NSOU ? CC-ED-07 ? 134 2. Question that arise after selecting objectives are - How can learning experiences be selected? Which experiences are likely to be useful in attaining these objectives? or What educational experiences will attain the purposes? This question determines the instructional strategies and content required to fulfil the predetermined objectives. The term learning experience should be clearly defined to understand the general principles of selecting learning experiences. And this all together can be an important source for selection of objectives. Tyler, like his mentor John Dewey, also believed that students learn through exploration and teachers should encourage children to engage actively in discovering what the world is like. 3. How can these experiences be effectively organised for effective instruction? This question signifies the organisation of learning experiences suitable for the learner as well as the pre-set objectives. In Tyler's model the central idea is to organise learning activities effectively. Learning experiences need to be concrete so that the students' readings can be meaningfully connected. Learning experiences should be organised on the basis of three basic criteria, namely - continuity, sequence and integration. Hence meaning of organisation, criteria for effective organisation, the elements that need to be organised, principles of organisation and the process of planning a unit of organisation; all these can contribute for organisation of effective learning experiences. 4. How can one determine that the purposes are met? or how can the effectiveness of learning experiences be evaluated? This question directs to assessment and evaluation of the curriculum programme that has already been developed. The process of assessment is not simple in Tyler's model and it begins with determination of objectives of the educational program. This process of evaluation is essentially the

57%

MATCHING BLOCK 219/392

SA

MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

process of determining the extent to which the educational objectives are actually realised by the programme of curriculum and instruction.

Evaluation procedures, results of evaluation, values and uses of evaluation procedures and the need for evaluation; altogether can form a sound basis for evaluating learning experiences.

NSOU ? CC-ED-07 ? 135 Tyler's Model Importance of Tyler model : ? The basic principles of Tyler's curriculum model and instruction have been a standard reference for anyone working with curriculum development. ? His book shows how educators can critically approach curriculum planning, studying progress and retooling when needed. ? The readers will develop a firm understanding of how to formulate educational objectives, how to analyse and modify their plans to meet the students purpose or objectives. ? Tyler also explains that curriculum planning is a continuous cyclical process and instrument of education that needs to be tuned finely. ? Tyler emphasized on thoughtful evaluation that has kept basic principles of curriculum and instruction relevant and entrusted companion for more than 60 years. ? Tyler's recommendations act as direct, sound and effective tools for educator's, who can create a curriculum that integrates National level objectives with needs of individual students. Strengths of the model: This is one of the best known models of curriculum development.

NSOU ? CC-ED-07 ? 136 Some major strengths of the model are mentioned here - 1. It involves the active participation of the learners. 2. The objectives are clearly defined in the purposes and these purposes are translated into educational objectives. 3. This model indicates a simple linear approach to development of behavioural objectives. 4. Special attention is paid for planning of each phase. 5. Another positive aspect of this model is its deductive nature, so it proceeds from general to the specific. Criticisms of Tyler model: The Tyler's model is criticized in the following issues - 1. The objectives are narrowly interpreted. 2. The process of construction of behavioural objectives is difficult and time consuming. 3. Curriculum is restricted to a constricted range of student skills and knowledge. 4. Higher level objectives like critical thinking, problem solving and value acquiring processes cannot be clearly mentioned in behavioural objectives. 5. Learning experiences are so individual that teacher is not in a position to select the most effective learning experiences. 6. The teacher may attempt to control the learning experience by manipulating the environment which results in stimulating situations sufficient to evoke the desired learning outcomes. 4.5.2

Hilda Taba Model She was an architect, a curriculum theorist, a curriculum reformer and a teacher educator. Taba was a

student of John Dewey. She authored the book named - Curriculum Development: Theory and Practice (1962), a very important document in the field of curriculum studies. Curriculum development can be defined as the process of planning, implementing and evaluating curriculum that ultimately results in a curriculum plan. This theory is based on higher order inductive thinking. Hilda Taba believed that the skills used in inductive thinking need to be taught and practiced by students.

more effectively if it is based on the principles of democratic guidance and distribution of work. Emphasis should be on competence not administration.

Some features of Taba's model: ? Taba's model is based on inductive approach. ? The teachers are aware of

76%

MATCHING BLOCK 222/392

W

the students' needs therefore they should be the one to develop the curriculum.

Hence teacher's approach or perspective is the basis of Taba model. ? Approach is basically the Grassroot approach. ? The basic idea of this approach emphasizes that the needs of the students should be in the forefront of the curriculum.

100%

MATCHING BLOCK 223/392

W

Taba believed that the curriculum should be designed by the teachers rather than handed down by

the higher authority. She also felt, it is the teachers who

78%

MATCHING BLOCK 224/392

W

should begin the process by creating specific teaching-learning units for their students in their own schools. Approach to curriculum development

is inductive. In inductive approach the curriculum workers start with the specifics and construct a general design of curriculum as opposed to the traditional deductive approach by Tyler, who advocated a deductive approach to curriculum development that is starting with the general design and then working down to the specifics. There are seven stages in Hilda Taba's model of curriculum development. Taba perceived the stages of curriculum development in the following order as shown in the table.

NSOU ? CC-ED-07 ? 138

TABA'S MODEL OF CURRICULUM DEVELOPMENT (Taba 1962)

89%

MATCHING BLOCK 226/392

W

Step 1 : Diagnosis of needs ? Step 2 : Formulation of objectives ? Step 3 : Selection of content ? Step 4 : Organisation of content ? Step 5 : Selection of learning experiences ? Step 6 : Organisation of learning experiences ? Step 7 : Determination of what to evaluate and ways and means of doing it.

Stage 1 : Diagnosis of needs This implies diagnosis of the learners' needs and expectations of the larger society. The learners' need can be diagnosed through diagnosis of achievement, diagnosis of students as learners and diagnosis of curriculum problems. The diagnosis process should be conducted systematically, it should start with problem identification then the identified problem is analysed. After this the formulation of hypothesis and gathering of data will be followed by experimenting with action. Stage 2 : Formulation of learning objectives: Learning objectives will be based on the objectives of education, which are as follows - ? To add to knowledge they possess or their existing knowledge; ? to enable the students

100%

MATCHING BLOCK 229/392

SA

MEDHC 2.1 Curriculum- Principles and Planning ... (D154644155)

perform skills which otherwise they would not perform; ? to develop certain understanding, insights and

appreciations; ? to understand and analyse the culture of a particular society, which the education programme is supposed to serve; ? to develop a healthy and balanced personality of the students; These educational objectives are of much importance as they transmit culture, reconstruct society and help in fullest development of the individual. Certain principles are to be followed in formulation of objectives. These are - objectives should be useful, clear and concrete. Objectives should have a broad scope and realistically achievable.

NSOU ? CC-ED-07 ? 139 Stage 3 : Selection of learning content: Content should be selected rationally. By nature the content should be significant, valid and consistent with social realities. Appropriateness to the needs and interests of the students should be verified. There should be clear distinctions between different levels of contents. Stage 4 : Organisation of learning content The contents should be organised based on the principles

94%

MATCHING BLOCK 227/392

W

of sequencing. A teacher cannot just select content, but must organise it in some type of sequence, taking into consideration the maturity of learners, their academic achievement, and their interests. Content must be presented to students and students must be engaged with the content. At this point, the teacher selects instructional methods that will involve the students with the content.

Stage 5 : Selection of learning experiences The

principles of learning are applied at this stage. What are the different teaching methods that have been used? While using lecture method the teacher should be active to use questioning and discussions. In this phase it is decided whether the students have enough opportunities to learn from one another and whether the students are using these opportunities to solve their real problems or using only while working in projects. Stage 6 : Organisation of learning experiences After selecting the learning experiences the teacher needs to organise the selected ones to present it before the students more effectively. Stage 7 :

100%

MATCHING BLOCK 228/392

W

Determination of what to evaluate and the ways and means of doing it.

In this phase planning is done for evaluation. The curriculum implementers or the teachers try to evaluate whether the aims and objectives are actually achieved by students. Attempts should be made to assess the quality of learning and it should also be ensured that curriculum organisation provide experiences which offer maximum opportunities for all types of learners to attain their goals independently. Taba believed, to evolve a theory of curriculum development, one needs to understand the demands and requirements of a culture and society both for the present and the future, as curriculum is a way of preparing the young to participate in one's culture.

NSOU ? CC-ED-07 ? 140 Applications of Taba's model This model is currently used in most curriculum designs.

For identifying the needs of the students, developing objectives and selecting instruction method

this model is widely used. Learning experiences are organised and evaluated by using this model. Strengths : 1. The teachers enjoy great autonomy as the role of teacher is not limited to implementation of the curriculum but she acts as the developer of the curriculum too. 2. Base model mentions that the teachers are aware of the students names therefore there can plan for students learning in a better way. 3. The objectives are considered to be very important in this model as they determine what to include, exclude and emphasise in the curriculum. Some criticisms of Taba model : 1. This model

90%

MATCHING BLOCK 231/392

W

applies the concept of participatory democracy as a highly technical and specialised process, therefore it

lacks simplicity. 2. The connection between the content, activities, teaching methods and evaluation are always not understandable to the teachers. 3. Another special requirement of this model is keeping the resources up-to-date. 4. The new teachers require training for using this method and they also need support as the plan is often reviewed. 5.

84%

MATCHING BLOCK 233/392

SA

SCE 611 Mankutu.docx (D50988352)

The model has employed the concept of participatory democracy to a highly technical, complex and specialized process, and this cannot guarantee an effective

curriculum. 6. This model believes

100%

MATCHING BLOCK 234/392

SA

SCE 611 Mankutu.docx (D50988352)

that teachers have the time and expertise to engage in such extensive curricular activities.

The Taba-Tyler rationales Both Taba and Tyler follow the technical/ scientific approach. When comparing between these two models of curriculum development it is difficult to ascertain who borrowed from whom and when but we have to admit the basic difference of the two curriculum design approaches, which has a critical meaning not only for researchers of modern times but also for those developing curriculum for current school praxis.

NSOU ? CC-ED-07 ? 141 The sequence of development as propounded by Piaget's learning theories form the basis of curriculum principles propounded by Tyler and Taba, and curriculum principles remains the same for all individuals. Tyler (1962) propounds three methods of organizing learning experience which were based on Piaget's theory of cognitive development: Continuity: Skills and concepts in a curriculum should have vertical recurrence, which enable the learner to practice those concepts. Sequence: Understanding of concepts should be in a sequence such that each successive experience builds on the preceding one. Integration: Curricular experiences should be horizontally interrelated and should be unified in relation to other elements. Concepts in a particular subject should not be in isolation to concepts in other subjects. Taba reviews Piaget's four stages of cognitive development and analyses their implications for intelligence and mental development. Complex concepts and subject matter should be transformed into mental operations appropriate to the learner's development stage. Taba also takes into consideration Piaget's cognitive process of assimilation, accommodation and equilibration. Taba's curricular experiences are compatible with existing experiences; the concept should be organized so as to move from concrete principles (accommodation) and classifying new relationships/ equilibration. Points in favour of Tyler's approach ? This model is Deductive in approach. ? Argues from the administrator's perspective or approach. ? Believes that administration should design the curriculum and the Teachers should implement it. ? Places main stress on objectives, evaluation and control. ? This approach may be perfect for market oriented education but inadequate for the development of responsible and creative individuals who need to meet the challenges of constantly changing circumstances of the society. Points in favour of Taba's approach ? This model is Inductive in approach. ? Reflects the teachers approach, she believes that teachers are aware of the students needs hence they are the one who should develop the curriculum and implement in practice.

NSOU ? CC-ED-07 ? 142 ? Her rationale does not start with the objectives as she believes that the demand for education in a particular society should be studied first. ? In Taba model attention is

93%

MATCHING BLOCK 237/392

(D29551053)

paid to the selection of the content and its organisation with an aim to provide students with an opportunity to learn with comprehension. 4.3.3

Kilpatrick approach to Curriculum development William H. Kilpatrick (1871 – 1965) was the much acclaimed progressive educational philosopher, teacher and interpreter of John Dewey's work and at the same time a bitterly criticised person by a section of American educators. Commonly he is famous for the formulation and giving useful shape to his Project Method and Project based curriculum. According to

85%

MATCHING BLOCK 235/392

W

Kilpatrick, curricula are purposeful activities which are child centred. Purpose of curriculum is child'

s development and growth. He was the pioneer to the idea of personalised curriculum as in his project method teacher and the student plan of the activities to be undertaken by the latter. Another reason for Kilpatrick's rising influence in American education was his effective teaching and charismatic public-speaking ability. Post World War II, critics attacked several aspects of the ideas and practices of Progressive education. They saw a curriculum that lacked firmness and students were academically unprepared to compete with in a global economy. Kilpatrick's consistent Progressive message was that schools needed to be more child-centered, democratic, and socially oriented. It is important to remember that the Project Method was not a rigid method but actually a philosophy. Specific criticism aimed at Kilpatrick emerged in the school reform literature of the 1980s and 1990s. Kilpatrick's spectacular rise in educational circles began with the publication in 1918 of his article "The Project Method". In the article Kilpatrick provided a practical approach to implementing John Dewey's educational philosophy. He banked upon Dewey's earlier work, *Interest and Effort*, he attempted to demonstrate how students could engage in purposeful activity at the intellectual, physical, and affective levels. "The Project Method" was an immediate bestseller among educators and launched Kilpatrick's national public career. The inclusion of projects matched the child-centered approach advocated by Progressive educators at this time. The emphases that projects placed on individual learning, on reflective activity, and on the development of the whole child struck an echoing chord with teachers of the period. The project method was nothing but an idea of approaching a child-centered learning experience. Kilpatrick believed, education was about the social development of the child rather than their cognitive development through the mastery of content. The emphasis was on learning to think and not focusing on what to think.

NSOU ? CC-ED-07 ? 143 The curriculum should originate from comprehensive real-life situations and not compartmentalized subject matter. This idea calls for a need for an integrated curriculum that stressed maximum student participation. These beliefs led Kilpatrick to create a unique form of teaching. Teachers have to perform very significant role in Kilpatrick's form of education. Firstly teachers need to decide what they are trying to do. Next, they need to develop a plan for achieving these objectives. The development of observable goals is clearly the behavioural aspect of this method. Execution involves the implementation of the plan. Lastly, the teacher has to judge and assess the success of the plan. Again, assessing the students and curriculum is a behavioural aspect of the Project Method. Kilpatrick firmly believed that students should be leaders in the development of their learning as nothing would motivate them more. This also led to the development of decision-making skills. Therefore the progressivist aspect of this method suggested constant revision of the curriculum based on student need and interest and the curriculum was to be developed jointly with the students. After initial popularity and use for twenty years, this philosophy was criticised due to the difficulty in implementation in large-scale systems. Recently constructivists have used the theories of Piaget and Vygotsky to develop a problem solving system, which emphasizes an adaptive curriculum with students as problem solvers. This instructional process of student-directed learning has been promoted as a new idea, which may be a tentative way to solve the problem of students' motivation and achievement in the modern world. Kilpatrick's Project Method had put forward similar ideas long back. The ultimate goal for Kilpatrick and present-day constructivist educators is the learners, who can think critically, judge situations and face problems independently in a democratic society. Educational success in the 21st century requires the ability to find answers by the students on their own and move beyond the traditional teacher directed system that emphasised only on assimilation of material. Imaginative thinking and creativity is required in real world situations and Kilpatrick's ideas are highly relevant in this context. The successes and failures of Kilpatrick's work in the twenties and thirties are still beneficial in examining today's curriculum development processes. The above discussion proves that Kilpatrick's work was much ahead of his time who was virtually instrumental to the development of many modern ideas in contemporary education like personalized curriculum, individualised instruction etc.

NSOU ? CC-ED-07 ? 144 4.6 Summary In this subunit we have discussed the definitions of Curriculum design. Various components of curriculum design have been elaborated with an outline the curriculum tips to establish a Broad Curriculum Design. The Dimensions of Curriculum design are described briefly. This subsection also described the different types of theories of Curriculum Development. Various types of curriculum development models – namely the Prescriptive theories, the descriptive theories, the critical theories and the Personal theories of Curriculum Development are discussed in detail. Different models of curriculum development are described in detail. Tyler, Taba and Kilpatrick's approach to Curriculum development are elaborately discussed along implementation of the models of curriculum development. 4.7 Self-Assessment Questions 1. Define Curriculum design. 2. Identify important areas for curriculum design. 3. Name the Dimensions of Curriculum design. 4. Mention the different types of Models of Curriculum Development 5. You also studied the influences of different theories and models that have immense impact on the development of curriculum. In this unit we will discuss the concept of curriculum evaluation its nature purpose source and methods. A framework of curriculum is based on the assumptions about the learner and society. Aims and objectives, content and subject matter selection, scope and sequence, modes of transaction, methodology, learning environment and evaluation are some of the major concerns of curriculum development. In the previous unit we have discussed the different dimensions of curriculum development. Three vital aspects are considered in organizing curriculum. They are Articulation, Balance and Continuity. We learnt articulation is interdisciplinary, interrelationship among subjects must be maintained during design of the curriculum. Balance among structure, scope and sequence, content, life experience, time, text book, teaching aids etc. should be achieved through Cognitive, affective and psychomotor domain of objectives. Continuous flow of knowledge and learning experiences should also be ensured in this process. There should be well defined relationships among different components. The influences of different theories are also studied. In this unit we will discuss the concept of curriculum evaluation its nature, purpose, source and method. We shall also discuss curriculum evaluation at Micro and Macro level. 5.3 Curriculum Evaluation : Concept, Objec- tives, Micro Macro Level 5.3.1 Concept

feedback on continuous curriculum adjustments

75%**MATCHING BLOCK 239/392****W**

and processes of curriculum implementation. Curriculum evaluation aims to examine the impact of implemented curriculum on student learning

and

93%**MATCHING BLOCK 244/392****SA**

Sambalpur-MA-Education-SEM-II-Curriculum Devel ...
(D156211172)

achievement so that the official curriculum can be revised if necessary and teaching and learning processes

can be reviewed before classroom application. It also aims to find out how much of the intended Curriculum has been transacted in a classroom and how much students are involved in learning activities. The process of curriculum evaluation can provide several ways to improve the teaching-learning systems.

