogs used internally, and only

available to employees via an Intranet are called corporate blogs. Companies use internal corporate blogs to enhance the communication, culture and employee engagement in a corporation. 5.5.2 **Blogging Platforms** There are several

blogging platforms. Followings are some important blogging platforms (other than Facebook and Twitter) where user can create their blog and post text, picture, videos etc. accordingly for educational purpose: 1) **Word Press:** Word Press is a Downloadable blogging (and website management) software, as well as of of the most popular blogging platform.

Currently 25 percent of the entire web blogs are powered by Word Press. The software you get from WordPress.org is a downloadable package, which you then have to upload/install on a web server you already manage. WordPress is very easy to use and need not any specific training for using it. Only having basic computer skills are enough for use blog managed by WordPress. Once, blog is being created, using this blogging platform on a daily basis to publish your posts is very straightforward and easier. There are more than enough free themes in the official directory at WordPress.org. 2)

Google Blogger Blogger is one of the oldest blogging platforms and owned by Google. The separate login account is not needed for creating a blog on blogger. One need to sign

132 up with his/her standard Google account, similarly to WordPress.com. Blogger takes care of all the technical heavy lifting, allowing you to just focus on creating content. Blogger platform is free but, personalized web domain and hoisting may lead to additional payment. When one creates blog on blogger, individual gets a subdomain like example.blogspot.com. You can change your custom domain too. Basic computer skills are enough to start blogging under Blogger. 3) Tumblr A trendy micro blogging hosted platform with a social network aspect. Tumblr is a great blogging platform optimized specifically for bloggers who want to publish short-form content, such as micro-blogs, quotes, images, videos, and animated pictures. Tumblr is also a community of users, ready to promote and comment on each other's work. Tumblr hosts your blog for no additional cost. No specific skills are required to start and run a Tumblr blog. The interface is user-friendly Tumblr blogs are easy to set up and easy to run afterwards. 4) Medium A publishing platform for your blog posts, stories and articles. Medium has grown in popularity a lot during the last couple of years (more than a million people have joined Medium). In short, it's a community of writers and bloggers, all using the same looking site design to share their opinions and stories on various topics. 1111 Wix: Wix is very easy to use when it comes to launching a new website. However, you do need to go through a couple of additional steps to add the blog module. Nothing too difficult but still. Overall, Wix provides a step-by-step wizard to get through the whole process. More than 500 designs available. There's a number of essential site management features built-in.

133 5.5.3 Creation of Blog Each platform does have certain specification and a certain path to create a blog on that. It is very difficult to discuss creation of blog on each and every blogging platforms. We are taking Google Blogger as an example to create a blog and use the same. Following are the steps to create a bog with help of Google Blogger: To set up a blog of your own Ø Go to <https://www.blogger.com/start> and Click the orange "Create a Blog" button. Ø Fill out the registration information, click that you accept the terms of service, then click "continue." Ø Fill in the information on the next screen, officially opening a Google account, then click "continue." Ø Give your blog a name (remember—it should suit your chosen character!) and choose a unique URL address. Check the availability on the URL you have chosen, and once you find an available one, click "continue." Ø Now comes the fun part: scroll through the available templates and select one you think would appeal to your character. Click "continue." Ø Congratulations! You should see the "Your blog has been created" screen. Click "start blogging now." To make a post Ø The most recent posts will always appear at the top of your blog. Ø Sign in to your blog at <https://www.blogger.com/start2> with the e-mail and password you gave during set-up. Ø Now you will see your dashboard page, with many options for what to do. Click the blue bubble that reads "New Post." Ø Type in a title for your post- this will show up above the text in your blog - then enter whatever text you wish in the box. You may also add images, videos, or links (see below). The menu across the top will allow you to alter the font, size, and color of your text, should you wish to do so. Keep your graphic design interesting, but remember that the text of your posts is more important than changing each letter into a rainbow of color. Try to make design decisions you believe your character would make. Ø Click "Publish Post." You will now be able to choose to "View Blog," "Edit Post," or "Create a New Post." Select an option.

134 To add an image to a post Ø Save an image to your desktop. If it is not an image you took, be sure to write down the source information and include that in a Sources Cited section on your blog. continued Blog Creation Steps (continued) Ø On the "New Post" page run your mouse across the menu of option icons just above the text box. Click on the little blue box with the mountain in it that reads "Add Image" when your mouse crosses it. Ø In the new box, click "Browse" and then choose the picture file from your desktop. Choose to place image in the left, center, or right of the screen. Choose to make image small, medium, or large. You may format and add up to five images at a time. Ø Click "I accept the terms of service" and then "Upload Image." Your images should soon appear in your post. To add a video to a post Ø Save a video file to your desktop. If it is not a video you took, be sure to write down the source information and include that in a Sources Cited section on your blog. Ø On the "New Post" page run your mouse across the menu of option icons just above the text box. Click on the little film strip that reads "Add Video" when your mouse crosses it. Choose the file from your desktop, give the video a title, accept the terms of service, and then click "Upload Video." To add a link to a post Ø Copy the desired URL from your web browser. Ø Copy the link into your post, and then highlight it again with the mouse. Ø Run your mouse across the menu of option icons just above the text box. Click on the one with a green circle that reads "Add Link" when your mouse crosses it. Paste or retype your link into the box and click OK. Ø Your text should change color and become a link. To edit or delete a post Ø From your main blog page (you can always access this page by choosing "View Blog"), choose "New Post." On the new post page, just above the main box, choose the link "Edit Posts."

135 Ø This will take you to a page showing all past posts. You may click the box for any post and then choose "Edit" on the far left. This will take you back into the page as if you are still continued. Blog Creation Steps (continued) working on the post for the first time. You can make any changes you wish and then click "Publish Post." The new post will replace the old one. Ø If you prefer to erase the post altogether, simply click "Delete" on the far right of the "Edit" page for the chosen post. To add a group of links, text, survey, or image to the sidebar Ø From your main blog page (you can always access this page by choosing "View Blog"), choose "Customize" in the upper right corner. Ø From the "Customize" page, you can add any number of page elements. On the upper right, choose "Add a Gadget." Ø Scroll through your gadget options, selecting the one you wish from: "Poll," "Link List," "Picture," or "Text." You can also try adding other gadgets' Xexperiment! Ø Follow the instructions for the gadget you choose and then click "Save" to put the gadget into your sidebar. This will return you to the layout page. Ø Back on the layout page, you can click "Preview" to see what your new gadget looks like, or you can click "Save" to make it part of your blog. Ø You can always delete gadgets from the layout page, simply by clicking "Edit" in the gadget's box, and then choosing "Remove." Ø You may also rearrange your page elements in this page by clicking and dragging any element to a new location. To add a footer image or quotation Ø From your main blog page (you can always access this page by choosing "View Blog"), choose "Customize" in the upper right corner. Ø From the "Customize" page, you can add any number of page elements. On the bottom of the page choose "Add a Gadget." You may now add a picture or text across the bottom just like you did in the sidebar in the previous menu.

136 5.6. Tele-Conferencing From the points of view of the teaching functions, interactivity and user friendliness, tele-conferencing emerges as an appropriate technology for reaching varied clientele groups in diverse settings. Teleconferencing means meeting through a telecommunications medium. It is a generic term for linking people between two or more locations by electronics.

This technology is famous in open and distance learning modalities. With the advancement of communication technologies and reduction of costs, various organizations are also opting this technology in their education and training programmes. 5.6.1 Teleconferencing: Concept and Scope The word 'tele' means distance. The word 'conference' means consultations, discussions. Through teleconferencing two or more locations situated at a distance are connected so that they can hear or both see and hear each other. It allows the distant sites to interact with each other and with the teaching end through phone, fax, and e- mail. The interactions occur in real time. This means that the learners/participants and the resource persons are present at the same time in different locations and are able to communicate with each other. There are three following essential features of teleconferencing: Ø Learners/participants present at particular time and in dispersed places Ø Resource persons present at the same time at the teaching end or different teaching ends. Ø Interactions between: Ø Learner–resource persons/AV materials at the teaching end(s). Ø Learner–learner at the learner center Ø Learner–facilitator/materials/activities at the learner center Ø Learner–learner at/between other learner centers

137 Ø Resource person–resource person. Tele-conferencing (especially video-conferencing) increases efficiency and results in a more profitable use of limited resources. It is a

very personal medium for human issues where face-to-face communications are necessary.

When you can see and hear the person you are talking to on a television monitor, they respond as though you were in the same room together.

Videoconferencing maximizes efficiency because it provides a way to meet with several groups in different locations, at the same time.

The communication in teleconferencing is both vertical and horizontal, and the emphasis is on interaction at all levels. Meaningful interaction in real time is the strength of teleconferencing, and this sets it apart from other technologies used in education. The one-way limitation of educational broadcasting is overcome through the technology configuration. Stimulating responses to visuals, situations, dialogue, discussion, sharing, active experimentation, project work, etc. encourage interactivity. Some of other features of tele-conferencing are as follows: Ø Move Information, Not People or physical things. Ø Electronic delivery is

more efficient than physically moving people to a site, whether it is a faculty member or administrator. Ø Save Time: Content presented by one or many sources is received in many places simultaneously and instantly. Travel is reduced resulting in more productive time.

Ø

Lower Costs: Costs (travel, meals, lodging) are reduced by keeping employees in the office, speeding up product development cycles, improving performance through frequent meetings with timely information.

Ø Accessible: Through any origination site in the world. Ø Larger Audiences: More people can attend. The larger the audience,

the lower cost per person. Ø Adaptable: Useful for business, associations, hospitals, and institutions to discuss, inform, train, educate or present.

Ø

Flexible: With a remote receive or transmit truck, a transmit or receive site can be located anywhere.

138 Ø Security: Signals can be encrypted (scrambled) when it is necessary. Encryption prevents outside viewers. Ø Unity: Provides a shared sense of identity. People feel more a part of the group...more often. Individuals or groups at multiple locations can be linked frequently.

Ø

Timely: For time-critical information, sites can be linked quickly. An audio or point-to-point teleconference can be convened in three minutes. Ø Interactive: Dynamic; requires the user's active participation. It enhances personal communication. When used well for learning, the interactivity will enhance the learning and the teaching experience. Ø Concretization of experience Ø Reflective observation Teleconferencing could have different technical configurations and applications. It includes use of telephone for audio conferencing, graphics in addition to audio for audio-graphic conferencing, television and/or computer for video conferencing. Following are different types of Teleconferencing: Ø Audio Teleconferencing: Sometimes, it is called as Voice-only conference or, conference calling. Interactively links people in remote locations via telephone lines. Audio bridges tie all lines together. Meetings can be conducted via audio conference.

Preplanning is necessary which includes naming a chair, setting an agenda, and providing printed materials to participants ahead of time so that they can be reviewed.

Distance learning can be conducted by audio conference. Ø Audiographics Teleconferencing: Uses narrowband telecommunications channels to transmit visual information such as graphics, alpha- numerics, documents, and video

pictures as an adjunct to voice communication. Other terms are desk-top computer

conferencing and enhanced audio. Devices include electronic tablets/ boards, freeze-frame video terminals, integrated graphics systems, Fax, remote- access microfiche and slide projectors, optical graphic scanners, and voice/data terminals.

Ø Computer Teleconferencing:

Uses telephone lines to connect two or more computers and modems. Anything that can be done on a computer can be sent over the lines.

It can be

synchronous or asynchronous. An example of an asynchronous mode is electronic mail.

Using electronic mail (E-Mail), memos, reports, updates,

139 newsletters can be sent to anyone on the local area network (LAN) or wide area network (WAN).

Items generated on computer which are normally printed and then sent by facsimile can be sent by E-Mail. Computer conferencing is an emerging area for distance education. Some institutions offer credit programmes completely by computer. Through computers, faculty, students and administrators have easy access to one another as well as access to database resources provided through libraries. Ø Video Teleconferencing: Combines

audio and video to provide voice communications and video images. Can be one-way video/two-way audio, or two- way video/two-way audio.

It

can display anything that can be captured by a TV camera.

In two-way audio/video systems, a common application is to show people which creates a social presence that resembles face-to-face meetings and classes and enables participants to see the facial expressions of participants at remote sites.

Video conferencing is an effective way to use one teacher who teaches to a number of sites. It is very cost effective for classes which may have a small number of students enrolled at each site. Rural areas benefit particularly from classes provided through video conferencing when they work with a larger institution.

5.6.2 Advantages of Teleconferencing

- Ø It provides learning to large groups, which are geographically dispersed.
- Ø For organizations, delivery costs are reduced with resultant cost benefit in terms of time, travelling and spread of resources over large groups
- Ø It makes the best use of the available resources by expanding their learning opportunity and taking the resources to the learners.
- Ø It overcomes time or scheduling problems for the learners who can assemble at a learning centre for a limited period only because of their full time or part time work, and family and community commitments.
- Ø It can be designed to meet local specific requirements of training in terms of content, language and conditions.

140 Ø There is greater appeal, motivation and retention of information as a variety of teaching methodologies are used.

- Ø By using animation, graphics and other techniques, teleconferencing is good at showing processes for demonstrations and experiments, thereby concretizing learning.
- Ø By conveying sights, sounds, and the spirit of the subject, it provides a more rounded view of an issue.
- Ø It provides uniformity of training, which is interactive. On the basis of feedback, instructors can make appropriate shifts in the teaching strategies to meet learner needs.
- Ø The element of interactivity in teleconferencing is encouraged through dialogue and by stimulating responses to situations and visuals. The opportunity of dialogue allows the learners to discuss, question, and challenge issues. Stimulating the learners to respond to situations and visuals leads to higher processes of learning. As the learners become familiar with the technology and its practices, their communication and learning skills are enhanced.
- Ø Interactivity gives a sense of participation and an active environment for learning.
- Ø The learners may feel themselves to be a part of the 'real-life' learning situation, and though located on different sites they feel they are connected. Relationships are established as in a group situation.
- Ø For the field functionaries in remote rural areas, it reduces the sense of isolation, encourages sharing of concerns and ideas, and helps solve their problems.

5.6.3 Limitations of Teleconferencing

Teleconferencing has its limitations, but these can be overcome to a great extent by corrective measures and using appropriate content, planning, organization and management.

- Ø If the number of centers is increased, time for interactivity for each center is correspondingly reduced.
- Ø Since teleconferencing demands real time interaction, the learners are required to be present at particular times and places. Otherwise it will not work. It may be difficult for learners to do so because of logistics problems and other regional reasons resulting in poor attendance at the sessions.

141 Ø Evaluation of learning could be a challenge in tele-conferencing.

- Ø Teleconferencing to be effective for any type and purpose would require planning, teaching strategy, development of content and materials, presentation techniques and evaluation.

5.7 Distance Learning and ICT Technology

is not limited to the use of machines, and the aim is to apply the scientific knowledge in order to obtain a practical result. The humankind has created science and technologies, from the wheel to the computer, and the changes were significant in their relations between the human beings and the nature, overcoming the traditional learning and teaching process. We cannot simply use a resource. It is important that all the pedagogical action is previously prepared, using structured objectives and allowing students to keep in touch with new and different contents. By doing it, learners are stimulated to build new relations with themes previously acquired. The teaching work makes use of a pool of technological assets, aiming the learning appropriation according to the mediation of the educator, with diversified resources and from different methodological procedures. Technology becomes the mediation for Distance Education and the technology serves as a vehicle through which the course is conducted.

5.7.1 Distance Learning

In conventional system of education teaching-learning takes place in classrooms, where the students and teachers meet regularly at fixed timings. Distance education was an educational mode supplementary, complementary and alternative to conventional/ traditional system of education, depending on the situation it was practised. Today it has evolved into an independent system of education. The growth of communication technologies and the cognitive sciences which are flexible enough to use the technologies for pedagogic purposes have key roles in

distance education. The term open and distance learning and its definition are relatively new in the field of education, having gained prominence only in the past 20 years. The language and terms used to describe distance learning activities can still be confusing, and geographical differences in usage.

There is no one definition of open and distance learning. Rather, there are many approaches to defining the term. Most definitions, however, pay attention to the following characteristics:

- Ø separation of teacher and learner in time or place, or in both time and place;

Ø

use of mixed-media courseware, including print, radio and television broadcasts, video and audio cassettes, computer-based learning and telecommunications. Courseware tends to be pre-tested and validated before use; Ø two-way communication allows learners and tutors to interact as distinguished from the passive receipt of broadcast signals. Ø Communication can be synchronous or asynchronous; Ø possibility of face-to-face meetings for tutorials, learner-learner interaction, library study and laboratory or practice sessions; and Ø institutional accreditation.

5.7.2 ICT and Distance Education Distance education is an educational innovation to meet the ever increasing and diversified educational needs and demands of the society which are sequel to changing social, economic, and other conditions on one hand and technological developments on the other. Information and communication technology has widened the scope of educational technology and enhanced the efficiency of educational communication coupled with accuracy and speed of feedback. As a result of this, it has become possible to offer a variety of educational programmes to different sections or groups of people through various media of communication. Distance Education follows the evolution of the communication technologies, which gives support to this kind of education. In this context, the teacher may understand that technology contributions as a pedagogical resource will occur continuously. Then, he/she needs to act according to this possibility, planning his/her practices and organizing the pedagogical actions as a mediation for this learning process, trying to 143 overcome expectations and, consequently, the appropriation of knowledge. The development of new technologies, which has instigated a revolution in our society and in people's jobs, has permitted other possibilities for teaching and learning process. It has also provided the development of new alternatives for the Distance Education modality, combining the familiar educational resources with the tools of the Information and Communications Technologies (ICTs). These directions point to the renovation of teaching by formulating a wider conception of the educational process in order to meet the demand of the society. In doing so, the ICTs can be used by the higher education institutes aiming to adequate and make their contents available, then giving rise to a greater flexibility of access to the distance courses.

5.8.

e-Classroom: Concept and adaptations for children with visual impairment

Teaching without chalk and blackboard made possible through technology that serves as fundamental structural changes as integral to achieving significant improvements in productivity. It used to support both teaching and learning, technology infuses classrooms with digital learning tools, such as computers and hand held devices. Student engagement and motivation; and accelerates learning. Technology also has the power to transform teaching by ushering in a new model of connected teaching. This model links teachers to their students and to professional content, resources, and systems to help them improve their own instruction and personalized learning.

5.8.1 e-Classroom: Concept E-classroom as part of our educational technology eliminates the barrier to quickly access new information and it bridges the gap between the rich and the poor and urban

144 to remote areas to quest for quality learning. This type of learning creates opportunities to teachers and pupils/students to use the educational resources and other technologies that can increase educational productivity by accelerating the rate of learning reducing costs associated with instructional materials and better utilizing teacher's time. E- classroom has also the potential to improve educational productivity by accelerating the rate of learning, taking advantage of learning time outside of school hours, reducing the cost of instructional materials, and utilizing teacher's time. It also helps to develop the mindset of the students towards positive thinking and quest for more learning towards excellence. These can be particularly useful in rural areas where online learning can help teachers and learners accessible to information and to overcome distance. Digital resources like electronic grade books, digital portfolios, learning games, is a powerful tools to help teachers create more engaging and interactive teaching ways of learning on teacher and student performance, are a few ways that technology can be utilized to transform learning.

5.8.2 Objectives of the E-Classroom There are a number of pedagogical methods and models of instruction. Rather the goals of the electronic classroom focus on the support of a wide range of instructional and classroom activities. The high level goals of the electronic classroom are as follows: Ø To provide a more interactive learning experience than is generally possible in the traditional classroom.

Ø To provide interactive and hypermedia technologies during classroom interaction. Ø

To increase student-to-student and student-to-teacher interaction and collaboration. Ø To provide students with an integrated learning environment with access to hypermedia databases,

telecommunications, and simulations. One primary theme running through these objectives is interactivity, to involve the student actively in the learning process. The other primary theme is to enrich the educational environment. Hypermedia provides a way to bring text, graphics, audio, and video together;

145 telecommunications opens up a window to the world; and simulations provide dynamic, graphic models of abstract systems and theories. These technological objectives, however, should in no way obscure or take precedence over higher educational objectives. A good lecture devoid of technology may be necessary to engage students in a theme.

Face-to-face, unmediated interaction may be necessary to drive a point home. Only when it proves beneficial should the instruction turn to the electronic media. The narrow view of the electronic classroom is that it is a room with computers and multimedia displays. The broader view is that it

is an electronic environment that supports the many processes

of

classroom education. But to provide such an environment the classroom must have some combination of the following elements: Ø A computer workstation for the instructor. Ø A multimedia system capable of presenting a variety of types of information (e.g., text, graphics, animation, audio, and video). Ø A database of educational materials within the classroom.

Ø

A computer workstation for each student Ø A local area network that allows communication among all of the workstations, and the viewing and sharing of screen images. Ø A system that provides storage, sharing, and transfer of documents.

Ø

A telecommunication system to link the classroom to external educational resources. 5.8.3

e-Classroom: Adaptations for Visually Impaired The Internet and internet based learning are tremendously important, including the lives of people who are blind or visually impaired. The world-wide-web makes daily life a lot easier for most of us but there are also people who cannot fully take advantage of the benefits of the web such as blind people. Not every e-classroom platform is optimally designed for use by individuals with visual impairments. When an e- classroom is built without regard to proper web design, they become inaccessible by people with vision loss who use access technology. Fortunately, things are changing and blind people can use the web just like everyone else although web accessibility for blind people is far from ideal. Everyone could be benefited by accessible e-classroom. The same good techniques that

146 make platform accessible to those of us who use access technology benefit users of other devices as well. For example, people with slower Internet connections and those using devices such as cell phones or tablets that have smaller screens. Since the web and computers are primarily a visual media, blind people obviously cannot use it without specially designed technology. They typically use web browsers which are specially designed for blind people or the so-called screen readers - software programmes which work by speaking the text. Some, however, also use the refreshable Braille display which, like its name suggests, converts textual information into Braille characters. In addition to enabling blind people to understand the content on a particular website, screen readers can also "detect" text that is highlighted or differently coloured, read pre- selected text on demand, "determine" the location of the cursor, etc. by which they make the web fully accessible to blind people but only under condition that the websites they are accessing are designed with the use of codes that can be "read" by screen readers. Despite the ethical standards, not all website and web based platforms are fully accessible for blind or visually impaired people. This is partly related to the fact that blind people form a small percentage of disabled web users and partly due to misconception that making proper adjustments to improve web accessibility is complicated and expensive. But it is not complicated nor expensive. It is important to mention that web accessibility for blind people does not affect the attractiveness or usability of the website for non-disabled people in any way. And proper adjustments that make a website accessible for all users regardless of their disabilities are not expensive nor complicated. 5.9 Let us sum up Computer Aided Learning is an integrative technology, which describes an educational environment where a computer programme is used to assist the user in learning a particular subject. It refers to an overall integrated approach of instructional methods.

147 Computer aided learning is a device as well as a learning strategy to make teaching more interesting joyful and sustainable. Social media are forms of electronic communication (such as websites for social networking and microblogging) through which users create online communities to share information, ideas, personal messages, and other content (such as text, pictures and videos) Social media has gained credibility over the years as a trusted source of information and platform where individuals or organizations can interact with other individuals. Social media infuses today's society with millions of us engrossed, some would argue to the point of unhealthy addiction, in the latest happenings via apps such as Facebook and Twitter. The use of social media in education provides students with the ability to get more useful information, to connect with learning groups and other educational systems that make education convenient. Social network tools afford students and institutions with multiple opportunities to improve learning methods. A blog or, weblog

is a discussion or informational website published on the World Wide Web consisting of discrete, often informal diary-style text entries.

These text entries or multimedia entries are known as posts. Posts are typically displayed in reverse chronological order, so that

the most recent post appears first, at the top of the web page.

The emergence and growth of blogs in the late 1990s coincided with the advent of web publishing tools that facilitated the posting of content by non-technical users who did not have much experience with HTML or computer programming. Blogging can be seen as a form of social networking service. Indeed, bloggers do not only produce content to post on their blogs, but also often build social relations with their readers and other bloggers.

Many blogs provide commentary on a particular subject or topic, ranging from politics to sports or education. A typical blog combines text, digital images, and links to other blogs, web pages, and other media related to its topic. The ability of readers to leave

publicly viewable comments, and interact with other commenters,

is an important contribution to the popularity of many blogs.

However, blog owners or authors often moderate and filter online comments to remove hate speech or other offensive content. In education, blogs can be used as instructional resources. These blogs are referred to as edublogs. Through teleconferencing two or more locations situated at a distance are connected so that they can hear or both see and hear each other. It allows the distant sites to interact with each other and with the teaching end through phone, fax, and e-mail. The interactions occur in real time. This means that the learners/ participants and the resource persons are present at the same time in different locations and are able to communicate with each other. Tele-conferencing (especially video-

148 conferencing)

increases efficiency and results in a more profitable use of limited

resources. It is a

very personal medium for human issues where face-to-face communications are necessary.

When you can see and hear the person you are talking to on a television monitor, they respond as though you were in the same room together.

Videoconferencing maximizes efficiency because it provides a way to meet with several groups in different locations, at the same time.

The communication in teleconferencing is both vertical and horizontal, and the emphasis is on interaction at all levels. Meaningful interaction in real time is the strength of teleconferencing, and this sets it apart from other technologies used in education. The one-way limitation of educational broadcasting is overcome through the technology configuration. Stimulating responses to visuals, situations, dialogue, discussion, sharing, active experimentation, project work, etc. encourage interactivity. E-classroom as part of our educational technology eliminates the barrier to quickly access new information in the field of research and it bridges the gap between the rich and the poor and urban to remote areas to quest for quality learning. This type of learning creates opportunities to teachers and pupils/students to use the educational resources and other technologies that can increase educational productivity by accelerating the rate of learning reducing costs associated with instructional materials and better utilizing teacher's time. E-classroom has also the potential to improve educational productivity by accelerating the rate of learning, taking advantage of learning time outside of school hours, reducing the cost of instructional materials, and utilizing teacher's time.

5.10 Check your progress

- 1) Computer aided learning is to make teaching more: a. interesting b. joyful c. sustainable d. all of the above
- 2) Computer aided learning is a _____ to make teaching more interesting: a. device b. learning strategy c. Both d. None
- 3) Social media are forms of a. electronic communication b. face to face meeting c. Personal meeting d. Sharing papers
- 4) Major disadvantages of using social media in education: a. It may create distraction b. Cyberbullying c. Discouraging Face-to-Face Communication d. All of the above
- 5) Wikispaces Classroom is a free social writing platform for a. Education b. Industry c. Movies d. Games
- 6) In blogs posts are typically in a. reverse chronological order b. chronological order c. random order d. increasing post size
- 7) Essential features of teaching through teleconferencing: a. Learners present at particular time at dispersed places b. Resource persons present at the same time at the teaching end c. Interactions between them (a & b) d. All of the above

150 8) In e-classroom technology contributions are as : a. learning barrier b. content facilitator c. pedagogical resource d. readiness

9) e-learning creates opportunities to teachers and pupils to a. Use the educational resources b. Use other technologies that can increase educational productivity c. Accelerating the rate of learning d. Reducing costs associated with instructional materials.

3 Netaji Subhas Open University From the Vice-Chancellor's Desk Dear Students, from this Academic Session (2015-17) the Curriculum and Course Structure of B. Ed.- Special Education have been thoroughly revised as per the stipulations which featured in the Memorandum of Understanding (MoU) between the Rehabilitation Council of India (RCI) and the National Council for Teacher Education (NCTE). The newly designed course structure and syllabus is comprehensive and futuristic has, therefore, been contextualized and adopted by NSOU from the present academic session, following the directives of the aforesaid national statutory authorities. Consequent upon the introduction of new syllabus the revision of Self Instructional Material (SIM) becomes imperative. The new syllabus was circulated by RCI for introduction in the month of June, 2015 while the new session begins in the month of July. So the difficulties of preparing the SIMs within such a short time can easily be understood. However, the School of Education of NSOU took up the challenge and put the best minds together in preparing SIM without compromising the standard and quality of such an academic package. It required many rigorous steps before printing and circulation of the entire academic package to our dear learners. Every intervening step was meticulously and methodically followed for ensuring quality in such a time bound manner. The SIMs are prepared by eminent subject experts and edited by the senior members of the faculty specializing in the discipline concerned. Printing of the SIMs has been done with utmost care and attention. Students are the primary beneficiaries of these materials so developed. Therefore, you must go through the contents seriously and take your queries, if any, to the Counselors during Personal Contact Programs (PCPs) for clarifications. In comparison to F2F mode, the onus is on the learners in the ODL mode. So please change your mind accordingly and shrug off your old mindset of teacher dependence and spoon feeding habits immediately.

I would further urge you to go for other Open Educational Resources (OERs) - available on websites, for better understanding and gaining comprehensive mastery over the subject. From this year NSOU is also providing ICT enabled support services to the students enrolled under this University. So, in addition to the printed SIMs, the e-contents are also provided to the students to facilitate the usage and ensure more flexibility at the user end. The other ICT based support systems will be there for the benefit of the learners. So please make the most of it and do your best in the examinations. However, any suggestion or constructive criticism regarding the SIMs and its improvement is welcome. I must acknowledge the contribution of all the content writers, editors and background minds at the SoE, NSOU for their respective efforts, expertise and hard work in producing the SIMs within a very short time. Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor, NSOU

1.1 Introduction There was a time when students used to be clustered at the feet of their gurus to listen and memorize what was read to them from a precious, laboriously produced hand written manuscript. Then gradually came the printed book which was a form of automation, a kind of teaching machine and students got their own copy to study on their own. So the function of the teacher has been changed. The teacher got relief from the tedious duty of reading information and got time to counsel and provide individualized teaching to students. The teacher got time to improve teaching by Explanation, interpretation and correlate the mass of information and knowledge available in text book to make the learning easier and joyful for the learners. But as the world is progressing very rapidly due to new innovations in the field of science and technology which can be seen everywhere in our daily lives, we need to prepare our children for this new world by changing the way we educate them. The 21st century is dealing with two basic problems namely population explosion and information explosion. The educational institutions has been affected with the increased number of students due to population explosion, increased mobility of students, increased range of students abilities and diverse backgrounds. The world has become a global village and due to technological advancement information flows rapidly among learners. The Administrators and Teachers are actively searching for ways to prepare students for the future, and the educational system has been evolving faster than ever before. A classroom is no longer consisting of four walls with a blackboard and a lecturer in front, talking to students instead of interacting with them. Interactive whiteboards, tablet PCs, projectors, mobiles and a host of other tools allow teachers to present information

11 in ways that prompt discussion and collaboration and make learning interactive and accessible. Educationists believe that if technology is properly supported and widely used in teaching and learning process could help the most of the pressing needs and many teaching problems can be solved by the proper use of rich experience that can be gained through various media. In this technological era therefore, a modern and updated teacher must take full advantage of the existing technological resources to help facilitate students learning. In this first unit of, we will make an attempt at understanding the concept and nature of educational technology. This unit will also help us to understand hardware, software, and systems approaches to educational technology. The scope of educational technology, recent trends and significance of ET. We will also know about another important learning point, the concept of universal design of learning and individualized instruction which can help teachers to teach children with learning problems or who are differently able to access education with the help of educational and instructional technology. 1.2 Objectives After going through this unit, the learner will be able to l Understand the concept of educational technology; l Understand the scope and importance of educational technology in the teaching- learning process; l Understand the role of technology in education and acquire knowledge about its various approaches and modes. l differentiate hardware, software, and systems approach to educational technology; l classify different types of educational technologies and recent trends l understand the concept and importance of universal design of learning and individualised instruction 1.3

Educational and Instructional Technology - Meaning, Nature, Scope, Definition, Objectives and Significance 1.3.1

Meaning and Definition of Educational Technology - Before understanding the meaning of educational technology we should first of all know

12 the meaning of technology. In general we say the application of scientific laws and principles for the purpose of making daily life easy and comfortable is technology. With the help of these applications we make different machines and devices which accelerate and systematize our daily life. Therefore technology refers to two aspects namely - theoretical, based on ideas and practical based on putting those ideas into practice. When we use technology for the purpose of accelerating and facilitating educational process and to make the education accessible to all kind of learners, that technology is called as educational technology. But this is not the complete meaning of educational technology. For many of us the term 'educational technology' is associated only with the equipment and with the hardware, which is used, viz. over head projector (OHP), LCD projector, television, computer etc. However, the concept of educational technology should not be confused or limited with the electronic gadgetry; it has a broader meaning. In its wider perspectives ET includes the entire process of the setting of educational goals, the continuous reforms of curriculum, the tryout of new teaching methods and materials, the evaluation of the education system as an integrated whole and if necessary, resetting of goals on the basis of the findings of evaluation and innovations.

Educational technology implies the use of all type of educational resources - men, materials, machine, methods and techniques, means and media in an integrated and systematic manner for optimizing teaching learning process in its best possible manner. Educationists have understood educational technology in different ways, some of these dimensions are: J.K Gailberth in his book *The New Industrial State* has given two main characteristics of every technology: 1. Systematic application of scientific knowledge to the practical tasks and 2. The division of the practical task into sections and sub sections. These two techniques are followed in educational technology too. For example by using educational technology the teacher first determines the teaching objectives then creates environment, all inputs (hardware and software), selects and applies appropriate teaching strategies for achieving teaching objectives. At the end the teacher will evaluate the students to understand whether the teaching objectives have been achieved or not. If the outputs of the students are not satisfactory then changes will be made in the strategies so that teaching objectives can be achieved. This whole process completes into four stages: 1. Analysis of teaching tasks including inputs, process and outputs. 2. Observation or combined search and analysis for some specific components which has been used during teaching learning process.

13 3. Drawing conclusions about what strategy or behaviour has been successful. 4. Translating the experience into usable language for the benefit of other teachers. Second meaning is Mechanization of educational process of human knowledge for the benefit of big masses through three phases (A) Preservation of knowledge like printed books, tape recorder, CDs and digitals. (B) Transmission of knowledge - sharing knowledge with the help of media. (C) Advancement of knowledge - through machine knowledge reaches to mass and when they face any problem and they try to find out the solution with the help of technology and intelligence then knowledge advances automatically. Third meaning is ET unites the science of learning with Art of teaching. Definitions of educational technology: There are number of definitions of educational technology which have been provided by educationists, Researchers and scholars over the years. Some of the representative definitions are given below to get a better understanding of the term "educational technology".

G.

O.M. Leith: "Educational Technology is the systematic application of scientific knowledge about teaching-learning and conditions of learning to improve the efficiency of teaching and training (Leith, 1967)."

S.S. Kulkarni: "

Educational Technology can be defined as the application of the laws as well as recent discoveries of science and technology to the process of education (Kulkarni, 1969)."

D. Unwin: "Educational Technology in concerned with the application of modern skill and techniques to requirements of

educational training. This includes facilitation of learning by manipulation of media and methods, and the control of environment is so far as this reflects on learning (

Unwin, 1969)." W. Kenneth Richmond: "Educational Technology is concerned with providing appropriately designed learning situations which, holding the view of objectives of teaching or training, bring to bear the best means of instruction (Richmond, 1979)."

J.R. Gases: "

Educational

Technology has to be seen as a part of persistence and complex endeavor of bringing pupils, teachers and technical means together

is

an effective way (Ford Foundation Team, 1971)."

14

US President Commission of Enquiry: "Educational Technology may be defined as

a systematic way of designing, carrying out and evaluating a

total process of teaching and learning in terms of specific objectives based on

findings from research in human learning and communication (

cited in, tucker, 1979:159). "

Educational technology offers the means

to reach large numbers in remote and inaccessible areas, remove disparity in educational facilities available to the disadvantaged, and provide individualized instruction to learners conveniently suited to their needs and pace of learning (

NPE, 1986). - Educational technology is a communication process resulting from the application of scientific methods to

the behavioural science of teaching and learning. This communication may or may not require the use of media such as

television broadcasts, radio, cassettes etc. (UNESCO, 2001). Based on the above discussion we may conclude that

Educational technology is concerned with the systematic application of science and technology in the field of education.

It is helpful for both, the teacher and learner to set the learning objectives, strategies, procedures, materials and establish

a good communication between them and make the teaching learning process more effective. 1.3.2 Nature of

Educational Technology | ET is the applications of scientific principles to education. | ET is the development of methods

and techniques for effective teaching-learning. | ET is not confined to the use of electronic media in Education. It

includes systems approach also. | ET involves total teaching and learning process:input, output and process aspects of

education. | ET provides technical guidance and solution to the educational problems. | It helps in effective

communication between teacher and students. | ET speed up the process of learning. | ET is very effective in large

classroom management by using projector, microphone, speaker etc. | ET can train large masses with the help of media.

15 | New concepts are coming out with help of edu tech like e-learning, online learning, mobile learning etc. So we can

say educational technology has the potential to bring about improvement in education both qualitatively and

quantitatively. 1.3.3 Objectives of Educational Technology | General Objectives The objectives of Educational Technology

at macro level or broad level are as under: 1. Identifying educational needs of the community. 2. Determining the aims of

education. 3. Developing a suitable curriculum. 4. Developing certain models to improve the process of teaching and

learning. 5. Identifying the human and non-human resources. 6. Developing

the appropriate aids and equipment to meet the educational needs. 7. Identifying the major obstacles in the

educational environment and the ways and means to tackle those. 7. Suggesting remedies to overcome the above traced

out obstacles. 8. Managing the whole system of education including planning, implementation and the evaluation

phases. | Specific Objectives The objectives of educational technology

at micro-level i.e., in view of specific class- room teaching are as under: 1. Identifying the educational needs and

analyzing the characteristics of the pupils. 2. Determining the class-room objectives in behavioural terms. 3. Analysing

the contents of instructions and

organise them sequentially. 4. Identifying the available and necessary teaching-learning materials and resources. 5.

Planning the suitable teaching strategies 6. Utilizing the man-material resources for achieving specific classroom

objectives.

16 7. Evaluating class-room teaching in terms of students' performance. 8. Providing feedback to the teacher and the students for betterment of teaching- learning process. Regarding objectives of Educational Technology, Hilliard Joson has given the following objectives : 1. Transmission of Information. 2. Serving as role model. 3. Assisting the practice of specific skills. 4. Contribution to the provision of feedback. l

Main Objectives of Educational Technology 1. To help to improve the environment required for the teaching learning process. 2. To make the class-room teaching-learning more effective. 3. To modify the behaviour of the teacher and the learner. 4. To improve and update the methods of

teaching and learning. 1.3.4 Origin and history of educational technology: To describe the emergence of educational technology we need to discuss it from two aspects. The first aspect is the global and general worldwide historical development, while the second aspect relates to the historical development at the local level or Indian history. Global Historical Development of Educational Technology Stone Age Period: We have studied in our school that during Stone Age people used to live in cave and they used to draw on the cave wall, tree trunk, slabs, and rocks to share their experience. There was no teaching concept or standardized writing language for communication. People used to experience and learn from the environment. Those drawings are associated with the invention of writing technology. At about 3100 B.C Egyptians devised a system of picture writing called hieroglyphics. Gradually standardized writing system evolved in many countries. With the progress of civilization education system emerged. Socrates used to teach his pupil with oral dialogue system and pupil used to memorize it. Hand written books were in uses for teaching.

17 The Age of Book and Chalkboard In 1456, Johann Guttenberg developed the printing machine and printed the first Bible. With this invention, the art of printing spread widely and other books were produced. The one each to one teaching or verbal method of teaching changed and knowledge spread among pupil in the form of books. School system started and teacher started teaching with the help of blackboard and chalk. Mass Communication Age The invention of the radio and the television made a significant landmark in the development of Educational technology worldwide. Knowledge spread all over the world without any boundary and to the mass. Mass education and education to less privileged society was easy with the help of this technology. Though, the radio served this purpose better than the television as it was low cost. The Information Communication Age/Computer Age The invention of the computer has remarkably changed the educational practice the world over. With computer technology comes the information age. The first computer was invented by IBM. With the advent of the computer technology the following developments started (Conway, 1990): (i) Electronic board akin to the white boards with special pens capable to transferring data written on it to the system; (ii) Multimedia system equipped with a sound blaster and speakers; (iii) CD-ROM player / DVD-ROM player (on which audio, images and video files are recorded); (iv) Video disk player and a videotape player controlled by the personal computer PC); (v) PC - PC conferencing mode; (vi) The touch screen and voice recognition/communication devices for the special education students; (vii) The digital camera that combines very well with computer where images can be shown and be manipulated / printed; (viii) Advances in virtual reality - virtual libraries, virtual universities, etc. Computers are now using packaged instructions like CAI, CBI, and CAL either in a mediated form or in non-mediated form using any or a combination of the styles of drill and practice, tutorials, games, simulations, and/or interactive knowledge-based system.

18 So nowadays education does not depend on face to face interaction between teacher and learner and a closed set up rather than education is now anytime anywhere matter with the help of technological devices and programmed learning. Online learning with the help of internet facility has opened limitless quantity of doors of possibilities for contemporary learner to make their life happier than ever before. Use of educational technology in India: Indian education started with Gurukul system where pupil used to listen to their gurus and learn. Then gradually came the age of books and some other teaching material like, blackboard chalk, teaching aids etc. Before 1960 the term educational technology was not popular to Indian education system. But now educational technology is being used in all sector of education and both in formal and non formal education system. The use of technology properly started and became popular after the invention of radio. In 1929 Bombay aired some educational programmes for school children for the first time. As the radio network cover most of the part of the country so it was easy to reach many people at a time. Thus various education programme was started to develop to educate the mass. Radio was used to teach people about agriculture, weather, basic literacy and educational programmes for both in school and out school groups. The school TV project was first introduced in Delhi in 1961 and it is widely used in education sector. In the year 1972-1973 govt. of India launched first education technology project.

With the advent of satellite services and with the launching of EDUSAT project,

television started to be used more and more for the national development and reached to the masses living in remote or rural areas. The central institute of technology NCERT established in 1984. The CIET started working to develop software materials to meet the educational needs and also conducted research, trained human resource to use educational technology in education sector. In 1975, the satellite television experiment (SITE) was launched. INSAT was used by UGC. National open school and IGNOU established in 1979 and 1985. Distance mode education, NOS started to use technology with combination of media and it was helpful for those who could not complete formal education. For teaching foreign languages like, German, Spanish, French etc also technology is used.

19 Nowadays we are using computers, advanced form of ICT and internet in association with various technological aids in education sector. Country like India where population is very high and scope of higher education is limited in rural and remote areas technology is kind of boon which can help to learn at own place. To sum up, educational technology in India is being used as under: Ø School broadcast Ø TV Telecast lessons Ø Teacher preparation Ø Distance education Ø Correspondence courses Ø Development of audio- visual materials Ø Language teaching Ø Production of multipurpose kits or instructional aids Ø Computer literacy and studies in schools.

1.3.5 The Scope of Educational Technology (By Lucido, 1997)

Educational

technology is the

development, application, and evaluation

of systems, technique, and aids to improve the process of human learning. (

Association for Educational

Communication and Technology)

ET is

the theory and practice of design, development, utilization, management, and evaluation of processes and resources for learning. (

Hoffman, 1994-2009, as

cited by www.books.google.com) ET is a systematic, iterative process for designing instruction or training used to improve performance. As

Educational technology aims to improve the quality of human learning process so

the scope is unlimited as it tries to reach out to more and more people involved in the teaching-learning process. The scope of educational technology

can be described under the following points: 1. Spelling out Educational goals and Objectives. Ø Help for the formulation of objectives and goals of education based on individualized and social needs.

20 2. Curriculum Development. Ø Planning of curricular and co-curricular inputs in order to realize planned goals and objectives. 3. Developing Teaching-Learning materials and Resources. Ø Develops necessary learning materials in the form of

programmed learning books, computer learning packages, mass media instruction, individualized self- instructional packages etc. 4.

Developing Human resources. Ø ET covers the area of teacher education. 5. Developing Strategies. Ø

Teaching strategies, approaches and methods are devised and developed catering to different types of students. 6.

Developing Multi-Sensory Aids. Ø Design, development of audio visual aids. 7. Develops Feedback Mechanism. Ø ET

develops tool of evaluation to provide feedback. 8. Develops Passive Instruction Services. Ø Educational radio, TV, computers are used for transmitting information. They are passive services since all decisions are in the hands of the providers, i.e., what to be presented, for how long, in what sequence and when. 9. Develops Interactive Instruction

Services. Ø ET tries to provide opportunities for the learner to control the pace, mode of presentation etc. e.g. Computer Assisted Instruction (CAI), Teleconferencing via Internet etc. 10. Develops Learning Environments. Ø ET develops learning

environment that are learner friendly. Eg. Simulation 11. Developing Information Resources. Ø ET bridging the gap between developments in Information Technology and Education. Information Resources:Eg. E-libraries, On line

encyclopaedia,World Wide Web, 12. Develops Communication Devices. Ø ET has developed communication devices for students who have problem in communication.

21 Thus we can say Educational technology aims at increasing efficiency, effectiveness of teaching learning process and simultaneously aims at bringing pedagogical changes for betterment of education.

It works for over all

planning and organization of the system or subsystem of education. 1.4

Educational Technology

and Instructional Technology: Role and Recent Trends The two concepts Educational Technology and Instructional Technology are used interchangeably. Instructional Technology is a subset of educational technology, based on the concept that instruction is a subset of education. Educational Technology is wider concept than Instructional Technology as education is wider than instruction. Instructional Technology is the theory and application of proper tools and techniques in instructional settings, while educational technology is concerned with whole education process and contexts. All parameters of instructional technology are suited within that of educational technology, while all of educational technology does not suit within the parameters of instructional technology. Instructional Technology is not merely a knowledge area that deals only with audiovisual instructional materials. It is a way to think about problems of teaching and learning to find workable solutions (Wittich&Schuller, 1973). 1.4.1 Definition and Meaning of Instructional Technology

As defined by Momurin (1970), Instructional technology

is a

systematic way of designing, carrying out and evaluating the total process of learning and teaching in terms of human learning and communication, and employing a combination of human and non-human resources to bring about more effective instruction.

Sharma (1989) defined

instructional technology

as a network of techniques or devices employed to accomplish certain defined set of learning objectives.

Instructional technology applies the

principles and theories of psychological learning to get deep insight into the content, structure and sequence of instruction to develop instructional resources for attaining desired learning outcomes. In other words, instructional technology works at shaping the instructional uses of the materials to turn them into instructional resources.

In brief we can say the term "Instruction" refers to systematically organized programme designed to produce certain knowledge, skill, understanding, attitude, and behaviour patterns among learners.

22 The term "Technology" refers to systematic application of scientific or other organized knowledge to practical tasks.

So a technology of Instruction is a particular systematic arrangement of teaching learning events designed to put the knowledge into practice in a predictable effective manner so as to attain specific objectives.

Further, Instructional technology determines

and provides appropriate stimuli to the learner to produce appropriate responses for making learning more effective.

The

definition of Instructional Technology prepared by

the

Association for Educational Communications and Technology (2000) is as follows,

Instructional Technology is

the Theory and Practice of Design, Development, Utilization, Management, and Evaluation of processes and resources for learning.

23

From the above it is understood, theory consists of concepts, constructs, principles, and propositions that serve as the body of knowledge; Practice is the application of that knowledge to solve problems; Design refers to the process of specifying conditions for learning; Development refers to the process of translating the design specifications into physical form; Utilization refers to the use of processes and resources for learning; Management refers to processes for controlling Instructional Technology, and Evaluation is the process for determining the adequacy of instruction. (Seels & Richey, 1994). Through Instructional Technology teachers share content or information to the learners. Contents can be presented on three levels, memory, understanding and reflective levels. However instructional Technology present the content to the second level of teaching only and for reflective level of teaching, help of teaching technology is necessary. In a similar way communication also has two elements verbal and nonverbal. When teacher asks question and students give answer then it is called as verbal communication. But when teacher uses his body actions or gestures or material for communicating the content then it is called as nonverbal instruction. For example if a teacher wants to show the meaning of clap to the class he does the activity and say it is clap. Instruction can be provided by the teacher or by the machine like in online learning or self instructional material, and it does not make any difference. For example Open Universities gives teaching instructions by using TV, radio or Internet to thousands of students in a single sitting and who's over is interested can take the benefit of this program. So instructional technology is based on hardware approach as all the communication with the learners are being done by using audio video recorder, radio or television or computers. There is no direct interaction between teacher and students as we see in teaching or behaviour Technologies. Here teacher plays the role of an instructor and he/ she does not invite the students to participate in the lesson. With effective communication skill teachers makes the instruction proves interesting and intellectually stimulating. In instructional technology, instructional materials are prepared based on the objectives formulated in advance, and then content is presented by using different strategies, techniques and material. At the end the outcomes of the learners are evaluated in order to ascertain whether instructional process is successful or not. A teacher needs knowledge of psychological and scientific principles and laws and awareness of social values and norms, teaching maxims and principles of teaching while preparing instructional materials.

24 1.4.2 Characteristics of Instructional Technology: 1. Objectives of cognitive domain can be achieved. 2. This technology is helpful to fill up the deficiency of effective teachers because we can communicate the instructional material to thousands of learners at a time by recording the lecture of an effective teacher into machines. 3. By the use of this technology students can learn according to their own ability and needs and pace. Can practice same content repeatedly as long as he wants without the help of teacher. 4. With trial and error process students learn independently. Students can be reinforced regularly which will lead to for the right responses to occur. 5. Analysis of the subject matter is also possible with the help of this technology and it can make the presentation easy and logical. 6. Developing instructional technologies based on psychological learning theories and principles. To develop a successful instructional plan/strategy for a specific content following steps should be kept in mind: 1. Setting of instructional objectives To develop a successful instructional plan first we needs to plan and set instructional objectives. After learning the content or matter what type of behavioural changes are expected from the learner that needs to be decided and written

in behavioural terms by taking the help of Robert eggert's approach Robert Miller approach or RCEM approach before proceeding further in the task of imparting instruction. Instructional objectives must be based on the following: Ø

Grade level of the learner Ø

the physical emotional social and mental potential of the learner

Ø

the previous experiences of the learner related to the subject and topic Ø the main material resources available for imparting instruction

Taking decisions about the instructional material Based on the instructional objectives learning experience and teaching materials need to be decided and organized for delivering the instructions successfully. Instructional material will be selected and used based on the

following the principles of simple to Complex specific to general theory to practice etc.

There are different types of teaching learning material available from visual to audio-visual aids and many technologically advanced products like computer, projector, audio books etc, so the teacher must select appropriate TLM based on the content and instructional strategy.

25 Taking Decision about the media and methods: To carry out the teaching learning process effectively, appropriate decision must be made for selecting media and method for delivering instructions. Various types of instructional strategies are available, so teacher must have enough knowledge to select and use the strategy properly according to the syllabus and topics. Some of the important

instructional strategies like lecture strategy, demonstration strategy tutorial strategy innovation strategy description strategy, role playing, gaming, group discussion, question answer, discovery, problem solving

Strategies and strategy assignment etc. can be used for teaching and learning. Special instructions are needed for carrying out auto instruction of

self learning like program instruction carrying out with the help of teaching machines, computer assisted instruction, personalized system of instruction CSI learner construction LCI, etc.

Taking decision about the proper instructional environment: A suitable instructional environment must be chosen by the teacher based on the topic for carrying out the particular type of instruction. Helping in the task of evaluation : Evaluation is a very important part in

any type of instructional activity carried out by the teacher or learner in the shape of auto instruction to understand that the instructional objectives have been achieved or not. Some evaluation strategies are , teacher made test, standardized test, construction of the achievement test, evaluating the cognitive affective and psychomotor changes in people's behaviour through suitable test and techniques, self evaluation test Strategies and techniques.

So in this way instructional technology can help the teacher as well as the learners in the attainment of the stipulated instructional objectives. 1.4.3 Advantages and Needs of Instructional Technology n Advantages

of Instructional Technology Ø Advantages of Instructional Technology Ø Makes the instruction more interesting. Ø Delivery of instruction is more standardized. Ø Learning becomes more interactive by applying accepted learning techniques. Ø

Quantity

of learning is improved. Ø Instruction can be provided as and when required. Ø Help in development of positive attitude of students towards learning and to the learning process itself. Ø The role of instruction can be appreciably changed in positive direction.

26

n Needs of Instructional Technology The purpose of instructional technology is to make education more productive, individualistic, powerful and scientific which enhances the learning more immediate with more equal access. The use of instructional Technology can solve educational problems related to are given below as l Growing population l

Heterogeneity of learners l Divergent and even conflicting needs of the learners coming from different socio- cultural areas l Rapid development of new information l Knowledge explosion l Development of communication devices l

Extending curricular and social changes arising from modernization 1.4.4 Role of Educational Technology in the

Teaching-Learning Process 1. Educational Technology has brought revolution in the entire education system. Previously, the teachers used to be the sole interpreter of knowledge to the learners and the textbooks was the sole resource. But

now this conventional role has been changed and it has opened up the new areas of teacher functions such as management of resources and management of learning. Today, teachers have a range of media to assist and supplement

the instructional work. With the help of technology teachers can even specify the learning intentions, select the topic, identify the stimulus situation, determine media, manage teaching and finally conduct evaluation and modify the

instructions in the light of evaluation results. So the teachers have the opportunity to design meaningful learning experiences that embed technology. 2. Learning with technology has become essential in today's schools. Worldwide,

governments, education systems, researchers, school leaders, teachers and parents consider technology to be a critical part of a child's education. 3. Educational process can't proceed systematically without the help of educational

technology. Every aspect of educational system is fully enlightened with educational technology. 4. Educational

technology has provided a scientific base to the educational theory and practice. It has transformed a passive classroom to an active and interactive classroom, with audio-visuals, charts and models, smart classrooms and e-learning

27 room which has drastically motivated and increased the attention level of the students. 5. The teaching-learning climate of the educational institutions has been modernized.. The learners are being exposed to professionally designed programmes on video or computers under programme learning concept. 6. Educational technology helps the learners to learn at their own pace with repeated practice so teachers are relieved of the burden of routine repetition for exercise and revision purposes. It has helped and supplemented the teachers in their instructional programmes also through the structured lessons for remedial, enrichment or drill purposes. 7. Educational technology has provided well-integrated structured materials for teachers thus saving a lot of their time which in turn may be utilized for creative work and quality improvement. 8. Educational technology helps the teacher to use scientific methods for solving educational and administrative problems. It adds to the teaching competence of teachers and inculcates a scientific outlook and scientific temper in teachers and students. 9. Educational technology has made the teaching-learning process more effective and process oriented. Television, Radio, V.C.R, Computers and LCD projectors etc. have enriched and facilitated effective transmission of knowledge. 10. Educational technology has improved the process of teaching by giving it Teaching Aids and Programmed Instructional Material. 11. Feedback devices have modified teaching-learning behaviour so produced effective teachers in the teacher-training institutes. 12. Educational programmes on T.V, Radio and Internet are beneficial for Students who appear for higher or competitive examinations. 13. Examination process, evaluation, classroom-teaching and various other sectors of education are being modified with the help of ET and new researches are going on to make it more effective for learning. 14. Educational technology can help teachers to teach according to individual differences of learners and based on the learners need assistive technology can be introduced for smooth learning. 15. It helps in constant social interaction; digital content can be easily created and shared among large population. 16. Technology helps to find information by accessing the internet through cell phones and computers or chatting with friends on social networking sites.

28 17. Educational technology has provided scientific foundation to education through the theories of learning and intelligence and it allows for 24/7 access to information. 18.

Thus educational technology is required in each and every aspect of teaching learning process and serves all the purposes for modern education.

According to Davis and Hartley. 19. "Educational Technology in its wide sense as understood today, includes the development, application and evaluation of systems and techniques involving men, machines, media and instructional material as components, so as improve the process of human learning and attain the educational goals. -" 1.4.5 Recent Trends of Educational Technology and Instructional Technology Let us look at a table to understand the recent trends in technological development in education sector: Source: IGNOU E-gyankosh, Santosh Panda

29 From the above tables it is very clear that technology has a great impact on the entire education system. From face to face interaction or lecture method to online learning, things has been changed a lot. Now classrooms are well equipped with different types of technological devices from smart board to laptops, speaker, microphone, head phone, projectors, smart phones, e books, audio books, internet, Wikipedia, you tube, blogs, podcasts, moodle, CAI, and many more things to improve and personalize the learning experience. 1.5 Major approaches of Educational Technology Lumsdaine(1964) has suggested following approaches of Educational technology:- A. Hardware approach or first Educational technology B. Software approach or second Educational technology C. Systems approach or third Educational technology D. Individual and Mass Media Approach. 1.5.1 . Hardware Approach (Technology in Education) This approach implies the use of mechanical materials and equipments in education. The term was first introduced by James O. Finn & Others. This approach originated from

Physical Science and engineering and is based on the concept of service, i.e., using technology in education (Silverman 1968).

This approach is a by-product of the scientific and technological developments of the 20th century. In this approach the main feature is the use of audiovisual aids like charts, models, film-strips, slides, audio cassettes, and sophisticated equipments like film projectors, OHP, slide projector, radio, tape recorder, LCD projector, DLP Projector, CD players, DVD Players, TV, computer etc in teaching learning process.

Hardware approach mechanizes the process of teaching so that teachers would be able to deal with more students with less expenditure, less time and effort

in educating them. Human knowledge has three aspects I Preservation, I Transmission and I Development. With the invention of printing machines the preservation of knowledge

started. The knowledge is preserved with these machines in the form of books and kept in the libraries,
30

taperecorders and films.

The second aspect of human knowledge is its transmission. A teacher can impart knowledge himself to his pupils. Now days, transmission of the knowledge is supported by machine like mike, radio and television.

With these, thousands of pupils can

be benefitted at a time. The third aspect of human knowledge is its development. Teachers can study through online libraries and enrich themselves other than that they can do research work to develop new knowledge.

For this purpose, presently the researcher uses the electronic machines and computers to collect and analysis of data.

Hence, all the three aspects of knowledge allow the use of machines. In short, the teaching process has been mechanized. The mechanization of teaching process is termed as the Hardware Approach

and also called as technology of education. 1.5.2 Software Approach (Technology of Education) This approach implies the use of Psychological principles and learning theories in education. The term was first introduced by Skinner & Gagne and it originated from Behavioral Science.

Software

Approach is also termed as Instructional Technology or Teaching Technology or Behavioural Technology.

This approach

of educational technology

involves a systematic, scientific application of appropriate scientific research, both from the physical science, social sciences and particularly from psychology and sociology, in order to solve a problem. Here, it is important to understand that technology of education emphasizes on the techniques of teaching and learning derived from the principles, ideas, and practices drawn from various fields of knowledge such as; psychology, sociology, philosophy, management, cybernetics, etc. in order to optimize the teaching-learning process. Instead of using machines this approach uses the principles of teaching-learning for bringing desirable changes in the behaviors of the pupils. In software approach machines are only used for clarification of concept and principles. So this technology is related with the mental aspect of the task and it writes the educational objectives in the behavioural terms, selects suitable presentation strategies of the subject matter, uses reinforcement devices and evaluates the outcome of the learners. According to Silcherman (1968) it is also called as constructive educational technology. It consists of 6 steps: 1. Analysis of instructional problems. 2. Writing objectives in behavioural terms 3. Selecting suitable teaching strategies 4. Reinforcing the students on right responses

31 5. Selecting or constructing measuring instruments for evaluating instructional outcomes. 6. Decision making and improvement. From the above discussion it is very clear that both software and hardware approaches are so interlinked that they cannot be separated from each other. One without the other is incomplete. It is software approach which makes the hardware approach function well. 1.5.3 Systems Approach System: A system is any collection of interrelated parts that together constitute a larger whole. Many number of units working together for a particular goal. These component parts, or elements of the system are intimately linked with one another, either directly or indirectly, and any change in one or more elements may affect the overall performance of the system, either beneficially or adversely. The Term was first introduced by Davis & Hartley. Definition: System approach is an integrated, programmed complex of instructional media, hardware and personnel whose components are structured as a single unit with a schedule of time and sequential phasing.

32 It is a modern approach in educational administration and organization. It acts as a link between hardware and software approach. It is

also known as 'Management Technology'. It has brought to educational management a scientific approach for solving educational administrative problems.

As we know that teaching learning is a complex process and it needs systematic planning to achieve pre determined objectives. To streamline the teaching-learning process we use the systems approach which is concerned with systematic planning, designing, construction and evaluation of the education system. Systems approach is applied to develop, implement and evaluate the whole educational system, sub-system, and curriculum or, for designing an individual lesson. There are four elements of the systems approach: input, process, output, and analysis & feedback. Let us understand, how these elements function together to make the education system more productive. Parameters of system approach So we see that

the System Approach focuses first upon the learner and then course content, learning experiences and effective media and instructional strategies

and then the performance level of the students. Based on the performance level feedback will be collected from all including teachers, students and administrators .So if there is any problem within the system then it will be identified and rectified and also the parameters of the system approach can be modified for improving the overall teaching learning system.

Such a system incorporates within itself the capability of providing continuous self-correction and improvement. It is concerned with all elements of instruction including media, including hardware and software and evaluates various aspects of the education system, and sub-system. The main purpose of the systems analysis is to create a systematic, organized, effective and enabling learning environment for both teachers and students.

33 1.5.4 Individual and Mass Media Approach Due to information explosion and population explosion we need to use mass media which is a boon of science and technology to convey loads of information to larger section of people within short time span. For example newspaper, TV, radio, internet etc. As number of students are increasing day by day and world has become a global village, now a days this mass media technology is utilized for educational purposes also.

Mass media

have proved to help in classifying concepts, stimulating group and individual activities, developing a collective critical awareness, changing attitudes, imposing a new structure or organization on certain subjects and encouraging originality and creativeness.

Therefore, teachers need to be properly motivated and interested

for using such materials. Other than that training is also necessary for the teachers to use and maintain the materials. For a learning society like India which has a huge population of one billion, the media systems based on modern technology constitute a very potent tool for education and development. It has varied and numerous applications bearing on almost all aspects of individual and social life. In one sense, all these uses of information technology basically have their impact in educating people, giving them knowledge, skills, improving understanding and changing their attitudes. The media is used for both formal and non- formal education systems and also for individual and mass levels of learning. Technology is used for Distance Learning Mode courses and appears to be an avenue of promise for every country in the world. In India, IGNOU and CIET (Central Institute of Educational Technology) are launching distance education programmes throughout the country. In general, distance education employs a variety of delivery systems such as correspondence courses, radio, television, audio-visual materials, telephone lessons and teleconferencing. So it is seen that mass media approach is very effective role to play in adult education. In the formal school situations also we can use media to make the teaching learning process more interactive or interesting. The Delors Commission (P-173) also observed that the new technology has created a host of new tools for use in the classroom as under: -- Computers and Internet, - Cable and Satellite TV Education,

34 -- Multimedia equipments, -- Inter-active information exchange system including e-mail and on-line access to libraries and public data base. Ø Teachers can coach their students to use media effectively for the information (like helping students to find specific websites) and in this way, a new partnership can develop in the classroom. Ø If technology and media is used with the conventional mode of education it can enrich the formal system by filling instructional gaps, updating knowledge, and giving new learning experiences. Ø With the advent of computer and internet the information and knowledge is not limited within teacher and library only, the students can access to any information at home also and can learn on their own. Ø The role of media and educational technology has been clearly defined in NPE-86 as under: Ø "Modern communication techniques have the potential to bypass several stages and sequences in the process of development encountered in earlier decades. Both the constraints of time and distance become manageable. In order to avoid structural dualism, modern educational technology must reach out to most distant areas and most deprived

sections of beneficiaries."

Importance

of Mass Media: 1.

Mass Media provide information to the mass within a less time. 2. It takes a wide coverage of information regarding anything that is happening in any corner of the world. 3. It brings the entire world to the individual or to the classroom.

Children spend hours together sitting in front of

the

television and can visualize, hear and acquire knowledge about the world

so it is kind of multisensory learning also. 4.

These media easily reach groups, allow repeated use, give more reality, influence attitudes, show cause and effect relationships and ultimately motivate

the audience. 5. It sends information to remote places and helps in distant learning. 6.

It helps in modification of attitudes, inculcation of desirable values and acquaintance with cultural heritage. 7. Mass media acts as an agency of social change. 8. Mass media are useful for reinforcing group dynamics and interpersonal communication.

35 9. Mass media as means of communication make ideas clear to children and help them to acquire correct knowledge.

They help in simplifying and in giving vividness to explanation. 10. Mass Media make the instruction concrete and stimulate interest and excite curiosity in things.

So

education today, has a far greater responsibility than it had ever before. It has to meet the demands of a dynamic world which change its character every day. Contemporary education has to be more comprehensive and complete than it was ever before.

The role of the various agencies of education like home, society, community etc. has consequently increased, so has the role of the mass media like television, radio, cinema, newspaper increased.

According to educationists and researchers use of mass media like educational TV, radio, press, newspaper, films, documentaries, internet, educational apps, mobile, etc has made the quality of education improved and also made the learners and teachers modern and up to date. Individual approach: Using individual approach is a modern trend in education. If a student cannot understand a matter in classroom set up, they need individualized teaching and repeated practice but due to heavy workload teachers cannot help a student individually always. So with the help of technological equipment and media like Programmed instruction, programmed books, and programmed learning modules, teaching machines, computer assisted instruction and computer managed learning, video and audio recorded learning and instructional material, email, internet, teleconferencing,

online library etc these problems can be solved. The use of computers and multimedia systems make it possible to design individual learning paths along which each pupil can move at his/her own pace. The compact disc technology (CD) has a special role to play, for it can handle large amount of information complete with sound pictures and text. Interactive media allows pupils to ask questions and look up information themselves. It is observed that pupils who are under-achievers or experienced difficulties in conventional mode of education reveal their talents better and show more motivation and curiosity in informal mode. But development of these technologies cannot replace the textbook and the teacher. In child's education they have their own role to play. Text books are the cheapest media and easiest to handle, illustrating the teacher's lessons, allowing the pupils to 'revise lessons and to gain independence. Similarly, the development of these technologies does not diminish the role of teachers, but it is also true that in today's world teachers cannot be regarded as the only repository of knowledge that they have to pass on to the younger generation. Now the role of the teachers have been changed, now they are learning partner, guide, instructional designer and supervisor for self learning and how to seek, look up and appraise facts and information.

36 1.6 Differential Instruction, Universal Design of learning and Individualized Instruction 1.6.1 Differential Instruction As we know that 'one size doesn't fit all' (Willis and Mann 2000) so the one single curriculum, one instructional or evaluation strategy may not be suitable for all type of learner. Every child is unique and special and differs from one to another in size, shape, and social development. Students also learn differently. Teachers can no longer teach "The Lesson" and hope that everyone gets it. Based on this knowledge, differentiated instruction applies an approach to teaching and learning that gives students multiple options for taking in information and making sense of ideas. Differentiated instruction is a teaching theory based on the premise that instructional approaches should vary and be adapted in relation to individual and diverse students in classrooms (Tomlinson, 2001). Differentiated instruction recognizes the fact that we have a diverse student population and teachers must understand students' background knowledge, readiness, learning styles, language and interests. According to right to education Act (RTE) - 2009, the present day classroom should be inclusive in nature and welcoming and is pedagogically capable of educating the naturally diverse population of students who arrive at its door. Based on the Differentiated instruction principles teachers can create such classrooms. Differentiated instruction is a technique that teachers use to accommodate each student's learning style and instructional preferences. This strategy may involve teaching the same material to all students using a variety of instructional methods, or it may require the teacher to teach content at varying levels of difficulty based on the readiness, interests and ability of each student. The foundation of Differentiated instruction is based on Piaget's constructivist theory, Vygotsky's socio-cultural theory; Gardner's multiple intelligence theory, varied learning style. According to Piaget' teachers should facilitate the learning process by organizing learning activities and using variety of aid material according to the level of student's cognitive structure to enable him to construct knowledge through his experiences. According to Gardener teachers should provide educational opportunities in such a way that nurture the strong area of intelligences but also allow students to use all their intelligences.

37 Tomlinson (2005), a leading expert in this field, defines differentiated instruction as a philosophy of teaching that is based on the premise that students learn best when their teachers accommodate the differences in their readiness levels, interests and learning profiles. A chief objective of differentiated instruction is to take full advantage of every student's ability to learn (Tomlinson, 2001a, 2001c, 2004c, 2005). In addition, she points out that differentiating can be performed in a variety of ways, and if teachers are willing to use this philosophy in their classrooms, they opt for a more effective practice that responds to the needs of diverse learners (Tomlinson, 2000a, 2005). Tomlinson (2000) maintains that differentiation is not just an instructional strategy, nor is it a recipe for teaching, rather it is an innovative way of thinking about teaching and learning. To differentiate instruction is to acknowledge various student backgrounds, readiness levels, languages, interests and learning profiles (Hall, 2002). Differentiated instruction sees the learning experience as social and collaborative, the responsibility of what happens in the classroom is first to the teacher, but also to the learner (Tomlinson, 2004c). Building on this definition, Mulroy and Eddinger (2003) add that differentiated instruction emerged within the context of increasingly diverse student populations. Within the learning environment permitted by the differentiated instruction model, teachers, support staff and professionals collaborate to create an optimal learning experience for students (Mulroy and Eddinger, 2003). Also in this environment, each student is valued for his or her unique strengths, while being offered opportunities to demonstrate skills through a variety of assessment techniques (Mulroy and Eddinger, 2003; Tomlinson, 2001a; Tomlinson and Kalbfleisch, 1998; Tuttle, 2000). Differentiated instruction supports the classroom as a community, accommodating differences and sameness (Bosch, 2001; Brimijoin, Marquissee, and Tomlinson, 2003; Lawrence-Brown, 2004; Tomlinson, 2003). It allows for the creation of an environment in which all students can succeed and derive benefit (Lawrence-Brown, 2004; Tomlinson, 2003). Students differ in three important ways - readiness, interests and learning profiles - in a differentiated classroom, the teacher is obliged to attend to these differences in order to maximize the learning potential of each student in that classroom (Tomlinson, 2000b, 2001a). Differentiated instruction requires teachers to transform their practices from a program- based pedagogy to a student-based pedagogy. Teachers attempt to adapt pedagogical interventions to the needs of each student, acknowledging that each student differs in interests, learning profile, and level of functioning. Differentiated instruction may facilitate high levels of both student engagement and curricular achievement (Caron, 2003; Tomlinson, 2004).

38 Curriculum tells teachers what to teach, while differentiated instruction tells teachers how to teach it to a range of learners by employing a variety of teaching approaches. Students can develop their potential if they are provided with appropriate activities in an environment that is planned and organized to meet the needs of all students. The teacher can differentiate one or a number of the following elements in any classroom learning situation (Tomlinson, 2004):

- l The content (what the students are going to learn)
- l The processes (the activities)
- l The products (the accomplishment following a learning period)
- l The learning environment

Differentiation is a process through which teachers enhance learning by matching student characteristics to instruction and assessment. Differentiation allows all students to access the same classroom curriculum by providing entry points, learning tasks, and outcomes that are tailored to students' needs. In a differentiated classroom, variance occurs in the way in which students gain access to the content being taught, the process by which they acquire information, and the manner in which they demonstrate understanding (Hall, Strangman, & Meyer, 2003). Let us know the strategies of differentiating instruction:

- Content: What the teacher plans to teach and what the students need to learn. The teacher can plan range of activities:
- l Students level will be determined through formative assessment
- l Using reading materials at varying readability levels
- l Putting text materials on tape/CD
- l Using spelling/vocab lists at readiness level of students
- l Presenting ideas through auditory, visual, kinaesthetic, & tactile means
- l Using reading buddies
- l Flex grouping
- l Compacting
- l Meeting with small groups to reteach idea/skill, or to extend the thinking/skill

39

- l Multi-levelled questions
- l Modelling Process: How the students will access the information. Activities in which the students engage in order to make sense of or master the content
- Strategies:
- l Tiered activities through which all learners work with the same information, understanding, & skills, but proceed with different levels of support, challenge, or complexity.
- l Centres/Stations
- l Developing personal agendas
- l Manipulative
- l Varying the length of time a student may take to complete a task
- l Cubing
- l Learning logs or journals
- l Note-taking organizers
- l Graphic organizers
- l Highlighted materials
- l Jigsaw
- l Think, Pair, Share
- l Learning Menus
- l Web quests
- l Labs
- l Role Play / Simulations
- Product: How the student will demonstrate what s/he has learned.
- l Choice boards
- Podcast
- l Blog
- l Presentation

40

- l Quiz/Test
- l Using rubrics that match and extend students' varied skill levels.
- l Encouraging students to create their own product assignment as long as it contains required elements.
- l Enabling students to use contemporary media/technology as tools to demonstrate knowledge and understanding.

Let us see a graphical presentation of differential of instruction:

41 Conclusion Differential instruction

is an organized, but flexible way of adjusting teaching and learning methods to accommodate each child's learning needs, interests and preferences specifically children who have learning problems or special need in order to achieve his or her maximum growth as a learner and provide them best learning experiences.

1.6.2 Universal design of learning:

Learning in general is very person specific, as unique as a person thumb print. Universal design is an architectural concept that focuses on the design of the products, building or environments so that they can be used by all type of people. The term "universal design" was coined by architect and designer Ron Mace at the Center for Universal Design at North Carolina State University (

Burgstahler, 2008; Center for Applied Special Technology, 2011b). Mace and his colleagues defined UD as "

the design of products and environments

to be usable by all people, to the greatest extent possible, without the need for adaptation or specialized design" (Center for Applied Special Technology, 2011a). With ADA (Americans with Disabilities Act), 1990 Universal design became very popular among architects and designers who were trying to make public building and city streets accessible for all. Though it was basically for the people with disabilities but afterwards it was seen that this concept is very effective among other population also. So the chief characteristic of Universal Design is that it "proactively builds in features to accommodate the range of human diversity" (McGuire, Scott, & Shaw, 2006, p. 173).

- l Adaptation and modifications to the products, built environment and streets like audio books, closed captioning TV, trolley case, automatic door openers, curb cuts, entry ramps, universal-height drinking fountains, disable friendly toilet, lift with audio sounds, road signals with audio, low floor buss, signage, Wireless remote controlled power sockets and others-are beneficial to many people including pregnant woman, woman with kids in lap, sick and old people, not just those with disabilities. Indeed, people today routinely use door openers to enter a building

42 when their hands are full or kids in lap, pregnant women can use low floor bus, foreign language people can use signage for directions and children visiting the hospital can drink water from a fountain without assistance. Similarly, commuters in noisy airports and students in quiet libraries rely equally on TV closed captioning. Each of these conveniences was originally conceived as a disability accommodation. | Disabilities have less to do with individual deficits-what some people can't do that others can-and more to do with environmental barriers that obstruct people's ability to function effectively and participate fully in society (United Nations, 2006 - Preamble E). Universal Design helps all by removing unnecessary barriers. | The philosophy of UDL has been proved to be fruitful in the field of education also.

If the goal of UD is to remove barriers from the physical environment, the goal of UDL is the elimination of barriers from the learning environment. As David Rose, one of UDL's founders, has stated, "UDL puts the tag 'disabled' where it belongs-on the curriculum, not the learner. The curriculum is disabled when it does not meet the needs of diverse learners" (Council for Exceptional Children, 2011).

| A concise definition of Universal Design for Learning was provided by the Higher Education Opportunity Act of 2008, which stated: | The term UNIVERSAL DESIGN FOR LEARNING means a scientifically valid framework for guiding educational practice that:(A) provides flexibility in the ways information is presented, in the ways students respond or demonstrate knowledge and skills, and in the ways students are engaged; and(B) reduces barriers in instruction, provides appropriate accommodations, supports, and challenges, and maintains high achievement expectations for all students, including students with disabilities and students who are limited English proficient. |

Universal Design for Learning is a set of principles for curriculum development that give all individuals equal opportunities to learn. UDL

provides a blueprint for creating instructional goals, methods, materials, and assessments that work for everyone--not a single, one-size-fits-all solution but rather flexible approaches that can be customized and adjusted for individual needs.

The

origin of the term Universal Design for Learning (UDL) is generally attributed to David Rose, Anne Meyer, and colleagues at the Center for Applied Special Technology (CAST).

UDL is about providing options. In the words of David Gordon, a director at

43 the Center for Applied Special Technology (CAST), "Options are essential to learning, because no single way of presenting information, no single way of responding to information, and no single way of engaging students will work across the diversity of students that populate our classrooms. Alternatives reduce barriers to learning for students with disabilities while enhancing learning opportunities for everyone" (Council for Exceptional Children, 2011).

Why is UDL necessary? Individuals bring a huge variety of skills, needs, and interests to learning. Neuroscience reveals that these differences are as varied and unique as our DNA or fingerprints. Three primary brain networks come into play: Principles of UDL: I. Multiple means of representation - providing learners with various ways to acquire knowledge and information.