100%**MATCHING BLOCK 241/392****W**

Student assessment is an important aspect of curriculum evaluation which helps to facilitate the understanding of the impact and outcome of education programmes. A fundamental measure of the success of any curriculum is the quality of student learning. Knowing the extent to which students have achieved the outcomes specified in the curriculum is fundamental to both improving teaching and evaluating the curriculum.

100%**MATCHING BLOCK 245/392****SA**

MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

The ultimate goal of curriculum evaluation is to ensure that the curriculum is effective in promoting improved quality of student learning. Student assessment therefore connotes assessment of student learning. Assessment of student learning has always been a powerful influence on how and what teachers teach and is thus an important source of feedback on the appropriateness implementation of curriculum content.

The curriculum evaluation is the collection and provision of evidence to find out the feasibility, efficiency, effectiveness and educational value of curricula. The stages of curriculum evaluation process are stated in the figure below – STEPS OF CURRICULUM EVALUATION 1. Identifying Primary audience (sponsors, managers, administrators, school heads) 2. Identifying critical issues (expected desired and intended outcomes) 3. Identifying data sources (students, teachers, parents, curriculum planners) 4. Identifying techniques (standardised test, checklist, observation) of data collection 5. Identifying established standard and criteria (standards set by professional organisation) 6. Identifying techniques of data analysis (descriptive and inferential analysis and qualitative and quantitative analysis) 7. Preparing Evaluation report (written, oral, descriptive, graphic) 8. Preparing modes of presentation (product display through use of multimedia) NSOU ? CC-ED-07 ? 149 2nd Proof • Classic Print & Procces (09-02-2022) Curriculum evaluation basically translates government education policy into educational practice.

are identified and important inputs to improve learning and teaching are provided. The term "

94%**MATCHING BLOCK 246/392****W**

Curriculum" comprises all the learning which is planned and guided by the school whether it is carried on in groups or individually inside or outside of

the school. In the words it is the totality of experiences that pupils receive through various activities in the classroom, library, laboratory, workshop and playground. Curriculum is the tool in the hands of the teachers to develop the desired quantities is in the learner. Curriculum evaluation is the technique to check whether the curriculum objectives are fulfilled. Curriculum and Evaluation: Putting together Curriculum evaluation is a component of Curriculum development. It looks into evaluation reforms or innovations that happen in classrooms, School, district and/or the education system as a whole. The process of Curriculum evaluation helps to establish the merit or worth of a curriculum. Curriculum evaluation provides information necessary for teachers, school managers; curriculum exerts for policy recommendations that will enhance achieved learning outcomes. Curriculum evaluation identifies the strengths and weaknesses of an existing curriculum that will be the basis of the intended plan, design or implementation. When evaluation is done in the middle of the curriculum development, it will tell if the designed or implemented curriculum can produce or is producing the desired results. Based on some standards, curriculum evaluation will guide whether the results have equalled or exceeded the previously set standards, thus can be labelled as success. The process of collecting data on a specific course or programme by utilising scientific tools and techniques to determine its value or worth is known as evaluation. The curriculum developer or the planner conducts evaluation of Curriculum to adopt, reject and revise the programme. The teachers are interested to know the effectiveness of their classroom teaching. Other stakeholders and

100%**MATCHING BLOCK 247/392****W**

the public want to know whether the curriculum implemented has

been able to achieve its aims and objectives. Any aspect of an activity or endeavour can be evaluated for better performance in future and this brings good result and quality performance if curriculum is evaluated objectively. Curriculum evaluation or assessment is a continuous process and not a

NSOU ? CC-ED-07 ? 150 one shot deal. The purpose of curriculum evaluation is to improve and not to prove. Curriculum evaluation is the process that resolves the issues mentioned above. Diversity of opinion among curriculum experts is found in respect of nature and purpose of evaluation. Some of them view curriculum evaluation as a means for quality control in education. The process starts with the act of stating the objectives of the course and is followed by the definition of these objectives in behavioural terms. Then the new materials are developed such to satisfy the purposes and the objectives that curriculum developers have already conceptualised. To some expert the primary objective is to provide relevant information to the decision makers so as to enable them to arrive at decisions. This implies that there is more to evaluate in the curriculum programme than its stated objectives. This diversity of opinion among curriculum experts are also reflected in the definition put forward by them. Towards a definition of Curriculum evaluation Going through the given below definitions one can easily realise the diversity of opinion among curriculum framers and experts of this area in respect of nature and purpose of evaluation. Curriculum evaluation is an ongoing and dynamic process hence experts viewing different aspects or stages of the process may come up with a definition that seem to be apparently different for the other. Gay, L. (1985) evaluation is to identify the weaknesses and strengths as well as problems encountered in the implementation to improve the curriculum development process. According to Olivia, P. (1988) it is a

95%

MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

Curriculum evaluation may be an internal activity and process conducted by the various units within the education system for their own respective purposes. These units may include National Ministries of Education, Regional Education Authorities, Institutional Supervision and Reporting Systems, Departments of Education, Schools and Communities. Curriculum evaluation may also be external or commissioned review processes. These may be undertaken regularly by special committees or task forces on the curriculum, or there may be research-based studies on the status and effectiveness of various aspects of the curriculum and its implementation. These processes might examine, for example, the effectiveness of curriculum content, existing pedagogies and instructional approaches, teacher

education and textbooks and teaching-learning materials. Another very important task for curriculum evaluation is linking the curriculum to the needs of the society for which it is prepared. 5.3.1 Objectives of Curriculum evaluation 1. To provide necessary information to teachers, school managers, curriculum specialist and significant others regarding policy recommendations that will enhance achieved learning outcomes. 2. The basic idea of Curriculum evaluation is to identify the strengths and weaknesses of an existing curriculum that will be considered as the basis of the intended plan design or implementation 3. By this process the obsolete areas, ideas and practices are removed and existing curriculum is updated based on the recent advancements in the field of knowledge. To meet the new challenges and concerns; the outdated, obsolete and redundant material are eliminated from the curriculum. 4. When evaluation is done during curriculum development the objective is to determine whether the design of the curriculum being developed can produce the desired results. 5. One important objective of Curriculum development is to make the curriculum more efficient in achieving the determined objectives. Need assessment and continuous monitoring is done to enhance the effectiveness of a curriculum.

NSOU ? CC-ED-07 ? 152 6. To identify the gap if any between the requirements of the consecutive grades and to analyse the suitability of objectives of the present grade and if required filling these gaps with appropriate learning experiences. 7. Terminal assessment and decision making are two other important objectives of Curriculum evaluation. Terminal assessment is conducted towards the end of the curriculum development process and the strength of a programme is ascertained by this process. The fundamental purpose

100%

MATCHING BLOCK 253/392

SA

MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

of curriculum evaluation is to ensure that the curriculum is effective

and valuable in promoting improved quality of student learning. Student assessment is therefore considered as an important indicator for assessing

98%

MATCHING BLOCK 255/392

SA

MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

student learning. Assessment of student learning has always been a powerful influence on how and what teachers teach and is thus an important source of feedback on the appropriateness of

implementation of curriculum content. Curriculum evaluation fulfils the diverse objectives of diagnosis, certification and accountability. This process

100%

MATCHING BLOCK 254/392

requires different kinds of assessment instruments and strategies selected to achieve specific purposes.

84%

MATCHING BLOCK 260/392

SA

MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

Assessment of student learning could be summative or formative, and there are various types of tests to address different needs such as standardized tests, performance-based tests, ability tests, aptitude tests, personality tests, interest inventories and intelligence tests.

The process of curriculum evaluation can easily be understood by asking the following six questions which are nothing but the six determining factors in curriculum evaluation: What is to be evaluated? Who is to be evaluated? What is the purpose of evaluation? Who will conduct evaluation? Where to conduct evaluation? What to be done after evaluation? 5.3.2 Steps in Conducting a Curriculum Evaluation Curriculum evaluation process comprises of some simple steps easy to follow. Begin thinking of how curriculum evaluators will proceed in finding out if there is a need to modify, enhance or continue with the implementation of the curriculum. After all, the main purpose of evaluation is to improve the existing condition, so that it would benefit the students by improving their education.

NSOU ? CC-ED-07 ? 153 2nd Proof • Classic Print & Procces (09-02-2022) 1. Identifying Primary Audiences Identifying Curriculum Programme Sponsors, managers and administrators, School heads or institutional head, direct participants i.e. the teachers and the students, content specialist; and other stake holders etc. as the primary audience is the first step. 2. Identifying critical issues In the second stage the Outcomes which may be of three types i.e. expected, desired and intended should be determined along with the process of implementation and required resources or inputs. 3. Identifying data source Identification of data source is followed. People (teachers, students, parents, curriculum developers) may act as important source of information, along with these existing documents, available records and evaluation studies also may provide significant data. 4. Identifying techniques for collecting data Standardized test, informal or teacher made test, sample of students work, interview, participant observations, checklist, anecdotal record and cumulative record cards may be used effectively for collection of data. There are numerous Sources of collecting data for Evaluation. The important sources of curriculum evaluation are primarily the Students, Teachers, Subject experts and Parents. Policy makers, Community, Drop out students, Administrators, School Boards of Education, Examination Boards, Employers and entrepreneurs etc. re also important sources from which data may be collected. Data collected from these sources is considered for introducing changes in content. Evaluation process may reveal that content is not congruent with objectives then some new content may be introduced and mismatched the objectives can be eliminated. Evaluation process can also improve teaching by making use of appropriate methodology. The teacher needs to refine his/her teaching strategies to suit the needs of the students. Again this process can assess the need and scope for introducing new courses as science, technology and information expanding everyday. Evaluation process should always provide the scope of introducing contemporary courses that can help the future students of universities find jobs that are in demand today at present. 5. Identifying established standards and criteria After deciding on the techniques for collecting data, in the following stage of curriculum evaluation process the standards previously set by any professional oragnization or agency should be identified to determine the standard of the programme.

NSOU ? CC-ED-07 ? 154 6. Identifying techniques in data analysis Now the data collected need to be analysed. Content analysis, process analysis, statistics, comparison, evaluation process etc. may be done for analysis of data. Curriculum evaluation process may make use of one variable analyses and correlational analyses as mostly used data analysis technique. Based on the results achieved decision is taken regarding more use of qualitative and advanced statistical methods. 7. Preparing evaluation report Evaluation report should be well documented and duly contain all the components identified for evaluation. The important components are goals and objectives, prerequisites like entry level knowledge, contents, processes, outputs, assessment procedures, references etc. All the techniques for obtaining evaluation information should be mentioned while reporting. Information regarding improving teaching learning strategies and the introduction of new courses, etc. should be stated duly. The evaluation report should contain the progress of the programme, final scenario and summary in descriptive or graphic mode. The nature of the report should be evaluative and judgmental. List of recommendations should be well documented for further improvement. This is the age of new-wave evaluation, therefore field testing should not play the only role in evaluation but there is a great variety of factors that need to be considered.

100%

MATCHING BLOCK 256/392

W

Student assessment is an important aspect of curriculum evaluation which helps to facilitate the understanding of the impact and outcome of education programmes. A fundamental measure of the success of any curriculum is the quality of student learning. Knowing the extent to which students have achieved the outcomes specified in the curriculum is fundamental to both improving

the teaching-learning process and evaluation of the curriculum. 5.3.3 Curriculum Evaluation at Micro & Macro Level Curriculum evaluation is very long process that starts even before planning of curriculum and continues even after evaluation. It

81%

MATCHING BLOCK 257/392

W

is a necessary and important aspect of any national education system. It provides the basis for curriculum policy decisions, feedback on continuous curriculum adjustments and processes of curriculum implementation. Curriculum evaluation is primarily concerned with effectiveness and efficiency of translating government education policy into educational practice.

Determining the importance

90%**MATCHING BLOCK 258/392****W**

of curriculum contents and practices in the global, national and local

contexts

the achievement of the goals and aims of educational programmes are some important areas of curriculum evaluation

process. The range of this curriculum evaluation process sometimes starts at the macro level then proceeds to micro level i.e. from national level to local level or vice versa i.e. from local level to national level. Curriculum Evaluation at Macro level At the macro level the all curriculum professionals of curriculum development are guided into an analysis through three major activities. Firstly, to determine the structure of a curriculum framework, this includes the typical components of curriculum frameworks to be used as a structural analysis tool. Secondly to formulate what students should know and be able to do, it helps the participant to revise and choose several alternatives to define the expected achievements of students. Thirdly, to integrate different available approaches of curriculum development by reviewing the existing strategies having different focus and depth. Schematic Diagram Showing Macro Level Evaluation Process

MACRO LEVEL EVALUATION PROCESS Evaluation of the overall effectiveness of the whole curriculum Summary and Preparation of Evaluation Report Decisions by the disciplines communities Decisions by the interdisciplinary communities Revision of Curriculum Students who completed the course and are employed Employers or Entrepreneurs Subject Exports Principals or Teachers Curriculum Exports Officers in charge of exam cert of Board & Secondary Education

NSOU ? CC-ED-07 ? 156 Some characteristics of Curriculum evaluation at Macro level: 1. At macro level the entire curriculum is organised starting from theory to the contents of each subject. 2. Macro level refers to as the 'function of Curriculum design'. 3. The range of curriculum evaluation at this level is huge. Curriculum change, curriculum development, curriculum supplementing, curriculum adaptation, curriculum planning, curriculum experimentation, curriculum design, curriculum expansion, content sequencing, materials evaluation, material writing etc. all these are strategies of macro level curriculum evaluation. 4. At the macro level curriculum evaluation is based on social, political and educational philosophy of the nation and society. 5. The scope of curriculum evaluation at the macro level consists of socio- cultural system, educational system, educational policies and curriculum policies. It also includes activities outside the classroom, co-curricular activities and community involvement activities. Schematic Diagram Showing Micro Level Evaluation Process

MACRO LEVEL EVALUATION PROCESS Evaluation of each subject of the curriculum Judgement Teachers Students Subject Exports Curriculum Evaluation Team Summary and Recommendations Observation Some characteristics of Curriculum evaluation at Micro level 1. This implies arranging the content of a specific discipline of subject. 2. Micro level refers to as the 'function of Curriculum organisation'.

NSOU ? CC-ED-07 ? 157 2nd Proof • Classic Print & Procces (09-02-2022) 3. This level indicates change, development, adaptation, planning, experimen-tation, sequencing and evaluation of Curriculum at the school or institutional level. 4. Curriculum evaluation at the micro level concentrates on fulfilment of objectives related to student's needs, self-sufficiency, significance, interest, utility feasibility etc. 5. Curriculum evaluation at the micro level is very much specific and it refers to the learning expectations of the school or any educational institution regarding the prescribed subject or content areas. 5.3.4 Some issues and challenges faced in different levels of Curriculum Evaluation The ultimate indicator for an effective school is the measure of academic growth of its students. Without sufficient data, schools cannot fine-tune programs or respond to students' individual needs quickly enough to meet local, state, or national guidelines. This is a major problem with the states and the government at the centre to authorise those schools that attain a high proficiency rate of student achievement. 1. Lack of congruence between instructional practices; namely - learning objectives, contents and instructional methods as well as assessment at macro and micro levels. 2. To develop alignment between different levels of Curriculum evaluation, adequacy in teacher training and professional development is difficult to attain. 3. Identifying appropriate methods to be used for facilitating student learning at different levels is hard to find. 4. For monitoring and improving the quality of education effective use of curriculum assessment is important. This becomes further difficult when synchronisation between different levels has to be achieved. 5. Most of the time the curriculum evaluation and monitoring system at different levels lacks consistency, resulting in ineffective

99%**MATCHING BLOCK 261/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

evaluation. Curriculum evaluation may be an internal activity and process conducted by the various units within the education system for their own respective purposes. These units may include National Ministries of Education, Regional Education Authorities, Institutional Supervision and Reporting Systems, Departments of Education, schools and communities. Curriculum evaluation may also be external or commissioned review processes. These may be undertaken regularly by special committees or task forces on

research-

NSOU ? CC-ED-07 ? 158 based studies of the state or the nation. All these organizations and departments examine

100%**MATCHING BLOCK 262/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

effectiveness of various aspects of the curriculum and its implementation.

Presently, new developments in technology are allowing schools to use Internet- enabled assessment tools that can effectively adjust in difficulty to the individual students' ability. As electronic tests can be customized on demand, each student can be engaged and more accurate and instantaneous electronic results are acquired. This allows teachers to see quickly whether students are succeeding or falling behind. Curriculum and instruction can then be modified to address the results. Again tests can be tailored to meet national, state, district and if required local mandates. All these above mentioned processes might examine, for example, the authenticity of the sources of curriculum,

100%**MATCHING BLOCK 263/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

the effectiveness of curriculum content, existing pedagogies and instructional approaches, teacher training and textbooks and instructional materials.

Keeping in view the purpose of the curriculum under consideration importance of each of these aspects is assessed singly as well as wholly. 5.3.5 Importance of curriculum evaluation Curriculum development is an ongoing and dynamic process which keeps on changing as the demand from education keeps on changing depending on societal needs. In this process, Curriculum evaluation is a method for determining the worth and effectiveness of any newly implemented curriculum which can help and decision makers take objective decision on curriculum. There are several stakeholders with interest in the results of curriculum evaluation that include subject experts, curriculum experts, parents, teachers, the community, administrators, and curriculum publishers. The most important reason behind curriculum evaluation is to improve student learning and quality of education. Let us discuss the importance of curriculum evaluation. 1. Introducing changes in subject matter or content: If curriculum experts discover that content is incompatible with objectives and new content may be introduced then curriculum evaluations become important. Curriculum experts can eliminate those contents that do not match the objectives. 2. Improving teaching: If the course has been evaluated by the students as 'confusing' or 'inadequate', it is possible the methodology was not completely correct. It is completely up to the teacher then to refine his/her teaching strategies to suit the needs of the students. For instance, the lecture method in some areas can be replaced by group discussions or seminars or vice-versa. 3. To study and analyse curriculum under implementation: The policy framers and curriculum makers may require immediate feedback on implementation of a NSOU ? CC-ED-07 ? 159 2nd Proof • Classic Print & Procces (09-02-2022) curriculum in order to make changes or amendments for effective realisation of all the pre-specified objectives. 4. To update an existing curriculum: some contents in the curriculum may become backdated with time. For excluding this obsolete ideas and practices from the curriculum evaluation of the curriculum become necessary. 5. To develop a new curriculum: whenever a new curriculum has to be developed the existing curriculum has to be evaluated objectively, so that decisions regarding new emerging requirements can be considered. As expand science, technology and information is taking place everyday, there is always the scope of introducing contemporary courses that can help the future students of universities find jobs that are in demand today. Development of a new curriculum can be taken up only after evaluating the curriculum. 6. To assess the effectiveness of a curriculum: The curriculum has both short-term and long-term objectives. When it becomes necessary to evaluate both the type of objectives curriculum evaluation is conducted. 7. To assess the effectiveness of

92%**MATCHING BLOCK 264/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

student learning: The essential goal of curriculum evaluation is to ensure that the curriculum is effective in promoting improved quality of student learning. Student assessment therefore connotes assessment of student learning. Assessment of student learning has always been a powerful determiner on how and what teachers teach and is thus an important source of feedback on the appropriateness implementation of curriculum content. 8.