44 II.

Multiple means of expression - providing learners with alternatives to demonstrate what they know and what and how they think. III. Multiple means of engagement - providing learners with appropriate means of engaging and interacting with the learning environment. The provision is built into the planning and design of all aspects of the activity or unit - not as an add-on. The approach of Universal Design for Learning can be supported using inclusive technologies. How UDL can help all students to learn | Enriches learning environment | Caters to different learning styles | Motivates learners and increases productivity | Engages reluctant learners | Improves independence and self directed learning | Enhances self esteem | Provides indirect and unplanned learning opportunities How UDL assists teachers | Helps to make education practices more inclusive | UDL caters to diverse learners | Supports effective pedagogy | Improves the quality of teaching and learning | UDL makes planning more efficient | UDL is cost/time effective | Supports Curriculum Framework | Consistent with legislation | Disability Standards in Education 2005 | Education General Provisions Act 2006 Multiple means of representation to support all students

45 Visual support | Graphics | Movies | Animations | Text | Physical objects or movement Supports visual lestrum Disorder. Auditory support | Digital recordings | Wav or MP3 files | Text-to-speech Supports auditory learners as well as students with cognitive impairment, learning difficulties, Dyslexia, speech-language impairment, English as second language. | Signs - Makaton signs supports students with intellectual impairment | Auslan and signed English supports students with hearing impairment Captions | Video captions support students with a hearing impairment Multiple means of expression Communication modes - Speech, sign, AAC including speech generating devices, text- tospeech Writing modes - Pencil and paper - Computer Visual modes - Sculpture - Photos - Movies - Dance - Drama Auditory modes - Sounds - Music Multiple means of engagement Tools that assist students to actively engage with learning, both input and output. The most successful of these for UDL are those that can engage a diversity of students within the one device or system. Many of these devices will have hidden benefits HARDWARE - Various configurations of keyboards

46 | Range of pointing devices | Trackballs ? Joysticks ? Alternative mouse systems ? Glidepoint ? Touch screens ? IWBs - Digital Pens ? Smartpen ? Intellipen | Alternative Computer Systems | Micro laptops ? iPad SOFTWARE Configuration of system or software | Windows/Mac OS | Wordprocessor configuration | Writing templates or scaffolds Rate enhancement software | Supports students who may fatigue from the mechanics of writing | Supports students who struggle with reading or writing and may have poor motivation | Reduces errors in literacy processes | Increases accuracy, speed, productivity and motivation | WordTalk; Natural Reader; Co Writer; textHELP Graphic Organizers | for students with difficulties organizing information and getting started with writing Multi-media interactive | Contain tools and functions that enable a range of students to engage with the learning | Framework applications (Clicker 5, IntelliTools Classroom Suite, "Communicate" series) | 'Learning objects' from TLF An example of how ICT functionality and UDL can address learner differences using multiple means of representation: digitized text

47 | More flexible than printed materials | Readily manipulated | Enlarged text | Background/foreground colour highlighting | Recorded sounds or voice | Graphic support | Text-to-speech | Converted to MP3 | Print to Braille printer Source: CAST 1.6.3 Individualization of instruction: It is auniversally recognized and accepted effective approach to the teaching-learning

48 process.It is a teaching methodology that is to be used for a specific purpose and an identified client.It is also called "tailor-planned" mode of instruction.Sometimes termed as programmed instruction alsoif the teaching material follows a "programmed" style of presentation. As this is the era of inclusive education so individualization of instruction is a major trend in the modern educational practices and is the demand of the hour. Based on the psychology of individual differences instructional process also must be organized according to the needs, interests, learning speed and abilities of the learners.

To individualize the instructional process we need the help of hardware and software technology both. Some of the necessary materials and equipments which are used for individualized instructions are as follows: | Programmed instruction,

programmed books, and programmed learning modules. | Teaching machines, computer assisted instruction and computer managed learning. | Video and audio recorded learning and instructional material.

| Email, internet, teleconferencing and other online educational facilities. | For students with disabilities assistive aids, Special aid material, equipment and appliances can be used. | Special provisions and facilities are made for the creative and gifted students to nurture and develop their individual capacities according to their pace and interest. | Steps of individualized instruction planning: 1. Assessment of student's background, needs and interests 2. Selection of appropriate subject matter 3. Determining the teaching strategies to meet the needs and interests 4. Constant monitoring progress 5. Undertaking revisions/alternative wherever needed 6. Comprehensive evaluation, including qualitative and quantitative records.

49 Advantages: 1. Success-guaranteed as teaching is based on the interest, needs and abilities of the students and are carefully planned. 2. Teaching learning process will be joyful as students will not be bored with the activities. / Care in planning is important so that the procedure must not be too easy or difficult to accomplish. 3. The student progress is in accordance with his intellectual and social traits. 4. Strong retention of learning 5. Substitution of materials or choice of alternatives activities will be easy since the teacher is considering only one student. 6. Easy to adjust planned progsor and can easily pinpoint problems and guide in overcoming problems. / Problems and errors could easily be observed and instant remedy could be undertaken. 8. Student learns to be more responsible and is ready to suggest alternative activities to suit his needs. 9. Evaluation system will also be individualized to find out the actual individual achievement.

1.7 Implication of differential instruction, UDL and individualized instruction for inclusion: 1.7.1 Concept of Inclusion As we believe that every child can learn and "If a child can't learn the way we teach, maybe we should teach the way they learn"- Ignacio Estrada Education makes a person self reliant and independent, so education systems must be designed and organized in such a way that it can meet the varying needs of individual learners, and provide an appropriate education and fulfill the fundamental right to education of each child.

50 To attain the goal of universalization of elementary education, govt. of India has launched some innovative legislation and policies like IEDC, RTE, RPWD, signed in UNCRPD etc. The dream of education for all (EFA) cannot be achieved unless all children, including the large population of children with special needs, are provided educational services. Due to disability and varying needs children with special need experience multiple disadvantage in the way of education. Most of the time they are perceived as different and unable to cope with mainstream education and they are kept isolated at home or special schools. But the scenario is being changed with the emergence of philosophy of inclusion, concept of UDL, differential instruction and individualized instruction. UNESCO Salamanca Statement and Framework for Action (1994) proclaimed that, "Every child has a fundamental right to education and must be given the opportunity to achieve & maintain an acceptable level of learning. Every child has unique characteristics, interest, abilities and learning needs, educational system should be designed & educational programmes implemented to take into account the wide diversity of these characteristics and needs. Those with special educated needs must have access to regular schools which should accommodate them within a child-centered pedagogy, capable of meeting these needs." The 1994 UNESCO World Conference also realized this situation when it argued that a school should, ...accommodate all children regardless of their physical, intellectual, social, linguistic or other conditions. This should include disabled and gifted children, street and working children, children from remote or nomadic populations, children from linguistic, ethnic, or cultural minorities and children from other disadvantaged or marginalized area and groups. (UNESCO, 1994, Framework for Action on Special Needs Education, p.6) These inclusive schools, ... must recognize and respond to the diverse needs of their students, accommodating both different styles of learning and ensuring quality education to all through appropriate curricula, organizational arrangements, teaching strategies, resource use and partnerships with their communities. (UNESCO, 1994, Framework for Action on Special Needs Education, p.11-12)

51 Sebba and Ainscow (1996) have offered a definition of inclusion: Inclusion describes the process by which a school attempts to respond to all pupils as individuals by reconsidering its curricular organization and provision. Through this process, the school builds its capacity to accept all pupils from the local community who wish to attend and, in so doing, reduces the need to exclude pupils (p.9). 1.7.2 National and International Legislations Support Inclusive Education : Let us look at the International legislations in support of inclusion: Source: World Bank Group: Education Global Practice Toolkit for master trainers in Preparing Teachers for Inclusive Education for Children with Special Needs

52 Module 1 : Education There are various constitutional provisions in India that have promoted mainstreaming of children with special needs into regular schools. Article 21A of the Constitution guarantees education as a fundamental right to all children in the 6-14 age group, while

53 Section 26

of the Persons

with Disabilities Act, (Equal Opportunities, Protection of Rights and Full Participation) Act (1995)

articulates that free and compulsory education has to be provided to all children with disabilities up to the minimum age of 18 years. The Government of India's 12th Five-Year Plan considered exclusion the single most important challenge in universalizing elementary education. The Draft Persons with Disabilities Bill (2012) enshrines a strong commitment to inclusive education. Government policies and schemes such as Sarva Shiksha Abhiyan (SSA) and Right of Children to Free and Compulsory Education (RTE) Act (2009), have changed the education landscape significantly, resulting in a significant decrease in the number of out-of-school children in the last decade. This has also led to an increasing number of children with disability entering government and private schools. SSA's goal is to provide eight years of elementary schooling for all children, including those with special needs, in the 6-14 age groups. Children with disabilities in the 15-18 age groups are provided free education under two national schemes: Integrated Education for Disabled (IEDC) and Rashtriya Madhyamik Shiksha Abhiyan (RMSA). The 2001 census report says that fifty-one percent of persons with disabilities are illiterate, so India has to continue its efforts to provide Education for All (EFA). It is therefore essential that to mainstream the children with disabilities effectively into regular schools teachers must be trained in inclusive education, need to learn to apply the principles of UDL, and understand the importance of differential instruction.

1.7.3 Key principles of inclusive education:

- Ø IE is based on the belief that the right to education is a basic human right for all children.
- Ø IE ensures good teaching
- Ø IE is a strategy to implement and fulfil the obligation of RTE
- Ø Providing equal opportunities to all children, which do not mean similar things for all children.
- Ø It is based on the concept of providing equitable learning opportunities, keeping in mind the differences and difficulties of the child besides their diverse background and their needs.
- Ø Teaching children from diverse backgrounds requires a tremendous amount of flexibility in teaching practices and processes as well as in curriculum design and learning materials.
- Ø Ensuring equitable learning opportunities by making the education system accessible and responsive to all children, including disadvantaged children, i.e. Scheduled Castes/Scheduled Tribes (SC/ST), minority, children with disabilities, girls, urban deprived, and also ensuring their entitlements to achieve optimal learning outcomes.

54 Ø IE is a process of addressing and responding to diverse needs of learners by reducing exclusion within schools. Ø IE is an entry point to improve the quality of the education system in terms of culture, policy and practices (pedagogy, classroom management, teaching learning materials [TLMs] and the learning environment). Ø Inclusive teachers are good teachers who are flexible in their approach and believe that the source of difficulties in learning is largely environmental and can be addressed.

55 From the above discussion and by looking at the international and national legislation we can clearly understand that inclusion is need of the hour to accommodate all children under the umbrella of education. With the passing of the rights of the persons with disabilities act (RPWDA) 2016 ON 27TH DECEMBER, 2016, inclusive education has become more than just rhetoric. For example section 16 of chapter III of the RPWDA, is clearly stated about inclusive education, "The appropriate government and local authorities shall endeavor that all educational institutions funded or recognized by them provide inclusive education to the children with disabilities and towards that end shall (i) Admit them without discrimination and provide education and opportunities for sports and recreation activities equally with others; (ii) Make building, campus and various facilities accessible; (iii) Provide reasonable accommodation according to the individual's requirements; (iv) Provide necessary support individualized or otherwise in environments that maximize academic and social development consistent with the goal of full inclusion; (v) Ensure that the education to persons who are blind or deaf or both is imparted in the most appropriate languages and modes and means of communication; (vi) Detect specific learning disabilities in children at the earliest and take suitable pedagogical and other measures to overcome them; (vii) Monitor participation, progress in terms of attainment levels and completion of education in respect of every student with disability; (viii) Provide transportation facilities to the children with disabilities and also the attendant of the children with disabilities having high support needs. In preamble it is clearly defined that "Inclusive education" means a system of education wherein students with and without disability learn together and the system of teaching and learning is suitably adapted to meet the learning needs of different types of students with disabilities; In UNCRPD, Article 24 Education stated that, (a) Persons with disabilities are not excluded from the general education system on the basis of disability, and that children with disabilities are not excluded from free and compulsory primary education, or from secondary education, on the basis of disability; (b) Persons with disabilities can access an inclusive, quality and free primary education and secondary education on an equal basis with others in the communities in which they live;

56 (c) Reasonable accommodation of the individual's requirements is provided; (d) Persons with disabilities receive the support required, within the general education system, to facilitate their effective education; (e) Effective individualized support measures are provided in environments that maximize academic and social development, consistent with the goal of full inclusion. 1.7.4 Educational practices Support Inclusive Education To make the dream of inclusion successful some strategies are being followed, Ø Principles of Effective Instruction Ø Universal Design for Learning (UDL) Ø Co-Teaching Ø Differentiated Instruction Ø Curricular Accommodations Ø Collaborative learning Ø Peer mediated teaching Ø Positive Behavior Supports

57 In the 1990 when UDL was introduced into the education domain as the momentum for inclusive education grew. The fundamental objective of inclusion was to prepare an appropriate curriculum to ensure all students can access and participate in the education system. Universal design was clearly relevant to full inclusion. Those who work in the application of UD to teaching and learning invented the term Universal design for learning. UDL emphasizes development of a curriculum that does not involve adaptation or retrofitting. In other words, it is not an add-on to the standard curriculum. Adjustment of curriculum and modified teachers instruction should be built from the beginning. UDL is the exchange of the Power base associated with the transfer of knowledge. UDL gives students control over the way in which they gain access to information, which encourages, their independence in learning and problem solving. It provides for equal access to all by removing barriers to knowledge and learning without diminishing the challenges. (Bauer & Kroeger, 2004) UDL involves the application of three primary principles: 1. Representation- It means using various ways of presenting essential concepts. As there is no single best way of presenting the curriculum that will satisfy the need of all students. For some students only lecture is enough but for some lesson notes are also needed along with the oral presentation. For some other students using graphics, drawings and photographs, even YouTube clips can also help. 2. Engagement - that is ensuring that learning activities must be designed in such a way so that they cater for student's skill levels, preferences and interests. So students must be provided such material which can capture their interests and motivate them in learning. 3. Expression - that is using alternative means of expression that allow students to demonstrate mastery of a topic, skill or acquired knowledge in a variety of way. Some students may write well and some may not, they may even find it difficult to write a simple letter. So providing a range of options that includes written, oral or multimedia presentations like dance, painting, project or even show and tell can help students to demonstrate their achievement of the curriculum goals. UDL also involves 7 teaching and learning features 1. Equitable use- the same technology or resources will be available to and usable by everyone, example most commercial digital mathematics programs have materials that cover a range of students capabilities

58 2. Flexible use - the same technology or resource is used for a number of purposes, example arithmetic or social or language 3. simple and intuitive application - example everyone knows how to look for a book in the library or use the web to search for information 4. Perceptible information - that the technology communicates essential information to the user regardless of the user's capabilities, example instruction and guidelines or manuals. 5. Tolerance for error - example the learning process includes recovery processes if error occurs. 6. Low physical effort - example the teaching process is accessible to students with sensory or mobility impairment 7. Size and space - example accommodates students with particular need such as making seating arrangement for a student with vision impairment at the front of the class. So UDL is all about tools and resources that are usable by all students in a classroom. Burgstahler (2001) distilled the initiatives achieved in design and architecture in to a set of features relating to classroom application. These are, Ø Inclusiveness - a classroom environment that respects and values diversity Ø Physical access - classroom resources and equipment that are accessible to all students. Ø Delivery methods - employment of varied instructional methods Ø Information access - use of for example captioned videos electronic copies of printed materials etc. Ø Interaction - different ways in which teacher and learner interact. Ø Feedback - effective and timely prompting and feedback and Ø Demonstration of knowledge - multiple ways for students to demonstrate their knowledge. UDL focuses on curriculum adaptation and ICT and promotes teaching practices that allow for equal access to all students. Differentiation is a core element of responsive teaching. The concept appears in the professional literature under several heading; curriculum differentiation differentiated

59 instruction and multi level instruction. Differentiation refers to flexible approach to teaching that address the different capabilities of individual student. Curriculum differentiation is the management of the, Ø Content - what is taught and learnt. (e.g.; by providing activity based task through to the conceptual and abstract) Ø process or methods for acquiring content - how knowledge is delivered(e.g.; accommodating preferred learning styles : visual auditory , tactile or kinesthetic) Ø method for assessment - how learning success is evaluated (using authentic task that involve real and relevant problems) Ø resources required - including material and human resources (e.g.; equipment, ICT teacher aids, volunteers, experts) The idea of differentiation is not new maker 1982 suggested ways in which the curriculum might be modified to take into account learner's characteristics, their skills and knowledge the pace of presentation, the complexity of the information and the depth of learning required. Conclusion: So with the implication of the above strategies inclusive education can be successful. Though there are some Barriers to access education and success inclusion which is physical as well as structural. But more than that, it is the curriculum, the pedagogy, the examination and the school's approach, which create barriers. So we need to take care of those barriers by applying the principles of UD(structural), UDL and differentiated instruction or individualized instruction to make the education accessible to all children. 1.8 Summary: So we have seen in this unit that

educational technology is concerned with the systematic application of science and technology in the field of education. It is helpful for both, the teacher and learner to set the learning objectives, strategies, procedures, materials and establish a good communication between them and make the teaching learning process more effective. The initiation of educational technology movement started with audiovisual aids (within 'technology in education') and behaviourism and programmed learning (within 'technology of education'). educational technology in India is being used for School 60 broadcast, TV Telecast lessons, Teacher preparation, Distance education, Correspondence courses, Development of audio- visual materials, Language teaching, Production of multipurpose kits or instructional aids, Computer literacy and studies in schools. The scope of educational technology is very wide and it is utilized in various areas of teaching and learning process like formulation of

educational goals and objectives, Curriculum Development, Developing Teaching-Learning materials and Resources, teacher training, Development of teaching - learning Strategies,Developing Multi- Sensory Aids, Develops Feedback Mechanism, Develops Interactive Instruction Services, Developing Information Resources, Develops Communication Devices etc. Instructional Technology is a subset of educational technology and

it is a systematic way of designing, carrying out and evaluating the total process of learning and teaching in terms of human learning and communication, and employing a combination of human and non-human resources to bring about more effective instruction.

It is helpful for both teacher and learner. Instructional Technology can make the instruction more interesting, more standardized, interactive, instant and need based, develops positive attitudes among students. Educational Technology has brought revolution in the entire education system in our country and also globally with the use of hardware approach, by using various technological aids, like projector, computer, smart phones and many other things; and software approach like using programmed instruction, CAI, CBI etc. With the help of educational technology teaching is not confined within the four wall of classrooms and source of information is not only the teacher, now learner can learn any time anywhere based on their needs and suitability with the help of online learning, online library, internet, blogs, Wikipedia, moodle and many more. There are three major approaches of Educational Technology namely Hardware Approach (Technology in education), Software Approach (Technology of Education) and System Approach. The use of hardware approach and software approach is very necessary to fulfill present age education needs. To reach large population easily, it is being used in distance mode courses, correspondence courses, online learning, and adult education very effectively. Educational Technology can make the teaching learning process effective and interesting by using multisensory approach, individualized education and reinforcement technique with the help of hardware and software technologies.

61 System Approach is a modern approach in educational administration and organization and it acts as a link between hardware and software approach. It is concerned with development, implement and evaluation of the whole educational system, sub-system, and curriculum by organizing human resource and physical resource in an effective and economic way to get the best from the education system. As we are living in the era of information explosion so role of mass media become very important in education sector. Mass media approach in education means to use educational TV, radio, press, newspaper, films, documentaries, internet, educational apps, mobile, etc to reach mass to provide education and also make the learners and teachers modern and up to date. Differentiated instruction is a teaching theory based on the premise that instructional approaches should vary and be adapted in relation to individual and diverse students in classrooms (Tomlinson, 2001). The teacher can differentiate instructional strategies based on the content (what the students are going to learn), the processes (the activities), the products (the accomplishment following a learning period) and the learning environment. The term "universal design" was coined by architect and designer Ron Mace at the Center for Universal Design at North Carolina State University (

Burgstahler, 2008; Center for Applied Special Technology, 2011b).The term UNIVERSAL DESIGN FOR LEARNING means a scientifically valid framework for guiding educational practice that: (A) provides flexibility in the ways information is presented,

in the ways students respond or demonstrate knowledge and skills, and in the ways students are engaged; and (B) reduces

barriers in instruction, provides appropriate accommodations, supports, and challenges, and maintains high achievement expectations for all students,

including students with disabilities. Principles of UDL are 1.Multiple means of representation - providing learners with various ways to acquire knowledge and information. 2.

Multiple means of expression - providing learners with alternatives to demonstrate what they know

and what and how they think and 3. Multiple means of engagement - providing learners with appropriate means of engaging and interacting with the learning environment. 1.9 Check your Progress Ø Explain the meaning and concept of educational technology in detail. Ø Explain 'hardware' and 'software' approach to education and their contribution

towards effective teaching and learning.

62 Ø Differentiate between "technology of education" and "technology in education". Ø Describe in detail the scope of educational technology. Ø Discuss the recent trends of Educational Technology and Instructional Technology in teaching learning process. Ø What is UDL and how it has a wide applicability to make inclusion successful? Ø Mention the three primary principles and their uses in inclusive classroom. Ø Justify the need of differential instruction for children with special needs. 1.10 References: Ø Sharma, S.R., Educational Technology, New Delhi: Mohit Publications, 2003. Use of ICT to Simplify Record Keeping: Information Management in Educational Administration in Special and Inclusive Setting 2.7.1 Role of ICT in record keeping and information management in school administration 2.7.2 Record Keeping 2.7.3 Use ofICT in Information management in Schools. 2.8 Let us sum up 2.9 Check your progress 2.10 References 2.1

Introduction Information and Communication Technology (ICT) is a generic term, which is being used for collecting, storing, editing and passing on information in various forms. Although there is no single, universal definition ofICT, the term is generally accepted to mean all devices, networking components, applications and systems that allow people and organizations (i.e., educational agencies, businesses, nonprofit agencies, governments and criminal enterprises) to interact in the digital world.

ICT is generally used to represent a broader, more comprehensive list of all components related to computer and digital technologies

than IT. The scope of ICT is not fixed, but is responsive to ongoing technological developments. ICT is leveraged for economic, societal and interpersonal transactions and interactions. ICT has drastically changed how people work, communicate, learn and live.

More than three decades ago, computers and related information technologies were introduced to educators for direct teaching and learning purposes.

Learning and teaching whether it is through actual classroom settings or through technological applications utilizes many psychological principles knowingly or unknowingly. ICT enables interactive and collaborative learning at several and best possible ways. ICT can help the school administrators to improve administrative tasks such as school record keeping system and school information management system.

67 2.2

Objectives After going through this unit, you will be able to • Understand the meaning, definition, scope and significance of

ICT • Understand

the

psychological bases for ICT among teachers and learners • Understand stages, requirement and process of development of ICT • Understand the process of using ICT in developing collaborative networks •

Understand the use of ICT to simplify record keeping 2.3 ICT - Meaning, Definition, Scope and Significance 2.3.1 Meaning and Definition of ICT The

integration of computers and communications offer unprecedented opportunities to the education system with its capacity to integrate and interact with each other over a wide geographic distance in a meaningful way to achieve the instructional objectives.

Increasingly rapid advances in ICT will have profound impact on way teachers teach and how learners learn in near future. The development of new broadband communication services, convergence of telecommunication with computers, recent developments in the field of communication protocol have fostered numerous proposals for the uses of ICT to support the teaching and learning environment.

The growth of these communication and computer systems, their ease of use, the power and diversity of information transfer allow teachers and students to have access to a world beyond the classroom.

It has the potential to transform the nature and process of the learning environment. Interactivity, flexibility and convenience have become the order of the day in the ICT supported environment.

Knowing how to use and integrate ICT in teaching and learning is of utmost importance for teachers in their role of creators of pedagogical environments. While literature provides some evidence of the effectiveness of using ICT in education, little is known about which learning strategies should be used for education and training. ICT development in education is a continuum approach along which an educational system or institution can be mapped depending on the stages of ICT development. These broad stages have been termed as Emerging, Applying, Infusing and Transforming stages of ICT development.

68

ICT stands

for information and communication technology and is defined as a "diverse set of technological tool and resources used to communicate, and to create, disseminate, store, and manage information."

ICT, or information and communication technology (or technologies), is the infrastructure and components that enable modern computing. 2.3.2 Components of an ICT system ICT encompasses both the internet-enabled sphere as well as the mobile one powered by wireless networks. It also includes antiquated technologies, such as landline telephones, radio and television broadcast -- all of which are still widely used today alongside cutting-edge ICT pieces such as artificial intelligence and robotics. ICT is sometimes used synonymously with IT (for

information technology); however, ICT is generally used to represent a broader, more comprehensive list of all components related to computer and digital technologies

than IT. The list of ICT components is exhaustive, and it continues to grow. Some components, such as computers and telephones, have existed for decades. Others, such as smart phones, digital TVs and robots, are more recent entries. ICT commonly means more than its list of components. It also encompasses the application of all those various components. It's here that the real potential, power and danger of ICT can be found.

2.3.3 The scope of ICT

The scope of ICT is not fixed, but is responsive to ongoing technological developments. This is evident in the emergence of advanced internet technology over the past few years and the resulting changes in the ways that students construct with others. Student develop capability in using ICT for tasks associated with information access and management, information creation and presentation, problem solving, decision making, communication, creative expression, and empirical reasoning. This includes conducting research, creating multimedia information products, analyzing data, designing solution to problems, controlling processes and devices, and supporting computation while working independently and in collaboration with others. Students develop knowledge, skills and dispositions around ICT and its use, and the ability to transfer these across environments and applications. They learn to use ICT with confidence, care and consideration, understanding its possibilities, limitations

69 and impact on individuals, groups

and communities. Information and Communication Technology is often used as an extended synonym or as an umbrella term for Information Technology (IT), but it is a most specific term

that

stresses

the role unified communications and the integration of telecommunications (telephone lines and wireless signals), computers

as well as necessary enterprise software, middleware,

storage, and

audio-visual systems, which enable users to access, store, transmit, and manipulate information.

The term ICT is also used to refer to the convergence of audio-visual and telephone networks with computer networks through a

single cabling or link system.

To some scholars,

ICT has no universal definition, as "

the concepts, methods and applications involved in ICT are constantly evolving on an almost daily basis."

The broadness of ICT

covers any product that will store, retrieve, manipulate, transmit or receive information electronically in a

digital form,

e.g. personal computers, digital television, email, robots;"

therefore, one can say that

ICT is concerned with the storage, retrieval, manipulation, or receipt of digital data."

ICT delineates how these various forms of digital mediums interact with one another.

Information and Communication Technology can contribute to universal access to education, equity in education, the delivery of quality learning and teaching, teacher's professional development and more efficient education management, governance and administration. UNESCO helps a lot in promoting ICT in education.

The scopes of ICT in various education sectors are: 1. Information Technology in Educational Management 2. Lifelong Learning 3. Distance Learning 4. IT-Professional and Vocational Education in Information Technology 5. Advancing community linkages 6. Improving policy planning and management 7. Establishing and sustaining lifelong learning 8. Facilitating skill formation 9. Lively teaching learning process. 10. Those students can find information, they need proper instructions, they need scope for creativity, and expectations of the teacher bring forth performance.

70 11. Helping the student learn. 12. Enhance teaching. 2.3.4 Significance of ICT ICT is leveraged for economic, societal and interpersonal transactions and interactions. leT has drastically changed how people work, communicate, learn and live. Moreover, leT continues to revolutionize all parts of the human experience as first computers and now robots do many of the tasks once handled by humans. For example, computers once answered phones and directed calls to the appropriate individuals to respond; now robots not only can answer the calls, but they can often more quickly and efficiently handle callers' requests for services. Pedagogical Usages of ICT

Studies of teaching and learning in schools

around the world identify four broad stages in the way the teachers and learners use leT as a support to teaching and learning.

More than three decades ago, computers and related information technologies were introduced to educators for direct teaching and learning purposes. It started with presentation software to CAL/CBT/CAI, then moved to multimedia courseware and finally to learning management system using open and flexible learning. Supporting work performance In the initial phase, teachers use productivity tools such as word processor, visual presentation software, spreadsheet, database, email etc. to support their daily work performance. In this initial stage, there is usually an emphasis on basic operations of electronic office software. This stage of using productivity tools for teaching and learning is linked with the emerging stage in ICT development Enhancing teaching Following on and from using productivity software, comes the stage of learning how to use and develop computer assisted learning software and beginning to make use of such software in different disciplines. This stage involves the technique of integrating computer-based learning in the traditional instructional process, and is linked with the applying stage in the ICT development model. Various instructional packages were selected, developed and used to enhance traditional classroom teaching. Facilitating learning The next stage involves using various types of instructional software to facilitate student learning. The key point is that the teachers need to learn how to choose the most

71 appropriate tools for a particular task, and using these tools in combination to solve real life problems. This stage implies the ability to recognize situations where various multimedia, simulation and modeling software can be utilized for teaching and learning. This stage is linked with the infusing stage in the ICT development model. Creating innovative learning environments The fourth and last stage involves specializing in the use of network based resources to create meaningful environment with rich affordable for innovative learning models so that it occurs when one enters more deeply into the shared learning environment that creates and transforms the learning situation. This is a completely new way of approaching teaching and learning using technology. It helps to develop, deliver and manage open & flexible learning program. This stage is linked with the transforming stage in the ICT continuum model. 2.3.5

Functional Approach of leT Usage Several attempts have been made to classify the functions of ICT in education in the literature, However, the most comprehensive and well defined classification describes the following functions of the use of ICT in education: (a) ICT as Object (b) ICT as Assisting Tools (c) ICT as Management of Learning and (d) ICT as Medium of Teaching & Learning. ICT as Object It refers to learning about ICT. Mostly organized in a specific course. What is being learned depends on the type of education and the level of the students. ICT curriculum prepares students for the future occupation and social life. There are various types of short term, long term and modular courses being offered in this area to satisfy the ever growing demand of skill personnel in the software industry. ICT as an Assisting Tool ICT is used as a tool, for example while making assignments, collecting data and documentation, communicating and conducting research.

It is independent from subject content. Generic assisting tools may be general or specialised in their application. Some of the examples of generic tools have been described below: Word Processing and Publishing Tools-preparing, editing and producing written, tabular and graphical material; Freehand and Geometric Drawing Tools-devising and producing pictorial representations of events, ideas and art effects;

72 Database Tools-searching, storing, categorizing and arranging data and information; Statistical Analysis and Modeling Tools-deducing trends and patterns, organizing and synthesizing information; Multimedia and Authoring Tools-capturing, editing, modifying integrating text, graphics, audio & video information; Simulation Tools-devising and testing ideas and hypotheses, and projecting future consequences; Animation Tools-creating editing and modifying 2D and 3D animation. 2.3.6 ICT as Medium of

Teaching and Learning This refers to ICT as a tool for the purpose of teaching and learning itself.

More than three decades ago, computers and related information technologies were introduced to educators for direct teaching and learning purpose. It started with CAL/CBT/CAI, then moved to Multimedia courseware and finally to Web Based instruction & Computer Mediated Communication (CMC) system. Using CAI for drill and practice of basic skills can be highly effective according to a large body of data and a long history of use. Students usually learn more, and learn more rapidly, in courses that use computer assisted instruction (CAI). This has been shown to be the case across all subject areas, from preschool to higher education, and in both regular and special education classes. Effective instruction requires presenting information, guiding the learner, practice, and assessment of student learning. The use of a computer to provide any combination of these factors may be termed computer-assisted instruction. It should be noted that there is no requirement that the computer provides all of these elements. Rather, any combination of these can be appropriate computer intervention in the learning process. Interactivity, flexibility and learner control is the hallmark of these technologies. The application of educational technologies to instruction has progressed beyond the use of basic drill and practice software, and now includes the use of complex multimedia products and advanced networking technologies. Today, students use multimedia to learn interactively and work on class projects. They use the Internet to do research, engage in projects, and to communicate. The new technologies allow students to have more control over their own learning, to think analytically and critically, and to work collaboratively. An increasing body of evidence suggests positive results of the ICT integration with teaching and learning. The type, features, styles, usage and pedagogical base of these transformations from CAL to WBI has been described below.

Type: Computer Assisted Learning (CAL)
73 Features: Interactivity, Flexibility and Learner Centered Styles: Drill & Practice, Tutorials, Simulation and Instructional Games Usage: Self Paced Instruction Pedagogical Base: Primarily Behavioral Objectives Type: Multimedia Based Instructional Software Features: Interactivity & Multi model Instruction Styles: Drill & Practice, Tutorials and Simulation & Modeling Usage: Self-Paced Instruction Pedagogical Base: Primarily Behavioral Objectives & Constructivism Type: Web Based Instruction Features: Interactivity, Just in time & On demand Instruction Styles: Computer Supported Collaborative Learning Environment Usage: Asynchronous & Synchronous Virtual Class Room Pedagogical Base: Primarily Constructivism

2.4 Psychological Bases for ICT among Teachers and Learners

2.4.1 Different psychological principles

The fast budding influence of Information and Communication Technology (ICT) and e-learning in content development and content delivery can be seen in every sector of education. Learning and teaching whether it is through actual classroom settings or through technological applications utilizes many psychological principles knowingly or unknowingly. The most commonly used or heard Schools of Psychology are Behaviourism, Cognitivism and Constructivism. All these schools of psychology are developed based on theories formulated by many psychologists and are being effectively applied in actual classroom situations. However, the application of these psychological principles in e-Learning is not much thought of. e-Learning could be more efficient and effective by the contextual use of different psychological principles. An innovative application of computer in the pedagogy and learning process is e-learning. E-Learning may be network based, intranet based or internet based, which includes

74 text, video, audio, animation and virtual environments. The facility of Internet and Intranet enables e-learning that allows learning anytime and anywhere. E-Learning provides faster learning at reduced costs, increased access to learning and clear accountability for all participants in the learning process. The fast budding influence of Information and Communication Technology (ICT) and e-learning in content development and content delivery can be seen in every sector of education. The American Society for Training and Development (ASTD) defines e-learning as a broad set of applications and processes which include web-based learning, computer-based learning, virtual classrooms, and digital. The definition of e-learning varies depending on the organization and how it is used; but basically it involves electronic means of communication, education, and training. Learning and teaching whether it is through actual classroom settings or through technological applications utilizes many psychological principles knowingly or unknowingly. Some of the predictions about the future of education tend to focus not so much on the technology, but on the intersection between pedagogy and technology, and its effect on psychology, epistemology and teaching praxis. The most commonly used or heard Schools of Psychology are Behaviourism, Cognitivism and Constructivism. The early use of technology in educational settings reflected a behaviourist view of teaching and learning. Behaviourism discusses behaviours that can be observed and does not fully consider the thought processes that go on in the learner's mind. Cognitivism differs from behaviourism in that it deals with the internal mental processes of the mind and how these processes could be used to endorse effective learning. We know that 'Learning is relatively permanent changes of behavior through some experience'.

2.4.2 Use of ICT in education from the point of view of learning

ICT is used in education for supporting students' learning or for development of competences, in other words for helping to reach the goals of education. The quality of learning depends on how ICT is used in learning. According to Bransford, Brown, & Cocking (1999) meaningful learning engages students in tackling the topic to be learnt in such a way that they create meaningful and understandable knowledge structures on the basis of a goal for learning. Based on them, it is possible to present an outline of learning with a specific focus on ICT use in learning. Learning represents each individual learner's own personal knowledge construction process which presupposes each learner's active, goal-oriented and feedback-seeking role. The constituents of meaningful learning are the following: activity, intention, contextualization, construction, collaboration, interaction, reflection, and transfer. These serve as development and selection criteria when choosing teaching and learning activities emphasizing ICT use. Activity and intention mean that students take responsibility over their own learning. Thus they set, together with a teacher, their learning goals and proceed according to the plan to reach the goals they set. This process may be facilitated, for example, by guiding students to plan by themselves or in small cooperative groups. On the other hand, students neither master the logical structure of the subject nor recognise their own biased preconceptions, and therefore students goal setting needs to be supported and guided by the teachers. Thus, activities that support co-operative planning and evaluating learning are important for learning. Learning could also be enhanced by self-evaluating activities. Bransford and Donovan (2005) emphasize the role of self-evaluation in learning. They suggest that a teacher should provide support for students self-evaluating for example by giving them opportunities to test their ideas by building things or making investigations and seeing then whether their preliminary ideas were working. Feedback is important for learning. Reflection means that students examine their own learning and develop metacognitive skills to guide and regulate their learning. Metacognitive skills are necessary for planning and evaluating one's own work. These skills make also learning a self-regulatory process in which the student becomes less dependent of the teacher. For example, self-evaluating or evaluating in a small group, taking multiple-choice tests, doing exercises and consulting answer keys support developing reflective and, moreover, metacognitive skills. Collaboration and interaction mean that students actively take part in group activities and support each other by discussing and sharing knowledge. Learning new concepts presupposes a dialogue both between the teacher and the students and amongst the students (explaining, debating, questioning). In addition to face-to-face interaction ICT offers several possibilities to share ideas through newsgroups, email, a LMS, or through social media like Facebook. Construction means that students combine their earlier knowledge with the new topics to be learnt and thereby tailor information structures that they can comprehend. Therefore, the teacher should encourage students to bring up their previous views and beliefs and thereby construct new knowledge on the basis of this shared information. For

76 example, prior to starting reading or writing, students need to be guided to bring up their prior views on the subject to be dealt with. Respectively, before an investigation or other practical activity students should be encouraged to present his or her prediction or even supposition. Contextualization means that learning takes place in real life situations or in situations simulating real-life instances. This in turn presupposes that the learning setting allows for authentic and real-life learning experiences. For example, when using a search machine (Google), students should be encouraged to look information in different sources. This enables them to treat the concepts in various contexts and thereby deepen the meanings these concepts acquire. It pays off also to keep in mind that the quality of all Internet-based sources needs to be checked carefully to ensure that the facts are right (source criticism). From the point of view of interestingness, the context in which science ideas are learned, rather than the ideas themselves, has important influence on learning. For example, when writing it is crucial that students write to prospective readers other than their teacher. Learning is cumulative and, therefore, students are aided in noticing how a new concept or skill is related to other already familiar concepts or the network of concepts or skills. Learning of science process and of ICT skills are similar processes. In both areas there are low level and high level skills. For example, before a student learns to use a LMS he or she should learn to use word processing and a search machine. Consequently, students should be supported in learning new skills and in internalizing the new concepts and in building conceptual networks in the given field. The previous characteristics of learning activity may be realized through the use of ICT. For example, by employing the Internet in the inquiry-based learning, students have access to meaningful information of the topic. When looking up information in varied sources, students at the same time actively structure the flow of information they encounter into meaningful entities in order to be able to complete tasks. Similarly, this exploration of information in varied sources forces students to evaluate the reliability of both the information and the sources they use. Within an activity students could be encouraged to work together and also to systematically evaluate their activities. Several studies have indicated that information processing, inquiry-based learning, and exploring resources via networks, are beneficial for education (Linn, 2003). 2.4.3 Use of ICT in teacher education from the point of view of motivation ICT could be used in education for supporting the development of students' motivation.

77 There are many concepts that can be used to describe motivational aspects of teaching and learning. Here we base our analysis on Self Determination Theory (SDT) (Ryan & Deci, 2000) and Theory of Interest (Krapp, 2007). According to SDT, a student's way of thinking has an important role in the process of motivation. Motivated behaviour may be (i) self-determined or (ii) controlled and they involve different reasons for behaving. Self-determined or autonomous behaviour is behaviour which arises freely from one's self. Controlled behaviour, in contrast, means that the behaviour is controlled by some interpersonal or intrapsychic force, like a curriculum or a task. The motivation styles in SDT are: (i) amotivation, (ii) extrinsic motivation and (iii) intrinsic motivation. Intrinsic motivation has positive effects on learning, in particular, to the quality of learning. Intrinsically motivated behaviours are based on the need to feel competent and self-determined (Deci & Ryan, 2000). Extrinsically motivated behaviour is instrumental in nature. Such action is performed for the sake of some expected outcome or extrinsic reward or in order to comply with a demand. Central to SDT is the concept of basic psychological needs assumed to be innate and universal. These needs are the need for autonomy, the need for competence, and the need for relatedness (need to belong to a group). The fulfillment of need for competence is especially problematic in the case of ICT because the required studies are perceived as being difficult. This perceived lack of competence has an effect on interest and motivation. Furthermore, the interest of the student in a learning activity has an effect to motivation. Consequently, the features of a learning activity and behaviour of a teacher (trainer) could increase the motivation of a learner (student teacher). This is because self-determined learning occurs when a learning activity itself supports fulfillment of basic psychological needs or development of interest. A closer analysis on motivational aspects is based on SDT; ICT is used for motivating or for increasing students' interest for learning. How motivating learning with ICT is for students depends on how ICT is used in this context. Interest is a content-specific motivational variable (Krapp, 2007). Interest is approached from two major points of view. One is interest as a characteristic of a person (personal

78 interest) and the other is interest as a psychological state aroused by specific characteristics of the learning environment (situational interest). Personal interest is topic specific, persists over time, develops slowly and tends to have long-lasting effects on a person's knowledge and values (Hidi, 1990). Pre-existing knowledge, personal experiences and emotions are the basis of personal interest (Schiefele, 1991). Situational interest is spontaneous, fleeting, and shared among individuals. It is an emotional state that is evoked by something in the immediate environment and it may have only a short-term effect on an individual's knowledge and values. Situational interest is aroused as a function of the interestingness of the topic or an event and is also changeable and partially under the control of teachers (Schraw & Lehman, 2001). Although students themselves primarily produce their motivation, it can be enhanced and learned. In practice, a teacher can offer optimal challenges and rich sources of motivating stimulations through choosing the learning activities. Therefore, in addition to previously discussed features of self-determined and controlled behaviour of a learner, it is appropriate to analyse also features of a learning activity which could increase motivation of a learner. This is because self-determined learning occurs when learning activity itself is considered as interesting, enjoyable, or personally important by a learner. From the point of view of the SDT, the motivational features of a learning activity could be classified in five categories: I. autonomy-supporting activities/teacher, through • choosing student-centred learning methods like "open ended" inquiry and other tasks where students have some choices how to plan or study. • collaborative learning activities which support feeling of autonomy, • co-planning of the learning activities. II. Use of ICT where students have • choices, possibilities for planning and evaluating one's own activities, and • support to the feeling of effectiveness and importance of working. III. Support to students' feeling of competency, through • choosing inquiry and other tasks, which are possible for the student to solve; • choosing and using constructive evaluation methods, like self assessment, portfolio evaluation

79 • informal discussions, which help students to recognise that they are good at an activity or do the activity well, • giving support to the feeling that the activity has some value or use for the student. IV. Support to students' social relatedness, through • choosing tasks, collaborative learning activities, co-planning, and ICT use which help students to feel close to peers • giving support to the feeling that the students can trust each other and feel themselves close to each other, • supporting the formation of learning communities over social media and various forms of networking v. Support to interest and enjoyment, through • waking up curiosity by choosing surprise-evoking inquiry and other activities or tasks, • organising enjoyable, fun-evoking and interesting activities, like through choosing interesting web pages or simulations, • choosing activities which hold attention, • interesting content (new materials or new knowledge) and context (human being, occupations, technology, or history). 2.5 Development of ICT - Stages, Requirement and Process 2.5.1 Stages of ICT development Countries in the various region of the world are at different stages of ICT development, in terms of both infrastructure and application of ICT in teaching and learning. Within any such country, there may be uneven development from region to region, area to area, and even from institution to institution. In view of the above considerations, it is useful to have a model for ICT development for developing competency standards for teacher development. Such a model can be a representation of the essential characteristics of ICT development to provide a scaffold or a framework. It can also be useful to show the inter-relationship of various components within a system and thus helping to locate its position in the whole framework. Based on the UNESCO publication, a model has been presented that can be useful in

80 determining the stage of ICT development reached by a country, a district, or even an individual institution. As mentioned earlier, this model is derived from international and national studies of ICT development that have identified a series of broad stages that educational system and institutions typically proceed through, in the adoption and use of ICT. The model is presented here to provide a framework for stages of pedagogy technology integration. Studies of ICT development in both developed and developing countries

identify at least four broad approaches through which educational systems and individual institutions typically proceed in their adoption and use of ICT. Sometimes, the number of stages identified varies, though there is a general consensus that the introduction and use of ICT in education proceeds in broad stages that may be conceived as a continuum or series of steps. These steps, termed Emerging, Applying, Infusing, and Transforming, are elaborated in

Figure 1. Figure 1: Stages of ICT development

Emerging Stage: Schools at the beginning stages of ICT development demonstrate the emerging approach.

Such schools have just started on their journey in the ICT field with a skeleton computing infrastructure either donated or purchased by the school authority.

In this initial phase, administrators and teachers just start to explore the possibilities and consequences of using leT for school management and adding leT to the curriculum. Applying Stage:

Those

schools, in which a new understanding of the contribution of K'T to learning

81 has developed,

exemplify

the applying approach. In this secondary

phase, administrators and teachers use leT for tasks already carried out in school management and in the curriculum.

Schools at the applying approach phase adapt the curriculum in order to increase the use of ICT in various subject areas with specific tools and software such as drawing, designing, modelling and application specific tools.

Infusing Stage: At the third stage, the infusing approach involves integrating or embedding ICT across the curriculum, and is seen in those schools that now employ a range of computer-based technologies in laboratories, classrooms, and administrative offices. The curriculum begins to merge subject areas to reflect real-world applications.

In the infusing approach to ICT development, ICT infuses all aspects of teachers' professional lives in such ways as to improve student learning and the management of learning processes.

Transforming Stage: Schools that use ICT to rethink and renew school organization in creative ways are at the transforming approach. ICT becomes an integral though invisible part of daily personal productivity and professional practice. The

focus of the curriculum is now learner-centered that integrates subject areas in real-world applications. 2.5.2

Characteristics of schools related to ICT development Along with approaches to ICT development noted above, there are various characteristics of schools, or aspects of school leadership, that relate to a school's progress in ICT

development. Below are general descriptions of the more important of these characteristics of schools that have an

effect on ICT development within schools. Vision Vision refers to the aspirations and goals of both individuals within a school and the school system as a whole. As the school advances, the mission statements should become clearer and

provide a basis for decision-making. Mission statements should help individual members of the learning community

visualize a school's aspirations for the future and act in harmony. Philosophy of learning and pedagogy Ways in which

teachers and students interact and how the school is managed for learning are part of what is meant by a school's

philosophy of learning and pedagogy. These philosophies will necessarily characterize the ways in which ICT is

incorporated into a

82 school. A setting that is dominated by the teacher as the main provider of subject content is adopting a teacher-

centred philosophy. The teacher controls the use of ICT in such a setting as well. A learner centred philosophy, by

contrast, describes a setting where content comes from a variety of resources, and where projects are chosen and

designed by the students. ICT tools and resources are selected by students in ways that match the aims of a project best.

These contrasting approaches to pedagogy are sometimes referred to as instructivist and constructivist respectively.

Development plans and policies How a school's vision and teaching philosophies are carried out is translated into

development plans and policies. In the detailed steps of such plans and policies, goals and objectives are further defined

providing interim and long-term targets. Policies are set, a budget is allocated, facilities are determined, roles are defined,

tasks are delegated, and an evaluation plan is created to define the direction ICT development will take. Facilities and

resources The learning environment in which ICT is used requires certain facilities and resources. Facilities include basic

infrastructure such as electrical wiring, Internet access, lighting, air-conditioning, and space. Decisions on inclusion or

lack of ergonomic design and choice of furniture impact not only on use of ICT, but also on the health and well being of

users. Resources include various types of technological devices from computers with peripherals, video equipment, and

specialized tools like digital microscopes. Further resources include various types of software, as well as traditional tools

like books, videos, and audiotapes. Understanding the curriculum An understanding of the curriculum affects the

progression of ICT in the curriculum in following various stages of development. First, is an awareness stage in which

students become ICT literate with regard to what technology is available and how it might be used. Second, as students

learn basic skills, they begin to apply various ICT tools to their regular learning assignments and projects.

83 Third, as students become more capable and confident with ICT, they begin to integrate and overlap both subject areas and tools. Last, is the applied use of ICT in which students are now enabled to address larger, more complex, real-world professional issues. Professional development of school staff In parallel with the curriculum for students, there must be professional development of the staff within a school. The personal productivity and professional practice of teachers are enhanced with the use of ICT. First, is an awareness stage in which teachers and staff become ICT literate with regard to what technology is available and how it might be used. Second, as teachers and staff learn basic skills, they begin to apply various ICT tools to their regular tasks and projects Third, as teachers and staff become more capable and confident with ICT, they begin to integrate and overlap both subject areas and tools. Last, is a change in professional practice in which teachers are now enabled to design lessons to incorporate larger, more complex, real-world projects using ICT tools and resources. As ICT is introduced into school systems, there is a tendency to move from discrete skills training to reflective practice and integrative professional development. Budgetary allocation and provision for release time for teacher professional development seriously impact on the ability of a school system to incorporate ICT in a meaningful way. Community involvement Community involvement may include parents, families, businesses, industry, government agencies, private foundations, social, religious and professional organizations, as well as other educational institutions such as vocational schools and universities. Community involvement can come in the form of donations of equipment and resources, or may be in human resources provided for training and technical assistance. As a community contributes to a school, so the school can give back in many ways. For example, a school may decide to provide community members with evening access to computer labs, or have students offer training to parents. The use of ICT provides an opportunity for a school and its students to interact with both local and global communities. Interaction may range from building web sites for community organizations, to sharing projects with remote schools.

84 Assessment Assessment includes both assessments of students as well as overall evaluation of a school system, two aspects that are intricately interwoven. An improvement in the one should predicate an improvement in the other. Means of student assessment should reflect choices in learning pedagogy and an understanding of ICT in the curriculum. For example, in the emerging and applying stages of ICT, assessment may be linked to pencil and paper tests, whereas in the infusing and transforming stages project based portfolios may be more appropriate. Each part of a school system needs to be evaluated to determine its impact on learning. Assessment should inform practice and support the management of learning. Assessment should allow a system to determine whether outcomes have been met, and then reviewed and revised accordingly. Budget allocations, policies, and procedures for ICT should match vision, teaching philosophies, and curriculum choices.

2.5.3 Process of ICT development

Teaching and learning are best thought of, not as separate and independent activities, but rather as two sides of the same coin, interconnected and interrelated. Studies of teaching and learning in schools around the world identify four broad stages in the way that teachers and students learn about and gain confidence in the use of ICT.

Discovering ICT tools The first stage that teachers and learners go through in ICT development is of discovering ICT tools and their general functions and uses. In this discovery stage, there is usually an emphasis on ICT literacy and basic skills. This stage of discovering ICT tools is linked with the emerging approach in ICT development. Learning how to use ICT

tools Following on from the discovery of ICT tools comes the stage of learning how to use ICT tools, and beginning to make use of them in different disciplines This stage involves the use of general or particular applications of ICT, and is linked with the applying approach in ICT development.

Understanding how and when to use ICT tools The next stage is understanding how and when to use ICT tools to achieve a particular purpose, such as in completing a given project. This stage implies the ability to recognize situations where ICT will be helpful, choosing the most appropriate tools for a particular

85 task, and using these tools in combination to solve real problems. This stage is linked with the infusing and transforming approaches in ICT development. Specializing in the use of ICT tools The fourth and last stage involves specializing in the use of ICT tools such as occurs when one enters more deeply into the science that creates and supports ICT. In this stage students study ICT as a subject to become specialists. Such study concerns vocational or professional education rather than general education and is quite different from previous stages involving the use

of ICT tools. 2.6 Use of ICT in Developing Collaborative Networks for Sharing and Learning such as -internet, E-mail, Tele-teaching,

Teleconferance 2.6.1 ICT in developing collaborative network:

The potential of each technology varies according to how it is used.

Haddad and Draxler identify at least five levels of technology use in education:

presentation, demonstration, drill and practice, interaction, and collaboration.

Each of the different ICTs—print, audio/video cassettes, radio and TV broadcasts, computers or the Internet—may be used for presentation and demonstration, the most basic of the five levels.

Except for video technologies, drill and practice may likewise be performed using the whole range of technologies.

On the other hand, networked computers and the Internet are the ICTs that enable interactive and collaborative learning best;

their full potential as educational tools will remain unrealized if they are used merely for presentation or demonstration.

ICTs

stand for information and communication technologies and are defined, for the purposes

of this primer,

as

a "

diverse set of technological tools and resources used to communicate,

and to create, disseminate, store, and manage information." These technologies include computers,

the Internet, broadcasting technologies (radio and television), and

telephone

to be used and their modalities of use. 2.6.2

Teleconferencing and

its educational use:

Teleconferencing refers

to "interactive electronic communication among people located at two or more different places."

There are four types of teleconferencing based on the nature and extent of interactivity and the sophistication of the technology: 1) Audio conferencing;

86 2)

Audio-graphic conferencing, 3) Videoconferencing;

and 4) Web-based

conferencing.

Audio conferencing involves the live (real-time)

exchange of voice messages over a telephone network. When low-bandwidth text and still images such as graphs, diagrams or pictures can also be exchanged along with voice messages, then this type of conferencing is called audio graphic.

Non-moving visuals are added using a computer keyboard or by drawing/writing on a graphics tablet or whiteboard.

Videoconferencing allows the exchange not just of voice and

graphics but also of moving images.

Videoconferencing technology

does not use telephone lines but either a satellite link or television network (

broadcast/cable). Web-based conferencing, as the name implies, involves the transmission of text, and graphic, audio and visual media via the Internet;

it requires the use of a computer with a browser and communication can be both synchronous and asynchronous.

Teleconferencing is used in both formal and non- formal learning contexts

to

facilitate teacher-learner

and learner-

learner discussions, as well as to access experts and other resource persons remotely.

In open and distance learning, teleconferencing is a useful tool for providing direct instruction and learner support, minimizing learner isolation.

The audio-graphic teleconferencing network aims to provide continuing education and academic upgrading to nurses in parts of Tianjin municipality where access to nursing education has been extremely limited. Various higher education institutions using teleconferencing in their online learning programs include the Open University of the United Kingdom, Unitar (Universiti Tun Abdul Ruzak) in Malaysia, Open University of Hong Kong, and Indira Gandhi National Open University. 2.6.3 Telecollaboration Online learning involving students logging in to formal courses online is perhaps the most commonly thought of application of the Internet in education. However, it is by no means the only application. Web-based collaboration tools, such as email, message boards, real-time chat, and Web-based conferencing, connect learners to other learners, teachers, educators, scholars and researchers, scientists and artists, industry leaders and politicians-in short, to any individual with access to the Internet who can enrich the learning process. The organized use of Web resources and collaboration tools for curriculum appropriate purposes is called telecollaboration.

Judi Harris defines telecollaboration as "an

87 educational endeavor that involves people in different locations using Internet tools and resources to work together. Much educational telecollaboration is curriculum- based, teacher-designed, and teacher-coordinated. Most use e-mail to help participants communicate with each other. Many telecollaborative activities and projects have Web sites to support them." The best telecollaborative projects are those that are fully integrated into the curriculum and not just extra-curricular activities, those in which technology use enables activities that would not have been possible without it, and those that empower students to become active, collaborative, creative, integrative, and evaluative learners (see Table 1). There are currently hundreds of telecollaborative projects being implemented worldwide and many more that have either been completed or are in development. 2.6.4 Use

of

radio and TV broadcasting in education:

Radio and television have been used widely as educational tools since the 1920s

and

the 1950s, respectively.

There are three general approaches to the use of radio and TV broadcasting in education: ●

direct class teaching, where broadcast programming substitutes for teachers on a temporary basis; ●

school broadcasting, where broadcast programming provides complementary teaching and learning resources not otherwise available; and ●

general educational programming over community, national and international stations which provide general and informal educational

opportunities. 2.6.5

Internet

The

Internet has introduced improvements in technology, communication and online entertainment, but it is also incredibly useful for education purposes as well. Teachers use the Internet to supplement their lessons, and a number of prestigious universities have opened up free online lectures and courses to everyone. It has even allowed retired teachers to read to and educate children in poorer countries. Widespread use of the Internet has opened up a substantial amount of knowledge to a much broader range of people than ever before. The development of Internet technologies has raised the education level in all countries and it has changed the way students are being taught at schools. That's why it is very important for the present generation that they provide internet education for their young generations.

88 Internet applications respond to students and other people questions in real time. Students are seeing Google as a new Teacher and the Internet as a school. That's why it is important for teachers to use information technology in education. The Internet has been crucial in the evolution of our education system in various ways. Teachers can use the internet as a modern tool for education. Education department should provide the infrastructure that teachers and student can use to get benefits of technology in education. Students are always curious and creative by nature. They are smart enough to know how they can use the internet to search for almost anything. It doesn't matter if they are studying at a private school or government school. But at the same time, there is a difference in the ways they use the internet for education in schools. In private schools, teachers will teach about computer and internet skills to students. The students note the homework that needs to be done related to that computer class. And do you know how some students do this? They are forced to go to a cyber cafe with their parents to collect data that they have to include in their assignments. This is not good. If students are taking the help of cyber boy to collect the data for their homework I don't think these students learned anything in this process. But the one thing they do learn is that money can work wonders anywhere. The teaching process that schools are following is not good and they need to use the internet as a tool, not the source. The source is a student. Teachers need to explore the creativity in their student's minds. And then students can learn and solve problems using their own creativity and innovative thinking and not by the direct work of parents/ tuition. If necessary the parents can help with encouragement but they should not do the homework themselves. Completing the assignment given is not as important as the learning process that a child goes through while doing it. It is essential for parents to provide computer and internet facilities to their children. It is not that easy for parents to pick up modern technologies as fast as their children but it is very important that parents also know about the importance of computers literacy and internet education. In government school especially in India, the level of computer and internet infrastructure is very low. I know government school or school in villages provide computer education only after 9th or 10th class. Within that little time too, a government school student barely gets to learn much because there are 5- 10 students who are assigned a single computer. It is very difficult to learn this way. I agree that this is the best time to teach them about the advanced computer skills but this is not the way to do it. The lack of Information technology infrastructure in schools is a big question mark against

89 Government policies towards computer education. It feels bad to see on the news that computer teachers are on strike again. This happens once a year. The government must think, how computer teachers can teach with low-quality IT infrastructure in government schools and a small salary? 2.6.6 Electronic Mail Electronic mail is a method of exchanging messages via computer networks and the Internet; the addressee receives the message virtually instantly. Using e-mail requires creating mailbox with an e-mail service provider. The mailbox is protected with a username and password. Advantages: An e-mail message can be sent to many recipients at once; A message can have one or several file attachments; Users can access their e-mail account from any computer connected to the Internet; No paper needed; Very low direct and indirect costs; Messages can be received on mobile devices. Disadvantages: The advantages of e-mail are also used by spammers and computer viruses; Attached files can contain viruses. 2.7

Use of ICT to Simplify Record Keeping: Information Management in Educational Administration in Special and Inclusive Setting 2.7.1 Role of ICT in record keeping and information management in school administration ICT makes dynamic changes in society. It is influencing all aspects of life. The influences are felt more and more at schools. Because ICT provides both students and teachers with more opportunities in adapting learning, teaching and managing the individual needs, society is forcing schools to aptly respond to this innovation. It provides newer and more effective ways of mitigating some of the challenges being faced by the educational system of the country. These technologies distinguish themselves by their

90 rapid evolution and revolution, continuously changing the modes of engagement with them. A decade long infusion of computers, and more recently ICT, has demonstrated varying impacts on learning. In the current information age, educational institutions are expected to play a crucial role as the engine for knowledge generation and learning environment. In this regard ICT becomes the vital means to facilitate this task. ICT has become an essential part of our everyday life, accordingly this integration in school improvement is not only for the purpose of teaching and learning, but also for educational management use, it has become one of the most effective factors in the school improvement. ICT plays a vital role in improving the functional effectiveness of school system. ICT can help the school administrators to improve administrative tasks such as school record keeping system and school information management system. 2.7.2

Record Keeping School records are books, documents, files and CD ROM in which is embodied information on what goes on in school (e.g. scholastic, co-scholastic, non-scholastic activities and important events etc), the school plant as well as other relevant information focusing on the growth and development of the school. The school records are official transcripts or copies of proceedings of actions, events, other matters kept by the school administrator, school records could be viewed as authentic registers or instruments or documents of official accounts of transaction or occurrence which are preserved in the school's office. Therefore, every school must keep certain specified records. Importance of school records: School records keeping includes the fact that school records tell the history of the school and are useful historical sources. 1. Tell the history of the school and are useful historical sources. 2. Facilitate continuity in the administration and management of a school. 3. Facilitate and enhance the provision of effective guidance and counselling services for students in the social, academic career domains. 4. Provide information about student's special educational or other needs, students current level of performance, students medical history etc. 5.

Provide information needed on ex-students by higher and other related institutions and employers of labour for admission or placement.

91 6. Facilitate the supply of information to parents and guardians for the effective monitoring of the progress of their children/wards in schooling or performance. 7. Provide data needed for planning and decision making by school heads, ministries of education and related educational authorities. 8. Provide a basis for the objective assessment of the state of teaching and learning in a school, including staff and student performance by supervisors and inspectors. 9. Provide information for the school community, the general public employers as well as educational and social science researchers for the advancement of knowledge. 10. Enable school heads to collate information on pupils and staff for decision making by higher authorities, the law courts security agencies and other related government agencies when occasion demands. 11. Provide a mechanism such as the school timetable for the productive management of time and coordination of school work and activities. 12. Serve as data bank on which both the school head and staff and even students can draw on. Some Important School Records • Admission and Withdrawal Register: This is a permanent record book into which is entered information regarding the entry and exit, including the details of the education and progress of each pupil that ever passes through the school. • Attendance Register: An attendance register is a book in which the presence or absence of students in a school is recorded on a daily basis. It is a statutory record that must be kept by every school. This record is kept on individual class basis. The class teacher is the custodian of this record. • Log Book: The log book is a historical record of events that have significant effects on the schools' activities. • The Visitors Book: The book is meant for recording the visits of important personalities, including officials and from the ministries of education or other related government agencies or any other school related visitors. • Staff and Students' Personal Files: It is necessary that the school should have as much information on every teacher and student as possible without violating their privacy.

92 • Cumulative Record Folder: Students' cumulative record folder is a storehouse of information on students' cognitive, affective and psycho-motor development. • Students' Report Sheet/Card' 1. It keeps data on students' academic performance. 2. It assists in monitoring students' academic progress. 3. It is a compliment to cumulative record folders. • Lesson Notes/Plan 1. It gives information on what a teacher plans to teach the students at a period of time. 2. It clearly shows the teachers' level of preparedness and their level of competence. 3. It challenges teachers for the task ahead. • Scheme and Record of Work Book: It reflects estimate of academic work which teachers expect to accomplish in each subject based on number of lessons they will have during each term. Pertinently it shows the ability of the teacher to organize the year's work and his/her resourcefulness and enthusiasm regarding the progress of the pupils. • Staff Time Book and Movement Book 1. They provide information on when staff report and or close at work. 2. They promote regular attendance and punctuality 3. They help checking truancy and gross indiscipline in staff. • Transfer and Leaving Certificate: Transfer and leaving certificate is the formal exit of the student after completion of study or leaving during the course of study in a school. • Library records: The library will have many records like stock register, issue register etc. Many of the routine function of the library can be automated using library management software. • Stock register: it is the record of all equipments and materials available in the school including the laboratories ●●●●● Cash Register 1. It is a record of financial transactions in schools.

93 2. It gives information about income and expenditures. 3. It promotes accountability and prevents corrupt practices. • Potential

of ICT in Record Keeping The usefulness of keeping school records with Information and Communication Technologies (ICT) is for the following reasons: ●●●● Administrative Efficiency:

One major setback in achieving the educational objective of the secondary education is inefficiency of the principal in keeping some

records. With the introduction of information and communication technologies such as computers, digital libraries, e-mail, internet and so on where information are stored and disseminated, principals can do better in keeping records, and become effective and efficient in performing their prescribed roles

as administrators. ● Availability of Information:

Information and Communication Technologies will help maintain adequate and accurate records in our schools and make it available with ease. ●

Easy Retrieval: It also leads to easy accessibility and dissemination of information on school records, will become available for national planning, financial budgeting, effective implementation of the educational programs and policies. School record keeping

is all about information collection, storage, retrieval, use, transmission, manipulation and dissemination for the purpose of enriching communication, decision-making and problem solving ability in the school system. It is therefore necessary that this process be as accurate and accessible as possible. Using ICT in keeping school records will help to facilitate and enhance the administration of the school towards achieving the goals of the secondary education. 2.7.3

Use of ICT in Information Management in Schools. E-mail: Schools can create and send out a classroom newsletter to keep parents up to date by e-mail. They can collect the e-mail addresses in the beginning of the school year or give parents the opportunity to sign in for the newsletter on the school website. Individual teachers can send e-mails when there are problems in the classroom or for giving parents good news about the learning process of their children. E-mails can be sent individually or in group. It is very easy to make groups of addresses in the most

94 common e-mail programs. Parents can read and respond to e-mails whenever they have time. E-mails are also available in the LMS and students contributions in terms of chats and forum postings get e-mailed automatically by the system. Website or Blog: On the school website all information of the school such as contact information, expectations, school rules, about the school and the teachers, how to use the internet at home, etc can be showed. The website can also have a calendar with useful information about school trips, parental evenings, and a map with pictures of activities with learners, etc. A school or class can make its own website on hired web space or can use free hosting web sites.

Many schools are using free blogging services from Google and word press to provide information to parents, students and public in general. Online Survey: Technology currently permits to get quick feedback from parents through online survey. Tools like Google form and survey monkey can be easily set up to get the information from parents and community members. These tools not only collect the information but perform the basic analysis and the outputs are

provided automatically for quick decision making. Virtual Learning Environments: A virtual learning environment (VLE) is a software system designed to support teaching and learning in an educational setting. A VLE will normally work over the Internet and provide a collection of tools such as those for assessment (particularly of types that can be marked automatically, such as multiple choice) or self-evaluation, communication through discussion boards, uploading of content, return of students' work, peer assessment, administration of student groups, collecting and organizing student grades, questionnaires, tracking tools, etc. New features in these systems include wikis, blogs, RSS and 3D virtual learning spaces. It can be seen that the VLE or the Learner Management Systems (LMS) have its own inbuilt communication modules to interact with the learners which in turn can be monitored by parents at home. MOODLE is one of the popular open source LMS. You can review the features of MOODLE from its website at www.moodle.org Media Sharing: currently it is possible to share various kinds of media online. Most popular one is sharing of videos through online video sharing sites like You Tube. Schools can use this to communicate with parents by sharing school programme related videos, videos for training parents on child rearing practices, helping students manage stress, time etc. School related audio programme could be podcasted using online podcasting sites. Presentations by teachers and others could be shared with parents through slide sharing sites. Images can be shared using flicker.

95 Social Networks. It is possible to use social networks like Facebook, Twitter or MSN to communicate with parents. It is possible to make groups in Facebook and share information with the parents. Parents can communicate with each other of the class of their children. They can share pictures, important information, etc. Facebook is not so difficult to work with and a lot of parents already have a Facebook account. An interesting website to teach parents to use Facebook is <http://facebookforparents.org/> Online Groups and Forums: Communicating with parents are made easy using forum and e-mail groups like Google groups and Yahoo groups. The school can create specific group of parents using Google or Yahoo services to communicate each other and among parents. It is also possible to share files among the group members. SMS and Instant Messaging: School can send SMS to the parents when the child is not at school. So the parents will immediately know if their child is playing truant. When the school has to send an urgent message for parents, school can send a collective SMS, warn parents or an individual SMS to contact a specific parent. Now days instant messaging service like WhatsApp is very popular among teachers, students, and parents. The simplicity of this tool makes it easy for sending information to parents. Specific WhatsApp group could also be formed for taking up discussion on a specific issue.

2.8 Let us sum up • The integration of computers and communications offer unprecedented opportunities to the education system with its capacity to integrate and interact with each other over a wide geographic distance in a meaningful way to achieve the instructional objectives. •

The development of new broadband communication services, convergence of telecommunication with computers, recent developments in the field of communication protocol have fostered numerous proposals for the uses of IeT to support the teaching and learning environment.

The growth of these communication and computer systems, their ease of use, the power and diversity of information transfer allow teachers and students to have access to a world beyond the classroom. • ICT development in education is a continuum approach along which an educational system or institution can be mapped depending on the stages of ICT development. These broad stages have been termed as Emerging, Applying, Infusing and Transforming stages of ICT development. •

ICT stands

for information and communication technology and is defined as a

96 "diverse set of technological tool and resources used to communicate, and to create, disseminate, store, and manage information." •

ICT encompasses both the internet-enabled sphere as well as the mobile one powered by wireless networks. It also includes antiquated technologies, such as landline telephones, radio and television broadcast - all of which are still widely used today alongside cutting-edge ICT pieces such as artificial intelligence and robotics. • ICT commonly means more than its list of components. It also encompasses the application of all those various components. It's here that the real potential, power and danger of ICT can be found. • The scope of ICT is not fixed, but is responsive to ongoing technological developments. This is evident in the emergence of advanced internet technology over the past few years and the resulting changes in the ways that students construct with others. • Student develop capability in using ICT for tasks associated with information access and management, information creation and presentation, problem solving, decision making, communication, creative expression, and empirical reasoning. This includes conducting research, creating multimedia information products, analyzing data, designing solution to problems, controlling processes and devices, and supporting computation while working independently and in collaboration with others. The scopes of ICT in various education sectors are: 13. Information Technology in Educational Management 14. Lifelong Learning 15. Distance Learning 16. IT-Professional and Vocational Education in Information Technology 17. Advancing community linkages 18. Improving policy planning and management 19. Establishing and sustaining lifelong learning 20. Facilitating skill formation 21. Lively teaching learning process. 22. Those students can find information, they need proper instructions, they need scope for creativity, and expectations of the teacher bring forth performance.

97 23. Helping the student learn. 24. Enhance teaching. • ICT is leveraged for economic, societal and interpersonal transactions and interactions. ICT has drastically changed how people work, communicate, learn and live. • Studies of teaching and learning in schools

around the world identify four broad stages in the way the teachers and learners use ICT as a support to teaching and learning -

supporting work performance, enhancing teaching, facilitating learning and creating innovative learning environments. • Several attempts have been made to classify the functions of ICT in education in the literature, However, the most comprehensive and well defined classification describes the following functions of the use of ICT in education: (a) ICT as Object (b) ICT as Assisting Tools (c) ICT as Management of Learning and (d) ICT as Medium of Teaching & Learning. • An increasing body of evidence suggests positive results of the ICT integration with teaching and learning. The type, features, styles, usage and pedagogical base of these transformations from CAL to WBI has been described below. Type: Computer Assisted Learning (CAL) Features: Interactivity, Flexibility and Learner Centered Styles: Drill & Practice, Tutorials, Simulation and Instructional Games Usage: Self Paced Instruction Pedagogical Base: Primarily Behavioral Objectives Type: Multimedia Based Instructional Software Features: Interactivity & Multi model Instruction Styles: Drill & Practice, Tutorials and Simulation & Modeling Usage: Self-Paced Instruction Pedagogical Base: Primarily Behavioral Objectives & Constructivism Type: Web Based Instruction Features: Interactivity, Just in time & On demand Instruction Styles: Computer Supported Collaborative Learning Environment

98 Usage: Asynchronous & Synchronous Virtual Class Room Pedagogical Base: Primarily Constructivism • Learning and teaching whether it is through actual classroom settings or through technological applications utilizes many psychological principles knowingly or unknowingly. The most commonly used or heard Schools of Psychology are Behaviourism, Cognitivism and Constructivism. • ICT is used in education for supporting students' learning or for development of competences, in other words for helping to reach the goals of education. The quality of learning depends on how ICT is used in learning. • ICT could be used in education for supporting the development of students' motivation. • There are many concepts that can be used to describe motivational aspects of teaching and learning. • According to SDT, a student's way of thinking has an important role in the process of motivation. • Based on the UNESCO publication, a model has been presented that can be useful in determining the stage of ICT development reached by a country, a district, or even an individual institution. • Studies of ICT development in both developed and developing countries

identify at least four broad approaches through which educational systems and individual institutions typically proceed in their adoption and use of ICT. Sometimes, the number of stages identified varies, though there is a general consensus that the introduction and use of ICT in education proceeds in broad stages that may be conceived as a continuum or series of steps. These steps, termed Emerging, Applying, Infusing, and Transforming. •

The potential of each technology varies according to how it is used.

Haddad and Draxler identify at least five levels of technology use in education:

presentation, demonstration, drill and practice, interaction, and collaboration. • Each of the different ICTs-print, audio/video cassettes, radio and TV broadcasts, computers or the Internet-may be used for presentation and demonstration, the most basic of the five levels.

Except for video technologies, drill and practice may likewise be performed using the whole range of technologies. • Teleconferencing refers

to "interactive electronic communication among people

99 located at two or more different places."

There are four types of teleconferencing based on the nature and extent of interactivity and the sophistication of the technology: • 1) Audio conferencing; • 2)

Audio-graphic conferencing, • 3) Videoconferencing;

and • 4) Web-based

conferencing. •

Online learning involving students logging in to formal courses online is perhaps the most commonly thought of application of the Internet

in education. •

Radio and television have been used widely as educational tools

since the 1920s

and the 1950s, respectively. •

The Internet has introduced improvements in technology, communication and online entertainment, but it

is also incredibly useful for education purposes as well. • Electronic mail is a method of exchanging messages via computer networks and the Internet; the addressee receives the message virtually instantly. • ICT has become an essential part of our everyday life, accordingly this integration in school improvement is not only for the purpose of teaching and learning, but also for educational management use, it has become one of the most effective factors in the school improvement. ICT plays a vital role in improving the functional effectiveness of school system. ICT can help the school administrators to improve administrative tasks such as school record keeping system and school information management system.

2.9 Check your progress Define ICT What are the components of an ICT system? What are the scopes of ICT in various education sectors? What are the use of ICT in education from the point of view of learning? Explain ICT in developing collaborative network.

Unit - 3 □ Use of Multimedia in Education Structure

- 3.1 Introduction
- 3.2 Objectives
- 3.3 Multimedia: Meaning, Nature, Scope, Definition and Approaches
 - 3.3.1 Meaning of Multimedia
 - 3.3.2 Basic Assumptions and Principles
 - 3.3.3 Definitions and Meaning of Multimedia
 - 3.3.4 Nature of Multimedia
 - 3.3.5 Educational Implications of Multimedia
 - 3.3.6 Why Use Multimedia in the Classroom?
 - 3.3.7 Role of Teacher in Multimedia Approach
 - 3.3.8 Elements of Multimedia
 - 3.3.9 Types of Multimedia
- 3.4 Types of Instructional Aids: Projected and Non-projected Aids, Projector, Radio, Tape Recorder, Television, Films, Computer, White Board, Smart Board, E- Flash, Cards, Educational Toys
 - 3.4.1 Instructional Aids
 - 3.4.2 Importance of Instructional Aids
 - 3.4.2 Types of Instructional Aids
 - 3.4.4 Characteristics of Good Instructional Aids
 - 3.4.5 Objectives of Instructional Aids
 - 3.4.6 Advantages of Instructional Aids
 - 3.4.7 Limitations in Instructional Aids
 - 3.4.8 Audio Visual Aids
 - 3.4.9 Classification of A.V. Aids: 3.4.10 Principles to be Followed for the Effective Use of AV-Aids
 - 3.4.11 Projected AV-Aids
 - 3.4.12 Non-Projected Aids
- 3.5 Advantages, Limitations and Challenges of Using Multimedia in Education
 - 3.5.1 The Advantages of Using Multimedia in Education
 - 3.5.2 Limitations of Using Multimedia
 - 3.5.3 Some Disadvantages

of Multimedia in Education 3.6 Recent Trends in Multimedia 3.7 Implications of Multimedia in Teaching and Learning 3.8 Lets Sum Up 3.9 Check Your Progress 3.10

References 3.1 Introduction There has been a rapid growth in recent years in the uses of digital technologies in education, which mirrors the increasing importance of the use of these technologies in the world in general. In mainstream education in many parts of the world, the uses of digital technologies have been constantly increasing and we find ourselves in situations in which all teachers are being expected to demonstrate their ability to use such technologies as part of their teaching toolkit. With the advancement of technology in this world, we can see that the world that we live in is changing rapidly and the field of education are one of the field that are growing to be much better. The old day education where the learning environments are passive is long gone. We can see that the use of multimedia in education has grown a lot in this recent years and is looking to expand ever further in the future. The traditional education also known as conventional education is a long-established customs found in school that society has traditionally deemed appropriate. This type of education is more to teacher-centered that focused on rote learning and memorization. In the traditional learning, students are passive absorbers of information and authority. They are less active in class and lack in problem solving skills. Furthermore, the traditional ways of learning are much more linear with factual accumulation and skill mastery while the new approach with the help of multimedia are non-linear, with one idea linked to another, allowing the learner to choose the path that they want to learn.

104 The traditional approach of learning also lack in resource. Knowledge can only be absorbed through lecture and textbook. By using multimedia, there will be much more resource that can be attained especially through the use of the internet. The traditional approach of learning is also less creative. The students are more passive as they lack in material resource needed in order to express their creativity. Such loop hole can make children to be less passionate to learn. This is why multimedia use in education is vital in education. Multimedia is vital in our life. This is because it is packed with various elements such as text, graphic, sound, video and animation. All of this element can be seen in our surrounding. It is also used in various fields such as in education, training, business, games, science and technology. This is a proof that multimedia is important. In fact, multimedia is changing the ways of learning itself. Instead of just limiting with a linear presentation such as reading text from a book, multimedia makes many improvements in learning by bringing various elements in order to make it more dynamic. "Multimedia is a synthesis: a hybrid offering the advantages of the user-driven book with the wonders of electronic technology" -Robert Winter. A primary application of the interactive multimedia for instruction is in an instructional situation where the learner is given control so that he/she may review the material at his or her own pace and in keeping with his/her own individual interests, needs, and cognitive processes. The basic objective of interactive multimedia material is not so much to replace the teacher as to change the teacher's role entirely. As such, multimedia must be extremely well designed and sophisticated enough to mimic the best teacher, by combining in its design the various elements of the cognitive processes and the best quality of the technology. With today's multimedia courseware, once a programme has been designed and built in with the appropriate responses, it should be flexible and permit change and alteration. Multimedia is a melody sung in harmony with multi-channel and multi-modal bits of knowledge and creation. Multimedia facilitates mastering basic skills of a student by means of drill and practice. It helps in problem solving by means of learning by doing, understanding abstract concepts, provide enhanced

access for teachers and students in remote locations, facilitate individualized and cooperative learning, helps in management and administration of classroom activities and learning content, and simulate real life problem handling environments. Multimedia Technology is used and experimented by various educational institutions of all levels all over the world in their own designed modes.

105 3.2

Objectives After going through this unit you will be able to ●

define multimedia and

discuss its meaning, nature, scope and approach. ● explain the different types of projected and non-projected aids along with their merits and demerits. ● discuss about the different

advantages and limitations of multimedia in education. ● discuss the recent trends in multimedia. ● Explain the implications of multimedia in teaching and learning. 3.3

Multimedia : Meaning, Nature, Scope, Definition and Approaches

Information which is stored in different forms could be combined and used in different combinations.

Multimedia can be recorded and played, displayed, dynamic, interacted with or accessed by information processing devices, such as computerized and electronic devices. Multimedia devices are electronic media devices used to store and experience multimedia content.

This process has given rise to the term 'Multi-media'.