To provide Feedback: The outcome of the process of curriculum Evaluation provides

100%**MATCHING BLOCK 266/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

feedback to students and educational programmes in order to bring about an improvement in the system.

Feedback may be collected from any stakeholder concerned with the process of curriculum development. Therefore, we may say that

93%**MATCHING BLOCK 265/392****W**

Curriculum evaluation is a necessary and important aspect of any national education system. It provides the basis for curriculum policy decisions, for feedback on continuous curriculum adjustments and processes of curriculum implementation. 5.4 Sources of curriculum evaluation

There are several sources from where meaningful information can be collected regarding evaluation of curriculum. The curriculum evaluator can collect information from the students, peer groups, teachers, educational experts, subject experts, curriculum experts, policy making community, employers and entrepreneurs, professional evaluators and even dropout sample.

NSOU ? CC-ED-07 ? 160 1. The student or the learners Curriculum can be evaluated by students, either those who have completed the course or those who are still studying.

100%**MATCHING BLOCK 267/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

The learners of a particular course are the primary and most important source of information regarding how relevant

that

94%**MATCHING BLOCK 268/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

intended curriculum is and how well it is being implemented. The list of the output specifications can be given to the learners who are undergoing a particular course and detailed information can be gathered in two ways. Firstly by finding out whether the learners have really achieved the intended output specifications. Secondly by finding out the perceptions of

the

100%**MATCHING BLOCK 269/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

learners regarding the extent to which they feel they have achieved the objectives of the course. This information is more qualitative in nature as these

are

88%**MATCHING BLOCK 270/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

the perceptions of students and they are of immense value from the point of view of revising a curriculum. This valuable data can be collected even from

the students have passed out. 2. Different subject experts and teachers Teachers are the artists who implement

84%**MATCHING BLOCK 271/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

the curriculum in classroom. Teachers can help in curriculum mapping which is the process of content alignment in accordance with curriculum goals.

Teachers are an important source of curriculum implementation as they are considered to be most important in curriculum transaction obviously after the students. The subject experts from the discipline can also help in this regard. 3. Curriculum framers or experts The curriculum framers are in a position to provide information on the modern techniques that can be used for developing a curriculum. At present the curriculum development procedure has been updated and the output specifications are made clear in the modern and meaningful curriculum. Does

68%**MATCHING BLOCK 272/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

the curriculum itself mentions what the student will be able to do at the end of the course, the conditions under which the learners will be observed, the

minimum criteria to be fulfilled and the level of acceptance of errors etc. are determined by the curriculum experts. Therefore it can be said that the contribution of the curriculum experts has become inevitable in curriculum evaluation and they act as a very good source of data for curriculum evaluation. 4. Policymakers Central board of education, State board of education, National and state council of educational research and training are some of the important institutions which play a very important role in decision making regarding curriculum development. Policymakers occupy responsible positions in these apex bodies

90%**MATCHING BLOCK 273/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

by virtue of their position they are better informed about the current and important changes in government policies regarding economy,

NSOU ? CC-ED-07 ? 161 2nd Proof • Classic Print & Procces (09-02-2022) industry, agriculture, technology, science and education. All these areas have direct or indirect impact on curriculum. Inclusion or exclusion of topics in textbooks or making specific changes may be necessary due to change in government policies. The policy makers can be considered as an important source for curriculum evaluation in this regard. 5. Community or society The National and the local community can be considered as an important ground for delivering information regarding curriculum development. The products i.e. the educated or trained persons of a particular course are absorbed in the local community hence this

95%**MATCHING BLOCK 274/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

can be another important source of information for curriculum evaluation. The

curriculum should take into consideration the requirements of a local committee to make it relevant and need-based. The concept of community is dynamic so revision should be based

48%**MATCHING BLOCK 276/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

on the needs and requirements of the community. This will help the curriculum to serve the community better and produce better balanced, socialized and responsible citizens. 6.

Stagnation status and dropouts The

100%**MATCHING BLOCK 275/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

students who have dropped out of a particular course can be

considered as a valuable source of information for curriculum evaluation. Data collected from these students can throw light on those

100%**MATCHING BLOCK 277/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

curricular factors that might have been responsible for their withdrawal from the course.

If necessary a diagnostic test can be administered on these dropouts to get

85%**MATCHING BLOCK 278/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

valuable information regarding the misconceptions generated by the present curriculum. This can help in

providing feedback that may help in improving the curriculum. Even some form of remedial curriculum can be designed from these feedbacks collected from dropout children. 7. Employees and entrepreneurs Employers' opinion can be considered as a very important source of curriculum evaluation, as they have to absorb the products or outputs of the educational system. They can

84%**MATCHING BLOCK 279/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

reflect the strengths and weaknesses of the curriculum. Persons who are self employed

and working

63%**MATCHING BLOCK 280/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

in unorganised service sector can provide valuable information regarding advantages and limitations of a particular curriculum. This information can help the curriculum

framers to develop the curriculum in a socially relevant and useful manner. All these sources have got important implication in curriculum evaluation. Therefore for developing a comprehensive and effective curriculum, information should be gathered from each of these sources in order to improve the quality of the programme under consideration. NSOU ? CC-ED-07 ? 162 5.5 Methods of curriculum evaluation Curriculum is all of the planned experiences provided by the school to assist pupils in attaining the designated learning outcomes to the best of their abilities. curriculum is defined as all the planned learning opportunities offered to learners by the educational institution and the experiences learners encounter when the curriculum is implemented. This includes those activities that educators have devised for learners which are represented in the form of a written document. These activities need to be assessed through the process

93%**MATCHING BLOCK 281/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

of evaluation. The term 'evaluation' generally applies to the process of making a value judgment. In education, the term 'evaluation' is used in reference to operations associated with curricula, programmes, interventions, methods of teaching and organizational factors. Evaluation

is the process of collecting data on a programme to determine its value or worth with the aim of deciding whether to adopt, reject, or revise the programme.

100%**MATCHING BLOCK 283/392****SA**Sambalpur-MA-Education-SEM-II-Curriculum Devel ...
(D156211172)

Curriculum evaluation aims to examine the impact of implemented curriculum on student (learning) achievement so that the official curriculum can be revised if necessary and to review teaching and learning processes in the classroom.

Definition given by Worthen and Sanders (1987) can be mentioned here, they stated that

89%**MATCHING BLOCK 282/392****W**

curriculum evaluation means "the formal determination of the quality, effectiveness, or value of a programme, product, project, process, objective, or curriculum." Curriculum evaluation

82%**MATCHING BLOCK 285/392****W**

Programmes are evaluated to answer questions and concerns of various stakeholders or parties. General people want to know whether the curriculum implemented has achieved its aims and objectives; teachers want to know whether what they are doing in the classroom is effective; and the developer or planner wants to know how to improve the curriculum product. The scope of curriculum evaluation

includes curriculum design, learning environment, instruction process, resources and materials; used in the process

of imparting education. To find out about the adequacy along with the facility of

NSOU ? CC-ED-07 ? 163 2nd Proof • Classic Print & Procces (09-02-2022) resources required for teaching such as teaching aids, laboratories, library books and instruments can be essentially done by the process of curriculum evaluation. Curriculum evaluation process helps identify procedures for using assessment information to determine long-range and annual improvement goals. This is a method for determining the worth and effectiveness of any newly implemented curriculum or improving the existing one. Parents, teachers, the community and administrators are the several stakeholders who are interested in the results

100%**MATCHING BLOCK 287/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

of curriculum evaluation. Curriculum evaluation can be done by an external agency

as well as

95%**MATCHING BLOCK 288/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

by insiders, those who are involved in the planning and development of the curriculum. A combination of both the groups

may also work for curriculum evaluation. Objective and comprehensive evaluation can be ensured if it is done by a combined group of outsiders and insiders. Teachers, learners and curriculum framers are considered as insiders. While outsiders or External evaluators are usually brought in from outside the situation in which the curriculum is being developed. The methods of Curriculum evaluation may follow strict rules or be flexible depending on the pre-specified objectives. It may vary from a highly structured questionnaire based evaluation to a supple evaluation method based on unstructured interview. The method of collecting information can be either direct or indirect depending on the objectives of evaluation. Curriculum evaluation is based on information and data gathered from a comprehensive assessment system that is designed for accountability and committed to that all learners will achieve high grades leading to significant and sustainable improvements in teaching and student learning.

MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

the support of formative evaluation. These exercises are usually not practiced in schools

as a result the curriculum suffers from several drawbacks. Pilot testing should be an essential step in curriculum evaluation. Defining data reporting procedures and verifying assessment tools as fair for all students and are consistent steps of Curriculum evaluation processes. Identification of NSOU ? CC-ED-07 ? 164 procedures for multiple assessment measures are necessary for making good decisions and drawing appropriate conclusions about student learning. Therefore curriculum evaluation also define procedures for regular and clear communication about assessment results to the various internal and external publics. A well prepared curriculum should be able to accommodate an evaluation cycle even at the planning stage. In other words every phase of curriculum development should have inbuilt evaluation cycle which will strengthen the process to move further and provide necessary support to the stake holders in using data to make instructional decisions. In the next section let us discuss how evaluation of curriculum is done at different stages of curriculum development. 5.5.1 Evaluation and at the time of curriculum development Curriculum evaluation is a fundamental phase of curriculum development. The process is conducted by the evaluation team within the framework of the model. Through evaluation it is discovered whether a curriculum is fulfilling its purpose and whether students are actually learning.

73%

MATCHING BLOCK 293/392

SA

MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

One of the major tasks of curriculum development is to prepare an exhaustive list of specific objectives to be achieved through curriculum. Once the list is prepared it has to undergo evaluation cycle. The list of objectives may be referred to a group of practicing teachers for their specific comments,

they may add or delete objectives if define necessary. Along with the serving teachers the list of objectives can also be sent to prospective employers, a group of prospective students, planners and administrators for their opinion. List of objectives can further be modified based on the feedback given. One important fundamental concern of curriculum evaluation is relating the

82%**MATCHING BLOCK 292/392****W**

status of curriculum contents and practices in the contexts of global, national and local demands. The achievement of the goals and aims of educational programmes is another important concern of curriculum

development process. Another major task

83%**MATCHING BLOCK 294/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

of evaluation exercise required during the development of a curriculum is the

selection of

75%**MATCHING BLOCK 296/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

instructional materials that have been prepared to achieve the objectives. These materials have to be tried out on a sample of students for their feedback on learning routes and difficulties. A field try out with a small sample is ideal in getting adequate evaluation information from a sample. This can be used for further improvement of the course materials. Data collected from the inbuilt evaluation exercises of learning material can also be used in modifying the learning material. Here curriculum material refers to all learning materials that include textbooks, self-learning text, audio and video programmes, teacher's manual, assignment questions, project work etc. Similarly the evaluation procedures can be adopted during curriculum development

for the modification based on data collected through the try-out phase.

provides the basis for curriculum policy decisions, for feedback on continuous curriculum adjustments and processes of curriculum implementation

therefore it

100%**MATCHING BLOCK 297/392****W**

is a necessary and important aspect of any national education system.

Curriculum evaluation is very significant for translating government education policy into educational practice. 5.5.2 Evaluation and at the time of

97%**MATCHING BLOCK 298/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

curriculum implementation After the curriculum has been tested and the materials are duly modified it is important that the teachers and administrators are oriented and trained for proper implementation of curriculum. To implement curriculum without introductory or supporting courses would be quite a severe risk, it may lead to the use of new materials in unsatisfactory ways. Training of the personnel involved and provisions of all necessary facilities and resources are essential for successful implementation of any curriculum. Evaluation is necessary at the time when curriculum is implemented as well as each of the

stages of the course development.

77%**MATCHING BLOCK 299/392****SA**MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

The purpose of evaluation at this stage is two fold a) To find out the areas of support needed for effective implementation of the curriculum in schools. b) To control the quality of the product i.e. the educated person at the end of the course. Important information to be collected at this stage includes All aspects of curriculum according to the curriculum planning need to be studies in order to identify the missing features of the curriculum being implemented in the schools. A Checklist which gives all the features of the objectives and content of the curriculum, students entry behaviour or the characteristics necessary to begin the teaching learning process, teachers characteristics necessary for implementing the curriculum,

(D154644155)

materials required to implement the curriculum, organisation of the curriculum with respect to time requirements and the order in which the activities and materials are to be processed, methods of implementation of curriculum and evaluation of students performance can be used to assess the discrepancies or gaps in the implementation of different aspects of curriculum. i) Effectiveness of the curriculum :

The crucial question in determining the effectiveness of curriculum is to determine the extent to which the students attain the standards or achieve the objectives as decided already in the phase of curriculum NSOU ? CC-ED-07 ? 166 planning. Thus the effectiveness of curriculum reveals whether curriculum is able to achieve the preset objectives as determined by the social system. But practically speaking all students cannot achieve all the objectives of the content of subject matter. Therefore it is important to find out whether the minimum expected number of students achieves the minimum specified number of objectives according to the criteria. The criteria of judging the effectiveness of a programme should provide feedback from the employers and also the students who have passed through the same curriculum. Another thing that needs to be mentioned here is that effectiveness offer programme may also be relative i.e. whether the new curriculum is more effective than the previous one can be most appropriately determined only by a series study. ii) Acceptability of the programme : In addition to assessing the effectiveness of the curriculum it is important to assess its acceptability. Acceptability here means whether the people involved in implementing the curriculum for example teachers, administrators etc. like the programme or not. The perceptions of students, teachers, supervisors, administrators of the school and other educational institutions should be referred to get an insight into the acceptability of the programme. iii) Efficiency of the programme : Efficiency of curriculum implies whether the curriculum is able to achieve the pre-specified objectives used in the most economic way in terms of cost, time, labour or energy. An effective curriculum ensures that the predetermined objectives are achieved irrespective of the amount of time for money spent. Effective and efficient curriculum will ensure that objectives are achieved with minimum resources efforts and finance. Efficiency indicates the ratio between output and the input of energy and resources. It is very easy to calculate efficiency of any machine as it gives result in absolute quantities. But determining programme efficiency is not that easy in case of any social system like education. Valid assessment of an educational programme is indeed extremely difficult. Controlled experiments can be of great help here but again it is not easy to control the significant variables. Nevertheless, it is important to assess the programme efficiency by comparing to other programmes in the light of achieved results or effects. Whether a programme is efficient enough can be judged by finding out if the outcome of the programme is justified to the expenditure incurred for all the total resources. Again the programme should be more efficient than the previous existing programme without any wastage of student time, teacher time or material resource. No equipment or personnel should remain under-utilized and there should be adequate scope for a programme to improve by enhancing its efficiency.

NSOU ? CC-ED-07 ? 167 2nd Proof • Classic Print & Procces (09-02-2022) 5.5.3 Tools for effective Curriculum Evaluation The instruments commonly used in curriculum evaluation are Questionnaires and Checklists, interviews, observations, tests, survey and online feedback. Questionnaires and Checklists Questionnaire and checklist are useful data collection tools. Questionnaires and checklists can collect data anonymously so lots of information from people can be collected in a non-threatening way. These tools

88%**MATCHING BLOCK 301/392****W**

are relatively inexpensive to administer. Since data collected is quantitative, it is easy to compare and analyse and can be administered to many people. It is also easy to design as there are many sample questionnaires already in existence.

Massive amount of data can be obtained; however, the information obtained may be to some extent non-accurate as it depends on truthfulness of subjects who respond to the questions. Interviews

88%**MATCHING BLOCK 302/392****W**

The person asking the questions is called the interviewer while the person giving answers to the questions is called the interviewee. Interviews are used when one wants to understand someone's

individual opinion and

100%**MATCHING BLOCK 303/392****W**

experiences, or learn more about their answers to questionnaires. There are two general types of interviews depending on the extent to which the responses required are unstructured or structured. In an unstructured interview, the interviewer does not follow a rigid script and there is a great deal of flexibility in the responses.

96%**MATCHING BLOCK 304/392****W**

The advantage of the unstructured interview is that it allows the evaluator to gather a variety of information, especially in relation to the interviewee's knowledge, beliefs or feelings toward a particular situation. In a structured interview, the questions asked usually require very specific responses.

100%**MATCHING BLOCK 305/392****W**

Evaluators should ensure that each question is relevant for its intended purpose. In the end, the data must be translated into a form that can be analysed and this has to be done carefully to preserve accuracy and to maintain the sense of the data. The advantage of interviews is that it can get a full range and depth of information;

however, interview can take much time, can be hard to analyze and compare, can be costly and interviewer can bias client's responses. Observations Observation may act as an important technique

100%**MATCHING BLOCK 306/392****W**

to gather accurate information about how a programme actually operates.

Observation may be participant or non- participant. So information may be collected from groups who are direct beneficiaries of the curriculum and also those who are formulating the programme for implementation.