This combination of different media for communication has influenced and changed all aspects of our life, including the teacher and the learner. Multimedia has become an inevitable part of any presentation. We have seen that it has found a variety of applications right from entertainment to education. The evolution of internet has also increased the demand for multimedia content. Multimedia is a term used to describe how multiple means of media like text, audio, graphics, animation, video, and interactivity are used to communicate information. It is also often used to describe any computer media. This helps us to understand information at a faster rate.

3.3.1 Meaning of Multimedia

Multimedia is defined in many ways.

Most of the definitions agree on the characteristic that multimedia contains texts, graphics, animations, video and sound in an unified way and the content can be structured and presented differently.

Let us explore some of the definitions given below. "

Multimedia is the

exciting combination of computer hardware and software that allows you to integrate video, animation, audio, graphics, and text resources to develop effective presentations on an affordable desktop computer" (

Fenrich, 1997).

106 "

Multimedia is characterized by the presence of text, pictures, sound, animation and video; some or all of which are organized into

some coherent program" (Phillips, 1997).

From these definitions we see that Multimedia is a concept which sees the use of text, graphic art, sound, animation, and video in different combinations. This integration of Media into one whole and that which gives the user more benefits than any one of the media used individually is Multimedia. Interactive Multimedia: The Encyclopedia Britannica Online defines "Interactive Multimedia" as, any computer-delivered electronic system that allows the user to control, combine, and manipulate different types of media, such as text, sound, video, computer graphics, and animation. Interactive multimedia integrates computer, memory storage, digital (binary) data, telephone, television, and other information technologies. Their most common applications include training programs, video games, electronic encyclopedias, and travel guides. Interactive multimedia shift the user's role from observer to participant and are considered the next generation of electronic information systems.

Multimedia learning as learning from words and pictures (Mayer 2005), o The words can be printed (e.g., on-screen text) or spoken (e.g., narration). o The pictures can be static (e.g., illustrations, graphs, charts, photos, or maps) or dynamic (e.g., animation, video, or interactive illustrations). Multimedia instruction is intended to foster learning by presenting words and pictures. Figure : Visual Representation of the Cognitive Theory of Multimedia Learning (sources:

http://www.ied.edu.hk/apfs/lt/v12_issue2/rias/image1.jpg)

107 3.3.2 Basic Assumptions and Principles Richard E. Mayer discusses twelve principles that shape the design and organization of multimedia presentations. Some examples are included: Coherence Principle - People learn better when extraneous words, pictures and sounds are excluded rather than included.

Signaling Principle - People learn better when cues that highlight the organization of the essential material are added.

Spatial Contiguity Principle - People

learn better when corresponding words and pictures are presented near rather than far from each other

on the page or screen. Segmenting Principle - People learn better from a multimedia lesson is presented in user-paced segments rather than as a continuous unit. Pre-training Principle - People learn better from a multimedia lesson when

they know the names and characteristics of the main concepts. Modality Principle - People learn better from graphics and narrations than from animation and on-screen text. Multimedia Principle - People learn better from words and

pictures than from words alone. Personalization Principle - People learn better from multimedia lessons when words are

in conversational style rather than formal style

3.3.3 Definitions and Meaning of Multimedia

Multimedia is a burning topic in education because it represents the latest technology and introduces into the classroom whole new ways of thinking about curriculum, interactions with students and even the nature of learning itself. He elaborates that the meaning of multimedia has changed from meaning nothing to everything. Multimedia can mean any kind of file or document, either a text or spreadsheet that have audio or video effects or "an interactive information cafe". Whatever it is not, it certainly is the most promising technology in education. - WeidongXhang (2003) Packiam (1986)

had

referred
to the use of appropriate and carefully selected varieties of learning experiences which
when presented to the learner through selected teaching strategies will reinforce and strengthen one another
in such a way that the learner
will achieve predetermined objectives in an effective way.

108

Education is defined as a means of providing systematic training and instruction and training is provided by instruction, discipline on drill. In terms of having training and instruction, Multimedia is a powerful tool which can provide individual and interactive instructions as well as motivation for practice in an entertainment environment. Multimedia also provides students with different learning styles, the opportunity to learn, share, communicate and grow using all their faculties.

3.3.4

Nature of Multimedia Multi - Many Media - Techniques /methods. Multimedia approach uses a number of media, devices, techniques, in the teaching learning process. Multimedia approach has come out of researches and experiments in educational technology that have been undertaken in order to improve the

process

of teaching learning.

Multimedia approach aims at providing meaningful learning experiences via a mix of media in order to achieve predetermined objectives. The choice of the media has to be done carefully so that one does not hamper or reduce the effect of the other i.e. each media must complement the
after. The media have to be used sequentially and judiciously. Only necessary ones are to be used. Then it would be possible to make optimum use of them in a most economical manner. In multimedia approach, several media and techniques are used as powerful means of communication. ●

Multimedia

approach uses a number of media, devices, techniques in the teaching learning process. ● Multimedia approach can convey vast information and provide many sources from which student can access the information. ● Multimedia approach will improve the teaching learning process. ● Multimedia approach is not restricted to a single type of learning style. It can provide the support of a wide range of activities. ●

Multimedia approach aims at providing meaningful learning experience via a mix of media in order to achieve predetermined objectives. ●

Multimedia approach provides the opportunity to gain mastery of competencies and skills. ●

The choice of the media has to be done carefully so that one does not hamper or reduce the effect of the other. That is each media must complement the other.

109 ● Multimedia approach will enable the learner to get access to information in dynamic environment. 3.3.5

Educational

Implications of Multimedia ● Multimedia enables students to represent information using several different media. Hypermedia links allow students to organize information in meaningful ways. ● Multimedia can take into account

different learning styles. Some students learn by interpreting text, while others require more graphical or aural representations. ● Multimedia allows for self-pacing and discovery, students can take the time they need and choose the path of learning making learning meaningful and pleasurable. ● Multimedia helps in development of higher order thinking skills. Interactive multimedia encourages student. ● Multimedia provided the students the flexibility of anywhere, 'any time' learning. ● Multimedia helps in developing group and interpersonal skills. Better communication between students via e-mail, chat sessions etc., can encourage collaborative learning and enhance student-teacher interaction. ● Multimedia helps students to learn the

content in a given discipline. It helps students to think effectively, practice problem solving and decision making. 3.3.6 Why Use Multimedia in the Classroom?

Multimedia activities encourage students to work in groups, express their knowledge in multiple ways, solve problems, revise their own work, and construct knowledge.

The advantages of integrating multimedia in the classroom are many. Through participation in multimedia activities, students can learn:

- Real-world skills related to technology

- The value of teamwork
- Effective collaboration techniques
- The impact and importance of different media

- The challenges of communicating to different audiences
- How to present information in compelling ways

- Techniques for synthesizing and analyzing complex content
- The importance of research, planning, and organization skills

- 110 • The significance of presentation and speaking skills
- How to accept and provide constructive feedback
- How to express their ideas creatively

There are, however, some constraints to using multimedia in the classroom, including:

- Technological resources, both hardware and software
- Technological skills, for both the students and teacher
- Time required to plan, design, develop, and evaluate multimedia activities

3.3.7 Role of Teacher in Multimedia Approach

Teacher has to adopt a number of methods and techniques.

-

Teacher has to aware of the different available media and their availability.

- Teacher should be physically competent to use and demonstrate the use of the different media.
-

Teacher should be skillful enough to make a judicious choice of media and competent enough to mix them sequentially and in an orderly manner.

- Teacher's role is that of a facilitator or manager of activities.
- Teacher has to lead his student for independent, individualized learning.
-

Prerequisites for developing a Multimedia Instructional device 3.3.8

Elements of Multimedia The different building blocks

of Multimedia are Text, Images and graphics, Audio, Video, and Animation.

Any multimedia application consists any or all of them.

Let us learn about each one

- Text - ASCII/Unicode, HTML, Postscript, PDF
- Audio - Sound, music, speech, structured audio (e.g. MIDI)
-

- Still Image - Facsimile, photo, scanned image, photographs, drawings, maps and slides
- Video (Moving Images) - Movie, a sequence of pictures
- Graphics - Computer produced image
- Animation - A sequence of graphics images

111 1.

Text: Text and symbols are very important for communication in any medium. Using text in online training has many advantages: text files are small so they perform well at low bandwidth, the user can search for specific words or phrases, and text can be easily updated. You can create text directly within an authoring application or import it from external text files. Anti-aliasing enables you to create attractive text that blends into the background color without any jagged edges. Authorware, Director, and Flash all support anti-aliased text. Using anti-aliased text helps avoid having to create display text as a graphics file, which would make your overall course size much larger than if you simply entered text directly into the authoring tool. 2.

Images and Graphics: Images play a very important role in a multimedia. It is expressed in the form of still picture, painting or a photograph taken through a digital camera. The points at which an image is sampled are known as picture elements, commonly abbreviated as pixels. The pixel values of intensity images are called grayscale levels. There are different kinds of image formats like the Captured Image Format and the format when images are stored. The captured image Format is known by two main factors that is spatial resolution which is specified as pixels x pixels (eg. 640x480) and color encoding, which is specified by bits per pixel. Both factors depend on hardware and software for input/output of images. The Stored Image Format is when we store an image; we are storing a two- dimensional array of values, in which each value represents the data associated with a pixel in the image.

These images can be edited with the help of few of the software like general drawing programs, JASC Paint Shop Pro, Corel Photo Paint, Macromedia Fireworks ,Art Rage: free (NZ) paint program simulating, Corel Draw, and Open Office / Libre Office Draw, GIMP, and Mypaint.

Graphics Formats: Most Web browsers can display GIF and JPEG graphics files. Web browsers that are version 4.0 or later can use the JPEG format for continuous-tone images, such as photographs and images that use color gradients. The PNG format was

112 developed as a patent-free replacement for the GIF format. PNGs can use an alpha channel to define transparency in a graphic. Import PNG files into any of the Macromedia tools as an alternative to GIF files, especially if you need 24-bit graphics or graphics with transparency. Use this format in Web-native content only when delivering to newer browsers; some older browsers do not support the PNG format also display PNG graphics files.

The two most popular graphic formats for online training and Web pages in general are GIFs and JPEGs. Both are bitmap files that are relatively small in size. The two formats compress images differently, each excelling at compressing different types of graphics. Using software such as Macromedia Fireworks, you can compare the file size of your graphics with various optimization settings to help you pick the best file format. Use the GIF format for line art and graphics that have large areas of a single color. Graphics saved in the GIF format can have one transparent color where JPEG graphics cannot. There are applications like format factory which helps us in converting graphics from one format to other. 3.

Audio: Audio can enhance learning concepts and reinforce ideas presented as text or graphics on the screen. Using audio may be essential to the teaching of topics such as a foreign language or music appreciation. There are three types of audio assets that are commonly used in e-learning: • Music • Narration (voice-overs) • Sound effects Music demands a higher-quality and a wider sound-frequency range than narration and therefore produces larger files. Narrations generally have a smaller sound frequency range so it can be compressed more than music and still retain good sound quality. Sound effects are generally short so they don't have a large impact on the overall file size of an online course.

Audio Formats: The WAV and AIFF audio formats, popular on Microsoft Windows and Macintosh systems respectively, usually create files that are too large to use in an online course. Use one of the compressed formats with the goal of balancing small file size with acceptable quality audio. You have different options depending upon which authoring software

you use. Both Shockwave Audio (SWA) used by Authorware and Director, and MP3, which is used by Flash are popular compressed formats useful for all three types of audio used in e-learning.

The open source audio editing software like

113 audacity is very popular tool for audio editing. 4. Video: Although video requires lots of bandwidth to download, it is very useful for conveying certain information. Using video in e-learning helps realistically demonstrate equipment and processes among other things. For instance, an e-learning course in botany might show a video of a sprouting seed. A course about the features of an airplane might show a video of a crewmember properly closing and securing a door for takeoff. The intricate level of detail visible in video is also ideal for illustrating subtle, nonverbal information.

For example, to teach sales skills you could use a video to demonstrate an interaction between a salesperson and a customer, then have the learners analyze the body language of the people involved in the transaction.

Video Formats: There are three standard digital video formats: Quick Time, Video for Windows, and MPEG. Video files tend to be large so they really aren't appropriate for delivery on modem connections. You may choose to include video in your e-learning course if you are delivering it over an intranet or to users with relatively high bandwidth connections.

There are many open source video editing tool and open shot is one such popular tool. 5. Animation: Animation illustrates concepts with movement, shows processes, or draws attention to a region or elements of a screen. Since animations usually involve graphics, they are highly dependent upon the size and file type of the graphics that are being animated.

Animation Formats: There are many ways you can create animations. Authorware, Dreamweaver, Director and Flash can all create animations. An animation created within an authoring program is usually smaller and more efficient than an animation created in another tool and then imported in your authoring program. This is particularly true when an animation is based on shapes created with the software's drawing tools rather than with imported bitmaps. For example, Flash excels at creating vector graphics and animations. Although Flash can animate bitmap graphics, animations made predominately with vector graphics in Flash are considerably smaller than animations created with bitmap graphics.

Simple 2D animations can be created using open source tools like pencil and more advance tools like blender. 3.3.9

Types of Multimedia

Multimedia may be broadly divided into Linear and Non-linear

Multimedia.

In

Linear Multimedia the active content progresses without any navigational control

114 for the viewer. The viewer interacts with the multimedia application in which the content is sequentially arranged. The viewer does not control the progress of the content. In other words, the viewer is a passive receiver of the multimedia content most of the time. For example a movie uses a combination of audio, graphics and animations, but the viewer has no control over the sequence of events. Non-linear Multimedia uses interactivity to control progress as with a video game or self-paced computer based training. It allows one to use the content according to ones wants. It is a two way communication. This communication can be controlled by using buttons, links and hypertext. Hypermedia is an example of non-linear content. It connects to different media elements such as audio and video. Multimedia presentations which are live or recorded are also Non-linear.

A recorded presentation may allow interactivity via a navigation system. A live multimedia presentation may allow interactivity via an interaction with the presenter or performer. 3.4

Types of

Instructional Aids: Projected and

Non-projected Aids, Projector, Radio, Tape Recorder, Television, Films, Computer, White Board, Smart Board, E-Flash, Cards, Educational Toys 3.4.1

Instructional Aids The word instructional aid refers to any material or device used to assist the instructor in: Preparation of the lesson(s) Presentation (teaching) of the lesson(s) Facilitates trainees' learning 3.4.2 Importance of Instructional Aids Instructional aids assist to reinforce and supplement the instructor's communication during the presentation of the lesson. This is done by: - clarifying the concept or idea - making the communication channel more explicit - helping the learners to develop a good conceptual understanding of the content or skill taught. For example an idea which would be difficult (abstract) can easily be simplified when an instructional aid is used to present it. Therefore learners are able to relate an idea to their common reality or environment with the use of aids.

115 3.4.3 Types of instructional aids There are many types of instructional aids. Each instructional aid, however, may have inherent advantages and disadvantages (or limitations). Essentially types of instructional aids are determined by: The instructor/teacher. The instructor's ability either to create (improvise) and use aids or select from the readily made and suitably available aids is crucial. This squarely depends on the instructor's prowess, ability or experience. Objective of the lesson. By virtue of the objective(s) of a lesson, the use of certain instructional aids may be more desirable or otherwise. For example if a lesson involves the demonstration of a particular skill, then the use of demonstrational aids becomes inevitable. Nature of subject matter. The subject matter or content to be taught will underline the type of aids (if any) to be used. For example, if the material is considered comparatively difficult or abstract, then instructional aids have to be carefully selected and used. Generally, instructional aids can be grouped in four main categories: (a) Visual aids These appeal to sight. They include the blackboard, posters, charts, displays, models, pictures etc. (b) Auditory aids These type of instructional aids appeal to learners sense of hearing. They include radio and many types of audio recording. (c) Audio-Visual Aids Audio Visual aids appeal to both hearing and seeing. They include sound motion pictures, slides on sound and television. (d) Stimulation devices These are the actual representation of the real objects or process, but reduced in size. They include devices built to stimulate the action or function of the real device. Their purpose is to develop the 'feel' of the actual functioning of the real objects. 3.4.4 Characteristics of good instructional aids Instructional aids are essential to effective instruction. The instructor should know

116 how to prepare and use instructional aids and should recognize their value in fostering good instruction. The greatest value of instructional aids lies in: • Their appeal to trainees senses and perceptions • Their ability to attract and hold trainees attention and interest. • The ability in developing understanding of the material to be learned • Helps the trainees to learn faster and save instructional time • Helps trainees to understand the relationships between different concepts or ideas. A good instructional aid should promote certain desirable results. It should stimulate interest, command attention, be easily understood and promote a positive reaction on the part of the trainee. An instructional aid should be complete, have some explanation in the form of a label, and finally be as simple as possible. 3.4.5 Objectives of Instructional Aids 1. To enhance teachers skills which help to make teaching-learning process effective 2. Make learners active in the classroom 3. Communicate them according to their capabilities 4. Develop lesson plan and build interest 5. To make students good observer 6. Develop easy and understandable learning material 7. Follow child cornered learning process 8. Involve intimation in objectives 9. To create interest in different groups 10. To make teaching process more effective 3.4.6 Advantages of Instructional aids 1. Its helps to make learning process more effective and conceptual. 2. It helps to grab the attention of students 3. It builds interest and motivation teaching students learning process 4. It enhance the energy level of teaching and students 5. It is even better for over burden classrooms 6. It provides students a realistic approach and experience

117 3.4.7 Limitations in Instructional aids 1. Technical Problems 2. Students Distractions 3. Expensive 4. Time consuming 5. Need Space 6. Convenience 3.4.8 Audio Visual Aids Audio visual material must be seen in their relationship to teaching as a whole and to the learning process as a whole, until the teacher understands the relationship between audio visual material and teaching learning process. Audio visual materials are produced, distributed and used as planned components of educational programs. It helps the process of learning that is motivation, classification and stimulation. A.V. aids are multisensory materials which motivate and stimulate the individual. It makes dynamic learning experience more concrete realistic and clarity. It provides significant gains in thinking and reasoning. Audio visual aids are sensitive tools used in teaching and as avenues for learning. These are planned educational materials that appeal to the senses of the people and quicken learning facilities for clear understanding. Definitions: 1. According to Kinder S. James: Audio visual aids are any device which can be used to make the learning experience more concrete, more realistic and more dynamic. 2. According to Burton: audio visual aids are those sensory objects or images which initiate or stimulate and reinforce learning. 3.

According to Carter.V.Good: audio visual aids are those aids which help in completing the triangular process of learning that is motivation, classification and stimulation. 4. According to good's dictionary of education: audio visual aids are anything by means of which learning process may be encouraged or carried on through the sense of hearing or sense of sight. 5. According to Edger Dale: audio visual aids are those devices by the use of which communication of ideas between persons and groups in various teaching and

118 training situations is helped. These are also termed as multi-sensory materials. 6. According to McKean and Roberts: audio visual aids are supplementary devices by which the teacher, through the utilization of more than one sensory channel is able to clarify, establish and correlate concepts, interpretations and appreciations. 7. According to KP. Neeraja: an audio visual aid is an instructional device in which the message can be heard as well as seen. Purpose of A-V aids: • To supplement and enrich teachers own teaching to make teaching-learning more concrete. • To serve an instructional role in itself. • To create interest among the group. • To make teaching as an effective process. Advantages of AV aids: 1. A.V.Aids helps in effective perceptual and conceptual learning. 2. A.V.Aids helpful in capturing and sustaining attention of students. 3. A.V.Aids arouses interest and motivates students to learn. 4. A.V.Aids is helpful in new learning. 5. A.V.Aids helps in saving energy and time of both the teachers and students. 6. A.V.Aids provides near realistic experience. 7. A.V.Aids can meet individual demands. 8. A.V.Aids is useful in for education of masses. 3.4.9 Classification of A.V. Aids: Various classifications are given for Audio visual aids according to the type of projection by various authors. A) Classification of A.V.Aids I) Audio aids Audio materials are those which can be heard. Ex: - radio, tape recorder, walkman, Headphones. II) Visual aids: these are helpful to visualize the things. Ex: - graphic aids, 3d-aids, display boards, and print material.

119 III) Audio visual aids: these aids can be heard and seen simultaneously. Ex: - projected aids, TV, films. B) Classification of A.V.Aids I) Simple A.V.Aids: It includes graphic aids, display boards, 3d-aids, print material...etc. II) Sophisticated A.V.Aids: includes audio-visual aids. 3.4.10 Principles to be Followed for the Effective Use of A.V. Aids: Audio visual materials should function as an integral part of the educational program. A.V. aids should be centralized, under specialized direction and leadership in educational programs. An advisory committee consisting of representative from all areas of curriculum should be appointed to assist in selection and coordination of A.V. materials. An education program should be flexible. A.V. material should be carefully located to eliminate duplication, easy accessibility and convenient use. A.V. material should be available whenever and wherever they needed for effective utilization as an integral part of curriculum Budget appropriations should be made regularly for A.V. education programs. Periodic evaluation to be done to assess the function of, utilization and expenditure of the program. 3.4.11 Projected Audio Visual Aids: OVER HEAD PROJECTOR: The over head projector is the most used in all a.v. aids. It projects transparencies with brilliant screen images suitable for use in a lighted room. The teacher can write or draw diagrams on the transparency while he teaches; these are projected simultaneously on the screen by the OHP. During presentation: Keep the screen above the heads of the participants. Keep the screen in full view of participants

120 Make sure you are not blocking any ones view when presenting. Darken the room appropriately by blocking out sunshine and dimming nearby. Turn the screen off between slides if you are going to talk for more than two. Talk to the audience, not to the screen Purposes: To develop concepts and sequences in a subject matter area. To make marginal notes on the transparencies for the use of the teacher that can carry without exposing them to the class. To test students performances, while other classmates observe. To show relationships by means of transparent overlays in contrasting color. To give the illusion of motion in the transparency. Advantages: It permits the teacher to stand in front of the class while using the projector, thus enabling her to point out features appearing on the screen by pointing to the materials at the projector it self and at the same time, to observe the students reactions to her discussion. Gains attention of the student OVER HEAD TRANSPERENCIES: Transparencies are popular instructional medium. They are simple to prepare and easy to prepare and easy to operate with the overhead projector which is light weight. A 10*10 inches sheet with printed, written or drawn material is placed on the platform of the projector and a large image is projected on a screen behind you. The projector is used from near to the front of the room with the teacher standing or sitting beside, facing the student. Guidelines for making effective transparencies: ● Have one main idea an each transparency. ● Include only related figures and diagrams. ● Use simple lettering style in writing. ● Use diagrams in proposition to its lettering. ● Keep the message clear and simple.

121 ● Emphasize the key messages. ● Use color and lettering with discretion. Advantages: ● Permits face to face interaction with the students. ● Can be used in daylight conditions. ● Can present information in systemic developmental sequences. ● Requires limited planning and can be prepared in variety of inexpensive methods. ● Easily available. THE OPAQUE PROJECTOR Opaque projector is the only projector on which you can project a variety of materials ex: - book pages, objects, coins, postcards, or any other similar flat material that is non- transparent The opaque projector will project and simultaneously enlarge, directly from the originals, printed matter, all kinds of written or pictorial matter in any sequence derived by the teacher. It requires a dark room, as projector is large and not reality movables. Advantages: ● Stimulates attention and arouses interest. ● Can project a wide range of materials like stamps, coins, specimen, when one copy is available. ● Can be used for enlarging drawings, pictures and maps. ● Does not require any written or typed materials, hand-written material can be used. ● Helps students to retain knowledge for longer period. ● Review instructional problems. ● Test knowledge and ability. ● Simple operation. Disadvantages: ● Costly equipment. ● Needs to use it with care. ● Needs a dark room for projection

122 SLIDE PROJECTOR A slide is a small piece of transparent material on which a single pictorial image or scene or graphic image has been photographed or reproduced otherwise. Slides are a form of projected media that are easy to prepare. They are still pictures on positive film which you can process and mount individually yourself or send to a film laboratory. The standard size of the slides is 2" X 2" any 35mm camera will make satisfactory slides. Types of slides 1. Photographic slides: 2" X 2" 3" X 4" a) Black and white b) Colored 2. Handmade slides: can be made with a) Acetate sheet b) Cellophane c) Etched glass d) Plain glass e) Lumarith Slides can be made from photographs and pictures by teachers and pupils taking photographs and snapshots when they go on fieldtrips for historical, geographical, literacy or scientific excursions. The arrangement of slides in proper sequence, according to the topic discussed, is an important aspect of teaching with them. Advantages: 1. Requires only filming, processing and mounting by self or laboratory. 2. Results in colorful, realistic, reproduction original subject. 3. Preparation with any 35mm camera for most uses. 4. Easy to revise and up-date. 5. Easily handled, stored and re-arranged for various uses. 6. Can be combined with tape narration or can control time for discussion.

123 7. May be adapted to group or individual use FILMSTRIPS Film strips are sequence of transparent still pictures with individual frames on 35mm film. A tap recorded narration can be synchronized with film strip. Each strip contains from 12 to 18 or more pictures. It is a fixed sequence of related stills on a roll of 35mm film or 8mm film. PRINCIPLES 1. Preview filmstrips before using them and selected carefully to meet the needs of the topic to be taught. 2. Show again any part of the filmstrip needing more specific study. 3. Use filmstrip to stimulate emotions, build attitudes and to point up problems. 4. It should be introduced appropriately and its relationship to the topic of the study brought out. 5. Use a pointer to direct attention, to specific details on the screen. TYPES OF FILMSTRIP: 1) Discussion filmstrip: it is continuous strip of film consisting of individual frames arranged in sequence usually with explanatory titles. 2) Sound slide film: it is similar to filmstrip but instead of explanatory titles or spoken discussion recorded explanation is audible, which is synchronized with the pictures. ADVANTAGES OF FILM STRIPS: 1) Are compact, easily handled and always in proper sequence. 2) Can be supplemented with recordings. 3) Are inexpensive when quantity reproduction is required. 4) Are useful for group or individual study at projection rate are controlled by instructor or user. 5) Are projected with simple light weight equipment. RADIO Radio is a device with which the whole mass can be contacted at a time, efficiently and economically. Now-a-days, which increase in rural electrification, the number of radio sets in India is increasing greatly. Moreover, people are purchasing battery sets

124 and they have realized that it is a good thing to have one in the house. Radio sets have been provided in the common meeting places by the C.D. Organization. Radio is a good source of communication of idea. It gives news-bulletins, special programmes for rural people, housewives and children. It is a good source of disseminating information for health workers, farmers etc. In case of audio-aids, the message has to be simple so that the people can understand and act. The broadcaster has to get and hold the attention of the audience, otherwise the message is lost. The All India Radio stations publish a Journal 'Akashvani' which gives the meters and frequency in Kilo cycles on medium and short waves. The radio receiving set receives only one selected programme at a time, and conveys the same through its speaker. The station is selected by a tuner of the receiving set, which tunes the set to the frequency of the station. The movement of the tuner over the dial of the radio set is controlled by a knob. The entire broadcast frequency of the tuner is divided into a number of bands, each band including a small range of frequencies or wave-lengths. A band selector switch or knob is incorporated in the Cabinet of the radio. There is also an on and off switch and volume control are incorporated in a single knob. A radio can be operated by dry battery wet battery or electricity. For rural areas with no electricity, dry battery sets are generally used. Uses of Radio Radio is a popular, pleasing and a fast medium. However, it cannot be used to convey heavy, detailed knowledge. It uses are for: * Announcements-meetings, demonstrations etc. * Intimation or information- regarding availability of material, prices, places etc. * Warnings-relating to weather, outbreaks of diseases. * News reviews-about farmers etc. * Interviews. * Questions & Answers. * Short talks. * Play, skits, etc. * Features and Documentaries. Advantages of utilizing Radio i) In-expensiveness - Radio instructions costs 1/5 or 1/6 that of T.V. instructions,

125 hence this is quite a suitable audio aid for reaching the masses, especially in the interior of villages, where means of communication and facilities are very few. ii) Easy availability - There has been a lot of production of radio sets, with the result that their cost has been considerably reduced and therefore, radio is available these days with almost all families, even in the rural areas. iii) A radio leaps barrier of time and space - A historical event can be reproduction on a radio set as well as a live broadcast can be transmitted from one corner of the world to another. iv) Upto-date and Immediate - All the latest data as well as the current information can be transmitted and that too immediately. v) Emotional Impact - A radio can bring a dramatic feeling in the group. It has the warmth of a drama, can create personal feeling of actor's presence and inspite emotions. vi) Can bring realism - Voices of various experts can be brought right into the classroom. vii) It can reach more people more quickly than any other means of communication. viii) It can reach illiterates also. ix) It inspires to form some action. x) It is portable. Disadvantages i) It is a one way communication and audience reaction is not known. ii) It requires concentrated attention of the listeners as only aural sense is used. iii) Time-the learners have to adjust their time to the particular programme timing. iv) Prehearsing is not possible. v) Radio set should be in a working condition. vi) Frequently loses out in competition with entertainment. TAPE RECORDERS Tape recorders have become very common now-a-days and their use in education is gradually increasing. Tape recording, especially cassette tape recordings may be

126 prepared for group or individual learning. Advantages * Pre-rehearsing is possible. * Information can be stored & used repeatedly. * No problem of time. * Communicator can present programme made by him. * It can facilitate editing also, i.e. shortening, eliminating or adding of materials from different sources. Disadvantages * Many or may not be up-to-date. * More expensive. * One way communication. Features to look for in a tape-recorder i) Simplicity: It should be easy to operate. ii) Portable: The recording equipment should be as light as possible. iii) Cost: the amount of money available should be carefully considered before buying the equipment. However, expensive equipment generally is durable and as a result is may prove cheaper in the long run. iv) Speed: The higher the speed used, the better will be the quality. v) Size of the Tape Reels: Different machine will use different sizes. vi) Frequency Range: In fact one of the two important points to be considered in making the selection is sound frequency range of the equipment and the programmes you plan to record. For high fidelity recording, the frequency range of the equipment should be similar to the frequency range of the sounds in the programme. TELEVISION Michael J. Apter says, "Television is the most powerful medium of mass communication which has ever existed and it has revolutionized our lives in many ways." Television is already being used to spread health and nutrition messages.

127 Television shows the actual picture, figure or diagram, along with the hearing sound. So, it has an advantage over radio, where the audience is only listening. The movements of the pictures hold the attention of the audience. Most of the homes in cities have a T.V. set. Now-a-days with increase in electrification, they are available in villages also. Uses of Television Radio is a popular, pleasing and fast medium. However, it cannot to be used convey heavy, detailed knowledge. Its uses are for:- * Announcements - meetings, demonstrations etc.; * Intimation or information - regarding availability of materials, prices, places, etc.; * Warnings - relating to weather, outbreaks of diseases; * News reviews - about farmers etc.; * Interviews; * Questions & Answers; * Short talks; * Plays, skits, ballads etc.; * Features and Documents. Advantages i) T.V. can be used to broaden and enrich the experience of the audience. ii) It can create a genuine interest in a subject or topic which then gives the teacher something on which he can build. For example one can really see the result of malnutrition due to lack of food etc. iii) If a scientific experiment is mentioned, then it can be shown. iv) T.V., if it is not used for a disproportionate amount of time, provides a welcome element of variety from the normal routine of group teaching etc. v) It overcomes the barrier of time and space and to some extent of the language due to its visual effects. Evaluating the T.V.Programme Edger Dale suggests a simple method evaluating education television programmes by the following questions: i) Whether the purpose of the presentation made clear to both audience and teacher?

128 Did the audience have something to watch for? ii) Was the audience prepared for the telecast by reading etc? iii) Did the audience understand the material? iv) Did the receiver/audience find the presentation interesting? v) Was the programme well organized? vi) Was opportunity given to become involved, to participate? vii) Were the key points emphasized by means of repetition and review? viii) Did the telecast add certain experiences not easily available in the usual classroom situation or day-to-day life? 3.4.12 Non-Projected Aids CHALK BOARD DEFINITION A chalkboard or blackboard is a reusable writing surface on which text or drawings are made with chalk or other erasable markers. Blackboards were originally made of smooth, thin sheets of black or dark grey slate stone. Modern versions are often green or brown and are thus sometimes called a green board or brown board instead. A blackboard can simply be a piece of board painted with matte dark paint (usually black or dark green). A more modern variation consists of a coiled sheet of plastic drawn across two parallel rollers, which can be scrolled to create additional writing space while saving what has been written. The highest grade chalkboards are made of rougher version porcelain enameled steel (black, green, blue or sometimes other colours). Porcelain is very hard wearing and chalkboards made of porcelain usually last 10-20 years in intensive use. Blackboards have disadvantages: • They produce a fair amount of dust, depending on the quality of chalk used. • Some people find this uncomfortable or may be allergic to it, and there has been speculation about links between chalk dust and respiratory problems. • The dust also precludes the use of chalk in areas shared with dust-sensitive equipment such as computers. However, these alternative methods of displaying information have drawbacks of their own.

129 • The scratching of fingernails on a blackboard is a sound that is well-known for being extremely irritating. Blackboards are also used in many establishments (typically public houses) as a form of advertising often for upcoming events and menus - as well as to keep the score in darts matches. FLANNEL BOARD Sometimes called a flannel graph. This teaching tool is called by different names: Visual Board, Frick Board, Slap Board, Felt Board, Coherograph, Video graph Flannelgraph is a storytelling system that uses a board covered with flannel fabric, usually resting on an easel. It is very similar to Fuzzy felt, although its primary use is as a storytelling medium, rather than as a toy How to use The principle involved is the interlocking of fibers of two rough or bairy surfaces, so that the pieces pressed on to a background which is hard and vertical will stay. It can be illustrated on a larger scale by pressing two tooth brushes or hair brushes together, so the bristle inter-look. In case of flannel graph similar principle of friction helps an object to cling to the surface of the board. The flannel board is usually painted to depict a background scene appropriate to the story being told. Paper cutouts of characters and objects in the story are then placed on the board, and moved around, as the story unfolds. These cutouts are backed, either with flannel, or with some other substance that adheres lightly to the flannel background, such as coarse sandpaper. Advantages 1) Permits numerous and varied arrangements of visual materials. 2) Permits the use of either chart or small pieces of material Materials can be packed and transported complete notes. 3) Permits the development of a complete story. 4) Promotes conscientious planning, which must precede the development of the material in the first place. 5) Challenges one to develop symbols to portray such things as abstractions. 6) Easier to construct materials for flannel board than to make slides or movies.

130 Disadvantages: 1) Transportation and storing of boards and materials is a problem. Suitable tables to support boards must be available. 2) Time and cost of making material for presentation present a problem. 3) Cost of boards themselves can't be overlooked. 4) Presentation is limited a new idea involves a lapse of time before the new material can be added 5) Might tend to deter one from using other more effective methods and techniques when it is evident that other methods might be more appropriate. 6) To tell a complete story it often takes either too much board space or smaller designs and materials some of which cannot be seen well. BULLETIN BOARD DEFINITION It is a soft board which will hold pins or tags almost suitable. Simple device placed either indoor or outdoor. Items generally displayed are photographs, publications, posters, newspaper cut outs. Advantages Explains important events Reports special activities Disadvantages Not effective for illiterate group. Takes lot of preplanning and preparation A bulletin board (pinboard, pin board or notice board in British English) is a place where people can leave public messages, for example, to advertise things to buy or sell, announce events or provide information. Dormitory corridors, well-trafficked hallways, lobbies, and freestanding kiosks often have cork boards attached to facilitate the posting of notices. At some universities, lampposts, bollards, trees, and walls often become impromptu poster sites in areas where official boards are sparse in number. PEG BOARD It is a type of board which contains small holes to fix certain letters into the holes

131 which is used especially in the offices to display certain items, name of the personal or faculty member. **MAGNETIC BOARDS** It is a framed iron sheet carrying porcelain coating in some dark color generally black or green. It can be used to display pictures, cutouts and light objects with disc magnets or magnetic holders. Advantages Movement of visual material is easy. **SMART BOARDS** SMART boards put simply, are a sophisticated replacement of the traditional overhead projector. Over the years, this cutting-edge technology has proved popular for students of all ages. The interactive board turns a typical classroom into a fun learning environment. It enriches classrooms in several ways by providing hands on collaboration and creating the perfect learning setting. There are several advantages of bringing in a SMART interactive whiteboard into a classroom setting. Here are the top 8 advantages of this state-of-the-art technology in the education industry. Reasons why SMART Boards are an essential component in the modern day classroom: 1. Provides Flexibility: Interactive whiteboards allow many different forms of media - including photos, illustrations, maps, graphs, games, and video, to be displayed. These tools not only enrich the classroom experience but also help to expand the nature of content that can be used in learning. In addition, SMART Boards makes learning to be more dynamic owing to the different forms of presenting information. 2. Enhanced teaching/learning experience: SMART Boards provide new ways for teachers to teach, and student to learn. These tools support a wide variety of learning styles. For instance, visual learners can watch as their tutors use the whiteboards to project visual elements, whereas audio learners can listen and have discussions. On the other hand, the Boards come with touchscreen capabilities that allow tactile learners to touch and interact with the board. 3. Interact and share: The interactive nature of SMART boards offers learners an opportunity to share and participate in the instructional process. Interactivity

132 provides a platform for students to demonstrate their grasp of the subject through touching, drawing, and writing. Every learner has an opportunity to participate or contribute to the presentation and/or discussion via notebooks and tablets. In addition, the boards provide for rapid assessment whereby learners can receive immediate feedback. Teachers and students are able to identify individual strengths and weaknesses in various subject areas and isolate areas/topics that need more focus or review. 4. Low-Maintenance: SMART Boards are neat and easy to use. There are no hassles cleaning or maintaining whiteboards. The data on the screen can be modified using a specialized highlighting tool or pen. There is no need for using unhygienic chalk or marker pens. 5. Access to online information & tools: SMART boards allow learners to easily access a rich database of online resources. Teachers can use the wide variety of online information sources such as knowledge databases, online video and news items to reinforce their lessons. Learners can also quickly access the wide range of powerful tools and resources to conduct research and supplement their usual study material. 6. Going Green: Interactive boards are also environmentally friendly. They offer teachers an entirely different way of presenting information to students, which eliminates the need for writing, printing or photocopying. Which, contribute to eliminate waste and pollution, from over-utilization of paper and ink. 7. Technology Integration: SMART boards allows for integration of various technologies in order to improve the learning experience. For instance, it is possible to attach tools such as microscopes, document cameras, cameras or video cameras to a whiteboard to aid in instruction. It is also possible to integrate the interactive learning tools with a wide range of software applications. 8. Communication: Interactive whiteboards allow for connectivity in different locations; making ideal collaboration and distance learning environments. When using SMART boards, student show to increase student-to-student collaboration and increase overall participation in the lesson. Overall, incorporating SMART Boards to the classroom environment is likely to change the way teachers impart knowledge to students and at the same time simplify

133 the learning process for students. Students will find it easy to engage with lessons and gain a better understanding of the overall lesson. COMPUTER AS A TOOL IN MODERN TEACHING Computers have become of the most important learning aids of the modern times. Today's education is considered incomplete without computers. This is the basic machine on which all other electronic medias of learning depend. These can be bought in various forms like desktops, lap tops, notebooks and simply e-readers. Computers are used to play the computer based educational games which can now be played also through television screens. The computers have been playing an important tool for teaching from the last few years of the 20th century and since then it has brought about a revolution in the methods of teaching which our future teachers will be using. The computers make use of multimedia programme which include attractive colours, clear graphics, wonderful sounds, the fascinating animations and enjoyable videos discharging to the students the various elements of their subjects of study. Some critics of computers as a teaching aid may point out that the conventional methods of teaching in the hands of an enthusiastic, creative and industrious teacher could also do the job as well if not better than a computer. To such critics, I would say that the computers are not there to undermine the role of the efficient teachers. The computers are only a tool in the hands of a teacher to make the teacher's job easy and fast and make the teacher more efficient. A computer or any other teaching tool cannot work at its own; it definitely needs mediation from an enterprising teacher. No one would feel like to do away with the blackboard where it is necessary to use a blackboard or any other conventional tool. The computer has brought about a tremendous change the way the world looks at the teaching aids. With the advent of internet technology, the use of a computer as part of today's educational aids has become inevitable. Just think of a simple situation where you want to teach a student the word 'trumpet' used for the sound produced by an elephant and expect the student to describe the sound which the elephant makes. Obviously, you cannot bring the elephant to the classroom other than showing its picture. Even if you take the class to the zoo park where is the guarantee that the students can listen to the sound of an elephant trumpeting. But you can play the recorded sound of the elephant through a computer and can also show its picture or even live video of an elephant. For this purpose I have loaded the sound files of all animals, birds and insects to enable 134 the children to hear the sounds of these living beings through computer in their classrooms. We can make the young students practice their language lessons including regional languages through computers. I have practically done it for my computer virtually turning the computer lab as a language lab. You can see the image above where the students of a primary class are seriously engaged in learning Hindi through computers. Computers bring to the students a world of entertainment along with learning by providing computer based educational games for learning various subjects through computers. Many websites on the internet provide these games free for the students and parents and a few also charge nominally for the educational games made available to their members. INTERACTIVE ELECTRONIC WHITE BOARD AS A TOOL IN MODERN TEACHING

- o Interactive electronic white boards of today also known as smart boards are the latest tools in the methods of modern teaching. These need a computer, an overhead projector and preloaded educational software.
- o These are very costly equipment and require a lot of investment and can be afforded by only by schools who charge a very high rate of fees from the students. For this reason, these have not become very popular with ordinary schools. It is not only the heavy initial investment if purchased outright which has to be kept in mind but also the day to day costs of running the equipment which should be thought of by the end users. These costs are the high power bills and the replacement of lamps of the projectors which should be given attention to while buying this costly equipment.
- o Some companies supplying the white boards like the Edu comp, Smart Boards etc. make offers to the institutions to pay on monthly basis for the equipment and also appoint the support staff for running the system. They charge the institutions monthly charges ranging from Rs.50 to Rs.100 per student dependent upon the school strength. Here also these companies do not apprise the schools about the hidden costs in the form of higher power bills and replacement of projector lamps which the schools have to incur.
- o Of course, the electronic white board has many user friendly offering a lot of interaction to its user. It is a colourful tool in the hands of the teachers. Its inter-

135 activity features are beyond description. But the biggest disadvantage of the electronic white board is that it has to be fixed on the wall and does not leave the place for use of your ordinary blackboard to be used in case of emergencies like the power failure. It is more so if the classroom does not happen to be very big. The projector and the computer has to be always on if you want to use the electronic board. FLASH CARDS Definition: • Flash cards are a set of pictured paper cards of varying sizes that are flashed one by one in a logical sequence." • Flash cards can be self-made or commercially prepared and are made up of chart or drawing paper, paper using colors or ink on them for drawings." Purposes: 1. To teach the students. 2. To give health education. 3. Useful for small group. 4. Used in group discussions. Principles: • The messages can be brief, simple line drawing or photographs, cartoons and the content will be written in few lines at the back of the each card. • 10" X 12" or 22" X 28" is commonly used size. • 10-12 cards for one talk can be used. It should not be less than 3 and more than 20. • Prepare a picture for each idea which will give visual impact to the idea. • The height of writing on the flash card is to be approximately 5cm for better visualization. Using the flashcards: For class room instruction, the flash cards is to be properly used. The following steps are used while displaying flash cards.

136 1. Give brief introduction about the lesson to students. 2. Give instructions to students about their actions while you flash the cards. 3. Flash the card in front of the class by holding it high with both your hands so that all the students can see it. 4. Let the student respond as per instructions already given. 5. Review the lesson by selectively using flash cards. Advantages: • Flash cards can be used to introduce and present topics. • It can be used to apply information already gained by students to new situations • It can be used to review a topic. • Can be used for drill and practice in elementary classes • To develop the cognitive abilities of recognition and recall of students. • It can work as a useful supplementary aid and can be effectively used with other material. Disadvantages: • Cannot be used for a large group • Prone to get spoiled soon • Preparation is time consuming. E-FLASHCARDS An extensive selection of images listed according to theme that helps learners to understand basic vocabulary. These images may be printed out or used with an interactive digital whiteboard. The audio option also tells students how each word is pronounced. EDUCATIONAL TOYS Toys are usually used in small classes for teaching the children the names of various fruits, vegetables, animals, birds, insects etc. Toy models of these objects are easily available in the market. o Children in lower classes are also given some objects like marbles and beads to learn numbers. o Toy clocks and watches are used in schools to teach children the concept of time.

137 3.5 Advantages, Limitations and Challenges of Using Multimedia in Education By incorporating multimedia in their instruction, teachers can capture attention, engage learners, explain difficult concepts, inspire creativity, and have fun. However, there are many tools available and many ways to use those tools. "

Multimedia is characterized by the presence of text, pictures, sound, animation and video; some or all of which are organized into

some coherent program" (Phillips, 1997). 3.5.1

The Advantages of using Multimedia in Education 1.

Deeper understanding According to research, a benefit of multimedia learning is that it takes advantage of the brain's ability to make connections between verbal and visual representations of content, leading to a deeper understanding, which in turn supports the transfer of learning to other situations. All of this is important in today's 21st century classrooms, as we are preparing students for a future where higher-level thinking; problem solving and collaborative skills will be required. 2. Improved problem solving A large percentage of the human brain dedicates itself to visual processing. Thus, using images, video and animations alongside a text stimulates the brain. Student attention and retention increase. Under these circumstances, in a multimedia learning environment, students can identify and solve problems more easily compared to the scenario where teaching is made possible only by textbooks. 3. Increased positive emotions According to psychologist Barbara Fredrickson, experiencing positive emotions makes people see more possibilities in their lives. Using multimedia during instructions impacts student's mood during the learning process. With a positive attitude they learn better and tend to be more proactive. 4. Access to a vast variety of information With computers, tablets, smartphones and the internet, students are today better equipped than ever to search and find the information they need.

A study revealed that 95% of students who have access to internet, use it to search for online information. Sharing the information and participating in class discussions is done in a more confident way when access to information is as easy as today.

138 5. World exploration There is no surprise here. With the help of multimedia children can explore and learn about places they would never been to. In a geography class, students can explore different cities of the world, the tallest mountains and the most dangerous jungles. In a science class, space and planets exploration is now possible. In a biology class, the dissection of rare animals and different habitats exploration are like a walk in a park for students benefiting of a multimedia learning environment. Altogether, multimedia learning environments have a direct effect on learning and even on growing as a person. An effect that differs and can't be achieved as easy whilst using traditional education materials. Therefore, it is no wonder the edutech business is increasing and schools desire more and more to create multimedia learning environments for their students.

Multimedia is very helpful and fruitful in education due to its characteristics of interactivity, flexibility, and the integration of different media that can support learning, take into account individual differences among learners and increase their motivation. The provision of interaction is the biggest advantage of the digital media in comparison with other media. It refers to the process of providing information and response. Interactivity allows control over the presented content to a certain extent: learners can change parameters, observe their results or respond to choice options. They can also control the speed of applications and the amount of repetition to meet their individual needs. Furthermore, the ability to provide feedback tailored to the needs of students distinguishes the interactive multimedia from any other media without a human presence. However, many aspects need to be taken into account when using multimedia in education. Even though multimedia is offered worldwide, access to learning materials and computing equipment differs from country to country. The use of multimedia by students needs to be supported by very skilled teachers. They must guide students through the learning process and provide them with appropriate and effective learning strategies. Like the use of textbooks, the use of educational multimedia fosters teaching strategies, where the teacher's role is not just that of information provider but the one of guide, supporter and facilitator. Multimedia offers a variety of media usually combined in a meaningful manner. This gives an opportunity to use the computer for the presentation of ideas in different ways, including by means of:

139 • Images, including scanned photographs, drawings, maps and slides;
• Sounds, e.g. recordings of voice, noise and music; • Video, including complex procedures and 'talking heads'; • Animation and simulations; • Discussions among learners (social networks, online discussions, blogs, etc.). Often, presentations supported by attractive images or animations are visually more appealing than static texts, and they can support the appearance of emotions to complement the information presented. Multimedia can appeal to many types of learning preferences - some students profit more from learning by reading, some by hearing and some by watching, etc. In addition, the use of multimedia allows for different ways of working - students can decide on their own how to explore the materials as well as how to use interactive and collaborative tools. Moreover, students can adjust their own learning processes according to their abilities and preferences. They can work according to their interests, repeat material as much as they want reducing embarrassment concerning their learning outcomes. The use of multimedia can thus be tailored to the students' differences in interests, social and cultural backgrounds, learning preferences and rates, etc. Individual learning can promote active, self-directed learning. In addition, multimedia applications can be used to facilitate group work. Small groups of students can work through multimedia applications together - in order to learn from each other as well as to improve their dialogue skills. The interactive opportunities of multimedia lead to high flexibility, which can be very helpful for students with special needs: • Dyslectic students can use synthetic speech in order to become familiar with the content of digital texts. • Autistic children show an increase of phonologic awareness and word reading by using multimedia (

Heimann et al. 1995). •

Students with severe speech and physical impairments gain from learning with multimedia, because the computer is flexible enough to meet individual needs - they can repeat as oft en they want, can hear it loud, etc. (

Steelman, 1993). •

For deaf students, the visual presentation of content improves their motivation to learn (

Voltena et al., 1995).

The computer can noticeably improve student access to information. Such delivery platforms as the World Wide Web provide 24-hour access to information. Moreover, it is relatively easy to update web-based educational materials, i.e. to change design, content, instruction methods, etc.

140 3.5.2

Limitations of Using Multimedia Multimedia requires high-end computer systems. Sound, images, animation, and especially video, constitute large amounts of data, which slow down, or may not even fit in a low-end computer. Unlike simple text files created in word processing, multimedia packages require good quality computers. A major disadvantage of writing multimedia courseware is that it may not be accessible to a large section of its intended users if they do not have access to multimedia-capable machines. For this reason, courseware developers should think very carefully about the type of multimedia elements that need to be incorporated into applications and include only those that have significant value. Multimedia has other weaknesses too. While proponents of this new technology are very enthusiastic about its potential, they often leave the financial and technical issues unattended. Developments in multimedia are very high and the process of developing effective multimedia takes time. Further, if the prerequisites for using multimedia include computers with related software, the user must possess a minimum level of computer literacy in order to exploit the capabilities of this medium for learning. And finally, of the educator who is unfamiliar with the production and design of multimedia courseware or packages can be equally complicating. The critical question, then, is: How do we overcome some of the identified barriers and begin the process of multimedia implementation alongside the instructor, textbook, and blackboard? It is the barriers rather than the technologies which we must address before multimedia, or for that matter, any media technology becomes as accepted as the printed text or guidebook. Following are a few limitations of using Multimedia

- Information overload. Because it is so easy to use, it can contain too much information at once.
- It takes time to compile. Even though it is flexible, it takes time to put the original draft together.
- It can be expensive. Multimedia makes use of a wide range of resources, which can cost a large amount of money.
- Too much makes it unpractical. Large files like video and audio has an effect of the time it takes for a presentation to load. Adding too much can mean that we have to use a larger computer to store the files.
- In case we want to upload it onto the Internet, there are a few factors to keep in mind, for example bandwidth and the user's abilities.

3.5.3 Some Disadvantages of Multimedia in Education

Self-regulated learning: Some learners are not able to handle the freedom provided by hypertext-based multimedia.

141 Distraction: Often, confused presentations of the material can cause distraction due to conflicting messages. Non-linear structured multimedia allows the user to follow the supplied links, which can distract from the topic to be learned. The massive amount of information provided by multimedia applications may distract our attention during learning. The human short-term memory is limited; usually it can hold around 7 pieces of information. When several media presented at the same time, the learner can only concentrate on some of them and ignore others. This could result in ignoring important information. Human beings cannot use all channels available simultaneously, and this can prevent us from realizing the full potential of multimedia. Low interactivity: Even though the interactivity between the learner and multimedia applications is increasing, it is still considered restricted compared to the elaborated human-human interactivity. No selective feedback: Feedback is generally very limited within computer-assisted learning packages. Generally, computers can't substitute for person-to-person teaching, only enhance it. Often, the feedback provided is limited to right/wrong, and it does not support in learning strategies or further content explanations. Multimedia applications cannot identify individual needs or problems of the learner, so they cannot respond like people. Simulations are often not enough: It may be important for students to have true hands-on experience. For example, for studying insects in biology it is necessary to go out in nature, to see insects living in their natural environments. Lack of skills - pupils and teachers: Students, particularly mature-age students, may not be ICT literate. Also teachers may lack some personal skills, which are needed to teach effectively with multimedia. Difficult to do: Creating audio, video and graphical materials can be more challenging than creating ordinary texts. Time consuming: Using multimedia can be time consuming. Especially the production of multimedia takes much time. Access: Not all students have appropriate access to proper hardware and the Internet. This may limit the scope of teaching. Social in/exclusion: Not all members of a society can be involved in the use of

142 multimedia technology due to lack of access to the Internet or lack of hardware to make full use of the educational material on the web. Equipment problems: Hardware and software needs to be configured in a way that their usage is as simple as straight forwarded as possible. Bandwidth issue: Limited bandwidth means slow performance for sound, graphics and video, interrupting streaming and causing long waits for download that can affect the ease of learning. Multimedia is portable: Paper-based notes can be read everywhere, on the bus, at the beach, etc., but web-based materials or multimedia materials require specific hardware devices. Computer screens aren't paper: The content on screens may not be as easy to read as the content on paper. If there are large chunks of information that need to be read from top to bottom, it is probably best to view such a document on paper. Books and journal articles may still be better to read in paper. End users often prefer to use technology to search for information, but when it comes to reading, they tend to read from print-outs. In summary, multimedia products can be used to represent and process various types of knowledge. They can be used as means of representation and communication of knowledge. The use of these products can foster students' construction of their own knowledge. They can construct knowledge and develop skills related to various subjects by accessing or producing digital representations of knowledge. In particular, they can develop literacy and other core competencies. For example, they can develop motivation for learning activities, communication abilities, social competencies as well as learning competencies, values and ethics.

3.6 Recent Trends in Multimedia

The technological advancements have made society take a leap towards success. Every technological reform is a small step towards advancement. Every new invention in technology is a step towards progress of mankind. Centuries ago, hardly anyone would have even dreamt of working on a computer. Generations of the yester years would have hardly imagined being able to communicate with people on the other side of the globe. But there were some intelligent minds to dared to dream of such revolutionary discoveries and they made the impossible possible.

143 Since several years ago, education experts had been proposing a new style of education involving using multimedia, which differs radically from the traditional ways. Changing the education systems as a new ways is towards a new paradigm for teach (Rosenberg, 2001).

The development of multimedia technologies for learning offers new ways in which learning can take place in education areas. In last decades, there has been a growing interest in the creation and use of multimedia technologies throughout the education world. There have been many experiments and innovations in the field of education and training regarding knowledge delivery (Tally, 2002). From face to face to virtual education, different technologies have played great roles at different times.

In the last decades, due to the advent of multimedia technologies has got new meaning (Del, 1998; Moreno, 2000). Development, access, and transfer of text, sound, and video data gave given a unique face to education centers, in the form of multimedia learning. The development of multimedia systems can be very rewarding. So interest and investment in this technology are increasing and multimedia technologies are the need of the day (Bransford, 1990; Mayer, 1990).

Multimedia Technologies as an Educational Tool throughout the 1980s and 1990s, the concept of multimedia took on a new meaning, as the capabilities of satellites, computers, audio and video converged to create new media with enormous potential. Combined with the advances in hardware and software, these technologies were able to provide enhanced learning facility and with attention to the specific needs of individual users (Fenrich, 1997; Meyer, 2001; Mayer, 2003). Multimedia is a term frequently heard and discussed among educational technologists today. Now multimedia technologies these called "new media," "hypermedia," "integrated media," or more commonly "multimedia" have been defined in a number of ways. Actually the term "multimedia" covers a lot of territory. "Multimedia", in its broadest sense, means graphics, music, sound effects, voice, video, and animation, in any combination, in the same program or presentation (Blumenfeld, 1991. Fensham,, 1990).

It can be defined as an integration of multiple media elements (audio, video, graphics, text, animation, etc.) into one synergetic and symbiotic whole that results in more benefits for the end user than any one of the media elements can provide individually. Multimedia can be defined generically as any combination of two or more media such as sound, images, text, animation, and video. For educational technology purposes,

144 multimedia refers to computer-based systems that use associative linkages to allow users to navigate and retrieve information stored in a combination of text, sounds, graphics, video, movies, music, lighting and other media as for education (Meyer, 2001; www.wps.prenhall.com; Sandholtz, 1997; Vanbuel, 2006). When the term is used with computer technology, multimedia refers to a variety of applications that combine media and that use CD-ROM, video, audio, DVD, and other media equipment. As it seen multimedia is the combined use of media, such as images, video, audio, CD/DVD-ROMs, the internet and interactive applications such as applets and flash for education and entertainment (Chang, 2004; Finn, 2002).

Multimedia hardware requirements include a basic computer system with the standard input devices, central processor, and output devices, CD-ROMs or DVDs, sound boards or cards, speakers, video boards, highspeed central processors, extensive secondary storage or hard disk (Lieshout, 2001; Millar, 2005). Multimedia's basic technologies include

text, maps, graphic images, electronic presentations, animation, videoconferencing, digital audio and video, web learning environment, videoconferencing systems (Lieshout and etc, 2001; Phillips, 1997; Behrens, 1996, 1997; Bijmens 2004, 2005; Cleveland, 1998).

Multimedia combines five basic types of media into the learning environment; text, video, sound, graphics and animation, thus providing a powerful new tool for education (Duke, 1993). These are to demonstrate abstract concepts, to accommodate students with a variety of learning styles, to engage students, to enable active learning, by incorporating multimedia into learning, activities, students can manipulate, create and interact with material rather than just absorb representations created by others (Kearsley, 1998; Person, 2003).

Multimedia technologies have a lot of advantages such as;

widely available, reusable, multimedia, and decrease pressure on lecturer, better individual student engagement, globality (Repman, 1993; West, 2006). These are fun and interesting, provide a pre question, and make description a narration, no need to include an image or video of the narrator, unless there's some demonstration. Do not include explanation in both text and narration styles, Give students chance to pause the video/audio and ask questions, Make the multimedia interactive, Provide pre training on key components, concepts in the multimedia to enhance students' understanding of the multimedia resource,

Presenting more materials may result in less understanding (Mayer, Heiser, and Lonn, 2001; Mayer, Dow and Mayer, 2003; Wallace, 2006).

145

E-LEARNING E-Learning is the use of technology to enable people to learn anytime and anywhere.

E-Learning can include training, the delivery of just-in-time information and guidance from experts.

It is a new education concept by using the Internet technology, it delivers the digital content, provides a learner-oriented environment for the teachers and students. The e-learning promotes the construction of life-long learning opinions and learning society. Delivery of the digital content is the main characters of e-learning. E-Learning is an important consideration in education for several reasons: 1. Implemented correctly, it can reduce some of the costs associated with education 2. It allows schools to educate people they could not previously (e.g. people that work for a living, people geographically dispersed, etc.) 3. Many students communicate better in a web based environment than in the traditional classroom. Studies have shown that students who would not raise a hand in class will be very active in posting to discussion boards for example. E-Learning is a challenge for educational institutions because the technology involved can be difficult to manage and use. A lot of training or practice is required to get proficient in e-Learning solutions. For example, Flash based applications need to target customers that have a large learning audience to justify the expense. Virtual classrooms are often a more cost efficient solution in many cases. E-Learning is an active and growing industry. It may take a hit with the economy being like it is but it will reemerge very strong. 3.7 Implications of Multimedia in Teaching and Learning Education encounters, in modern times, challenges in all aspects of social, economic & cultural life; the most important of which are over-population, over-knowledge, education philosophy development & the change of teacher's role, the spread of illiteracy, lack of the staff & the technological development & mass media (Aloraini, 2005, p. 30- 32). This drove the teaching staff to use the modern teaching technologies to face some of the main problems, which education & its productivity encounter, by increasing the learning level which may be achieved through providing equivalent opportunities for all people whenever & wherever they are, while taking into account the individual differences between learners (Wilkinson, 1986, p. 13 & Abd El-Halim Said, 1997, p. 19). To improve the educational productivity, some of the teaching staff sought to mainstream technology within education, developing traditional techniques & using new educational methods (Al-A'ny, 2000).

146 Mainstreaming the technological media within what is called "Multimedia" is the pattern which led to infinite applications of computer technologies. The concept of this technology came into being with the appearance of sound cards, then compact disks, then came the use of digital camera, then the video which made computer an essential educational tool. Nowadays, multimedia expanded to become a field on its own. Interaction is the main element in multimedia technology as most of its applications are characterized by interaction. Consequently, multimedia programs may provide a more effective & more influential experiment than using each technology separately. Multimedia is one of the best educational techniques because it addresses more than one sense simultaneously, as it addresses the senses of sight & hearing. Multimedia programs provide different stimuli in their presentations which include a number of elements some of which are (Aloraini, 2005, p. 55-75): Texts Spoken words Sound & music, Graphics, Animations and Still pictures Some of the potential advantages of multimedia programs are: 1. They make the reading process a dynamic one instead of the written presentation of the texts printed in the book (Zaitoun, 2002, p. 259). 2. Presenting different drawings & pictures supports the clarification of ideas & communication of information. 3. Moving easily from a presented subject to another provides a good chance for questions & discussions. 4. Using different presentations like video clips along with maps or other kinds of presentations help to get the information closer to reality. Adding music makes the idea clearer and it attracts the attention of the learners (Aloraini, 2005, p. 73). 5. They rise the attention & interaction between students & the educational subject (Qandeel, 1998, p. 1625). 6. They comprise the elements of amusement & suspense (Qandeel, 1998, p. 1625).

147 7. They are graded according to the learner's abilities from easy to difficult ones (Qandeel, 1998, p. 1625). 8. They provide teachers with a new educational style & encourage curiosity (Holsinger, 1995, p. 9). 9. They help teachers & learners look into topics from a broader perspective as each topic comprises enormous information (Holsinger, 1995, p. 9). 10. They guide learners to peer learning (Alfar, 2009, p. 123). 11. They are concerned with providing simultaneous feedback (Qandeel, 1998, p. 1625). 12. They help learners remember & transfer their knowledge (Alfar, 2009, p. 123). 13. They support the user's work & innovation, which makes the possession of a computer a necessity for both the student & the teacher. Teaching and learning are two complementary aspects of education. Within learning, there are two key elements: content, which forms the "what" of learning; and skills, which describe the application of content to specific tasks, or the "how." These two elements are mirrored in teaching by the curriculum and syllabus (the "what") and the teaching methodology (the "how"). Multimedia technology affects both aspects of teaching and learning. It does this in three ways: in how it presents information; in how students interact both with the medium and through the medium with the teacher and other learners; and in how knowledge is structured within multimedia. Multimedia can represent knowledge in more ways than text or speech can. Multimedia combines text, audio, visual, graphic, and dynamic elements, such as animation and video. This presents learners and teachers with unique learning resources that can be used in a wide variety of ways to stimulate various forms of learning. The most significant feature of the multiple forms of media is that they allow for the presentation of knowledge in numerous ways. Thus students can learn about abstract principles through text and can see the application of those principles through an animation or a video example. This presents the opportunity for deeper levels of understanding, particularly if the presentational qualities are fully and deliberately exploited to achieve this purpose and are combined with the potential for learner interaction. Well-designed applications of multimedia then can do two things: they can enable learners to come to understandings more quickly than through more conventional classroom or textual media; and perhaps more significant, they can change how we come to know or to understand and hence what we know and understand. In other words, a learner may have an image or a mental "construction" that is far richer than an abstract verbal understanding. From an educational perspective, it is essential that learners can move confidently between concrete and abstract understandings and not become locked into one or the other. This does not happen by accident. Multimedia needs to be carefully designed to facilitate the development of this kind of thinking. Thus the role of the teacher is by no means diminished; indeed, such design requires highly skilled teachers working in teams with multimedia producers.

3.8 Let Us Sum Up 1. Multimedia is the encompass of all media used in electronics, particularly with computers. The use of computers to present text, graphics, video, animation, and sound in an integrated way. Long touted as the future revolution in computing, multimedia applications were, until the mid-90s, uncommon due to the expensive hardware required. With increases in performance and decreases in price, however, multimedia is now commonplace. Nearly all Personal Computers are capable of displaying video, though the resolution available depends on the power of the computer's video adapter and microprocessor. 2. Technology does not necessarily drive education. That role belongs to the learning needs of students. With multimedia, the process of learning can become more goal oriented, more participatory, flexible in time and space, unaffected by distances and tailored to individual learning styles, and increase collaboration between teachers and students. Multimedia enables learning to become fun and friendly, without fear of inadequacies or failure. 3. Interactive Multimedia is the means to interface with these media typically with a computer keyboard, mouse, touch screen, on screen buttons, and text entry allowing a user to make decisions as to what takes place next. 4. Specific uses of multimedia include: Drill and practice to master basic skills the development of writing skill problem solving understanding abstract mathematics and science concepts simulation in science and mathematics manipulation of data acquisition of computer skills for general purposes, and for business and vocational training access and communication to understand populations and students access for teachers and students in remote locations individualized and cooperative learning management and administration of classroom activities. 5. Role of Teacher in Multimedia Approach ● Teacher has to adopt a number of methods and techniques.

149 ● Teacher has to aware of the different available media and their availability. ● Teacher should be physically competent to use and demonstrate the use of the different media. ●

Teacher should be skillful enough to make a judicious choice of media and competent enough to mix them sequentially and in an orderly manner. • Teacher's role is that of a facilitator or manager of activities. • Teacher has to lead his student for independent, individualized learning. 6.

Advantages of the multimedia Approach • Multimedia approach enables the student to represent information using several different media. • Can arouse the curiosity among the learner and provide them vivid impressions. • Multimedia can take into account

different learning styles - some pupil learn by interpreting text, while others require more graphical representations. • Can develop a positive attitude among the learners towards the teaching-learning process. • Multimedia Approach allows for self-pacing • Technique of simulation can be effectively applied through the multimedia approach. • Helps in development of higher order thinking skills. • Multimedia approach provides the student the flexibility of 'anywhere', 'any time' learning. • Helps in developing group and interpersonal skills. • Effective remediation programmes can be implemented through the multimedia approach. • Multimedia approach can bridge language barriers since audio is not the only means of communication. 7. Disadvantages of the multimedia Approach • Requires highly sophisticated infrastructure facilities, which may lead to heavy financial burden. • Expertise and skill are required to operate the multimedia devices, which will lead to the problem of non-availability of human resources. • Not feasible in the all topics of study.

150 8. With a multimedia approach, the student could also access Web sites on the Internet to get more information. The student could then add film clips on these animals in their natural habitat (all may be from the same CD-ROM) and blend them into a report. Then by adding titles and credits, the student now has a new and original way of communicating his/her own individual perspective. 9. With multimedia simulation technique can be effectively applied. By using simulation, student can grasp a better understanding about the step and producer to make or do a certain project. This can improve their understanding and also help improving their skills. 10. Multimedia possessed a lot of advantages to make learning interesting. With the help of its elements, it can invoke creativity in both teacher and students so that they can apply it in order to teach or learn. Learning also becomes much easier with the help of multimedia. Multimedia can help improve our educational system. 3.9 Check Your Progress 1. Define Multimedia. Briefly discuss the advantages of multimedia learning over traditional learning. 2. Comment on the recent trends in Multimedia teaching and learning process. 3. How had multimedia changed the educational scenario? Explain. 4. Give a comparative study on the advantages of smart board over blackboard. 3.10 References 1. Bates, A. 153 4.1 Introduction The

effective Use of Technology in Education has changed the face of education and it has created more educational opportunities. Both teachers and students have benefited from various educational technologies, teachers have learned how to integrate technology in their classrooms and students are getting more interested in learning with technology. The use of technology in education has removed educational boundaries, both students and teachers can collaborate in real time using advanced educational technologies. Technology has helped in the growth of mobile learning and long distance learning. The use of internet technology has enabled teachers to reach students across borders and also students from developing countries have used internet technology to subscribe for advanced educational courses. Many universities and colleges have embraced online education by creating virtual classrooms. Online education is flexible and affordable, students can attend classrooms during their free time, and they can also have a chance to interact with other students virtually. Recent advancements in educational technologies have yielded positive results in our education sector. This new educational technology is supporting both teaching and learning processes, technology has digitized classrooms through digital learning tools like, computers, iPads, smartphones, smart digital white boards; it has expanded course offerings, it has increased student's engagement and motivation towards learning. The teaching strategies based on educational technology can be described as ethical practices that facilitate the students' learning and boost their capacity, productivity, and performance. Technology integration in education inspires positive changes in teaching methods on an international level. Benefits of Technology in a Special Educational Classroom 1. Most students are drawn to technology and special education teachers often find that these students are then more motivated to work because they get to use a technology device in the classroom. 2. Teachers can work with more students at one time more effectively, such as using a phonetic ear so that more students can hear or a clicker response system to engage all of the students at once. 3. Technology is an equalizer and parents even report that when their children with challenges or disabilities uses technology that they are seen as more capable by peers.

154 4. Children learn valuable technology skills that can translate into marketable skills. 5. Children with physical disabilities have more opportunities for engaged learned with modified assistive technology such as touch screens and assistive wands. 6. Students who spend time in mainstream classes and special education classrooms can use technology to bridge the expectations and demands of each, such as by using a device to record lectures for playback later. 7. Technology can help build confidence in children. They are finding more success academically and they are also feeling more like their classmates who utilize technology every day, too. Even though there are many other tools that are valuable to special education teachers, technology can be counted as a beneficial resource that can turn special education classrooms into launch-pads for learning - and life. 4.2

Objectives After going through this unit you will be able to ●

discuss how to enhancing Technology Friendly Practices among Teachers. ●

discuss about the importance of

Computer-Assisted & Computer Managed Instructions, Cybernetics, E- learning, Use of Net Search and Websites ●

discuss about

Disability Friendly Technology - Punarjani, and e-learning Framework developed by C-DAC 4.4

Developing Technology Integrated Lessons - Individual and Group ● discuss the implications of Technology based instruction in Inclusion 4.3

Enhancing Technology Friendly Practices Among Teachers 4.3.1 Technology and Teaching Practice Thomas Edison once said, "Books will soon be obsolete in the public schools...our school system will be completely changed inside of ten years." Amazingly enough, however, one of our nation's most important inventors was proven quite wrong. The education system has a remarkable resistance to innovation and the classroom experience has changed very little in the 100 years since Edison's prediction. Advances in information technology have revolutionized how people communicate and learn in nearly every aspect of modern life except for education. The short school 155 day and the break in the summer were meant to allow children to work on family farms. Schools have an enduring industrial mentality placing students in arbitrary groups based on their age regardless of their competencies. Technology has failed to transform our schools because the education governance system insulates them from the disruptions that technology creates in other organizations. The government regulates schools perhaps more than any other organization. Rules govern where students study, how they will learn, and who will teach them. To overcome these obstacles, we must persuade teachers that technology will empower them and help their students learn. There are five strategies for successful teacher adoption of education technology and that these principles will help fulfill the potential that Edison saw a century ago: Schools must use technology that empowers teachers. Teachers rightly reject education technologies that divert their attention from instruction. The best education technologies enable teachers to do more with fewer resources. Communication platforms like Twitter and Facebook enable dynamic communication with students. Teacher-empowering technologies include mobile apps that grade written student work and provide lesson plan databases. School systems need to aggressively track what works for their teachers and put all other unworkable technologies aside. Teachers should treat the adoption of technology as part of lesson planning. Teachers can incorporate technology directly into their practice and insulate their students from the deleterious effects of policy churn. Systematic adoption of technology at the classroom levels limits the damage of shifting policy maker priorities. Teachers should not fear open-source technologies. Many mistakenly believe that education technologies are expensive and complicated to use. Open-source technologies are stable, secure, and compatible with other platforms. Organizations both small and large use open source devices every day. Many businesses use open-source servers for their efficiency and costs savings. They often have large communities that provide high quality customer support. Best of all, open-source technologies often cost less than proprietary products. Use online education portfolios to evaluate students. Educators have known about the benefits of paper based portfolios for generations. Portfolios allow students to express creativity for difficult to assess subjects. Teachers can choose from a variety of online portfolio providers tailored to the needs of their classroom. They also serve as a platform for students to demonstrate growth. Online portfolios have many advantages over paper based options because they cost less and allow for more robust outreach. Online

156 portfolios are also amenable to a wider variety of formats including video, music or other interactive features. Teachers should embrace the Common Core State Standards. Common standards make teaching simpler. Teachers have to write lessons that comply with district, state, and national standards (e.g. NCTM or NCTE). Having a single set of standards eliminates redundancy and conflicting guidelines. Furthermore universal adoption of common standards will support future technological innovations that aid teachers. From a technical perspective, standards facilitate the development of new technologies. Innovators can focus on developing tools that better serve students rather than solving technical challenges of interoperability created by multiple sets of standards. Undoubtedly weak financial support inhibits the adoption of education technology. Despite this obstacle, teachers working together have tremendous potential to reform education. Every day teachers face choices about how to implement the curriculum and instruct students. Those moments are opportunities for teachers to engage in education reform that has a real impact on students. Teachers should use education technologies that are inexpensive, easy to use, and improve student learning.

4.3.2 Role of Technology in School Management to Enhance Learning: India has one of the largest networks of schools in the world. During the last five decades the system has grown manifold in size both in terms of institutions and enrolment. Some say, that the nature of Indian education system shifted from an elite system to a system of mass education. For instance, the number of primary schools was around 200,000 in 1950, which is at present more than 600,000. If one were to take into consideration the number of alternate schools that have sprung up in recent years, and include the upper primary and secondary schools, the network consists of more than a million schools. Traditionally, school education acquired immense importance in the post-Independence period and with the consequent expansion of the system, the role of the school teacher also underwent a significant transformation. An important consequence of the expanding system of schools, with ever increasing enrolment and acquiring of mass character, has been the increase in complexity of school management.

The changing pace of technology development like ICT and knowledge revolution has made the job of the teacher more demanding. They are required and should be encouraged to assume the new roles and responsibilities for ICT to improve the quality of education and access to education by learners

in an informal and non-formal education setting. (Govinda, 2002) The system demands new knowledge and skills from the teacher and head teachers. It also demands greater capability at the school level to respond to the emerging diversity in the student population and among those entering the teaching

157 profession. In effect, changes in the characteristics of the system have made the role of the school teacher even more critical than what it was earlier. Has the State, which is the main provider of education in the country, responded to the changed reality? Has the teacher become more empowered? Have adequate efforts been made to equip the teacher to face the emerging challenges? What is the current reality with respect to status, roles and functions of the teacher and the head teachers in India? And how can we come out from this challenge? These are few issues which need attention especially now when the country is moving towards becoming a knowledge center and quality education has become determinate in such process. 4.3.3 An Overview of Teacher Managerial Function in the Class Room Historically, most of teachers restricted their role to teaching. The different government organizations and departments provided a guide line for the role and responsibility of the teacher. The teacher plays multiple roles in the school. The role of teacher is assessed in terms of his/her attendance in the class, completion of the course and interpersonal relation in the school.

Till now, hardly any indicator is developed to assess the performance of teacher on the basis of learning achievement of the student. The critical managerial functions of a teacher in elementary education are similar to those in other sectors. These are: (i) Administration. Administration refers to the direction, control, management and organization of human and material resources for educational growth and development. (ii) Personnel management. Planning and managing human resources is personnel management. It includes recruitment, transfer and redeployment; promotional opportunities and performance appraisal systems, grievance redressal mechanisms and professional development issues. (iii) Planning. Planning is a systematic exercise of determining a future course of action in accordance with identified objectives, needs, priorities and existing/likely capacities, within a given time frame, reflecting cost-effective choices. (iv) Financial management. Financial management refers to mobilization, deployment and efficient use of financial resources as per stated objectives and strategies. (v) Supervision, monitoring and support. Monitoring and facilitation of teaching- learning processes, and other school development activities, for enhancing their

158 quality through suitable tools, methods and mechanisms. The focus is on school, because this is the unit where primary learning takes place, and any effort to improve the quality of processes should ultimately be reflected here. 4.3.4 Benefits of Technology in the Classroom As we sail through the 21st century, technology in the classroom is becoming more and more predominant. Tablets are replacing our textbooks, and we can research just about anything that we want to on our smartphones. Social media has become commonplace, and the way we use technology has completely transformed the way we live or lives. Educators, too, have seen firsthand the benefits of technology in the classroom. Educators also recognize the importance of developing these technological skills in students so they will be prepared to enter the workforce once they complete their schooling. The impact that technology has had on today's schools has been quite significant. This widespread adoption of technology has completely changed how teachers teach and students learn. Teachers are learning how to teach with emerging technologies (tablets, iPads, Smart Boards, digital cameras, computers), while students are using advanced technology to shape how they learn. Here are a few benefits of using technology in the classroom. Technology in the Classroom Makes Learning More Fun Students prefer technology because they believe that it makes learning more interesting and fun. They especially like laptops and tablets. Subjects that students deem challenging or boring can become more interesting with virtual lessons, through a video, or when using a tablet. Technology Prepares Students for the Future Using technology in the classroom would help prepare them for the digital future. These 21st-century skills are essential in order to be successful in this day and age. Jobs that may not have had a digital component in the past, may have one now. Education isn't just about memorizing facts and vocabulary words, it's about solving complex problems and being to collaborate with others in the workforce. Ed-tech in the classroom prepares students for their future and sets them up for this increasing digital economy.