NSOU ? CC-ED-07 ? 168 Survey For conducting curriculum evaluation effectively through survey, Questionnaires and Checklists can be used carefully to review the proposed or ongoing curriculum programme in order to determine whether the stated learning objectives adequately prepare students with the knowledge and skill required to be successful in the programme field. Online feedback and other Documents Nowadays online feedback has become very important source for collecting feedback of curriculum from different stakeholders. Feedback forms should be judiciously prepared and mailed. One may collect huge information regarding the curriculum programme within a very short time. Again when we want review and feedback of how a programme operates without interrupting the programme; we can review the memos, minutes, etc to get comprehensive information about the implementation of the programme. The assessment and feedback thus provided is important for the programme approval process conducted by the Department. Any recommendations for change should be made before final approval is granted. Traditionally, the state governments also follow the NCF in revising their respective school curriculum through the participation of the State Councils of Educational Research and Training (SCERT), which draw up the State Curriculum Frameworks (SCF). Significantly, the NEP also states that elements such as knowledge from ancient India “will be incorporated in an accurate and scientific manner throughout the school curriculum wherever relevant” and that “Indian Knowledge Systems, including tribal knowledge and indigenous and traditional ways of learning, will be covered and included in mathematics, astronomy, philosophy, yoga, architecture, medicine, agriculture, engineering, linguistics, literature, sports, games, as well as in governance, polity, conservation”. The 12-member National Steering Committee will be headed by former ISRO chief K Kasturirangan, who also headed the drafting committee of the National Education Policy (NEP) 2020. The document, known as the National Curriculum Framework (NCF), was last prepared in 2005 under the UPA government, and before that, it was revised in 1975, 1988 and 2000. This committee is set for drafting the broad guidelines for making revisions in the curriculum. (The Indian Express, New Delhi, September 22, 2021) 5.6 Summary In this unit we have discussed various definitions of curriculum evaluation as well as important areas that comes under this process. Identification of important sources for curriculum evaluation, different objectives of curriculum evaluation the steps of conducting

NSOU ? CC-ED-07 ? 169 2nd Proof • Classic Print & Procces (09-02-2022) curriculum evaluation, numerous challenges faced in the process of curriculum evaluation and discuss in detail in this unit. Role of students’ subject experts and teachers in curriculum evaluation has been discussed here. Curriculum evaluation is conducted both at the micro and macro level. This section takes into consideration both the levels of curriculum evaluation with diagrammatic representation of the processes. The process of curriculum evaluation with special focus on each and every stage is elaborated here. Curriculum evaluation required various types of tools this section has also describe in detail the different tools used in the process. 5.7 Self-Assessment Questions 1. Define curriculum evaluation. 2. Identify important areas for curriculum evaluation. 3. Identify important sources of curriculum evaluation. 4. Outline the challenges faced in different levels of curriculum evaluation 5. Mention the objectives of curriculum evaluation 6. Mention the Tools of curriculum evaluation 7. Describe briefly the steps in conducting a curriculum evaluation 8. Justify the significance of curriculum evaluation at micro & macro level 9. Discuss the significance of curriculum evaluation. 10. Outline the role of students as an important source of curriculum evaluation. 11. Describe the role of subject experts and teachers as an important source of curriculum evaluation. 12. How do employees and entrepreneurs serve as important source of curriculum evaluation? 13. Describe the process curriculum evaluation 14. Outline the process of Evaluation during curriculum implementation 15. Describe the process of Evaluation during curriculum implementation. 16. Describe briefly the Tools for effective Curriculum Evaluation. 17. Describe the process of online feedback. 18. Write short notes on questionnaire as a tool for effective Curriculum Evaluation.

Summary 6.7 Self-Assessment Questions 6.8 References 6.1 Objectives After going through the sub units the students will be able to: ? Explain the different approaches of curriculum development; ? Explain the background for National Curriculum Frameworks in India; ? Understand the aims and objectives of National Curriculum Framework 2000; ? Describe the major contents of the National Curriculum Framework 2005; ? Evaluate the recommendations of National Curriculum Framework 2005; ? Explain the rationale of CBCS; ? Mention the Characteristics of Choice Based Credit System; ? Describe the Methods of examination and assessment in CBCS; ? Describe the Methods of computation of SGPA and CGPA; ? Justify the significance of Role of teachers in CBCS;
 NSOU ? CC-ED-07 ? 172 6.2 Introduction In the previous units we have discussed meaning, nature and scope of curriculum. Determinants and factors influencing curriculum has also been discussed. the relevance and significance of curricular and co-curricular activities have been elaborated. In the second unit we have already discussed the bases of curriculum namely philosophical sociological and psychological. major approaches to curriculum subject centred, broad fields approach and humanistic approach have been introduced and explained. the process of curriculum development has also been highlighted. Curriculum transaction and curriculum evaluation, as a continuous process has been considered in the third unit. basic considerations in curriculum planning and stages for planning of curriculum development (system approach in curriculum development) is also explained. The Dimensions of curriculum have been discussed in the fourth unit, components and sources of curriculum design along with the theories of curriculum development is discussed here. In the fifth unit we discussed concept and objectives of curriculum evaluation. This unit also take into consideration the sources and methods of curriculum evaluation at both marco and micro level. In this unit, we will discuss different approaches of curriculum development, describe the grassroot approach and administrative approach of curriculum development. The background for National Curriculum Frameworks in India will be discussed elaboratively. The basic guidelines, aims and objectives and the major contents of the National Curriculum Framework 2000 will be described in this section. the recommendations of National Curriculum Framework 2005 along with the major challenges of implementation of National Curriculum Framework 2005 will be discussed here. The last topic of this unit is choice based credit system. Meaning of the term CBCS, objectives, rationale, process of evaluation under CBCS etc. are discussed in this subunit. This unit establishes the fact that curriculum development is an ongoing process and revision takes place in a regular fashion. The pace of change is varying from ancient to modernity because of the technological innovation, social innovation and cultural diffusion. Explosion of knowledge, aspiration and social needs and demands always works as the factors of change for curriculum development. 6.3 Curriculum Development Approaches/ Approaches to Curriculum Education is not just teaching the prescribed content or syllabus but opening the mind of the learner to multiple possibilities, learning life skills and preparation

NSOU ? CC-ED-07 ? 173 2nd Proof • Classic Print & Procces (09-02-2022) for being entrepreneurial, in every walk of life is the need of the hour. The future is individual learning and customized consumption which require a dynamic change in teacher-student relationship. Textbooks and all teaching learning materials should be more aligned to the application of knowledge rather than assessment of retention. Flexible learning methods with focus on imparting life skills, student centric learning methods and use of technology are the new considerations of modern education. Curriculum across the world should undergo time to time revisions to cope with the newly emerged socio-economic demand of any country. 21st century curriculum is about giving the learners the skills they need to succeed in this new emerging world, and helping them grow the confidence to practice those skills. With so much readily available information, 21st century education need to focus more on sharing and using information in smart ways. The Process of Curriculum Development in general could mean the preparation of an entirely new curriculum or curriculum construction, can also revise or upgrade the existing curriculum i.e. curriculum improvement. Curriculum development has been holding a key position in education because it relates to determining the direction, content, and educational processes that ultimately determine the quality of an educational institution. That's why efficiency, position, role and purpose of every institution of education, both formal and non formal education depends on the process of curriculum development. In this section different approach to curriculum development has been discussed.

90%

MATCHING BLOCK 311/392

SA

MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

The traditional approaches to curriculum change may be classified under three specific categories: 1. The Administrative approach 2. The

Grassroots approach 3. he Deductive approach of Curriculum 6.3.1 The Administrative approach: This is the oldest and most widely used approach of curriculum development. Curriculum development ideas come from the administrators of education who uses and determines

83%

MATCHING BLOCK 312/392

SA

Sambalpur-MA-Education-SEM-II-Curriculum Devel ...
(D156211172)

administrative procedures. Furthermore, administrators formed Task Team consisting of education experts, curriculum experts, discipline experts

from universities, and senior teachers, which is held responsible for formulating the actual curriculum. The operational concepts are outlined and the basic policies are established by the steering team; such as formulating goals for operations, selecting the sequence of materials, selecting and evaluating learning strategies, and formulate guidelines for the implementation of curriculum for teachers. In doing so, the required monitoring, supervision and guidance is conducted by the administrators.

NSOU ? CC-ED-07 ? 174 In this approach the head of the institution or superintendent of schools or any other school administrator

90%

MATCHING BLOCK 315/392

SA

MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

makes the first move when he realises the need for curriculum development and sets up

the machinery to make the required revisions. The head of the institution arranges for faculty meetings in which the need for curriculum revision and improvement is presented. After this a steering committee is appointed consisting of administrative officers and teachers. Now this committee is responsible for formulating general plans, developing guiding principles and preparing assessment of general objectives. These objectives should cover the entire School system and formulations become the curriculum development manual. In addition to this, steering committee works out different plans and programs for training of teachers in the revised curriculum. It also determines the number and kind of consultants to be required and the types of activities to be used to familiarise the pictures with the theory and practice of Curriculum building to provide a proper setup regarding forming committee for production. This committee will consist of teachers who will prepare a new course of study following objectives and guiding principles already laid down by the steering committee. When the courses of study are completed, the courses are reviewed either by the steering committee or any special committee created specifically to serve this purpose. Following this the courses of study are finally tried out and implemented. Taba

76%**MATCHING BLOCK 313/392****W**

was of the opinion that the Tyler model was based on an administrative

approach of Curriculum development. Tyler, Saylor, Alexander, and Lewis are the main proponents of this approach to Curriculum, who plan to

100%**MATCHING BLOCK 314/392****W**

begin by specifying the major educational goals and specific objectives they wish to

be accomplished. Galen Saylor and his associates (1981) adopt an administrative approach to curriculum development. They describe and analyze curriculum plans in terms of the relations of ends and means, the

81%**MATCHING BLOCK 318/392****SA**

by curriculum planners about a curriculum, its content organisation and appropriate learning experienecs Curriculum implementation - Decisions regarding instruction by teachers. Various

experiences

100%**MATCHING BLOCK 317/392****W**

are included in the curriculum plan so that teachers have options Curriculum Evaluation - Decisions assessing the effectiveness of the curriculum and the teachers Feedback and

adjustments Goals, objectives and domains - Each major goal depicts a curriculum domain External Forces : These are the guidelines given by the state, legal demands, data based on research findings, guidelines formulated by professional associations etc. These sources are considered as the external variables and act as most important sources for specifying the Goals, objectives and Domains of Curriculum development. Another important source for determining the goals and objectives are the bases of curriculum development, these are society, learners and knowledge. Goals & Objectives : These are statements that specifically mention the purpose of the curriculum development process in terms of the terminal behaviour of the target group or the students. The two important determiners of goals and objectives are the external forces and the bases of curriculum. Curriculum Designing : Decisions regarding the curriculum design are made by the responsible curriculum planning groups for a particular educational centre. Various prior decisions by political and social agencies may limit the final designs.

NSOU ? CC-ED-07 ? 176 Curriculum Implementation : Decisions as to instructional modes made by responsible teachers which is a significant part of curriculum implementation. The curriculum plan includes alternative modes with suggestions as to resources, media, and organization, thus encouraging flexibility and more freedom for the teachers and students. Curriculum Evaluation : Decisions as to evaluative procedures for determining learner progress made by the responsible teachers helps in decision making for evaluating the curriculum. Plans are made by the responsible planning group. Evaluative data become bases for decision making in further planning. Feedback : After evaluation of the curriculum, feedback becomes necessary to do the required adjustments in the curriculum. 6.3.2 The Grassroots Approach The proponents of this approach claim that the seed for development emerges from the actual site of action, the classroom. The pressure or demand comes from the teachers and the learners who have immediate experience and access to the day- to-day factors influencing the effectiveness of the existing curriculum. In this case, the curriculum can be seen as the consequence of a deliberate collaborative enterprise involving the teachers, the learners, the subject matter, and the situational context or environment. Here, the teachers and learners are recognised as the actual creators of the curriculum and the system of education can be viewed as a democratic set-up. This is a comprehensive and community-wide approach.

85%**MATCHING BLOCK 327/392****SA**

2019, CFP3749, 1.pdf (D54921545)

approach to curriculum development. She believed that the curriculum should be designed by the teachers rather than handed down by

NSOU ? CC-ED-07 ? 177 2nd Proof • Classic Print & Procces (09-02-2022)

97%**MATCHING BLOCK 325/392****W**

higher authority. Further, she felt that teachers should begin the process by creating teaching-learning units for their students in their schools

rather initially in creating a general

curriculum design. She also believed that teachers who teach the curriculum should actively participate in the process of development. She mentioned seven major steps in her model based on Grass root approach

66%**MATCHING BLOCK 326/392****W**

in which teachers would have major input. 1. Diagnosis of need : The teacher is considered as the curriculum designer.

Her task starts with identification of

67%**MATCHING BLOCK 329/392****SA**

Pdf.pdf (D78069646)

the needs of the learners for whom the curriculum is planned. One significant function of the teacher

is to develop the ability of critical thinking among the students. 2. Formulation of objectives : At this stage the teacher has already identified the needs of the learners that need to be addressed. Therefore, teacher can list the specific objectives that need to be accomplished. 3. Selection of content : On the basis of pre-specified objectives the subject matter or content of the curriculum is chosen. There should be a match between the objectives and content as well as the validity and significance of the subject matter based on chosen needs is also to be determined. The relevance and significance of the content should also be justified. 4. Organisation of the content : Selection of the content based on pre- specified objectives is not enough therefore the teacher should also consider the maturity of the learners their academic achievement and interests. Based on these factors the teacher will organise the content in a specific sequence. 5. Selection of learning experiences : contents finally selected must be presented to the learners in such a way so that all the learners are engage with the content. The instructional methods that will ensure students participation and involvement with the content is selected by the teacher at this point. 6. Organisation of learning activities : The learning activities also need to be organised and sequenced in a specific order like the content. Most of the time

65%**MATCHING BLOCK 328/392****W**

sequence of the learning activities is determined by the content. So the teacher needs to relate the need of the particular students

to the content to be delivered. 7. Evaluation : At this stage curriculum planner should determine the extent of accomplishment of objectives. Suitable evaluation tools and techniques need to be designed to assess the terminal behaviour or learning outcomes of students. This curriculum Development approach is the opposite of the first model. Curriculum development initiatives and effort will start from the teachers or the

NSOU ? CC-ED-07 ? 178 school and not from any external authority. The first model of curriculum development emphasises the management systems used in education, so curriculum is centralized, while grass roots approach suggested a decentralized education system. Development or improvement can be related to a curriculum component, one or several fields of study or the entire field of study and all components of the curriculum. When conditions are allowed, in terms of the ability of teachers, facilities and materials costs, literature, grassroots approach to curriculum development seems to be better. This was based on the consideration that the teacher is the planner, executor, and also she is best to know the needs of her class, therefore she is the most competent person to implement the curriculum for the class. 6.3.3 The Deductive approach of

82%

MATCHING BLOCK 333/392

SA

Curriculum Planning and Development CFP3010 - ...
(D13185640)

Curriculum The Oliva Model is a deductive model that offers a faculty a process for the complete development of a curriculum. Oliva recognized the needs of students in particular communities are not always the same as the general needs of students throughout our society. In this approach a faculty can fashion a plan for the curriculum of an area and design ways in which it will be carried out through

the period of instruction. According to Oliva, a model curriculum should be simple, comprehensive and systematic. Following this approach, a faculty can focus on the curricular components to make decisions regarding the programme and also allow teachers to concentrate on the instructional components.

(D156211172)

In the early years of 20th century, the traditional concept of

education viewed curriculum in a narrow sense and described curriculum as a
NSOU ? CC-ED-07 ? 179 2nd Proof • Classic Print & Procces (09-02-2022)

100%

MATCHING BLOCK 334/392

W

body of subjects or subject matter prepared by the teachers for the students to learn. It was synonymous to the "course of study" and "syllabus"

100%**MATCHING BLOCK 335/392****W**

to be taught in school. In a broader sense, it refers to the total learning experiences of individuals not only in schools but in society as well.

So, modern

100%**MATCHING BLOCK 336/392****W**

curriculum is defined as the total learning experiences of the individual.