159 Improved Retention Rate Technology helps them retain information better. Technology indeed helps students remember what they learn. Technology Helps Students Learn at Their Own Pace Today's technology enables students to learn at their own pace. For example, almost all apps allow for individualized instruction. Students can learn according to their abilities and needs. This form of teaching is also great for the teacher because it gives him/her the time to work individually with students who may be struggling. Technology Connects with Students Technology occupies an important place within students' lives. When they are not in school, just about everything that they do is connected in some way to technology. By integrating technology into the classroom, teachers are changing the way they used to teach and providing students with the tools that will take them into the 21st century. Technology changes by the minute, and as educators we need to keep up with the times in order to best prepare our students for this ever-changing world that we live in. While we just saw how integrating technology into the classroom has its benefits, it's important to note that traditional learning processes are just as essential. 4.3.5 Teacher Technology

Competencies Teachers need to improve knowledge and skills to enhance, improve and explore their teaching practices. Many of the studies on competencies of teachers focus on the teaching role of teachers in the classroom rather than teachers' competencies. Competencies are defined as "the set of knowledge, skills, and experience necessary for future, which manifests in activities" (Katane et.al. Gupta defines competencies as "

knowledge, skills, attitudes, values, motivations and beliefs people need in order to be successful in a job." ICT competencies are based on using tools and technical equipment for the reaching, disturbing and transferring the knowledge. They include any technology that helps to produce, manipulate, store, communicate, and/or disseminate information. It means that the ICT competency is very important to improve the communication in the learning and teaching process. The ICT Competencies are a set of technology standards that define

160 proficiency in using computer technology in the classroom. The competencies consist of computer-related skills grouped into four general domains: (1) Basic Technology Operation, (2) Personal and Professional Use of Technology Tools, (3) Social, Ethical, and Human Issues, and (4) Application of Technology in Instruction. 4.3.6

Importance of ICT Competency for Teachers Teaching is a complex activity. Competent teachers apply broad, deep, and integrated sets of knowledge and skills as they plan for, implement, and revise instruction. Technology proficiency (including technical skills and instructional applications) is but one dimension of teacher competence. The acquisition of technology knowledge and skills must be connected with the development of a broader array of competencies. Early attempts to develop technology standards for teachers were isolated from the broader teacher competencies and were focused primarily on technology skills. Consequently these competencies were largely ignored by teacher-training institutions. Typically, colleges of education simply required a single media course to satisfy accreditation requirements; often, colleges were reluctant to insert yet another course into an already overloaded curriculum. The International Society for Technology in Education (ISTE) has actively addressed the technology isolation problem and has recently released a set of revised teacher technology standards. Developed through a rigorous process of expert and lay-person input, the NETS-T Project (National Educational Technology Standards for Teachers) explicitly describes what competent teachers should know and should be able to do with technology in the context of broader teacher competencies. The NETS-T standards are categorized as follows: 1. Technology operations and concepts, 2. Planning and designing learning environments and experiences, 3. Teaching, learning, and the curriculum, 4. Assessment and evaluation 5. Productivity and professional practice, 6. Social, ethical, legal, and human issues.

161 4.3.7

Basic Technology Competencies Fundamental skills come first - like managing electronic files, using computerized databases and spreadsheets, sending and receiving e-mail messages, and creating documents with graphics. These skills are prerequisites for more advanced skills, such as accessing online resources, creating desktop publishing documents, developing multimedia presentations, selecting and customizing instructional software to fit students' needs, streamlining recordkeeping and other administrative procedures with electronic tools, and observing the correct protocols in sharing intellectual property. The competencies are organized into five aspects: productivity, communication, research, media and presentation. 1. Productivity • Produce and manage learning documents. This includes composing standard educational publications such as parent newsletters and handouts for students and class lists; teaching students how to prepare their own documents on a computer. • Analyze quantitative data. This includes administrative work such as putting student test scores into a spreadsheet and analyzing them, as well as preparing curriculum materials with digital tables and graphs of curriculum content. • Organize information graphically. He or she can use specialized graphic organizer programs, as well as general tools such as word processors or presentation programs, to create digital representations of educational information. 2. Research • Use effective online search strategies. In their professional preparation, as well as in their classroom assignments, the teacher chooses the most appropriate research tools and databases, and applies the most effective search techniques, to produce useful and safe online resources in the classroom. • Evaluate and compare online information and sources. Once located, the teacher knows the difference between authoritative and untrustworthy sources, how to 4 ascertain authorship, and how to find sources with different points of view. And can teach these skills to students. • Save and cite online information and sources. The teacher knows a variety of methods for bookmarking and saving valuable online resources so that may easily be found later and employed in learning materials.

162 3. Communication • Communicate using digital tools. These include email, instant messaging, mobile colleagues, and knowing how to organize and manage these tools in the classroom. • Collaborate online for learning. Takes advantage of the tools listed above plus blogs, wikis, chats, audio and videoconferencing to bring outside resources into the classroom and to encourage academic collaboration among students. • Publish learning resources online. From a simple teacher's web site to a complex curriculum wiki to the online posting of student projects, to podcasting, the teacher has mastered an array of tools and techniques for publishing learning materials online. 4. Media • Differentiate instruction with digital media. This includes an awareness of assistive technologies for disabled students as well as the ability to use a computer to prepare and present academic ideas in a variety of forms for better learning by all students. • Capture and edit images, audio, and video. The teacher can use digital still and video cameras, edit their output on a computer, and produce learning materials that range from simple slide shows to the archiving of student presentations and performances. • Produce digital multimedia educational experiences. The teacher can combine media from a wide array of sources into a useful presentation of academic content, and can teach this skill to students. 5. Presentation • Create effective digital presentations. Using common tools for preparing slide shows, videos, and podcasts, the teacher can create presentations that follow the principles of communication, and can apply these design principles to the evaluation of students' digital work. • Deliver digital multimedia presentations. Using common devices such as computers, projectors, and screens, the teacher can set up classroom presentations and arrange for students to do the same. • Employ new media devices for learning. From large Smart Boards to tiny iPods to science probes, the teacher can incorporate a variety of digital devices into the instruction in the classroom.

163 Those are the skills that just about every teacher needs, no matter the subject or grade. Beyond these are the more specific technical skills required of a high school math teacher or a teacher of visually-impaired students, competencies that would be embedded into specialized courses and programs. 4.3.8 Strategies for Preparing Teachers to Use Technologies Given the importance of well-trained teachers for technologies to be effective in enhancing learning, what might education policy makers do to support and encourage appropriate strategies for training teachers? No single approach to professional development will meet the learning needs of all teachers seeking to develop skills and knowledge in the integration and application of technology. Teachers' progress through a series of five predictable stages as their expertise in technology adoption and integration evolves. It is likely that within a school, and certainly within a district, teachers will exhibit varying levels of expertise and therefore a variety of different professional-development opportunities will be required. In contrast, learning that occurs outside the confines of programs provided by institutions is considered informal learning. Informal learning, sometimes referred to as self-directed learning, typically occurs in the learner's "natural setting" and is initiated and conducted independently (Merriam & Caffarella, 1999). Policy makers may want to consider both kinds of approaches. A brief overview of the kinds of possible training strategies is as follows: Encouraging Teachers to Acquire Necessary Skills: For many teachers, having access to technologies is not viewed initially as a benefit. Teachers may consider technologies yet another demand on their time, a set of tools they did not ask for and do not know how to use. Some teachers feel they are already doing a good job in the classroom and wonder how technologies will contribute to improvements. Still other teachers, of course, welcome the technologies and are eager to learn how to use them. Policies that either mandate or provide opportunities will cost money, but without the establishment of policy that mandates or provides professional-development opportunities (or, ideally, both), teachers are unlikely to acquire the skills they need to use the technologies available to them, thus negating the potential benefits of the investment that has been made in infrastructure. Providing sustained support for Teachers' use of Technologies: It is very important for teachers to acquire knowledge and skills in how to use technologies. But once teachers

164 begin to acquire such skills and begin to use technologies, there is a need to provide means of continuing support to teacher use of technologies. That is, initial training of teachers is not likely to guarantee that the technology infrastructure will continue to be used. Evaluating Teacher Use of Technologies: The issue for education policy makers here concerns the extent to which a teacher uses technologies effectively, which can or should be an important criterion in evaluating a teacher's performance. This is a complicated issue for policy makers. This general issue is complex in part because of divided opinion on how important technology use is to the future well-being of individual citizens in a given entity, or to the entity as a whole. There are many writers who make the argument that neither an individual nor a state or nation can hope to survive or prosper unless they are very familiar with technologies. Others dispute this claim and worry about the survival of traditional cultural values in a technological age. Given this deeply-rooted controversy, establishing policy according to which teacher performance will be judged is of critical importance.

Teachers are central to the effectiveness of technology infrastructures that serve education. How teachers acquire the skills they need to use technologies and how the technology is actually used and to what ends, are critical policy domains that must be carefully explored. Hopefully, issues of this nature will be considered as decisions are made about technology and as educators make decisions about the future shape of their schools. 4.4

Computer Assisted and

Computer Managed Instructions, Cybernetics, E- Learning, Use of Net Search and Websites 4.4.1 Computer Assisted Instruction (

CAI)

A self-learning technique, usually off line/

online, involving interaction of the student with programmed instructional materials. Computer Assisted Instruction (CAI) is an interactive instructional technique whereby a computer is used to present the instructional material and monitor the learning that takes place. CAI uses a combination of text, graphics, sound and video in enhancing the learning process.

The computer has many purposes in the

class room,

and it can be utilized to help a student in all areas of the curriculum. CAI

refers to the use of the computer as a tool to facilitate and improve instruction. CAI programs use tutorials, drill and practice, simulation, and problem solving approaches to present topics and they test the students' understandings.

165 Typical

CAI Provides 1. Text or

multimedia content 2. Multiple-choice questions 3. Problems 4. Immediate feedback 5. Notes on incorrect responses 6.

Summarizes students' performance 7. Exercises for practice 8. Worksheets and tests.

Types of Computer Assisted Instruction 1. Drill-and-practice Drill and practice provides opportunities or students

to repeatedly practice the skills that have previously been presented and that further practice is necessary for mastery. 2.

Tutorial Tutorial activity includes both the presentation of information and its extension into different forms of work, including drill practice, games and simulation. 3.

Games

Games software often creates

a contest to achieve the highest score and either beat others or beat the computer. 4. Simulation Simulation software can provide an approximation of reality that does not require the expense of real life or its risks. 5.

Discovery Discovery approach provides

a large database of information specific to a course or content area and challenges the learner to analyze, compare, infer and evaluate based on their explorations of the data. 6. Problem solving This approach helps children develop specific problem solving skills and strategies.

Advantages of Computer Assisted Instruction *One to one interaction

166 *Greater motivator *Freedom to experiment with different options *Instantaneous response/immediate feedback to the answers elicited *Self-pacing allow students

to proceed at their own pace *Helps teacher can devote more time to individual students *Privacy helps the shy and slow learner to learn *Individual attention *

Learn more and more rapidly *

Multimedia helps to understand difficult concepts through multi-sensory approach *Self-directed learning-students can decide when, where, and what to learn. Limitations of Computer Assisted Instruction *May feel overwhelmed by the

information and resources available *Over use of multimedia may divert the attention from the content *Learning becomes too mechanical *Non availability of good CAI packages *Lack of infrastructure. 4.4.2

Computer Managed

Learning Computer Managed Learning (CML) is not to be confused with Computer Assisted Instruction (CAI), Computer Based Instruction (CBI), or Computer Based Learning (CBL). It is however, often referred to as Computer Managed Instruction (CMI). When discussing computers and education, if one remembers that learning and instruction generally refer to the same thing, a good deal of the confusion between different terms is often eliminated. CMI has both a broad and narrow meaning. In the broader sense, CMI refers to the following definition; CMI in its most sophisticated levels provides the following instructional functions; (1) Assesses the learners present level of knowledge (2) diagnoses weakness in the students learning (3) prescribes learning activities to remediate the identified weaknesses, and (4) continuously monitors progress of the learner

167 CML can save time, money, and bureaucratic headaches, special educators are likely to continue developing and using microcomputer management tools for;

- Storing demographic and educational information on students and their needs
- Recording, monitoring, and reporting students' progress
- Listing incomplete information on student records
- Recording contacts with parents and supporting agencies/personnel
- Recording, monitoring and reporting student due process status
- Generating reports on referrals, meeting, evaluation, placement, programming and review for each student.
- Locating, describing, and recommending appropriate materials based on individual student need
- Generating IEP objectives from a large data base and
- Issuing reminders for when reports are due.

4.4.3 Cybernetics: Cybernetics is not a new invention but its potential for application has not exhausted even after nearly seventy years of its origin. It started with idea of automation and control in the electrical and mechanical systems, but later on extended to biological, social systems and learning systems.

Cybernetics means 'to steer', 'to navigate' or 'to govern' for taking the system to desired goal. Here in classroom teaching-learning process is a system and the goal is success of the learner and learning process. Classroom cybernetics is constituted by Constructivism, Conversation theory and a feedback system. Constructivism resulted in five E's namely- Engage, Explore, Explain, Elaborate and Evaluate.

Conversation theory necessitates interaction between teacher and learner. Feedback is another essential element of cybernetics which is an instrument for controlling the system to maintain equilibrium, move forward or even reverse it. The aims of Cybernetics divided into three classes as follows:-

1. To construct an effective theory, with or without actual hardware models, such that the various aspects of human and other sorts of behaviour can be simulated.
2. To produce models and theories of human behaviour which present these functions of human beings and other systems in the same manner in which they are performed by human beings or other such systems as are considered. In other words, it is not enough merely to produce the same end result; we want to produce the same end result by similar or even identical means.

168 3. Finally, to produce, or simulate, the whole of human or animal behaviour by models which in their construction are identical with human beings or animals. That is, they should in the end be chemico-colloidal systems, or protoplasmic systems.

4.4.4 E-Learning Use of computers and new technologies has become a crucial part of learning as well as teaching. E-learning today has been a key factor in various industries and teaching is one among them; especially teaching language. E-learning has redefined some strategies and concepts of teaching that have enabled the teaching community to perform better. E-Learning is learning utilizing electronic technologies to access educational curriculum outside of a traditional classroom. In most cases, it refers to a course, program or degree delivered completely online. There are many terms used to describe learning that is delivered online, via the internet, ranging from Distance Education, to computerized electronic learning, online learning, internet learning and many others. We define eLearning as courses that are specifically delivered via the internet to somewhere other than the classroom where the professor is teaching. It is not a course delivered via a DVD or CD-ROM, video tape or over a television channel. It is interactive in that you can also communicate with your teachers, professors or other students in your class. Sometimes it is delivered live, where you can "electronically" raise your hand and interact in real time and sometimes it is a lecture that has been prerecorded. What is e-learning? Is it important in education?

When it comes to online learning in education, the model has been pretty straightforward - up until the early 2000s education was in a classroom of students with a teacher who led the process. Physical presence was a no-brainer, and any other type of learning was questionable at best. Then the internet happened, and the rest is history.

E-learning is a rapidly growing industry, the effects of which we can trace back to the 1980s and even well before that (in the form of distance learning and televised courses) - these will be discussed later in this ebook.

Now that affordable e-learning solutions exist for both computers and internet, it only takes a good e-learning tool for education to be facilitated from virtually anywhere. Technology has advanced so much that the geographical gap is bridged with the use of tools that make you feel as if you are inside the classroom. E-learning offers the ability to share material in all kinds of formats such as videos, slideshows, word documents

169 and PDFs. Conducting webinars (live online classes) and communicating with professors via chat and message forums is also an option available to users.

There is a plethora of different e-learning systems (otherwise known as Learning Management Systems, or LMSs for short) and methods, which allow for courses to be delivered.

With the right tool various processes can be automated such as a course with set materials and automatically marked tests. E-learning is an affordable (and often free) solution which provides the learners with the ability to fit learning around their lifestyles, effectively allowing even the busiest person to further a career and gain new qualifications. Some of the most important developments in education have happened since the launch of the internet. These days' learners are well versed in the use of smartphones, text messaging and using the internet so participating in and running an online course has become a simple affair. Message boards, social media and various other means of online communication allow learners to keep in touch and discuss course related matters, whilst providing for a sense of community. In the fast-paced world of e-learning the available technologies to make a course new and exciting are always changing, and course content can and should be updated quickly to give students the very latest information. This is especially important if the e-learning training is being given to employees in a sector where keeping up-to-date on industry developments is of the utmost importance. This is one of the reasons why many businesses are now offering training via e-learning - other reasons includes low costs and the ability for employees to study in their own time and place. Overall, traditional learning is expensive, takes a long time and the results can vary. The importance of E-learning is now a given fact and it can offer an alternative that is much faster, cheaper and potentially better.

170

The history of e-learning The term "e-learning" has only been in existence since 1999, when the word was first utilized at a CBT systems seminar. Other words also began to spring up in search of an accurate description such as "online learning" and "virtual learning". However, the principles behind e-learning have been well documented throughout history, and there is even evidence which suggests that early forms of e-learning existed as far back as the 19th century. An e-learning history timeline Long before the internet was launched, distance courses were being offered to provide students with education on particular subjects or skills. In the 1840's Isaac Pitman taught his pupils shorthand via correspondence. This form of symbolic writing was designed to improve writing speed and was popular amongst secretaries, journalists, and other individuals who did a great deal of note taking or writing. Pitman, who was a qualified teacher, was sent completed assignments by mail and he would then send his students more work to be finished using the same system. In 1924, the first testing machine was invented. This device allowed students to tests themselves. Then, in 1954, BF Skinner, a Harvard Professor, invented the "teaching machine", which enabled schools to administer programmed instruction to their students. It wasn't until 1960 however that the first computer based training program was introduced to the world. This computer based training program (or CBT program) was known as PLATO- Programmed Logic for Automated Teaching Operations. It was originally designed for students attending the University of Illinois, but ended up being used in schools throughout the area. The first online learning systems were really only set up to deliver information to students but as we entered the 70s online learning started to become more interactive. In Britain the Open University was keen to take advantage of e-learning. Their system of education has always been primarily focused on learning at a distance. In the past, course materials were delivered by post and correspondence with tutors was via mail. With the internet the Open University began to offer a wider range of interactive educational experiences as well as faster correspondence with students via email etc. Online learning today With the introduction of the computer and internet in the late 20th century, e-learning tools and delivery methods expanded. The first MAC in the 1980's enabled individuals to have computers in their homes, making it easier for them to learn about particular subjects and develop certain skill sets. Then, in the following decade, virtual learning

171 environments began to truly thrive, with people gaining access to a wealth of online information and e-learning opportunities. By the early 90s several schools had been set up that delivered courses online only, making the most of the internet and bringing education to people who wouldn't previously have been able to attend a college due to geographical or time constraints. Technological advancements also helped educational establishments reduce the costs of distance learning, a saving that would also be passed on to the students - helping bring education to a wider audience. In the 2000's, businesses began using e-learning to train their employees. New and experienced workers alike now had the opportunity to improve upon their industry knowledge base and expand their skill sets. At home individuals were granted access to programs that offered them the ability to earn online degrees and enrich their lives through expanded knowledge.

The benefits and drawbacks of online learning Whether you're a high-school teacher looking to engage your students in a more interactive way, or a corporate trainer hired by a large company to design training curricula, e-learning packs a punch when it comes to benefits that make the creation and delivery processes easier and hassle-free. Important benefits are outlined below: No Boundaries, No Restrictions Along with locational restrictions, time is one of the issues that learners and teachers both have to face in learning. In the case of face-to-face learning, the location limits attendance to a group of learners who have the ability to participate in the area, and in the case of time, it limits the crowd to those who can attend at a specific time. E- learning, on the other hand, facilitates learning without having to organize when and where everyone who is interested in a course can be present. More Fun Designing a course in a way that makes it interactive and fun through the use of multimedia or the more recently developed methods of gamification (further discussed in later chapters) enhances not only your engagement factor, but also the relative lifetime of the course material in question. Cost Effective This is directed to both learners and teachers, but there is a good chance that 172 whatever your role you had to pay exorbitant amounts of money at some point to acquire updated versions of textbooks for school or college. While textbooks often become obsolete after a certain period of time, the need to constantly acquire new editions is not present in e-learning. It Just Fits! As companies and organizations adopt technologies to improve the efficiency of day-to-day operations, the use of the internet becomes a necessity. As multinational corporations expand across the globe, the chances of working with people from other countries increases, and training all those parties together is an issue that e-learning successfully addresses. And that's a great advantage of online learning! Let's blend all of that together and apply it in a real-life scenario: In an effort to enhance the credibility of course material, oftentimes a professor will summon a field specialist to give a lecture relevant to the topic at hand. In the traditional model of education, the professor would have to extend an invitation to said expert, and incur the costs of his flight, stay and training. With e-learning: With e-learning the professor has the ability to host a guest lecture without having to spend much money. It can be done virtually, with cameras for both the lecturer and the students, and with the use of microphones to facilitate the same level of interaction that would be possible if the lecturer were physically present in the room. The added benefit comes in when we are able to replay the lecture and gain even more out of it. Students that missed out can view the recording, or students that attended can watch it again to further their understanding. Concerns that arise with e-learning Even given all the benefits of e-learning, one cannot deny there are some drawbacks. A good example of a disadvantage of online learning is that practical skills are somewhat harder to pick up from online resources. For example, although building a wooden table is something you can easily share information about, record videos of and explain, the practical experience is essential. Pottery and car engineering are examples of skills that require hands-on experience. Isolation Though e-learning offers ease, flexibility and the ability to remotely access a

173 classroom in the student's own time, learners may feel a sense of isolation. This is because learning online is a solo act for the most part, which may give the learner the feeling that they are acting completely alone. As technology progresses and e-learning benefits from the advancements being made, learners can now engage more actively with professors or other students using tools such as video conferencing, social media, and discussion forums amongst others. Health Related Concerns E-learning requires the use of a computer and other such devices; this means that eyestrain, bad posture and other physical problems may affect the learner. When running an online course it's a good practice to send out guidelines about correct sitting posture, desk height, and recommendations for regular breaks. 4.4.5 Importance of

Internet and Websearches in the Modern Education Things are changing rapidly as the world is progressing. In this modern world people are using advanced machines to do their work. Computer is the most advanced machine that people use to do their work. This particular machine is used in every field of life. Advanced techniques are used with help of computers to diagnose dangerous diseases. Advanced manufacturing techniques are used with the help of computers to manufacture the products. Computers are extensively used in the field of engineering. In past one machine was used to perform only a single task but now-a-days with the help of computers you can perform different tasks at one time. In modern business environment computers have special importance. A huge amount of time is saved due to multitasking. In business terms time is money, so if you are saving time you are saving money as well. Due to multitasking the costs of businesses have reduced. What is the meaning of multitasking? It means that running several programs simultaneously. Since modern computers typically execute instructions several orders of magnitude faster than human perception, it may appear that many programs are running at the same time even though only one is ever executing in any given instant. Multitasking may slow down a computer that is running several programs at one time. Many advanced computers are designed to share their work across many CPUs. This process is called multiprocessing. This technique is generally used in powerful computers such as super computers, mainframe computers and servers. Thus, the entire world is fully dependent on computers. Due to this factor demand of computers has been increased. Computers have changed the way we work, be it any profession. Therefore, it is only but natural the role of computers in education has been given a lot of prominence in the recent years. Computers play a vital role in every field.

174 Importance of Educational Websites In this technology era, the passion of internet is boosting among the students. For any search they usually like to use the Google to collect the information. Similarly in the case of education, it is often helpful to use education websites as a means of collecting the relevant information about the concerned subject. Well, it has become very necessary for any new business to promote over the web. If we want to put up and enlarge your business in worldwide then it's vital for you to make a good web site, so that people can easily understand the mission and vision of your business and liberally enjoy the various services. Today the many institutes and colleges in India are developing their own sites to offer the clear concepts to the students. With the help of these education websites student can search any colleges across the country just by entering the few relevant keywords like best law colleges in India, medical colleges in India. It is well said "Action Speaks Louder than Words"; in the same way education website will speak volume for students. At present there are some great education websites are available which directly conveys the useful information. Suppose you want to find the list of best law colleges in India these education websites help you out and shows the all best law colleges in India in the form of list even it can also mentioned the complete details of the colleges including courses offered, fee details, duration of the course and contact details of the colleges. The concept of education websites is still new in India but owing to its growing need, it is gaining popularity at a fast pace. Students have become more conscious about their career so that picking right course is necessary as it is the merely way that ensures their good professional life. In this regard, they visit education websites and openly discuss their areas of interest and seek all significant info. Students also visit these education websites to get the information about the various college or institute; they want to take admission in like medical colleges in India. These education websites are especially best for those students who live in the remote areas and don't able to reach the colleges. They can add their request by mailing these education websites and fetch the instant responses. 4.5

Disability Friendly Technology - Punarjani and E-Learning Framework Developed by C-DAC 4.5.1

Punarjani:

Punarjani is an assessment tool for the children with Intellectual disabilities. CDAC

175 Trivandrum is engaged in developing an assessment tool named Punarjani. The system will collect a lot of data about a particular child with intellectual disabilities like developmental history, school history, home environment, social environment etc. and will be capable of suggesting a long term goal for the

child. This is an assessment tool for teachers who work with children with intellectual disabilities. This tool frees the teacher from time consuming activities like preparing reports. Doing manual assessment etc. and thus gives the teacher more time with the children. The teacher can override the assessment data generated by Punarjani but then has to give sufficient reasons why the result has been overridden. The software has built in learning capability based on the teacher's input.

4.5.2 E-Learning Framework developed by C-DAC Centre for Development of Advanced Computing (C-DAC) is the premier R&D organization of the Ministry of Electronics and Information Technology (MeitY) for carrying out R&D in IT, Electronics and associated areas. Different areas of C-DAC, had originated at different times, many of which came out as a result of identification of opportunities.

- The setting up of C-DAC in 1988 itself was to build Supercomputers in context of denial of import of Supercomputers by USA. Since then C-DAC has been undertaking building of multiple generations of Supercomputer starting from PARAM with 1 GF in 1988.
- Almost at the same time, C-DAC started building Indian Language Computing Solutions with setting up of GIST group (Graphics and Intelligence based Script Technology); National Centre for Software Technology (NCST) set up in 1985 had also initiated work in Indian Language Computing around the same period.
- Electronic Research and Development Centre of India (ER&DCI) with various constituents starting as adjunct entities of various State Electronic Corporations had been brought under the hold of Department of Electronics and Telecommunications (now MeitY) in around 1988. They were focusing on various aspects of applied electronics, technology and applications.
- With the passage of time as a result of creative echo system that got set up in C-DAC, more areas such as Health Informatics, etc., got created; while right from the beginning the focus of NCST was on Software Technologies; similarly C-DAC started its education & training activities in 1994 as a spin-off with the passage

176 of time, it grew to a large efforts to meet the growing needs of Indian Industry for finishing schools. C-DAC has today emerged as a premier R&D organization in IT&E (Information Technologies and Electronics) in the country working on strengthening national technological capabilities in the context of global developments in the field and responding to change in the market need in selected foundation areas. In that process, C-DAC represents a unique facet working in close junction with MeitY to realize nation's policy and pragmatic interventions and initiatives in Information Technology. As an institution for high-end Research and Development (R&D), C-DAC has been at the forefront of the Information Technology (IT) revolution, constantly building capacities in emerging/enabling technologies and innovating and leveraging its expertise, caliber, skill sets to develop and deploy IT products and solutions for different sectors of the economy, as per the mandate of its parent, the Ministry of Electronics and Information Technology, Ministry of Communications and Information Technology, Government of India and other stakeholders including funding agencies, collaborators, users and the market-place.

C-DAC has developed a number of indigenous solutions for content management, evaluation and assessment, virtual classroom, collaboration for e-learning domain. Some of the solutions are listed below.

- e-Shikshak is a learning management system with rich support for Indian languages.
- National Online Examination System (NOES) is an examination system primarily aimed at conducting recruitment.
- Online Labs (Olabs) for school lab experiments provides students with the ease and convenience of conducting experiments over the Internet.
- Veda is a general purpose online testing and question banking system, primarily supporting multiple choice questions (including its variant forms such as match the following).
- Video conferencing solutions for building virtual classrooms supporting synchronous lectures are also available from C-DAC.
- e-Saadhya (SaraAnukulaneyAdhyayan) an Adaptable and Accessible e-Learning framework for the children with mild mental retardation and Autism, is being developed with the domain support from National Institute for the Mentally Handicapped (NIMH) with local language support in three Indian languages Hindi, Telugu and Kannada.

177 • An Academic Networking portal for the faculty members, students, and academic institutions to network and share information about courses, academic events, projects, etc. has been created through a portal called SEEKHA (www.seekha.in)

e-Sikshak - Learning Management System

Salient features of e-Sikshak: 1. Course Organizer 1. Support for 3-level course organization with a hierarchy of Course, Module and lesson 2. Create and modify courses 3. Course Reports 2. Online Assessment 1. Question bank creation 2. Multiple-choice single answers 3. Multiple-choice multiple answers 4. True or False questions 5. Uploading of assignments by instructor 6. Uploading solutions by student 7. Student performance reports 3. Whiteboard 1. Synchronous communication between student and instructor 2. Graphical interface to simulate real world Whiteboard 3. Facilitates drawings with color; all drawing tools like rectangle, circle, free- hand etc. 4. Text with desired color font etc 5. Shared discussion area between student and instructor 4. Bulletin board 1. Creates forums for subject discussions 2. Thread based discussions 3. Search

178 5. Chat 1. Real-time communication between instructor and learner 2. Public chat between student and instructor 3. Blocking/unblocking chat users by the instructor 6. e-Mail 1. Asynchronous communication tool 2. Facilitates offline interaction with instructor or among the student community 3. Attachment facility 7. User Management 1. Portal efficiently handles user management in successful implementation of the course. The different users involved are : 1. Administrator Can • Manage users • Create and update courses • Assigns learners to the courses 2. Instructor Can • Upload course material • Maintain question bank • Evaluate assignments • Activate discussion forums 3. Learner Can • Register into multiple courses • Access course material and download • Get the performance report • Take online test e-Sikshak is a Multi-lingual e-Learning framework Features: 1. Unicode based multilingual solution 179 2. Customizable Graphical User Interface 3. Supports multi media content 4. Portable to mySQL and Oracle 5. Servlet based serve side technology

e-Sikshak is right now used by : 1. Information Security and Education- CDAC Hyderabad 2. Indian Law Institute- New Delhi 3. National Institute Of Agricultural Extension Management- Hyderabad 4. India Development Gateway - CDAC Hyderabad. 5. Two online courses are being offered by CDAC Hyderabad on esikshak portal (www.esikshak.in) • Core Competency in Software Process Management [CCSPM] • Certificate Course on Cyber Security [CCCS] • C-DAC Certified Cyber Security Professional [CCCSP] • C-DAC's Certified Professional in Linux System Programming [CCP-LSP] • C-DAC's Certified Professional in Linux Kernel Programming & Device Drivers [CCP-LKPDD National Online Examination System National Online Examination System (NOES) is a robust, fault tolerant, secure and scalable examination system through which examinations can be delivered on an "on demand" basis in selected examination centers spread across the country. The system can be used by educational institutes and organizations for registration, examination and multi-level interviews.

180 Architecture The system has been developed using Adobe Flex, Spring, and Hibernate framework and is highly secure and fail safe. It utilizes the following framework across its various tiers namely Adobe Flex at the Presentation tier, Blaze DS at the Remoting tier, Spring at the Business tier, Hibernate at the Object Relational Mapping tier and Terracotta for providing JVM Level Clustering for high availability and better throughput. Functionality The main functionalities provided by the system include: • Online Registration Process through which candidates can provide their demographic details, choose their examinations, select exam slot timings and make payments (either through payment gateway or demand drafts) • Question Entry and Verification system through which questions can be entered under various subject headings and subsequent verification of those questions. • Exam Administration which provides the facility for creating examination, generation of question paper, result generation etc. • Exam Conduct system which presents the question paper to the candidate and captures the response submitted by the candidate. It supports both static and adaptive mode of examination. • Interview Conduct process comprising of Interviewer & Interview controller module. Interviewer module is used by interviewer for grading an eligible candidate. Interview controller module is used for assigning the candidate to a particular Interview Panel. Salient Features: • Authorized user based access control. • Online registration process with provision of exam scheduling and making payment (either through payment gateway or demand draft. • Automatic generation of admit cards. • Automatic generation of question paper by the system using input criteria like subject, number of questions and difficulty level. • System provides end to end security as question papers are encrypted. • AIR sandbox environment for the examination screen. • Highly fail safe with the ability to resume exam on the last saved state.

181 • Supports both static and adaptive modes of examination. • Multi-level interview process • Immediate result generation. MySikshak (personalized e-Learning framework) MySikshak (personalized e-Learning framework) which extends the learning environment with personalized e-Learning services assisted by instructor through web. It mainly focuses on needs and aspirations of individual learners. This model recognizes that every student is an individual, with a distinct learning style, learning pace, learning path, and learning aspiration. It is also dedicated for building individualized learning programs whose intent is to engage learner continuously in the learning process in the most productive way to optimize learner's learning potential and success Salient Features • Interoperable Services • Standards Compliant • User interface with rich interaction • Intelligent filter mechanism to group the learners • Collaborative activity/course building environment for Instructors • User interface with rich interaction • Platform independent Services provided by MySikshak: User Registration • Online registration • Updating user profile • Necessary user reports for instructor and learner • Provides the learning style • Request for a course Course Organizer • Add and Delete courses • Folder hierarchy based conversion into SCORM compliant standard course

182 • Collaboration among the instructor to upload the content into the course Learners' Information in dashboard • Dashboard provides assistance to instructor in analyzing the learning styles of the student cluster • Cluster management tool provides the facility of creating/deleting/ modifying the student clusters and their corresponding characteristics Learning Path Editor • Provides facility to instructor to design the SCORM compliant learning path template based on learner's prior knowledge and learning style • Provision for instructor/expert to add and modify the e-Learning activities like quizzes, examples and/or case studies within template, specific to the group identified • Leads to the creation of personalized learning path template comprising of learning content and activities Personalized Content and Activity Delivery • Takes the SCORM compliant learning path template assigned for learners • Use Run Time Environment (RTE), to deliver and track the learners' activities according to SCORM complaint learning path template Adaptive Assessment • Pre, Formative and Summative Assessments • Formative assessment using Computerized Adaptive Testing (CAT) • Summative assessment using Computerized Classification Testing (CCT) • æpQuestion Repository conforming to standards (IMS QTI) Query Handler with semantic web technology • Query Handler capable of semantically identifying the queries and supervised with expert rating mechanism • Ontology editor provides facility to create subject specific ontologies with help of experts

183 • Provides assistance to instructors for replying the queries with additional multimedia support from web. 4.6 Devolving Technology Integrated Lessons- Individual And Group When technology integration in the classroom is seamless and thoughtful, students not only become more engaged, they begin to take more control over their own learning, too. Effective tech integration changes classroom dynamics, encouraging student- centered project-based learning. The first step in successful tech integration is recognizing the change that may need to happen inside of yourself and in your approach to teaching. When any teacher brings technology into the classroom, he or she will no longer be the center of attention. The level of refocused attention will, of course, depend on the amount and the type of technology (e.g., mobile device, e-reader, laptop, interactive whiteboard) being brought into the classroom. However, this does not mean that the teacher is no longer essential to the learning process. While students may be surrounded by technology at home, it is dangerous to assume that they know how to use it for learning -- this is commonly referred to as the "myth of the digital native," Lesson Development Using Technology Lesson development refers to all the activities that teachers do as they create, teach, and evaluate lessons with students. Lesson development involves a teacher's decisions about three interrelated elements of teaching lessons: • Academic content (what to teach) • Teaching goals, methods, and procedures (how to teach) • Learning assessments (how to know what students have learned) Lesson development using technology involves how teachers use electronic resources to facilitate these processes. Academic Content (What to Teach) Every time they teach, teachers make choices about academic content-the facts, concepts, ideas, skills, and understandings they intend to share with students. Clearly, school system guidelines and state and national curriculum frameworks define and in some cases mandate "what to teach." Lesson development must be connected to local curriculum frameworks, which are aligned to state and national standards. However, because no local

184 curriculum or national standard spells out everything to teach about any given topic, classroom teachers must make choices about what will be explored or explained to students each day. Technology plays an essential role in assisting teachers to answer the academic content or "what to teach" question. Digital content available on the Internet includes a vast collection of curriculum resources and information. Using Internet search engines, electronic databases, online encyclopedias, blogs, wikis, and other technology tools, teachers and students have access to powerful new ways to research and retrieve information. Teaching Goals, Methods, and Procedures (How to Teach) As they answer the "what to teach" question, teachers simultaneously decide the teaching goals, methods, and procedures they will use in their classes. Goals are the reason why a lesson is being taught. Methods are the instructional strategies—large groups or small groups, discussions, lectures, role-plays, simulations, case studies, inquiry-based activities, creative writing, learning and reflection journals, drill and practice exercises, online tutors, or learning games—that teachers use to convey academic content to students. Procedures are the scheduling and grouping of students by teachers during a lesson, including how much time each activity has allotted to it. Teachers combine goals, methods, and procedures into formats for daily learning. Sometimes curriculum content dictates these processes; sometimes the goals, methods, and procedures dictate the choice of content. Either way, content, goals, methods, and procedures mutually support each other in a dynamic process of lesson development, which technology can support in a variety of ways, such as the following:

- Presentation software
- Visual thinking software
- Web-based diagram- and flowchart-making tools
- Teacher-developed websites
- Threaded discussions and email
- Web Quests
- Intelligent tutoring systems
- Digital cameras and movie-making software
- Assistive technologies

Learning Assessments (Knowing What Students Have Learned) Learning assessments occur before, during, and after teaching lessons and enable teachers

185 to evaluate student knowledge, understanding, and performance. They can be summative (summarizing what students have learned at the end of a lesson), formative (happening as a lesson unfolds), or diagnostic (preceding a lesson as a way to measure what students already know) (McTighe & O'Connor, 2005). Assessment tools include multiple-choice and short answer tests, essays and other written tasks, oral discussions, teacher observations, class participation, and student projects, portfolios, and performances, all of which provide evidence of what students have learned and are able to do as a result of the teaching. Technology tools that support the assessment and evaluation process include

- Electronic tests and quizzes
- Digital portfolios
- Personal response systems
- Online surveys
- Online evaluation rubrics

When technology integration in the classroom is seamless and thoughtful, students not only become more engaged, they begin to take more control over their own learning, too. Effective tech integration changes classroom dynamics, encouraging student learning.

4.7 Implications of Technology Based Instruction In Inclusion

Inclusion or integration

is an important part of equal opportunity in education. Demands for inclusive education have increased and fostered major changes to schooling and education. Students with disabilities are educated alongside their peers within the local community therefore mainstream schools are required to adapt to accommodate a diverse group of students with a variety of needs (O'Gorman, 2005, p. 377).

Approaches to the inclusion of children and young people into mainstream classrooms, and the identification and recognition of special educational needs, is an integral part of daily school work.

The wellbeing and actualization of developmental and learning potential within a diverse student population is challenging

the organization of learning settings.

Educational Technology for Inclusive Classroom: Integrating Technology into Instruction in an Inclusive Classroom for Diverse Learners is a welcome step to overcome the challenges. Inclusive Education is based on the concept of multiple intelligence and

186 individual difference. There is evidence to say that all individuals are different from each other and no two individuals can be completely alike even if they have been brought up in the same environment. Teachers should also realize that having high scholastic ability is not the only measure of child's intelligence. What is important is to develop flexible student centered pedagogy capable of educating all students, including those who are disabled or disadvantaged. In an inclusive setting we expect greater participation of students with special educational needs in the culture and curricula of mainstream schools. In this context we have to think of some techniques that permit all students who are different from each other to learn together in the same classroom.

Major Teaching Strategies: To make inclusive education a success and to teach students having diverse abilities in the same class the following teaching strategies may be used: 1. Use of Multimedia and computer assisted instruction 2. Team teaching 3. Cooperative learning 1. Use of Multimedia and computer assisted instruction One major factor to enhance learning in the inclusive classroom is the use of technology. Technology provides ways for children with disability to communicate and interact on a more equal level with other children. Adaptive technologies can open a new world to children with physical limitations and therefore children often feel better about themselves as active learners. Computer programmes can be individualized and automatically adjusted to the student's instructional level. This is more evident in the case of individuals with hearing and vision impairment. Multimedia approach of instruction (audio, video, graphics, internet, animations etc.) is essential for effective and efficient learning because in any learning situation, the more the senses are stimulated, the more the person learns and the longer he retains. Multimedia in the classroom also includes Power Point presentations that are created by the teachers.

Multimedia activities encourage students to work in groups, express their knowledge in multiple ways, solve problems, revise their own work, and construct knowledge.

The advantages of integrating multimedia in the classroom are many. Through participation in multimedia activities, students can learn: • Real-world skills related to technology •

The value of teamwork

187 " Effective collaboration techniques • The impact and importance of different media • How to present information in convincing ways •

Techniques for synthesizing and analyzing complex content • The importance of research, planning, and organization skills • The significance of presentation and speaking skills • How to accept and provide constructive feedback • How to express their ideas creatively 2.

Team Teaching: The special education teacher may brief the regular teacher on the IEP (Individual Educational Plan) of the learning disabled students. The two teachers can develop instructional plans and worksheets weekly. They share the task of grading student worksheets. In actual practice, the regular education teacher assumed most of the responsibility for the overall instruction and classroom management while the special education teacher give individual support to both special and regular students. Throughout the year the two teachers can refine their team teaching skills and can become a finely tuned instrument of education serving all the students in an enhanced classroom organization. For eg.if a blind student writes his/ her answer in Braille the general teacher may require the help of specialist to correct the answers. 2. Cooperative Learning: A working definition of Cooperative Learning is the use of small groups through which students work together to maximize their own and each other's learning. In cooperative learning, students work with their peers to accomplish a shared or common goal. The goal is reached through interdependence among all group members rather than working alone. Each member is responsible for the outcome of the shared goal. Cooperative learning is the instructional use of small groups so that students work together to maximize their own and each other's learning (Johnson & Johnson, 1989). Cooperative learning makes sense in inclusive classrooms because it builds upon heterogeneity and formalizes and encourages peer support and connection. However, cooperative learning is not of value only to children with disabilities, it is equally important for the normal children. Important skills such as critical thinking, creative problem solving, and the synthesis of knowledge can easily be accomplished through cooperative group activities

188 in inclusive classrooms. Not only can students get to know each other's abilities within a cooperative process, but teachers can as well. A general education teacher and a special education teacher planning together often find that they have unique skills and ideas to contribute to the process. The general education teacher may have a broader perspective on the curriculum and on curriculum integration, whereas the special education teacher may have special skills in modifying instruction and developing adaptations that benefit many children. General education teachers who are used to working with larger groups of children often can contribute important classroom management and organizational strategies to balance some of the individualized approaches proposed by the special education teacher. Cooperative learning is a strategy used by group/ number of students to achieve a common goal with mutual collaboration and support. In cooperative learning groups, students have two responsibilities: 1. To learn the assigned material 2. To make sure all other members do likewise. When learning situations are structured cooperatively, regular and special education students can work together in pairs or teams to accomplish their common goals. 4. Peer -tutoring: This involves one-to-one instruction from one student in the tutoring role to another student. In this method, students teach each other on one-to-one basis. Peer is defined as the individual of the same social gathering. For example, in a class a fellow student would be a peer. Therefore, when a student from the same class provides instruction to another student of the class the technique is called peer-tutoring. Sometimes peer tutoring may prove to be quite effective and both the student and the peer tutor may gain from the process. The push for technology in the classroom is not a new initiative. In the past there have been many attempts to incorporate technology in the classroom. In some cases school districts did not have funding to support technology while in others schools with technology and resources do not have the personnel and the know how to implement it effectively. In some cases teachers are not provided with the support needed to successfully integrate technology into the classrooms. In today's ever changing world, technology has found its way into every facet of our lives. The internet, mobile devices, you tube videos, social networking, I-pads and android all comprise the world our students are living and learning in. As educators, we must be able to embed this

189 technology into our practices and allow our children to benefit from these technological advances. Although this may seem like a difficult venture it really isn't. The reality is that most kids do not need instruction on how to operate a computer; we instead need to focus on learning how to teach content with and through technology. Teachers need to understand how technology can benefit student learning. Technology can allow a teacher to access each and every child's individual learning style while providing a platform where students can work at their own pace. Technology can help teachers balance the limited instruction time by providing activities, project-based learning, and one-on-one coaching and peer support all while making learning interactive and fun. Well employed use of technology in the classroom can allow teachers to tailor learning to students' individual needs while freeing up classroom time, leaving teachers more time for projects, one-on-one coaching, and more creative activities. 4.8 Let Us Sum Up

Today's generation of students are growing up in a digital world. Using digital devices is a huge part of their everyday experience out of school. Through Google they have access to a wide wealth of digital information, content and resources. With all of this so intrinsic to their 'outside school' experience, the challenge for the teaching profession is how to harness all this for learning within the classroom and at home. This generation of 'digital natives' has much lower need for libraries of physical content for example, the traditional resource used by students half a generation ago. Learning styles are changing and teachers need to adapt their teaching styles accordingly. One crucial question is will this new technology actually improve education? The impact of ICT on learning outcomes has been inconclusive, billions of pounds/euros spent - but is generally difficult to evaluate effectiveness in terms of improved results. Nonetheless there are outcomes that are conclusive, and which indirectly impact on learning outcomes. These include improvements in: • Engagement • Motivation • Independent learning • Parental engagement • Student and staff attendance and punctuality • Extending the children's learning time

190 With the change in learning styles, the role of the teacher is changing too; as well as being a presenter of lesson material; they also assume the role of facilitator/coach in an increasingly collaborative learning environment. These two key styles of learning; presenting and collaborating; link directly to some of the different types of technology employed in the classroom. Interactive White Boards have been the base of the presenting style of learning, where the teacher is at front of class, and all students are involved in interactive learning. For the more personalized learning, laptops, netbooks and tablets are increasingly pervasive in the classroom. Globally 2% of students have a mobile computing device supplied by the school, forecast to increase to 7% by 2016. The crucial point is that the teacher will still want and need to be in charge of the classroom, they may decide to let students use technology for some parts of a lesson but they will still want to be the centre-point of attention and control. This may be at the front of the classroom or, as is becoming more relevant, to be able to move around the classroom and still remain in control. In these styles of classroom environment clearly the ability of devices to talk to each other ie the seamless connectivity between student tablets and front-of-class display, becomes increasingly key.

Currently 13% of the 34 million classrooms globally have an interactive display, leaving a massive 87% without Individual 1:1 teaching equipment is not new, in its most basic format many schools use small simple hand-held whiteboards for children to write on, allowing each to write an answer or create a picture which can be held up for the teacher or class to see. The first individual student communication technology was the voting system, allowing each student to answer questions which could then be automatically collated and attributed to them. Teachers would often start the lesson with a couple of short questions to assess understanding of the previous lesson and if they needed to go back and recap - much more precise than just a show of hands. However mobile PCs (laptops, netbooks, tablets) truly unleash the full potential of 1:1 learning, allowing a fully personalised learning experience for each student. The concept of the "Flipped Classroom" is a method of teaching which is turning the traditional classroom on its head. Students do not need a teacher there when they are just viewing a lecture which can be done at home, perhaps by watching a video created by the teacher, or when they are completing an assignment.

191 Teachers do need to be present to help understand issues and work through problems and answer questions. The teacher then becomes a facilitator, tutor or guide and can spend more time one on one with the students. Teachers are finding that they can start to introduce this concept and slowly build on it and does not need to start as a complete radical change The transition to digital within education is leading to a raft of new exciting opportunities for education. The key factors for schools when considering technology investments are:

- Carefully consider technology investments in the context of their impact on pedagogy
- A need for a clear vision as to how the devices would be utilised and add value to the learning experience.
- Some concepts can be introduced, and slowly built on, without having to start with a complete radical change e.g. the flipped classroom.
- Take a broad approach to investment, considering both presentation style and collaborative style learning, and how the relevant devices communicate and interconnect.
- Consider the student's holistic learning experience, both in-class and at home and how these can feed into each other.
- Recognise the impact on teachers and the amount of training that will be needed to maximise the benefit of the technology.

195 5.1 Introduction

Today's generation of students are growing up in a digital world. Using digital devices is a huge part of their everyday experience out of school. Through Google they have access to a wide wealth of digital information, content and resources. With all of this so intrinsic to their 'outside school' experience, the challenge for the teaching profession is how to harness all this for learning within the classroom and at home. This generation of 'digital natives' has much lower need for libraries of physical content for example, the traditional resource used by students half a generation ago. Learning styles are changing and teachers need to adapt their teaching styles accordingly. One crucial question is will this new technology actually improve education? The impact of ICT on learning outcomes has been inconclusive, billions of pounds/euros spent - but is generally difficult to evaluate effectiveness in terms of improved results. Nonetheless there are outcomes that are conclusive, and which indirectly impact on learning outcomes. These include improvements in:

Ø Engagement Ø Motivation Ø Independent learning Ø Parental engagement Ø

Student and staff attendance and punctuality ∅ Esxtending the children's learning time With the change in learning styles, the role of the teacher is changing too; as well as being a presenter of lesson material; they also assume the role of facilitator/coach in an increasingly collaborative learning environment. These two key styles of learning; presenting and collaborating; link directly to some of the different types of technology employed in the classroom. Interactive White Boards have been the bastion of the presenting style of learning, where the teacher is at front of class, and all students are involved in interactive learning. For the more personalized learning, laptops, netbooks and tablets are increasingly pervasive in the classroom. Globally 2% of students have a mobile computing device supplied by the school, forecast to increase to 7% by 2016. The crucial point is that the teacher will still want and need to be in charge of the classroom, they may decide to let students use technology for some parts of a lesson but 196 they will still want to be the centre-point of attention and control. This may be at the front of the classroom or, as is becoming more relevant, to be able to move around the classroom and still remain in control. In these styles of classroom environment clearly the ability of devices to talk to each other ie the seamless connectivity between student tablets and front-of-class display, becomes increasingly key.

Technology in education plays an important role in improving the educational skills and knowledge of the people. This is very important especially those who need improve their knowledge in order for them to achieve a successful life in the future. Technology in education is manifested through the use of computers. This is also a great help for teachers since they can already enhance their teaching skills and strategies every time they are facing their class. This technology is very essential for both the students and the teacher but there are some instances wherein this technology is seen to be disadvantageous for both of them as well.

Information technology in education has improved and has also brought about an easy access to different learning resources. They help to improve teaching skills and learning abilities of students. These learning resources include audio and visual education. Students are taught with projectors in classrooms or lectured through class speakers. Students and teachers can also easily download eBooks from the internet which can be read from anywhere through your phone or tablet. 4.2

Objectives After going through this unit you will be able to

∅ discuss about application of technology in

lesson planning, worksheet preparation, report writing and evaluation.

∅ discuss about the assistive devices. ∅ discuss about the advantages and disadvantages of technology. ∅ discuss the implications

of technology in Inclusion 5.3 Application of Technology in Lesson Planning, Worksheet Preparation, Report Writing and Evaluation. 5.3.1

Technology and Classroom Learning Technology integration is an important way to create meaningful learning experiences.

197 Lesson planning for teachers can be overwhelming when incorporating the use of computers in activities. Technology has revolutionized the way humans interact and connect with each other, and modern classrooms, homes, and offices are drastically different from how they were just 20 or 30 years ago. Students today need to prepare for a workplace more exposed than ever to social media, television, video games, and other technological advancements. By bringing technology into the classroom, teachers help prepare students to handle the professional world of the future. Here are seven ways teachers can leverage the Internet and other technologies to enhance classroom learning.

1. The amount of information available When using the Internet, teachers and their students have the opportunity to access seemingly limitless information. School projects are no longer confined to the reach of textbooks within their local libraries. Students can use Google to learn more about topics in far less time. Teachers can use the information students have at their fingertips to challenge them and encourage them to delve deeper into subjects and master the information.
2. The modern languages opportunities Modern language skills are extremely valuable in the professional world. Allowing students to communicate with native speakers of that language is just one of the uses of technology in education. Students are able to hear the language, practice speaking skills, and enhance their overall understanding.
3. The chance to learn geography, history, and culture With a world that is increasingly defined by global trade and intercommunication, the opportunity to meet and speak with students in other countries is a valuable experience in itself. Geography, international history, languages, and cultures take on a much greater meaning when students can interact with people from that country rather than just learn about them in a textbook. Students can interview other children about their local customs and cultures to get first hand experiences.
4. Access to new norms of education Large classrooms with disproportionate student-to-teacher ratios make it challenging for a teacher to give individualized attention to each student. While the Internet is not a substitute for personal interaction, it does offer a wide range of resources for teachers to use to help some students gain understanding of the material. There are study guides, interactive diagrams, explanations, and videos all available on the Internet.

198 The Internet can be extremely helpful for students who have different learning styles. There may be some who will learn a subject the best when they can read the material, taking time to digest it. Others may learn better through videos or interactive instruction. These methods can all be taught simultaneously through the Internet.

5. Individualized lessons With the Internet, not only will students have the opportunity to study using their preferred means of learning, they will also be able to better set the pace. In every classroom there are some students who grasp material quickly and become bored with subsequent repetition. On the other hand, there are students struggling to keep up. Technology can help teachers create lessons that will allow the quickly moving students to delve deeper into the subject or explore related topics while allowing the slower students more time to understand the material.
6. Adding new meaning to student projects Students enjoy finding meaning to their work. While in the past they could create reports and projects that would be viewed only by their teacher and fellow students, their work can now be easily displayed online. They can create materials to be used by other students and get feedback on their ideas from students in other schools all over the world. This will help students take pride in their work and find meaning in their assignments.
7. Student collaboration opportunities Along the same lines, students can collaborate on projects with students from around the world. They can work with students from the school across the street or across the country. There is a full range of technology, such as the recent popularity in cloud technology, which will allow the students to speak and work together with ease without ever meeting in person. Technology presents teachers the opportunity to open doors for their students. They have access to limitless information and students are better prepared to enter the workforce because integrating technology into their educational lives better prepares them for the global world.

5.3.2 Technology Integration Lesson Planning Process When designing computer-based activities, you must

give consideration to how technology can be used to acquire, organize, demonstrate, and communicate information. The planning process for technology integration is similar to planning a curriculum unit. The main differences are HOW the students acquire the knowledge and skills,

199 HOW they demonstrate and apply the knowledge and skills, and HOW learning will be assessed or evaluated. These differences have a major influence on the structure of a lesson plan as they incorporate the use of the computer. In addition to the skills and knowledge that must be taught as part of the curriculum, consideration must also be given to the technology skills students need to learn. Often teachers assume that the students will figure it out on their own. However, this can waste instructional time. It is a good idea to plan ahead, so that the time in the computer lab is well spent.

Step 1: Examine Curriculum Documents

- Ø select the topic

∅
identify learning objectives within a subject Step 2: Determine Knowledge and Skills
∅ determine students' background knowledge and existing technology skills ∅ decide how students will acquire new knowledge and skills ∅
gather resources required to achieve instructional goals Step 3: Select a Technology Product to Apply Learning ∅ choose a technology-based product for students to create ∅ outline the content it will contain
∅
select the software program(s) needed ∅ list the technology skills required to complete the task Step 4: Select a Method of Assessment and Criteria for Evaluation
∅ determine the method of assessment ∅
set the criteria to evaluate the technology product with a focus upon content, quality of information, layout and design, and technology skills demonstrated. 5.3.3
Assistive Technology Tools & Resources for Students with Disabilities One tool to help students with disabilities even in the face of a special education teacher shortage is assistive technology. Today, assistive technology can help students with certain disabilities learn more effectively. Ranging in sophistication from "low" technologies such as a graphic organizer worksheet to "high" technologies including cutting-edge software and smartphone apps, assistive technology is a growing and
200 dynamic field. Several areas of assistive technology and sample products may be found in any given classroom, making a difference in how students of all abilities learn. Text-To-Speech Assistive Tools As an assistive technology, text-to-speech (TTS) software is designed to help children who have difficulties reading standard print. Common print disabilities can include blindness, dyslexia or any type of visual impairment, learning disability or other physical condition that impedes the ability to read. However, other students can benefit from TTS technology, such as children that have autism, attention deficit hyperactivity disorder (ADHD) or an intellectual disability. The technology works by scanning and then reading the words to the student in a synthesized voice, using a large number of speech sounds that make up words in any given context. With the advances in speech synthesis, TTS technology is more accurate and lifelike than ever. Intel Reader The Intel Reader is a mobile handheld device that uses TTS technology to read printed text aloud. It features a high-resolution camera that captures printed text, converts it to digital text and reads it to the user. During playback, words are highlighted as they are read aloud, and the user can pause and have the device spell out highlighted words. The available Intel Portable Capture Station functions as a stand for the Intel Reader to easily and quickly capture text from books and other documents. At about the size and weight of a paperback book, the Intel Reader is mobile enough to use in any environment. Students can also transfer content from a home computer, or save generated audio versions of printed materials to a computer. Available voices vary in gender, pitch and speed. Kurzweil 3000 The Kurzweil 3000 is a leader in TTS software for individuals that struggle with literacy. In addition to a range of TTS features, the full-featured software program integrates abilities that can help students in other areas, potentially appealing to those who may have a non-print disability or those who may not typically consider a TTS program. Some of the features include: ∅ Multiple TTS voices ∅ Support for 18 languages and dialects ∅ Talking spell-checker

201 Ø Picture dictionary graphics for more than 40,000 words Ø Text magnification Ø Tools for test taking, essay writing, note taking, reference and more The Kurzweil 3000 strives to provide students with a multi-sensory approach to literacy learning. It is available for Windows and Macintosh. Graphic organizers can be effective in helping students to organize their thoughts during the writing process. As an assistive technology, graphic organizers can be a strong choice for students with dysgraphia or disorders of written expressions - particularly the conceptual aspects of writing. Graphic organizers work by helping the student map out a course of action. Depending on the type of writing, the graphic organizer can prompt the writer to describe an object, chart out a course of events or perform some other task that can help in planning the piece. Graphic organizers vary by type and technological sophistication. Low-Tech Handouts Graphic organizers do not need to be technologically advanced; in fact, they can exist in simple handout form. Sample handouts can be found at the Houghton Mifflin Harcourt Company. The sandwich chart can assist students with paragraph writing. The sequence chart can help with narrative writing and the ordering of events. The sense chart is designed for descriptive writing, where writers are prompted for terms that characterize and express an item. Dozens of other sample charts exist and can help students with virtually any type of writing. Draft:Builder Draft:Builder is a writing tool that integrates outlining, note taking and draft writing functions to break down the writing process into three steps. Using a graphical organizer, the program helps the student visualize the project and insert information into the appropriate place without having to conceptualize the whole process. It then automates the process of creating the paper, where the student can drag and drop what is written in each note to the rough draft. Other features include a talking spell checker that uses TTS technology, a bibliography tool, a dictionary and the ability for teachers to add locked text into the program for further guidance. Draft:Builder is available for Windows and Macintosh.

202 Assistive Listening Systems A variety of assistive listening systems, or hearing assistive technology, can help students who are deaf or hard of hearing, as well as those with other auditory and learning problems. According to the National Association for the Deaf, assistive listening systems can be used to enhance the reach and effectiveness of hearing aids and cochlear implants, or by children who do not need those tools but still need help hearing. Assistive listening systems use a microphone, a type of transmission technology and a device for capturing and bringing the sound to the ear. The specific transmission technology used in the system is typically what contrasts one type of assistive listening system from another. FM Systems According to the American Speech-Language-Hearing Association (ASHA), FM systems are the best choice for children with sensorineural hearing loss. The most common type of hearing loss for all ages, sensorineural hearing loss occurs when the inner ear (cochlea) or nerve pathways from the inner ear to the brain are damaged. FM systems work using radio broadcast technology. With a transmitter microphone and a receiver, the teacher and student can maintain a consistent sound level regardless of distance and background noise. Additionally, ASHA notes that the hearing aid microphone can be turned off, so the student can concentrate on the teacher alone. Sound-Field Systems Sound-field systems are a strong choice for classrooms that need to assist listening for all children in the class. ASHA notes that these systems benefit not only children that have hearing loss, but those that have other auditory and learning problems, such as language delays, central auditory processing disorder, articulation disorders and development delays. Additionally, sound-field systems can be used for students who are learning English as a second language. Sound-field systems use a microphone that projects sound through mounted speakers around the classroom. In classrooms that have good acoustics, sound is able to travel evenly throughout space, eliminating problems of distance between the speaker and each listener. Sip-and-Puff Systems Sip-and-puff systems are used by students who have mobility challenges, such as paralysis and fine motor skill disabilities. These systems allow for control of a computer, mobile device or some other technological application by the child moving the device

203 with his or her mouth. Similar to a joystick, the child can move the controller in any direction and click on various navigational tools using either a sip or a puff. An on- screen keyboard allows the child to type using the same movements. Sip-and-puff systems are a type of switch device, which refers to the technology used to replace a computer keyboard or mouse. Other switch devices include buttons or other objects that a student can touch, push, pull, kick or perform some other simple action that can then control the device. Jouse 3 The Jouse3 is a sip-and-puff system that allows children to control a device using any part of the mouth, cheek, chin or tongue. Due to its accuracy and quick response, home users can use it for drawing or computer games. It can mount to the desktop, a bedframe or any other type of structure; it does not require a headpiece or placement on the body of the user. The product supports Windows, Macintosh, Linux and Unix based computers, in addition to Android and iOS mobile devices. It can support one or two external switches, and has two types of mouthpieces. Sip-and-Puff Systems from Origin Instruments Origin Instruments offers a range of sip-and-puff products that students can use to control an electronic device. Using a head mounted or gooseneck user interface or available tubing for a custom solution, the child can control a mouse, joystick or keyboard with ease. The primary system is powered using USB technology. The product supports Windows, Macintosh and Linux based computers. Two pressure switches connect the system to the user interface solution for use on electronic devices. Proofreading Software Proofreading software is a branch of assistive technology that goes above and beyond the typical proofreading features found in a word processing system, such as correcting words frequently misspelled by students with dyslexia. A number of other features offered within this category can help students work on his or her English skill set to become a more effective and accurate writer. Although primarily geared towards individuals with dyslexia, proofreading software can be helpful to those with any type of learning disorder that makes writing and reading challenging.

204 Ginger Ginger offers several features that can help students with dyslexia and other learning disorders with writing. It is also designed for speakers of languages other than English. Some of the features include: Ø Grammar checker that analyses context to determine any errors or misspellings. For instance, Ginger can recognize whether "there," "their" or "they're" should be used in a sentence, which is a common mistake in writing. Ø Word prediction and sentence rephrasing tools that can be helpful for students learning how to construct sentences properly. Ø TTS functionality so students can hear what they've written. Ø A personal trainer that provides practice sessions based on past mistakes made by the student. Ginger is available for Windows and Macintosh systems, as well as for use on iOS and Android mobile devices. Ghotit Ghotit is specifically designed for students with dyslexia and other learning disorders who have difficulties with writing. The name is inspired by the word "Ghoti," which is a constructed term that illustrates irregularities in the English language. And since many spellings are counterintuitive - especially for those with dyslexia - Ghotit dedicates itself to assisting children and adults who struggle with writing accurately. It features the ability to learn from the user's past mistakes, personalizing suggestions for spelling and grammatical errors. Ghotit can predict words, check passages of text contextually, read text aloud using TTS technology and recognize split and merged words. It also includes an integrated dictionary for students to quickly look up a word. Math Tools A range of technology and tools can help students that have trouble with math, most commonly found in a learning disability called dyscalculia. Dyscalculia makes it difficult to grasp numbers and it is characterized by a general lack of understanding in the field of math. Assistive technology in math is not just for those with dyscalculia. It can also help students with blindness, fine motor skill disabilities or some other type of disability that makes it difficult to perform math-related work.

205 MathTalk MathTalk is a speech recognition software program for math that can help students with a range of disabilities. From prealgebra to Ph.D. level mathematics, students can perform math problems by speaking into a microphone on their computer. The program works with Dragon NaturallySpeaking programs for voice-to-text functionality, making it ideal for students who have fine motor skill disabilities. Students with blindness or vision disabilities can use the integrated braille translator. In addition to these audiences, MathTalk also appeals to students with dyscalculia. The program functions as an electronic math worksheet, allowing the child to organize, align and work through problems on the screen, making it helpful for students who have difficulties performing math problems on paper. Math Simulations Math simulations can help students with dyscalculia visualize math problems and concepts. As a result, students can better understand the application of a particular type of problem, since many students struggle with the conceptual aspects of math.

5.4 Application of Technology in Assistive Devices

5.4.1 Assistive devices and technologies

Assistive devices and technologies are those whose primary purpose is to maintain or improve an individual's functioning and independence to facilitate participation and to enhance overall well-being. They can also help prevent impairments and secondary health conditions. Examples of assistive devices and technologies include wheelchairs, prostheses, hearing aids, visual aids, and specialized computer software and hardware that increase mobility, hearing, vision, or communication capacities. In many low-income and middle-income countries, only 5-15% of people who require assistive devices and technologies have access to them.

5.4.2 Technology Areas

Academic and Learning Aids: Many students with disabilities use assistive technology to enhance their participation and achievement in their educational programs. There are a range of assistive technology solutions to address student needs in all academic areas including reading, writing and spelling, math, and study and organization.

Aids to Daily Living: Many students with disabilities use assistive technology to enhance their participation and achievement in their educational programs. There are a range of assistive technology solutions to address student needs in all academic areas including reading, writing and spelling, math, and study and organization.

Assisted Living Devices and Environmental Aids: Students who are hard of hearing or deaf often need assistive technology to access information that is typically presented verbally and accessed through the auditory modality. A variety of technology solutions are available that amplify speech and other auditory signals or that provide an alternative to the auditory modality. These include assistive listening devices that amplify sound and speech both in the classroom and home environment, text telephone (TTY), closed captioning devices, real time captioning, and environmental aids that support independent living skills.

Augmentative Communication: Students with severe expressive communication impairments have difficulty communicating with peers and adults within their environments. Many of these students need a means of supplementing their communication skills. These students frequently use augmentative communication technology. A range of low technology to high technology solutions are available including: object based communication displays, picture communication boards and books, talking switches, voice output communication devices and computer based communication devices.

Computer Access and Instruction: A variety of technology solutions are available to adapt the classroom computer for students with disabilities. Some computer access technology offers a method of input other than the standard computer keyboard and mouse. Other computer adaptations include software and hardware that modifies the visual and sound output from the computer. Varieties of devices are available and include the following: adaptive pointing devices, keyboard adaptations.

Environmental Control: High technology environmental aids are available to assist students with physical disabilities in controlling electronic appliances within the school and home. These devices allow the student to use an alternate input device such as a switch to control one or more electronic appliances such as lights, televisions, and electronically controlled doors.

Mobility Aids: Students with physical disabilities often need access to mobility aids to provide them with a means of moving about their environments. Mobility aids include canes, crutches, walkers, scooters, and wheelchairs. Generally, assistive technology devices such as the mobility aids referenced above are recommended by physical and occupational therapists based on the student's individual needs.

207 Oral Communication and the AAC: Assistive Technology in the field of Oral Communication can include a variety of areas to assist individuals with speech or language difficulties. Pre-Vocational and Vocational Aids: Students with physical and cognitive disabilities who are enrolled in educational programs that address pre-vocational and vocational skills may benefit from the use of pre-vocational and vocational aids. These types of technology solutions include modifications of the tools and manipulative used in the completion of work related tasks. Low technology solutions include grips for handling materials and stabilization devices for supporting work materials. For students using electronic appliances such as staplers and paper shredders, an environmental control unit such as the model available from AbleNet can be used to allow for switch control of the appliance. Many of the adaptations required for participation in work activities may be teacher constructed. For example, a picture-based task schedule can be created to represent all of the steps in a particular activity for students with intellectual disabilities. Recreation and Leisure: Some students with physical, sensory, and intellectual disabilities require assistive technology in order to participate more fully in appropriate recreation and leisure activities. A range of low technology to high technology solutions are available including game adaptations, book adaptations, switch adapted toys, and environmental control access for televisions, videos, tape players, CD players and MP3 players. Seating and Positioning: Students with physical disabilities often require adaptive seating and positioning systems as an alternative to the standard classroom seating systems. Adaptive seating and positioning systems include seat inserts for wheelchairs, side liars, prone sanders, and adaptive chairs. These seating and positioning systems are generally determined by the physical and occupational therapist in consultation with the classroom staff. Sammons Preston offers several different seating and positioning devices for the classroom. Visual Aids: Students with visual impairments can benefit from assistive technology in a variety of areas. A critical need for assistive technology is often in the area of accessing printed information and to providing a means of producing written communication. There are many visual aids including talking dictionaries, adapted tape player/recorders, large print and talking calculators, braille writers, closed circuit televisions (CCTV), and software such as screen reading and text enlargement programs.

5.4.3 JAWS Screen Readers JAWS, Job Access With Speech, is the world's most popular screen reader, developed for computer users whose vision loss prevents them from seeing screen content or 208 navigating with a mouse. JAWS is a screen reader for Microsoft Windows offered by Freedom Scientific, Inc. JAWS will assist users who are blind or low-vision to use a Windows computer. A JAW has a variety of features, including Braille support, multi-lingual speech synthesis, and multi-screen support. It stands for "Job Access With Speech." JAWS works with the PC to provide access to software applications and the Internet. JAWS also outputs to refreshable Braille displays. Features Ø Two multi-lingual synthesizers: Eloquence and Vocalizer Expressive Ø Talking installation Ø Built-in free DAISY Player and full set of DAISY-formatted basic training books Ø Works with Microsoft Office, Internet Explorer, Firefox, and much more Ø Supports Windows 8.1 and Windows 10, including touch screens and gestures Ø Support for MathML content presented in Internet Explorer that is rendered with MathJax Ø Fast information look-up at your fingertips with Research It Ø Convenient OCR feature provides access to the text of PDF documents, even those with scanned images that are reported as empty documents by screen readers Ø Save time with Skim Reading Ø The only Windows screen reader to provide contracted Braille input from your Braille keyboard Ø Fully compatible with MAGic, screen magnification software, and Open Book, scanning and reading program Advanced Features Ø JAWS Tandem available for free to help with support and training Ø Optional support for Citrix, Terminal Services, and Remote Desktop Ø Powerful scripting language to customize the user experience on any application Ø Includes drivers for all popular Braille displays Ø Includes voices for over 30 different languages Ø Distributed worldwide with local sales and support in most countries

209 Powerful Access to Screen Content JAWS is the world's most popular screen reader, developed for computer users whose vision loss prevents them from seeing screen content. JAWS reads aloud what's on the PC screen and gives the user a unique set of intelligent tools for navigating and accesses Web pages and all screen content. Compatible with the Most Frequently Used Workplace and Classroom Applications JAWS enable you to work with Lotus Symphony, a suite of IBM tools for word processing, spread sheets, and presentation creation and with Lotus Notes by IBM. JAWS also is compatible with Microsoft Office Suite, MSN Messenger, Corel WordPerfect, Adobe Acrobat Reader, Internet Explorer, Firefox - and many more applications that are used on a regular basis on the job and in school. Unmatched Braille Support With a refreshable Braille display like Freedom Scientific's Focus, JAWS also provides Braille output in addition to, or instead of, speech. An array of versatile features and customizable options lets you tailor JAWS for your individual needs and preferences 5.4.4 Smartphones Assistive

Technology is an ever-changing group of products and devices. Today devices everyone uses can be easily adapted to assist those with special needs. The current trend for technology is to make it simple to learn, to use, integrate, and support. This is welcome news to parents and caregivers of children with special needs. This new trend allows for more people to have

the

ability to use the technology. Smart phones are an excellent example of technology with the potential to enhance the teaching and learning experience of children with disabilities. In addition to serving as a means of communication, smart phones have the capability to run multiple applications that support and accompany students in their day-to-day activities. For example, the iPhone offers the application isign. The app facilitates communication between deaf students and general education teachers and other who do not sign. Students and teachers who need to learn American Sign Language can use the program containing 800 signs with gestures modelled with a 3D character. Students with hearing and speech impairments can communicate with their hearing peers and teachers using the Google Android phone and an application called Speaking Pad. Users of these technologies enter data into their cell phone and then make information available through speech output.

210 Another application can be used by students with autism and other disabilities to create and organize personal tasks. iPrompts, which provides visual prompting tools to help users transition between activities, understand upcoming events and make choices and focus on tasks. For students with visual impairments, screen magnifiers are available, enabling user to capture text and images with a built-in camera and then enlarge items that appear on the phone's screen. At the same time, applications designed for people with disabilities are crossing over into the mainstream, blurring the distinctions between AT and consumer technologies. Text-to-speech is an integral part of in vehicle GPS units and cell phones, screen magnifiers help consumers cope with shrinking screen sizes, and captions on TV and internet video are being used to reinforce language learning

and to provide viewing solutions for noisy environments. 5.4.5 Screen Readers Screen readers are software programs that allow blind or visually impaired users to read the text that is displayed on the computer screen with a speech synthesizer or braille display.

A screen reader is the interface between the computer's operating system, its applications, and the user. The user sends commands by pressing different combinations of keys on the computer keyboard or braille display to instruct the speech synthesizer what to say and to speak automatically when changes occur on the computer screen. A command can instruct the synthesizer to read or spell a word, read a line or full screen of text, find a string of text on the screen, announce the location of the computer's cursor or focused item, and so on. In addition, it allows users to perform more advanced functions, such as locating text displayed in a certain color, reading pre- designated parts of the screen on demand, reading highlighted text, and identifying the active choice in a menu. Users may also use the spell checker in a word processor or read the cells of a spreadsheet with a screen reader.

How does a screen reader relay information to the user? There are two ways that a screen reader can provide feedback to the user: Ø Speech; Ø Braille. A screen reader uses a Text-To-Speech (TTS) engine to translate on-screen information into speech, which can be heard through earphones or speakers. A TTS may be a software application that comes bundled with the screen reader, or it may be a hardware device

211 that plugs into the computer. Originally, before computers had soundcards, screen readers always used hardware TTS devices, but now that soundcards come as standard on all computers many find that a software TTS is preferable. In addition to speech feedback, screen readers are also capable of providing information in Braille. An external hardware device, known as a refreshable Braille display is needed for this. A refreshable Braille display contains one or more rows of cells. Each cell can be formed into the shape of a Braille character, a series of dots that are similar to domino dots in their layout. As the information on the computer screen changes, so do the Braille characters on the display change, providing refreshable information directly from the computer. Whilst it is possible to use either format independently, Braille output is commonly used in conjunction with speech output. How does a screen reader work? Since the majority of screen reader users don't use a mouse, all screen readers use a wide variety of keyboard commands to carry out different tasks. Tasks include reading part or whole of a document, navigating web pages, opening and closing files, editing and listening to music. A visually impaired computer user will use a combination of screen reader commands and operating system commands to accomplish the many tasks a computer is capable of performing. All current operating systems have their own keyboard shortcuts, which are available to everyone not just screen reader users. An example of a Microsoft Windows keyboard shortcut is using the alt + A key combination to open the Favourites menu in Internet Explorer. Each screen reader uses a different series of commands, so most people will tend to choose a screen reader and stick with it, as the task of learning a large number of new keyboard commands is considerable. Which operating systems do screen readers work with? Screen readers are available for each of the most common operating systems, Linux, Mac OS and Windows. 5.5

Application of Technology in Instruction: Individual, Small Group and Large Group

The information age with the mass of technology it brings can be both blessing and curse for the teaching and learning environment. As lecturer and teacher one is confronted with new roles, new work, new decisions, new skill requirements, new language, and last but not least, a new generation of learners (with their own unique new excuses!). On the other side of the coin there are unprecedented opportunities to use technology to enhance learning, to increase the excitement of the subject matter and to expose learners

212 to their subject in "real life". This brings with it the temptation to use all the "bells and whistles" of the wonderful hardware and software available, and leaves many of us confused and overwhelmed as to what is useful and what is over the top. 5.5.1 Enhancing Small Group Instruction through Technology Classroom interaction, combined with online activities, can greatly accelerate the learning process and reduce the time. Technology is a tool that can change the nature of learning. First and foremost, educators want students to learn. It is certainly not enough to tell educators that they need to use the boxes and wires that have invaded their schools simply because they are expensive or because students need to know how to use the latest widget. If it's clear that technological tools will help them achieve that goal, educators will use those tools. The real world is not broken down into discrete academic disciplines. I've heard a number of teachers say that they would like to be able to change the way they teach -- to find ways to implement project-based, multidisciplinary lessons. Let's think about how that might happen when technology is used to support learning. Technology lends itself to exploration. But before technology can be used effectively, exploration must be valued as important to both teaching and learning. In a technology- rich classroom, students might search the Web for information, analyze river water, chart the results, and record what they've learned on the computer. In many small group teaching situations, the role of the teacher is that of facilitator of learning: leading discussions, asking open-ended questions, guiding process and task, and enabling active participation of learners and engagement with ideas. However, small groups function and behave in various ways and have different purposes. Teachers therefore need to be able to adopt a range of roles and skills to suit specific situations, often during the same teaching session which technology can support. Effective tutors are essential to ensuring that small groups work well. Any teaching event will be more successful if the teacher: Ø is enthusiastic Ø has organised the session well Ø has a feeling for the subject Ø can conceptualise the topic Ø has empathy with the learners

213 Ø understands how people learn Ø has skills in teaching and managing learning Ø is alert to context and 'classroom' events Ø is teaching with their preferred teaching style Ø has a wide range of skills in their teaching repertoire, including 'questioning, listening, reinforcing, reacting, summarising and leadership' (McCrorie, 2006, p. 8). Technology has all the above qualities required as an effective small group instructor. 5.5.2 Enhancing Large Group Instruction through Technology Technology is making it increasingly possible to envision the ideal of customizing instruction on an individual basis. Today schools can implement software that assesses student strengths and weaknesses, builds an individualized learning plan, delivers computer-based content using a variety of interactive methods, and then tests mastery of content standards. Teaching with technology can deepen student learning by supporting instructional objectives. However, it can be challenging to select the "best" tech tools while not losing sight of your goals for student learning. Once identified, integrating those tools can itself be a challenge albeit an eye-opening experience.

Students Use Information Technologies to: 1. Participate in a media revolution, profoundly affecting the way they think about and use information technologies. 2. Improve the ways of learning in new learning fashions 3. Extend the ability and skills of applying their learning in real situation. 4. Working in groups for cooperative and collaborative learning 5. Developing self-learning habits at their own pace and time. 6. Learn with the teacher rather by the teacher. 7. Develop inquiry-learning habits. 8. Use right information at right time to achieve right objective. 9. Review and explore qualitative data.