So

92%**MATCHING BLOCK 337/392****W**

listing of school subjects, syllabi, course of study, and list of courses or specific discipline definitely do not make a curriculum;

curriculum is something more than this, having some added value. During the ancient times, people taught their children how to catch fish or hunt animals for food in order to develop knowledge and skills necessary to survive. At that time there was no formal education but they already had a curriculum which other educators call as, 'the saber-tooth curriculum'. This type of curriculum refers to a kind of curriculum that existed during the ancient times in which the purpose of teaching was to prepare for survival. However, gradually with discoveries and inventions, ancient people's way of life changed for the better. Consequently education became formal and the process of curriculum development evolved as systematic, planned, purposeful and progressive venture. Curriculum development cannot be complete unless the curriculum is implemented and put into action. Careful attention must be paid to issues of implementation. The curriculum developer must ensure that sufficient resources, political and financial support, and administrative strategies have been developed to successfully implement the curriculum. It is the combined efforts of the learner, the teacher and other stakeholders in ensuring effective execution of the curriculum document. It has been often observed in many countries, that lofty policies are formulated and inadequately implemented, for a variety of reasons. Here comes the need of an appropriate Curriculum Framework. Pre-specifying learning objectives, determining

55%**MATCHING BLOCK 338/392****W**

the bases for the choice of objectives, comparing the learners' needs and interests with the needs of the society,

choice of methodology, organization of the content and formulating evaluation strategy; all these decisions are taken in the curriculum framework. NCERT developed NCF in 1975 following the recommendations of Education Policy on 1968. In 1976, the constitution was amended to include education in the concurrent list, and in 1986 India had a National Policy on Education (NPE-1986) which envisions National Curriculum Framework, for the first time as a means of modernising education. NPE-1986 emphasised a relevant, flexible and learner-centred curriculum as a means for developing

92%**MATCHING BLOCK 339/392****W**

a national system of education capable of responding to India's geographical and cultural

diversity. In 1988, NCERT prepared the National Curriculum Framework for school education based on the recommendations of Educational Policy of 1986. Later, it was felt that curriculum needs to be flexible and relevant to meet the needs of

NSOU ? CC-ED-07 ? 180 diverse learners and issues of curriculum load and examinations stress needed attention. Consequently, National Curriculum Framework was reviewed in the year 2000 and then it was revised in 2005, which is known as the National Curriculum Framework 2005. CONCEPT AND MEANING OF CURRICULUM FRAMEWORK A curriculum framework

95%**MATCHING BLOCK 340/392****W**

is 'a document' or set of documents that sets standards for curriculum and provides the context i.e. available resources, capabilities of teachers and system support; in which subject specialists develop

syllabus. It

is usually a single document which is supplemented by other materials to guide the implementation of specific parts of the

86%**MATCHING BLOCK 341/392****W**

framework. Curriculum framework is a proposal that interprets educational aims, considering both individual and society, to arrive at an understanding of the kinds of learning experiences schools must provide to

students so that individual development of the child will lead to social development. Selection of content and learning experience for the curriculum frame work may

depend on the nature of knowledge, the learners' characteristics as well as the learning process. A curriculum framework should also take into consideration whether the choice of methodology is in accordance with accepted teaching-

75%**MATCHING BLOCK 349/392****SA**

MEDHC 2.1 Curriculum- Principles and Planning ... (D154644155)

learning principles. Curriculum Framework is one of the most important instruments in ensuring consistency, effectiveness and quality in

an educational system; hence it should include the fundamental assumptions and basis of choice for experiences. Ideally curriculum framework should give detailed specification or guidance by providing year-wise breakup of

100%**MATCHING BLOCK 343/392****W**

subject or learning area, addressing the requirements of the school system,

along with need of individual schools and the classroom as per geographical location. These frameworks may be developed by the central government, state government and rarely by local authorities; but coordination between different levels is always desired. In any country the focus of curriculum remains with the school but it goes without saying that the other levels of education are also covered in this framework. Depending on the area of coverage curriculum frameworks may be international, national and state level. 6.4.2 Fundamental Elements of Curriculum Framework 1. Constitutional provisions regarding education It is based on the constitutional provisions of the nation if it is a national curriculum framework.

100%**MATCHING BLOCK 344/392****W**

Educational Policy Statements describes the Government's goals for education, such as universal literacy and numeracy, the development of skills needed for economic prosperity and the creation of a stable and tolerant society;

these goals are expected to be achieved through curriculum framework.

NSOU ? CC-ED-07 ? 181 2nd Proof • Classic Print & Procces (09-02-2022) 2. Statement of broad learning objectives and outcomes This is a document that states the

68%**MATCHING BLOCK 345/392****W**

broad Learning Objectives and Outcomes to be achieved at each level. It describes what students should know and be able to do when they complete their school education. Outcomes are mentioned in a range of domains, including knowledge, understanding, skills and competencies, values and attitudes. 3.

Present

100%**MATCHING BLOCK 346/392****W**

context It describes the social and economic environment in which educational policy is

formulated. This document also describes the environment or the contextual background where teaching-learning will take place. The

62%**MATCHING BLOCK 347/392****W**

Structure of the Education System, more specifically the school system is described where the curriculum framework is to be applied. 4.

Structure of educational system A complete structure is specified mentioning the number of years of schooling, number of weeks available per year, hours or

94%**MATCHING BLOCK 348/392****W**

teaching periods in the school week, structure of curriculum content, learning areas and subjects. It also describes the organization of content within the framework and the extent to which schools and students can make choices. 5.

Resources required for implementation The desired standards to be achieved and resources required are also mentioned in curriculum framework. Resources include Teachers (qualifications, teaching load), Students, Teaching-learning materials (textbooks, computers, other equipments), facilities (classrooms, library, laboratory, furniture, fittings). 6.

84%**MATCHING BLOCK 350/392****W**

Structure of curriculum content, learning areas and subjects It describes the organisation of

subjects within the framework and it also offers the options for choice of learning areas, so that the students get some flexibility in choice of subject content. 7. Teaching techniques and strategies

84%**MATCHING BLOCK 351/392****W**

Teaching methodology describes various teaching approaches that might be employed in the implementation of the framework.

Flexibility due to individual difference of students is allowed.

NSOU ? CC-ED-07 ? 182 8. Assessment strategies undertaken

87%**MATCHING BLOCK 352/392****W**

Assessing the extent to which students achieve the outcomes in each subject.

Curriculum framework prescribes types of assessment strategies - such as written or oral performance and practical skills demonstration. Evaluation is done on the basis of pre-specified objectives and students' achievement is duly assessed and reported. 6.4.3 Key Principles of the Curriculum Framework The Curriculum framework works on the basis of some vital principles. These principles guide schools and other educational institutions in planning and running the whole educational programme. The principles are as follows - a) Principle of comprehensiveness Curriculum

87%**MATCHING BLOCK 353/392****W**

encompasses the learning environment, teaching methods, the resources provided for learning, the systems of assessment, the school methods and the ways in which students and staffs behave towards one another. All of these provide experiences from which student learn meaningfully, purposefully and joyfully. Particular attention is required to ensure that there is congruence between the various dimensions of curriculum.

b) Principle of balance and integration There should be a proper balance between segments of the curriculum and the whole curriculum. Students need experience to build patterns of interconnectedness, that will help them realise the value of own lives in the greater society. Education to become effective should enable

100%**MATCHING BLOCK 354/392****W**

students to make connections between ideas, people and things, and to relate local, national and global events and phenomena. It encourages students to see various forms of knowledge as related and forming part of a larger whole.

Hence there should be balance and integration within the curriculum. c) Principle of sharing

79%**MATCHING BLOCK 355/392****W**

and collaboration Education is the shared responsibility of students, teachers, parents and the community. Successful implementation of the framework requires a collaborative approach to planning by all concerned stakeholders. Then only students' achievement of the intended outcomes

will be possible. d) Principle of inclusivity Curriculum framework is intended to include all students in Indian schools. Inclusivity means providing opportunities to all groups of students, irrespective of NSOU ? CC-ED-07 ? 183 2nd Proof • Classic Print & Procces (09-02-2022)

100%**MATCHING BLOCK 356/392****W**

educational setting, with access to a wide and empowering range of knowledge, skills and values.

Keeping in mind the geographical and social diversity the curriculum framework should attempt to bring all students of the nation together under one umbrella. e) Principle of flexibility The curriculum must be flexible and

92%**MATCHING BLOCK 357/392****W**

adaptable to the particular needs of different schools and communities. It must also be responsive to social and technological change and meet student's needs arising from that change. Effective use of new technologies as tools for learning

process should be encouraged. This kind of flexibility and openness is utmost required for education in the twenty first century. f) Principle of joyful learning Curriculum framework in any country should develop each learner's unique potential, which includes child's

93%**MATCHING BLOCK 358/392****W**

physical, emotional, aesthetic, spiritual, intellectual, moral and social aspects. Respect and concern for others and their rights, resulting in sensitivity and concern for the well-being of others, respect for others

should also be emphasises. With this the focus in any frame work is promotion of students' enjoyment of learning and achieving excellence in learning. g) Holistic principle Curriculum should have a holistic outlook. Special attention is paid for development of

93%**MATCHING BLOCK 359/392****W**

vital skills as literacy, numeracy and social cooperation, and the need to integrate knowledge, skills and values across all learning areas. Therefore, the

framework should provide a complete coverage of

100%**MATCHING BLOCK 360/392****W**

knowledge, skills and values, essential for the education of students.

h) Dynamic principle

95%**MATCHING BLOCK 361/392****W**

As the society and the social needs change from time to time there is need for revision of curriculum. No single curriculum is suitable for all the time. The curriculum has to change in accordance with the change in individual growth, scientific process, technological innovation and social advancement.

i) Principle of assessment and evaluation Traditional examination or measurement of students' performance is replaced by evaluation. The old system was concerned with the results only, presently evaluation is also concerned with the results but with reference to pre-specified aims and objectives. Curriculum framework should balance between the goals and aims and evaluation strategies.

NSOU ? CC-ED-07 ? 184 6.4.4 Importance of Curriculum Framework Curriculum framework defines the learning content clearly. It helps to understand what the student should know and be able to do. Thus is a very significant mechanism to achieve the desired goals of education.

82%**MATCHING BLOCK 363/392****SA**

MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

Curriculum development has a broad scope because it is not only about the school, the learners and the teachers. It is also about the development of a society in general. In this age of knowledge explosion, curriculum development plays a vital role in development of a country. Curriculum

framework provides answers or solutions to the world's pressing conditions and problems, such as environment, politics, socio- economics, and other issues on poverty and sustainable development.

A country's economy can improve the people's way of life. Curriculum is the most effective tool for this. In order to fulfil this, curriculum experts or specialists should work hand in hand with the lawmakers, the local government officials, such as governors, mayors, and others; the business communities; and all stakeholders to set the rules and policies for educational reforms in the most desirable manner. 6.4.5 National Curriculum Framework 2000 In 1986 for the first time India had a National Policy on Education, which visualised National Curriculum Framework as a means of modernising education. The Policy proposed a national framework of curriculum as a means of evolving a national system of education. A relevant, flexible and learner-centred curriculum was recommended in this national policy and the NCERT (National Council for Education Research and Training) was entrusted with the responsibility of developing the National Curriculum Framework and reviewing the framework at regular intervals. NCERT in continuation of its curriculum-related work carried out studies and consultations and had drafted a curriculum framework as a part of its activity. This exercise aimed at making school education comparable and uniform across the country in qualitative terms and also at making it a means of ensuring national integration without compromising on the country's pluralistic character. Based on such experience, the council's work culminated in the 'National Curriculum Framework for School Education, 1988'. However, after the implementation of NCF, courses of studies and text books changed rapidly which resulted in an increase in 'curricular load' and made learning at school a source of stress for young minds and bodies during their formative years of childhood and adolescence. This issue was addressed in 'Learning Without Burden, 1993', the report of the committee under the

NSOU ? CC-ED-07 ? 185 2nd Proof • Classic Print & Procces (09-02-2022) chairmanship of Professor Yash Pal.

84%**MATCHING BLOCK 362/392****W**

In spite of the recommendations of the NPE, 1986 to identify competencies and values to be nurtured at different stages, school education came up be more and more examination oriented based on information- loaded

teaching-learning materials. In 1988 NCERT prepared the National Curriculum Framework for school education based on the recommendations of NPE 1986. At this time it was felt that curriculum needs to be flexible and relevant to meet the needs of diverse learners and at the same time, issues of curriculum load and examinations stress needed urgent attention. Despite the mandate of the policy, NCF1988 could not be reviewed for twelve long years. It was revised in 2000 and 'National Curriculum Framework for School Education 2000' was formulated. Major Concerns of NCF 2000 ? To enrich the curriculum so that it goes beyond textbooks. ?

To develop a sense of self-reliance and dignity of the individual as the basis of social relationship and would develop a sense of nonviolence and oneness across the society. ? To develop a child centred approach and to promote universal enrolment and retention up to the age of 14. ?

To inculcate the feeling of oneness, democracy and unity in the students the curriculum is enabled to strengthen our national identity of the country. Curricular concerns Building cohesion by reinforcing distinctions is one of the major curricular concerns. About 18 different concerns are listed and discussed elaborately. The first among these is termed 'Education for a cohesive society'. This is an important section as it outlines the perspectives for handling a variety of educational discriminations – gender, caste, physical, etc. Indian society is characterised by various kinds of biases and imbalances such as rural/urban, rich/poor, and differences on the basis of caste, religion, ideology, gender, etc. Education can play a very significant role in minimising and eliminating these differences by providing equality of access

NSOU ? CC-ED-07 ? 186 to quality education and opportunity (NCERT 2000). This equality is to be achieved in two ways, by ensuring that each person receives suitable education and through suitable methods. Secondly, by developing a curriculum that promotes the awareness of inherent equality of all. It proposed on the one hand to remove all gender discrimination and gender bias in school curriculum, textbooks and the process of transaction. It is stated with equal emphasis that 'it will be the most appropriate thing to recognise and nurture the best features of each gender in the best Indian tradition.' (NCERT 2000) In other words, what the so-called Indian tradition prescribes for women will be nurtured in them through an educational approach that suits most. The approach outlined for the education of other 'disadvantaged groups' (scheduled castes, scheduled tribes and other socially and economically disadvantaged groups) complements the approach on gender question. Condensed educational programmes are recommended for educating the migrant population. The section on vocational education is even more explicitly mentioned. NCF 2000 recommends 'vocational education for all': 'The vocational education programme designed to meet the varying needs of the socially disadvantaged groups, such as women, scheduled castes, scheduled tribes, and physically challenged persons, would help them acquire suitable productive skills. It will make their lives more meaningful as they will be economically independent and self-reliant.' (NCERT 2000) This document attempted to promote the idea of having multiple curricular strategies in tune with the requirements of the target groups. Reaching the still unreached will require designing and developing new modules and delivery systems that would suit the needs of specific groups. Strengthening the concept of national pride Strengthening national identity and unity is intimately associated with the study of the cultural heritage of India. Therefore, the school curriculum should emphasize the inclusion of specific contents to inculcate national identity, a profound sense of nationalism and patriotism, capacity for tolerating differences arising out of caste, religion, ideology, region, language, sex, etc. Value Education Education about values and religions cannot be left entirely to home and to the community. The community in general has little time or inclination to know about religions in the right spirit. This makes it essential for the Indian school curriculum to include inculcation of the basic values like regularity and punctuality, cleanliness,

NSOU ? CC-ED-07 ? 187 2nd Proof • Classic Print & Procces (09-02-2022) self-control, industriousness, sense of duty, desire to serve, responsibility, enterprise, creativity, sensitivity to greater equality, fraternity, democratic attitude and sense of obligation to environmental protection and an awareness of all the major religions of the country as one of the central components. Current Pedagogic Concerns The teachers will become facilitators and libraries will be put to more and more use. This would result in a shift from the traditional learning atmosphere to climate of values that encourages exploration, problem solving and decision making. The pedagogic perspective outlined in the 2000 document is thus a welcome shift. The document seems to emphasise a rather unstructured construction of knowledge by children by letting the child construct their own knowledge and skill building. NCERT's views on social science teaching Most of the novel elements discussed above are sought to be delivered through changes in social science teaching. 'Social studies are the most suited areas of study for integrating almost all the core components indicated earlier.' (NCERT, 2000) It should be recognised that the question of contextualising curriculum is a complex issue. There can be no escape from the fact that India has a very widely varying learner profile having different cultural, economic, social and geographic contexts. Children have different paces of learning and different interests. This would be true of any classroom. It can be further stated when we set out to draft a curriculum with the twin objective of building a national identity and transforming the society to bring in greater equity and justice, we need to develop a perspective for handling this varied and stratified learner profile. There is no doubt that each child has to be prepared for social mobility so that he or she can hope to change his or her social status by choosing a new career in new socio-cultural settings. Education is considered useful in reinforcing the distinctions and in fostering the 'national identity'. The document indicates a vision which seeks to consolidate the fragmentation of Indian society along the lines of caste, community and other divisive identities and to strengthen the hold of orthodoxies in each of these fragments. 6.4.6 National Curriculum Framework 2005 Background of NCF 2005 'Education can play a very significant role in minimising and eliminating the differences, biases and imbalances such as rural/urban, rich/poor, and differences on the basis of caste, religion, ideology, gender, etc. by providing equality of access to quality education and opportunity'(NCERT, 2000). During the pre and post-

NSOU ? CC-ED-07 ? 188 independence period Indian education has undergone many changes due to several socio-political considerations. It is strange to observe that the planned reforms brought into Indian education system have failed to respond to its societal needs. Thus, achieving education for all with quality has emerged as a need and challenge before educational planners and practitioners in India. Earlier Indian constitution allowed the state governments used to take decisions on all matters pertaining to school education including curriculum and the centre only provided guidance to the states on policy issues. This situation started changing when the National Education Policy of 1968 and the Curriculum Framework designed by NCERT in 1975 were formulated. NCERT developed NCF in 1975 following the recommendations of Education Policy on 1968. Consequently, the constitution was amended to include education in the concurrent list in 1976, and for the first time India had a National Policy on Education in 1986 the country as a whole which envisages National Curriculum Framework as a means of modernising education system. India has a unique characteristic of unity in diversity, so its curriculum should be capable of responding to India's geographical and cultural diversity while ensuring common core values and a comparable standard of education. National Policy on Education (1986) emphasised a relevant, flexible and learner-centred curriculum as a means of evolving a national system of education. NPE 1986 recommended a common core component in school education throughout the country through a national curriculum. Therefore, NCERT was entrusted with the responsibility of developing the National Curriculum Framework and reviewing the framework at frequent intervals. Accordingly, NCERT prepared the National Curriculum Framework for school education in 1988. In one section of this document entitled 'Equality of Education and Opportunity' it mentioned 'The curriculum should provide for new methodologies for developing compensatory and remedial measures in education to suit the needs of the deprived, the disadvantaged and the disabled so that they could be brought on par with others' (NCERT, 1988, p. 4). Thus the inequality issues were not addressed in the desired way in the proposed curriculum and it will simply assert that all humans are inherently equal. But as we know that how a large number of educationists have been struggling for recognition of the fact that each child may have his/her own pace and pattern of learning. Rate of altogether dropout is one of the consequences of forcing all children to follow a single and similar pattern of learning content and experiences. An emergent need was felt for education to be sensitive to the specific contexts of the learners. At this time it was felt that curriculum needs to be flexible and relevant to meet the needs of diverse learners and issues of curriculum load, increase in size of

NSOU ? CC-ED-07 ? 189 2nd Proof • Classic Print & Procces (09-02-2022) school bag and continuous stress of examinations needed attention. After 1988, the National Curriculum Framework was subsequently reviewed in 2000 and 2005. NCF 2005 is the revised version of NCF 2000. Thus National Curriculum Framework (NCF 2005) is one of the

100%

MATCHING BLOCK 367/392

SA

Book Final modification 10.12.2018.docx (D45523568)

four National Curriculum Frameworks published in 1975, 1988, 2000 and 2005 by the National Council of Educational Research and Training (NCERT) in India.

National Curriculum Framework 2005 was developed by NCERT, which provides guidelines for developing syllabi and textbooks and school curriculum. NPE 1986 assigned a special role to NCERT in preparing and promoting NCFs. In this context, the Yash Pal Committee Report, 'Learning without Burden' (1993), is very important as it observes that learning has become a source of burden and stress on children and their parents. Considering all these observations and situational demand the Executive Committee of NCERT decided at its meeting of 14 th July, 2004, to revise the National Curriculum Framework. The process of development of NCF was initiated in November, 2004. National Steering Committee was set up that comprised 35 members including scholars, principals and teachers, NGO representatives and NCERT faculty and representatives of MHRD, Govt. of India. Renowned scholar and practitioner Prof. Yash Pal chaired the National Steering Committee.

Book Final modification 10.12.2018.docx (D45523568)

The NCF 2005 document draws its policy basis from earlier government reports on education.

The Input Documents include National Curriculum Frameworks (1975, 1988, 2000), Secondary Education Commission (1952-53), Education Commission (1964-66), National Education Policy (1968, 1986) and Programme of Action (1992), Chattopadhyay Commission (1984) and Learning Without Burden (1993). Country wide consultations and interactions with classroom practitioners, scholars of the country, rural teachers, State Governments, Local Self Governments, Voluntary Agencies and Principals of private schools took place. This was followed by unprecedented media debates and advertisements inviting suggestions, which were placed in 28 national and regional dailies. Over 2000 responses were received. After these wide ranging deliberations, 21 National Focus Group Position Papers have been developed under the guidance of NCF-2005. The state of art position papers provided inputs for formulation of NCF-2005 and inputs from multiple sources involving different levels of stakeholders helped in shaping the document. The draft was translated into 22 languages listed in the VIII schedule of Indian constitution, which were sent to stake holders at district and local levels and they were consulted. Opinion of the stakeholder helped to shape the draft of the document. Central Advisory Board on Education approved the NCF in September, 2005.

NSOU ? CC-ED-07 ? 190 The sole objective of National Curriculum Framework 2005 was to provide a roadmap for quality school education at the national level. The basic philosophy of this approach was to enable every child to think and build a structure of knowledge that will ultimately create a knowledge society. A wide range of issues regarding aims of education; epistemological assumption about nature and forms of knowledge; and assumptions about learner and learning are thoroughly discussed in this curriculum framework. It places learner at the centre and primarily the experiences of the learners are focused. The framework views that knowledge is evolving in nature through involvement learners as active participants in the process of knowledge construction. NCF (2005) recommends different curricular areas to be taught at different stages of school education. The recommendations of National Policy on Education (1986) have been restated in this curriculum framework of 2005. Five Guiding Principles of NCF 2005 Few observations about Indian Schools revealed, the contemporary system was not flexible and resistant to change. Learning was an isolated activity that discourages creative thinking. Ability of child to construct knowledge is ignored. Future of the child is more emphasized than present and no freedom to learn and participate was allowed for children. Lack of Equality, Equity and Quality was also observed. In this backdrop, NCF came to operate with a view to establish role of teacher as an autonomous Facilitator, to use Evaluation as a tool to find strengths rather than weaknesses, to confirm Quality, Quantity and Universalisation and finally to provide Commitment to democratic values and ways. The principles on which the NCF 2005 is formulated are - 1. Connecting knowledge to outside world 2. Shifting focus from rote learning 3. Enriching curriculum beyond text books 4. Making evaluation and monitoring more flexible and integrated to classroom work 5. Building commitment to democratic values of equality, justice, secularism and freedom. AIMS AND OBJECTIVES OF NCF 2005 Nurturing a Democratic Identity -To uphold values enshrined in the Constitution of India by building commitment to democratic values of equality, justice, secularism and freedom.

NSOU ? CC-ED-07 ? 191 2nd Proof • Classic Print & Procces (09-02-2022) a) To reduce of curriculum load by including only age appropriate concepts. b) To ensure that learning is shifted away from rote methods. The need to move away from "Herbartian" lesson plan was felt and teaching plans and activities should be prepared in such a pattern that challenge children to think and try out what they are learning. c) To initiate certain systemic changes in the existing educational system. d) To shift learning from rote method to activity and experience based method that will promote creative and divergent thinking along with insight. e) To connect knowledge to life outside the school so that learning is no more considered as an isolated activity. Moreover, children should be encouraged to link knowledge with their lives. f) To integrate examination into regular classroom learning, to make the minds of the young learners free from the fear or phobia of examination. Evaluation and assessment should be more flexible and non-threatening. g) To bring flexibility in school system as at that time the system of education was rigid and resistant to change. h) To enrich the curriculum so that it goes beyond textbooks. Learning tasks must be designed to enable children to seek knowledge other than text books and the value of Interaction with environment, peers and older people may be suitably used to enhance learning. i) To ensure quality education for all by considering the child's present to be more significant than child's future. In contemporary education the future of the child had taken centre stage to mere exclusion of the child's present, which was detrimental to the wellbeing of the child as well as the society and nation. MAJOR COMPONENTS OF NCF 2005 The document is divided into 5 chapters – perspective, learning and knowledge, curriculum areas, school stages and assessment, School and classroom environment and systematic reforms. Each component is discussed below - 1. Perspective NCF 2005 provides the historical backdrop as it recalls the educational documents since the inception of India as an independent nation, including the Mudaliar Commission (1952-53), the Kothari Commission (1964-66), the Curriculum Framework (1975) and the NCF1988, along with the NPE1986. Perspective, the first chapter, takes into account the rationale behind the revision of the National Curriculum Framework. It discusses the efforts of all previous documents that worked

NSOU ? CC-ED-07 ? 192 for reforming the curriculum. The chapter recognizes the Gandhian vision of education, as a means of raising the national conscience towards the social problems of injustice, violence, inequality & so on. It refers to the report entitled, Learning without Burden (1993), which highlighted the problems of curriculum overload, which made learning a source of stress for children during their formative years. It refers to the National Curriculum Framework for School Education, introduced in 2000. This curriculum framework revolves around the question of curriculum load on children, the tendency to teach everything arises from our lack of faith in child's creative instincts. So it should be understood that information and knowledge are not similar, new topics and subjects may be included in coherence with the existing syllabus. Encyclopaedic textbooks and traumatic examinations were not beneficial for the child's health. This framework proposes guiding principles for curriculum development. It recommends connecting knowledge to life outside the school, to ensure that learning shifts away from rote methods. To achieve this, curriculum should be enriched so that it goes beyond textbooks thus making examinations flexible too. NCF also views the social context of education. Indian societies are characterised by hierarchies of caste, economic status, gender relations that influence access and participation in education. NCF mentioned careful vigilance against pressures to commodify schools and application of market related concepts to schools and school quality. The aims of education were specifically mentioned in NCF. Building commitment to democratic values of equality, justice, freedom, concern for others' well being, secularism and respect for human dignity and rights were the desired objectives of this curriculum framework. Thus this chapter discusses the educational aims, as derived from the Guiding Principles. Education should aim to build a commitment to democratic values of equality, justice, freedom, concern for others' well being, secularism, respect for human dignity and rights. It should, also, aim at fostering independence of thought and action, sensitivity to others' well being and feelings, learning to learn and unlearn ability to work for developing a social temper and inculcate an aesthetic appreciation. 2. Learning and knowledge Holistic curriculum was recommended including knowledge and participation. Inherent motivation of children to know, understand and apply may be used for achieving higher cognitive abilities. A variety of interesting ways and means may be used to teach them.

NSOU ? CC-ED-07 ? 193 2nd Proof • Classic Print & Procces (09-02-2022) a) Focus on child as an active learner giving primacy to children's experience, their voices and participation. Children's voices, experiences and interests should be given adequate importance in classroom proceedings. Critical pedagogy should be in teaching and stereotype regarding learning ability should be ignored. b) Adults need to change their perception of children as passive receiver of knowledge. The tender age and soft nature of children should be the prime concern. c) Children can be active participants in the construction of knowledge and the fact that every child comes to school with a fund of pre-knowledge. Individualized activity based lessons should be used. Constructivism should be allowed to operate in the class, considering Interaction as the most effective tool of learning. d) Children must be encouraged to relate their learning to their immediate environment i.e. what they are learning in schools to things happening outside. Associate child knowledge with local knowledge and school knowledge with community knowledge. Experiences attained from inside and outside school should be considered. The need for developing a non-threatening and friendly environment was recognised. e) Emphasizes that gender, class, creed should not be constrain the child's participation in experiences provided in the school. f) Highlights the value of Integration between all the experiences acquired by children. g) Learning tasks and experiences must be designed to enable children to seek out knowledge from sites other than textbooks. More challenging activities should be selected so that children may make use of different knowledge resources available around them. h) Children must be encouraged to ask questions, and answer in their own words rather than by memorizing. Attempt should be made to engage the child in concept generation for deeper learning and longer retention. i) Neither teacher and nor text books are authority to learning. j) The value of interaction with environment, peers and older people were highlighted to enhance learning. k) Need to move away from rigid lesson planning was felt. Moreover planning and designing activities should be kept flexible enabling children to think and try out what they are learning. l) Learning experiences should be designed to acquire competencies rather than measurable traits.

NSOU ? CC-ED-07 ? 194 This chapter highlights that factors like - gender, caste, class, religion and minority status or disability should not constrain participation in the experiences provided in school. It also points out that there is a possibility that learning disabilities may arise from inadequate and insufficient instruction. 3. Curriculum areas, School stages and assessment With overall view to reduce stress, make education more relevant, meaningful NCF recommends significant changes in Language, Mathematics, Natural Sciences and Social Sciences. Arts education and Physical and Health education were recommended as curricular subjects at elementary and secondary stage and optional subjects at higher secondary stage. The objectives and pedagogy of these subjects are also mentioned here. Significant changes in language, mathematics, natural sciences and social sciences was recommended. An overall attempt to reduce stress and make education more relevant and meaningful was undertaken. Different content areas recommended in this frame work are mentioned here. a. Language NCF makes renewed attempt to implement 3-language formula. Emphasis on home language or mother tongue is recommended. Language learning should build sound language pedagogy of the mother tongue. Curriculum should promote multi-lingual proficiency. "English as subject" and "English as medium" both should be considered as a resource for Multilingualism. Focus on language is mentioned as an integral part of every subject. Development of skills like reading, writing, listening and speaking contribute to learner's progress in all curricular areas and must be the basis for curriculum planning. NCF 2005 focuses on language, as an integral part of every subject, as reading, writing, listening and speech contribute to a child's progress in all curricular areas and, therefore, constitute the basic of learning. b. Mathematics Succeeding in Mathematics should be seen as the right of every child. A majority of children have a sense of fear and failure of Mathematics and they give up early. Mathematics curriculum is mostly disappointing as the nature is non-participating to majority of the students. Again it hardly offers challenges to the talented minority. Textbooks are full with problems, exercises and methods of evaluation which are repetitive and mechanical. NCF recommended, teaching mathematics should focus on child's ability and resources to think and reason; visualize and handle abstractions; formulate and solve problems etc. Developing a positive attitude is the key to learn without fear. Developing computational skill in an interdisciplinary manner may make it more meaningful. Interest may be enhanced by putting less stress on computation and using integrated approaches between different

NSOU ? CC-ED-07 ? 195 2nd Proof • Classic Print & Procces (09-02-2022) branches of mathematics. Variety of tools should be made available in teaching mathematics and curriculum should progress from play way to abstract terminology, symbols, procedures and techniques. c. Sciences Teaching of science should be recast to enable children to examine and analyze everyday experiences. It may be designed in a way to focus on methods and processes that will nurture thinking process, curiosity and creativity. Environmental Education should become part of every subject to provide wide range of activities involving outdoor project. The National Curriculum Framework 2005 recommends hands-on, inquiry-based science curriculum. NCF-2005 also addresses the issues of curriculum load, rote memorisation and rigid examination system. It suggests flexible examination system and time schedule, reducing curriculum load and integration of theory and practical work in teaching-learning of science. NCF-2005 recommends that emphasis should be laid on the active participation of the learner in the construction of their knowledge. In this document the learner is recognised as constructor of knowledge and it is suggested that learners be provided with learning-experiences which enable them to inquire, solve problems and develop their own concepts.

Unit -4- Pedagogy.docx (D77413908)

At the primary stage, the child should be engaged in

joyful exploration of the world around and harmonising with it. The main objectives at this stage are to arouse curiosity about the natural environment and people around and to engage the child in exploratory and hands on activities. At the upper primary stage science education should provide a gradual transition from environmental studies of the primary stage to elements of science and technology. Science content at the upper primary stage should not be governed by disciplinary approach. At this

100%

MATCHING BLOCK 370/392

SA

Unit -4- Pedagogy.docx (D77413908)

stage the child should be engaged in learning the principles of science through

day to day experiences, working with hands to simple technological models.

At the secondary stage, students should be engaged in learning science as a composite discipline, in working with hands and tools to design more advanced technological models than at the upper primary stage.

At the higher secondary stage, science should be introduced as a separate discipline, with emphasis on experiments, technology and problem solving.

NSOU ? CC-ED-07 ? 196 d. Social Sciences A broad range of content, drawn from the disciplines of history, geography, political science, economics and sociology is included under social sciences. The selection and organisation of material into a meaningful social science curriculum, to develop a critical understanding of society, among students is not an easy task. So in this context the possibilities of including new dimensions and concerns are immense. The relevance and significance of social sciences is expanding as it is indispensable in laying the foundations for an analytical and creative mindset. Social sciences have a specific responsibility to create and widen the popular base for human values, namely freedom, trust, mutual respect, respect for diversity and similar other values. Thus, the purpose of teaching social science will help to provide the child with the mental energy to think independently and deal with the social forces that threaten these values, without losing individuality. Studying social sciences, helps children to appreciate the values enshrined in the Indian Constitution such as justice, liberty, equality and fraternity and the unity and integrity of the nation and the building of a socialist, secular and democratic society. It enables children to understand the society in which they live to learn how society is structured, managed, and governed, and also about the forces seeking to transform and redirect society in various ways. By learning to respect differences of opinion, lifestyle, and cultural practices, the learners grow up as active, responsible, and reflective members of society. It will facilitate the students undertake activities that will help them develop social and life skills and make them understand that these skills are important for social interaction. It also allows the children to acquire pleasure in reading, by providing them with enjoyable reading material. Therefore, NCF 2005 recommends paradigm shift to study social sciences from the perspective of marginalized groups. Gender justice and sensitivity to issues of tribal and socially deprived groups, and minority sensibilities must be imparted in teaching of all social science subjects. National Curriculum Framework also draws attention on the following four other areas - e. Art Education It covers four major spheres; namely music, dance, visual arts and theatre. Interactive approaches and not instruction is focused – because the goal is to promote aesthetic awareness and enable children to express themselves in different forms.

NSOU ? CC-ED-07 ? 197 2nd Proof • Classic Print & Procces (09-02-2022) f. Health and Physical Education Malnutrition and transmissible diseases are the major health problems mostly faced by Indian children, from the pre-primary to the higher secondary school stages. Health depends upon nutrition and planned physical activities and success in school depend on hale and hearty children. g. Work and Education Work alone can create a social temper. Work should be infused in all content areas from primary stage upwards to the secondary and higher secondary stages. Agencies offering work opportunities outside the school should be formally recognised. Work related generic competences should be pursued at every level using it as potential pedagogy for knowledge acquisition. h. Education for Peace Peace education is viewed as a precondition for national development in view of growing tendency towards intolerance and violence. NCF recommends nurturing non- violent and peaceful behaviour and skills for conflict resolution. It also emphasises respect for human rights, justice, tolerance, cooperation, social responsibility, respect for cultural diversity and commitment to democratic values. This peace aspect should be infused in all subjects and activities of the school and activities including peace clubs, peace educating films, peace workshop, celebrating cultural diversity and gender justice etc. should be conducted. i. Habitat and Learning This theme of 'Habitat and Learning' is equivalent to environmental education. Environmental education may be best pursued by infusing the issues and concerns of the environment into the teaching of different disciplines at all levels while ensuring that adequate time is allotted for relevant activities. Schools could work with panchayats, municipalities and city corporations to document biodiversity resources and associated knowledge. 4. School and classroom environment NCF focuses on nurturing an enabling environment where the teacher is a facilitator and supporter. Classroom environment is characterised by Learner centeredness and autonomy. Through active learner engagement and in company of others understanding-based-learning will be organised. Learners' performance may be improved by giving primacy to learners' experiences.

NSOU ? CC-ED-07 ? 198 Emphasises learning from other resources like – learning sites, tools, laboratories, media, ICT etc. apart from prescribed text books and minimum infrastructure and material facilities should be available. NCF revisits the traditional notions of discipline and support for planning a flexible daily schedule. It also discusses the need for providing space to parents and community in the sphere of education. Children should develop sensitivity towards environment, where they will learn to accept different cultures. Children should be prepared to participate in productive work.

5. Systemic Reforms Systemic reform implies the system's capacity to reform itself by enhancing its ability to remedy its own weaknesses and to develop new capabilities which is not possible without quality concern. Monitoring quality must be seen as a process of sustaining interaction with individual schools in terms of teaching-learning processes.

a. Academic Planning Reform It includes reforms in academic planning for monitoring, teacher education and evaluation system. NCF covers needs for academic planning for monitoring quality of education. It reaffirms faith in the Panchayati Raj or local self government and suggests the strengthening of the Panchayati Raj. It also proposes systematic activity and mapping of functions appropriate at relevant levels of local self government. This chapter looks at issues of academic planning and leadership, at the school level, to improve quality. Meaningful academic planning has to be done in a participatory manner by headmasters and teachers.

b. Teacher Education Reform Teacher education should focus on developing professional identity of the Teacher as well as in-service education and training of teachers. NCF mentioned necessary systemic reforms including teacher education reforms to achieve the goal of education. Teacher Education Reforms should emphasize on preparation of teachers towards the fulfilment of the following aspects, so that the teacher should learn to view learning as 'a search for meaning' out of personal experience, and knowledge generation as a continuously evolving process of reflective learning. They should also be able to view knowledge not as an external reality embedded in textbooks, but as constructed in the shared context of teaching-learning and personal experience. It addresses the need for plurality of material and teacher autonomy or professional independence to use such material.