214 10. Exchange learning experiences and information with others students and teachers living anywhere in the world. Information technologies

facilitate students in their learning process through their active participation on one hand and help teachers on the other hand. Therefore, Teachers Use The

Information Technologies to: 1. Present the material in more interesting and attractive way. 2. Guide and help students in searching the qualitative material. 3. Make best use of time. 4. Coach the students. 5. Provide individualized instruction. 6. Direct

the students toward cooperative

as well as collaborative learning activities. 7. Prepare learning material for students, rather teaching in conventional situations. 8. Diagnose the learning problem of students and help them to overcome. 9. Solve the study problems of students. 5.6

Advantages, Merits and Demerits of Application of Technology

Technological advancements have made the world a great and convenient place to live in. There is no denying of how they make lives better and easier, especially in the fields of science, medicine and education. But, like most things, technology also has its drawbacks. In fact, some of the more recent inventions are now being categorized as lazy aids, and are considered major contributors of obesity and a generally unhealthy population.

Can the same thing be said for technology used in the classroom? Tools, such as computers, mobile devices and the internet, are now integrated into the educational system. While they are beneficial in certain academic aspects, they also have negative implications. 5.6.1

List of the Advantages of Technology in Education 1. Promotes independent learning in students

The internet is a treasure trove of information. Practically anything you need to know can be found online. Although there is a question of the credibility of the source and the data provided, it can still serve as an educational resource for students. Even without

215 assistance from parents and teachers, students can just look up their lessons online. Unlike regular textbooks, electronic books and web-based content are updated in real time, feeding students with the most current information they can get their hands on, helping them become more knowledgeable even outside the classroom setting. 2. Prepares students for the future From the way technological advancements are going, it is obvious that the future will be digital and technology-focused. If students are well-versed on using technology to collaborate and communicate as early as now, they will not have trouble fitting in, competing and finding jobs in the future. Being familiar with using at least one form of technology at an early age will help them become comfortable using it, and eventually develop other skills necessary to handle other innovative devices and processes. 3. Has the potential to lower textbook and tuition prices With resources more accessible and in great abundance, the cost of textbooks is likely to decrease. It is also possible that students may no longer need to buy a textbook, if it is converted into digital format. The actual books can stay in the classroom, while the content is saved on a student's computer. Tuition will also decrease when learning is done online, rather than inside the classroom. By taking out the factors that contribute to a higher tuition fee, such as utility bills and transportation allowance of teachers, the overall cost of education will be lower. 4.

Allows teachers to create an exciting way to educate students

Gone are the days when the only tools for teaching are limited to books, a blackboard or whiteboard, and a chalk or markers. With technology integrated to education, teachers can now incorporate images, videos and other graphics when delivering lessons. Specific websites, apps and programs will also enable teachers to vary how they provide instructions. This creates an exciting learning environment and promotes interest in education in general. Other tools available for teachers include Smart Boards (interactive whiteboards), email Skype, and PowerPoint. 5. Encourages development of new teaching methods Rather than spend an hour or so talking while the students listen, or have them read an entire chapter in silence, teachers and professors now have the option to use advanced teaching methods, such as podcasts, blogs and social media. When working with a particular group or one-on-one, teachers can take advantage of web conferencing

216 technologies other online communication tools.

Technology also presents universal tools that enable teachers to educate all types of students, including those who are struggling or have special needs. These include voice recognition, text-to-speech converter, translator, volume control, word prediction software and other assistive technologies. 5.6.2

List of Disadvantages of Technology in Education 1. Results in a lack of interest in studying

Because everything is now accessible online or through data saved in a computer or mobile devices, students are likely to develop poor studying habits and a lazy attitude towards education. Some of them may even think they can skip school because they can find answers and lessons online. Who needs teachers when you have internet and Google, right? This can also lead to students forgetting the basics of studying. They would rather rely on computers and the internet, instead of their books and the input from their teachers. Most of them will misspell words because they often use spell checkers. Rather than solve mathematical equations the traditional way, they would seek assistance from computers or look for the answers directly through search engines. When it is time to take the tests in the classroom and without any form of technology, students are likely to fail. 2. Makes students vulnerable to potential pitfalls While computers prove to be an invaluable educational tool, it can also be a source of problems. This is especially true for students who lack the skills needed to maximize a device's functionalities. Technical problems and computer malfunctions can cause loss of assignments and other materials, resulting in high levels of stress that students would rather not experience. Difference in internet speeds and a device's capabilities can also lead to certain difficulties that will de-motivate students. Add to this other things that they will discover online, which are completely unrelated to school and education, and they will be distracted to no end. 3. Negative views on technology Consumerism has taught us that technologies, from computers to mobile devices, are widely viewed as tools to entertain rather than educate. Textbooks, on the other hand, are seen as tools for learning. So, between a tablet and a textbook, students are likely to gravitate towards learning when reading a book, while they are likely to use a tablet to

217 play games or spend time on social media. 4. Raise instructional challenges For professors and teachers to stay abreast with technology, they may need to be retrained. Those who have been teaching all their lives using traditional methods may not be very susceptible to the changes being applied. They may even see it as a threat to their job security and shun technology altogether. In fact, a majority of teachers believe that constant use of digital technology is affecting a student's attention span and his ability to persevere when a challenging task is thrown his way. Although such belief is subjective, scholars, experts and teachers all agree that technology has changed the way students learn. 5. Can diminish overall value of in-person education Although research on online learning did not establish a direct link to how personal interaction affects a student's performance, data gathered did show that those who enrolled in online courses have higher chances of failing, dropping out of classes, and are less likely to benefit from them. This may have something to do with the fact that lessons delivered online or through digital resources lack the face-to-face interaction between teacher and student that provides a more personal experience 5.7 Implications for Inclusion

Technology can be the great equalizer in a classroom with diverse learners. Whereas teachers can find it difficult to differentiate instruction for 30+ students in one class, all with different needs and abilities, "assistive technology" (devices and software to assist students with disabilities) can often help teachers personalize lessons and skills enhancement to each child.

Children with learning disabilities often have better technology skills than their teachers and are drawn to computers and other gadgets, so using them in the classroom make perfect sense. For children with physical disabilities, technology can give access to learning opportunities previously closed to them. E-readers help students turn book pages without applying dexterity, and voice adaptive software can help students answer questions without needing to write. Computers are engaging and more advanced than the typical modified lesson allows. Assistive technology is not always just for students with disabilities; it can be used to help any student with motivation, academic skills, and social development. There is no doubt that technology has changed the way children learn in the classroom. Technology has altered how students engage in learning activities, the format of learning

218 materials they use, how tasks are completed, and how they demonstrate what they know. The way we as educators design and deliver learning experiences, and what instructional materials we use to enhance student learning, has also changed. What about students who experience consistent academic failure due to learning difficulties or disabilities? Are computers and other technologies going to assist them to access the curriculum, keep up with their peers and learn how to learn? Students with learning difficulties can be defined as students who experience particular difficulties in achieving at school that are not due to a disability or impairment. (Ashman, 2005; Westwood, 2003) Students with learning disabilities include those students with chronic academic problems. These students may have been diagnosed with dyslexia, dyspraxia, dyscalculia, dysgraphia or other neurologically based conditions. Students with learning difficulties and disabilities display a variety of characteristics that can be grouped into four main categories, academic, emotional, motivational, cognitive and metacognitive. (E. Twomey, 2006.) These students typically encounter learning problems across all curriculum areas. Persistent failure throughout school, despite remediation, may lead some students to develop social and emotional difficulties including low self esteem, an embarrassing reliance on others, low motivation and disengagement from school activities. Poor handwriting, comprehension and organisational difficulties may also be barriers to learning for these students. Inclusive learning technologies can be described as those technologies, whether software or hardware, that help students learn strategies to bypass, work around or compensate for their difficulties. Many of these technologies incorporate Universal Design features which focus on providing learning resources that accommodate for learner differences. Inclusive technologies may be designed to remediate specific difficulties and contain key supportive features, while others have many features that support a range of learning needs. They may be standalone programs or may integrate with other commonly used applications. What types of technologies are there and how can they help? Reading Tools Text to speech Software that incorporates text to speech enables students to access content and information by having text read aloud, often in a high quality, realistic synthesised

219 voice. This software may highlight words, sentences or paragraphs in selected colours to draw the reader's attention to the text as it is being spoken. Using this method, students are assisted to decode words, and maintain reading fluency and comprehension. Using text to speech, they can read and re-read information as many times as they need. Talking word processors are one kind of software that incorporates text to speech. Other software packages work with standard software programs such as Microsoft Word, to speech enable them. Many of these programs allow students to read aloud text in a range of formats, including Word documents, PDFs, emails and web pages. Text to speech is also an important support for proofreading, helping students listen for any possible errors in their writing.

ØØØØ OCR Optical Character Recognition (OCR) is a method of converting text from paper format to an electronic version. This is usually carried out by using a scanner. Software that incorporates OCR, may also provide the option of scanning text into a range of formats (such as Word, PDF or other documents). This means that books, printed worksheets, even photographs with graphics and text can be converted to electronic format and read aloud using text to speech. Reading material is instantly made accessible.

ØØØØ Talking books Talking books are essentially books that are in electronic format, often looking very similar to the paper version. They may read text aloud, and include a range of multimedia elements such as real photos, animations, videos and recorded sounds that make the reading experience motivating and fun. The advantage talking books is that they allow students of any age and ability to be independent readers and take advantage of supports if and when they choose. Additional extension activities may be included with some books to help support balanced literacy instruction. Using book making templates, teachers can create their own high interest individualised learning materials.

llll Software that converts text files to audio Being able to convert text to an audio file has the advantage of providing yet another format for accessing information and is an ideal way for students to engage in independent revision and study. Students can listen to audio files via their computer or their iPod anytime, any place. Software that has this feature may also include high quality synthesised speech and the ability to save the files in a range of formats including WAV, Mp3 and WMA.

220 Writing Tools Common problems for students with learning difficulties and disabilities centre around spelling, grammatical errors, tense and punctuation. They may have ideas which they can articulate very well, but because of spelling problems fall back on using simple sentence construction and vocabulary. These students often need scaffolding to help organise and articulate their ideas into a written format.

llll Organisational software Organisational software helps students brainstorm and display their ideas using a concept map of words and/or pictures that can then be transferred to a document outline with the click of a button. Templates to assist students develop their ideas for different writing tasks may also be included as an added feature. Another strategy for developing a written draft is to use highlighting tools and extract main points from a document or web page. By creating an outline of what has been read, students can use this as a starting point for their writing.

" Onscreen word banks Learners needing support to spell words or construct meaningful sentences can quickly and easily carry out written tasks using on-screen word banks. This software provides the additional support of text to speech and pictures for those whose visual recognition of words is poor. "

Word prediction Word prediction is a strategy that assists with spelling and word completion by making suggestions as you type. These suggestions are displayed in a window. Word prediction can help students expand their vocabulary, as they are less likely to avoid words for which they are unsure of spelling. In some cases, the word prediction program may accommodate for phonetic spelling errors. Such programs also learn words that are used frequently. Research studies have reported up to a 70% reduction in spelling errors when using word prediction programs. "

Voice recognition Voice recognition software allows students to create large amounts of text or control their computer entirely by voice. Documents and e-mails can be dictated without spelling mistakes and the need to extensively use the keyboard and mouse is significantly reduced.

221 " Portable word processors or notetakers For students whose handwriting is untidy or illegible, and who find writing with pen and paper frustrating, these devices help overcome these barriers and encourage students to independently take notes rather than rely on a scribe or peers. They are low cost, portable alternatives to laptops. Infrared capabilities mean that no cords are needed when transferring text to a computer for further editing. These devices are lightweight, sturdy and have the advantage of a long battery life. They are easy to use and can be used in conjunction with word prediction programs if the student struggles with spelling 5.8 Let us sum up Earlier, technology in education was a debatable topic amongst the society. Everyone had their own views on modernizing education and making it technology aided. There were a huge number of positives and negatives to education technology. But, gradually as technology was embraced by the educational institutes, they realized the importance of technology in education. Its positives outnumbered the negatives and now, with technology, education has taken a whole new meaning that it leaves us with no doubt that our educational system has been transformed owing to the ever-advancing technology. Technology and education are a great combination if used together with a right reason and vision. With technology, educators, students and parents have a variety of learning tools at their fingertips. Here are some of the ways in which technology improves education over time: Ø

Teachers can collaborate to share their ideas and resources online: They can communicate with others across the world in an instant, meet the shortcomings of their work, refine it and provide their students with the best. This approach definitely enhances the practice of teaching.

Ø

Students can develop valuable research skills at a young age: Technology gives students immediate access to an abundance of quality information which leads to learning at much quicker rates than before. Ø Students and teachers have access to an expanse of material: There are plenty of resourceful, credible websites available on the Internet that both teachers and students can utilize. The Internet also provides a variety of knowledge and doesn't limit students to one person's opinion.

222 Ø Online learning is now an equally credible option: Face-to-face interaction is huge, especially in the younger years, but some students work better when they can go at their own pace. Online education is now accredited and has changed the way we view education. Technology that is made use of in the classroom is very beneficial in helping the students understand and absorb what they are being taught. For instance, since there are a number of students who are visual learners, projection screens connected to computers could be put in classrooms to let the students see their notes as opposed to simply sitting down and listening to the instructor teach. There is a number of very good software that can be used to supplement the class curriculum. The programs make available to students quizzes, tests, activities and study questions that could help the students continue with the learning process when they are out of the classroom. Today, technology has been incorporated into a good number of curriculum even those that do not belong to the technology and computer classes. Students make use of computers to come up with presentations and also make use of the internet to carry out research on a variety of topics for their essays and papers. Students also get to know how to use the technology available in the world today through the tech and computer classes. This gives the guarantee that following their graduation, the students will not have any difficulties with using technology when they are out there in the work place, which might serve to make them more competitive compared to an individual who has no access to a certain software or technology in school. With the continuing advances in the technological world, students are getting improved access to such educational opportunities. Every time something 'better' and 'new' is brought into the market, the price of the existing technology is decreased which makes it much more accessible in the educational setting even to those schools that might not have a lot of financial resources available to them. Technology has greatly grown to the point that it is also available today to assist those kids who are yet to begin school. There are a number of educational systems and video games for the small children that assist them in getting ready for school and in a number of situations also give them a head start on their education.

223 5.9 Check your Progress 1. Write about the different assistive devices used for children with special needs. 2. Discuss about the use of Screen readers for children with visual impairment. 3. Comment on the implications of technology in an inclusive classroom. 5.10 References for further reading

3 Netaji Subhas Open University From the Vice-Chancellor's Desk Dear Students, from this Academic Session (2015-17) the Curriculum and Course Structure of B. Ed.- Special Education have been thoroughly revised as per the stipulations which featured in the Memorandum of Understanding (MoU) between the Rehabilitation Council of India (RCI) and the National Council for Teacher Education (NCTE). The newly designed course structure and syllabus is comprehensive and futuristic has, therefore, been contextualized and adopted by NSOU from the present academic session, following the directives of the aforesaid national statutory authorities. Consequent upon the introduction of new syllabus the revision of Self Instructional Material (SIM) becomes imperative. The new syllabus was circulated by RCI for introduction in the month of June, 2015 while the new session begins in the month of July. So the difficulties of preparing the SIMs within such a short time can easily be understood. However, the School of Education of NSOU took up the challenge and put the best minds together in preparing SIM without compromising the standard and quality of such an academic package. It required many rigorous steps before printing and circulation of the entire academic package to our dear learners. Every intervening step was meticulously and methodically followed for ensuring quality in such a time bound manner. The SIMs are prepared by eminent subject experts and edited by the senior members of the faculty specializing in the discipline concerned. Printing of the SIMs has been done with utmost care and attention. Students are the primary beneficiaries of these materials so developed. Therefore, you must go through the contents seriously and take your queries, if any, to the Counselors during Personal Contact Programs (PCPs) for clarifications. In comparison to F2F mode, the onus is on the learners in the ODL mode. So please change your mind accordingly and shrug off your old mindset of teacher dependence and spoon feeding habits immediately.

I would further urge you to go for other Open Educational Resources (OERs) - available on websites, for better understanding and gaining comprehensive mastery over the subject. From this year NSOU is also providing ICT enabled support services to the students enrolled under this University. So, in addition to the printed SIMs, the e-contents are also provided to the students to facilitate the usage and ensure more flexibility at the user end. The other ICT based support systems will be there for the benefit of the learners. So please make the most of it and do your best in the examinations. However, any suggestion or constructive criticism regarding the SIMs and its improvement is welcome. I must acknowledge the contribution of all the content writers, editors and background minds at the SoE, NSOU for their respective efforts, expertise and hard work in producing the SIMs within a very short time. Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor, NSOU

1.1 Introduction There was a time when students used to be clustered at the feet of their gurus to listen and memorize what was read to them from a precious, laboriously produced hand written manuscript. Then gradually came the printed book which was a form of automation, a kind of teaching machine and students got their own copy to study on their own. So the function of the teacher has been changed. The teacher got relief from the tedious duty of reading information and got time to counsel and provide individualized teaching to students. The teacher got time to improve teaching by Explanation, interpretation and correlate the mass of information and knowledge available in text book to make the learning easier and joyful for the learners. But as the world is progressing very rapidly due to new innovations in the field of science and technology which can be seen everywhere in our daily lives, we need to prepare our children for this new world by changing the way we educate them. The 21st century is dealing with two basic problems namely population explosion and information explosion. The educational institutions has been affected with the increased number of students due to population explosion, increased mobility of students, increased range of students abilities and diverse backgrounds. The world has become a global village and due to technological advancement information flows rapidly among learners. The Administrators and Teachers are actively searching for ways to prepare students for the future, and the educational system has been evolving faster than ever before. A classroom is no longer consisting of four walls with a blackboard and a lecturer in front, talking to students instead of interacting with them. Interactive whiteboards, tablet PCs, projectors, mobiles and a host of other tools allow teachers to present information 11 in ways that prompt discussion and collaboration and make learning interactive and accessible. Educationists believe that if technology is properly supported and widely used in teaching and learning process could help the most of the pressing needs and many teaching problems can be solved by the proper use of rich experience that can be gained through various media. In this technological era therefore, a modern and updated teacher must take full advantage of the existing technological resources to help facilitate students learning. In this first unit of, we will make an attempt at understanding the concept and nature of educational technology. This unit will also help us to understand hardware, software, and systems approaches to educational technology. The scope of educational technology, recent trends and significance of ET. We will also know about another important learning point, the concept of universal design of learning and individualized instruction which can help teachers to teach children with learning problems or who are differently able to access education with the help of educational and instructional technology. 1.2 Objectives After going through this unit, the learner will be able to l Understand the concept of educational technology; l Understand the scope and importance of educational technology in the teaching- learning process; l Understand the role of technology in education and acquire knowledge about its various approaches and modes. l differentiate hardware, software, and systems approach to educational technology; l classify different types of educational technologies and recent trends l understand the concept and importance of universal design of learning and individualised instruction 1.3

Educational and Instructional Technology - Meaning, Nature, Scope, Definition, Objectives and Significance 1.3.1

Meaning and Definition of Educational Technology - Before understanding the meaning of educational technology we should first of all know

12 the meaning of technology. In general we say the application of scientific laws and principles for the purpose of making daily life easy and comfortable is technology. With the help of these applications we make different machines and devices which accelerate and systematize our daily life. Therefore technology refers to two aspects namely - theoretical, based on ideas and practical based on putting those ideas into practice. When we use technology for the purpose of accelerating and facilitating educational process and to make the education accessible to all kind of learners, that technology is called as educational technology. But this is not the complete meaning of educational technology. For many of us the term 'educational technology' is associated only with the equipment and with the hardware, which is used, viz. over head projector (OHP), LCD projector, television, computer etc. However, the concept of educational technology should not be confused or limited with the electronic gadgetry; it has a broader meaning. In its wider perspectives ET includes the entire process of the setting of educational goals, the continuous reforms of curriculum, the tryout of new teaching methods and materials, the evaluation of the education system as an integrated whole and if necessary, resetting of goals on the basis of the findings of evaluation and innovations.

Educational technology implies the use of all type of educational resources - men, materials, machine, methods and techniques, means and media in an integrated and systematic manner for optimizing teaching learning process in its best possible manner. Educationists have understood educational technology in different ways, some of these dimensions are: J.K Gailberth in his book *The New Industrial State* has given two main characteristics of every technology: 1. Systematic application of scientific knowledge to the practical tasks and 2. The division of the practical task into sections and sub sections. These two techniques are followed in educational technology too. For example by using educational technology the teacher first determines the teaching objectives then creates environment, all inputs(hardware and software), selects and applies appropriate teaching strategies for achieving teaching objectives. At the end the teacher will evaluate the students to understand whether the teaching objectives have been achieved or not. If the outputs of the students are not satisfactory then changes will be made in the strategies so that teaching objectives can be achieved. This whole process completes into four stages: 1. Analysis of teaching tasks including inputs, process and outputs. 2. Observation or combined search and analysis for some specific components which has been used during teaching learning process.

13 3. Drawing conclusions about what strategy or behaviour has been successful. 4. Translating the experience into usable language for the benefit of other teachers. Second meaning is Mechanization of educational process of human knowledge for the benefit of big masses through three phases (A) Preservation of knowledge like printed books, tape recorder, CDs and digitals. (B) Transmission of knowledge - sharing knowledge with the help of media. (C) Advancement of knowledge - through machine knowledge reaches to mass and when they face any problem and they try to find out the solution with the help of technology and intelligence then knowledge advances automatically. Third meaning is ET unites the science of learning with Art of teaching. Definitions of educational technology: There are number of definitions of educational technology which have been provided by educationists, Researchers and scholars over the years. Some of the representative definitions are given below to get a better understanding of the term "educational technology".

G.

O.M. Leith: "Educational Technology is the systematic application of scientific knowledge about teaching-learning and conditions of learning to improve the efficiency of teaching and training (

Leith, 1967)."

S.S. Kulkarni: "

Educational Technology can be defined as the application of the laws as well as recent discoveries of science and technology to the process of education(Kulkarni, 1969)."

D. Unwin: "Educational Technology

in

concerned with the

application of modern skill and techniques to requirements of

educational training. This includes facilitation of learning by manipulation of media and methods, and the control of environment is so far as this reflects on learning (

Unwin, 1969)." W. Kenneth Richmond: "Educational Technology is concerned with providing appropriately designed learning situations which, holding the view of objectives of teaching or training, bring to bear the best means of instruction (Richmond, 1979)."

J.R. Gases: "

Educational

Technology has to be seen as a part of persistence and complex endeavor of bringing pupils, teachers and technical means together

is

an effective way (Ford Foundation Team, 1971)."

14

US President Commission of Enquiry: "Educational Technology may be defined as

a systematic way of designing, carrying out and evaluating a

total process of teaching and learning in terms of specific objectives based on

findings from research in human learning and communication (

cited in, tucker, 1979:159). "

Educational technology offers the means

to reach large numbers in remote and inaccessible areas, remove disparity in educational facilities available to the disadvantaged, and provide individualized instruction to learners conveniently suited to their needs and pace of learning (

NPE, 1986). - Educational technology is a communication process resulting from the application of scientific methods to

the behavioural science of teaching and learning. This communication may or may not require the use of media such as

television broadcasts, radio, cassettes etc. (UNESCO, 2001). Based on the above discussion we may conclude that

Educational technology is concerned with the systematic application of science and technology in the field of education.

It is helpful for both, the teacher and learner to set the learning objectives, strategies, procedures, materials and establish

a good communication between them and make the teaching learning process more effective. 1.3.2 Nature of

Educational Technology | ET is the applications of scientific principles to education. | ET is the development of methods

and techniques for effective teaching-learning. | ET is not confined to the use of electronic media in Education. It

includes systems approach also. | ET involves total teaching and learning process:input, output and process aspects of

education. | ET provides technical guidance and solution to the educational problems. | It helps in effective

communication between teacher and students. | ET speed up the process of learning. | ET is very effective in large

classroom management by using projector, microphone, speaker etc. | ET can train large masses with the help of media.

15 | New concepts are coming out with help of edu tech like e-learning, online learning, mobile learning etc. So we can

say educational technology has the potential to bring about improvement in education both qualitatively and

quantitatively. 1.3.3 Objectives of Educational Technology | General Objectives The objectives of Educational Technology

at macro level or broad level are as under: 1. Identifying educational needs of the community. 2. Determining the aims of

education. 3. Developing a suitable curriculum. 4. Developing certain models to improve the process of teaching and

learning. 5. Identifying the human and non-human resources. 6. Developing

the appropriate aids and equipment to meet the educational needs. 7. Identifying the major obstacles in the

educational environment and the ways and means to tackle those. 7. Suggesting remedies to overcome the above traced

out obstacles. 8. Managing the whole system of education including planning, implementation and the evaluation

phases. | Specific Objectives The objectives of educational technology

at micro-level i.e., in view of specific class- room teaching are as under: 1. Identifying the educational needs and

analyzing the characteristics of the pupils. 2. Determining the class-room objectives in behavioural terms. 3. Analysing

the contents of instructions and

organise them sequentially. 4. Identifying the available and necessary teaching-learning materials and resources. 5.

Planning the suitable teaching strategies 6. Utilizing the man-material resources for achieving specific classroom

objectives.

16 7. Evaluating class-room teaching in terms of students' performance. 8. Providing feedback to the teacher and the students for betterment of teaching- learning process. Regarding objectives of Educational Technology, Hilliard Joson has given the following objectives : 1. Transmission of Information. 2. Serving as role model. 3. Assisting the practice of specific skills. 4. Contribution to the provision of feedback. l

Main Objectives of Educational Technology 1. To help to improve the environment required for the teaching learning process. 2. To make the class-room teaching-learning more effective. 3. To modify the behaviour of the teacher and the learner. 4. To improve and update the methods of

teaching and learning. 1.3.4 Origin and history of educational technology: To describe the emergence of educational technology we need to discuss it from two aspects. The first aspect is the global and general worldwide historical development, while the second aspect relates to the historical development at the local level or Indian history. Global Historical Development of Educational Technology Stone Age Period: We have studied in our school that during Stone Age people used to live in cave and they used to draw on the cave wall, tree trunk, slabs, and rocks to share their experience. There was no teaching concept or standardized writing language for communication. People used to experience and learn from the environment. Those drawings are associated with the invention of writing technology. At about 3100 B.C Egyptians devised a system of picture writing called hieroglyphics. Gradually standardized writing system evolved in many countries. With the progress of civilization education system emerged. Socrates used to teach his pupil with oral dialogue system and pupil used to memorize it. Hand written books were in uses for teaching.

17 The Age of Book and Chalkboard In 1456, Johann Guttenberg developed the printing machine and printed the first Bible. With this invention, the art of printing spread widely and other books were produced. The one each to one teaching or verbal method of teaching changed and knowledge spread among pupil in the form of books. School system started and teacher started teaching with the help of blackboard and chalk. Mass Communication Age The invention of the radio and the television made a significant landmark in the development of Educational technology worldwide. Knowledge spread all over the world without any boundary and to the mass. Mass education and education to less privileged society was easy with the help of this technology. Though, the radio served this purpose better than the television as it was low cost. The Information Communication Age/Computer Age The invention of the computer has remarkably changed the educational practice the world over. With computer technology comes the information age. The first computer was invented by IBM. With the advent of the computer technology the following developments started (Conway, 1990): (i) Electronic board akin to the white boards with special pens capable to transferring data written on it to the system; (ii) Multimedia system equipped with a sound blaster and speakers; (iii) CD-ROM player / DVD-ROM player (on which audio, images and video files are recorded); (iv) Video disk player and a videotape player controlled by the personal computer PC); (v) PC - PC conferencing mode; (vi) The touch screen and voice recognition/communication devices for the special education students; (vii) The digital camera that combines very well with computer where images can be shown and be manipulated / printed; (viii) Advances in virtual reality - virtual libraries, virtual universities, etc. Computers are now using packaged instructions like CAI, CBI, and CAL either in a mediated form or in non-mediated form using any or a combination of the styles of drill and practice, tutorials, games, simulations, and/or interactive knowledge-based system.

18 So nowadays education does not depend on face to face interaction between teacher and learner and a closed set up rather than education is now anytime anywhere matter with the help of technological devices and programmed learning. Online learning with the help of internet facility has opened limitless quantity of doors of possibilities for contemporary learner to make their life happier than ever before. Use of educational technology in India: Indian education started with Gurukul system where pupil used to listen to their gurus and learn. Then gradually came the age of books and some other teaching material like, blackboard chalk, teaching aids etc. Before 1960 the term educational technology was not popular to Indian education system. But now educational technology is being used in all sector of education and both in formal and non formal education system. The use of technology properly started and became popular after the invention of radio. In 1929 Bombay aired some educational programmes for school children for the first time. As the radio network cover most of the part of the country so it was easy to reach many people at a time. Thus various education programme was started to develop to educate the mass. Radio was used to teach people about agriculture, weather, basic literacy and educational programmes for both in school and out school groups. The school TV project was first introduced in Delhi in 1961 and it is widely used in education sector. In the year 1972-1973 govt. of India launched first education technology project.

With the advent of satellite services and with the launching of EDUSAT project,

television started to be used more and more for the national development and reached to the masses living in remote or rural areas. The central institute of technology NCERT established in 1984. The CIET started working to develop software materials to meet the educational needs and also conducted research, trained human resource to use educational technology in education sector. In 1975, the satellite television experiment (SITE) was launched. INSAT was used by UGC. National open school and IGNOU established in 1979 and 1985. Distance mode education, NOS started to use technology with combination of media and it was helpful for those who could not complete formal education. For teaching foreign languages like, German, Spanish, French etc also technology is used.

19 Nowadays we are using computers, advanced form of ICT and internet in association with various technological aids in education sector. Country like India where population is very high and scope of higher education is limited in rural and remote areas technology is kind of boon which can help to learn at own place. To sum up, educational technology in India is being used as under: Ø School broadcast Ø TV Telecast lessons Ø Teacher preparation Ø Distance education Ø Correspondence courses Ø Development of audio- visual materials Ø Language teaching Ø Production of multipurpose kits or instructional aids Ø Computer literacy and studies in schools.

1.3.5 The Scope of Educational Technology (By Lucido, 1997)

Educational

technology is the

development, application, and evaluation

of systems, technique, and aids to improve the process of human learning. (

Association for Educational

Communication and Technology)

ET is

the theory and practice of design, development, utilization, management, and evaluation of processes and resources for learning. (

Hoffman, 1994-2009, as cited by www.books.google.com) ET is a systematic, iterative process for designing instruction or training used to improve performance. As

Educational technology aims to improve the quality of human learning process so

the scope is unlimited as it tries to reach out to more and more people involved in the teaching-learning process. The scope of educational technology

can be described under the following points: 1. Spelling out Educational goals and Objectives. Ø Help for the formulation of objectives and goals of education based on individualized and social needs.

20 2. Curriculum Development. Ø Planning of curricular and co-curricular inputs in order to realize planned goals and objectives. 3. Developing Teaching-Learning materials and Resources. Ø Develops necessary learning materials in the form of

programmed learning books, computer learning packages, mass media instruction, individualized self- instructional packages etc. 4.

Developing Human resources. Ø ET covers the area of teacher education. 5. Developing Strategies. Ø

Teaching strategies, approaches and methods are devised and developed catering to different types of students. 6.

Developing Multi-Sensory Aids. Ø Design, development of audio visual aids. 7. Develops Feedback Mechanism. Ø ET

develops tool of evaluation to provide feedback. 8. Develops Passive Instruction Services. Ø Educational radio, TV, computers are used for transmitting information. They are passive services since all decisions are in the hands of the providers, i.e., what to be presented, for how long, in what sequence and when. 9. Develops Interactive Instruction

Services. Ø ET tries to provide opportunities for the learner to control the pace, mode of presentation etc. e.g. Computer Assisted Instruction (CAI), Teleconferencing via Internet etc. 10. Develops Learning Environments. Ø ET develops learning

environment that are learner friendly. Eg. Simulation 11. Developing Information Resources. Ø ET bridging the gap between developments in Information Technology and Education. Information Resources:Eg. E-libraries, On line

encyclopaedia,World Wide Web, 12. Develops Communication Devices. Ø ET has developed communication devices for students who have problem in communication.

21 Thus we can say Educational technology aims at increasing efficiency, effectiveness of teaching learning process and simultaneously aims at bringing pedagogical changes for betterment of education.

It works for over all

planning and organization of the system or subsystem of education. 1.4

Educational Technology

and Instructional Technology: Role and Recent Trends The two concepts Educational Technology and Instructional Technology are used interchangeably. Instructional Technology is a subset of educational technology, based on the concept that instruction is a subset of education. Educational Technology is wider concept than Instructional Technology as education is wider than instruction. Instructional Technology is the theory and application of proper tools and techniques in instructional settings, while educational technology is concerned with whole education process and contexts. All parameters of instructional technology are suited within that of educational technology, while all of educational technology does not suit within the parameters of instructional technology. Instructional Technology is not merely a knowledge area that deals only with audiovisual instructional materials. It is a way to think about problems of teaching and learning to find workable solutions (Wittich&Schuller, 1973).

1.4.1 Definition and Meaning of Instructional Technology

As defined by Momurin (1970), Instructional technology

is a

systematic way of designing, carrying out and evaluating the total process of learning and teaching in terms of human learning and communication, and employing a combination of human and non-human resources to bring about more effective instruction.

Sharma (1989) defined

instructional technology

as a network of techniques or devices employed to accomplish certain defined set of learning objectives.

Instructional technology applies the

principles and theories of psychological learning to get deep insight into the content, structure and sequence of instruction to develop instructional resources for attaining desired learning outcomes. In other words, instructional technology works at shaping the instructional uses of the materials to turn them into instructional resources.

In brief we can say the term "Instruction" refers to systematically organized programme designed to produce certain knowledge, skill, understanding, attitude, and behaviour patterns among learners.

22 The term "Technology" refers to systematic application of scientific or other organized knowledge to practical tasks.

So a technology of Instruction is a particular systematic arrangement of teaching learning events designed to put the knowledge into practice in a predictable effective manner so as to attain specific objectives.

Further, Instructional technology determines

and provides appropriate stimuli to the learner to produce appropriate responses for making learning more effective.

The

definition of Instructional Technology prepared by

the

Association for Educational Communications and Technology (2000) is as follows,

Instructional Technology is

the Theory and Practice of Design, Development, Utilization, Management, and Evaluation of processes and resources for learning.

23

From the above it is understood, theory consists of concepts, constructs, principles, and propositions that serve as the body of knowledge; Practice is the application of that knowledge to solve problems; Design refers to the process of specifying conditions for learning; Development refers to the process of translating the design specifications into physical form; Utilization refers to the use of processes and resources for learning; Management refers to processes for controlling Instructional Technology, and Evaluation is the process for determining the adequacy of instruction. (Seels & Richey, 1994). Through Instructional Technology teachers share content or information to the learners. Contents can be presented on three levels, memory, understanding and reflective levels. However instructional Technology present the content to the second level of teaching only and for reflective level of teaching, help of teaching technology is necessary. In a similar way communication also has two elements verbal and nonverbal. When teacher asks question and students give answer then it is called as verbal communication. But when teacher uses his body actions or gestures or material for communicating the content then it is called as nonverbal instruction. For example if a teacher wants to show the meaning of clap to the class he does the activity and say it is clap. Instruction can be provided by the teacher or by the machine like in online learning or self instructional material, and it does not make any difference. For example Open Universities gives teaching instructions by using TV, radio or Internet to thousands of students in a single sitting and who's over is interested can take the benefit of this program. So instructional technology is based on hardware approach as all the communication with the learners are being done by using audio video recorder, radio or television or computers. There is no direct interaction between teacher and students as we see in teaching or behaviour Technologies. Here teacher plays the role of an instructor and he/ she does not invite the students to participate in the lesson. With effective communication skill teachers makes the instruction proves interesting and intellectually stimulating. In instructional technology, instructional materials are prepared based on the objectives formulated in advance, and then content is presented by using different strategies, techniques and material. At the end the outcomes of the learners are evaluated in order to ascertain whether instructional process is successful or not. A teacher needs knowledge of psychological and scientific principles and laws and awareness of social values and norms, teaching maxims and principles of teaching while preparing instructional materials.

24 1.4.2 Characteristics of Instructional Technology: 1. Objectives of cognitive domain can be achieved. 2. This technology is helpful to fill up the deficiency of effective teachers because we can communicate the instructional material to thousands of learners at a time by recording the lecture of an effective teacher into machines. 3. By the use of this technology students can learn according to their own ability and needs and pace. Can practice same content repeatedly as long as he wants without the help of teacher. 4. With trial and error process students learn independently. Students can be reinforced regularly which will lead to for the right responses to occur. 5. Analysis of the subject matter is also possible with the help of this technology and it can make the presentation easy and logical. 6. Developing instructional technologies based on psychological learning theories and principles. To develop a successful instructional plan/strategy for a specific content following steps should be kept in mind: 1. Setting of instructional objectives To develop a successful instructional plan first we needs to plan and set instructional objectives. After learning the content or matter what type of behavioural changes are expected from the learner that needs to be decided and written

in behavioural terms by taking the help of Robert Eggers approach Robert Miller approach or RCEM approach before proceeding further in the task of imparting instruction. Instructional objectives must be based on the following: Ø Grade level of the learner Ø

the physical emotional social and mental potential of the learner Ø

the previous experiences of the learner related to the subject and topic Ø the main material resources available for imparting instruction

Taking decisions about the instructional material Based on the instructional objectives learning experience and teaching materials need to be decided and organized for delivering the instructions successfully. Instructional material will be selected and used based on the

following the principles of simple to Complex specific to general theory to practice etc.

There are different types of teaching learning material available from visual to audio-visual aids and many technologically advanced products like computer, projector, audio books etc, so the teacher must select appropriate TLM based on the content and instructional strategy.

25 Taking Decision about the media and methods: To carry out the teaching learning process effectively, appropriate decision must be made for selecting media and method for delivering instructions. Various types of instructional strategies are available, so teacher must have enough knowledge to select and use the strategy properly according to the syllabus and topics. Some of the important

instructional strategies like lecture strategy, demonstration strategy tutorial strategy innovation strategy description strategy, role playing, gaming, group discussion, question answer, discovery, problem solving

Strategies and strategy assignment etc. can be used for teaching and learning. Special instructions are needed for carrying out auto instruction of

self learning like program instruction carrying out with the help of teaching machines, computer assisted instruction, personalized system of instruction CSI learner construction LCI, etc.

Taking decision about the proper instructional environment: A suitable instructional environment must be chosen by the teacher based on the topic for carrying out the particular type of instruction. Helping in the task of evaluation : Evaluation is a very important part in

any type of instructional activity carried out by the teacher or learner in the shape of auto instruction to understand that the instructional objectives have been achieved or not. Some evaluation strategies are , teacher made test, standardized test, construction of the achievement test, evaluating the cognitive affective and psychomotor changes in people's behaviour through suitable test and techniques, self evaluation test Strategies and techniques.

So in this way instructional technology can help the teacher as well as the learners in the attainment of the stipulated instructional objectives. 1.4.3 Advantages and Needs of Instructional Technology n Advantages

of Instructional Technology Ø Advantages of Instructional Technology Ø Makes the instruction more interesting. Ø Delivery of instruction is more standardized. Ø Learning becomes more interactive by applying accepted learning techniques. Ø

Quantity

of learning is improved. Ø Instruction can be provided as and when required. Ø Help in development of positive attitude of students towards learning and to the learning process itself. Ø The role of instruction can be appreciably changed in positive direction.

26

n Needs of Instructional Technology The purpose of instructional technology is to make education more productive, individualistic, powerful and scientific which enhances the learning more immediate with more equal access. The use of instructional Technology can solve educational problems related to are given below as l Growing population l

Heterogeneity of learners l Divergent and even conflicting needs of the learners coming from different socio- cultural areas l Rapid development of new information l Knowledge explosion l Development of communication devices l

Extending curricular and social changes arising from modernization 1.4.4 Role of Educational Technology in the

Teaching-Learning Process 1. Educational Technology has brought revolution in the entire education system. Previously, the teachers used to be the sole interpreter of knowledge to the learners and the textbooks was the sole resource. But

now this conventional role has been changed and it has opened up the new areas of teacher functions such as management of resources and management of learning. Today, teachers have a range of media to assist and supplement

the instructional work. With the help of technology teachers can even specify the learning intentions, select the topic, identify the stimulus situation, determine media, manage teaching and finally conduct evaluation and modify the

instructions in the light of evaluation results. So the teachers have the opportunity to design meaningful learning experiences that embed technology. 2. Learning with technology has become essential in today's schools. Worldwide,

governments, education systems, researchers, school leaders, teachers and parents consider technology to be a critical part of a child's education. 3. Educational process can't proceed systematically without the help of educational

technology. Every aspect of educational system is fully enlightened with educational technology. 4. Educational technology has provided a scientific base to the educational theory and practice. It has transformed a passive classroom

to an active and interactive classroom, with audio-visuals, charts and models, smart classrooms and e-learning

27 room which has drastically motivated and increased the attention level of the students. 5. The teaching-learning climate of the educational institutions has been modernized.. The learners are being exposed to professionally designed programmes on video or computers under programme learning concept. 6. Educational technology helps the learners to learn at their own pace with repeated practice so teachers are relieved of the burden of routine repetition for exercise and revision purposes. It has helped and supplemented the teachers in their instructional programmes also through the structured lessons for remedial, enrichment or drill purposes. 7. Educational technology has provided well-integrated structured materials for teachers thus saving a lot of their time which in turn may be utilized for creative work and quality improvement. 8. Educational technology helps the teacher to use scientific methods for solving educational and administrative problems. It adds to the teaching competence of teachers and inculcates a scientific outlook and scientific temper in teachers and students. 9. Educational technology has made the teaching-learning process more effective and process oriented. Television, Radio, V.C.R, Computers and LCD projectors etc. have enriched and facilitated effective transmission of knowledge. 10. Educational technology has improved the process of teaching by giving it Teaching Aids and Programmed Instructional Material. 11. Feedback devices have modified teaching-learning behaviour so produced effective teachers in the teacher-training institutes. 12. Educational programmes on T.V, Radio and Internet are beneficial for Students who appear for higher or competitive examinations. 13. Examination process, evaluation, classroom-teaching and various other sectors of education are being modified with the help of ET and new researches are going on to make it more effective for learning. 14. Educational technology can help teachers to teach according to individual differences of learners and based on the learners need assistive technology can be introduced for smooth learning. 15. It helps in constant social interaction; digital content can be easily created and shared among large population. 16. Technology helps to find information by accessing the internet through cell phones and computers or chatting with friends on social networking sites.

28 17. Educational technology has provided scientific foundation to education through the theories of learning and intelligence and it allows for 24/7 access to information. 18.

Thus educational technology is required in each and every aspect of teaching learning process and serves all the purposes for modern education.

According to Davis and Hartley. 19. "Educational Technology in its wide sense as understood today, includes the development, application and evaluation of systems and techniques involving men, machines, media and instructional material as components, so as improve the process of human learning and attain the educational goals. -" 1.4.5 Recent Trends of Educational Technology and Instructional Technology Let us look at a table to understand the recent trends in technological development in education sector: Source: IGNOU E-gyankosh, Santosh Panda

29 From the above tables it is very clear that technology has a great impact on the entire education system. From face to face interaction or lecture method to online learning, things has been changed a lot. Now classrooms are well equipped with different types of technological devices from smart board to laptops, speaker, microphone, head phone, projectors, smart phones, e books, audio books, internet, Wikipedia, you tube, blogs, podcasts, moodle, CAI, and many more things to improve and personalize the learning experience. 1.5 Major approaches of Educational Technology Lumsdaine(1964) has suggested following approaches of Educational technology:- A. Hardware approach or first Educational technology B. Software approach or second Educational technology C. Systems approach or third Educational technology D. Individual and Mass Media Approach. 1.5.1 . Hardware Approach (Technology in Education) This approach implies the use of mechanical materials and equipments in education. The term was first introduced by James O. Finn & Others. This approach originated from

Physical Science and engineering and is based on the concept of service, i.e., using technology in education (Silverman 1968).

This approach is a by-product of the scientific and technological developments of the 20th century. In this approach the main feature is the use of audiovisual aids like charts, models, film-strips, slides, audio cassettes, and sophisticated equipments like film projectors, OHP, slide projector, radio, tape recorder, LCD projector, DLP Projector, CD players, DVD Players, TV, computer etc in teaching learning process.

Hardware approach mechanizes the process of teaching so that teachers would be able to deal with more students with less expenditure, less time and effort

in educating them. Human knowledge has three aspects I Preservation, I Transmission and I Development. With the invention of printing machines the preservation of knowledge

started. The knowledge is preserved with these machines in the form of books and kept in the libraries,
30

taperecorders and films.

The second aspect of human knowledge is its transmission. A teacher can impart knowledge himself to his pupils. Now days, transmission of the knowledge is supported by machine like mike, radio and television.

With these, thousands of pupils can

be benefitted at a time. The third aspect of human knowledge is its development. Teachers can study through online libraries and enrich themselves other than that they can do research work to develop new knowledge.

For this purpose, presently the researcher uses the electronic machines and computers to collect and analysis of data.

Hence, all the three aspects of knowledge allow the use of machines. In short, the teaching process has been mechanized. The mechanization of teaching process is termed as the Hardware Approach

and also called as technology of education. 1.5.2 Software Approach (Technology of Education) This approach implies the use of Psychological principles and learning theories in education. The term was first introduced by Skinner & Gagne and it originated from Behavioral Science.

Software

Approach is also termed as Instructional Technology or Teaching Technology or Behavioural Technology.

This approach

of educational technology

involves a systematic, scientific application of appropriate scientific research, both from the physical science, social sciences and particularly from psychology and sociology, in order to solve a problem. Here, it is important to understand that technology of education emphasizes on the techniques of teaching and learning derived from the principles, ideas, and practices drawn from various fields of knowledge such as; psychology, sociology, philosophy, management, cybernetics, etc. in order to optimize the teaching-learning process. Instead of using machines this approach uses the principles of teaching-learning for bringing desirable changes in the behaviors of the pupils. In software approach machines are only used for clarification of concept and principles. So this technology is related with the mental aspect of the task and it writes the educational objectives in the behavioural terms, selects suitable presentation strategies of the subject matter, uses reinforcement devices and evaluates the outcome of the learners. According to Silcherman (1968) it is also called as constructive educational technology. It consists of 6 steps: 1. Analysis of instructional problems. 2. Writing objectives in behavioural terms 3. Selecting suitable teaching strategies 4. Reinforcing the students on right responses

31 5. Selecting or constructing measuring instruments for evaluating instructional outcomes. 6. Decision making and improvement. From the above discussion it is very clear that both software and hardware approaches are so interlinked that they cannot be separated from each other. One without the other is incomplete. It is software approach which makes the hardware approach function well. 1.5.3 Systems Approach System: A system is any collection of interrelated parts that together constitute a larger whole. Many number of units working together for a particular goal. These component parts, or elements of the system are intimately linked with one another, either directly or indirectly, and any change in one or more elements may affect the overall performance of the system, either beneficially or adversely. The Term was first introduced by Davis & Hartley. Definition: System approach is an integrated, programmed complex of instructional media, hardware and personnel whose components are structured as a single unit with a schedule of time and sequential phasing.

32 It is a modern approach in educational administration and organization. It acts as a link between hardware and software approach. It is

also known as 'Management Technology'. It has brought to educational management a scientific approach for solving educational administrative problems.

As we know that teaching learning is a complex process and it needs systematic planning to achieve pre determined objectives. To streamline the teaching-learning process we use the systems approach which is concerned with systematic planning, designing, construction and evaluation of the education system. Systems approach is applied to develop, implement and evaluate the whole educational system, sub-system, and curriculum or, for designing an individual lesson. There are four elements of the systems approach: input, process, output, and analysis & feedback. Let us understand, how these elements function together to make the education system more productive. Parameters of system approach So we see that

the System Approach focuses first upon the learner and then course content, learning experiences and effective media and instructional strategies

and then the performance level of the students. Based on the performance level feedback will be collected from all including teachers, students and administrators .So if there is any problem within the system then it will be identified and rectified and also the parameters of the system approach can be modified for improving the overall teaching learning system.

Such a system incorporates within itself the capability of providing continuous self-correction and improvement. It is concerned with all elements of instruction including media, including hardware and software and evaluates various aspects of the education system, and sub-system. The main purpose of the systems analysis is to create a systematic, organized, effective and enabling learning environment for both teachers and students.

33 1.5.4 Individual and Mass Media Approach Due to information explosion and population explosion we need to use mass media which is a boon of science and technology to convey loads of information to larger section of people within short time span. For example newspaper, TV, radio, internet etc. As number of students are increasing day by day and world has become a global village, now a days this mass media technology is utilized for educational purposes also.

Mass media

have proved to help in classifying concepts, stimulating group and individual activities, developing a collective critical awareness, changing attitudes, imposing a new structure or organization on certain subjects and encouraging originality and creativeness.

Therefore, teachers need to be properly motivated and interested

for using such materials. Other than that training is also necessary for the teachers to use and maintain the materials. For a learning society like India which has a huge population of one billion, the media systems based on modern technology constitute a very potent tool for education and development. It has varied and numerous applications bearing on almost all aspects of individual and social life. In one sense, all these uses of information technology basically have their impact in educating people, giving them knowledge, skills, improving understanding and changing their attitudes. The media is used for both formal and non- formal education systems and also for individual and mass levels of learning. Technology is used for Distance Learning Mode courses and appears to be an avenue of promise for every country in the world. In India, IGNOU and CIET (Central Institute of Educational Technology) are launching distance education programmes throughout the country. In general, distance education employs a variety of delivery systems such as correspondence courses, radio, television, audio-visual materials, telephone lessons and teleconferencing. So it is seen that mass media approach is very effective role to play in adult education. In the formal school situations also we can use media to make the teaching learning process more interactive or interesting. The Delors Commission (P-173) also observed that the new technology has created a host of new tools for use in the classroom as under: -- Computers and Internet, - Cable and Satellite TV Education,

34 -- Multimedia equipments, -- Inter-active information exchange system including e-mail and on-line access to libraries and public data base. Ø Teachers can coach their students to use media effectively for the information (like helping students to find specific websites) and in this way, a new partnership can develop in the classroom. Ø If technology and media is used with the conventional mode of education it can enrich the formal system by filling instructional gaps, updating knowledge, and giving new learning experiences. Ø With the advent of computer and internet the information and knowledge is not limited within teacher and library only, the students can access to any information at home also and can learn on their own. Ø The role of media and educational technology has been clearly defined in NPE-86 as under: Ø "Modern communication techniques have the potential to bypass several stages and sequences in the process of development encountered in earlier decades. Both the constraints of time and distance become manageable. In order to avoid structural dualism, modern educational technology must reach out to most distant areas and most deprived

sections of beneficiaries."

Importance

of Mass Media: 1.

Mass Media provide information to the mass within a less time. 2. It takes a wide coverage of information regarding anything that is happening in any corner of the world. 3. It brings the entire world to the individual or to the classroom. Children spend hours together sitting in front of the television and can visualize, hear and acquire knowledge about the world

so it is kind of multisensory learning also. 4.

These media easily reach groups, allow repeated use, give more reality, influence attitudes, show cause and effect relationships and ultimately motivate the audience. 5. It sends information to remote places and helps in distant learning. 6. It helps in modification of attitudes, inculcation of desirable values and acquaintance with cultural heritage. 7. Mass media acts as an agency of social change. 8. Mass media are useful for reinforcing group dynamics and interpersonal communication.

35 9. Mass media as means of communication make ideas clear to children and help them to acquire correct knowledge. They help in simplifying and in giving vividness to explanation. 10. Mass Media make the instruction concrete and stimulate interest and excite curiosity in things.

So

education today, has a far greater responsibility than it had ever before. It has to meet the demands of a dynamic world which change its character every day. Contemporary education has to be more comprehensive and complete than it was ever before.

The role of the various agencies of education like home, society, community etc. has consequently increased, so has the role of the mass media like television, radio, cinema, newspaper increased.

According to educationists and researchers use of mass media like educational TV, radio, press, newspaper, films, documentaries, internet, educational apps, mobile, etc has made the quality of education improved and also made the learners and teachers modern and up to date. Individual approach: Using individual approach is a modern trend in education. If a student cannot understand a matter in classroom set up, they need individualized teaching and repeated practice but due to heavy workload teachers cannot help a student individually always. So with the help of technological equipment and media like Programmed instruction,

programmed books, and programmed learning modules, teaching machines, computer assisted instruction and computer managed learning, video and audio recorded learning and instructional material, email, internet, teleconferencing,

online library etc these problems can be solved. The use of computers and multimedia systems make it possible to design individual learning paths along which each pupil can move at his/her own pace. The compact disc technology (CD) has a special role to play, for it can handle large amount of information complete with sound pictures and text. Interactive media allows pupils to ask questions and look up information themselves. It is observed that pupils who are under-achievers or experienced difficulties in conventional mode of education reveal their talents better and show more motivation and curiosity in informal mode. But development of these technologies cannot replace the textbook and the teacher. In child's education they have their own role to play. Text books are the cheapest media and easiest to handle, illustrating the teacher's lessons, allowing the pupils to revise lessons and to gain independence. Similarly, the development of these technologies does not diminish the role of teachers, but it is also true that in today's world teachers cannot be regarded as the only repository of knowledge that they have to pass on to the younger generation. Now the role of the teachers have been changed, now they are learning partner, guide, instructional designer and supervisor for self learning and how to seek, look up and appraise facts and information.

36 1.6 Differential Instruction, Universal Design of learning and Individualized Instruction 1.6.1 Differential Instruction As we know that 'one size doesn't fit all' (Willis and Mann 2000) so the one single curriculum, one instructional or evaluation strategy may not be suitable for all type of learner. Every child is unique and special and differs from one to another in size, shape, and social development. Students also learn differently. Teachers can no longer teach "The Lesson" and hope that everyone gets it. Based on this knowledge, differentiated instruction applies an approach to teaching and learning that gives students multiple options for taking in information and making sense of ideas. Differentiated instruction is a teaching theory based on the premise that instructional approaches should vary and be adapted in relation to individual and diverse students in classrooms (Tomlinson, 2001). Differentiated instruction recognizes the fact that we have a diverse student population and teachers must understand students' background knowledge, readiness, learning styles, language and interests. According to right to education Act (RTE) - 2009, the present day classroom should be inclusive in nature and welcoming and is pedagogically capable of educating the naturally diverse population of students who arrive at its door. Based on the Differentiated instruction principles teachers can create such classrooms. Differentiated instruction is a technique that teachers use to accommodate each student's learning style and instructional preferences. This strategy may involve teaching the same material to all students using a variety of instructional methods, or it may require the teacher to teach content at varying levels of difficulty based on the readiness, interests and ability of each student. The foundation of Differentiated instruction is based on Piaget's constructivist theory, Vygotsky's socio-cultural theory; Gardner's multiple intelligence theory, varied learning style. According to Piaget' teachers should facilitate the learning process by organizing learning activities and using variety of aid material according to the level of student's cognitive structure to enable him to construct knowledge through his experiences. According to Gardener teachers should provide educational opportunities in such a way that nurture the strong area of intelligences but also allow students to use all their intelligences.

37 Tomlinson (2005), a leading expert in this field, defines differentiated instruction as a philosophy of teaching that is based on the premise that students learn best when their teachers accommodate the differences in their readiness levels, interests and learning profiles. A chief objective of differentiated instruction is to take full advantage of every student's ability to learn (Tomlinson, 2001a, 2001c, 2004c, 2005). In addition, she points out that differentiating can be performed in a variety of ways, and if teachers are willing to use this philosophy in their classrooms, they opt for a more effective practice that responds to the needs of diverse learners (Tomlinson, 2000a, 2005). Tomlinson (2000) maintains that differentiation is not just an instructional strategy, nor is it a recipe for teaching, rather it is an innovative way of thinking about teaching and learning. To differentiate instruction is to acknowledge various student backgrounds, readiness levels, languages, interests and learning profiles (Hall, 2002). Differentiated instruction sees the learning experience as social and collaborative, the responsibility of what happens in the classroom is first to the teacher, but also to the learner (Tomlinson, 2004c). Building on this definition, Mulroy and Eddinger (2003) add that differentiated instruction emerged within the context of increasingly diverse student populations. Within the learning environment permitted by the differentiated instruction model, teachers, support staff and professionals collaborate to create an optimal learning experience for students (Mulroy and Eddinger, 2003). Also in this environment, each student is valued for his or her unique strengths, while being offered opportunities to demonstrate skills through a variety of assessment techniques (Mulroy and Eddinger, 2003; Tomlinson, 2001a; Tomlinson and Kalbfleisch, 1998; Tuttle, 2000). Differentiated instruction supports the classroom as a community, accommodating differences and sameness (Bosch, 2001; Brimijoin, Marquissee, and Tomlinson, 2003; Lawrence-Brown, 2004; Tomlinson, 2003). It allows for the creation of an environment in which all students can succeed and derive benefit (Lawrence-Brown, 2004; Tomlinson, 2003). Students differ in three important ways - readiness, interests and learning profiles - in a differentiated classroom, the teacher is obliged to attend to these differences in order to maximize the learning potential of each student in that classroom (Tomlinson, 2000b, 2001a). Differentiated instruction requires teachers to transform their practices from a program- based pedagogy to a student-based pedagogy. Teachers attempt to adapt pedagogical interventions to the needs of each student, acknowledging that each student differs in interests, learning profile, and level of functioning. Differentiated instruction may facilitate high levels of both student engagement and curricular achievement (Caron, 2003; Tomlinson, 2004).

38 Curriculum tells teachers what to teach, while differentiated instruction tells teachers how to teach it to a range of learners by employing a variety of teaching approaches. Students can develop their potential if they are provided with appropriate activities in an environment that is planned and organized to meet the needs of all students. The teacher can differentiate one or a number of the following elements in any classroom learning situation (Tomlinson, 2004):

- l The content (what the students are going to learn)
- l The processes (the activities)
- l The products (the accomplishment following a learning period)
- l The learning environment

Differentiation is a process through which teachers enhance learning by matching student characteristics to instruction and assessment. Differentiation allows all students to access the same classroom curriculum by providing entry points, learning tasks, and outcomes that are tailored to students' needs. In a differentiated classroom, variance occurs in the way in which students gain access to the content being taught, the process by which they acquire information, and the manner in which they demonstrate understanding (Hall, Strangman, & Meyer, 2003). Let us know the strategies of differentiating instruction:

- Content: What the teacher plans to teach and what the students need to learn. The teacher can plan range of activities:
- l Students level will be determined through formative assessment
- l Using reading materials at varying readability levels
- l Putting text materials on tape/CD
- l Using spelling/vocab lists at readiness level of students
- l Presenting ideas through auditory, visual, kinaesthetic, & tactile means
- l Using reading buddies
- l Flex grouping
- l Compacting
- l Meeting with small groups to reteach idea/skill, or to extend the thinking/skill

39

- l Multi-levelled questions
- l Modelling Process: How the students will access the information. Activities in which the students engage in order to make sense of or master the content
- Strategies:
 - l Tiered activities through which all learners work with the same information, understanding, & skills, but proceed with different levels of support, challenge, or complexity.
 - l Centres/Stations
 - l Developing personal agendas
 - l Manipulative
 - l Varying the length of time a student may take to complete a task
 - l Cubing
 - l Learning logs or journals
 - l Note-taking organizers
 - l Graphic organizers
 - l Highlighted materials
 - l Jigsaw
 - l Think, Pair, Share
 - l Learning Menus
 - l Web quests
 - l Labs
 - l Role Play / Simulations
- Product: How the student will demonstrate what s/he has learned.
 - l Choice boards
 - l Podcast
 - l Blog
 - l Presentation

40

- l Quiz/Test
- l Using rubrics that match and extend students' varied skill levels.
- l Encouraging students to create their own product assignment as long as it contains required elements.
- l Enabling students to use contemporary media/technology as tools to demonstrate knowledge and understanding.

Let us see a graphical presentation of differential of instruction:

41 Conclusion Differential instruction

is an organized, but flexible way of adjusting teaching and learning methods to accommodate each child's learning needs, interests and preferences specifically children who have learning problems or special need in order to achieve his or her maximum growth as a learner and provide them best learning experiences.

1.6.2 Universal design of learning: Learning in general is very person specific, as unique as a person thumb print. Universal design is an architectural concept that focuses on the design of the products, building or environments so that they can be used by all type of people. The term "universal design" was coined by architect and designer Ron Mace at the Center for Universal Design at North Carolina State University (Burgstahler, 2008; Center for Applied Special Technology, 2011b). Mace and his colleagues defined UD as "

the design of products and environments

to be usable by all people, to the greatest extent possible, without the need for adaptation or specialized design" (Center for Applied Special Technology, 2011a). With ADA (Americans with Disabilities Act), 1990 Universal design became very popular among architects and designers who were trying to make public building and city streets accessible for all. Though it was basically for the people with disabilities but afterwards it was seen that this concept is very effective among other population also. So the chief characteristic of Universal Design is that it "proactively builds in features to accommodate the range of human diversity" (McGuire, Scott, & Shaw, 2006, p. 173).

- l Adaptation and modifications to the products, built environment and streets like audio books, closed captioning TV, trolley case, automatic door openers, curb cuts, entry ramps, universal-height drinking fountains, disable friendly toilet, lift with audio sounds, road signals with audio, low floor buss, signage, Wireless remote controlled power sockets and others-are beneficial to many people including pregnant woman, woman with kids in lap, sick and old people, not just those with disabilities. Indeed, people today routinely use door openers to enter a building

42 when their hands are full or kids in lap, pregnant women can use low floor bus, foreign language people can use signage for directions and children visiting the hospital can drink water from a fountain without assistance. Similarly, commuters in noisy airports and students in quiet libraries rely equally on TV closed captioning. Each of these conveniences was originally conceived as a disability accommodation. | Disabilities have less to do with individual deficits-what some people can't do that others can-and more to do with environmental barriers that obstruct people's ability to function effectively and participate fully in society (United Nations, 2006 - Preamble E). Universal Design helps all by removing unnecessary barriers. | The philosophy of UDL has been proved to be fruitful in the field of education also.

If the goal of UD is to remove barriers from the physical environment, the goal of UDL is the elimination of barriers from the learning environment. As David Rose, one of UDL's founders, has stated, "UDL puts the tag 'disabled' where it belongs-on the curriculum, not the learner. The curriculum is disabled when it does not meet the needs of diverse learners" (Council for Exceptional Children, 2011).

| A concise definition of Universal Design for Learning was provided by the Higher Education Opportunity Act of 2008, which stated: | The term UNIVERSAL DESIGN FOR LEARNING means a scientifically valid framework for guiding educational practice that:(A) provides flexibility in the ways information is presented, in the ways students respond or demonstrate knowledge and skills, and in the ways students are engaged; and(B) reduces barriers in instruction, provides appropriate accommodations, supports, and challenges, and maintains high achievement expectations for all students, including students with disabilities and students who are limited English proficient. | Universal Design for Learning is a set of principles for curriculum development that give all individuals equal opportunities to learn. UDL provides a blueprint for creating instructional goals, methods, materials, and assessments that work for everyone--not a single, one-size-fits-all solution but rather flexible approaches that can be customized and adjusted for individual needs.

The origin of the term Universal Design for Learning (UDL) is generally attributed to David Rose, Anne Meyer, and colleagues at the Center for Applied Special Technology (CAST).

UDL is about providing options. In the words of David Gordon, a director at 43 the Center for Applied Special Technology (CAST), "Options are essential to learning, because no single way of presenting information, no single way of responding to information, and no single way of engaging students will work across the diversity of students that populate our classrooms. Alternatives reduce barriers to learning for students with disabilities while enhancing learning opportunities for everyone" (Council for Exceptional Children, 2011).

Why is UDL necessary? Individuals bring a huge variety of skills, needs, and interests to learning. Neuroscience reveals that these differences are as varied and unique as our DNA or fingerprints. Three primary brain networks come into play: Principles of UDL: I. Multiple means of representation - providing learners with various ways to acquire knowledge and information.

44 II.

Multiple means of expression - providing learners with alternatives to demonstrate what they know and what and how they think. III. Multiple means of engagement - providing learners with appropriate means of engaging and interacting with the learning environment. The provision is built into the planning and design of all aspects of the activity or unit - not as an add-on. The approach of Universal Design for Learning can be supported using inclusive technologies. How UDL can help all students to learn | Enriches learning environment | Caters to different learning styles | Motivates learners and increases productivity | Engages reluctant learners | Improves independence and self directed learning | Enhances self esteem | Provides indirect and unplanned learning opportunities How UDL assists teachers | Helps to make education practices more inclusive | UDL caters to diverse learners | Supports effective pedagogy | Improves the quality of teaching and learning | UDL makes planning more efficient | UDL is cost/time effective | Supports Curriculum Framework | Consistent with legislation | Disability Standards in Education 2005 | Education General Provisions Act 2006 Multiple means of representation to support all students

45 Visual support | Graphics | Movies | Animations | Text | Physical objects or movement Supports visual lestrum Disorder. Auditory support | Digital recordings | Wav or MP3 files | Text-to-speech Supports auditory learners as well as students with cognitive impairment, learning difficulties, Dyslexia, speech-language impairment, English as second language. | Signs - Makaton signs supports students with intellectual impairment | Auslan and signed English supports students with hearing impairment Captions | Video captions support students with a hearing impairment Multiple means of expression Communication modes - Speech, sign, AAC including speech generating devices, text- tospeech Writing modes - Pencil and paper - Computer Visual modes - Sculpture - Photos - Movies - Dance - Drama Auditory modes - Sounds - Music Multiple means of engagement Tools that assist students to actively engage with learning, both input and output. The most successful of these for UDL are those that can engage a diversity of students within the one device or system. Many of these devices will have hidden benefits HARDWARE - Various configurations of keyboards

46 | Range of pointing devices | Trackballs ? Joysticks ? Alternative mouse systems ? Glidepoint ? Touch screens ? IWBs - Digital Pens ? Smartpen ? Intellipen | Alternative Computer Systems | Micro laptops ? iPad SOFTWARE Configuration of system or software | Windows/Mac OS | Wordprocessor configuration | Writing templates or scaffolds Rate enhancement software | Supports students who may fatigue from the mechanics of writing | Supports students who struggle with reading or writing and may have poor motivation | Reduces errors in literacy processes | Increases accuracy, speed, productivity and motivation | WordTalk; Natural Reader; Co Writer; textHELP Graphic Organizers | for students with difficulties organizing information and getting started with writing Multi-media interactive | Contain tools and functions that enable a range of students to engage with the learning | Framework applications (Clicker 5, IntelliTools Classroom Suite, "Communicate" series) | 'Learning objects' from TLF An example of how ICT functionality and UDL can address learner differences using multiple means of representation: digitized text

47 | More flexible than printed materials | Readily manipulated | Enlarged text | Background/foreground colour highlighting | Recorded sounds or voice | Graphic support | Text-to-speech | Converted to MP3 | Print to Braille printer Source: CAST 1.6.3 Individualization of instruction: It is auniversally recognized and accepted effective approach to the teaching-learning

48 process.It is a teaching methodology that is to be used for a specific purpose and an identified client.It is also called "tailor-planned" mode of instruction.Sometimes termed as programmed instruction alsoif the teaching material follows a "programmed" style of presentation. As this is the era of inclusive education so individualization of instruction is a major trend in the modern educational practices and is the demand of the hour. Based on the psychology of individual differences instructional process also must be organized according to the needs, interests, learning speed and abilities of the learners.

To individualize the instructional process we need the help of hardware and software technology both. Some of the necessary materials and equipments which are used for individualized instructions are as follows: | Programmed instruction,

programmed books, and programmed learning modules. | Teaching machines, computer assisted instruction and computer managed learning. | Video and audio recorded learning and instructional material.

| Email, internet, teleconferencing and other online educational facilities. | For students with disabilities assistive aids, Special aid material, equipment and appliances can be used. | Special provisions and facilities are made for the creative and gifted students to nurture and develop their individual capacities according to their pace and interest. | Steps of individualized instruction planning: 1. Assessment of student's background, needs and interests 2. Selection of appropriate subject matter 3. Determining the teaching strategies to meet the needs and interests 4. Constant monitoring progress 5. Undertaking revisions/alternative wherever needed 6. Comprehensive evaluation, including qualitative and quantitative records.

49 Advantages: 1. Success-guaranteed as teaching is based on the interest, needs and abilities of the students and are carefully planned. 2. Teaching learning process will be joyful as students will not be bored with the activities. / Care in planning is important so that the procedure must not be too easy or difficult to accomplish. 3. The student progress is in accordance with his intellectual and social traits. 4. Strong retention of learning 5. Substitution of materials or choice of alternatives activities will be easy since the teacher is considering only one student. 6. Easy to adjust planned progress and can easily pinpoint problems and guide in overcoming problems. / Problems and errors could easily be observed and instant remedy could be undertaken. 8. Student learns to be more responsible and is ready to suggest alternative activities to suit his needs. 9. Evaluation system will also be individualized to find out the actual individual achievement.

1.7 Implication of differential instruction, UDL and individualized instruction for inclusion: 1.7.1 Concept of Inclusion As we believe that every child can learn and "If a child can't learn the way we teach, maybe we should teach the way they learn"- Ignacio Estrada Education makes a person self reliant and independent, so education systems must be designed and organized in such a way that it can meet the varying needs of individual learners, and provide an appropriate education and fulfill the fundamental right to education of each child.

50 To attain the goal of universalization of elementary education, govt. of India has launched some innovative legislation and policies like IEDC, RTE, RPWD, signed in UNCRPD etc. The dream of education for all (EFA) cannot be achieved unless all children, including the large population of children with special needs, are provided educational services. Due to disability and varying needs children with special need experience multiple disadvantage in the way of education. Most of the time they are perceived as different and unable to cope with mainstream education and they are kept isolated at home or special schools. But the scenario is being changed with the emergence of philosophy of inclusion, concept of UDL, differential instruction and individualized instruction. UNESCO Salamanca Statement and Framework for Action (1994) proclaimed that, "Every child has a fundamental right to education and must be given the opportunity to achieve & maintain an acceptable level of learning. Every child has unique characteristics, interest, abilities and learning needs, educational system should be designed & educational programmes implemented to take into account the wide diversity of these characteristics and needs. Those with special educational needs must have access to regular schools which should accommodate them within a child-centered pedagogy, capable of meeting these needs." The 1994 UNESCO World Conference also realized this situation when it argued that a school should, ...accommodate all children regardless of their physical, intellectual, social, linguistic or other conditions. This should include disabled and gifted children, street and working children, children from remote or nomadic populations, children from linguistic, ethnic, or cultural minorities and children from other disadvantaged or marginalized area and groups. (UNESCO, 1994, Framework for Action on Special Needs Education, p.6) These inclusive schools, ... must recognize and respond to the diverse needs of their students, accommodating both different styles of learning and ensuring quality education to all through appropriate curricula, organizational arrangements, teaching strategies, resource use and partnerships with their communities. (UNESCO, 1994, Framework for Action on Special Needs Education, p.11-12)

51 Sebba and Ainscow (1996) have offered a definition of inclusion: Inclusion describes the process by which a school attempts to respond to all pupils as individuals by reconsidering its curricular organization and provision. Through this process, the school builds its capacity to accept all pupils from the local community who wish to attend and, in so doing, reduces the need to exclude pupils (p.9).

1.7.2 National and International Legislations Support Inclusive Education : Let us look at the International legislations in support of inclusion: Source: World Bank Group: Education Global Practice Toolkit for master trainers in Preparing Teachers for Inclusive Education for Children with Special Needs

52 Module 1 : Education There are various constitutional provisions in India that have promoted mainstreaming of children with special needs into regular schools. Article 21A of the Constitution guarantees education as a fundamental right to all children in the 6-14 age group, while

53 Section 26

of the Persons

with Disabilities Act, (Equal Opportunities, Protection of Rights and Full Participation) Act (1995)

articulates that free and compulsory education has to be provided to all children with disabilities up to the minimum age of 18 years. The Government of India's 12th Five-Year Plan considered exclusion the single most important challenge in universalizing elementary education. The Draft Persons with Disabilities Bill (2012) enshrines a strong commitment to inclusive education. Government policies and schemes such as Sarva Shiksha Abhiyan (SSA) and Right of Children to Free and Compulsory Education (RTE) Act (2009), have changed the education landscape significantly, resulting in a significant decrease in the number of out-of-school children in the last decade. This has also led to an increasing number of children with disability entering government and private schools. SSA's goal is to provide eight years of elementary schooling for all children, including those with special needs, in the 6-14 age groups. Children with disabilities in the 15-18 age groups are provided free education under two national schemes: Integrated Education for Disabled (IEDC) and Rashtriya Madhyamik Shiksha Abhiyan (RMSA). The 2001 census report says that fifty-one percent of persons with disabilities are illiterate, so India has to continue its efforts to provide Education for All (EFA). It is therefore essential that to mainstream the children with disabilities effectively into regular schools teachers must be trained in inclusive education, need to learn to apply the principles of UDL, and understand the importance of differential instruction.

1.7.3 Key principles of inclusive education:

- Ø IE is based on the belief that the right to education is a basic human right for all children.
- Ø IE ensures good teaching
- Ø IE is a strategy to implement and fulfil the obligation of RTE
- Ø Providing equal opportunities to all children, which do not mean similar things for all children.
- Ø It is based on the concept of providing equitable learning opportunities, keeping in mind the differences and difficulties of the child besides their diverse background and their needs.
- Ø Teaching children from diverse backgrounds requires a tremendous amount of flexibility in teaching practices and processes as well as in curriculum design and learning materials.
- Ø Ensuring equitable learning opportunities by making the education system accessible and responsive to all children, including disadvantaged children, i.e. Scheduled Castes/Scheduled Tribes (SC/ST), minority, children with disabilities, girls, urban deprived, and also ensuring their entitlements to achieve optimal learning outcomes.

54 Ø IE is a process of addressing and responding to diverse needs of learners by reducing exclusion within schools. Ø IE is an entry point to improve the quality of the education system in terms of culture, policy and practices (pedagogy, classroom management, teaching learning materials [TLMs] and the learning environment). Ø Inclusive teachers are good teachers who are flexible in their approach and believe that the source of difficulties in learning is largely environmental and can be addressed.

55 From the above discussion and by looking at the international and national legislation we can clearly understand that inclusion is need of the hour to accommodate all children under the umbrella of education. With the passing of the rights of the persons with disabilities act (RPWDA) 2016 ON 27TH DECEMBER, 2016, inclusive education has become more than just rhetoric. For example section 16 of chapter III of the RPWDA, is clearly stated about inclusive education, "The appropriate government and local authorities shall endeavor that all educational institutions funded or recognized by them provide inclusive education to the children with disabilities and towards that end shall (i) Admit them without discrimination and provide education and opportunities for sports and recreation activities equally with others; (ii) Make building, campus and various facilities accessible; (iii) Provide reasonable accommodation according to the individual's requirements; (iv) Provide necessary support individualized or otherwise in environments that maximize academic and social development consistent with the goal of full inclusion; (v) Ensure that the education to persons who are blind or deaf or both is imparted in the most appropriate languages and modes and means of communication; (vi) Detect specific learning disabilities in children at the earliest and take suitable pedagogical and other measures to overcome them; (vii) Monitor participation, progress in terms of attainment levels and completion of education in respect of every student with disability; (viii) Provide transportation facilities to the children with disabilities and also the attendant of the children with disabilities having high support needs. In preamble it is clearly defined that "Inclusive education" means a system of education wherein students with and without disability learn together and the system of teaching and learning is suitably adapted to meet the learning needs of different types of students with disabilities; In UNCRPD, Article 24 Education stated that, (a) Persons with disabilities are not excluded from the general education system on the basis of disability, and that children with disabilities are not excluded from free and compulsory primary education, or from secondary education, on the basis of disability; (b) Persons with disabilities can access an inclusive, quality and free primary education and secondary education on an equal basis with others in the communities in which they live;

56 (c) Reasonable accommodation of the individual's requirements is provided; (d) Persons with disabilities receive the support required, within the general education system, to facilitate their effective education; (e) Effective individualized support measures are provided in environments that maximize academic and social development, consistent with the goal of full inclusion. 1.7.4 Educational practices Support Inclusive Education To make the dream of inclusion successful some strategies are being followed, Ø Principles of Effective Instruction Ø Universal Design for Learning (UDL) Ø Co-Teaching Ø Differentiated Instruction Ø Curricular Accommodations Ø Collaborative learning Ø Peer mediated teaching Ø Positive Behavior Supports

57 In the 1990 when UDL was introduced into the education domain as the momentum for inclusive education grew. The fundamental objective of inclusion was to prepare an appropriate curriculum to ensure all students can access and participate in the education system. Universal design was clearly relevant to full inclusion. Those who work in the application of UD to teaching and learning invented the term Universal design for learning. UDL emphasizes development of a curriculum that does not involve adaptation or retrofitting. In other words, it is not an add-on to the standard curriculum. Adjustment of curriculum and modified teachers instruction should be built from the beginning. UDL is the exchange of the Power base associated with the transfer of knowledge. UDL gives students control over the way in which they gain access to information, which encourages, their independence in learning and problem solving. It provides for equal access to all by removing barriers to knowledge and learning without diminishing the challenges. (Bauer & Kroeger, 2004) UDL involves the application of three primary principles: 1. Representation- It means using various ways of presenting essential concepts. As there is no single best way of presenting the curriculum that will satisfy the need of all students. For some students only lecture is enough but for some lesson notes are also needed along with the oral presentation. For some other students using graphics, drawings and photographs, even YouTube clips can also help. 2. Engagement - that is ensuring that learning activities must be designed in such a way so that they cater for student's skill levels, preferences and interests. So students must be provided such material which can capture their interests and motivate them in learning. 3. Expression - that is using alternative means of expression that allow students to demonstrate mastery of a topic, skill or acquired knowledge in a variety of way. Some students may write well and some may not, they may even find it difficult to write a simple letter. So providing a range of options that includes written, oral or multimedia presentations like dance, painting, project or even show and tell can help students to demonstrate their achievement of the curriculum goals. UDL also involves 7 teaching and learning features 1. Equitable use- the same technology or resources will be available to and usable by everyone, example most commercial digital mathematics programs have materials that cover a range of students capabilities

58 2. Flexible use - the same technology or resource is used for a number of purposes, example arithmetic or social or language 3. simple and intuitive application - example everyone knows how to look for a book in the library or use the web to search for information 4. Perceptible information - that the technology communicates essential information to the user regardless of the user's capabilities, example instruction and guidelines or manuals. 5. Tolerance for error - example the learning process includes recovery processes if error occurs. 6. Low physical effort - example the teaching process is accessible to students with sensory or mobility impairment 7. Size and space - example accommodates students with particular need such as making seating arrangement for a student with vision impairment at the front of the class. So UDL is all about tools and resources that are usable by all students in a classroom. Burgstahler (2001) distilled the initiatives achieved in design and architecture in to a set of features relating to classroom application. These are, Ø Inclusiveness - a classroom environment that respects and values diversity Ø Physical access - classroom resources and equipment that are accessible to all students. Ø Delivery methods - employment of varied instructional methods Ø Information access - use of for example captioned videos electronic copies of printed materials etc. Ø Interaction - different ways in which teacher and learner interact. Ø Feedback - effective and timely prompting and feedback and Ø Demonstration of knowledge - multiple ways for students to demonstrate their knowledge. UDL focuses on curriculum adaptation and ICT and promotes teaching practices that allow for equal access to all students. Differentiation is a core element of responsive teaching. The concept appears in the professional literature under several heading; curriculum differentiation differentiated

59 instruction and multi level instruction. Differentiation refers to flexible approach to teaching that address the different capabilities of individual student. Curriculum differentiation is the management of the, Ø Content - what is taught and learnt. (e.g.; by providing activity based task through to the conceptual and abstract) Ø process or methods for acquiring content - how knowledge is delivered(e.g.; accommodating preferred learning styles : visual auditory , tactile or kinesthetic) Ø method for assessment - how learning success is evaluated (using authentic task that involve real and relevant problems) Ø resources required - including material and human resources (e.g.; equipment, ICT teacher aids, volunteers, experts) The idea of differentiation is not new maker 1982 suggested ways in which the curriculum might be modified to take into account learner's characteristics, their skills and knowledge the pace of presentation, the complexity of the information and the depth of learning required. Conclusion: So with the implication of the above strategies inclusive education can be successful. Though there are some Barriers to access education and success inclusion which is physical as well as structural. But more than that, it is the curriculum, the pedagogy, the examination and the school's approach, which create barriers. So we need to take care of those barriers by applying the principles of UD(structural), UDL and differentiated instruction or individualized instruction to make the education accessible to all children. 1.8 Summary: So we have seen in this unit that

educational technology is concerned with the systematic application of science and technology in the field of education. It is helpful for both, the teacher and learner to set the learning objectives, strategies, procedures, materials and establish a good communication between them and make the teaching learning process more effective. The initiation of educational technology movement started with audiovisual aids (within 'technology in education') and behaviourism and programmed learning (within 'technology of education'). educational technology in India is being used for School 60 broadcast, TV Telecast lessons, Teacher preparation, Distance education, Correspondence courses, Development of audio- visual materials, Language teaching, Production of multipurpose kits or instructional aids, Computer literacy and studies in schools. The scope of educational technology is very wide and it is utilized in various areas of teaching and learning process like formulation of

educational goals and objectives, Curriculum Development, Developing Teaching-Learning materials and Resources, teacher training, Development of teaching - learning Strategies,Developing Multi- Sensory Aids, Develops Feedback Mechanism, Develops Interactive Instruction Services, Developing Information Resources, Develops Communication Devices etc. Instructional Technology is a subset of educational technology and

it is a systematic way of designing, carrying out and evaluating the total process of learning and teaching in terms of human learning and communication, and employing a combination of human and non-human resources to bring about more effective instruction.

It is helpful for both teacher and learner. Instructional Technology can make the instruction more interesting, more standardized, interactive, instant and need based, develops positive attitudes among students. Educational Technology has brought revolution in the entire education system in our country and also globally with the use of hardware approach, by using various technological aids, like projector, computer, smart phones and many other things; and software approach like using programmed instruction, CAI, CBI etc. With the help of educational technology teaching is not confined within the four wall of classrooms and source of information is not only the teacher, now learner can learn any time anywhere based on their needs and suitability with the help of online learning, online library, internet, blogs, Wikipedia, moodle and many more. There are three major approaches of Educational Technology namely Hardware Approach (Technology in education), Software Approach (Technology of Education) and System Approach. The use of hardware approach and software approach is very necessary to fulfill present age education needs. To reach large population easily, it is being used in distance mode courses, correspondence courses, online learning, and adult education very effectively. Educational Technology can make the teaching learning process effective and interesting by using multisensory approach, individualized education and reinforcement technique with the help of hardware and software technologies.

61 System Approach is a modern approach in educational administration and organization and it acts as a link between hardware and software approach. It is concerned with development, implement and evaluation of the whole educational system, sub-system, and curriculum by organizing human resource and physical resource in an effective and economic way to get the best from the education system. As we are living in the era of information explosion so role of mass media become very important in education sector. Mass media approach in education means to use educational TV, radio, press, newspaper, films, documentaries, internet, educational apps, mobile, etc to reach mass to provide education and also make the learners and teachers modern and up to date. Differentiated instruction is a teaching theory based on the premise that instructional approaches should vary and be adapted in relation to individual and diverse students in classrooms (Tomlinson, 2001). The teacher can differentiate instructional strategies based on the content (what the students are going to learn), the processes (the activities), the products (the accomplishment following a learning period) and the learning environment. The term "universal design" was coined by architect and designer Ron Mace at the Center for Universal Design at North Carolina State University (

Burgstahler, 2008; Center for Applied Special Technology, 2011b). The term UNIVERSAL DESIGN FOR LEARNING means a scientifically valid framework for guiding educational practice that: (A) provides flexibility in the ways information is presented,

in the ways students respond or demonstrate knowledge and skills, and in the ways students are engaged; and (B) reduces

barriers in instruction, provides appropriate accommodations, supports, and challenges, and maintains high achievement expectations for all students,

including students with disabilities. Principles of UDL are 1. Multiple means of representation - providing learners with various ways to acquire knowledge and information. 2.

Multiple means of expression - providing learners with alternatives to demonstrate what they know

and what and how they think and 3. Multiple means of engagement - providing learners with appropriate means of

engaging and interacting with the learning environment. 1.9 Check your Progress Ø Explain the meaning and concept of educational technology in detail. Ø Explain 'hardware' and 'software' approach to education and their contribution towards effective teaching and learning.

62 Ø Differentiate between "technology of education" and "technology in education". Ø Describe in detail the scope of educational technology. Ø Discuss the recent trends of Educational Technology and Instructional Technology in

teaching learning process. Ø What is UDL and how it has a wide applicability to make inclusion successful? Ø Mention

the three primary principles and their uses in inclusive classroom. Ø Justify the need of differential instruction for

Use of ICT to Simplify Record Keeping: Information Management in Educational Administration in Special and Inclusive Setting 2.7.1 Role of ICT in record keeping and information management in school administration 2.7.2 Record Keeping 2.7.3 Use of ICT in Information management in Schools. 2.8 Let us sum up 2.9 Check your progress 2.10 References 2.1

Introduction Information and Communication Technology (ICT) is a generic term, which is being used for collecting, storing, editing and passing on information in various forms. Although there is no single, universal definition of ICT, the term is generally accepted to mean all devices, networking components, applications and systems that allow people and organizations (i.e., educational agencies, businesses, nonprofit agencies, governments and criminal enterprises) to interact in the digital world.

ICT is generally used to represent a broader, more comprehensive list of all components related to computer and digital technologies

than IT. The scope of ICT is not fixed, but is responsive to ongoing technological developments. ICT is leveraged for economic, societal and interpersonal transactions and interactions. ICT has drastically changed how people work, communicate, learn and live.

More than three decades ago, computers and related information technologies were introduced to educators for direct teaching and learning purposes.

Learning and teaching whether it is through actual classroom settings or through technological applications utilizes many psychological principles knowingly or unknowingly. ICT enables interactive and collaborative learning at several and best possible ways. ICT can help the school administrators to improve administrative tasks such as school record keeping system and school information management system.

67 2.2

Objectives After going through this unit, you will be able to • Understand the meaning, definition, scope and significance of

ICT • Understand

the

psychological bases for ICT among teachers and learners • Understand stages, requirement and process of development of ICT • Understand the process of using ICT in developing collaborative networks •

Understand the use of ICT to simplify record keeping 2.3 ICT - Meaning, Definition, Scope and Significance 2.3.1 Meaning and Definition of ICT The

integration of computers and communications offer unprecedented opportunities to the education system with its capacity to integrate and interact with each other over a wide geographic distance in a meaningful way to achieve the instructional objectives.

Increasingly rapid advances in ICT will have profound impact on way teachers teach and how learners learn in near future. The development of new broadband communication services, convergence of telecommunication with computers, recent developments in the field of communication protocol have fostered numerous proposals for the uses of ICT to support the teaching and learning environment.

The growth of these communication and computer systems, their ease of use, the power and diversity of information transfer allow teachers and students to have access to a world beyond the classroom.

It has the potential to transform the nature and process of the learning environment. Interactivity, flexibility and convenience have become the order of the day in the ICT supported environment.

Knowing how to use and integrate ICT in teaching and learning is of utmost importance for teachers in their role of creators of pedagogical environments. While literature provides some evidence of the effectiveness of using ICT in education, little is known about which learning strategies should be used for education and training. ICT development in education is a continuum approach along which an educational system or institution can be mapped depending on the stages of ICT development. These broad stages have been termed as Emerging, Applying, Infusing and Transforming stages of ICT development.

68

ICT stands

for information and communication technology and is defined as a "diverse set of technological tool and resources used to communicate, and to create, disseminate, store, and manage information."

ICT, or information and communication technology (or technologies), is the infrastructure and components that enable modern computing. 2.3.2 Components of an ICT system ICT encompasses both the internet-enabled sphere as well as the mobile one powered by wireless networks. It also includes antiquated technologies, such as landline telephones, radio and television broadcast -- all of which are still widely used today alongside cutting-edge ICT pieces such as artificial intelligence and robotics. ICT is sometimes used synonymously with IT (for

information technology); however, ICT is generally used to represent a broader, more comprehensive list of all components related to computer and digital technologies

than IT. The list of ICT components is exhaustive, and it continues to grow. Some components, such as computers and telephones, have existed for decades. Others, such as smart phones, digital TVs and robots, are more recent entries. ICT commonly means more than its list of components. It also encompasses the application of all those various components. It's here that the real potential, power and danger of ICT can be found.

2.3.3 The scope of ICT

The scope of ICT is not fixed, but is responsive to ongoing technological developments. This is evident in the emergence of advanced internet technology over the past few years and the resulting changes in the ways that students construct with others. Student develop capability in using ICT for tasks associated with information access and management, information creation and presentation, problem solving, decision making, communication, creative expression, and empirical reasoning. This includes conducting research, creating multimedia information products, analyzing data, designing solution to problems, controlling processes and devices, and supporting computation while working independently and in collaboration with others. Students develop knowledge, skills and dispositions around ICT and its use, and the ability to transfer these across environments and applications. They learn to use ICT with confidence, care and consideration, understanding its possibilities, limitations

69 and impact on individuals, groups

and communities. Information and Communication Technology is often used as an extended synonym or as an umbrella term for Information Technology (IT), but it is a most specific term

that

stresses

the role unified communications and the integration of telecommunications (telephone lines and wireless signals), computers

as well as necessary enterprise software, middleware,

storage, and

audio-visual systems, which enable users to access, store, transmit, and manipulate information.

The term ICT is also used to refer to the convergence of audio-visual and telephone networks with computer networks through a

single cabling or link system.

To some scholars,

ICT has no universal definition, as "

the concepts, methods and applications involved in ICT are constantly evolving on an almost daily basis."

The broadness of ICT

covers any product that will store, retrieve, manipulate, transmit or receive information electronically in a

digital form,

e.g. personal computers, digital television, email, robots;"

therefore, one can say that

ICT is concerned with the storage, retrieval, manipulation, or receipt of digital data."

ICT delineates how these various forms of digital mediums interact with one another.

Information and Communication Technology can contribute to universal access to education, equity in education, the delivery of quality learning and teaching, teacher's professional development and more efficient education management,

governance and administration. UNESCO helps a

lot in promoting ICT in education.

The scopes of ICT in various education sectors are: 1. Information Technology in Educational Management 2. Lifelong

Learning 3. Distance Learning 4. IT-Professional and Vocational Education in Information Technology 5. Advancing

community linkages 6. Improving policy planning and management 7. Establishing and sustaining lifelong learning 8.

Facilitating skill formation 9. Lively teaching learning process. 10. Those students can find information, they need proper

instructions, they need scope for creativity, and expectations of the teacher bring forth performance.

70 11. Helping the student learn. 12. Enhance teaching. 2.3.4 Significance of ICT ICT is leveraged for economic, societal and interpersonal transactions and interactions. leT has drastically changed how people work, communicate, learn and live. Moreover, leT continues to revolutionize all parts of the human experience as first computers and now robots do many of the tasks once handled by humans. For example, computers once answered phones and directed calls to the appropriate individuals to respond; now robots not only can answer the calls, but they can often more quickly and efficiently handle callers' requests for services. Pedagogical Usages of ICT

Studies of teaching and learning in schools

around the world identify four broad stages in the way the teachers and learners use leT as a support to teaching and learning.

More than three decades ago, computers and related information technologies were introduced to educators for direct teaching and learning purposes. It started with presentation software to CAL/CBT/CAI, then moved to multimedia courseware and finally to learning management system using open and flexible learning. Supporting work performance In the initial phase, teachers use productivity tools such as word processor, visual presentation software, spreadsheet, database, email etc. to support their daily work performance. In this initial stage, there is usually an emphasis on basic operations of electronic office software. This stage of using productivity tools for teaching and learning is linked with the emerging stage in ICT development Enhancing teaching Following on and from using productivity software, comes the stage of learning how to use and develop computer assisted learning software and beginning to make use of such software in different disciplines. This stage involves the technique of integrating computer-based learning in the traditional instructional process, and is linked with the applying stage in the ICT development model. Various instructional packages were selected, developed and used to enhance traditional classroom teaching. Facilitating learning The next stage involves using various types of instructional software to facilitate student learning. The key point is that the teachers need to learn how to choose the most

71 appropriate tools for a particular task, and using these tools in combination to solve real life problems. This stage implies the ability to recognize situations where various multimedia, simulation and modeling software can be utilized for teaching and learning. This stage is linked with the infusing stage in the ICT development model. Creating innovative learning environments The fourth and last stage involves specializing in the use of network based resources to create meaningful environment with rich affordable for innovative learning models so that it occurs when one enters more deeply into the shared learning environment that creates and transforms the learning situation. This is a completely new way of approaching teaching and learning using technology. It helps to develop, deliver and manage open & flexible learning program. This stage is linked with the transforming stage in the ICT continuum model. 2.3.5

Functional Approach of leT Usage Several attempts have been made to classify the functions of ICT in education in the literature, However, the most comprehensive and well defined classification describes the following functions of the use of ICT in education: (a) ICT as Object (b) ICT as Assisting Tools (c) ICT as Management of Learning and (d) ICT as Medium of Teaching & Learning. ICT as Object It refers to learning about ICT. Mostly organized in a specific course. What is being learned depends on the type of education and the level of the students. ICT curriculum prepares students for the future occupation and social life. There are various types of short term, long term and modular courses being offered in this area to satisfy the ever growing demand of skill personnel in the software industry. ICT as an Assisting Tool ICT is used as a tool, for example while making assignments, collecting data and documentation, communicating and conducting research.

It is independent from subject content. Generic assisting tools may be general or specialised in their application. Some of the examples of generic tools have been described below: Word Processing and Publishing Tools-preparing, editing and producing written, tabular and graphical material; Freehand and Geometric Drawing Tools-devising and producing pictorial representations of events, ideas and art effects;

72 Database Tools-searching, storing, categorizing and arranging data and information; Statistical Analysis and Modeling Tools-deducing trends and patterns, organizing and synthesizing information; Multimedia and Authoring Tools-capturing, editing, modifying integrating text, graphics, audio & video information; Simulation Tools-devising and testing ideas and hypotheses, and projecting future consequences; Animation Tools-creating editing and modifying 2D and 3D animation. 2.3.6 ICT as Medium of

Teaching and Learning This refers to ICT as a tool for the purpose of teaching and learning itself.

More than three decades ago, computers and related information technologies were introduced to educators for direct teaching and learning purpose. It started with CAL/CBT/CAI, then moved to Multimedia courseware and finally to Web Based instruction & Computer Mediated Communication (CMC) system. Using CAI for drill and practice of basic skills can be highly effective according to a large body of data and a long history of use. Students usually learn more, and learn more rapidly, in courses that use computer assisted instruction (CAI). This has been shown to be the case across all subject areas, from preschool to higher education, and in both regular and special education classes. Effective instruction requires presenting information, guiding the learner, practice, and assessment of student learning. The use of a computer to provide any combination of these factors may be termed computer-assisted instruction. It should be noted that there is no requirement that the computer provides all of these elements. Rather, any combination of these can be appropriate computer intervention in the learning process. Interactivity, flexibility and learner control is the hallmark of these technologies. The application of educational technologies to instruction has progressed beyond the use of basic drill and practice software, and now includes the use of complex multimedia products and advanced networking technologies. Today, students use multimedia to learn interactively and work on class projects. They use the Internet to do research, engage in projects, and to communicate. The new technologies allow students to have more control over their own learning, to think analytically and critically, and to work collaboratively. An increasing body of evidence suggests positive results of the ICT integration with teaching and learning. The type, features, styles, usage and pedagogical base of these transformations from CAL to WBI has been described below.

Type: Computer Assisted Learning (CAL)
73 Features: Interactivity, Flexibility and Learner Centered Styles: Drill & Practice, Tutorials, Simulation and Instructional Games Usage: Self Paced Instruction Pedagogical Base: Primarily Behavioral Objectives Type: Multimedia Based Instructional Software Features: Interactivity & Multi model Instruction Styles: Drill & Practice, Tutorials and Simulation & Modeling Usage: Self-Paced Instruction Pedagogical Base: Primarily Behavioral Objectives & Constructivism Type: Web Based Instruction Features: Interactivity, Just in time & On demand Instruction Styles: Computer Supported Collaborative Learning Environment Usage: Asynchronous & Synchronous Virtual Class Room Pedagogical Base: Primarily Constructivism

2.4 Psychological Bases for ICT among Teachers and Learners

2.4.1 Different psychological principles

The fast budding influence of Information and Communication Technology (ICT) and e-learning in content development and content delivery can be seen in every sector of education. Learning and teaching whether it is through actual classroom settings or through technological applications utilizes many psychological principles knowingly or unknowingly. The most commonly used or heard Schools of Psychology are Behaviourism, Cognitivism and Constructivism. All these schools of psychology are developed based on theories formulated by many psychologists and are being effectively applied in actual classroom situations. However, the application of these psychological principles in e-Learning is not much thought of. e-Learning could be more efficient and effective by the contextual use of different psychological principles. An innovative application of computer in the pedagogy and learning process is e-learning. E-Learning may be network based, intranet based or internet based, which includes

74 text, video, audio, animation and virtual environments. The facility of Internet and Intranet enables e-learning that allows learning anytime and anywhere. E-Learning provides faster learning at reduced costs, increased access to learning and clear accountability for all participants in the learning process. The fast budding influence of Information and Communication Technology (ICT) and e-learning in content development and content delivery can be seen in every sector of education. The American Society for Training and Development (ASTD) defines e-learning as a broad set of applications and processes which include web-based learning, computer-based learning, virtual classrooms, and digital. The definition of e-learning varies depending on the organization and how it is used; but basically it involves electronic means of communication, education, and training. Learning and teaching whether it is through actual classroom settings or through technological applications utilizes many psychological principles knowingly or unknowingly. Some of the predictions about the future of education tend to focus not so much on the technology, but on the intersection between pedagogy and technology, and its effect on psychology, epistemology and teaching praxis. The most commonly used or heard Schools of Psychology are Behaviourism, Cognitivism and Constructivism. The early use of technology in educational settings reflected a behaviourist view of teaching and learning. Behaviourism discusses behaviours that can be observed and does not fully consider the thought processes that go on in the learner's mind. Cognitivism differs from behaviourism in that it deals with the internal mental processes of the mind and how these processes could be used to endorse effective learning. We know that 'Learning is relatively permanent changes of behavior through some experience'.

2.4.2 Use of ICT in education from the point of view of learning

ICT is used in education for supporting students' learning or for development of competences, in other words for helping to reach the goals of education. The quality of learning depends on how ICT is used in learning. According to Bransford, Brown, & Cocking (1999) meaningful learning engages students in tackling the topic to be learnt in such a way that they create meaningful and understandable knowledge structures on the basis of a goal for learning. Based on them, it is possible to present an outline of learning with a specific focus on ICT use in learning. Learning represents each individual learner's own personal knowledge construction process which presupposes each learner's active, goal-oriented and feedback-seeking role. The constituents of meaningful learning are the following: activity, intention, contextualization, construction, collaboration, interaction, reflection, and transfer. These serve as development and selection criteria when choosing teaching and learning activities emphasizing ICT use. Activity and intention mean that students take responsibility over their own learning. Thus they set, together with a teacher, their learning goals and proceed according to the plan to reach the goals they set. This process may be facilitated, for example, by guiding students to plan by themselves or in small cooperative groups. On the other hand, students neither master the logical structure of the subject nor recognise their own biased preconceptions, and therefore students goal setting needs to be supported and guided by the teachers. Thus, activities that support co-operative planning and evaluating learning are important for learning. Learning could also be enhanced by self-evaluating activities. Bransford and Donovan (2005) emphasize the role of self-evaluation in learning. They suggest that a teacher should provide support for students self-evaluating for example by giving them opportunities to test their ideas by building things or making investigations and seeing then whether their preliminary ideas were working. Feedback is important for learning. Reflection means that students examine their own learning and develop metacognitive skills to guide and regulate their learning. Metacognitive skills are necessary for planning and evaluating one's own work. These skills make also learning a self-regulatory process in which the student becomes less dependent of the teacher. For example, self-evaluating or evaluating in a small group, taking multiple-choice tests, doing exercises and consulting answer keys support developing reflective and, moreover, metacognitive skills. Collaboration and interaction mean that students actively take part in group activities and support each other by discussing and sharing knowledge. Learning new concepts presupposes a dialogue both between the teacher and the students and amongst the students (explaining, debating, questioning). In addition to face-to-face interaction ICT offers several possibilities to share ideas through newsgroups, email, a LMS, or through social media like Facebook. Construction means that students combine their earlier knowledge with the new topics to be learnt and thereby tailor information structures that they can comprehend. Therefore, the teacher should encourage students to bring up their previous views and beliefs and thereby construct new knowledge on the basis of this shared information. For

76 example, prior to starting reading or writing, students need to be guided to bring up their prior views on the subject to be dealt with. Respectively, before an investigation or other practical activity students should be encouraged to present his or her prediction or even supposition. Contextualization means that learning takes place in real life situations or in situations simulating real-life instances. This in turn presupposes that the learning setting allows for authentic and real-life learning experiences. For example, when using a search machine (Google), students should be encouraged to look information in different sources. This enables them to treat the concepts in various contexts and thereby deepen the meanings these concepts acquire. It pays off also to keep in mind that the quality of all Internet-based sources needs to be checked carefully to ensure that the facts are right (source criticism). From the point of view of interestingness, the context in which science ideas are learned, rather than the ideas themselves, has important influence on learning. For example, when writing it is crucial that students write to prospective readers other than their teacher. Learning is cumulative and, therefore, students are aided in noticing how a new concept or skill is related to other already familiar concepts or the network of concepts or skills. Learning of science process and of ICT skills are similar processes. In both areas there are low level and high level skills. For example, before a student learns to use a LMS he or she should learn to use word processing and a search machine. Consequently, students should be supported in learning new skills and in internalizing the new concepts and in building conceptual networks in the given field. The previous characteristics of learning activity may be realized through the use of ICT. For example, by employing the Internet in the inquiry-based learning, students have access to meaningful information of the topic. When looking up information in varied sources, students at the same time actively structure the flow of information they encounter into meaningful entities in order to be able to complete tasks. Similarly, this exploration of information in varied sources forces students to evaluate the reliability of both the information and the sources they use. Within an activity students could be encouraged to work together and also to systematically evaluate their activities. Several studies have indicated that information processing, inquiry-based learning, and exploring resources via networks, are beneficial for education (Linn, 2003). 2.4.3 Use of ICT in teacher education from the point of view of motivation ICT could be used in education for supporting the development of students' motivation.

77 There are many concepts that can be used to describe motivational aspects of teaching and learning. Here we base our analysis on Self Determination Theory (SDT) (Ryan & Deci, 2000) and Theory of Interest (Krapp, 2007). According to SDT, a student's way of thinking has an important role in the process of motivation. Motivated behaviour may be (i) self-determined or (ii) controlled and they involve different reasons for behaving. Self-determined or autonomous behaviour is behaviour which arises freely from one's self. Controlled behaviour, in contrast, means that the behaviour is controlled by some interpersonal or intrapsychic force, like a curriculum or a task. The motivation styles in SDT are: (i) amotivation, (ii) extrinsic motivation and (iii) intrinsic motivation. Intrinsic motivation has positive effects on learning, in particular, to the quality of learning. Intrinsically motivated behaviours are based on the need to feel competent and self-determined (Deci & Ryan, 2000). Extrinsically motivated behaviour is instrumental in nature. Such action is performed for the sake of some expected outcome or extrinsic reward or in order to comply with a demand. Central to SDT is the concept of basic psychological needs assumed to be innate and universal. These needs are the need for autonomy, the need for competence, and the need for relatedness (need to belong to a group). The fulfillment of need for competence is especially problematic in the case of ICT because the required studies are perceived as being difficult. This perceived lack of competence has an effect on interest and motivation. Furthermore, the interest of the student in a learning activity has an effect to motivation. Consequently, the features of a learning activity and behaviour of a teacher (trainer) could increase the motivation of a learner (student teacher). This is because self-determined learning occurs when a learning activity itself supports fulfillment of basic psychological needs or development of interest. A closer analysis on motivational aspects is based on SDT; ICT is used for motivating or for increasing students' interest for learning. How motivating learning with ICT is for students depends on how ICT is used in this context. Interest is a content-specific motivational variable (Krapp, 2007). Interest is approached from two major points of view. One is interest as a characteristic of a person (personal

78 interest) and the other is interest as a psychological state aroused by specific characteristics of the learning environment (situational interest). Personal interest is topic specific, persists over time, develops slowly and tends to have long-lasting effects on a person's knowledge and values (Hidi, 1990). Pre-existing knowledge, personal experiences and emotions are the basis of personal interest (Schiefele, 1991). Situational interest is spontaneous, fleeting, and shared among individuals. It is an emotional state that is evoked by something in the immediate environment and it may have only a short-term effect on an individual's knowledge and values. Situational interest is aroused as a function of the interestingness of the topic or an event and is also changeable and partially under the control of teachers (Schraw & Lehman, 2001). Although students themselves primarily produce their motivation, it can be enhanced and learned. In practice, a teacher can offer optimal challenges and rich sources of motivating stimulations through choosing the learning activities. Therefore, in addition to previously discussed features of self-determined and controlled behaviour of a learner, it is appropriate to analyse also features of a learning activity which could increase motivation of a learner. This is because self-determined learning occurs when learning activity itself is considered as interesting, enjoyable, or personally important by a learner. From the point of view of the SDT, the motivational features of a learning activity could be classified in five categories: I. autonomy-supporting activities/teacher, through • choosing student-centred learning methods like "open ended" inquiry and other tasks where students have some choices how to plan or study. • collaborative learning activities which support feeling of autonomy, • co-planning of the learning activities. II. Use of ICT where students have • choices, possibilities for planning and evaluating one's own activities, and • support to the feeling of effectiveness and importance of working. III. Support to students' feeling of competency, through • choosing inquiry and other tasks, which are possible for the student to solve; • choosing and using constructive evaluation methods, like self assessment, portfolio evaluation

79 • informal discussions, which help students to recognise that they are good at an activity or do the activity well, • giving support to the feeling that the activity has some value or use for the student. IV. Support to students' social relatedness, through • choosing tasks, collaborative learning activities, co-planning, and ICT use which help students to feel close to peers • giving support to the feeling that the students can trust each other and feel themselves close to each other, • supporting the formation of learning communities over social media and various forms of networking v. Support to interest and enjoyment, through • waking up curiosity by choosing surprise-evoking inquiry and other activities or tasks, • organising enjoyable, fun-evoking and interesting activities, like through choosing interesting web pages or simulations, • choosing activities which hold attention, • interesting content (new materials or new knowledge) and context (human being, occupations, technology, or history). 2.5 Development of ICT - Stages, Requirement and Process 2.5.1 Stages of ICT development Countries in the various region of the world are at different stages of ICT development, in terms of both infrastructure and application of ICT in teaching and learning. Within any such country, there may be uneven development from region to region, area to area, and even from institution to institution. In view of the above considerations, it is useful to have a model for ICT development for developing competency standards for teacher development. Such a model can be a representation of the essential characteristics of ICT development to provide a scaffold or a framework. It can also be useful to show the inter-relationship of various components within a system and thus helping to locate its position in the whole framework. Based on the UNESCO publication, a model has been presented that can be useful in

80 determining the stage of ICT development reached by a country, a district, or even an individual institution. As mentioned earlier, this model is derived from international and national studies of ICT development that have identified a series of broad stages that educational system and institutions typically proceed through, in the adoption and use of ICT. The model is presented here to provide a framework for stages of pedagogy technology integration. Studies of ICT development in both developed and developing countries

identify at least four broad approaches through which educational systems and individual institutions typically proceed in their adoption and use of ICT. Sometimes, the number of stages identified varies, though there is a general consensus that the introduction and use of ICT in education proceeds in broad stages that may be conceived as a continuum or series of steps. These steps, termed Emerging, Applying, Infusing, and Transforming, are elaborated in

Figure 1. Figure 1: Stages of ICT development

Emerging Stage: Schools at the beginning stages of ICT development demonstrate the emerging approach.

Such schools have just started on their journey in the ICT field with a skeleton computing infrastructure either donated or purchased by the school authority.

In this initial phase, administrators and teachers just start to explore the possibilities and consequences of using leT for school management and adding leT to the curriculum. Applying Stage:

Those

schools, in which a new understanding of the contribution of K'T to learning

81 has developed,

exemplify

the applying approach. In this secondary

phase, administrators and teachers use leT for tasks already carried out in school management and in the curriculum.

Schools at the applying approach phase adapt the curriculum in order to increase the use of ICT in various subject areas with specific tools and software such as drawing, designing, modelling and application specific tools. Infusing Stage: At

the third stage, the infusing approach involves integrating or embedding ICT across the curriculum, and is seen in those schools that now employ a range of computer- based technologies in laboratories, classrooms, and administrative offices. The curriculum begins to merge subject areas to reflect real-world applications.

In the infusing approach to ICT development, ICT infuses all aspects of teachers' professional lives in such ways as to improve student learning and the management of learning processes.

Transforming Stage: Schools that use ICT to rethink and renew school organization in creative ways are at the transforming approach. ICT becomes an integral though invisible part of daily personal productivity and professional practice. The

focus of the curriculum is now learner-centered that integrates subject areas in real-world applications. 2.5.2

Characteristics of schools related to ICT development Along with approaches to ICT development noted above, there are various characteristics of schools, or aspects of school leadership, that relate to a school's progress in ICT

development. Below are general descriptions of the more important of these characteristics of schools that have an

effect on ICT development within schools. Vision Vision refers to the aspirations and goals of both individuals within a school and the school system as a whole. As the school advances, the mission statements should become clearer and

provide a basis for decision-making. Mission statements should help individual members of the learning community visualize a school's aspirations for the future and act in harmony. Philosophy of learning and pedagogy Ways in which

teachers and students interact and how the school is managed for learning are part of what is meant by a school's philosophy of learning and pedagogy. These philosophies will necessarily characterize the ways in which ICT is

incorporated into a

82 school. A setting that is dominated by the teacher as the main provider of subject content is adopting a teacher-centred philosophy. The teacher controls the use of ICT in such a setting as well. A learner centred philosophy, by

contrast, describes a setting where content comes from a variety of resources, and where projects are chosen and designed by the students. ICT tools and resources are selected by students in ways that match the aims of a project best.

These contrasting approaches to pedagogy are sometimes referred to as instructivist and constructivist respectively.

Development plans and policies How a school's vision and teaching philosophies are carried out is translated into development plans and policies. In the detailed steps of such plans and policies, goals and objectives are further defined

providing interim and long-term targets. Policies are set, a budget is allocated, facilities are determined, roles are defined, tasks are delegated, and an evaluation plan is created to define the direction ICT development will take. Facilities and

resources The learning environment in which ICT is used requires certain facilities and resources. Facilities include basic infrastructure such as electrical wiring, Internet access, lighting, air-conditioning, and space. Decisions on inclusion or

lack of ergonomic design and choice of furniture impact not only on use of ICT, but also on the health and well being of users. Resources include various types of technological devices from computers with peripherals, video equipment, and

specialized tools like digital microscopes. Further resources include various types of software, as well as traditional tools like books, videos, and audiotapes. Understanding the curriculum An understanding of the curriculum affects the

progression of ICT in the curriculum in following various stages of development. First, is an awareness stage in which students become ICT literate with regard to what technology is available and how it might be used. Second, as students

learn basic skills, they begin to apply various ICT tools to their regular learning assignments and projects.

83 Third, as students become more capable and confident with ICT, they begin to integrate and overlap both subject areas and tools. Last, is the applied use of ICT in which students are now enabled to address larger, more complex, real-world professional issues. Professional development of school staff In parallel with the curriculum for students, there must be professional development of the staff within a school. The personal productivity and professional practice of teachers are enhanced with the use of ICT. First, is an awareness stage in which teachers and staff become ICT literate with regard to what technology is available and how it might be used. Second, as teachers and staff learn basic skills, they begin to apply various ICT tools to their regular tasks and projects Third, as teachers and staff become more capable and confident with ICT, they begin to integrate and overlap both subject areas and tools. Last, is a change in professional practice in which teachers are now enabled to design lessons to incorporate larger, more complex, real-world projects using ICT tools and resources. As ICT is introduced into school systems, there is a tendency to move from discrete skills training to reflective practice and integrative professional development. Budgetary allocation and provision for release time for teacher professional development seriously impact on the ability of a school system to incorporate ICT in a meaningful way. Community involvement Community involvement may include parents, families, businesses, industry, government agencies, private foundations, social, religious and professional organizations, as well as other educational institutions such as vocational schools and universities. Community involvement can come in the form of donations of equipment and resources, or may be in human resources provided for training and technical assistance. As a community contributes to a school, so the school can give back in many ways. For example, a school may decide to provide community members with evening access to computer labs, or have students offer training to parents. The use of ICT provides an opportunity for a school and its students to interact with both local and global communities. Interaction may range from building web sites for community organizations, to sharing projects with remote schools.

84 Assessment Assessment includes both assessments of students as well as overall evaluation of a school system, two aspects that are intricately interwoven. An improvement in the one should predicate an improvement in the other. Means of student assessment should reflect choices in learning pedagogy and an understanding of ICT in the curriculum. For example, in the emerging and applying stages of ICT, assessment may be linked to pencil and paper tests, whereas in the infusing and transforming stages project based portfolios may be more appropriate. Each part of a school system needs to be evaluated to determine its impact on learning. Assessment should inform practice and support the management of learning. Assessment should allow a system to determine whether outcomes have been met, and then reviewed and revised accordingly. Budget allocations, policies, and procedures for ICT should match vision, teaching philosophies, and curriculum choices.

2.5.3 Process of ICT development

Teaching and learning are best thought of, not as separate and independent activities, but rather as two sides of the same coin, interconnected and interrelated. Studies of teaching and learning in schools around the world identify four broad stages in the way that teachers and students learn about and gain confidence in the use of ICT.

Discovering ICT tools The first stage that teachers and learners go through in ICT development is of discovering ICT tools and their general functions and uses. In this discovery stage, there is usually an emphasis on ICT literacy and basic skills. This stage of discovering ICT tools is linked with the emerging approach in ICT development. Learning how to use ICT

tools Following on from the discovery of ICT tools comes the stage of learning how to use ICT tools, and beginning to make use of them in different disciplines This stage involves the use of general or particular applications of ICT, and is linked with the applying approach in ICT development.

Understanding how and when to use ICT tools The next stage is understanding how and when to use ICT tools to achieve a particular purpose, such as in completing a given project. This stage implies the ability to recognize situations where ICT will be helpful, choosing the most appropriate tools for a particular

85 task, and using these tools in combination to solve real problems. This stage is linked with the infusing and transforming approaches in ICT development. Specializing in the use of ICT tools The fourth and last stage involves specializing in the use of ICT tools such as occurs when one enters more deeply into the science that creates and supports ICT. In this stage students study ICT as a subject to become specialists. Such study concerns vocational or professional education rather than general education and is quite different from previous stages involving the use

of ICT tools. 2.6 Use of ICT in Developing Collaborative Networks for Sharing and Learning such as -internet, E-mail, Tele-teaching,

Teleconferance 2.6.1 ICT in developing collaborative network:

The potential of each technology varies according to how it is used.

Haddad and Draxler identify at least five levels of technology use in education:

presentation, demonstration, drill and practice, interaction, and collaboration.

Each of the different ICTs—print, audio/video cassettes, radio and TV broadcasts, computers or the Internet—may be used for presentation and demonstration, the most basic of the five levels.

Except for video technologies, drill and practice may likewise be performed using the whole range of technologies.

On the other hand, networked computers and the Internet are the ICTs that enable interactive and collaborative learning best;

their full potential as educational tools will remain unrealized if they are used merely for presentation or demonstration.

ICTs

stand for information and communication technologies and are defined, for the purposes

of this primer,

as

a "

diverse set of technological tools and resources used to communicate,

and to create, disseminate, store, and manage information." These technologies include computers,

the Internet, broadcasting technologies (radio and television), and

telephone

to be used and their modalities of use. 2.6.2

Teleconferencing and

its educational use:

Teleconferencing refers

to "interactive electronic communication among people located at two or more different places."

There are four types of teleconferencing based on the nature and extent of interactivity and the sophistication of the technology: 1) Audio conferencing;

86 2)

Audio-graphic conferencing, 3) Videoconferencing;

and 4) Web-based

conferencing.

Audio conferencing involves the live (real-time)

exchange of voice messages over a telephone network. When low-bandwidth text and still images such as graphs, diagrams or pictures can also be exchanged along with voice messages, then this type of conferencing is called audio graphic.

Non-moving visuals are added using a computer keyboard or by drawing/writing on a graphics tablet or whiteboard.

Videoconferencing allows the exchange not just of voice and

graphics but also of moving images.

Videoconferencing technology

does not use telephone lines but either a satellite link or television network (

broadcast/cable). Web-based conferencing, as the name implies, involves the transmission of text, and graphic, audio and visual media via the Internet;

it requires the use of a computer with a browser and communication can be both synchronous and asynchronous.

Teleconferencing is used in both formal and non- formal learning contexts

to

facilitate teacher-learner

and learner-

learner discussions, as well as to access experts and other resource persons remotely.

In open and distance learning, teleconferencing is a useful tool for providing direct instruction and learner support, minimizing learner isolation.

The audio-graphic teleconferencing network aims to provide continuing education and academic upgrading to nurses in parts of Tianjin municipality where access to nursing education has been extremely limited. Various higher education institutions using teleconferencing in their online learning programs include the Open University of the United Kingdom, UIN Ar-Raniry (Universiti Tun Abdul Razak) in Malaysia, Open University of Hong Kong, and Indira Gandhi National Open University. 2.6.3 Telecollaboration Online learning involving students logging in to formal courses online is perhaps the most commonly thought of application of the Internet in education. However, it is by no means the only application. Web-based collaboration tools, such as email, message boards, real-time chat, and Web-based conferencing, connect learners to other learners, teachers, educators, scholars and researchers, scientists and artists, industry leaders and politicians-in short, to any individual with access to the Internet who can enrich the learning process. The organized use of Web resources and collaboration tools for curriculum appropriate purposes is called telecollaboration.

Judi Harris defines telecollaboration as "an

87 educational endeavor that involves people in different locations using Internet tools and resources to work together. Much educational telecollaboration is curriculum- based, teacher-designed, and teacher-coordinated. Most use e-mail to help participants communicate with each other. Many telecollaborative activities and projects have Web sites to support them." The best telecollaborative projects are those that are fully integrated into the curriculum and not just extra-curricular activities, those in which technology use enables activities that would not have been possible without it, and those that empower students to become active, collaborative, creative, integrative, and evaluative learners (see Table 1). There are currently hundreds of telecollaborative projects being implemented worldwide and many more that have either been completed or are in development. 2.6.4 Use

of

radio and TV broadcasting in education:

Radio and television have been used widely as educational tools since the 1920s

and

the 1950s, respectively.

There are three general approaches to the use of radio and TV broadcasting in education: ●

direct class teaching, where broadcast programming substitutes for teachers on a temporary basis; ●

school broadcasting, where broadcast programming provides complementary teaching and learning resources not otherwise available; and ●

general educational programming over community, national and international stations which provide general and informal educational

opportunities. 2.6.5

Internet

The

Internet has introduced improvements in technology, communication and online entertainment, but it is also incredibly useful for education purposes as well. Teachers use the Internet to supplement their lessons, and a number of prestigious universities have opened up free online lectures and courses to everyone. It has even allowed retired teachers to read to and educate children in poorer countries. Widespread use of the Internet has opened up a substantial amount of knowledge to a much broader range of people than ever before. The development of Internet technologies has raised the education level in all countries and it has changed the way students are being taught at schools. That's why it is very important for the present generation that they provide internet education for their young generations.

88 Internet applications respond to students and other people questions in real time. Students are seeing Google as a new Teacher and the Internet as a school. That's why it is important for teachers to use information technology in education. The Internet has been crucial in the evolution of our education system in various ways. Teachers can use the internet as a modern tool for education. Education department should provide the infrastructure that teachers and student can use to get benefits of technology in education. Students are always curious and creative by nature. They are smart enough to know how they can use the internet to search for almost anything. It doesn't matter if they are studying at a private school or government school. But at the same time, there is a difference in the ways they use the internet for education in schools. In private schools, teachers will teach about computer and internet skills to students. The students note the homework that needs to be done related to that computer class. And do you know how some students do this? They are forced to go to a cyber cafe with their parents to collect data that they have to include in their assignments. This is not good. If students are taking the help of cyber boy to collect the data for their homework I don't think these students learned anything in this process. But the one thing they do learn is that money can work wonders anywhere. The teaching process that schools are following is not good and they need to use the internet as a tool, not the source. The source is a student. Teachers need to explore the creativity in their student's minds. And then students can learn and solve problems using their own creativity and innovative thinking and not by the direct work of parents/ tuition. If necessary the parents can help with encouragement but they should not do the homework themselves. Completing the assignment given is not as important as the learning process that a child goes through while doing it. It is essential for parents to provide computer and internet facilities to their children. It is not that easy for parents to pick up modern technologies as fast as their children but it is very important that parents also know about the importance of computers literacy and internet education. In government school especially in India, the level of computer and internet infrastructure is very low. I know government school or school in villages provide computer education only after 9th or 10th class. Within that little time too, a government school student barely gets to learn much because there are 5- 10 students who are assigned a single computer. It is very difficult to learn this way. I agree that this is the best time to teach them about the advanced computer skills but this is not the way to do it. The lack of Information technology infrastructure in schools is a big question mark against

89 Government policies towards computer education. It feels bad to see on the news that computer teachers are on strike again. This happens once a year. The government must think, how computer teachers can teach with low-quality IT infrastructure in government schools and a small salary? 2.6.6 Electronic Mail Electronic mail is a method of exchanging messages via computer networks and the Internet; the addressee receives the message virtually instantly. Using e-mail requires creating mailbox with an e-mail service provider. The mailbox is protected with a username and password. Advantages: An e-mail message can be sent to many recipients at once; A message can have one or several file attachments; Users can access their e-mail account from any computer connected to the Internet; No paper needed; Very low direct and indirect costs; Messages can be received on mobile devices. Disadvantages: The advantages of e-mail are also used by spammers and computer viruses; Attached files can contain viruses. 2.7

Use of ICT to Simplify Record Keeping: Information Management in Educational Administration in Special and Inclusive Setting 2.7.1 Role of ICT in record keeping and information management in school administration ICT makes dynamic changes in society. It is influencing all aspects of life. The influences are felt more and more at schools. Because ICT provides both students and teachers with more opportunities in adapting learning, teaching and managing the individual needs, society is forcing schools to aptly respond to this innovation. It provides newer and more effective ways of mitigating some of the challenges being faced by the educational system of the country. These technologies distinguish themselves by their

90 rapid evolution and revolution, continuously changing the modes of engagement with them. A decade long infusion of computers, and more recently ICT, has demonstrated varying impacts on learning. In the current information age, educational institutions are expected to play a crucial role as the engine for knowledge generation and learning environment. In this regard ICT becomes the vital means to facilitate this task. ICT has become an essential part of our everyday life, accordingly this integration in school improvement is not only for the purpose of teaching and learning, but also for educational management use, it has become one of the most effective factors in the school improvement. ICT plays a vital role in improving the functional effectiveness of school system. ICT can help the school administrators to improve administrative tasks such as school record keeping system and school information management system. 2.7.2

Record Keeping School records are books, documents, files and CD ROM in which is embodied information on what goes on in school (e.g. scholastic, co-scholastic, non-scholastic activities and important events etc), the school plant as well as other relevant information focusing on the growth and development of the school. The school records are official transcripts or copies of proceedings of actions, events, other matters kept by the school administrator, school records could be viewed as authentic registers or instruments or documents of official accounts of transaction or occurrence which are preserved in the school's office. Therefore, every school must keep certain specified records. Importance of school records: School records keeping includes the fact that school records tell the history of the school and are useful historical sources. 1. Tell the history of the school and are useful historical sources. 2. Facilitate continuity in the administration and management of a school. 3. Facilitate and enhance the provision of effective guidance and counselling services for students in the social, academic career domains. 4. Provide information about student's special educational or other needs, students current level of performance, students medical history etc. 5.

Provide information needed on ex-students by higher and other related institutions and employers of labour for admission or placement.

91 6. Facilitate the supply of information to parents and guardians for the effective monitoring of the progress of their children/wards in schooling or performance. 7. Provide data needed for planning and decision making by school heads, ministries of education and related educational authorities. 8. Provide a basis for the objective assessment of the state of teaching and learning in a school, including staff and student performance by supervisors and inspectors. 9. Provide information for the school community, the general public employers as well as educational and social science researchers for the advancement of knowledge. 10. Enable school heads to collate information on pupils and staff for decision making by higher authorities, the law courts security agencies and other related government agencies when occasion demands. 11. Provide a mechanism such as the school timetable for the productive management of time and coordination of school work and activities. 12. Serve as data bank on which both the school head and staff and even students can draw on. Some Important School Records • Admission and Withdrawal Register: This is a permanent record book into which is entered information regarding the entry and exit, including the details of the education and progress of each pupil that ever passes through the school. • Attendance Register: An attendance register is a book in which the presence or absence of students in a school is recorded on a daily basis. It is a statutory record that must be kept by every school. This record is kept on individual class basis. The class teacher is the custodian of this record. • Log Book: The log book is a historical record of events that have significant effects on the schools' activities. • The Visitors Book: The book is meant for recording the visits of important personalities, including officials and from the ministries of education or other related government agencies or any other school related visitors. • Staff and Students' Personal Files: It is necessary that the school should have as much information on every teacher and student as possible without violating their privacy.

92 • Cumulative Record Folder: Students' cumulative record folder is a storehouse of information on students' cognitive, affective and psycho-motor development. • Students' Report Sheet/Card' 1. It keeps data on students' academic performance. 2. It assists in monitoring students' academic progress. 3. It is a compliment to cumulative record folders. • Lesson Notes/Plan 1. It gives information on what a teacher plans to teach the students at a period of time. 2. It clearly shows the teachers' level of preparedness and their level of competence. 3. It challenges teachers for the task ahead. • Scheme and Record of Work Book: It reflects estimate of academic work which teachers expect to accomplish in each subject based on number of lessons they will have during each term. Pertinently it shows the ability of the teacher to organize the year's work and his/her resourcefulness and enthusiasm regarding the progress of the pupils. • Staff Time Book and Movement Book 1. They provide information on when staff report and or close at work. 2. They promote regular attendance and punctuality 3. They help checking truancy and gross indiscipline in staff. • Transfer and Leaving Certificate: Transfer and leaving certificate is the formal exit of the student after completion of study or leaving during the course of study in a school. • Library records: The library will have many records like stock register, issue register etc. Many of the routine function of the library can be automated using library management software. • Stock register: it is the record of all equipments and materials available in the school including the laboratories ●●●●● Cash Register 1. It is a record of financial transactions in schools.

93 2. It gives information about income and expenditures. 3. It promotes accountability and prevents corrupt practices. • Potential

of ICT in Record Keeping The usefulness of keeping school records with Information and Communication Technologies (ICT) is for the following reasons: ●●●● Administrative Efficiency:

One major setback in achieving the educational objective of the secondary education is inefficiency of the principal in keeping some

records. With the introduction of information and communication technologies such as computers, digital libraries, e-mail, internet and so on where information are stored and disseminated, principals can do better in keeping records, and become effective and efficient in performing their prescribed roles

as administrators. ● Availability of Information:

Information and Communication Technologies will help maintain adequate and accurate records in our schools and make it available with ease. ●

Easy Retrieval: It also leads to easy accessibility and dissemination of information on school records, will become available for national planning, financial budgeting, effective implementation of the educational programs and policies. School record keeping

is all about information collection, storage, retrieval, use, transmission, manipulation and dissemination for the purpose of enriching communication, decision-making and problem solving ability in the school system. It is therefore necessary that this process be as accurate and accessible as possible. Using ICT in keeping school records will help to facilitate and enhance the administration of the school towards achieving the goals of the secondary education. 2.7.3

Use of ICT in Information Management in Schools. E-mail: Schools can create and send out a classroom newsletter to keep parents up to date by e-mail. They can collect the e-mail addresses in the beginning of the school year or give parents the opportunity to sign in for the newsletter on the school website. Individual teachers can send e-mails when there are problems in the classroom or for giving parents good news about the learning process of their children. E-mails can be sent individually or in group. It is very easy to make groups of addresses in the most

94 common e-mail programs. Parents can read and respond to e-mails whenever they have time. E-mails are also available in the LMS and students contributions in terms of chats and forum postings get e-mailed automatically by the system. Website or Blog: On the school website all information of the school such as contact information, expectations, school rules, about the school and the teachers, how to use the internet at home, etc can be showed. The website can also have a calendar with useful information about school trips, parental evenings, and a map with pictures of activities with learners, etc. A school or class can make its own website on hired web space or can use free hosting web sites.

Many schools are using free blogging services from Google and word press to provide information to parents, students and public in general. Online Survey: Technology currently permits to get quick feedback from parents through online survey. Tools like Google form and survey monkey can be easily set up to get the information from parents and community members. These tools not only collect the information but perform the basic analysis and the outputs are

provided automatically for quick decision making. Virtual Learning Environments: A virtual learning environment (VLE) is a software system designed to support teaching and learning in an educational setting. A VLE will normally work over the Internet and provide a collection of tools such as those for assessment (particularly of types that can be marked automatically, such as multiple choice) or self-evaluation, communication through discussion boards, uploading of content, return of students' work, peer assessment, administration of student groups, collecting and organizing student grades, questionnaires, tracking tools, etc. New features in these systems include wikis, blogs, RSS and 3D virtual learning spaces. It can be seen that the VLE or the Learner Management Systems (LMS) have its own inbuilt communication

modules to interact with the learners which in turn can be monitored by parents at home. MOODLE is one of the popular open source LMS. You can review the features of MOODLE from its website at www.moodle.org Media Sharing: currently it is possible to share various kinds of media online. Most popular one is sharing of videos through online video sharing sites like You Tube. Schools can use this to communicate with parents by sharing school programme related videos, videos for training parents on child rearing practices, helping students manage stress, time etc. School related audio programme could be podcasted using online podcasting sites. Presentations by teachers and others could be shared with parents through slide sharing sites. Images can be shared using flicker.

95 Social Networks. It is possible to use social networks like Facebook, Twitter or MSN to communicate with parents. It is possible to make groups in Facebook and share information with the parents. Parents can communicate with each other of the class of their children. They can share pictures, important information, etc. Facebook is not so difficult to work with and a lot of parents already have a Facebook account. An interesting website to teach parents to use Facebook is <http://facebookforparents.org/> Online Groups and Forums: Communicating with parents are made easy using forum and e-mail groups like Google groups and Yahoo groups. The school can create specific group of parents using Google or Yahoo services to communicate each other and among parents. It is also possible to share files among the group members. SMS and Instant Messaging: School can send SMS to the parents when the child is not at school. So the parents will immediately know if their child is playing truant. When the school has to send an urgent message for parents, school can send a collective SMS, warn parents or an individual SMS to contact a specific parent. Now days instant messaging service like WhatsApp is very popular among teachers, students, and parents. The simplicity of this tool makes it easy for sending information to parents. Specific WhatsApp group could also be formed for taking up discussion on a specific issue.

2.8 Let us sum up • The integration of computers and communications offer unprecedented opportunities to the education system with its capacity to integrate and interact with each other over a wide geographic distance in a meaningful way to achieve the instructional objectives. •

The development of new broadband communication services, convergence of telecommunication with computers, recent developments in the field of communication protocol have fostered numerous proposals for the uses of leT to support the teaching and learning environment.

The growth of these communication and computer systems, their ease of use, the power and diversity of information transfer allow teachers and students to have access to a world beyond the classroom. • ICT development in education is a continuum approach along which an educational system or institution can be mapped depending on the stages of ICT development. These broad stages have been termed as Emerging, Applying, Infusing and Transforming stages of ICT development. •

ICT stands

for information and communication technology and is defined as a

96 "diverse set of technological tool and resources used to communicate, and to create, disseminate, store, and manage information." •

ICT encompasses both the internet-enabled sphere as well as the mobile one powered by wireless networks. It also includes antiquated technologies, such as landline telephones, radio and television broadcast - all of which are still widely used today alongside cutting-edge ICT pieces such as artificial intelligence and robotics. • ICT commonly means more than its list of components. It also encompasses the application of all those various components. It's here that the real potential, power and danger of ICT can be found. • The scope of ICT is not fixed, but is responsive to ongoing technological developments. This is evident in the emergence of advanced internet technology over the past few years and the resulting changes in the ways that students construct with others. • Student develop capability in using ICT for tasks associated with information access and management, information creation and presentation, problem solving, decision making, communication, creative expression, and empirical reasoning. This includes conducting research, creating multimedia information products, analyzing data, designing solution to problems, controlling processes and devices, and supporting computation while working independently and in collaboration with others. The scopes of ICT in various education sectors are: 13. Information Technology in Educational Management 14. Lifelong Learning 15. Distance Learning 16. IT-Professional and Vocational Education in Information Technology 17. Advancing community linkages 18. Improving policy planning and management 19. Establishing and sustaining lifelong learning 20. Facilitating skill formation 21. Lively teaching learning process. 22. Those students can find information, they need proper instructions, they need scope for creativity, and expectations of the teacher bring forth performance.

97 23. Helping the student learn. 24. Enhance teaching. • ICT is leveraged for economic, societal and interpersonal transactions and interactions. ICT has drastically changed how people work, communicate, learn

and live. • Studies of teaching and learning in schools

around the world identify four broad stages in the way the teachers and learners use ICT as a support to teaching and learning -

supporting work performance, enhancing teaching, facilitating learning and creating innovative learning environments. • Several attempts have been made to classify the functions of ICT in education in the literature, However, the most comprehensive and well defined classification describes the following functions of the use of ICT in education: (a) ICT as Object (b) ICT as Assisting Tools (c) ICT as Management of Learning and (d) ICT as Medium of Teaching & Learning. • An increasing body of evidence suggests positive results of the ICT integration with teaching and learning. The type, features, styles, usage and pedagogical base of these transformations from CAL to WBI has been described below. Type: Computer Assisted Learning (CAL) Features: Interactivity, Flexibility and Learner Centered Styles: Drill & Practice, Tutorials, Simulation and Instructional Games Usage: Self Paced Instruction Pedagogical Base: Primarily Behavioral Objectives Type: Multimedia Based Instructional Software Features: Interactivity & Multi model Instruction Styles: Drill & Practice, Tutorials and Simulation & Modeling Usage: Self-Paced Instruction Pedagogical Base: Primarily Behavioral Objectives & Constructivism Type: Web Based Instruction Features: Interactivity, Just in time & On demand Instruction Styles: Computer Supported Collaborative Learning Environment

98 Usage: Asynchronous & Synchronous Virtual Class Room Pedagogical Base: Primarily Constructivism • Learning and teaching whether it is through actual classroom settings or through technological applications utilizes many psychological principles knowingly or unknowingly. The most commonly used or heard Schools of Psychology are Behaviourism, Cognitivism and Constructivism. • ICT is used in education for supporting students' learning or for development of competences, in other words for helping to reach the goals of education. The quality of learning depends on how ICT is used in learning. • ICT could be used in education for supporting the development of students' motivation. • There are many concepts that can be used to describe motivational aspects of teaching and learning. • According to SDT, a student's way of thinking has an important role in the process of motivation. • Based on the UNESCO publication, a model has been presented that can be useful in determining the stage of ICT development reached by a country, a district, or even an individual institution. • Studies of ICT development in both developed and developing countries

identify at least four broad approaches through which educational systems and individual institutions typically proceed in their adoption and use of ICT. Sometimes, the number of stages identified varies, though there is a general consensus that the introduction and use of ICT in education proceeds in broad stages that may be conceived as a continuum or series of steps. These steps, termed Emerging, Applying, Infusing, and Transforming. •

The potential of each technology varies according to how it is used.

Haddad and Draxler identify at least five levels of technology use in education:

presentation, demonstration, drill and practice, interaction, and collaboration. • Each of the different ICTs-print, audio/video cassettes, radio and TV broadcasts, computers or the Internet-may be used for presentation and demonstration, the most basic of the five levels.

Except for video technologies, drill and practice may likewise be performed using the whole range of technologies. • Teleconferencing refers

to "interactive electronic communication among people

99 located at two or more different places."

There are four types of teleconferencing based on the nature and extent of interactivity and the sophistication of the technology: • 1) Audio conferencing; • 2)

Audio-graphic conferencing, • 3) Videoconferencing;

and • 4) Web-based

conferencing. •

Online learning involving students logging in to formal courses online is perhaps the most commonly thought of application of the Internet

in education. •

Radio and television have been used widely as educational tools

since the 1920s

and the 1950s, respectively. •

The Internet has introduced improvements in technology, communication and online entertainment, but it

is also incredibly useful for education purposes as well. • Electronic mail is a method of exchanging messages via computer networks and the Internet; the addressee receives the message virtually instantly. • ICT has become an essential part of our everyday life, accordingly this integration in school improvement is not only for the purpose of teaching and learning, but also for educational management use, it has become one of the most effective factors in the school improvement. ICT plays a vital role in improving the functional effectiveness of school system. ICT can help the school administrators to improve administrative tasks such as school record keeping system and school information management system.

2.9 Check your progress Define ICT What are the components of an ICT system? What are the scopes of ICT in various education sectors? What are the use of ICT in education from the point of view of learning? Explain ICT in developing collaborative network.

References 3.1 Introduction There has been a rapid growth in recent years in the uses of digital technologies in education, which mirrors the increasing importance of the use of these technologies in the world in general. In mainstream education in many parts of the world, the uses of digital technologies have been constantly increasing and we find ourselves in situations in which all teachers are being expected to demonstrate their ability to use such technologies as part of their teaching toolkit. With the advancement of technology in this world, we can see that the world that we live in is changing rapidly and the field of education are one of the field that are growing to be much better. The old day education where the learning environments are passive is long gone. We can see that the use of multimedia in education has grown a lot in this recent years and is looking to expand ever further in the future. The traditional education also known as conventional education is a long-established customs found in school that society has traditionally deemed appropriate. This type of education is more to teacher-centered that focused on rote learning and memorization. In the traditional learning, students are passive absorbers of information and authority. They are less active in class and lack in problem solving skills. Furthermore, the traditional ways of learning are much more linear with factual accumulation and skill mastery while the new approach with the help of multimedia are non-linear, with one idea linked to another, allowing the learner to choose the path that they want to learn.

104 The traditional approach of learning also lack in resource. Knowledge can only be absorbed through lecture and textbook. By using multimedia, there will be much more resource that can be attained especially through the use of the internet. The traditional approach of learning is also less creative. The students are more passive as they lack in material resource needed in order to express their creativity. Such loop hole can make children to be less passionate to learn. This is why multimedia use in education is vital in education. Multimedia is vital in our life. This is because it is packed with various elements such as text, graphic, sound, video and animation. All of this element can be seen in our surrounding. It is also used in various fields such as in education, training, business, games, science and technology. This is a proof that multimedia is important. In fact, multimedia is changing the ways of learning itself. Instead of just limiting with a linear presentation such as reading text from a book, multimedia makes many improvements in learning by bringing various elements in order to make it more dynamic. "Multimedia is a synthesis: a hybrid offering the advantages of the user-driven book with the wonders of electronic technology" -Robert Winter. A primary application of the interactive multimedia for instruction is in an instructional

situation where the learner is given control so that he/she may review the material at his or her own pace and in keeping with his/her own individual interests, needs, and cognitive processes. The basic objective of interactive multimedia material is not so much to replace the teacher as to change the teacher's role entirely. As such, multimedia must be extremely well designed and sophisticated enough to mimic the best teacher, by combining in its design the various elements of the cognitive processes and the best quality of the technology. With today's multimedia courseware, once a programme has been designed and built in with the appropriate responses, it should be flexible and permit change and alteration. Multimedia is a melody sung in harmony with multi-channel and multi-modal bits of knowledge and creation.

Multimedia facilitates mastering basic skills of a student by means of drill and practice. It helps in problem solving by means of learning by doing, understanding abstract concepts, provide enhanced access for teachers and students in remote locations, facilitate individualized and cooperative learning, helps in management and administration of classroom activities

and learning content, and simulate real life problem handling environments. Multimedia

Technology is used and experimented by various educational institutions of all levels all over the world in their own designed modes.

105 3.2

Objectives After going through this unit you will be able to ●

define multimedia and

discuss its meaning, nature, scope and approach. ● explain the different types of projected and non-projected aids along with their merits and demerits. ● discuss about the different

advantages and limitations of multimedia in education. ● discuss the recent trends in multimedia. ● Explain the implications of multimedia in teaching and learning. 3.3

Multimedia : Meaning, Nature, Scope, Definition and Approaches

Information which is stored in different forms could be combined and used in different combinations.

Multimedia can be recorded and played, displayed, dynamic, interacted with or accessed by information processing devices, such as computerized and electronic devices. Multimedia devices are electronic media devices used to store and experience multimedia content.

This process has given rise to the term 'Multi-media'.

This combination of different media for communication has influenced and changed all aspects of our life, including the teacher and the learner. Multimedia has become an inevitable part of any presentation. We have seen that it has found a variety of applications right from entertainment to education. The evolution of internet has also increased the demand for multimedia content. Multimedia is a term used to describe how multiple means of media like text, audio, graphics, animation, video, and interactivity are used to communicate information. It is also often used to describe any computer media. This helps us to understand information at a faster rate.

3.3.1 Meaning of Multimedia

Multimedia is defined in many ways.

Most of the definitions agree on the characteristic that multimedia contains texts, graphics, animations, video and sound in an unified way and the content can be structured and presented differently.

Let us explore some of the definitions given below. "

Multimedia is the

exciting combination of computer hardware and software that allows you to integrate video, animation, audio, graphics, and text resources to develop effective presentations on an affordable desktop computer" (Fenrich, 1997).

106 "

Multimedia

is characterized by the presence of text, pictures, sound, animation and video; some or all of which are organized into some coherent program" (Phillips, 1997).

From these definitions we see that Multimedia is a concept which sees the use of text, graphic art, sound, animation, and video in different combinations. This integration of Media into one whole and that which gives the user more benefits than any one of the media used individually is Multimedia. Interactive Multimedia: The Encyclopedia Britannica Online defines "Interactive Multimedia" as, any computer-delivered electronic system that allows the user to control, combine, and manipulate different types of media, such as text, sound, video, computer graphics, and animation. Interactive multimedia integrates computer, memory storage, digital (binary) data, telephone, television, and other information technologies. Their most common applications include training programs, video games, electronic encyclopedias, and travel guides. Interactive multimedia shift the user's role from observer to participant and are considered the next generation of electronic information systems.

Multimedia learning as learning from words and pictures (Mayer 2005), o The words can be printed (e.g., on-screen text) or spoken (e.g., narration). o The pictures can be static (e.g., illustrations, graphs, charts, photos, or maps) or dynamic (e.g., animation, video, or interactive illustrations). Multimedia instruction is intended to foster learning by presenting words and pictures. Figure : Visual Representation of the Cognitive Theory of Multimedia Learning (sources: http://www.ied.edu.hk/apfslt/v12_issue2/rias/image1.jpg)

107 3.3.2 Basic Assumptions and Principles Richard E. Mayer discusses twelve principles that shape the design and organization of multimedia presentations. Some examples are included: Coherence Principle - People learn better when extraneous words, pictures and sounds are excluded rather than included.

Signaling Principle - People learn better when cues that highlight the organization of the essential material are added.

Spatial Contiguity Principle - People

learn better when corresponding words and pictures are presented near rather than far from each other

on the page or screen. Segmenting Principle - People learn better from a multimedia lesson is presented in user-paced segments rather than as a continuous unit. Pre-training Principle - People learn better from a multimedia lesson when

they know the names and characteristics of the main concepts. Modality Principle - People learn better from graphics and narrations than from animation and on-screen text. Multimedia Principle - People learn better from words and pictures than from words alone. Personalization Principle - People learn better from multimedia lessons when words are

in conversational style rather than formal style 3.3.3 Definitions and Meaning of Multimedia

Multimedia is a burning topic in education because it represents the latest technology and introduces into the classroom whole new ways of thinking about curriculum, interactions with students and even the nature of learning itself. He elaborates that the meaning of multimedia has changed from meaning nothing to everything. Multimedia can mean any kind of file or document, either a text or spreadsheet that have audio or video effects or "an interactive information cafe". Whatever it is not, it certainly is the most promising technology in education. - WeidongXhang (2003) Packiam (1986)

had

referred
to the use of appropriate and carefully selected varieties of learning experiences which
when presented to the learner through selected teaching strategies will reinforce and strengthen one another
in such a way that the learner
will achieve predetermined objectives in an effective way.

108

Education is defined as a means of providing systematic training and instruction and training is provided by instruction, discipline on drill. In terms of having training and instruction, Multimedia is a powerful tool which can provide individual and interactive instructions as well as motivation for practice in an entertainment environment. Multimedia also provides students with different learning styles, the opportunity to learn, share, communicate and grow using all their faculties.

3.3.4

Nature of Multimedia Multi - Many Media - Techniques /methods. Multimedia approach uses a number of media, devices, techniques, in the teaching learning process. Multimedia approach has come out of researches and experiments in educational technology that have been undertaken in order to improve the

process

of teaching learning.

Multimedia approach aims at providing meaningful learning experiences via a mix of media in order to achieve predetermined objectives. The choice of the media has to be done carefully so that one does not hamper or reduce the effect of the other i.e. each media must complement the
after. The media have to be used sequentially and judiciously. Only necessary ones are to be used. Then it would be possible to make optimum use of them in a most economical manner. In multimedia approach, several media and techniques are used as powerful means of communication. ●

Multimedia

approach uses a number of media, devices, techniques in the teaching learning process. ● Multimedia approach can convey vast information and provide many sources from which student can access the information. ● Multimedia approach will improve the teaching learning process. ● Multimedia approach is not restricted to a single type of learning style. It can provide the support of a wide range of activities. ●

Multimedia approach aims at providing meaningful learning experience via a mix of media in order to achieve predetermined objectives. ●

Multimedia approach provides the opportunity to gain mastery of competencies and skills. ●

The choice of the media has to be done carefully so that one does not hamper or reduce the effect of the other. That is each media must complement the other.

109 ● Multimedia approach will enable the learner to get access to information in dynamic environment. 3.3.5

Educational

Implications of Multimedia ● Multimedia enables students to represent information using several different media. Hypermedia links allow students to organize information in meaningful ways. ● Multimedia can take into account

different learning styles. Some students learn by interpreting text, while others require more graphical or aural representations. ● Multimedia allows for self-pacing and discovery, students can take the time they need and choose the path of learning making learning meaningful and pleasurable. ● Multimedia helps in development of higher order thinking skills. Interactive multimedia encourages student. ● Multimedia provided the students the flexibility of anywhere, 'any time' learning. ● Multimedia helps in developing group and interpersonal skills. Better communication between students via e-mail, chat sessions etc., can encourage collaborative learning and enhance student-teacher interaction. ● Multimedia helps students to learn the

content in a given discipline. It helps students to think effectively, practice problem solving and decision making. 3.3.6 Why

Use Multimedia in the Classroom?

Multimedia activities encourage students to work in groups, express their knowledge in multiple ways, solve problems, revise their own work, and construct knowledge.

The advantages of integrating multimedia in the classroom are many. Through participation in multimedia activities, students can learn:

- Real-world skills related to technology
- The value of teamwork
- Effective collaboration techniques
- The impact and importance of different media
- The challenges of communicating to different audiences
- How to present information in compelling ways
- Techniques for synthesizing and analyzing complex content
- The importance of research, planning, and organization skills

110

The significance of presentation and speaking skills

- How to accept and provide constructive feedback
- How to express their ideas creatively

There are, however, some constraints to using multimedia in the classroom, including:

- Technological resources, both hardware and software
- Technological skills, for both the students and teacher
- Time required to plan, design, develop, and evaluate

multimedia activities 3.3.7 Role of Teacher in Multimedia Approach

Teacher has to adopt a number of methods and techniques.

Teacher has to aware of the different available media and their availability.

- Teacher should be physically competent to use and demonstrate the use of the different media.

Teacher should be skillful enough to make a judicious choice of media and competent enough to mix them sequentially and in an orderly manner.

- Teacher's role is that of a facilitator or manager of activities.
- Teacher has to lead his student for independent, individualized learning.

Prerequisites for developing a Multimedia Instructional device 3.3.8

Elements of Multimedia The different building blocks

of Multimedia are Text, Images and graphics, Audio, Video, and Animation.

Any multimedia application consists any or all of them.

Let us learn about each one

of them

- Text - ASCII/Unicode, HTML, Postscript, PDF
- Audio - Sound, music, speech, structured audio (e.g. MIDI)
- Still Image - Facsimile, photo, scanned image, photographs, drawings, maps and slides
- Video (Moving Images) - Movie, a sequence of pictures
- Graphics - Computer produced image
- Animation - A sequence of graphics images

111 1.

Text: Text and symbols are very important for communication in any medium. Using text in online training has many advantages: text files are small so they perform well at low bandwidth, the user can search for specific words or phrases, and text can be easily updated. You can create text directly within an authoring application or import it from external text files. Anti-aliasing enables you to create attractive text that blends into the background color without any jagged edges. Authorware, Director, and Flash all support anti-aliased text. Using anti-aliased text helps avoid having to create display text as a graphics file, which would make your overall course size much larger than if you simply entered text directly into the authoring tool. 2.

Images and Graphics: Images play a very important role in a multimedia. It is expressed in the form of still picture, painting or a photograph taken through a digital camera. The points at which an image is sampled are known as picture elements, commonly abbreviated as pixels. The pixel values of intensity images are called grayscale levels. There are different kinds of image formats like the Captured Image Format and the format when images are stored. The captured image Format is known by two main factors that is spatial resolution which is specified as pixels x pixels (eg. 640x480) and color encoding, which is specified by bits per pixel. Both factors depend on hardware and software for input/output of images. The Stored Image Format is when we store an image; we are storing a two- dimensional array of values, in which each value represents the data associated with a pixel in the image.

These images can be edited with the help of few of the software like general drawing programs, JASC Paint Shop Pro, Corel Photo Paint, Macromedia Fireworks ,Art Rage: free (NZ) paint program simulating, Corel Draw, and Open Office / Libre Office Draw, GIMP, and Mypaint.

Graphics Formats: Most Web browsers can display GIF and JPEG graphics files. Web browsers that are version 4.0 or later can use the JPEG format for continuous-tone images, such as photographs and images that use color gradients. The PNG format was

112 developed as a patent-free replacement for the GIF format. PNGs can use an alpha channel to define transparency in a graphic. Import PNG files into any of the Macromedia tools as an alternative to GIF files, especially if you need 24-bit graphics or graphics with transparency. Use this format in Web-native content only when delivering to newer browsers; some older browsers do not support the PNG format also display PNG graphics files.

The two most popular graphic formats for online training and Web pages in general are GIFs and JPEGs. Both are bitmap files that are relatively small in size. The two formats compress images differently, each excelling at compressing different types of graphics. Using software such as Macromedia Fireworks, you can compare the file size of your graphics with various optimization settings to help you pick the best file format. Use the GIF format for line art and graphics that have large areas of a single color. Graphics saved in the GIF format can have one transparent color where JPEG graphics cannot. There are applications like format factory which helps us in converting graphics from one format to other. 3.

Audio: Audio can enhance learning concepts and reinforce ideas presented as text or graphics on the screen. Using audio may be essential to the teaching of topics such as a foreign language or music appreciation. There are three types of audio assets that are commonly used in e-learning: • Music • Narration (voice-overs) • Sound effects Music demands a higher-quality and a wider sound-frequency range than narration and therefore produces larger files. Narrations generally have a smaller sound frequency range so it can be compressed more than music and still retain good sound quality. Sound effects are generally short so they don't have a large impact on the overall file size of an online course.

Audio Formats: The WAV and AIFF audio formats, popular on Microsoft Windows and Macintosh systems respectively, usually create files that are too large to use in an online course. Use one of the compressed formats with the goal of balancing small file size with acceptable quality audio. You have different options depending upon which authoring software

you use. Both Shockwave Audio (SWA) used by Authorware and Director, and MP3, which is used by Flash are popular compressed formats useful for all three types of audio used in e-learning.

The open source audio editing software like

113 Audacity is very popular tool for audio editing. 4. Video: Although video requires lots of bandwidth to download, it is very useful for conveying certain information. Using video in e-learning helps realistically demonstrate equipment and processes among other things. For instance, an e-learning course in botany might show a video of a sprouting seed. A course about the features of an airplane might show a video of a crewmember properly closing and securing a door for takeoff. The intricate level of detail visible in video is also ideal for illustrating subtle, nonverbal information.

For example, to teach sales skills you could use a video to demonstrate an interaction between a salesperson and a customer, then have the learners analyze the body language of the people involved in the transaction.

Video Formats: There are three standard digital video formats: Quick Time, Video for Windows, and MPEG. Video files tend to be large so they really aren't appropriate for delivery on modem connections. You may choose to include video in your e-learning course if you are delivering it over an intranet or to users with relatively high bandwidth connections.

There are many open source video editing tool and open shot is one such popular tool. 5. Animation: Animation illustrates concepts with movement, shows processes, or draws attention to a region or elements of a screen. Since animations usually involve graphics, they are highly dependent upon the size and file type of the graphics that are being animated.

Animation Formats: There are many ways you can create animations. Authorware, Dreamweaver, Director and Flash can all create animations. An animation created within an authoring program is usually smaller and more efficient than an animation created in another tool and then imported in your authoring program. This is particularly true when an animation is based on shapes created with the software's drawing tools rather than with imported bitmaps. For example, Flash excels at creating vector graphics and animations. Although Flash can animate bitmap graphics, animations made predominately with vector graphics in Flash are considerably smaller than animations created with bitmap graphics.

Simple 2D animations can be created using open source tools like pencil and more advance tools like blender. 3.3.9

Types of Multimedia

Multimedia may be broadly divided into Linear and Non-linear

Multimedia.

In

Linear Multimedia the active content progresses without any navigational control 114 for the viewer. The viewer interacts with the multimedia application in which the content is sequentially arranged. The viewer does not control the progress of the content. In other words, the viewer is a passive receiver of the multimedia content most of the time. For example a movie uses a combination of audio, graphics and animations, but the viewer has no control over the sequence of events. Non-linear Multimedia uses interactivity to control progress as with a video game or self-paced computer based training.

It allows one to use the content according to ones wants. It is a two way communication. This communication can be controlled by using buttons, links and hypertext. Hypermedia is an example of non-linear content. It connects to different media elements such as audio and video. Multimedia presentations which are live or recorded are also Non-linear.

A recorded presentation may allow interactivity via a navigation system. A live multimedia presentation may allow interactivity via an interaction with the presenter or performer. 3.4

Types of

Instructional Aids: Projected and

Non-projected Aids, Projector, Radio, Tape Recorder, Television, Films, Computer, White Board, Smart Board, E-Flash, Cards, Educational Toys 3.4.1

Instructional Aids The word instructional aid refers to any material or device used to assist the instructor in: Preparation of the lesson(s) Presentation (teaching) of the lesson(s) Facilitates trainees' learning 3.4.2 Importance of Instructional Aids Instructional aids assist to reinforce and supplement the instructor's communication during the presentation of the lesson. This is done by: - clarifying the concept or idea - making the communication channel more explicit - helping the learners to develop a good conceptual understanding of the content or skill taught. For example an idea which would be difficult (abstract) can easily be simplified when an instructional aid is used to present it. Therefore learners are able to relate an idea to their common reality or environment with the use of aids.