NSOU ? CC-ED-07 ? 199 2nd Proof • Classic Print & Procces (09-02-2022) 'Pre-service training programmes need to be more comprehensive and long, incorporating sufficient opportunities for observation of children and integration of pedagogic theory with practice through school internship.' Teacher education programmes need to be reformulated and strengthened so that the teacher can be an: - encouraging, supportive and humane facilitator in teaching-learning situations to enable learners to discover their talents, to realise their physical and intellectual potentialities to the fullest, to develop character and desirable social and human values to function as responsible citizens; and - active member of a group of persons who make conscious efforts for curricular renewal so that it is relevant to changing social needs and the personal needs of learners. Teacher education programmes should be reformulated in a way that would place thrust on the active involvement of learners in the process of knowledge construction, shared context of learning, teacher as a facilitator of knowledge construction, multidisciplinary nature of knowledge of teacher education, integration theory and practice dimensions, and engagement with issues and concerns of contemporary Indian society from a critical perspective (NCF, 2005).

c. Evaluation and Assessment Reform Examination reforms to reduce psychological stress particularly on children in class X and XII. It recommends that assessment of learner should be made an integral part of school life. It also discusses the necessary systemic reforms including examination reforms to achieve the aims of education. Some highlights of the examination reforms are as follows ? Content based testing should be replaced by problem solving and competency based assessment ? Examinations of shorter duration with flexible time limit ? No public examination till class VIII ? Class X board exam to be made optional in long term ? Typology of questions should be revised so that reasoning and creative abilities may replace rote learning

NSOU ? CC-ED-07 ? 200 Few other recommendations of NCF 2005 are as follows - Vocational Education and Training (VET) NCF recommended the establishment of separate Vocational Education and Training (VET) centres and institutions in clusters in villages and blocks to sub-divisional/district towns and metropolitan areas in collaboration with the nation wide spectrum of facilities already existing in this sector. Suggestions for Syllabus Development Development of syllabi and textbooks should be based on the following considerations. Topics and themes should be relevant to the stages of children's development. There should be continuity between levels and linkage between school knowledge and concern in all subjects and at all levels. The values enshrined in the constitution of India should reflect in the organization of knowledge in all subjects. Work related attitudes and values in every subject and all levels should be integrated and nurtured with aesthetic sensibility. Syllabi should also contain components to develop sensitivity to gender, caste, class, peace, health and need of children with disability. School and college syllabi should be linked without any over lapping. Flexibility and creativity in all areas of knowledge and its construction by children must be encouraged. Development of Support Material NCF recommended the use of potential of media and new information technology in all subjects. It emphasized on - ? Teachers' handbooks and manuals. ? Audio/video programmes on NCF-2005 and textbooks ? Exemplar problems in Science and Mathematics ? Science and Mathematics kits ? Sourcebook on learning assessment ? Develop syllabi and textbooks in new areas such as Heritage Craft, Media Studies, Art Education, Health and Physical Education, etc. ? Taken various initiatives in the area of ECCE, Gender, Inclusive Education, Peace, Vocational Education, Guidance and Counseling, ICT, etc. Critical evaluation of NCF 2005 Before evaluating NCF 2005 it is important to mention that the question of contextualising curriculum is a complex issue and India is a country having a very NSOU ? CC-ED-07 ? 201 2nd Proof • Classic Print & Procces (09-02-2022) widely differing learner profile. Children have different paces of learning and different interests. This is true for any classroom. The children of the north-eastern tribes, the western and northern deserts and of the metropolitan cities are covered under education so they are set in widely different cultural and geographic contexts. Further in each of these cultural contexts we have a very stratified population in terms of economic and social status, thus getting learners who are altogether different from each other. Whenever a draft of curriculum framework is prepared, there are two specific objectives - building a national identity of commonhood and transforming the society to bring in greater equity and justice we need to develop a perspective for handling this varied and stratified learner profile. There can be no doubt that each child has to be prepared for social mobility so that he or she may get the scope to improve his or her social status by choosing a new career in new socio-cultural settings. Thus the possibility of moving away from the profession of one's 'family and caste' has to be structured into the curriculum. This requires identification of certain skills and perspectives that cut across all professions and cultures and those that enable one to learn new skills and perspectives for new professions. These are the universal constituents of a curriculum. Again, India is a democratic society where each individual irrespective of his or her socio-economic position is expected to perform certain civic duties relating to governance, to form an understanding of and make a reasoned choice between different policies, assert his/her demands and fight for them. Thus skills and perspectives relating to exercise of power are an essential component of any individual's intellectual tool kit. These not only relate to basic skills of literacy and numeracy but also an ability to learn about new things; leading to development of an ability to critically compare and examine the merits and demerits of anything and an ability to understand the lives and problems of people living in different conditions. These invariably require a study of both local contexts and also contexts from a wider universe. Studying the experiences of others and problems of the others is as important as the study of the local problems and issues. A thorough study of this document does give the feeling that the NCERT has a clear vision of Indian society which is composed of distinct socio-cultural blocks each with its assigned function and identity, held together by a sense of belonging to the 'Indian nation'. Education is considered useful in reinforcing the distinctions and in fostering the national identity or uniqueness. A distinct conception of nation and nationalism implicitly comes with this understanding.

NSOU ? CC-ED-07 ? 202 LIMITATIONS OF NCF 2005 A very important viewpoint of this curriculum framework is that it views human as a significant resource of the country. Human being is considered as, 'a positive asset and a precious national resource which needs to be cherished, nurtured and developed with tenderness and care coupled with dynamism.' At present one important social issue in India is population explosion; NCF 2005 considers this aspect very positively with the realisation that India is rich in resources. With this belief it also emphasises the role of the child as the constructor of his knowledge. In spite of such a liberal outlook the National Curriculum Framework 2005 suffers from some weaknesses which creates problems in its implementation. Let us discuss the limitations of this framework in the following sections. National Curriculum Framework should make necessary recommendations covering all the stages of education and maintaining connections between the stages. But NCF 2005 has not commented on the pre-primary level of education at all. Thus somewhere it seems to be incomplete. This document rightly observed excessive curriculum load in education and recommends a shift away from content. But it does not work out on implications of 'learning to learn', which is not a matter of emphasising process alone. Without some criteria to decide on the relative worth of what is to be learnt, the problem of curriculum load cannot be solved. This document seems to be more liberal in its psychological dimension, than in its socio-political, vision. This could have led to a tension, within the document, because of the two different views in human beings in different sections of the document. Theory of knowledge acts as the foundation for selection of content and learning experiences. Thus any curriculum framework needs a theory of knowledge, which looks at the selection and organization of the learning experiences. But this national curriculum document, however, seems to completely ignore the need for a theory of knowledge. This document looks back to the age-old practices, when it assumes that exploration, problem solving, decision-making, interactive group learning, seeing and understanding patterns, & so on, are significant processes of learning, but none of these ideas are new and some are as old as education itself. A curriculum framework with the objective to establish equity cannot consider human beings as a resource, and this document considers equality as its significant

NSOU ? CC-ED-07 ? 203 2nd Proof • Classic Print & Procces (09-02-2022) feature and at the same time views human beings as resource. Thus, making this National Framework somewhat self-contradictory. This national document has replaced a more important value i.e. equality with a less important one i.e. cohesiveness. Even highly undemocratic societies can be cohesive, both in theory and practice. At present education should make every effort to achieve the goal of a democratic and egalitarian society rather than a society which is cohesive and consistent. Another glaring short coming mentioned in NCF 2005 is lack of accountability. While formulating Curriculum Frameworks at the national level answerability of the system should be incorporated. Every individual concerned should be held accountable for the part for his/her part to get the best output. The document recommends for physical and cognitive development of the learner but has kept silent on emotional and other kinds of development. Development of different aspects pertaining to the development of affective domain should also be incorporated in National curriculum documents. Problems of Implementation The National Curriculum Framework of 2005 is a more cautiously and meticulously worked-out document than the 2000 document, as it looks at including various other subjects such as environment, peace and so on. The document focuses more on the creativity and the overall development of children, rather than filling their brains with information. The main emphasis in this Curriculum Framework is to provide learning without burden. Though it is well written framework and all the aspects of child centred learning is discussed but when we want to see as if it is implemented in schools or not, then we find a great failure on the part of educational leaders but fails to create any structure both human and financial. There is rarely something to criticize in the policies made by educationists but the drawbacks are surfaced when we think about implementation of the Curriculum Framework. The NCF is a massive document of 124 pages, which is loud on words but suffers from indistinctiveness and ambiguity. NCF 2005 is emphasizing that for learning without burden we should adopt the child centred approach of learning and must believe in the intelligence of a child. Each and every student is unique, that is why it is necessary to understand their uniqueness and provide knowledge as per their capabilities and interest. And for this we require a constructive approach of teaching and learning. Now the question that comes up naturally is, whether we can adopt constructivism in our teaching and

NSOU ? CC-ED-07 ? 204 the learning of students. The finest resolution may be to let them free, to let them think what they want to think and draw out the best possibility of interest in his or her own area. Though it seems very difficult but if we exclude the any specific content or syllabus from the system then it is quite easy to implement. But it is difficult to avoid syllabus from a curriculum frame work as syllabus itself is an important part of curriculum. In its report, "Learning without Burden," the committee pointed out that learning at school cannot become a joyful experience unless we change our perception of the child as a receiver of knowledge and more beyond the convention of using textbooks as the basis for examination. Therefore, the National Curriculum Framework 2005 gave emphasis to learning from "known to unknown," from "concrete to abstract" and from "local to global." It favoured child as a Natural learner who can learn from different activities and construct the knowledge from his past experiences. Burden remains Though NCF 2005 has given emphasis to learning without burden and presents the child as the natural learner who can learn from his own experiences but still in many schools the old techniques and methods of instructional base of teaching have been adopted where the child is still the passive listener. The main emphasis is only given to memorisation of facts and information and the capacity of reproduction during the examination. The hard reality The real situation is that in most of the schools in India, students, teachers and administrators are apathetic towards the process of education, fake and deceptive ways are being adopted to complete the process and a large number of educated youth find themselves without suitable jobs. Gradual degeneration of the process is observed and education as an activity seems to be going without any direction. The process of education becomes highly inconsistent when the people, government and those involved in implementing it, consider it to be desirable and at the same time they choose to ignore the real state of affair on ground. Policy makers, politicians, social activists and education experts are seen taking idealist positions when talking about education, most of the time. But this needs to be continued and expanded genuinely in action to bring constructive changes in the existing education system. Lack of supervisory staff Supervisory staff plays a significant role in any system to keep it running. There is no denial of the fact that the educational standard in India has taken a hit due to severe crunch of supervisory staff. In this condition it is difficult to fulfil the aim of constructive learning because if there is a shortage of supervisory staff then who will judge the performance of teachers and the outcomes of the learners.

NSOU ? CC-ED-07 ? 205 2nd Proof • Classic Print & Procces (09-02-2022) Teachers are overburdened Ideal teacher-pupil ratio is not maintained in any level of education. Many teaching posts are vacant in educational institutions. Again because of lack of infrastructure and staff in schools the teachers have been given the extra responsibilities which further affect the performance of the teachers. Students are the natural learners and they learn from their surroundings but if their surroundings and environment lacks the infrastructure then neither the student nor the teacher is able to do anything. Undoubtedly teacher is the facilitator, who helps the child to construct his knowledge but if teacher is loaded with extra burden then the teacher is unable to meet the expectations and perform the duties assigned. Learning based on understanding is not emphasised NCF 2005 has given emphasis to the constructive learning which is purely based on understanding, but still in school the traditional method of pipe line theory has been given importance. The child or learner is still considered as a passive listener in many schools as no one believes in the natural learning of the child. Understanding of the child is not emphasised thus learning remains at a superficial level only. Thus the long term implication of learning is suffering as what is learnt without comprehending the meaning if forgotten easily after examination. Rote Learning Rote learning is mentally seizing our school system in India. It is ironic, that we still follow what the colonial system Britishers had left for India. Researchers across the globe have reached the consensus that the key to addressing these challenges is to bring a transformation in student thinking, classroom dynamics, learning ambience, ICT integration and teacher empowerment. The above information reveals that still our education system needs a change in the ground level because policies are made for constructive or co- operative learning, which is completely based on understanding and develops the mental abilities of the child. But it is far from implementation and rote learning is still in practice. Corporal Punishment A Child should be provided such a kind of environment where he or she can learn without any force and fear. The news published in Times of India in August 13, 2012, emphasizes that corporal punishment is required for the desired behaviour of the child which is against the norms of NCF 2005 (Ramya, 2012). Again an educational survey revealed, 30% principals and 40% teachers believed that strict enforcement of discipline is necessary for proper teaching and the teacher's control over students is a must for discipline. They also said that there can be no discipline without fear of the teacher in

NSOU ? CC-ED-07 ? 206 students and those not paying attention to studies should be physically punished (Pandey, 2014). This type of mentality is not expected of educated persons, thus making the implementation of this National framework more difficult. Co-curricular activities need more attention There is no denying of the fact that co-curricular areas have direct impact on curricular areas and so are definitely relevant to curriculum and important for building students' self- confidence, self-control, sportsmanship, solidarity, teamwork, competitiveness, health, etc. However, school places no major emphasis for these areas in curriculum. Schools on an average spend very less time, on physical education, sports and other co-scholastic activities like music, art, dance, elocution and dramatics. Much more time of class is spent on learning academic subjects. Thus, a contradiction between the policy of NCF 2005 and the ground reality is coming up. Dominance of examination In school educational outcome is considered equivalent to score obtained in examination so there is dominance of number system. Schools don't have any concern with learning rather their main concern is to produce scores which further helps these institutes to get more admissions. Parents also don't bother about real learning of their children, they only have the interest on percentage of marks their children got during examination. This recent trends of the present schools is making the implementation of NCF 2005 more difficult. Faulty evaluation system The content and method used for educating the child is elected judiciously for the child's all round development. Teachers are trained to use various activity based strategies for teaching and instruction in classroom. Children learn to perform these activities through active participation. But the ultimate parameter for judging the overall assessment of a child is his or her academic performance so drawing the best of the child remains a dream in education and the purpose of activities become meaningless. Education will become burden if these institutions practice such kind of wrong ideas and do not coordinate between head and hands. We need the Education in which the child's natural instinct of learning is not suppressed and if it is suppressed by us then we all are the culprit of humanity. The futuristic society will not spare us if we don't rethink about it and find the exact measure to curb it.

NSOU ? CC-ED-07 ? 207 2nd Proof • Classic Print & Procces (09-02-2022) Difficulty in uniform implementation In India, every state has got two parallel systems of education, the state-run Govt. schools and so-called private schools offering education of two different standards altogether. The NCF does not even venture to suggest the need for bridging the gap between these two types of schools. Both these types of schools are different in their facilities, infrastructure, teaching-learning, teacher quality, administration and management etc. presenting two totally different education systems under the guidance and supervision of a single National Curriculum Framework. This double standard in school education has made implementation of this Curriculum Framework difficult. The NCF-2005 begins with a quotation from Tagore's essay 'Civilisation and Progress' in which the poet reminds us that a 'creative spirit' and 'generous joy' are basis of childhood and

90%

the concept of equality, within the cultural and socio-economic diversity.

These can be distorted if handled by an unthinking adult world. Seeking guidance from

89%

MATCHING BLOCK 372/392

W

the constitutional vision of India as a secular, egalitarian and pluralistic society, founded on

the values of social justice and equality, certain broad aims of education have been identified in this document NCF-2005. Independence of thought and action, sensitivity to others' well-being and feelings, learning to respond to new situations in a flexible and creative manner, predisposition towards participation in democratic process, and the ability to work and contribute to economic processes and social change – all these are the demand of time and NCF has correctly pointed them. Role of teachers is also given due importance and it also recommended that teaching should serve as a means of strengthening our democratic way of life, it must respond to the need of the first-generation school-goers, whose retention is vital owing to the constitutional amendment that has made elementary education a fundamental right of every child. Viewing learning as a source of burden and stress on children and their parents is an evidence of deep distortion in educational aims and quality. Teachers should be aware of the background of the child. J. P. Naik has described equality, quality and quantity as the exclusive triangle for Indian education.

100%**MATCHING BLOCK 374/392****SA**

Book Final modification 10.12.2018.docx (D45523568)

With respect to social context, NCF 2005 has ensured that irrespective of caste, creed, religion and sex - all are provided with a standard curriculum

to inculcate the feeling of oneness, democracy and unity in the students. The curriculum is enabled to strengthen our national identity and to enable the new generation to develop a sense of nonviolence and oneness across the society. For achieving this, learning has to be a joyful experience for the learners. The focus is shifted from textbooks and examination to remove stress of children and prepare

NSOU ? CC-ED-07 ? 208 them as self-reliant and dignified individuals forming the basis of ideal social relationship. NCF 2005 has made recommendations to fulfil all these objectives. 6.5 Choice Based Credit System (CBCS) Enhancement of academic standards and quality of higher education require continuous innovation and improvements in the curriculum, teaching learning process, examination and evaluation system and suitable monitoring. In India the University Grant Commission has formulated various regulations and guidelines from time to time to improve the higher education system and maintain minimum standards and quality across the higher educational institutions. Several reforms have taken place in recent past to improve the whole educational system along with its evaluation. There should be flexibility and freedom in designing the assessment methods that best fits the curriculum and teaching learning methods in higher education. Evaluation reform was significantly mentioned in the recommendations of Mudaliar commission and Kothari commission. Consequently, in the

63%**MATCHING BLOCK 375/392****SA**

Book Final modification 10.12.2018.docx (D45523568)

recommendations of the 11th five year plan and National Knowledge Commission the need to ensure quality in higher education

was deeply felt. Frequent revisions of curriculum, introduction of credit system, internal assessment and promotion of research were some of the major recommendations of NKC. Following this India's statutory body for higher education the UGC

100%**MATCHING BLOCK 376/392****SA**

Book Final modification 10.12.2018.docx (D45523568)

proposed a semester pattern in curriculum instead of yearly examination.