115 3.4.3 Types of instructional aids There are many types of instructional aids. Each instructional aid, however, may have inherent advantages and disadvantages (or limitations). Essentially types of instructional aids are determined by: The instructor/teacher. The instructor's ability either to create (improvise) and use aids or select from the readily made and suitably available aids is crucial. This squarely depends on the instructor's prowess, ability or experience. Objective of the lesson. By virtue of the objective(s) of a lesson, the use of certain instructional aids may be more desirable or otherwise. For example if a lesson involves the demonstration of a particular skill, then the use of demonstrational aids becomes inevitable. Nature of subject matter. The subject matter or content to be taught will underline the type of aids (if any) to be used. For example, if the material is considered comparatively difficult or abstract, then instructional aids have to be carefully selected and used. Generally, instructional aids can be grouped in four main categories: (a) Visual aids These appeal to sight. They include the blackboard, posters, charts, displays, models, pictures etc. (b) Auditory aids These type of instructional aids appeal to learners sense of hearing. They include radio and many types of audio recording. (c) Audio-Visual Aids Audio Visual aids appeal to both hearing and seeing. They include sound motion pictures, slides on sound and television. (d) Stimulation devices These are the actual representation of the real objects or process, but reduced in size. They include devices built to stimulate the action or function of the real device. Their purpose is to develop the 'feel' of the actual functioning of the real objects. 3.4.4 Characteristics of good instructional aids Instructional aids are essential to effective instruction. The instructor should know

116 how to prepare and use instructional aids and should recognize their value in fostering good instruction. The greatest value of instructional aids lies in: • Their appeal to trainees senses and perceptions • Their ability to attract and hold trainees attention and interest. • The ability in developing understanding of the material to be learned • Helps the trainees to learn faster and save instructional time • Helps trainees to understand the relationships between different concepts or ideas. A good instructional aid should promote certain desirable results. It should stimulate interest, command attention, be easily understood and promote a positive reaction on the part of the trainee. An instructional aid should be complete, have some explanation in the form of a label, and finally be as simple as possible. 3.4.5 Objectives of Instructional Aids 1. To enhance teachers skills which help to make teaching-learning process effective 2. Make learners active in the classroom 3. Communicate them according to their capabilities 4. Develop lesson plan and build interest 5. To make students good observer 6. Develop easy and understandable learning material 7. Follow child cornered learning process 8. Involve intimation in objectives 9. To create interest in different groups 10. To make teaching process more effective 3.4.6 Advantages of Instructional aids 1. Its helps to make learning process more effective and conceptual. 2. It helps to grab the attention of students 3. It builds interest and motivation teaching students learning process 4. It enhance the energy level of teaching and students 5. It is even better for over burden classrooms 6. It provides students a realistic approach and experience

117 3.4.7 Limitations in Instructional aids 1. Technical Problems 2. Students Distractions 3. Expensive 4. Time consuming 5. Need Space 6. Convenience 3.4.8 Audio Visual Aids Audio visual material must be seen in their relationship to teaching as a whole and to the learning process as a whole, until the teacher understands the relationship between audio visual material and teaching learning process. Audio visual materials are produced, distributed and used as planned components of educational programs. It helps the process of learning that is motivation, classification and stimulation. A.V. aids are multisensory materials which motivate and stimulate the individual. It makes dynamic learning experience more concrete realistic and clarity. It provides significant gains in thinking and reasoning. Audio visual aids are sensitive tools used in teaching and as avenues for learning. These are planned educational materials that appeal to the senses of the people and quicken learning facilities for clear understanding. Definitions: 1. According to Kinder S. James: Audio visual aids are any device which can be used to make the learning experience more concrete, more realistic and more dynamic. 2. According to Burton: audio visual aids are those sensory objects or images which initiate or stimulate and reinforce learning. 3.

According to Carter.V.Good: audio visual aids are those aids which help in completing the triangular process of learning that is motivation, classification and stimulation. 4. According to good's dictionary of education: audio visual aids are anything by means of which learning process may be encouraged or carried on through the sense of hearing or sense of sight. 5. According to Edger Dale: audio visual aids are those devices by the use of which communication of ideas between persons and groups in various teaching and

118 training situations is helped. These are also termed as multi-sensory materials. 6. According to McKean and Roberts: audio visual aids are supplementary devices by which the teacher, through the utilization of more than one sensory channel is able to clarify, establish and correlate concepts, interpretations and appreciations. 7. According to KP. Neeraja: an audio visual aid is an instructional device in which the message can be heard as well as seen. Purpose of A-V aids: • To supplement and enrich teachers own teaching to make teaching-learning more concrete. • To serve an instructional role in itself. • To create interest among the group. • To make teaching as an effective process. Advantages of AV aids: 1. A.V.Aids helps in effective perceptual and conceptual learning. 2. A.V.Aids helpful in capturing and sustaining attention of students. 3. A.V.Aids arouses interest and motivates students to learn. 4. A.V.Aids is helpful in new learning. 5. A.V.Aids helps in saving energy and time of both the teachers and students. 6. A.V.Aids provides near realistic experience. 7. A.V.Aids can meet individual demands. 8. A.V.Aids is useful in for education of masses. 3.4.9 Classification of A.V. Aids: Various classifications are given for Audio visual aids according to the type of projection by various authors. A) Classification of A.V.Aids I) Audio aids Audio materials are those which can be heard. Ex: - radio, tape recorder, walkman, Headphones. II) Visual aids: these are helpful to visualize the things. Ex: - graphic aids, 3d-aids, display boards, and print material.

119 III) Audio visual aids: these aids can be heard and seen simultaneously. Ex: - projected aids, TV, films. B) Classification of A.V.Aids I) Simple A.V.Aids: It includes graphic aids, display boards, 3d-aids, print material...etc. II) Sophisticated A.V.Aids: includes audio-visual aids. 3.4.10 Principles to be Followed for the Effective Use of A.V. Aids: Audio visual materials should function as an integral part of the educational program. A.V. aids should be centralized, under specialized direction and leadership in educational programs. An advisory committee consisting of representative from all areas of curriculum should be appointed to assist in selection and coordination of A.V. materials. An education program should be flexible. A.V. material should be carefully located to eliminate duplication, easy accessibility and convenient use. A.V. material should be available whenever and wherever they needed for effective utilization as an integral part of curriculum Budget appropriations should be made regularly for A.V. education programs. Periodic evaluation to be done to assess the function of, utilization and expenditure of the program. 3.4.11 Projected Audio Visual Aids: OVER HEAD PROJECTOR: The over head projector is the most used in all a.v. aids. It projects transparencies with brilliant screen images suitable for use in a lighted room. The teacher can write or draw diagrams on the transparency while he teaches; these are projected simultaneously on the screen by the OHP. During presentation: Keep the screen above the heads of the participants. Keep the screen in full view of participants

120 Make sure you are not blocking any ones view when presenting. Darken the room appropriately by blocking out sunshine and dimming nearby. Turn the screen off between slides if you are going to talk for more than two. Talk to the audience, not to the screen Purposes: To develop concepts and sequences in a subject matter area. To make marginal notes on the transparencies for the use of the teacher that can carry without exposing them to the class. To test students performances, while other classmates observe. To show relationships by means of transparent overlays in contrasting color. To give the illusion of motion in the transparency. Advantages: It permits the teacher to stand in front of the class while using the projector, thus enabling her to point out features appearing on the screen by pointing to the materials at the projector it self and at the same time, to observe the students reactions to her discussion. Gains attention of the student OVER HEAD TRANSPERENCIES: Transparencies are popular instructional medium. They are simple to prepare and easy to prepare and easy to operate with the overhead projector which is light weight. A 10*10 inches sheet with printed, written or drawn material is placed on the platform of the projector and a large image is projected on a screen behind you. The projector is used from near to the front of the room with the teacher standing or sitting beside, facing the student. Guidelines for making effective transparencies: ● Have one main idea an each transparency. ● Include only related figures and diagrams. ● Use simple lettering style in writing. ● Use diagrams in proposition to its lettering. ● Keep the message clear and simple.

121 ● Emphasize the key messages. ● Use color and lettering with discretion. Advantages: ● Permits face to face interaction with the students. ● Can be used in daylight conditions. ● Can present information in systemic developmental sequences. ● Requires limited planning and can be prepared in variety of inexpensive methods. ● Easily available. THE OPAQUE PROJECTOR Opaque projector is the only projector on which you can project a variety of materials ex: - book pages, objects, coins, postcards, or any other similar flat material that is non- transparent The opaque projector will project and simultaneously enlarge, directly from the originals, printed matter, all kinds of written or pictorial matter in any sequence derived by the teacher. It requires a dark room, as projector is large and not reality movables. Advantages: ● Stimulates attention and arouses interest. ● Can project a wide range of materials like stamps, coins, specimen, when one copy is available. ● Can be used for enlarging drawings, pictures and maps. ● Does not require any written or typed materials, hand-written material can be used. ● Helps students to retain knowledge for longer period. ● Review instructional problems. ● Test knowledge and ability. ● Simple operation. Disadvantages: ● Costly equipment. ● Needs to use it with care. ● Needs a dark room for projection

122 SLIDE PROJECTOR A slide is a small piece of transparent material on which a single pictorial image or scene or graphic image has been photographed or reproduced otherwise. Slides are a form of projected media that are easy to prepare. They are still pictures on positive film which you can process and mount individually yourself or send to a film laboratory. The standard size of the slides is 2" X 2" any 35mm camera will make satisfactory slides. Types of slides 1. Photographic slides: 2" X 2" 3" X 4" a) Black and white b) Colored 2. Handmade slides: can be made with a) Acetate sheet b) Cellophane c) Etched glass d) Plain glass e) Lumarith Slides can be made from photographs and pictures by teachers and pupils taking photographs and snapshots when they go on fieldtrips for historical, geographical, literacy or scientific excursions. The arrangement of slides in proper sequence, according to the topic discussed, is an important aspect of teaching with them. Advantages: 1. Requires only filming, processing and mounting by self or laboratory. 2. Results in colorful, realistic, reproduction original subject. 3. Preparation with any 35mm camera for most uses. 4. Easy to revise and up-date. 5. Easily handled, stored and re-arranged for various uses. 6. Can be combined with tape narration or can control time for discussion.

123 7. May be adapted to group or individual use FILMSTRIPS Film strips are sequence of transparent still pictures with individual frames on 35mm film. A tap recorded narration can be synchronized with film strip. Each strip contains from 12 to 18 or more pictures. It is a fixed sequence of related stills on a roll of 35mm film or 8mm film. PRINCIPLES 1. Preview filmstrips before using them and selected carefully to meet the needs of the topic to be taught. 2. Show again any part of the filmstrip needing more specific study. 3. Use filmstrip to stimulate emotions, build attitudes and to point up problems. 4. It should be introduced appropriately and its relationship to the topic of the study brought out. 5. Use a pointer to direct attention, to specific details on the screen. TYPES OF FILMSTRIP: 1) Discussion filmstrip: it is continuous strip of film consisting of individual frames arranged in sequence usually with explanatory titles. 2) Sound slide film: it is similar to filmstrip but instead of explanatory titles or spoken discussion recorded explanation is audible, which is synchronized with the pictures. ADVANTAGES OF FILM STRIPS: 1) Are compact, easily handled and always in proper sequence. 2) Can be supplemented with recordings. 3) Are inexpensive when quantity reproduction is required. 4) Are useful for group or individual study at projection rate are controlled by instructor or user. 5) Are projected with simple light weight equipment. RADIO Radio is a device with which the whole mass can be contacted at a time, efficiently and economically. Now-a-days, which increase in rural electrification, the number of radio sets in India is increasing greatly. Moreover, people are purchasing battery sets

124 and they have realized that it is a good thing to have one in the house. Radio sets have been provided in the common meeting places by the C.D. Organization. Radio is a good source of communication of idea. It gives news-bulletins, special programmes for rural people, housewives and children. It is a good source of disseminating information for health workers, farmers etc. In case of audio-aids, the message has to be simple so that the people can understand and act. The broadcaster has to get and hold the attention of the audience, otherwise the message is lost. The All India Radio stations publish a Journal 'Akashvani' which gives the meters and frequency in Kilo cycles on medium and short waves. The radio receiving set receives only one selected programme at a time, and conveys the same through its speaker. The station is selected by a tuner of the receiving set, which tunes the set to the frequency of the station. The movement of the tuner over the dial of the radio set is controlled by a knob. The entire broadcast frequency of the tuner is divided into a number of bands, each band including a small range of frequencies or wave-lengths. A band selector switch or knob is incorporated in the Cabinet of the radio. There is also an on and off switch and volume control are incorporated in a single knob. A radio can be operated by dry battery wet battery or electricity. For rural areas with no electricity, dry battery sets are generally used. Uses of Radio Radio is a popular, pleasing and a fast medium. However, it cannot be used to convey heavy, detailed knowledge. It uses are for: * Announcements-meetings, demonstrations etc. * Intimation or information- regarding availability of material, prices, places etc. * Warnings-relating to weather, outbreaks of diseases. * News reviews-about farmers etc. * Interviews. * Questions & Answers. * Short talks. * Play, skits, etc. * Features and Documentaries. Advantages of utilizing Radio i) In-expensiveness - Radio instructions costs 1/5 or 1/6 that of T.V. instructions,

125 hence this is quite a suitable audio aid for reaching the masses, especially in the interior of villages, where means of communication and facilities are very few. ii) Easy availability - There has been a lot of production of radio sets, with the result that their cost has been considerably reduced and therefore, radio is available these days with almost all families, even in the rural areas. iii) A radio leaps barrier of time and space - A historical event can be reproduction on a radio set as well as a live broadcast can be transmitted from one corner of the world to another. iv) Upto-date and Immediate - All the latest data as well as the current information can be transmitted and that too immediately. v) Emotional Impact - A radio can bring a dramatic feeling in the group. It has the warmth of a drama, can create personal feeling of actor's presence and inspite emotions. vi) Can bring realism - Voices of various experts can be brought right into the classroom. vii) It can reach more people more quickly than any other means of communication. viii) It can reach illiterates also. ix) It inspires to form some action. x) It is portable. Disadvantages i) It is a one way communication and audience reaction is not known. ii) It requires concentrated attention of the listeners as only aural sense is used. iii) Time-the learners have to adjust their time to the particular programme timing. iv) Prehearsing is not possible. v) Radio set should be in a working condition. vi) Frequently loses out in competition with entertainment. TAPE RECORDERS Tape recorders have become very common now-a-days and their use in education is gradually increasing. Tape recording, especially cassette tape recordings may be

126 prepared for group or individual learning. Advantages * Pre-rehearsing is possible. * Information can be stored & used repeatedly. * No problem of time. * Communicator can present programme made by him. * It can facilitate editing also, i.e. shortening, eliminating or adding of materials from different sources. Disadvantages * Many or may not be up-to-date. * More expensive. * One way communication. Features to look for in a tape-recorder i) Simplicity: It should be easy to operate. ii) Portable: The recording equipment should be as light as possible. iii) Cost: the amount of money available should be carefully considered before buying the equipment. However, expensive equipment generally is durable and as a result is may prove cheaper in the long run. iv) Speed: The higher the speed used, the better will be the quality. v) Size of the Tape Reels: Different machine will use different sizes. vi) Frequency Range: In fact one of the two important points to be considered in making the selection is sound frequency range of the equipment and the programmes you plan to record. For high fidelity recording, the frequency range of the equipment should be similar to the frequency range of the sounds in the programme. TELEVISION Michael J. Apter says, "Television is the most powerful medium of mass communication which has ever existed and it has revolutionized our lives in many ways." Television is already being used to spread health and nutrition messages.

127 Television shows the actual picture, figure or diagram, along with the hearing sound. So, it has an advantage over radio, where the audience is only listening. The movements of the pictures hold the attention of the audience. Most of the homes in cities have a T.V. set. Now-a-days with increase in electrification, they are available in villages also. Uses of Television Radio is a popular, pleasing and fast medium. However, it cannot to be used convey heavy, detailed knowledge. Its uses are for:- * Announcements - meetings, demonstrations etc.; * Intimation or information - regarding availability of materials, prices, places, etc.; * Warnings - relating to weather, outbreaks of diseases; * News reviews - about farmers etc.; * Interviews; * Questions & Answers; * Short talks; * Plays, skits, ballads etc.; * Features and Documents. Advantages i) T.V. can be used to broaden and enrich the experience of the audience. ii) It can create a genuine interest in a subject or topic which then gives the teacher something on which he can build. For example one can really see the result of malnutrition due to lack of food etc. iii) If a scientific experiment is mentioned, then it can be shown. iv) T.V., if it is not used for a disproportionate amount of time, provides a welcome element of variety from the normal routine of group teaching etc. v) It overcomes the barrier of time and space and to some extent of the language due to its visual effects. Evaluating the T.V.Programme Edger Dale suggests a simple method evaluating education television programmes by the following questions: i) Whether the purpose of the presentation made clear to both audience and teacher?

128 Did the audience have something to watch for? ii) Was the audience prepared for the telecast by reading etc? iii) Did the audience understand the material? iv) Did the receiver/audience find the presentation interesting? v) Was the programme well organized? vi) Was opportunity given to become involved, to participate? vii) Were the key points emphasized by means of repetition and review? viii) Did the telecast add certain experiences not easily available in the usual classroom situation or day-to-day life? 3.4.12 Non-Projected Aids CHALK BOARD DEFINITION A chalkboard or blackboard is a reusable writing surface on which text or drawings are made with chalk or other erasable markers. Blackboards were originally made of smooth, thin sheets of black or dark grey slate stone. Modern versions are often green or brown and are thus sometimes called a green board or brown board instead. A blackboard can simply be a piece of board painted with matte dark paint (usually black or dark green). A more modern variation consists of a coiled sheet of plastic drawn across two parallel rollers, which can be scrolled to create additional writing space while saving what has been written. The highest grade chalkboards are made of rougher version porcelain enameled steel (black, green, blue or sometimes other colours). Porcelain is very hard wearing and chalkboards made of porcelain usually last 10-20 years in intensive use. Blackboards have disadvantages: • They produce a fair amount of dust, depending on the quality of chalk used. • Some people find this uncomfortable or may be allergic to it, and there has been speculation about links between chalk dust and respiratory problems. • The dust also precludes the use of chalk in areas shared with dust-sensitive equipment such as computers. However, these alternative methods of displaying information have drawbacks of their own.

129 • The scratching of fingernails on a blackboard is a sound that is well-known for being extremely irritating. Blackboards are also used in many establishments (typically public houses) as a form of advertising often for upcoming events and menus - as well as to keep the score in darts matches. FLANNEL BOARD Sometimes called a flannel graph. This teaching tool is called by different names: Visual Board, Frick Board, Slap Board, Felt Board, Coherograph, Video graph Flannelgraph is a storytelling system that uses a board covered with flannel fabric, usually resting on an easel. It is very similar to Fuzzy felt, although its primary use is as a storytelling medium, rather than as a toy How to use The principle involved is the interlocking of fibers of two rough or bairy surfaces, so that the pieces pressed on to a background which is hard and vertical will stay. It can be illustrated on a larger scale by pressing two tooth brushes or hair brushes together, so the bristle inter-look. In case of flannel graph similar principle of friction helps an object to cling to the surface of the board. The flannel board is usually painted to depict a background scene appropriate to the story being told. Paper cutouts of characters and objects in the story are then placed on the board, and moved around, as the story unfolds. These cutouts are backed, either with flannel, or with some other substance that adheres lightly to the flannel background, such as coarse sandpaper. Advantages 1) Permits numerous and varied arrangements of visual materials. 2) Permits the use of either chart or small pieces of material Materials can be packed and transported complete notes. 3) Permits the development of a complete story. 4) Promotes conscientious planning, which must precede the development of the material in the first place. 5) Challenges one to develop symbols to portray such things as abstractions. 6) Easier to construct materials for flannel board than to make slides or movies.

130 Disadvantages: 1) Transportation and storing of boards and materials is a problem. Suitable tables to support boards must be available. 2) Time and cost of making material for presentation present a problem. 3) Cost of boards themselves can't be overlooked. 4) Presentation is limited a new idea involves a lapse of time before the new material can be added 5) Might tend to deter one from using other more effective methods and techniques when it is evident that other methods might be more appropriate. 6) To tell a complete story it often takes either too much board space or smaller designs and materials some of which cannot be seen well. BULLETIN BOARD DEFINITION It is a soft board which will hold pins or tags almost suitable. Simple device placed either indoor or outdoor. Items generally displayed are photographs, publications, posters, newspaper cut outs. Advantages Explains important events Reports special activities Disadvantages Not effective for illiterate group. Takes lot of preplanning and preparation A bulletin board (pinboard, pin board or notice board in British English) is a place where people can leave public messages, for example, to advertise things to buy or sell, announce events or provide information. Dormitory corridors, well-trafficked hallways, lobbies, and freestanding kiosks often have cork boards attached to facilitate the posting of notices. At some universities, lampposts, bollards, trees, and walls often become impromptu poster sites in areas where official boards are sparse in number. PEG BOARD It is a type of board which contains small holes to fix certain letters into the holes

131 which is used especially in the offices to display certain items, name of the personal or faculty member. **MAGNETIC BOARDS** It is a framed iron sheet carrying porcelain coating in some dark color generally black or green. It can be used to display pictures, cutouts and light objects with disc magnets or magnetic holders. Advantages Movement of visual material is easy. **SMART BOARDS** SMART boards put simply, are a sophisticated replacement of the traditional overhead projector. Over the years, this cutting-edge technology has proved popular for students of all ages. The interactive board turns a typical classroom into a fun learning environment. It enriches classrooms in several ways by providing hands on collaboration and creating the perfect learning setting. There are several advantages of bringing in a SMART interactive whiteboard into a classroom setting. Here are the top 8 advantages of this state-of-the-art technology in the education industry. Reasons why SMART Boards are an essential component in the modern day classroom: 1. Provides Flexibility: Interactive whiteboards allow many different forms of media - including photos, illustrations, maps, graphs, games, and video, to be displayed. These tools not only enrich the classroom experience but also help to expand the nature of content that can be used in learning. In addition, SMART Boards makes learning to be more dynamic owing to the different forms of presenting information. 2. Enhanced teaching/learning experience: SMART Boards provide new ways for teachers to teach, and student to learn. These tools support a wide variety of learning styles. For instance, visual learners can watch as their tutors use the whiteboards to project visual elements, whereas audio learners can listen and have discussions. On the other hand, the Boards come with touchscreen capabilities that allow tactile learners to touch and interact with the board. 3. Interact and share: The interactive nature of SMART boards offers learners an opportunity to share and participate in the instructional process. Interactivity

132 provides a platform for students to demonstrate their grasp of the subject through touching, drawing, and writing. Every learner has an opportunity to participate or contribute to the presentation and/or discussion via notebooks and tablets. In addition, the boards provide for rapid assessment whereby learners can receive immediate feedback. Teachers and students are able to identify individual strengths and weaknesses in various subject areas and isolate areas/topics that need more focus or review. 4. Low-Maintenance: SMART Boards are neat and easy to use. There are no hassles cleaning or maintaining whiteboards. The data on the screen can be modified using a specialized highlighting tool or pen. There is no need for using unhygienic chalk or marker pens. 5. Access to online information & tools: SMART boards allow learners to easily access a rich database of online resources. Teachers can use the wide variety of online information sources such as knowledge databases, online video and news items to reinforce their lessons. Learners can also quickly access the wide range of powerful tools and resources to conduct research and supplement their usual study material. 6. Going Green: Interactive boards are also environmentally friendly. They offer teachers an entirely different way of presenting information to students, which eliminates the need for writing, printing or photocopying. Which, contribute to eliminate waste and pollution, from over-utilization of paper and ink. 7. Technology Integration: SMART boards allows for integration of various technologies in order to improve the learning experience. For instance, it is possible to attach tools such as microscopes, document cameras, cameras or video cameras to a whiteboard to aid in instruction. It is also possible to integrate the interactive learning tools with a wide range of software applications. 8. Communication: Interactive whiteboards allow for connectivity in different locations; making ideal collaboration and distance learning environments. When using SMART boards, student show to increase student-to-student collaboration and increase overall participation in the lesson. Overall, incorporating SMART Boards to the classroom environment is likely to change the way teachers impart knowledge to students and at the same time simplify

133 the learning process for students. Students will find it easy to engage with lessons and gain a better understanding of the overall lesson. COMPUTER AS A TOOL IN MODERN TEACHING Computers have become of the most important learning aids of the modern times. Today's education is considered incomplete without computers. This is the basic machine on which all other electronic medias of learning depend. These can be bought in various forms like desktops, lap tops, notebooks and simply e-readers. Computers are used to play the computer based educational games which can now be played also through television screens. The computers have been playing an important tool for teaching from the last few years of the 20th century and since then it has brought about a revolution in the methods of teaching which our future teachers will be using. The computers make use of multimedia programme which include attractive colours, clear graphics, wonderful sounds, the fascinating animations and enjoyable videos discharging to the students the various elements of their subjects of study. Some critics of computers as a teaching aid may point out that the conventional methods of teaching in the hands of an enthusiastic, creative and industrious teacher could also do the job as well if not better than a computer. To such critics, I would say that the computers are not there to undermine the role of the efficient teachers. The computers are only a tool in the hands of a teacher to make the teacher's job easy and fast and make the teacher more efficient. A computer or any other teaching tool cannot work at its own; it definitely needs mediation from an enterprising teacher. No one would feel like to do away with the blackboard where it is necessary to use a blackboard or any other conventional tool. The computer has brought about a tremendous change the way the world looks at the teaching aids. With the advent of internet technology, the use of a computer as part of today's educational aids has become inevitable. Just think of a simple situation where you want to teach a student the word 'trumpet' used for the sound produced by an elephant and expect the student to describe the sound which the elephant makes. Obviously, you cannot bring the elephant to the classroom other than showing its picture. Even if you take the class to the zoo park where is the guarantee that the students can listen to the sound of an elephant trumpeting. But you can play the recorded sound of the elephant through a computer and can also show its picture or even live video of an elephant. For this purpose I have loaded the sound files of all animals, birds and insects to enable 134 the children to hear the sounds of these living beings through computer in their classrooms. We can make the young students practice their language lessons including regional languages through computers. I have practically done it for my computer virtually turning the computer lab as a language lab. You can see the image above where the students of a primary class are seriously engaged in learning Hindi through computers. Computers bring to the students a world of entertainment along with learning by providing computer based educational games for learning various subjects through computers. Many websites on the internet provide these games free for the students and parents and a few also charge nominally for the educational games made available to their members. INTERACTIVE ELECTRONIC WHITE BOARD AS A TOOL IN MODERN TEACHING o Interactive electronic white boards of today also known as smart boards are the latest tools in the methods of modern teaching. These need a computer, an overhead projector and preloaded educational software. o These are very costly equipment and require a lot of investment and can be afforded by only by schools who charge a very high rate of fees from the students. For this reason, these have not become very popular with ordinary schools. It is not only the heavy initial investment if purchased outright which has to be kept in mind but also the day to day costs of running the equipment which should be thought of by the end users. These costs are the high power bills and the replacement of lamps of the projectors which should be given attention to while buying this costly equipment. o Some companies supplying the white boards like the Edu comp, Smart Boards etc. make offers to the institutions to pay on monthly basis for the equipment and also appoint the support staff for running the system. They charge the institutions monthly charges ranging from Rs.50 to Rs.100 per student dependent upon the school strength. Here also these companies do not apprise the schools about the hidden costs in the form of higher power bills and replacement of projector lamps which the schools have to incur. o Of course, the electronic white board has many user friendly offering a lot of interaction to its user. It is a colourful tool in the hands of the teachers. Its inter-

135 activity features are beyond description. But the biggest disadvantage of the electronic white board is that it has to be fixed on the wall and does not leave the place for use of your ordinary blackboard to be used in case of emergencies like the power failure. It is more so if the classroom does not happen to be very big. The projector and the computer has to be always on if you want to use the electronic board. FLASH CARDS Definition: • Flash cards are a set of pictured paper cards of varying sizes that are flashed one by one in a logical sequence." • Flash cards can be self-made or commercially prepared and are made up of chart or drawing paper, paper using colors or ink on them for drawings." Purposes: 1. To teach the students. 2. To give health education. 3. Useful for small group. 4. Used in group discussions. Principles: • The messages can be brief, simple line drawing or photographs, cartoons and the content will be written in few lines at the back of the each card. • 10" X 12" or 22" X 28" is commonly used size. • 10-12 cards for one talk can be used. It should not be less than 3 and more than 20. • Prepare a picture for each idea which will give visual impact to the idea. • The height of writing on the flash card is to be approximately 5cm for better visualization. Using the flashcards: For class room instruction, the flash cards is to be properly used. The following steps are used while displaying flash cards.

136 1. Give brief introduction about the lesson to students. 2. Give instructions to students about their actions while you flash the cards. 3. Flash the card in front of the class by holding it high with both your hands so that all the students can see it. 4. Let the student respond as per instructions already given. 5. Review the lesson by selectively using flash cards. Advantages: • Flash cards can be used to introduce and present topics. • It can be used to apply information already gained by students to new situations • It can be used to review a topic. • Can be used for drill and practice in elementary classes • To develop the cognitive abilities of recognition and recall of students. • It can work as a useful supplementary aid and can be effectively used with other material. Disadvantages: • Cannot be used for a large group • Prone to get spoiled soon • Preparation is time consuming. E-FLASHCARDS An extensive selection of images listed according to theme that helps learners to understand basic vocabulary. These images may be printed out or used with an interactive digital whiteboard. The audio option also tells students how each word is pronounced. EDUCATIONAL TOYS Toys are usually used in small classes for teaching the children the names of various fruits, vegetables, animals, birds, insects etc. Toy models of these objects are easily available in the market. o Children in lower classes are also given some objects like marbles and beads to learn numbers. o Toy clocks and watches are used in schools to teach children the concept of time.

137 3.5 Advantages, Limitations and Challenges of Using Multimedia in Education By incorporating multimedia in their instruction, teachers can capture attention, engage learners, explain difficult concepts, inspire creativity, and have fun. However, there are many tools available and many ways to use those tools. "

Multimedia is characterized by the presence of text, pictures, sound, animation and video; some or all of which are organized into

some coherent program" (Phillips, 1997). 3.5.1

The Advantages of using Multimedia in Education 1.

Deeper understanding According

to research, a benefit of multimedia learning is that it takes

advantage of

the brain's ability to make connections between verbal and visual representations

of content,

leading to a deeper understanding, which in turn supports the transfer

of learning

to other situations. All of this is important in today's 21st century classrooms, as we are preparing students for a future where higher-level thinking; problem

solving and collaborative skills will be required. 2. Improved problem solving A

large percentage of the human brain dedicates itself to visual processing. Thus, using images, video and animations alongside a text stimulates the brain.

Student attention

and retention increase. Under these circumstances, in a multimedia learning environment, students can identify and solve problems more easily compared to

the scenario where teaching is made possible only by textbooks. 3. Increased positive emotions According

to psychologist Barbara Fredrickson, experiencing positive emotions makes people see more possibilities in their lives. Using multimedia during instructions impacts student's mood during the learning process. With a positive attitude they learn better and tend to be more proactive. 4. Access to a vast variety of information
With computers, tablets, smartphones and the internet, students are today better equipped than ever to search and find the information they need.

A study revealed that 95% of students who have access to internet, use it to search for online information. Sharing the information and participating in class discussions is done in a more confident way when access to information is as easy as today.

138 5. World exploration

There is no surprise here.

With the help of multimedia children can explore and learn

about places they would never been to. In a geography class, students can explore different

cities of the world, the tallest mountains and the most dangerous jungles. In a science

class, space and planets exploration is now possible. In a biology class, the dissection

of rare animals and different habitats exploration are like a walk in a park for students benefiting

of a multimedia learning environment. Altogether, multimedia learning environments have a direct effect on learning and even on

growing as a person. An effect that differs and can't be achieved as easy whilst using traditional education materials.

Therefore, it is no wonder the edutech business

is increasing and schools desire more and more to create multimedia learning environments for their students.

Multimedia is very helpful and fruitful in education due to its characteristics of interactivity, flexibility, and the integration of different media that can support learning, take into account individual differences among learners and increase their motivation. The provision of interaction is the biggest advantage of the digital media in comparison with other media. It refers to the process of providing information and response. Interactivity allows control over the presented content to a certain extent: learners can change parameters, observe their results or respond to choice options. They can also control the speed of applications and the amount of repetition to meet their individual needs. Furthermore, the ability to provide feedback tailored to the needs of students distinguishes the interactive multimedia from any other media without a human presence. However, many aspects need to be taken into account when using multimedia in education. Even though multimedia is offered worldwide, access to learning materials and computing equipment differs from country to country. The use of multimedia by students needs to be supported by very skilled teachers. They must guide students through the learning process and provide them with appropriate and effective learning strategies. Like the use of textbooks, the use of educational multimedia fosters teaching strategies, where the teacher's role is not just that of information provider but

the

one of guide, supporter and facilitator. Multimedia offers a variety of media usually combined in a meaningful manner.

This gives an opportunity to use the computer for the presentation of ideas in different ways, including by means of: ● Images, including scanned photographs, drawings, maps and slides;

139 • Sounds, e.g. recordings of voice, noise and music; • Video, including complex procedures and 'talking heads'; • Animation and simulations; • Discussions among learners (social networks, online discussions, blogs, etc.). Often, presentations supported by attractive images or animations are visually more appealing than static texts, and they can support the appearance of emotions to complement the information presented. Multimedia can appeal to many types of learning preferences - some students profit more from learning by reading, some by hearing and some by watching, etc. In addition, the use of multimedia allows for different ways of working - students can decide on their own how to explore the materials as well as how to use interactive and collaborative tools. Moreover, students can adjust their own learning processes according to their abilities and preferences. They can work according to their interests, repeat material as much as they want reducing embarrassment concerning their learning outcomes. The use of multimedia can thus be tailored to the students' differences in interests, social and cultural backgrounds, learning preferences and rates, etc. Individual learning can promote active, self-directed learning. In addition, multimedia applications can be used to facilitate group work. Small groups of students can work through multimedia applications together - in order to learn from each other as well as to improve their dialogue skills. The interactive opportunities of multimedia lead to high flexibility, which can be very helpful for students with special needs: • Dyslectic students can use synthetic speech in order to become familiar with the content of digital texts. • Autistic children show an increase of phonologic awareness and word reading by using multimedia (Heimann et al. 1995). •

Students with severe speech and physical impairments gain from learning with multimedia, because the computer is flexible enough to meet individual needs - they can repeat as often they want, can hear it loud, etc. (Steelman, 1993). •

For deaf students, the visual presentation of content improves their motivation to learn (Voltena et al., 1995).

The computer can noticeably improve student access to information. Such delivery platforms as the World Wide Web provide 24-hour access to information. Moreover, it is relatively easy to update web-based educational materials, i.e. to change design, content, instruction methods, etc.

140 3.5.2

Limitations of Using Multimedia

Multimedia requires high-end computer systems. Sound, images, animation, and especially video, constitute large amounts of data, which slow down, or may not even fit in a low-end computer. Unlike simple text files created in word processing, multimedia packages require good quality computers. A major disadvantage of writing multimedia courseware is that it may not be accessible to a large section of its intended users if they do not have access to multimedia-capable machines. For this reason, courseware developers should think very carefully about the type of multimedia elements that need to be incorporated into applications and include only

those that have significant value. Multimedia has other weaknesses too. While proponents of this new technology are very enthusiastic about its potential, they often leave the financial and technical issues unattended. Developments in multimedia are very high and the process of developing effective multimedia takes time.

Further, if the prerequisites for using multimedia include computers with related software, the user must possess a minimum level of computer literacy in

order to exploit the capabilities of this medium for learning. And finally, of the educator who is unfamiliar with the production and design of multimedia courseware or packages can be equally complicating.

The critical question, then, is: How do we overcome some of the identified barriers and begin the process of multimedia implementation alongside the instructor, textbook, and blackboard? It is the barriers rather than the technologies which we must address before multimedia, or for that matter, any media technology becomes

as accepted as the printed text or guidebook. Following are a few limitations of using Multimedia

- Information overload. Because it is so easy to use, it can contain too much information at once.
- It takes time to compile. Even though it is flexible, it takes time to put the original draft together.
- It can be expensive. Multimedia makes use of a wide range of resources, which can cost a large amount of money.
- Too much makes it impractical. Large files like video and audio has an effect of the time it takes for a presentation to load. Adding too much can mean that we have to use a larger computer to store the files.
- In case we want to upload it onto the Internet, there are a few factors to keep in mind, for example bandwidth and the user's abilities.

3.5.3 Some Disadvantages of Multimedia in Education Self-regulated learning: Some learners are not able to handle the freedom provided by hypertext-based multimedia.

141 Distraction: Often, confused presentations of the material can cause distraction due to conflicting messages. Non-linear structured multimedia allows the user to follow the supplied links, which can distract from the topic to be learned. The massive amount of information provided by multimedia applications may distract our attention during learning. The human short-term memory is limited; usually it can hold around 7 pieces of information. When several media presented at the same time, the learner can only concentrate on some of them and ignore others. This could result in ignoring important information. Human beings cannot use all channels available simultaneously, and this can prevent us from realizing the full potential of multimedia. Low interactivity: Even though the interactivity between the learner and multimedia applications is increasing, it is still considered restricted compared to the elaborated human-human interactivity. No selective feedback: Feedback is generally very limited within computer-assisted learning packages. Generally, computers can't substitute for person-to-person teaching, only enhance it. Often, the feedback provided is limited to right/wrong, and it does not support in learning strategies or further content explanations. Multimedia applications cannot identify individual needs or problems of the learner, so they cannot respond like people. Simulations are often not enough: It may be important for students to have true hands-on experience. For example, for studying insects in biology it is necessary to go out in nature, to see insects living in their natural environments. Lack of skills - pupils and teachers: Students, particularly mature-age students, may not be ICT literate. Also teachers may lack some personal skills, which are needed to teach effectively with multimedia. Difficult to do: Creating audio, video and graphical materials can be more challenging than creating ordinary texts. Time consuming: Using multimedia can be time consuming. Especially the production of multimedia takes much time. Access: Not all students have appropriate access to proper hardware and the Internet. This may limit the scope of teaching. Social in/exclusion: Not all members of a society can be involved in the use of

142 multimedia technology due to lack of access to the Internet or lack of hardware to make full use of the educational material on the web. Equipment problems: Hardware and software needs to be configured in a way that their usage is as simple as straight forwarded as possible. Bandwidth issue: Limited bandwidth means slow performance for sound, graphics and video, interrupting streaming and causing long waits for download that can affect the ease of learning. Multimedia is portable: Paper-based notes can be read everywhere, on the bus, at the beach, etc., but web-based materials or multimedia materials require specific hardware devices. Computer screens aren't paper: The content on screens may not be as easy to read as the content on paper. If there are large chunks of information that need to be read from top to bottom, it is probably best to view such a document on paper. Books and journal articles may still be better to read in paper. End users often prefer to use technology to search for information, but when it comes to reading, they tend to read from print-outs. In summary, multimedia products can be used to represent and process various types of knowledge. They can be used as means of representation and communication of knowledge. The use of these products can foster students' construction of their own knowledge. They can construct knowledge and develop skills related to various subjects by accessing or producing digital representations of knowledge. In particular, they can develop literacy and other core competencies. For example, they can develop motivation for learning activities, communication abilities, social competencies as well as learning competencies, values and ethics. 3.6

Recent Trends in Multimedia

The technological advancements have made society take a leap towards success. Every technological reform is a small step towards advancement. Every new invention in technology is a step towards progress of mankind. Centuries ago, hardly anyone would have even dreamt of working on a computer. Generations of the yester years would have hardly imagined being able to communicate with people on the other side of the globe. But there were some intelligent minds who dared to dream of such revolutionary discoveries and they made the impossible possible.

143 Since several years ago, education experts had been proposing a new style of education involving using multimedia, which differs radically from the traditional ways. Changing the education systems as a new ways is towards a new paradigm for teach (Rosenberg, 2001).

The development of multimedia technologies for learning offers new ways in which learning can take place in education areas. In last decades, there has been a growing interest in the creation and use of multimedia technologies throughout the education world. There have been many experiments and innovations in the field of education and training regarding knowledge delivery (Tally, 2002). From face to face to virtual education, different technologies have played great roles at different times.

In the last decades, due to the advent of multimedia technologies has got new meaning (Del, 1998; Moreno, 2000). Development, access, and transfer of text, sound, and video data gave given a unique face to education centers, in the form of multimedia learning. The development of multimedia systems can be very rewarding. So interest and investment in this technology are increasing and multimedia technologies are the need of the day (Bransford, 1990; Mayer, 1990).

Multimedia Technologies as an Educational Tool

throughout the 1980s and 1990s,

the concept of multimedia took on a new meaning, as the capabilities of satellites, computers, audio and video converged to create new media with enormous potential. Combined with the advances

in hardware and software, these technologies were able to provide enhanced learning facility

and with attention to the specific needs of individual users (Fenrich, 1997; Meyer, 2001; Mayer, 2003).

Multimedia is a term frequently heard and discussed among educational technologists today.

Now multimedia technologies these called "new media," "hypermedia," "integrated media," or more commonly "multimedia" have been defined in a number of ways. Actually the term "multimedia" covers a lot of territory.

"Multimedia", in its broadest sense, means graphics, music, sound effects, voice, video, and animation, in any combination, in the same program or presentation (Blumenfeld, 1991. Fensham,, 1990).

It

can be defined as an integration of multiple media elements (

audio, video, graphics, text,

animation, etc.) into one synergetic and symbiotic whole

that results in more benefits for the end user than any one of the media elements can provide individually.

Multimedia

can be defined generically as any combination of two or more media such as sound, images, text, animation, and video. For educational technology purposes,

144 multimedia refers to computer-based systems that use associative linkages to allow users to navigate and retrieve information stored in a combination of text, sounds, graphics, video, movies, music, lighting and other media as for education (Meyer, 2001; www.wps.prenhall.com; Sandholtz, 1997; Vanbuel, 2006). When the term is used with computer technology, multimedia refers to a variety of applications that combine media and that use CD-ROM, video, audio, DVD, and other media equipment. As it seen multimedia is the combined use of media, such as images, video, audio, CD/DVD-ROMs, the internet and interactive applications such as applets and flash for education and entertainment (Chang, 2004; Finn, 2002).

Multimedia hardware requirements include a basic computer system with the standard input devices, central processor, and output devices, CD-ROMs or DVDs, sound boards or cards, speakers, video boards, highspeed central processors, extensive secondary storage or hard disk (Lieshout, 2001; Millar, 2005). Multimedia's basic technologies include

text, maps, graphic images, electronic presentations, animation, videoconferencing, digital audio and video, web learning environment, videoconferencing systems (Lieshout and etc, 2001; Phillips, 1997; Behrens, 1996, 1997; Bijnens 2004, 2005; Cleveland, 1998).

Multimedia combines five basic types of media into the learning environment; text, video, sound, graphics and animation,

thus providing a powerful new tool for education (Duke, 1993). These are to demonstrate abstract concepts, to accommodate students with a variety of learning styles, to engage students, to enable active learning, by incorporating multimedia into learning, activities, students can manipulate, create and interact with material rather than just absorb representations created by others (Kearsley, 1998; Person, 2003).

Multimedia technologies have a lot of advantages such as;

widely available, reusable, multimedia, and decrease pressure on lecturer, better individual student engagement, globality (Repman, 1993; West, 2006). These are fun and interesting, provide a pre question, and make description a narration, no need to include an image or video of the narrator, unless there's some demonstration. Do not include explanation in both text and narration styles, Give students chance to pause the video/audio and ask questions, Make the multimedia interactive, Provide pre training on key components, concepts in the multimedia to enhance students' understanding of the multimedia resource,

Presenting more materials may result in less understanding (Mayer, Heiser, and Lonn, 2001; Mayer, Dow and Mayer, 2003; Wallace, 2006).

145

E-LEARNING E-Learning is the use of technology to enable people to learn anytime and anywhere.

E-Learning can include training, the delivery of just-in-time information and guidance from experts.

It is a new education concept by using the Internet technology, it delivers the digital content, provides a learner-orient environment for the teachers and students. The e-learning promotes the construction of life-long learning opinions and learning society. Delivery of the digital content is the main characters of e-learning. E-Learning is an important consideration in education for several reasons: 1. Implemented correctly, it can reduce some of the costs associated with education 2. It allows schools to educate people they could not previously (e.g. people that work for a living, people geographically dispersed, etc.) 3. Many students communicate better in a web based environment than in the traditional classroom. Studies have shown that students who would not raise a hand in class will be very active in posting to discussion boards for example. E-Learning is a challenge for educational institutions because the technology involved can be difficult to manage and use. A lot of training or practice is required to get proficient in e-Learning solutions. For example, Flash based applications need to target customers that have a large learning audience to justify the expense. Virtual classrooms are often a more cost efficient solution in many cases. E-Learning is an active and growing industry. It may take a hit with the economy being like it is but it will reemerge very strong. 3.7 Implications of Multimedia in Teaching and Learning Education encounters, in modern times, challenges in all aspects of social, economic & cultural life; the most important of which are over-population, over-knowledge, education philosophy development & the change of teacher's role, the spread of illiteracy, lack of the staff & the technological development & mass media (Aloraini, 2005, p. 30- 32). This drove the teaching staff to use the modern teaching technologies to face some of the main problems, which education & its productivity encounter, by increasing the learning level which may be achieved through providing equivalent opportunities for all people whenever & wherever they are, while taking into account the individual differences between learners (Wilkinson, 1986, p. 13 & Abd El-Halim Said, 1997, p. 19). To improve the educational productivity, some of the teaching staff sought to mainstream technology within education, developing traditional techniques & using new educational methods (Al-A'ny, 2000).

146 Mainstreaming the technological media within what is called "Multimedia" is the pattern which led to infinite applications of computer technologies. The concept of this technology came into being with the appearance of sound cards, then compact disks, then came the use of digital camera, then the video which made computer an essential educational tool. Nowadays, multimedia expanded to become a field on its own. Interaction is the main element in multimedia technology as most of its applications are characterized by interaction. Consequently, multimedia programs may provide a more effective & more influential experiment than using each technology separately. Multimedia is one of the best educational techniques because it addresses more than one sense simultaneously, as it addresses the senses of sight & hearing. Multimedia programs provide different stimuli in their presentations which include a number of elements some of which are (Aloraini, 2005, p. 55-75): Texts Spoken words Sound& music, Graphics, Animations and Still pictures Some of the potential advantages of multimedia programs are: 1. They make the reading process a dynamic one instead of the written presentation of the texts printed in the book (Zaitoun, 2002, p. 259). 2. Presenting different drawings & pictures supports the clarification of ideas & communication of information. 3. Moving easily from a presented subject to another provides a good chance for questions & discussions. 4. Using different presentations like video clips along with maps or other kinds of presentations help to get the information closer to reality. Adding music makes the idea clearer and it attracts the attention of the learners (Aloraini, 2005, p. 73). 5. They rise the attention & interaction between students & the educational subject (Qandeel, 1998, p. 1625). 6. They comprise the elements of amusement & suspense (Qandeel, 1998, p. 1625).

147 7. They are graded according to the learner's abilities from easy to difficult ones (Qandeel, 1998, p. 1625). 8. They provide teachers with a new educational style & encourage curiosity (Holsinger, 1995, p. 9). 9. They help teachers & learners look into topics from a broader perspective as each topic comprises enormous information (Holsinger, 1995, p. 9). 10. They guide learners to peer learning (Alfar, 2009, p. 123). 11. They are concerned with providing simultaneous feedback (Qandeel, 1998, p. 1625). 12. They help learners remember & transfer their knowledge (Alfar, 2009, p. 123). 13. They support the user's work & innovation, which makes the possession of a computer a necessity for both the student & the teacher. Teaching and learning are two complementary aspects of education. Within learning, there are two key elements: content, which forms the "what" of learning; and skills, which describe the application of content to specific tasks, or the "how." These two elements are mirrored in teaching by the curriculum and syllabus (the "what") and the teaching methodology (the "how"). Multimedia technology affects both aspects of teaching and learning. It does this in three ways: in how it presents information; in how students interact both with the medium and through the medium with the teacher and other learners; and in how knowledge is structured within multimedia. Multimedia can represent knowledge in more ways than text or speech can. Multimedia combines text, audio, visual, graphic, and dynamic elements, such as animation and video. This presents learners and teachers with unique learning resources that can be used in a wide variety of ways to stimulate various forms of learning. The most significant feature of the multiple forms of media is that they allow for the presentation of knowledge in numerous ways. Thus students can learn about abstract principles through text and can see the application of those principles through an animation or a video example. This presents the opportunity for deeper levels of understanding, particularly if the presentational qualities are fully and deliberately exploited to achieve this purpose and are combined with the potential for learner interaction. Well-designed applications of multimedia then can do two things: they can enable learners to come to understandings more quickly than through more conventional classroom or textual media; and perhaps more significant, they can change how we come to know or to understand and hence what we know and understand. In other words, a

148 learner may have an image or a mental "construction" that is far richer than an abstract verbal understanding. From an educational perspective, it is essential that learners can move confidently between concrete and abstract understandings and not become locked into one or the other. This does not happen by accident. Multimedia needs to be carefully designed to facilitate the development of this kind of thinking. Thus the role of the teacher is by no means diminished; indeed, such design requires highly skilled teachers working in teams with multimedia producers. 3.8 Let Us Sum Up 1. Multimedia is the encompass of all media used in electronics, particularly with computers. The use of computers to present text, graphics, video, animation, and sound in an integrated way. Long touted as the future revolution in computing, multimedia applications were, until the mid-90s, uncommon due to the expensive hardware required. With increases in performance and decreases in price, however, multimedia is now commonplace. Nearly all Personal Computers are capable of displaying video, though the resolution available depends on the power of the computer's video adapter and microprocessor. 2.

Technology does not necessarily drive education. That role belongs to the learning needs of students. With multimedia, the process of learning can become more goal oriented, more participatory, flexible in time and space,

unaffected by distances and tailored to individual learning styles, and increase collaboration between teachers and students. Multimedia enables learning to become fun and friendly, without fear of inadequacies or failure. 3.

Interactive Multimedia is the means to interface with these media typically with a computer keyboard, mouse, touch screen, on screen buttons, and text entry allowing a user to make decisions as to what takes place next. 4.

Specific uses of multimedia include: Drill and practice to master basic skills

the development of writing skill

problem solving understanding abstract mathematics and science concepts simulation in science and mathematics manipulation of data

acquisition of computer skills for general purposes, and for business and vocational training access and communication to understand

populations

and students access for teachers and students in remote locations individualized and cooperative learning management and administration of classroom activities. 5.

Role of Teacher in Multimedia Approach •

Teacher has to adopt a number of methods and techniques.

149 •

Teacher has to aware of the different available media and their availability. • Teacher should be physically competent to use and demonstrate the use of the different media. •

Teacher should be skillful enough to make a judicious choice of media and competent enough to mix them sequentially and in an orderly manner. • Teacher's role is that of a facilitator or manager of activities. • Teacher has to lead his student for independent, individualized learning. 6.

Advantages of the multimedia Approach • Multimedia approach enables the student to represent information using several different media. • Can arouse the curiosity among the learner and provide them vivid impressions. • Multimedia can take into account

different learning styles - some pupil learn by interpreting text, while others require more

graphical representations. • Can develop a positive attitude among the learners towards the teaching-learning process. •

Multimedia Approach allows for self-pacing • Technique of simulation can be effectively applied through the multimedia

approach. • Helps in development of higher order thinking skills. • Multimedia approach provides the student the

flexibility of 'anywhere', 'any time' learning. • Helps in developing group and interpersonal skills. • Effective remediation

programmes can be implemented through the multimedia approach. • Multimedia approach can bridge language

barriers since audio is not the only means of communication. 7. Disadvantages of the multimedia Approach • Requires highly sophisticated infrastructure facilities, which may lead to heavy financial burden. • Expertise and skill are required to operate the multimedia devices, which will lead to the problem of non-availability of human resources. • Not feasible in the all topics of study.

150 8.

With a multimedia approach, the student could also access Web sites on the Internet to get more information. The student could then add film clips on these animals in their natural habitat (all may be from the same CD-ROM) and blend them into a report. Then by adding titles and credits, the student now has a new and original way of

communicating his/her own individual perspective. 9. With multimedia simulation technique can be effectively applied. By using simulation, student can grasp a better understanding about the step and producer to make or do a certain project. This can improve their understanding and also help improving their skills. 10. Multimedia possessed a lot of advantages to make learning interesting. With the help of its elements, it can invoke creativity in both teacher and students so that they can apply it in order to teach or learn. Learning also becomes much easier with the help of multimedia. Multimedia can help improve our educational system.

3.9 Check Your Progress 1. Define Multimedia. Briefly discuss the advantages of multimedia learning over traditional learning. 2. Comment on the recent trends in Multimedia teaching and learning process. 3. How had multimedia changed the educational scenario? Explain. 4. Give a comparative study on the advantages of smart board over blackboard.

153 4.1 Introduction The

effective Use of Technology in Education has changed the face of education and it has created more educational opportunities. Both teachers and students have benefited from various educational technologies, teachers have learned how to integrate technology in their classrooms and students are getting more interested in learning with technology. The use of technology in education has removed educational boundaries, both students and teachers can collaborate in real time using advanced educational technologies. Technology has helped in the growth of mobile learning and long distance learning. The use of internet technology has enabled teachers to reach students across borders and also students from developing countries have used internet technology to subscribe for advanced educational courses. Many universities and colleges have embraced online education by creating virtual classrooms. Online education is flexible and affordable, students can attend classrooms during their free time, and they can also have a chance to interact with other students virtually. Recent advancements in educational technologies have yielded positive results in our education sector. This new educational technology is supporting both teaching and learning processes, technology has digitized classrooms through digital learning tools like, computers, iPads, smartphones, smart digital white boards; it has expanded course offerings, it has increased student's engagement and motivation towards learning. The teaching strategies based on educational technology can be described as ethical practices that facilitate the students' learning and boost their capacity, productivity, and performance. Technology integration in education inspires positive changes in teaching methods on an international level. Benefits of Technology in a Special Educational Classroom

1. Most students are drawn to technology and special education teachers often find that these students are then more motivated to work because they get to use a technology device in the classroom.
2. Teachers can work with more students at one time more effectively, such as using a phonetic ear so that more students can hear or a clicker response system to engage all of the students at once.
3. Technology is an equalizer and parents even report that when their children with challenges or disabilities uses technology that they are seen as more capable by peers.

154 4. Children learn valuable technology skills that can translate into marketable skills. 5. Children with physical disabilities have more opportunities for engaged learned with modified assistive technology such as touch screens and assistive wands. 6. Students who spend time in mainstream classes and special education classrooms can use technology to bridge the expectations and demands of each, such as by using a device to record lectures for playback later. 7. Technology can help build confidence in children. They are finding more success academically and they are also feeling more like their classmates who utilize technology every day, too. Even though there are many other tools that are valuable to special education teachers, technology can be counted as a beneficial resource that can turn special education classrooms into launch-pads for learning - and life. 4.2

Objectives After going through this unit you will be able to ●

discuss how to enhancing Technology Friendly Practices among Teachers. ●

discuss about the importance of

Computer-Assisted & Computer Managed Instructions, Cybernetics, E- learning, Use of Net Search and Websites ●

discuss about

Disability Friendly Technology - Punarjani, and e-learning Framework developed by C-DAC 4.4

Developing Technology Integrated Lessons - Individual and Group ● discuss the implications of Technology based instruction in Inclusion 4.3

Enhancing Technology Friendly Practices Among Teachers 4.3.1 Technology and Teaching Practice Thomas Edison once said, "Books will soon be obsolete in the public schools...our school system will be completely changed inside of ten years." Amazingly enough, however, one of our nation's most important inventors was proven quite wrong. The education system has a remarkable resistance to innovation and the classroom experience has changed very little in the 100 years since Edison's prediction. Advances in information technology have revolutionized how people communicate and learn in nearly every aspect of modern life except for education. The short school

155 day and the break in the summer were meant to allow children to work on family farms. Schools have an enduring industrial mentality placing students in arbitrary groups based on their age regardless of their competencies. Technology has failed to transform our schools because the education governance system insulates them from the disruptions that technology creates in other organizations. The government regulates schools perhaps more than any other organization. Rules govern where students study, how they will learn, and who will teach them. To overcome these obstacles, we must persuade teachers that technology will empower them and help their students learn. There are five strategies for successful teacher adoption of education technology and that these principles will help fulfill the potential that Edison saw a century ago: Schools must use technology that empowers teachers. Teachers rightly reject education technologies that divert their attention from instruction. The best education technologies enable teachers to do more with fewer resources. Communication platforms like Twitter and Facebook enable dynamic communication with students. Teacher-empowering technologies include mobile apps that grade written student work and provide lesson plan databases. School systems need to aggressively track what works for their teachers and put all other unworkable technologies aside. Teachers should treat the adoption of technology as part of lesson planning. Teachers can incorporate technology directly into their practice and insulate their students from the deleterious effects of policy churn. Systematic adoption of technology at the classroom levels limits the damage of shifting policy maker priorities. Teachers should not fear open-source technologies. Many mistakenly believe that education technologies are expensive and complicated to use. Open-source technologies are stable, secure, and compatible with other platforms. Organizations both small and large use open source devices every day. Many businesses use open-source servers for their efficiency and costs savings. They often have large communities that provide high quality customer support. Best of all, open-source technologies often cost less than proprietary products. Use online education portfolios to evaluate students. Educators have known about the benefits of paper based portfolios for generations. Portfolios allow students to express creativity for difficult to assess subjects. Teachers can choose from a variety of online portfolio providers tailored to the needs of their classroom. They also serve as a platform for students to demonstrate growth. Online portfolios have many advantages over paper based options because they cost less and allow for more robust outreach. Online

156 portfolios are also amenable to a wider variety of formats including video, music or other interactive features. Teachers should embrace the Common Core State Standards. Common standards make teaching simpler. Teachers have to write lessons that comply with district, state, and national standards (e.g. NCTM or NCTE). Having a single set of standards eliminates redundancy and conflicting guidelines. Furthermore universal adoption of common standards will support future technological innovations that aid teachers. From a technical perspective, standards facilitate the development of new technologies. Innovators can focus on developing tools that better serve students rather than solving technical challenges of interoperability created by multiple sets of standards. Undoubtedly weak financial support inhibits the adoption of education technology. Despite this obstacle, teachers working together have tremendous potential to reform education. Every day teachers face choices about how to implement the curriculum and instruct students. Those moments are opportunities for teachers to engage in education reform that has a real impact on students. Teachers should use education technologies that are inexpensive, easy to use, and improve student learning.

4.3.2 Role of Technology in School Management to Enhance Learning: India has one of the largest networks of schools in the world. During the last five decades the system has grown manifold in size both in terms of institutions and enrolment. Some say, that the nature of Indian education system shifted from an elite system to a system of mass education. For instance, the number of primary schools was around 200,000 in 1950, which is at present more than 600,000. If one were to take into consideration the number of alternate schools that have sprung up in recent years, and include the upper primary and secondary schools, the network consists of more than a million schools. Traditionally, school education acquired immense importance in the post-Independence period and with the consequent expansion of the system, the role of the school teacher also underwent a significant transformation. An important consequence of the expanding system of schools, with ever increasing enrolment and acquiring of mass character, has been the increase in complexity of school management.

The changing pace of technology development like ICT and knowledge revolution has made the job of the teacher more demanding. They are required and should be encouraged to assume the new roles and responsibilities for ICT to improve the quality of education and access to education by learners

in an informal and non-formal education setting. (Govinda, 2002) The system demands new knowledge and skills from the teacher and head teachers. It also demands greater capability at the school level to respond to the emerging diversity in the student population and among those entering the teaching

157 profession. In effect, changes in the characteristics of the system have made the role of the school teacher even more critical than what it was earlier. Has the State, which is the main provider of education in the country, responded to the changed reality? Has the teacher become more empowered? Have adequate efforts been made to equip the teacher to face the emerging challenges? What is the current reality with respect to status, roles and functions of the teacher and the head teachers in India? And how can we come out from this challenge? These are few issues which need attention especially now when the country is moving towards becoming a knowledge center and quality education has become determinate in such process.

4.3.3 An Overview of Teacher Managerial Function in the Class Room

Historically, most of teachers restricted their role to teaching. The different government organizations and departments provided a guide line for the role and responsibility of the teacher. The teacher plays multiple roles in the school. The role of teacher is assessed in terms of his/her attendance in the class, completion of the course and interpersonal relation in the school. Till now, hardly any indicator is developed to assess the performance of teacher on the basis of learning achievement of the student. The critical managerial functions of a teacher in elementary education are similar to those in other sectors. These are: (i) Administration. Administration refers to the direction, control, management and organization of human and material resources for educational growth and development. (ii) Personnel management. Planning and managing human resources is personnel management. It includes recruitment, transfer and redeployment; promotional opportunities and performance appraisal systems, grievance redressal mechanisms and professional development issues. (iii) Planning. Planning is a systematic exercise of determining a future course of action in accordance with identified objectives, needs, priorities and existing/likely capacities, within a given time frame, reflecting cost-effective choices. (iv) Financial management. Financial management refers to mobilization, deployment and efficient use of financial resources as per stated objectives and strategies. (v) Supervision, monitoring and support. Monitoring and facilitation of teaching- learning processes, and other school development activities, for enhancing their

158 quality through suitable tools, methods and mechanisms. The focus is on school, because this is the unit where primary learning takes place, and any effort to improve the quality of processes should ultimately be reflected here.

4.3.4 Benefits of Technology in the Classroom

As we sail through the 21st century, technology in the classroom is becoming more and more predominant. Tablets are replacing our textbooks, and we can research just about anything that we want to on our smartphones. Social media has become commonplace, and the way we use technology has completely transformed the way we live or lives. Educators, too, have seen firsthand the benefits of technology in the classroom. Educators also recognize the importance of developing these technological skills in students so they will be prepared to enter the workforce once they complete their schooling. The impact that technology has had on today's schools has been quite significant. This widespread adoption of technology has completely changed how teachers teach and students learn. Teachers are learning how to teach with emerging technologies (tablets, iPads, Smart Boards, digital cameras, computers), while students are using advanced technology to shape how they learn. Here are a few benefits of using technology in the classroom.

Technology in the Classroom Makes Learning More Fun

Students prefer technology because they believe that it makes learning more interesting and fun. They especially like laptops and tablets. Subjects that students deem challenging or boring can become more interesting with virtual lessons, through a video, or when using a tablet.

Technology Prepares Students for the Future

Using technology in the classroom would help prepare them for the digital future. These 21st-century skills are essential in order to be successful in this day and age. Jobs that may not have had a digital component in the past, may have one now. Education isn't just about memorizing facts and vocabulary words, it's about solving complex problems and being to collaborate with others in the workforce. Ed-tech in the classroom prepares students for their future and sets them up for this increasing digital economy.

159 Improved Retention Rate Technology helps them retain information better. Technology indeed helps students remember what they learn. Technology Helps Students Learn at Their Own Pace Today's technology enables students to learn at their own pace. For example, almost all apps allow for individualized instruction. Students can learn according to their abilities and needs. This form of teaching is also great for the teacher because it gives him/her the time to work individually with students who may be struggling. Technology Connects with Students Technology occupies an important place within students' lives. When they are not in school, just about everything that they do is connected in some way to technology. By integrating technology into the classroom, teachers are changing the way they used to teach and providing students with the tools that will take them into the 21st century. Technology changes by the minute, and as educators we need to keep up with the times in order to best prepare our students for this ever-changing world that we live in. While we just saw how integrating technology into the classroom has its benefits, it's important to note that traditional learning processes are just as essential. 4.3.5 Teacher Technology

Competencies Teachers need to improve knowledge and skills to enhance, improve and explore their teaching practices. Many of the studies on competencies of teachers focus on the teaching role of teachers in the classroom rather than teachers' competencies. Competencies are defined as "the set of knowledge, skills, and experience necessary for future, which manifests in activities" (Katane et.al. Gupta defines competencies as "knowledge, skills, attitudes, values, motivations and beliefs people need in order to be successful in a job." ICT competencies are based on using tools and technical equipment for the reaching, disturbing and transferring the knowledge. They include any technology that helps to produce, manipulate, store, communicate, and/or disseminate information. It means that the ICT competency is very important to improve the communication in the learning and teaching process. The ICT Competencies are a set of technology standards that define

160 proficiency in using computer technology in the classroom. The competencies consist of computer-related skills grouped into four general domains: (1) Basic Technology Operation, (2) Personal and Professional Use of Technology Tools, (3) Social, Ethical, and Human Issues, and (4) Application of Technology in Instruction. 4.3.6

Importance of ICT Competency for Teachers Teaching is a complex activity. Competent teachers apply broad, deep, and integrated sets of knowledge and skills as they plan for, implement, and revise instruction. Technology proficiency (including technical skills and instructional applications) is but one dimension of teacher competence. The acquisition of technology knowledge and skills must be connected with the development of a broader array of competencies. Early attempts to develop technology standards for teachers were isolated from the broader teacher competencies and were focused primarily on technology skills. Consequently these competencies were largely ignored by teacher-training institutions. Typically, colleges of education simply required a single media course to satisfy accreditation requirements; often, colleges were reluctant to insert yet another course into an already overloaded curriculum. The International Society for Technology in Education (ISTE) has actively addressed the technology isolation problem and has recently released a set of revised teacher technology standards. Developed through a rigorous process of expert and lay-person input, the NETS-T Project (National Educational Technology Standards for Teachers) explicitly describes what competent teachers should know and should be able to do with technology in the context of broader teacher competencies. The NETS-T standards are categorized as follows: 1. Technology operations and concepts, 2. Planning and designing learning environments and experiences, 3. Teaching, learning, and the curriculum, 4. Assessment and evaluation 5. Productivity and professional practice, 6. Social, ethical, legal, and human issues.

161 4.3.7

Basic Technology Competencies Fundamental skills come first - like managing electronic files, using computerized databases and spreadsheets, sending and receiving e-mail messages, and creating documents with graphics. These skills are prerequisites for more advanced skills, such as accessing online resources, creating desktop publishing documents, developing multimedia presentations, selecting and customizing instructional software to fit students' needs, streamlining recordkeeping and other administrative procedures with electronic tools, and observing the correct protocols in sharing intellectual property. The competencies are organized into five aspects: productivity, communication, research, media and presentation.

1. Productivity

- Produce and manage learning documents. This includes composing standard educational publications such as parent newsletters and handouts for students and class lists; teaching students how to prepare their own documents on a computer.
- Analyze quantitative data. This includes administrative work such as putting student test scores into a spreadsheet and analyzing them, as well as preparing curriculum materials with digital tables and graphs of curriculum content.
- Organize information graphically. He or she can use specialized graphic organizer programs, as well as general tools such as word processors or presentation programs, to create digital representations of educational information.

2. Research

- Use effective online search strategies. In their professional preparation, as well as in their classroom assignments, the teacher chooses the most appropriate research tools and databases, and applies the most effective search techniques, to produce useful and safe online resources in the classroom.
- Evaluate and compare online information and sources. Once located, the teacher knows the difference between authoritative and untrustworthy sources, how to ascertain authorship, and how to find sources with different points of view. And can teach these skills to students.
- Save and cite online information and sources. The teacher knows a variety of methods for bookmarking and saving valuable online resources so that they may easily be found later and employed in learning materials.

3. Communication

- Communicate using digital tools. These include email, instant messaging, mobile colleagues, and knowing how to organize and manage these tools in the classroom.
- Collaborate online for learning. Takes advantage of the tools listed above plus blogs, wikis, chats, audio and videoconferencing to bring outside resources into the classroom and to encourage academic collaboration among students.
- Publish learning resources online. From a simple teacher's web site to a complex curriculum wiki to the online posting of student projects, to podcasting, the teacher has mastered an array of tools and techniques for publishing learning materials online.

4. Media

- Differentiate instruction with digital media. This includes an awareness of assistive technologies for disabled students as well as the ability to use a computer to prepare and present academic ideas in a variety of forms for better learning by all students.
- Capture and edit images, audio, and video. The teacher can use digital still and video cameras, edit their output on a computer, and produce learning materials that range from simple slide shows to the archiving of student presentations and performances.
- Produce digital multimedia educational experiences. The teacher can combine media from a wide array of sources into a useful presentation of academic content, and can teach this skill to students.

5. Presentation

- Create effective digital presentations. Using common tools for preparing slide shows, videos, and podcasts, the teacher can create presentations that follow the principles of communication, and can apply these design principles to the evaluation of students' digital work.
- Deliver digital multimedia presentations. Using common devices such as computers, projectors, and screens, the teacher can set up classroom presentations and arrange for students to do the same.
- Employ new media devices for learning. From large Smart Boards to tiny iPods to science probes, the teacher can incorporate a variety of digital devices into the instruction in the classroom.

163 Those are the skills that just about every teacher needs, no matter the subject or grade. Beyond these are the more specific technical skills required of a high school math teacher or a teacher of visually-impaired students, competencies that would be embedded into specialized courses and programs.

4.3.8 Strategies for Preparing Teachers to Use Technologies

Given the importance of well-trained teachers for technologies to be effective in enhancing learning, what might education policy makers do to support and encourage appropriate strategies for training teachers? No single approach to professional development will meet the learning needs of all teachers seeking to develop skills and knowledge in the integration and application of technology. Teachers' progress through a series of five predictable stages as their expertise in technology adoption and integration evolves. It is likely that within a school, and certainly within a district, teachers will exhibit varying levels of expertise and therefore a variety of different professional-development opportunities will be required. In contrast, learning that occurs outside the confines of programs provided by institutions is considered informal learning. Informal learning, sometimes referred to as self-directed learning, typically occurs in the learner's "natural setting" and is initiated and conducted independently (Merriam & Caffarella, 1999). Policy makers may want to consider both kinds of approaches. A brief overview of the kinds of possible training strategies is as follows:

Encouraging Teachers to Acquire Necessary Skills:

For many teachers, having access to technologies is not viewed initially as a benefit. Teachers may consider technologies yet another demand on their time, a set of tools they did not ask for and do not know how to use. Some teachers feel they are already doing a good job in the classroom and wonder how technologies will contribute to improvements. Still other teachers, of course, welcome the technologies and are eager to learn how to use them. Policies that either mandate or provide opportunities will cost money, but without the establishment of policy that mandates or provides professional-development opportunities (or, ideally, both), teachers are unlikely to acquire the skills they need to use the technologies available to them, thus negating the potential benefits of the investment that has been made in infrastructure. Providing sustained support for Teachers' use of Technologies: It is very important for teachers to acquire knowledge and skills in how to use technologies. But once teachers

164 begin to acquire such skills and begin to use technologies, there is a need to provide means of continuing support to teacher use of technologies. That is, initial training of teachers is not likely to guarantee that the technology infrastructure will continue to be used.

Evaluating Teacher Use of Technologies:

The issue for education policy makers here concerns the extent to which a teacher uses technologies effectively, which can or should be an important criterion in evaluating a teacher's performance. This is a complicated issue for policy makers. This general issue is complex in part because of divided opinion on how important technology use is to the future well-being of individual citizens in a given entity, or to the entity as a whole. There are many writers who make the argument that neither an individual nor a state or nation can hope to survive or prosper unless they are very familiar with technologies. Others dispute this claim and worry about the survival of traditional cultural values in a technological age. Given this deeply-rooted controversy, establishing policy according to which teacher performance will be judged is of critical importance.

Teachers are central to the effectiveness of technology infrastructures that serve education. How teachers acquire the skills they need to use technologies and how the technology is actually used and to what ends, are critical policy domains that must be carefully explored. Hopefully, issues of this nature will be considered as decisions are made about technology and as educators make decisions about the future shape of their schools.

4.4 Computer Assisted and

Computer Managed Instructions, Cybernetics, E- Learning, Use of Net Search and Websites

4.4.1 Computer Assisted Instruction (CAI)

A self-learning technique, usually off line/

online, involving interaction of the student with programmed instructional materials. Computer Assisted Instruction (CAI) is an interactive instructional technique whereby a computer is used to present the instructional material and monitor the learning that takes place. CAI uses a combination of text, graphics, sound and video in enhancing the learning process.

The computer has many purposes in the class room,

and it can be utilized to help a student in all areas of the curriculum. CAI

refers to the use of the computer as a tool to facilitate and improve instruction. CAI programs use tutorials, drill and practice, simulation, and problem solving approaches to present topics and they test the students understandings.

165 Typical

CAI Provides 1. Text or

multimedia content 2. Multiple-choice questions 3. Problems 4. Immediate feedback 5. Notes on incorrect responses 6. Summarizes students' performance 7. Exercises for practice 8. Worksheets and tests.

Types of Computer Assisted Instruction 1. Drill-and-practice Drill and practice provides opportunities or students

to repeatedly practice the skills that have previously been presented and that further practice is necessary for mastery. 2.

Tutorial Tutorial activity includes both the presentation of information and its extension into different forms of work, including drill practice, games and simulation. 3.

Games

Games software often creates

a

contest to achieve the highest score and either beat others or beat the computer. 4. Simulation Simulation software can provide an approximation of reality that does not require the expense of

real life or its risks. 5.

Discovery Discovery approach provides

a large database of information specific to a course or content area and challenges the learner to analyze, compare, infer and evaluate based on their explorations of the data. 6. Problem solving This approach helps children develop specific problem solving skills and strategies.

Advantages of Computer Assisted Instruction *One to one interaction

166 *Greater motivator *Freedom to experiment with different options *Instantaneous response/immediate feedback to the answers elicited *Self-pacing allow

students

to proceed at their own pace *Helps teacher can devote more time to individual students *Privacy helps the shy and slow learner to learn *Individual attention *

Learn more and more rapidly *

Multimedia helps to understand difficult concepts through multi-sensory approach *Self-directed learning-students can decide when, where, and what to learn. Limitations of Computer Assisted Instruction *May feel overwhelmed by the

information and resources available *Over use of multimedia may divert the attention from the content *Learning

becomes too mechanical *Non availability of good CAI packages *Lack of infrastructure. 4.4.2

Computer Managed

Learning Computer Managed Learning (CML) is not to be confused with Computer Assisted Instruction (CAI), Computer Based Instruction (CBI), or Computer Based Learning (CBL). It is however, often referred to as Computer Managed

Instruction (CMI).When discussing computers and education, if one remembers that learning and instruction generally refer to the same thing, a good deal of the confusion between different terms is often eliminated. CMI has both a broad

and narrow meaning. In the broader sense, CMI refers to the following definition; CMI in its most sophisticated levels

provides the following instructional functions; (1) Assesses the learners present level of knowledge (2) diagnoses

weakness in the students learning (3) prescribes learning activities to remediate the identified weaknesses , and (4)

continuously monitors progress of the learner

167 CML can save time, money, and bureaucratic headaches, special educators are likely to continue developing and

using microcomputer management tools for; • Storing demographic and educational information on students and their needs • Recording, monitoring, and reporting students' progress • Listing incomplete information on student records •

Recording contacts with parents and supporting agencies/personnel • Recording, monitoring and reporting student due process status • Generating reports on referrals, meeting, evaluation, placement, programming and review for each

student. • Locating, describing, and recommending appropriate materials based on individual student need • Generating IEP objectives from a large data base and • Issuing reminders for when reports are due. 4.4.3 Cybernetics: Cybernetics is

not a new invention but its potential for application has not exhausted even after nearly seventy years of its origin. It

started with idea of automation and control in the electrical and mechanical systems, but later on extended to biological, social systems and learning systems.

Cybernetics means 'to steer', 'to navigate' or 'to govern' for taking the system to desired goal. Here in classroom teaching-learning process is a system and the goal is success of the learner and learning process. Classroom cybernetics is constituted by Constructivism, Conversation theory and a feedback system. Constructivism resulted in five E's namely- Engage, Explore, Explain, Elaborate and Evaluate.

Conversation theory necessitates interaction between teacher and learner. Feedback is another essential element of cybernetics which is an instrument for controlling the system to maintain equilibrium, move forward or even reverse it. The aims of Cybernetics divided into three classes as follows:- 1. To construct an effective theory, with or without actual hardware models, such that the various aspects of human and other sorts of behaviour can be simulated. 2. To produce models and theories of human behaviour which present these functions of human beings and other systems in the same manner in which they are performed by human beings or other such systems as are considered. In other words, it is not enough merely to produce the same end result; we want to produce the same end result by similar or even identical means.

168 3. Finally, to produce, or simulate, the whole of human or animal behaviour by models which in their construction are identical with human beings or animals. That is, they should in the end be chemico-colloidal systems, or protoplasmic systems. 4.4.4 E-Learning Use of computers and new technologies has become a crucial part of learning as well as teaching. E-learning today has been a key factor in various industries and teaching is one among them; especially teaching language. E-learning has redefined some strategies and concepts of teaching that have enabled the teaching community to perform better.

E-Learning

is learning utilizing electronic technologies to access educational curriculum outside of a traditional classroom. In most cases, it refers to a course, program or degree delivered completely online. There are many terms used to describe learning that is delivered online, via the internet, ranging from Distance Education, to computerized electronic learning, online learning, internet learning and many others. We define eLearning as courses that are specifically delivered via the internet to somewhere other than the classroom where the professor is teaching.

It is not a course delivered via a

DVD or CD-ROM, video tape or over a television channel. It is interactive in that you can also communicate with your teachers, professors or other students in your class. Sometimes it is delivered live, where you can "electronically" raise your hand and interact in real time and sometimes it is a

lecture that has been prerecorded. What is

e-learning? Is it important in education?

When it comes to online learning in education, the model has been pretty straightforward - up until the early 2000s education was in a classroom of students with a teacher who led the process. Physical presence was a no-brainer, and any other type of learning was questionable at best. Then the internet happened, and the rest is history.

E-learning is a rapidly growing industry, the effects of which we can trace back to the 1980s and even well before that (in the form of distance learning and televised courses) -

these will be discussed later in this ebook.

Now that affordable e-learning solutions exist for both computers and internet, it only takes a good e-learning tool for education to be facilitated from virtually anywhere. Technology has advanced so much that the geographical gap is bridged with the use of tools that make you feel as if you are inside the classroom. E-learning offers the ability to share material in all kinds of formats such as videos, slideshows, word documents

169 and PDFs. Conducting webinars (live online classes) and communicating with professors via chat and message forums is also an option available to users.

There is a plethora of different e-learning systems (otherwise known as Learning Management Systems, or LMSs for short) and methods, which allow for courses to be delivered.

With the right tool various processes can be automated such as a course with set materials and automatically marked tests. E-learning is an affordable (and often free) solution which provides the learners with the ability to fit learning around their lifestyles, effectively allowing even the busiest person to further a career and gain new qualifications.

Some of the most important developments in education have happened since the launch of the internet. These days' learners are well versed in the use of smartphones, text messaging and using the internet so participating in and running an online course has become a simple affair. Message boards, social media and various other means of online communication allow learners to keep in touch and discuss course related matters, whilst providing for a sense of community. In the fast-paced world of e-learning the available technologies to make a course new and exciting are always changing, and course content can and should be updated quickly to give students the very latest information. This is especially important if the e-learning training is being given to employees in a sector where keeping up-to-date on industry developments is of the utmost importance. This is one of the reasons why many businesses are now offering training via e-learning - other reasons includes low costs and the ability for employees to study in their own time and place. Overall, traditional learning is expensive, takes a long time and the results can vary. The importance of E-learning is now a given fact and it can offer an alternative that is much faster, cheaper and potentially better.

170

The history of e-learning The term "e-learning" has only been in existence since 1999, when the word was first utilized at a CBT systems seminar. Other words also began to spring up in search of an accurate description such as "online learning" and "virtual learning". However, the principles behind e-learning have been well documented throughout history, and there is even evidence which suggests that early forms of e-learning existed as far back as the 19th century. An e-learning history timeline Long before the internet was launched, distance courses were being offered to provide students with education on particular subjects or skills. In the 1840's Isaac Pitman taught his pupils shorthand via correspondence. This form of symbolic writing was designed to improve writing speed and was popular amongst secretaries, journalists, and other individuals who did a great deal of note taking or writing. Pitman, who was a qualified teacher, was sent completed assignments by mail and he would then send his students more work to be finished using the same system. In 1924, the first testing machine was invented. This device allowed students to tests themselves. Then, in 1954, BF Skinner, a Harvard Professor, invented the "teaching machine", which enabled schools to administer programmed instruction to their students. It wasn't until 1960 however that the first computer based training program was introduced to the world. This computer based training program (or CBT program) was known as PLATO- Programmed Logic for Automated Teaching Operations. It was originally designed for students attending the University of Illinois, but ended up being used in schools throughout the area. The first online learning systems were really only set up to deliver information to students but as we entered the 70s online learning started to become more interactive. In Britain the Open University was keen to take advantage of e-learning. Their system of education has always been primarily focused on learning at a distance. In the past, course materials were delivered by post and correspondence with tutors was via mail. With the internet the Open University began to offer a wider range of interactive educational experiences as well as faster correspondence with students via email etc. Online learning today With the introduction of the computer and internet in the late 20th century, e-learning tools and delivery methods expanded. The first MAC in the 1980's enabled individuals to have computers in their homes, making it easier for them to learn about particular subjects and develop certain skill sets. Then, in the following decade, virtual learning

171 environments began to truly thrive, with people gaining access to a wealth of online information and e-learning opportunities. By the early 90s several schools had been set up that delivered courses online only, making the most of the internet and bringing education to people who wouldn't previously have been able to attend a college due to geographical or time constraints. Technological advancements also helped educational establishments reduce the costs of distance learning, a saving that would also be passed on to the students - helping bring education to a wider audience. In the 2000's, businesses began using e-learning to train their employees. New and experienced workers alike now had the opportunity to improve upon their industry knowledge base and expand their skill sets. At home individuals were granted access to programs that offered them the ability to earn online degrees and enrich their lives through expanded knowledge.

The benefits and drawbacks of online learning Whether you're a high-school teacher looking to engage your students in a more interactive way, or a corporate trainer hired by a large company to design training curricula, e-learning packs a punch when it comes to benefits that make the creation and delivery processes easier and hassle-free. Important benefits are outlined below: No Boundaries, No Restrictions Along with locational restrictions, time is one of the issues that learners and teachers both have to face in learning. In the case of face-to-face learning, the location limits attendance to a group of learners who have the ability to participate in the area, and in the case of time, it limits the crowd to those who can attend at a specific time. E- learning, on the other hand, facilitates learning without having to organize when and where everyone who is interested in a course can be present. More Fun Designing a course in a way that makes it interactive and fun through the use of multimedia or the more recently developed methods of gamification (further discussed in later chapters) enhances not only your engagement factor, but also the relative lifetime of the course material in question. Cost Effective This is directed to both learners and teachers, but there is a good chance that 172 whatever your role you had to pay exorbitant amounts of money at some point to acquire updated versions of textbooks for school or college. While textbooks often become obsolete after a certain period of time, the need to constantly acquire new editions is not present in e-learning. It Just Fits! As companies and organizations adopt technologies to improve the efficiency of day-to-day operations, the use of the internet becomes a necessity. As multinational corporations expand across the globe, the chances of working with people from other countries increases, and training all those parties together is an issue that e-learning successfully addresses. And that's a great advantage of online learning! Let's blend all of that together and apply it in a real-life scenario: In an effort to enhance the credibility of course material, oftentimes a professor will summon a field specialist to give a lecture relevant to the topic at hand. In the traditional model of education, the professor would have to extend an invitation to said expert, and incur the costs of his flight, stay and training. With e-learning: With e-learning the professor has the ability to host a guest lecture without having to spend much money. It can be done virtually, with cameras for both the lecturer and the students, and with the use of microphones to facilitate the same level of interaction that would be possible if the lecturer were physically present in the room. The added benefit comes in when we are able to replay the lecture and gain even more out of it. Students that missed out can view the recording, or students that attended can watch it again to further their understanding. Concerns that arise with e-learning Even given all the benefits of e-learning, one cannot deny there are some drawbacks. A good example of a disadvantage of online learning is that practical skills are somewhat harder to pick up from online resources. For example, although building a wooden table is something you can easily share information about, record videos of and explain, the practical experience is essential. Pottery and car engineering are examples of skills that require hands-on experience. Isolation Though e-learning offers ease, flexibility and the ability to remotely access a 173 classroom in the student's own time, learners may feel a sense of isolation. This is because learning online is a solo act for the most part, which may give the learner the feeling that they are acting completely alone. As technology progresses and e-learning benefits from the advancements being made, learners can now engage more actively with professors or other students using tools such as video conferencing, social media, and discussion forums amongst others. Health Related Concerns E-learning requires the use of a computer and other such devices; this means that eyestrain, bad posture and other physical problems may affect the learner. When running an online course it's a good practice to send out guidelines about correct sitting posture, desk height, and recommendations for regular breaks. 4.4.5 Importance of

Internet and Websearches in the Modern Education Things are changing rapidly as the world is progressing. In this modern world people are using advanced machines to do their work. Computer is the most advanced machine that people use to do their work. This particular machine is used in every field of life. Advanced techniques are used with help of computers to diagnose dangerous diseases. Advanced manufacturing techniques are used with the help of computers to manufacture the products. Computers are extensively used in the field of engineering. In past one machine was used to perform only a single task but now-a-days with the help of computers you can perform different tasks at one time. In modern business environment computers have special importance. A huge amount of time is saved due to multitasking. In business terms time is money, so if you are saving time you are saving money as well. Due to multitasking the costs of businesses have reduced. What is the meaning of multitasking? It means that running several programs simultaneously. Since modern computers typically execute instructions several orders of magnitude faster than human perception, it may appear that many programs are running at the same time even though only one is ever executing in any given instant. Multitasking may slow down a computer that is running several programs at one time. Many advanced computers are designed to share their work across many CPUs. This process is called multiprocessing. This technique is generally used in powerful computers such as super computers, mainframe computers and servers. Thus, the entire world is fully dependent on computers. Due to this factor demand of computers has been increased. Computers have changed the way we work, be it any profession. Therefore, it is only but natural the role of computers in education has been given a lot of prominence in the recent years. Computers play a vital role in every field.

174 Importance of Educational Websites In this technology era, the passion of internet is boosting among the students. For any search they usually like to use the Google to collect the information. Similarly in the case of education, it is often helpful to use education websites as a means of collecting the relevant information about the concerned subject. Well, it has become very necessary for any new business to promote over the web. If we want to put up and enlarge your business in worldwide then it's vital for you to make a good web site, so that people can easily understand the mission and vision of your business and liberally enjoy the various services. Today the many institutes and colleges in India are developing their own sites to offer the clear concepts to the students. With the help of these education websites student can search any colleges across the country just by entering the few relevant keywords like best law colleges in India, medical colleges in India. It is well said "Action Speaks Louder than Words"; in the same way education website will speak volume for students. At present there are some great education websites are available which directly conveys the useful information. Suppose you want to find the list of best law colleges in India these education websites help you out and shows the all best law colleges in India in the form of list even it can also mentioned the complete details of the colleges including courses offered, fee details, duration of the course and contact details of the colleges. The concept of education websites is still new in India but owing to its growing need, it is gaining popularity at a fast pace. Students have become more conscious about their career so that picking right course is necessary as it is the merely way that ensures their good professional life. In this regard, they visit education websites and openly discuss their areas of interest and seek all significant info. Students also visit these education websites to get the information about the various college or institute; they want to take admission in like medical colleges in India. These education websites are especially best for those students who live in the remote areas and don't able to reach the colleges. They can add their request by mailing these education websites and fetch the instant responses. 4.5

Disability Friendly Technology - Punarjani and E-Learning Framework Developed by C-DAC 4.5.1

Punarjani:

Punarjani is an assessment tool for the children with Intellectual disabilities. CDAC

175 Trivandrum is engaged in developing an assessment tool named Punarjani. The system will collect a lot of data about a particular child with intellectual disabilities like developmental history, school history, home environment, social environment etc. and will be capable of suggesting a long term goal for the

child. This is an assessment tool for teachers who work with children with intellectual disabilities. This tool frees the teacher from time consuming activities like preparing reports. Doing manual assessment etc. and thus gives the teacher more time with the children. The teacher can override the assessment data generated by Punarjani but then has to give sufficient reasons why the result has been overridden. The software has built in learning capability based on the teacher's input.

4.5.2 E-Learning Framework developed by C-DAC Centre for Development of Advanced Computing (C-DAC) is the premier R&D organization of the Ministry of Electronics and Information Technology (MeitY) for carrying out R&D in IT, Electronics and associated areas. Different areas of C-DAC, had originated at different times, many of which came out as a result of identification of opportunities.

- The setting up of C-DAC in 1988 itself was to build Supercomputers in context of denial of import of Supercomputers by USA. Since then C-DAC has been undertaking building of multiple generations of Supercomputer starting from PARAM with 1 GF in 1988.
- Almost at the same time, C-DAC started building Indian Language Computing Solutions with setting up of GIST group (Graphics and Intelligence based Script Technology); National Centre for Software Technology (NCST) set up in 1985 had also initiated work in Indian Language Computing around the same period.
- Electronic Research and Development Centre of India (ER&DCI) with various constituents starting as adjunct entities of various State Electronic Corporations had been brought under the hold of Department of Electronics and Telecommunications (now MeitY) in around 1988. They were focusing on various aspects of applied electronics, technology and applications.
- With the passage of time as a result of creative echo system that got set up in C-DAC, more areas such as Health Informatics, etc., got created; while right from the beginning the focus of NCST was on Software Technologies; similarly C-DAC started its education & training activities in 1994 as a spin-off with the passage

176 of time, it grew to a large efforts to meet the growing needs of Indian Industry for finishing schools. C-DAC has today emerged as a premier R&D organization in IT&E (Information Technologies and Electronics) in the country working on strengthening national technological capabilities in the context of global developments in the field and responding to change in the market need in selected foundation areas. In that process, C-DAC represents a unique facet working in close junction with MeitY to realize nation's policy and pragmatic interventions and initiatives in Information Technology. As an institution for high-end Research and Development (R&D), C-DAC has been at the forefront of the Information Technology (IT) revolution, constantly building capacities in emerging/enabling technologies and innovating and leveraging its expertise, caliber, skill sets to develop and deploy IT products and solutions for different sectors of the economy, as per the mandate of its parent, the Ministry of Electronics and Information Technology, Ministry of Communications and Information Technology, Government of India and other stakeholders including funding agencies, collaborators, users and the market-place.

C-DAC has developed a number of indigenous solutions for content management, evaluation and assessment, virtual classroom, collaboration for e-learning domain. Some of the solutions are listed below.

- e-Shikshak is a learning management system with rich support for Indian languages.
- National Online Examination System (NOES) is an examination system primarily aimed at conducting recruitment.
- Online Labs (Olabs) for school lab experiments provides students with the ease and convenience of conducting experiments over the Internet.
- Veda is a general purpose online testing and question banking system, primarily supporting multiple choice questions (including its variant forms such as match the following).
- Video conferencing solutions for building virtual classrooms supporting synchronous lectures are also available from C-DAC.
- e-Saadhya (SaraAnukulaneyAdhyayan) an Adaptable and Accessible e-Learning framework for the children with mild mental retardation and Autism, is being developed with the domain support from National Institute for the Mentally Handicapped (NIMH) with local language support in three Indian languages Hindi, Telugu and Kannada.

177 • An Academic Networking portal for the faculty members, students, and academic institutions to network and share information about courses, academic events, projects, etc. has been created through a portal called SEEKHA (www.seekha.in)

e-Sikshak - Learning Management System

Salient features of e-Sikshak: 1. Course Organizer 1. Support for 3-level course organization with a hierarchy of Course, Module and lesson 2. Create and modify courses 3. Course Reports 2. Online Assessment 1. Question bank creation 2. Multiple-choice single answers 3. Multiple-choice multiple answers 4. True or False questions 5. Uploading of assignments by instructor 6. Uploading solutions by student 7. Student performance reports 3. Whiteboard 1. Synchronous communication between student and instructor 2. Graphical interface to simulate real world Whiteboard 3. Facilitates drawings with color; all drawing tools like rectangle, circle, free- hand etc. 4. Text with desired color font etc 5. Shared discussion area between student and instructor 4. Bulletin board 1. Creates forums for subject discussions 2. Thread based discussions 3. Search

178 5. Chat 1. Real-time communication between instructor and learner 2. Public chat between student and instructor 3. Blocking/unblocking chat users by the instructor 6. e-Mail 1. Asynchronous communication tool 2. Facilitates offline interaction with instructor or among the student community 3. Attachment facility 7. User Management 1. Portal efficiently handles user management in successful implementation of the course. The different users involved are : 1. Administrator Can • Manage users • Create and update courses • Assigns learners to the courses 2. Instructor Can • Upload course material • Maintain question bank • Evaluate assignments • Activate discussion forums 3. Learner Can • Register into multiple courses • Access course material and download • Get the performance report • Take online test e-Sikshak is a Multi-lingual e-Learning framework Features: 1. Unicode based multilingual solution 179 2. Customizable Graphical User Interface 3. Supports multi media content 4. Portable to mySQL and Oracle 5. Servlet based serve side technology

e-Sikshak is right now used by : 1. Information Security and Education- CDAC Hyderabad 2. Indian Law Institute- New Delhi 3. National Institute Of Agricultural Extension Management- Hyderabad 4. India Development Gateway - CDAC Hyderabad. 5. Two online courses are being offered by CDAC Hyderabad on esikshak portal (www.esikshak.in) • Core Competency in Software Process Management [CCSPM] • Certificate Course on Cyber Security [CCCS] • C-DAC Certified Cyber Security Professional [CCCSP] • C-DAC's Certified Professional in Linux System Programming [CCP-LSP] • C-DAC's Certified Professional in Linux Kernel Programming & Device Drivers [CCP-LKPDD National Online Examination System National Online Examination System (NOES) is a robust, fault tolerant, secure and scalable examination system through which examinations can be delivered on an "on demand" basis in selected examination centers spread across the country. The system can be used by educational institutes and organizations for registration, examination and multi-level interviews.

180 Architecture The system has been developed using Adobe Flex, Spring, and Hibernate framework and is highly secure and fail safe. It utilizes the following framework across its various tiers namely Adobe Flex at the Presentation tier, Blaze DS at the Remoting tier, Spring at the Business tier, Hibernate at the Object Relational Mapping tier and Terracotta for providing JVM Level Clustering for high availability and better throughput. Functionality The main functionalities provided by the system include: • Online Registration Process through which candidates can provide their demographic details, choose their examinations, select exam slot timings and make payments (either through payment gateway or demand drafts) • Question Entry and Verification system through which questions can be entered under various subject headings and subsequent verification of those questions. • Exam Administration which provides the facility for creating examination, generation of question paper, result generation etc. • Exam Conduct system which presents the question paper to the candidate and captures the response submitted by the candidate. It supports both static and adaptive mode of examination. • Interview Conduct process comprising of Interviewer & Interview controller module. Interviewer module is used by interviewer for grading an eligible candidate. Interview controller module is used for assigning the candidate to a particular Interview Panel. Salient Features: • Authorized user based access control. • Online registration process with provision of exam scheduling and making payment (either through payment gateway or demand draft. • Automatic generation of admit cards. • Automatic generation of question paper by the system using input criteria like subject, number of questions and difficulty level. • System provides end to end security as question papers are encrypted. • AIR sandbox environment for the examination screen. • Highly fail safe with the ability to resume exam on the last saved state.

181 • Supports both static and adaptive modes of examination. • Multi-level interview process • Immediate result generation. MySikshak (personalized e-Learning framework) MySikshak (personalized e-Learning framework) which extends the learning environment with personalized e-Learning services assisted by instructor through web. It mainly focuses on needs and aspirations of individual learners. This model recognizes that every student is an individual, with a distinct learning style, learning pace, learning path, and learning aspiration. It is also dedicated for building individualized learning programs whose intent is to engage learner continuously in the learning process in the most productive way to optimize learner's learning potential and success Salient Features • Interoperable Services • Standards Compliant • User interface with rich interaction • Intelligent filter mechanism to group the learners • Collaborative activity/course building environment for Instructors • User interface with rich interaction • Platform independent Services provided by MySikshak: User Registration • Online registration • Updating user profile • Necessary user reports for instructor and learner • Provides the learning style • Request for a course Course Organizer • Add and Delete courses • Folder hierarchy based conversion into SCORM compliant standard course

182 • Collaboration among the instructor to upload the content into the course Learners' Information in dashboard • Dashboard provides assistance to instructor in analyzing the learning styles of the student cluster • Cluster management tool provides the facility of creating/deleting/ modifying the student clusters and their corresponding characteristics Learning Path Editor • Provides facility to instructor to design the SCORM compliant learning path template based on learner's prior knowledge and learning style • Provision for instructor/expert to add and modify the e-Learning activities like quizzes, examples and/or case studies within template, specific to the group identified • Leads to the creation of personalized learning path template comprising of learning content and activities Personalized Content and Activity Delivery • Takes the SCORM compliant learning path template assigned for learners • Use Run Time Environment (RTE), to deliver and track the learners' activities according to SCORM complaint learning path template Adaptive Assessment • Pre, Formative and Summative Assessments • Formative assessment using Computerized Adaptive Testing (CAT) • Summative assessment using Computerized Classification Testing (CCT) • æpQuestion Repository conforming to standards (IMS QTI) Query Handler with semantic web technology • Query Handler capable of semantically identifying the queries and supervised with expert rating mechanism • Ontology editor provides facility to create subject specific ontologies with help of experts

183 • Provides assistance to instructors for replying the queries with additional multimedia support from web. 4.6 Devolving Technology Integrated Lessons- Individual And Group When technology integration in the classroom is seamless and thoughtful, students not only become more engaged, they begin to take more control over their own learning, too. Effective tech integration changes classroom dynamics, encouraging student- centered project-based learning. The first step in successful tech integration is recognizing the change that may need to happen inside of yourself and in your approach to teaching. When any teacher brings technology into the classroom, he or she will no longer be the center of attention. The level of refocused attention will, of course, depend on the amount and the type of technology (e.g., mobile device, e-reader, laptop, interactive whiteboard) being brought into the classroom. However, this does not mean that the teacher is no longer essential to the learning process. While students may be surrounded by technology at home, it is dangerous to assume that they know how to use it for learning -- this is commonly referred to as the "myth of the digital native," Lesson Development Using Technology Lesson development refers to all the activities that teachers do as they create, teach, and evaluate lessons with students. Lesson development involves a teacher's decisions about three interrelated elements of teaching lessons: • Academic content (what to teach) • Teaching goals, methods, and procedures (how to teach) • Learning assessments (how to know what students have learned) Lesson development using technology involves how teachers use electronic resources to facilitate these processes. Academic Content (What to Teach) Every time they teach, teachers make choices about academic content-the facts, concepts, ideas, skills, and understandings they intend to share with students. Clearly, school system guidelines and state and national curriculum frameworks define and in some cases mandate "what to teach." Lesson development must be connected to local curriculum frameworks, which are aligned to state and national standards. However, because no local

184 curriculum or national standard spells out everything to teach about any given topic, classroom teachers must make choices about what will be explored or explained to students each day. Technology plays an essential role in assisting teachers to answer the academic content or "what to teach" question. Digital content available on the Internet includes a vast collection of curriculum resources and information. Using Internet search engines, electronic databases, online encyclopedias, blogs, wikis, and other technology tools, teachers and students have access to powerful new ways to research and retrieve information. Teaching Goals, Methods, and Procedures (How to Teach) As they answer the "what to teach" question, teachers simultaneously decide the teaching goals, methods, and procedures they will use in their classes. Goals are the reason why a lesson is being taught. Methods are the instructional strategies—large groups or small groups, discussions, lectures, role-plays, simulations, case studies, inquiry-based activities, creative writing, learning and reflection journals, drill and practice exercises, online tutors, or learning games—that teachers use to convey academic content to students. Procedures are the scheduling and grouping of students by teachers during a lesson, including how much time each activity has allotted to it. Teachers combine goals, methods, and procedures into formats for daily learning. Sometimes curriculum content dictates these processes; sometimes the goals, methods, and procedures dictate the choice of content. Either way, content, goals, methods, and procedures mutually support each other in a dynamic process of lesson development, which technology can support in a variety of ways, such as the following:

- Presentation software
- Visual thinking software
- Web-based diagram- and flowchart-making tools
- Teacher-developed websites
- Threaded discussions and email
- Web Quests
- Intelligent tutoring systems
- Digital cameras and movie-making software
- Assistive technologies

Learning Assessments (Knowing What Students Have Learned) Learning assessments occur before, during, and after teaching lessons and enable teachers

185 to evaluate student knowledge, understanding, and performance. They can be summative (summarizing what students have learned at the end of a lesson), formative (happening as a lesson unfolds), or diagnostic (preceding a lesson as a way to measure what students already know) (McTighe & O'Connor, 2005). Assessment tools include multiple-choice and short answer tests, essays and other written tasks, oral discussions, teacher observations, class participation, and student projects, portfolios, and performances, all of which provide evidence of what students have learned and are able to do as a result of the teaching. Technology tools that support the assessment and evaluation process include

- Electronic tests and quizzes
- Digital portfolios
- Personal response systems
- Online surveys
- Online evaluation rubrics

When technology integration in the classroom is seamless and thoughtful, students not only become more engaged, they begin to take more control over their own learning, too. Effective tech integration changes classroom dynamics, encouraging student learning.

4.7 Implications of Technology Based Instruction In Inclusion

Inclusion or integration

is an important part of equal opportunity in education. Demands for inclusive education have increased and fostered major changes to schooling and education. Students with disabilities are educated alongside their peers within the local community therefore mainstream schools are required to adapt to accommodate a diverse group of students with a variety of needs (O'Gorman, 2005, p. 377).

Approaches to the inclusion of children and young people into mainstream classrooms, and the identification and recognition of special educational needs, is an integral part of daily school work.

The wellbeing and actualization of developmental and learning potential within a diverse student population is challenging

the organization of learning settings.

Educational Technology for Inclusive Classroom: Integrating Technology into Instruction in an Inclusive Classroom for Diverse Learners is a welcome step to overcome the challenges. Inclusive Education is based on the concept of multiple intelligence and

186 individual difference. There is evidence to say that all individuals are different from each other and no two individuals can be completely alike even if they have been brought up in the same environment. Teachers should also realize that having high scholastic ability is not the only measure of child's intelligence. What is important is to develop flexible student centered pedagogy capable of educating all students, including those who are disabled or disadvantaged. In an inclusive setting we expect greater participation of students with special educational needs in the culture and curricula of mainstream schools. In this context we have to think of some techniques that permit all students who are different from each other to learn together in the same classroom.

Major Teaching Strategies: To make inclusive education a success and to teach students having diverse abilities in the same class the following teaching strategies may be used: 1. Use of Multimedia and computer assisted instruction 2. Team teaching 3. Cooperative learning 1. Use of Multimedia and computer assisted instruction One major factor to enhance learning in the inclusive classroom is the use of technology. Technology provides ways for children with disability to communicate and interact on a more equal level with other children. Adaptive technologies can open a new world to children with physical limitations and therefore children often feel better about themselves as active learners. Computer programmes can be individualized and automatically adjusted to the student's instructional level. This is more evident in the case of individuals with hearing and vision impairment. Multimedia approach of instruction (audio, video, graphics, internet, animations etc.) is essential for effective and efficient learning because in any learning situation, the more the senses are stimulated, the more the person learns and the longer he retains. Multimedia in the classroom also includes Power Point presentations that are created by the teachers.

Multimedia activities encourage students to work in groups, express their knowledge in multiple ways, solve problems, revise their own work, and construct knowledge.

The advantages of integrating multimedia in the classroom are many. Through participation in multimedia activities, students can learn: ● Real-world skills related to technology ●

The value of teamwork

187 " Effective collaboration techniques ● The impact and importance of different media ● How to present information in convincing ways ●

Techniques for synthesizing and analyzing complex content ● The importance of research, planning, and organization skills ●

The significance of presentation and speaking skills ● How to accept and provide constructive feedback ● How to express their ideas creatively 2.

Team Teaching: The special education teacher may brief the regular teacher on the IEP (Individual Educational Plan) of the learning disabled students. The two teachers can develop instructional plans and worksheets weekly. They share the task of grading student worksheets. In actual practice, the regular education teacher assumed most of the responsibility for the overall instruction and classroom management while the special education teacher give individual support to both special and regular students. Throughout the year the two teachers can refine their team teaching skills and can become a finely tuned instrument of education serving all the students in an enhanced classroom organization. For eg. if a blind student writes his/ her answer in Braille the general teacher may require the help of specialist to correct the answers. 2. Cooperative Learning: A working definition of

Cooperative Learning is the use of small groups through which students work together to maximize their own and each other's learning.

In cooperative learning, students work with their peers to accomplish a shared or common goal. The goal is reached through interdependence among all group members rather than working alone. Each member is responsible for the outcome of the shared goal.

Cooperative learning

is the instructional use of small groups so that students work together to maximize their own and each other's learning (

Johnson & Johnson, 1989). Cooperative learning

makes sense in inclusive classrooms because it builds upon heterogeneity and formalizes and encourages peer support and connection. However, cooperative learning is not of value only to children with disabilities, it is equally important for the normal children. Important skills such as critical thinking, creative problem solving, and the synthesis of knowledge can easily be accomplished through cooperative group activities

188 in inclusive classrooms. Not only can students get to know each other's abilities within a cooperative process, but teachers can as well. A general education teacher and a special education teacher planning together often find that they have unique skills and ideas to contribute to the process. The general education teacher may have a broader perspective on the curriculum and on curriculum integration, whereas the special education teacher may have special skills in modifying instruction and developing adaptations that benefit many children. General education teachers who are used to working with larger groups of children often can contribute important classroom management and organizational strategies to balance some of the individualized approaches proposed by the special education teacher. Cooperative learning is a strategy used by group/ number of students to achieve a common goal with mutual collaboration and support. In cooperative learning groups, students have two responsibilities: 1. To learn the assigned material 2. To make sure all other members do likewise. When learning situations are structured cooperatively, regular and special education students can work together in pairs or teams to accomplish their common goals. 4. Peer -tutoring: This involves one-to-one instruction from one student in the tutoring role to another student. In this method, students teach each other on one-to-one basis. Peer is defined as the individual of the same social gathering. For example, in a class a fellow student would be a peer. Therefore, when a student from the same class provides instruction to another student of the class the technique is called peer-tutoring. Sometimes peer tutoring may prove to be quite effective and both the student and the peer tutor may gain from the process. The push for technology in the classroom is not a new initiative. In the past there have been many attempts to incorporate technology in the classroom. In some cases school districts did not have funding to support technology while in others schools with technology and resources do not have the personnel and the know how to implement it effectively. In some cases teachers are not provided with the support needed to successfully integrate technology into the classrooms. In today's ever changing world, technology has found its way into every facet of our lives. The internet, mobile devices, you tube videos, social networking, I-pads and android all comprise the world our students are living and learning in. As educators, we must be able to embed this

189 technology into our practices and allow our children to benefit from these technological advances. Although this may seem like a difficult venture it really isn't. The reality is that most kids do not need instruction on how to operate a computer; we instead need to focus on learning how to teach content with and through technology. Teachers need to understand how technology can benefit student learning. Technology can allow a teacher to access each and every child's individual learning style while providing a platform where students can work at their own pace. Technology can help teachers balance the limited instruction time by providing activities, project-based learning, and one-on-one coaching and peer support all while making learning interactive and fun. Well employed use of technology in the classroom can allow teachers to tailor learning to students' individual needs while freeing up classroom time, leaving teachers more time for projects, one-on-one coaching, and more creative activities. 4.8 Let Us Sum Up

Today's generation of students are growing up in a digital world. Using digital devices is a huge part of their everyday experience out of school. Through Google they have access to a wide wealth of digital information, content and resources. With all of this so intrinsic to their 'outside school' experience, the challenge for the teaching profession is how to harness all this for learning within the classroom and at home. This generation of 'digital natives' has much lower need for libraries of physical content for example, the traditional resource used by students half a generation ago. Learning styles are changing and teachers need to adapt their teaching styles accordingly. One crucial question is will this new technology actually improve education? The impact of ICT on learning outcomes has been inconclusive, billions of pounds/euros spent - but is generally difficult to evaluate effectiveness in terms of improved results. Nonetheless there are outcomes that are conclusive, and which indirectly impact on learning outcomes. These include improvements in: • Engagement • Motivation • Independent learning • Parental engagement • Student and staff attendance and punctuality • Extending the children's learning time

190 With the change in learning styles, the role of the teacher is changing too; as well as being a presenter of lesson material; they also assume the role of facilitator/coach in an increasingly collaborative learning environment. These two key styles of learning; presenting and collaborating; link directly to some of the different types of technology employed in the classroom. Interactive White Boards have been the base of the presenting style of learning, where the teacher is at front of class, and all students are involved in interactive learning. For the more personalized learning, laptops, netbooks and tablets are increasingly pervasive in the classroom. Globally 2% of students have a mobile computing device supplied by the school, forecast to increase to 7% by 2016. The crucial point is that the teacher will still want and need to be in charge of the classroom, they may decide to let students use technology for some parts of a lesson but they will still want to be the centre-point of attention and control. This may be at the front of the classroom or, as is becoming more relevant, to be able to move around the classroom and still remain in control. In these styles of classroom environment clearly the ability of devices to talk to each other ie the seamless connectivity between student tablets and front-of-class display, becomes increasingly key.

Currently 13% of the 34 million classrooms globally have an interactive display, leaving a massive 87% without Individual 1:1 teaching equipment is not new, in its most basic format many schools use small simple hand-held whiteboards for children to write on, allowing each to write an answer or create a picture which can be held up for the teacher or class to see. The first individual student communication technology was the voting system, allowing each student to answer questions which could then be automatically collated and attributed to them. Teachers would often start the lesson with a couple of short questions to assess understanding of the previous lesson and if they needed to go back and recap - much more precise than just a show of hands. However mobile PCs (laptops, netbooks, tablets) truly unleash the full potential of 1:1 learning, allowing a fully personalised learning experience for each student. The concept of the "Flipped Classroom" is a method of teaching which is turning the traditional classroom on its head. Students do not need a teacher there when they are just viewing a lecture which can be done at home, perhaps by watching a video created by the teacher, or when they are completing an assignment.

191 Teachers do need to be present to help understand issues and work through problems and answer questions. The teacher then becomes a facilitator, tutor or guide and can spend more time one on one with the students. Teachers are finding that they can start to introduce this concept and slowly build on it and does not need to start as a complete radical change The transition to digital within education is leading to a raft of new exciting opportunities for education. The key factors for schools when considering technology investments are: ● Carefully consider technology investments in the context of their impact on pedagogy ● A need for a clear vision as to how the devices would be utilised and add value to the learning experience. ● Some concepts can be introduced, and slowly built on, without having to start with a complete radical change e.g. the flipped classroom. ● Take a broad approach to investment, considering both presentation style and collaborative style learning, and how the relevant devices communicate and interconnect. ● Consider the student's holistic learning experience, both in-class and at home and how these can feed into each other. ● Recognise the impact on teachers and the amount of training that will be needed to maximise the benefit of the technology. 4.9

195 5.1 Introduction

Today's generation of students are growing up in a digital world. Using digital devices is a huge part of their everyday experience out of school. Through Google they have access to a wide wealth of digital information, content and resources. With all of this so intrinsic to their 'outside school' experience, the challenge for the teaching profession is how to harness all this for learning within the classroom and at home. This generation of 'digital natives' has much lower need for libraries of physical content for example, the traditional resource used by students half a generation ago.

Learning styles are changing and teachers need to adapt their teaching styles accordingly. One crucial question is will this new technology actually improve education? The impact of ICT on learning outcomes has been inconclusive, billions of pounds/euros spent - but is generally difficult to evaluate effectiveness in terms of improved results.

Nonetheless there are outcomes that are conclusive, and which indirectly impact on learning outcomes. These include improvements in:

Ø Engagement Ø Motivation Ø Independent learning Ø Parental engagement Ø

Student and staff attendance and punctuality Ø Esxtending the children's learning time With the change in learning styles, the role of the teacher is changing too; as well as being a presenter of lesson material; they also assume the role of facilitator/coach in an increasingly collaborative learning environment. These two key styles of learning; presenting and collaborating; link directly to some of the different types of technology employed in the classroom. Interactive White Boards have been the bastion of the presenting style of learning, where the teacher is at front of class, and all students are involved in interactive learning. For the more personalized learning, laptops, netbooks and tablets are increasingly pervasive in the classroom. Globally 2% of students have a mobile computing device supplied by the school, forecast to increase to 7% by 2016. The crucial point is that the teacher will still want and need to be in charge of the classroom, they may decide to let students use technology for some parts of a lesson but 196 they will still want to be the centre-point of attention and control. This may be at the front of the classroom or, as is becoming more relevant, to be able to move around the classroom and still remain in control. In these styles of classroom environment clearly the ability of devices to talk to each other ie the seamless connectivity between student tablets and front-of-class display, becomes increasingly key.

Technology in education plays an important role in improving the educational skills and knowledge of the people. This is very important especially those who need improve their knowledge in order for them to achieve a successful life in the future. Technology in education is manifested through the use of computers. This is also a great help for teachers since they can already enhance their teaching skills and strategies every time they are facing their class. This technology is very essential for both the students and the teacher but there are some instances wherein this technology is seen to be disadvantageous for both of them as well.

Information technology in education has improved and has also brought about an easy access to different learning resources. They help to improve teaching skills and learning abilities of students. These learning resources include audio and visual education. Students are taught with projectors in classrooms or lectured through class speakers. Students and teachers can also easily download eBooks from the internet which can be read from anywhere through your phone or tablet. 4.2

Objectives After going through this unit you will be able to

Ø discuss about application of technology in

lesson planning, worksheet preparation, report writing and evaluation.

Ø discuss about the assistive devices. Ø discuss about the advantages and disadvantages of technology. Ø discuss the implications

of technology in Inclusion 5.3 Application of Technology in Lesson Planning, Worksheet Preparation, Report Writing and Evaluation. 5.3.1

Technology and Classroom Learning Technology integration is an important way to create meaningful learning experiences.

197 Lesson planning for teachers can be overwhelming when incorporating the use of computers in activities. Technology has revolutionized the way humans interact and connect with each other, and modern classrooms, homes, and offices are drastically different from how they were just 20 or 30 years ago. Students today need to prepare for a workplace more exposed than ever to social media, television, video games, and other technological advancements. By bringing technology into the classroom, teachers help prepare students to handle the professional world of the future. Here are seven ways teachers can leverage the Internet and other technologies to enhance classroom learning.

1. The amount of information available When using the Internet, teachers and their students have the opportunity to access seemingly limitless information. School projects are no longer confined to the reach of textbooks within their local libraries. Students can use Google to learn more about topics in far less time. Teachers can use the information students have at their fingertips to challenge them and encourage them to delve deeper into subjects and master the information.
2. The modern languages opportunities Modern language skills are extremely valuable in the professional world. Allowing students to communicate with native speakers of that language is just one of the uses of technology in education. Students are able to hear the language, practice speaking skills, and enhance their overall understanding.
3. The chance to learn geography, history, and culture With a world that is increasingly defined by global trade and intercommunication, the opportunity to meet and speak with students in other countries is a valuable experience in itself. Geography, international history, languages, and cultures take on a much greater meaning when students can interact with people from that country rather than just learn about them in a textbook. Students can interview other children about their local customs and cultures to get first hand experiences.
4. Access to new norms of education Large classrooms with disproportionate student-to-teacher ratios make it challenging for a teacher to give individualized attention to each student. While the Internet is not a substitute for personal interaction, it does offer a wide range of resources for teachers to use to help some students gain understanding of the material. There are study guides, interactive diagrams, explanations, and videos all available on the Internet.

198 The Internet can be extremely helpful for students who have different learning styles. There may be some who will learn a subject the best when they can read the material, taking time to digest it. Others may learn better through videos or interactive instruction. These methods can all be taught simultaneously through the Internet.

5. Individualized lessons With the Internet, not only will students have the opportunity to study using their preferred means of learning, they will also be able to better set the pace. In every classroom there are some students who grasp material quickly and become bored with subsequent repetition. On the other hand, there are students struggling to keep up. Technology can help teachers create lessons that will allow the quickly moving students to delve deeper into the subject or explore related topics while allowing the slower students more time to understand the material.
6. Adding new meaning to student projects Students enjoy finding meaning to their work. While in the past they could create reports and projects that would be viewed only by their teacher and fellow students, their work can now be easily displayed online. They can create materials to be used by other students and get feedback on their ideas from students in other schools all over the world. This will help students take pride in their work and find meaning in their assignments.
7. Student collaboration opportunities Along the same lines, students can collaborate on projects with students from around the world. They can work with students from the school across the street or across the country. There is a full range of technology, such as the recent popularity in cloud technology, which will allow the students to speak and work together with ease without ever meeting in person. Technology presents teachers the opportunity to open doors for their students. They have access to limitless information and students are better prepared to enter the workforce because integrating technology into their educational lives better prepares them for the global world.

5.3.2 Technology Integration Lesson Planning Process When designing computer-based activities, you must

give consideration to how technology can be used to acquire, organize, demonstrate, and communicate information. The planning process for technology integration is similar to planning a curriculum unit. The main differences are HOW the students acquire the knowledge and skills,

199 HOW they demonstrate and apply the knowledge and skills, and HOW learning will be assessed or evaluated. These differences have a major influence on the structure of a lesson plan as they incorporate the use of the computer. In addition to the skills and knowledge that must be taught as part of the curriculum, consideration must also be given to the technology skills students need to learn. Often teachers assume that the students will figure it out on their own. However, this can waste instructional time. It is a good idea to plan ahead, so that the time in the computer lab is well spent.

Step 1: Examine Curriculum Documents

- Ø select the topic

∅
identify learning objectives within a subject Step 2: Determine Knowledge and Skills
∅ determine students' background knowledge and existing technology skills ∅ decide how students will acquire new knowledge and skills ∅
gather resources required to achieve instructional goals Step 3: Select a Technology Product to Apply Learning ∅ choose a technology-based product for students to create ∅ outline the content it will contain
∅
select the software program(s) needed ∅ list the technology skills required to complete the task Step 4: Select a Method of Assessment and Criteria for Evaluation
∅ determine the method of assessment ∅
set the criteria to evaluate the technology product with a focus upon content, quality of information, layout and design, and technology skills demonstrated. 5.3.3
Assistive Technology Tools & Resources for Students with Disabilities One tool to help students with disabilities even in the face of a special education teacher shortage is assistive technology. Today, assistive technology can help students with certain disabilities learn more effectively. Ranging in sophistication from "low" technologies such as a graphic organizer worksheet to "high" technologies including cutting-edge software and smartphone apps, assistive technology is a growing and
200 dynamic field. Several areas of assistive technology and sample products may be found in any given classroom, making a difference in how students of all abilities learn. Text-To-Speech Assistive Tools As an assistive technology, text-to-speech (TTS) software is designed to help children who have difficulties reading standard print. Common print disabilities can include blindness, dyslexia or any type of visual impairment, learning disability or other physical condition that impedes the ability to read. However, other students can benefit from TTS technology, such as children that have autism, attention deficit hyperactivity disorder (ADHD) or an intellectual disability. The technology works by scanning and then reading the words to the student in a synthesized voice, using a large number of speech sounds that make up words in any given context. With the advances in speech synthesis, TTS technology is more accurate and lifelike than ever. Intel Reader The Intel Reader is a mobile handheld device that uses TTS technology to read printed text aloud. It features a high-resolution camera that captures printed text, converts it to digital text and reads it to the user. During playback, words are highlighted as they are read aloud, and the user can pause and have the device spell out highlighted words. The available Intel Portable Capture Station functions as a stand for the Intel Reader to easily and quickly capture text from books and other documents. At about the size and weight of a paperback book, the Intel Reader is mobile enough to use in any environment. Students can also transfer content from a home computer, or save generated audio versions of printed materials to a computer. Available voices vary in gender, pitch and speed. Kurzweil 3000 The Kurzweil 3000 is a leader in TTS software for individuals that struggle with literacy. In addition to a range of TTS features, the full-featured software program integrates abilities that can help students in other areas, potentially appealing to those who may have a non-print disability or those who may not typically consider a TTS program. Some of the features include: ∅ Multiple TTS voices ∅ Support for 18 languages and dialects ∅ Talking spell-checker

201 Ø Picture dictionary graphics for more than 40,000 words Ø Text magnification Ø Tools for test taking, essay writing, note taking, reference and more The Kurzweil 3000 strives to provide students with a multi-sensory approach to literacy learning. It is available for Windows and Macintosh. Graphic organizers can be effective in helping students to organize their thoughts during the writing process. As an assistive technology, graphic organizers can be a strong choice for students with dysgraphia or disorders of written expressions - particularly the conceptual aspects of writing. Graphic organizers work by helping the student map out a course of action. Depending on the type of writing, the graphic organizer can prompt the writer to describe an object, chart out a course of events or perform some other task that can help in planning the piece. Graphic organizers vary by type and technological sophistication. Low-Tech Handouts Graphic organizers do not need to be technologically advanced; in fact, they can exist in simple handout form. Sample handouts can be found at the Houghton Mifflin Harcourt Company. The sandwich chart can assist students with paragraph writing. The sequence chart can help with narrative writing and the ordering of events. The sense chart is designed for descriptive writing, where writers are prompted for terms that characterize and express an item. Dozens of other sample charts exist and can help students with virtually any type of writing. Draft:Builder Draft:Builder is a writing tool that integrates outlining, note taking and draft writing functions to break down the writing process into three steps. Using a graphical organizer, the program helps the student visualize the project and insert information into the appropriate place without having to conceptualize the whole process. It then automates the process of creating the paper, where the student can drag and drop what is written in each note to the rough draft. Other features include a talking spell checker that uses TTS technology, a bibliography tool, a dictionary and the ability for teachers to add locked text into the program for further guidance. Draft:Builder is available for Windows and Macintosh.

202 Assistive Listening Systems A variety of assistive listening systems, or hearing assistive technology, can help students who are deaf or hard of hearing, as well as those with other auditory and learning problems. According to the National Association for the Deaf, assistive listening systems can be used to enhance the reach and effectiveness of hearing aids and cochlear implants, or by children who do not need those tools but still need help hearing. Assistive listening systems use a microphone, a type of transmission technology and a device for capturing and bringing the sound to the ear. The specific transmission technology used in the system is typically what contrasts one type of assistive listening system from another. FM Systems According to the American Speech-Language-Hearing Association (ASHA), FM systems are the best choice for children with sensorineural hearing loss. The most common type of hearing loss for all ages, sensorineural hearing loss occurs when the inner ear (cochlea) or nerve pathways from the inner ear to the brain are damaged. FM systems work using radio broadcast technology. With a transmitter microphone and a receiver, the teacher and student can maintain a consistent sound level regardless of distance and background noise. Additionally, ASHA notes that the hearing aid microphone can be turned off, so the student can concentrate on the teacher alone. Sound-Field Systems Sound-field systems are a strong choice for classrooms that need to assist listening for all children in the class. ASHA notes that these systems benefit not only children that have hearing loss, but those that have other auditory and learning problems, such as language delays, central auditory processing disorder, articulation disorders and development delays. Additionally, sound-field systems can be used for students who are learning English as a second language. Sound-field systems use a microphone that projects sound through mounted speakers around the classroom. In classrooms that have good acoustics, sound is able to travel evenly throughout space, eliminating problems of distance between the speaker and each listener. Sip-and-Puff Systems Sip-and-puff systems are used by students who have mobility challenges, such as paralysis and fine motor skill disabilities. These systems allow for control of a computer, mobile device or some other technological application by the child moving the device

203 with his or her mouth. Similar to a joystick, the child can move the controller in any direction and click on various navigational tools using either a sip or a puff. An on- screen keyboard allows the child to type using the same movements. Sip-and-puff systems are a type of switch device, which refers to the technology used to replace a computer keyboard or mouse. Other switch devices include buttons or other objects that a student can touch, push, pull, kick or perform some other simple action that can then control the device. Jouse 3 The Jouse3 is a sip-and-puff system that allows children to control a device using any part of the mouth, cheek, chin or tongue. Due to its accuracy and quick response, home users can use it for drawing or computer games. It can mount to the desktop, a bedframe or any other type of structure; it does not require a headpiece or placement on the body of the user. The product supports Windows, Macintosh, Linux and Unix based computers, in addition to Android and iOS mobile devices. It can support one or two external switches, and has two types of mouthpieces. Sip-and-Puff Systems from Origin Instruments Origin Instruments offers a range of sip-and-puff products that students can use to control an electronic device. Using a head mounted or gooseneck user interface or available tubing for a custom solution, the child can control a mouse, joystick or keyboard with ease. The primary system is powered using USB technology. The product supports Windows, Macintosh and Linux based computers. Two pressure switches connect the system to the user interface solution for use on electronic devices. Proofreading Software Proofreading software is a branch of assistive technology that goes above and beyond the typical proofreading features found in a word processing system, such as correcting words frequently misspelled by students with dyslexia. A number of other features offered within this category can help students work on his or her English skill set to become a more effective and accurate writer. Although primarily geared towards individuals with dyslexia, proofreading software can be helpful to those with any type of learning disorder that makes writing and reading challenging.

204 Ginger Ginger offers several features that can help students with dyslexia and other learning disorders with writing. It is also designed for speakers of languages other than English. Some of the features include: Ø Grammar checker that analyses context to determine any errors or misspellings. For instance, Ginger can recognize whether "there," "their" or "they're" should be used in a sentence, which is a common mistake in writing. Ø Word prediction and sentence rephrasing tools that can be helpful for students learning how to construct sentences properly. Ø TTS functionality so students can hear what they've written. Ø A personal trainer that provides practice sessions based on past mistakes made by the student. Ginger is available for Windows and Macintosh systems, as well as for use on iOS and Android mobile devices. Ghotit Ghotit is specifically designed for students with dyslexia and other learning disorders who have difficulties with writing. The name is inspired by the word "Ghoti," which is a constructed term that illustrates irregularities in the English language. And since many spellings are counterintuitive - especially for those with dyslexia - Ghotit dedicates itself to assisting children and adults who struggle with writing accurately. It features the ability to learn from the user's past mistakes, personalizing suggestions for spelling and grammatical errors. Ghotit can predict words, check passages of text contextually, read text aloud using TTS technology and recognize split and merged words. It also includes an integrated dictionary for students to quickly look up a word. Math Tools A range of technology and tools can help students that have trouble with math, most commonly found in a learning disability called dyscalculia. Dyscalculia makes it difficult to grasp numbers and it is characterized by a general lack of understanding in the field of math. Assistive technology in math is not just for those with dyscalculia. It can also help students with blindness, fine motor skill disabilities or some other type of disability that makes it difficult to perform math-related work.

205 MathTalk MathTalk is a speech recognition software program for math that can help students with a range of disabilities. From prealgebra to Ph.D. level mathematics, students can perform math problems by speaking into a microphone on their computer. The program works with Dragon NaturallySpeaking programs for voice-to-text functionality, making it ideal for students who have fine motor skill disabilities. Students with blindness or vision disabilities can use the integrated braille translator. In addition to these audiences, MathTalk also appeals to students with dyscalculia. The program functions as an electronic math worksheet, allowing the child to organize, align and work through problems on the screen, making it helpful for students who have difficulties performing math problems on paper. Math Simulations Math simulations can help students with dyscalculia visualize math problems and concepts. As a result, students can better understand the application of a particular type of problem, since many students struggle with the conceptual aspects of math.

5.4 Application of Technology in Assistive Devices

5.4.1 Assistive devices and technologies

Assistive devices and technologies are those whose primary purpose is to maintain or improve an individual's functioning and independence to facilitate participation and to enhance overall well-being. They can also help prevent impairments and secondary health conditions. Examples of assistive devices and technologies include wheelchairs, prostheses, hearing aids, visual aids, and specialized computer software and hardware that increase mobility, hearing, vision, or communication capacities. In many low-income and middle-income countries, only 5-15% of people who require assistive devices and technologies have access to them.

5.4.2 Technology Areas

Academic and Learning Aids: Many students with disabilities use assistive technology to enhance their participation and achievement in their educational programs. There are a range of assistive technology solutions to address student needs in all academic areas including reading, writing and spelling, math, and study and organization.

Aids to Daily Living: Many students with disabilities use assistive technology to enhance their participation and achievement in their educational programs. There are a range of assistive technology solutions to address student needs in all academic areas including reading, writing and spelling, math, and study and organization.

Assisted Living Devices and Environmental Aids: Students who are hard of hearing or deaf often need assistive technology to access information that is typically presented verbally and accessed through the auditory modality. A variety of technology solutions are available that amplify speech and other auditory signals or that provide an alternative to the auditory modality. These include assistive listening devices that amplify sound and speech both in the classroom and home environment, text telephone (TTY), closed captioning devices, real time captioning, and environmental aids that support independent living skills.

Augmentative Communication: Students with severe expressive communication impairments have difficulty communicating with peers and adults within their environments. Many of these students need a means of supplementing their communication skills. These students frequently use augmentative communication technology. A range of low technology to high technology solutions are available including: object based communication displays, picture communication boards and books, talking switches, voice output communication devices and computer based communication devices.

Computer Access and Instruction: A variety of technology solutions are available to adapt the classroom computer for students with disabilities. Some computer access technology offers a method of input other than the standard computer keyboard and mouse. Other computer adaptations include software and hardware that modifies the visual and sound output from the computer. Varieties of devices are available and include the following: adaptive pointing devices, keyboard adaptations.

Environmental Control: High technology environmental aids are available to assist students with physical disabilities in controlling electronic appliances within the school and home. These devices allow the student to use an alternate input device such as a switch to control one or more electronic appliances such as lights, televisions, and electronically controlled doors.

Mobility Aids: Students with physical disabilities often need access to mobility aids to provide them with a means of moving about their environments. Mobility aids include canes, crutches, walkers, scooters, and wheelchairs. Generally, assistive technology devices such as the mobility aids referenced above are recommended by physical and occupational therapists based on the student's individual needs.

207 Oral Communication and the AAC: Assistive Technology in the field of Oral Communication can include a variety of areas to assist individuals with speech or language difficulties. Pre-Vocational and Vocational Aids: Students with physical and cognitive disabilities who are enrolled in educational programs that address pre-vocational and vocational skills may benefit from the use of pre-vocational and vocational aids. These types of technology solutions include modifications of the tools and manipulative used in the completion of work related tasks. Low technology solutions include grips for handling materials and stabilization devices for supporting work materials. For students using electronic appliances such as staplers and paper shredders, an environmental control unit such as the model available from AbleNet can be used to allow for switch control of the appliance. Many of the adaptations required for participation in work activities may be teacher constructed. For example, a picture-based task schedule can be created to represent all of the steps in a particular activity for students with intellectual disabilities. Recreation and Leisure: Some students with physical, sensory, and intellectual disabilities require assistive technology in order to participate more fully in appropriate recreation and leisure activities. A range of low technology to high technology solutions are available including game adaptations, book adaptations, switch adapted toys, and environmental control access for televisions, videos, tape players, CD players and MP3 players. Seating and Positioning: Students with physical disabilities often require adaptive seating and positioning systems as an alternative to the standard classroom seating systems. Adaptive seating and positioning systems include seat inserts for wheelchairs, side liars, prone sanders, and adaptive chairs. These seating and positioning systems are generally determined by the physical and occupational therapist in consultation with the classroom staff. Sammons Preston offers several different seating and positioning devices for the classroom. Visual Aids: Students with visual impairments can benefit from assistive technology in a variety of areas. A critical need for assistive technology is often in the area of accessing printed information and to providing a means of producing written communication. There are many visual aids including talking dictionaries, adapted tape player/recorders, large print and talking calculators, braille writers, closed circuit televisions (CCTV), and software such as screen reading and text enlargement programs.

5.4.3 JAWS Screen Readers JAWS, Job Access With Speech, is the world's most popular screen reader, developed for computer users whose vision loss prevents them from seeing screen content or 208 navigating with a mouse. JAWS is a screen reader for Microsoft Windows offered by Freedom Scientific, Inc. JAWS will assist users who are blind or low-vision to use a Windows computer. A JAW has a variety of features, including Braille support, multi-lingual speech synthesis, and multi-screen support. It stands for "Job Access With Speech." JAWS works with the PC to provide access to software applications and the Internet. JAWS also outputs to refreshable Braille displays. Features Ø Two multi-lingual synthesizers: Eloquence and Vocalizer Expressive Ø Talking installation Ø Built-in free DAISY Player and full set of DAISY-formatted basic training books Ø Works with Microsoft Office, Internet Explorer, Firefox, and much more Ø Supports Windows 8.1 and Windows 10, including touch screens and gestures Ø Support for MathML content presented in Internet Explorer that is rendered with MathJax Ø Fast information look-up at your fingertips with Research It Ø Convenient OCR feature provides access to the text of PDF documents, even those with scanned images that are reported as empty documents by screen readers Ø Save time with Skim Reading Ø The only Windows screen reader to provide contracted Braille input from your Braille keyboard Ø Fully compatible with MAGic, screen magnification software, and Open Book, scanning and reading program Advanced Features Ø JAWS Tandem available for free to help with support and training Ø Optional support for Citrix, Terminal Services, and Remote Desktop Ø Powerful scripting language to customize the user experience on any application Ø Includes drivers for all popular Braille displays Ø Includes voices for over 30 different languages Ø Distributed worldwide with local sales and support in most countries

209 Powerful Access to Screen Content JAWS is the world's most popular screen reader, developed for computer users whose vision loss prevents them from seeing screen content. JAWS reads aloud what's on the PC screen and gives the user a unique set of intelligent tools for navigating and accesses Web pages and all screen content. Compatible with the Most Frequently Used Workplace and Classroom Applications JAWS enable you to work with Lotus Symphony, a suite of IBM tools for word processing, spread sheets, and presentation creation and with Lotus Notes by IBM. JAWS also is compatible with Microsoft Office Suite, MSN Messenger, Corel WordPerfect, Adobe Acrobat Reader, Internet Explorer, Firefox - and many more applications that are used on a regular basis on the job and in school. Unmatched Braille Support With a refreshable Braille display like Freedom Scientific's Focus, JAWS also provides Braille output in addition to, or instead of, speech. An array of versatile features and customizable options lets you tailor JAWS for your individual needs and preferences 5.4.4 Smartphones Assistive

Technology is an ever-changing group of products and devices. Today devices everyone uses can be easily adapted to assist those with special needs. The current trend for technology is to make it simple to learn, to use, integrate, and support. This is welcome news to parents and caregivers of children with special needs. This new trend allows for more people to have

the

ability to use the technology. Smart phones are an excellent example of technology with the potential to enhance the teaching and learning experience of children with disabilities. In addition to serving as a means of communication, smart phones have the capability to run multiple applications that support and accompany students in their day-to-day activities. For example, the iPhone offers the application isign. The app facilitates communication between deaf students and general education teachers and other who do not sign. Students and teachers who need to learn American Sign Language can use the program containing 800 signs with gestures modelled with a 3D character. Students with hearing and speech impairments can communicate with their hearing peers and teachers using the Google Android phone and an application called Speaking Pad. Users of these technologies enter data into their cell phone and then make information available through speech output.

210 Another application can be used by students with autism and other disabilities to create and organize personal tasks. iPrompts, which provides visual prompting tools to help users transition between activities, understand upcoming events and make choices and focus on tasks. For students with visual impairments, screen magnifiers are available, enabling user to capture text and images with a built-in camera and then enlarge items that appear on the phone's screen. At the same time, applications designed for people with disabilities are crossing over into the mainstream, blurring the distinctions between AT and consumer technologies. Text-to-speech is an integral part of in vehicle GPS units and cell phones, screen magnifiers help consumers cope with shrinking screen sizes, and captions on TV and internet video are being used to reinforce language learning

and to provide viewing solutions for noisy environments. 5.4.5 Screen Readers Screen readers are software programs that allow blind or visually impaired users to read the text that is displayed on the computer screen with a speech synthesizer or braille display.

A screen reader is the interface between the computer's operating system, its applications, and the user. The user sends commands by pressing different combinations of keys on the computer keyboard or braille display to instruct the speech synthesizer what to say and to speak automatically when changes occur on the computer screen. A command can instruct the synthesizer to read or spell a word, read a line or full screen of text, find a string of text on the screen, announce the location of the computer's cursor or focused item, and so on. In addition, it allows users to perform more advanced functions, such as locating text displayed in a certain color, reading pre- designated parts of the screen on demand, reading highlighted text, and identifying the active choice in a menu. Users may also use the spell checker in a word processor or read the cells of a spreadsheet with a screen reader.

How does a screen reader relay information to the user? There are two ways that a screen reader can provide feedback to the user: Ø Speech; Ø Braille. A screen reader uses a Text-To-Speech (TTS) engine to translate on-screen information into speech, which can be heard through earphones or speakers. A TTS may be a software application that comes bundled with the screen reader, or it may be a hardware device

211 that plugs into the computer. Originally, before computers had soundcards, screen readers always used hardware TTS devices, but now that soundcards come as standard on all computers many find that a software TTS is preferable. In addition to speech feedback, screen readers are also capable of providing information in Braille. An external hardware device, known as a refreshable Braille display is needed for this. A refreshable Braille display contains one or more rows of cells. Each cell can be formed into the shape of a Braille character, a series of dots that are similar to domino dots in their layout. As the information on the computer screen changes, so do the Braille characters on the display change, providing refreshable information directly from the computer. Whilst it is possible to use either format independently, Braille output is commonly used in conjunction with speech output. How does a screen reader work? Since the majority of screen reader users don't use a mouse, all screen readers use a wide variety of keyboard commands to carry out different tasks. Tasks include reading part or whole of a document, navigating web pages, opening and closing files, editing and listening to music. A visually impaired computer user will use a combination of screen reader commands and operating system commands to accomplish the many tasks a computer is capable of performing. All current operating systems have their own keyboard shortcuts, which are available to everyone not just screen reader users. An example of a Microsoft Windows keyboard shortcut is using the alt + A key combination to open the Favourites menu in Internet Explorer. Each screen reader uses a different series of commands, so most people will tend to choose a screen reader and stick with it, as the task of learning a large number of new keyboard commands is considerable. Which operating systems do screen readers work with? Screen readers are available for each of the most common operating systems, Linux, Mac OS and Windows. 5.5

Application of Technology in Instruction: Individual, Small Group and Large Group

The information age with the mass of technology it brings can be both blessing and curse for the teaching and learning environment. As lecturer and teacher one is confronted with new roles, new work, new decisions, new skill requirements, new language, and last but not least, a new generation of learners (with their own unique new excuses!). On the other side of the coin there are unprecedented opportunities to use technology to enhance learning, to increase the excitement of the subject matter and to expose learners

212 to their subject in "real life". This brings with it the temptation to use all the "bells and whistles" of the wonderful hardware and software available, and leaves many of us confused and overwhelmed as to what is useful and what is over the top. 5.5.1 Enhancing Small Group Instruction through Technology Classroom interaction, combined with online activities, can greatly accelerate the learning process and reduce the time. Technology is a tool that can change the nature of learning. First and foremost, educators want students to learn. It is certainly not enough to tell educators that they need to use the boxes and wires that have invaded their schools simply because they are expensive or because students need to know how to use the latest widget. If it's clear that technological tools will help them achieve that goal, educators will use those tools. The real world is not broken down into discrete academic disciplines. I've heard a number of teachers say that they would like to be able to change the way they teach -- to find ways to implement project-based, multidisciplinary lessons. Let's think about how that might happen when technology is used to support learning. Technology lends itself to exploration. But before technology can be used effectively, exploration must be valued as important to both teaching and learning. In a technology- rich classroom, students might search the Web for information, analyze river water, chart the results, and record what they've learned on the computer. In many small group teaching situations, the role of the teacher is that of facilitator of learning: leading discussions, asking open-ended questions, guiding process and task, and enabling active participation of learners and engagement with ideas. However, small groups function and behave in various ways and have different purposes. Teachers therefore need to be able to adopt a range of roles and skills to suit specific situations, often during the same teaching session which technology can support. Effective tutors are essential to ensuring that small groups work well. Any teaching event will be more successful if the teacher: Ø is enthusiastic Ø has organised the session well Ø has a feeling for the subject Ø can conceptualise the topic Ø has empathy with the learners

213 Ø understands how people learn Ø has skills in teaching and managing learning Ø is alert to context and 'classroom' events Ø is teaching with their preferred teaching style Ø has a wide range of skills in their teaching repertoire, including 'questioning, listening, reinforcing, reacting, summarising and leadership' (McCrorie, 2006, p. 8). Technology has all the above qualities required as an effective small group instructor. 5.5.2 Enhancing Large Group Instruction through Technology Technology is making it increasingly possible to envision the ideal of customizing instruction on an individual basis. Today schools can implement software that assesses student strengths and weaknesses, builds an individualized learning plan, delivers computer-based content using a variety of interactive methods, and then tests mastery of content standards. Teaching with technology can deepen student learning by supporting instructional objectives. However, it can be challenging to select the "best" tech tools while not losing sight of your goals for student learning. Once identified, integrating those tools can itself be a challenge albeit an eye-opening experience.

Students Use Information Technologies to: 1. Participate in a media revolution, profoundly affecting the way they think about and use information technologies. 2. Improve the ways of learning in new learning fashions 3. Extend the ability and skills of applying their learning in real situation. 4. Working in groups for cooperative and collaborative learning 5. Developing self-learning habits at their own pace and time. 6. Learn with the teacher rather by the teacher. 7. Develop inquiry-learning habits. 8. Use right information at right time to achieve right objective. 9. Review and explore qualitative data.

214 10. Exchange learning experiences and information with others students and teachers living anywhere in the world. Information technologies

facilitate students in their learning process through their active participation on one hand and help teachers on the other hand. Therefore, Teachers Use The

Information Technologies to: 1. Present the material in more interesting and attractive way. 2. Guide and help students in searching the qualitative material. 3. Make best use of time. 4. Coach the students. 5. Provide individualized instruction. 6. Direct

the students toward cooperative

as well as collaborative learning activities. 7. Prepare learning material for students, rather teaching in conventional situations. 8. Diagnose the learning problem of students and help them to overcome. 9. Solve the study problems of students. 5.6

Advantages, Merits and Demerits of Application of Technology

Technological advancements have made the world a great and convenient place to live in. There is no denying of how they make lives better and easier, especially in the fields of science, medicine and education. But, like most things, technology also has its drawbacks. In fact, some of the more recent inventions are now being categorized as lazy aids, and are considered major contributors of obesity and a generally unhealthy population.

Can the same thing be said for technology used in the classroom? Tools, such as computers, mobile devices and the internet, are now integrated into the educational system. While they are beneficial in certain academic aspects, they also have negative implications. 5.6.1

List of the Advantages of Technology in Education 1. Promotes independent learning in students

The internet is a treasure trove of information. Practically anything you need to know can be found online. Although there is a question of the credibility of the source and the data provided, it can still serve as an educational resource for students. Even without

215 assistance from parents and teachers, students can just look up their lessons online. Unlike regular textbooks, electronic books and web-based content are updated in real time, feeding students with the most current information they can get their hands on, helping them become more knowledgeable even outside the classroom setting. 2. Prepares students for the future From the way technological advancements are going, it is obvious that the future will be digital and technology-focused. If students are well-versed on using technology to collaborate and communicate as early as now, they will not have trouble fitting in, competing and finding jobs in the future. Being familiar with using at least one form of technology at an early age will help them become comfortable using it, and eventually develop other skills necessary to handle other innovative devices and processes. 3. Has the potential to lower textbook and tuition prices With resources more accessible and in great abundance, the cost of textbooks is likely to decrease. It is also possible that students may no longer need to buy a textbook, if it is converted into digital format. The actual books can stay in the classroom, while the content is saved on a student's computer. Tuition will also decrease when learning is done online, rather than inside the classroom. By taking out the factors that contribute to a higher tuition fee, such as utility bills and transportation allowance of teachers, the overall cost of education will be lower. 4.

Allows teachers to create an exciting way to educate students

Gone are the days when the only tools for teaching are limited to books, a blackboard or whiteboard, and a chalk or markers. With technology integrated to education, teachers can now incorporate images, videos and other graphics when delivering lessons. Specific websites, apps and programs will also enable teachers to vary how they provide instructions. This creates an exciting learning environment and promotes interest in education in general. Other tools available for teachers include Smart Boards (interactive whiteboards), email Skype, and PowerPoint. 5. Encourages development of new teaching methods Rather than spend an hour or so talking while the students listen, or have them read an entire chapter in silence, teachers and professors now have the option to use advanced teaching methods, such as podcasts, blogs and social media. When working with a particular group or one-on-one, teachers can take advantage of web conferencing

216 technologies other online communication tools.

Technology also presents universal tools that enable teachers to educate all types of students, including those who are struggling or have special needs. These include voice recognition, text-to-speech converter, translator, volume control, word prediction software and other assistive technologies. 5.6.2

List of Disadvantages of Technology in Education 1. Results in a lack of interest in studying

Because everything is now accessible online or through data saved in a computer or mobile devices, students are likely to develop poor studying habits and a lazy attitude towards education. Some of them may even think they can skip school because they can find answers and lessons online. Who needs teachers when you have internet and Google, right? This can also lead to students forgetting the basics of studying. They would rather rely on computers and the internet, instead of their books and the input from their teachers. Most of them will misspell words because they often use spell checkers. Rather than solve mathematical equations the traditional way, they would seek assistance from computers or look for the answers directly through search engines. When it is time to take the tests in the classroom and without any form of technology, students are likely to fail. 2. Makes students vulnerable to potential pitfalls While computers prove to be an invaluable educational tool, it can also be a source of problems. This is especially true for students who lack the skills needed to maximize a device's functionalities. Technical problems and computer malfunctions can cause loss of assignments and other materials, resulting in high levels of stress that students would rather not experience. Difference in internet speeds and a device's capabilities can also lead to certain difficulties that will de-motivate students. Add to this other things that they will discover online, which are completely unrelated to school and education, and they will be distracted to no end. 3. Negative views on technology Consumerism has taught us that technologies, from computers to mobile devices, are widely viewed as tools to entertain rather than educate. Textbooks, on the other hand, are seen as tools for learning. So, between a tablet and a textbook, students are likely to gravitate towards learning when reading a book, while they are likely to use a tablet to

217 play games or spend time on social media. 4. Raise instructional challenges For professors and teachers to stay abreast with technology, they may need to be retrained. Those who have been teaching all their lives using traditional methods may not be very susceptible to the changes being applied. They may even see it as a threat to their job security and shun technology altogether. In fact, a majority of teachers believe that constant use of digital technology is affecting a student's attention span and his ability to persevere when a challenging task is thrown his way. Although such belief is subjective, scholars, experts and teachers all agree that technology has changed the way students learn. 5. Can diminish overall value of in-person education Although research on online learning did not establish a direct link to how personal interaction affects a student's performance, data gathered did show that those who enrolled in online courses have higher chances of failing, dropping out of classes, and are less likely to benefit from them. This may have something to do with the fact that lessons delivered online or through digital resources lack the face-to-face interaction between teacher and student that provides a more personal experience 5.7 Implications for Inclusion

Technology can be the great equalizer in a classroom with diverse learners. Whereas teachers can find it difficult to differentiate instruction for 30+ students in one class, all with different needs and abilities, "assistive technology" (devices and software to assist students with disabilities) can often help teachers personalize lessons and skills enhancement to each child.

Children with learning disabilities often have better technology skills than their teachers and are drawn to computers and other gadgets, so using them in the classroom make perfect sense. For children with physical disabilities, technology can give access to learning opportunities previously closed to them. E-readers help students turn book pages without applying dexterity, and voice adaptive software can help students answer questions without needing to write. Computers are engaging and more advanced than the typical modified lesson allows. Assistive technology is not always just for students with disabilities; it can be used to help any student with motivation, academic skills, and social development. There is no doubt that technology has changed the way children learn in the classroom. Technology has altered how students engage in learning activities, the format of learning

218 materials they use, how tasks are completed, and how they demonstrate what they know. The way we as educators design and deliver learning experiences, and what instructional materials we use to enhance student learning, has also changed. What about students who experience consistent academic failure due to learning difficulties or disabilities? Are computers and other technologies going to assist them to access the curriculum, keep up with their peers and learn how to learn? Students with learning difficulties can be defined as students who experience particular difficulties in achieving at school that are not due to a disability or impairment. (Ashman, 2005; Westwood, 2003) Students with learning disabilities include those students with chronic academic problems. These students may have been diagnosed with dyslexia, dyspraxia, dyscalculia, dysgraphia or other neurologically based conditions. Students with learning difficulties and disabilities display a variety of characteristics that can be grouped into four main categories, academic, emotional, motivational, cognitive and metacognitive. (E. Twomey, 2006.) These students typically encounter learning problems across all curriculum areas. Persistent failure throughout school, despite remediation, may lead some students to develop social and emotional difficulties including low self esteem, an embarrassing reliance on others, low motivation and disengagement from school activities. Poor handwriting, comprehension and organisational difficulties may also be barriers to learning for these students. Inclusive learning technologies can be described as those technologies, whether software or hardware, that help students learn strategies to bypass, work around or compensate for their difficulties. Many of these technologies incorporate Universal Design features which focus on providing learning resources that accommodate for learner differences. Inclusive technologies may be designed to remediate specific difficulties and contain key supportive features, while others have many features that support a range of learning needs. They may be standalone programs or may integrate with other commonly used applications. What types of technologies are there and how can they help? Reading Tools Text to speech Software that incorporates text to speech enables students to access content and information by having text read aloud, often in a high quality, realistic synthesised

219 voice. This software may highlight words, sentences or paragraphs in selected colours to draw the reader's attention to the text as it is being spoken. Using this method, students are assisted to decode words, and maintain reading fluency and comprehension. Using text to speech, they can read and re-read information as many times as they need. Talking word processors are one kind of software that incorporates text to speech. Other software packages work with standard software programs such as Microsoft Word, to speech enable them. Many of these programs allow students to read aloud text in a range of formats, including Word documents, PDFs, emails and web pages. Text to speech is also an important support for proofreading, helping students listen for any possible errors in their writing.

ØØØØ OCR Optical Character Recognition (OCR) is a method of converting text from paper format to an electronic version. This is usually carried out by using a scanner. Software that incorporates OCR, may also provide the option of scanning text into a range of formats (such as Word, PDF or other documents). This means that books, printed worksheets, even photographs with graphics and text can be converted to electronic format and read aloud using text to speech. Reading material is instantly made accessible.

ØØØØ Talking books Talking books are essentially books that are in electronic format, often looking very similar to the paper version. They may read text aloud, and include a range of multimedia elements such as real photos, animations, videos and recorded sounds that make the reading experience motivating and fun. The advantage talking books is that they allow students of any age and ability to be independent readers and take advantage of supports if and when they choose. Additional extension activities may be included with some books to help support balanced literacy instruction. Using book making templates, teachers can create their own high interest individualised learning materials.

llll Software that converts text files to audio Being able to convert text to an audio file has the advantage of providing yet another format for accessing information and is an ideal way for students to engage in independent revision and study. Students can listen to audio files via their computer or their iPod anytime, any place. Software that has this feature may also include high quality synthesised speech and the ability to save the files in a range of formats including WAV, Mp3 and WMA.

220 Writing Tools Common problems for students with learning difficulties and disabilities centre around spelling, grammatical errors, tense and punctuation. They may have ideas which they can articulate very well, but because of spelling problems fall back on using simple sentence construction and vocabulary. These students often need scaffolding to help organise and articulate their ideas into a written format.

llll Organisational software Organisational software helps students brainstorm and display their ideas using a concept map of words and/or pictures that can then be transferred to a document outline with the click of a button. Templates to assist students develop their ideas for different writing tasks may also be included as an added feature. Another strategy for developing a written draft is to use highlighting tools and extract main points from a document or web page. By creating an outline of what has been read, students can use this as a starting point for their writing.

" Onscreen word banks Learners needing support to spell words or construct meaningful sentences can quickly and easily carry out written tasks using on-screen word banks. This software provides the additional support of text to speech and pictures for those whose visual recognition of words is poor. "

Word prediction Word prediction is a strategy that assists with spelling and word completion by making suggestions as you type. These suggestions are displayed in a window. Word prediction can help students expand their vocabulary, as they are less likely to avoid words for which they are unsure of spelling. In some cases, the word prediction program may accommodate for phonetic spelling errors. Such programs also learn words that are used frequently. Research studies have reported up to a 70% reduction in spelling errors when using word prediction programs. "

Voice recognition Voice recognition software allows students to create large amounts of text or control their computer entirely by voice. Documents and e-mails can be dictated without spelling mistakes and the need to extensively use the keyboard and mouse is significantly reduced.

221 " Portable word processors or notetakers For students whose handwriting is untidy or illegible, and who find writing with pen and paper frustrating, these devices help overcome these barriers and encourage students to independently take notes rather than rely on a scribe or peers. They are low cost, portable alternatives to laptops. Infrared capabilities mean that no cords are needed when transferring text to a computer for further editing. These devices are lightweight, sturdy and have the advantage of a long battery life. They are easy to use and can be used in conjunction with word prediction programs if the student struggles with spelling 5.8 Let us sum up Earlier, technology in education was a debatable topic amongst the society. Everyone had their own views on modernizing education and making it technology aided. There were a huge number of positives and negatives to education technology. But, gradually as technology was embraced by the educational institutes, they realized the importance of technology in education. Its positives outnumbered the negatives and now, with technology, education has taken a whole new meaning that it leaves us with no doubt that our educational system has been transformed owing to the ever-advancing technology. Technology and education are a great combination if used together with a right reason and vision. With technology, educators, students and parents have a variety of learning tools at their fingertips. Here are some of the ways in which technology improves education over time: Ø

Teachers can collaborate to share their ideas and resources online: They can communicate with others across the world in an instant, meet the shortcomings of their work, refine it and provide their students with the best. This approach definitely enhances the practice of teaching.

Ø

Students can develop valuable research skills at a young age: Technology gives students immediate access to an abundance of quality information which leads to learning at much quicker rates than before. Ø Students and teachers have access to an expanse of material: There are plenty of resourceful, credible websites available on the Internet that both teachers and students can utilize. The Internet also provides a variety of knowledge and doesn't limit students to one person's opinion.

222 Ø Online learning is now an equally credible option: Face-to-face interaction is huge, especially in the younger years, but some students work better when they can go at their own pace. Online education is now accredited and has changed the way we view education. Technology

that is made use of in the classroom is very beneficial in helping the students understand and absorb what they are being taught. For instance, since there are a number of students who are visual learners, projection screens connected to computers could be put in classrooms to let the students see their notes as opposed to simply sitting down and listening to the instructor teach. There is a number of very good software that can be used to supplement the class curriculum. The programs make available to students quizzes, tests, activities and study questions that could help the students continue with the learning process when they are out of the classroom. Today, technology has been incorporated into a good number of curriculum even those that do not belong to the technology and computer classes. Students make use of computers to come up with presentations and also make use of the internet to carry out research on a variety of topics for their essays and papers. Students also get to know how to use the technology available in the world today through the tech and computer classes. This gives the guarantee that following their graduation, the students will not have any difficulties with using technology when they are out there in the work place, which might serve to make them more competitive compared to an individual who has no access to a certain software or technology in school. With the continuing advances in the technological world, students are getting improved access to such educational opportunities. Every time something 'better' and 'new' is brought into the market, the price of the existing technology is decreased which makes it much more accessible in the educational setting even to those schools that might not have a lot of financial resources available to them. Technology has greatly grown to the point that it is also available today to assist those kids who are yet to begin school. There are a number of educational systems and video games for the small children that assist them in getting ready for school and in a number of situations also give them a head start on their education.