At present students' performance is reported conventionally by using marking system as well as grading system. Most of the institutions of higher learning across the country use the system of conversion from marks to letter grades. Grading is considered to be a better system than conventional marking, if it is uniform in nature. Uniformity in grading system will facilitate students' mobility across institutions within and across countries and this will enable potential employers to assess the performance of the students before employing them. Another important innovation in Indian higher education is the introduction of choice based credit system. At present most of the institutions of higher learning has already introduced CBCS. This new system accelerates the teaching learning process and enables vertical and horizontal mobility in learning. Ideally, this system also provides

91%**MATCHING BLOCK 377/392****SA**

Book Final modification 10.12.2018.docx (D45523568)

flexibility in designing the curriculum and assigning credits based on the course content and hours of teaching.

The students are free to take the course of their choice and learn at their own pace this system provides a 'cafeteria' type approach. They are supposed

90%**MATCHING BLOCK 378/392****SA**

Book Final modification 10.12.2018.docx (D45523568)

to choose from the prescribed courses which are referred as core, elective, soft skill courses.

NSOU ? CC-ED-07 ? 209 2nd Proof • Classic Print & Procces (09-02-2022)

67%**MATCHING BLOCK 384/392****SA**

Book Final modification 10.12.2018.docx (D45523568)

The fundamental idea is to cater the needs of the students so that they remain up to date with the development of higher education in India and abroad.

This system aims to redefine the curriculum and help students to keep pace with liberalisation and globalisation in education. Main objectives of CBCS: The UGC has underlined the following objectives for Choice based Credit system. 1. To bring reforms in higher education by improving the quality of education and excellence. 2. To match the scholastic needs and aspirations of learners in higher education. 3. To enable inter University transferability of learners. 4. To enhance learning opportunities in terms of courses and institutions available. 5. To improve the educational programs standardized and comparable across the country. 6. To bring more flexibility in course implementation. 7. To enhance learning opportunities of students. Some significant terminologies in Choice Based Credit System To understand the concept of CBCS brief description of the following terms are given – Choice based: This implies that the student can choose a subject or course among multiple courses according to his own preference. Semester: The duration of each course is of six months. Each semester consists of 15 to 18 weeks of academic work equivalent to 90 actual teaching days. Academic year: 1 academic year constitutes of two consecutive semesters - one odd and one even.

86%**MATCHING BLOCK 379/392****W**

Credit: A unit by which the course work is measured. It is determined by the number of hours of instructions required per week. Credit is

a very important component of CBCS.

86%**MATCHING BLOCK 380/392****W**

One credit is equivalent to one hour of teaching (lecture tutorial) or two hours of practical work /field work per week. Credit point: It is

100%**MATCHING BLOCK 381/392****W**

the product of grade point and number of credits for a course.

99%**MATCHING BLOCK 382/392****W**

Semester grade point average: It is a measure of performance of work done in a semester. It is ratio of total credit points secured by a student in various courses registered in a semester and the total course credits taken during that semester. It shall be expressed up to two decimal places.

NSOU ? CC-ED-07 ? 210

97%**MATCHING BLOCK 383/392****W**

Cumulative grade point average: CGPA is a measure of overall cumulative performance of a student over all semesters. The CGPA is

a

86%**MATCHING BLOCK 385/392****SA** Unit -4- Pedagogy.docx (D77413908)

ratio of total credit points secured by a student in various courses in all semesters and the sum of total credits of all courses in all semesters. Like SGPA it is also expressed upto two decimal places. Grade point: Grade point is a numerical weight allotted to each letter grade on a 10 point scale. Letter grade: It is an index of the performance of students in a said course. Grades are denoted by letters O, A+, A, B+, B, C, P and F.

Assessment: This system calls for continuous and comprehensive evaluation in the form of class attendance, internal assessment as well as external evaluation.

82%**MATCHING BLOCK 387/392****SA** Unit -4- Pedagogy.docx (D77413908)

Grade card or certificate: Based on the grades a grade certificate shall be issued to all the registered students after every semester. The course details, that is code, title, number of credits, grade secured along with SGPA of each semester and CGPA

and at the end of the course will be displayed in the grade card. Characteristics of Choice Based Credit System: 1. This is a uniform system for all central, state and other recognised universities. 2. There are three main courses, namely – core, elective and foundation. 3. All the three main courses will be evaluated and accessed to provide for an effective and balanced result. 4. In this system non credit courses are also available which are assessed as satisfactory and this is not included in computation of SGPA (semester grade point average) or CGPA (cumulative grade point average). 5. This system is a step from numerical marking to grading. 6. In CBCS the practice of grading minimises the stigma of failure. 7. This system allows mobility as the student can easily study few courses in one institution and continue the rest in another institution. Facility of credit transfer helps the student to complete the course successfully. Types of courses under CBCS There are three kinds of courses in a CBCS program namely core, elective and foundation. 1. Core course: The word core signifies any Central theme. Core course is to be NSOU ? CC-ED-07 ? 211 2nd Proof • Classic Print & Procces (09-02-2022) compulsorily studied by a student as a core requirement to complete the programme in a specific discipline of study. There may be a core course in every semester. 2. Elective course: These courses are not mandatory and can be chosen from a pool of papers. The specific paper may be supportive to the discipline of study and it may provide an expanded scope to some other discipline or domain. Elective courses help nurturing students' proficiency or skill. Again an elective course may be generic elective for discipline centric. Generic elective add general proficiency to the students, whereas discipline centric elective may be chosen from an unrelated discipline. Discipline centric elective is also known as open elective. 3. Foundation course: Compulsory foundation and elective foundation both comes under foundation course. Compulsory foundation

50%**MATCHING BLOCK 386/392****W**

courses are based upon contents that lead to knowledge enhancement and are mandatory for all disciplines. Elective foundation courses are value based and

have a broader aims like man making education. Methods of examination and assessment Examination and assessment are integral parts of system of education as this is the most important instrument for identifying and certifying the academic standards accomplished by learners. Hence these tools are considered to be an objective and impartial indicator of a student's performance. Thus, it becomes mandatory duty of a University to ensure that it is carried out in fair manner. In this regard, UGC recommends the following system of checks and balances which would facilitate the Universities effectively and fairly carry out the process of assessment and examination. ? At least 50% of core courses offered in different programmes across the disciplines, the assessment of the theoretical component towards the end of the semester should be undertaken by external examiners from outside the university conducting examination, who may be appointed by the competent authority. ? The question papers will also be set and assessed by external examiners. ? In case of the assessment of practical component of such core courses, the team of examiners should be constituted on 50 – 50 % basis. i.e. half of the examiners in the team should be invited from outside the university conducting examination. ? In case of the assessment of project reports / thesis / dissertation etc. the work should be undertaken by internal as well as external examiners.

NSOU ? CC-ED-07 ? 212 The higher education institutions presently follow various methods for assessing suitable courses as approved by their respective statutory bodies. The usual approach is to avoid marks based on performance of students in examinations. Marks obtained in midterm, end semester are converted to letter grades computed on the basis of absolute or relative grading. To calculate SGPA and CGPA the following system has to be followed as implemented by the UGC. Relative grading and absolute grading are the two methods popularly used for awarding grades in a course. Relative grading assumes where the distribution of marks is based on normal distribution, so grades are awarded on the basis of cut off marks or percentile. In absolute grading the marks are converted to grades based on predetermined class intervals. Colleges, universities and any other institutions of higher learning may use these methods. The 10 point grading system as introduced by UGC is given below: Grades and Grade Points Letter Grade Letter Grade

93%

MATCHING BLOCK 388/392

Book Final modification 10.12.2018.docx (D45523568)

O (Outstanding) 10 A+ (Excellent) 9 A (Very Good) 8 B+ (Good) 7 B (Above Average) 6 C (Average) 5 P (Pass) 4

F (Fail) 0 Ab (Absent) 0 Some other scoring criteria needs to be mentioned here - 1.

86%

MATCHING BLOCK 389/392

SA

Book Final modification 10.12.2018.docx (D45523568)

For non-credit courses satisfactory or unsatisfactory shall be indicated instead of letter grades. This will not be

considered while computing SGPA and CGPA. 2. The universities can decide upon the percentage of marks required to pass a course. The CGPA required to qualify for a degree will be decided by the statutory bodies of the universities. 3. A Student will reappear in the examination if he or she obtains F.

NSOU ? CC-ED-07 ? 213 2nd Proof • Classic Print & Procces (09-02-2022) SGPA and CGPA : Methods of computation - The method for computing SGPA i.e. Semester Grade Point Average and CGPA i.e. Cumulative Grade Point Average has been recommended by the University grants commission. The process is given below - The ratio of sum of the product of the number of credits with the grade points scored by a student in all courses in one semester and total credits earned in the specific semester is computed to find SGPA. Then CGPA is computed by finding the ratio of sum of the product of the number of credits with the grade points scored by a student in all semesters and total credits earned by the student altogether in all the semesters. Illustrations Course Credit Grade Grade Credit Point letter point (Credit x Grade) Course 1 3 A 8 3 x 8 = 24 Course 2 4 B+ 7 7 x 4 = 28 Course 3 3 B 6 3 x 8 = 18 Course 4 3 O 10 3 x 10 = 30 Course 5 2 C 5 2 x 5 = 10 Course 6 3 A+ 9 3 x 9 = 27 Total = 18 137 Therefore, SGPA = Total Credit Points (Credit x Grade)/ Total Credits or 137/18 = 7.61 (let this be the SGPA for first semester). The following section shows how CGPA is calculated for all the six semesters. Semester 1 Semester 2 Semester 3 Semester 4 Semester 5 Semester 6 Credit : 18 Credit : 20 Credit : 24 Credit : 22 Credit : 20 Credit : 24 SGPA : 7.61 SGPA : 7.8 SGPA : 5.6 SGPA : 6 SGPA : 6.3 SGPA : 8 Therefore, CGPA = Sum of the product of SGPA and credit/ Total credits earned or, 18 x 7.61 + 20 x 7.8 + 24 x 6.6 + 22 x 6.0 + 20 x 6.3 + 24 x 8.0 ÷ 128 or, 901.38 ÷ 128 = 7.04

NSOU ? CC-ED-07 ? 214 Advantages of CBCS 1. This system is flexible, student centric and effectively matches with today's demand of the student community. 2. This system is in compliance with other grading used in global institutions. 3. The student has an option to choose a specific paper among inter disciplinary or multi-disciplinary courses as per their interest. 4. Based on the students' abilities and potentialities a mentor guides a student to select courses. 5. The quality of teaching increases as a subject to be covered in each course is less. 6. It keeps students busy all the year with the same level of burden thus extreme pressure before annual examination can be avoided. 7. Inculcation of regular study habits in students makes learning easy and disciplined. The outcome is more in-depth study. 8. In this system the students can choose courses at basic or advanced level thus the students are provided with greater flexibility in choice of courses. 9. In Choice Based Credit System the curricular system is designed to promote group work research and community involvement. 10. It provides upward mobility thus the students can clear the backlog in one or many subjects even after moving to the next semester. 11. In this system the learner is given prospects to earn certification through a walk in /walk out approach. 12. In this system the course is designed in such a way that the learners acquired job oriented skills along with academic knowledge. 13. Students are allowed to progress at their own pace. For example one can skip a course to do it later as per his or her convenience. 14. Students who are highly motivated get the chance to gain extra credits. 15. Students moving from old college to new college or university can transfer the credits to the new migrating institution.

NSOU ? CC-ED-07 ? 215 2nd Proof • Classic Print & Procces (09-02-2022) Disadvantages of CBCS This system is tried and tested before implementation but sometimes it lacks accurate estimation of marks. 1. Teachers are challenged to keep pace with many courses at a time. 2. One important limitation is inadequacy of time. In CBCS system classes starts in July but admission continues till August. The students who are admitted late face lots of problem. 3. Every student follows a different course as a result they have different time table. This may create confusion among students. 4. In semester system more infrastructural facilities are required. Physical facilities like adequate number of classrooms are not available to fulfil the curricular demands. 5. Every student is following a different course and time table as a result more teachers are required for effective practice of CBCS. 6. Due to comprehensive and continuous evaluation huge amount data regarding the students' performance are generated which has to be preserved. This requires huge responsibilities on the part of teachers who are already over burdened with their teaching and evaluation. 7. Declaration of results in every six months of teaching is not easy. 8. In this system a huge reform in evaluation has taken place. Internal assessment is conducted every semester. Record keeping becomes a tedious job. This may even hamper the quality of teaching. 9. The course is so tightly scheduled that even after identification of any backwardness in students there is no option to take any remedial classes. 10. Another very significant drawback of the system is important co-curricular activities like NSS and NCC conducted in colleges will be hampered due to scarcity of time. This will also affect conduction of cultural and social activities, which are very important for college students. Role of teachers in CBCS The system demands a different role of teachers. Previously teachers were considered as the only source of knowledge. Presently teachers provide information and show their students how to take them. So teachers are facilitators in the learning process. The teachers in this system are required to have some special skills to make this system a success.

NSOU ? CC-ED-07 ? 216 1. For successful implementation of the system the teachers should have a sound knowledge of technology. They should be able to handle computer, photocopier, Power Point, projectors effectively. 2. Teachers should know to work in teams to cooperate with colleagues and parents. 3. In this system teachers should not only instruct but also inspire his or her students. 4. Teachers should get opportunity to exercise their academic freedom while performing their professional duties. 5. In service training programmes should be provided periodically so that the teachers can handle this new system effectively. 6. Teachers are assigned supervisory duties or special educational responsibilities like counselling in CBCS system. This will intensify teachers working load. Some suggestions 1. The teacher pupil ratio should be strictly maintained i.e. 1:30. 2. Orientation of teachers regarding teaching and evaluation should be conducted time to time to get clarity of newly added concepts. 3. The students taking admission under this system do not have any idea before entering this course. It is difficult for them to realise all the differences existing between the annual and semester system. Adequate and necessary counselling of students should be arranged from time to time. 4. Huge percentage of student coming for higher education is first generation learners. Therefore they are not getting any academic support from their parents. This gap should be bridged. 5. The number of students opting for different subjects is not same. The students should be inspired to take up subjects that are less opted for. Balance is required between classroom with few students and classroom with overcrowded students. 6. Teachers and members of board of studies need to communicate very often regarding implementation of CBCS courses. Subject expert should also be consulted. 7. A new dimension of this Choice Based Credit System is that students of science can opt for a course from social science or arts. Therefore, a uniform pattern should be adapted for subjects of all the streams. 8. The process of computation of CGPA and SGPA should also be made clear to the students as well as parents. This system allows students to study in different

educational institutions spread across the country with the facility of easy transfer of credits earned by

the students. This system has huge significance in India as the demand for higher education is on increase. But the pros and cons should be evaluated stringently to bring the best out of this system to make it best suitable for the Indian system. The total system should be made simple and clear for the teacher and the student.

6.6 Summary The unit began with a discussion on the approaches to curriculum change. We arrived at a conclusion that the curriculum development is a dynamic process change is inevitable. We also discussed the pattern and nature of curriculum of 20 th century. We have already discussed different approaches of curriculum development, described the grassroot approach and administrative approach of curriculum development. The background for National Curriculum Frameworks in India has been discussed elaboratively. The basic guidelines, aims and objectives and the major contents of the National Curriculum Framework 2000 has been described in this section. the recommendations of National Curriculum Framework 2005 along with the major challenges of implementation of National Curriculum Framework 2005 has also been discussed here. The last topic of this unit is choice based credit system. Meaning of the term CBCS, objectives, rationale, process of evaluation under CBCS etc. are discussed in this subunit. Scores awarded for attendance and internal assessment should be objectively marked, otherwise peoples' confidence in this system will not develop. Number of teaching faculty should be immediately increased as time required for evaluation and record keeping has increased immensely. Education is meant for all round development and if we want the education system to serve this purpose then credit should be added for co-curricular activities too and this should be included in the UGC guideline.

6.7 Self-Assessment Questions

1. What are the different approaches of curriculum development?
2. Define the term 'Curriculum Framework'.
3. Briefly describe the fundamental elements of Curriculum Framework.
4. What are major the aims and objectives of National Curriculum Framework 2000
5. Mention the major contents of the National Curriculum Framework 2000
6. Describe the five guiding principles of NCF 2005.
7. NSOU ? CC-ED-07 ? 218 Mention the objectives of NCF 2005.
8. What were the reasons behind reform in curriculum areas according to NCF 2005?
9. Mention the suggestions for revising mathematics curriculum in NCF 2005.
10. Write the objective of teaching sciences as mentioned in NCF 2005.
11. Describe the science curriculum for the primary stage of education.
12. What is the reason behind the recommending Education for peace in NCF 2005?
13. Justify the relation between Habitat and learning as mentioned in this curriculum framework.
14. Mention any two suggestions for examination reforms by NCF 2005.
15. Mention the limitations of NCF 2005.
16. Mention the Characteristics of Choice Based Credit System.
17. Describe the term choice-based.
18. Name the Types of courses under CBCS
19. Describe the different grassroots approach of curriculum development.
20. Explain the different administrative approach of curriculum development.
21. What are the key principles of Curriculum Framework?
22. Evaluate the significance of Curriculum Framework.
23. Narrate the perspective of NCF 2005 on the basis of the outline of first chapter of the document.
24. Discuss the recommendation of NCF 2005 on 'Learning and Knowledge'.
25. Elaborate the concept of NCF 2005 on school and classroom environment.
26. What do you mean by systematic reforms? Describe teacher education reform as mentioned in NCF 2005.
27. Describe and discuss evaluation and assessment reform in NCF 2005?
28. What Mention the Characteristics of Choice Based Credit System re the objectives of CBCS?
29. Explain the rationale of CBCS in India.
30. Outline the concept of Credit point.
31. Describe the evaluation process in CBCS
32. Write notes on the 10 point grading system as introduced by UGC. xxxiii. Describe the Methods of computation of SGPA and CGPA. xxxiv. What are the advantages of CBCS? xxxv. Mention the disadvantages of CBCS.

<p>curriculum implementation After the curriculum has been tested and the materials are duly modified it is important that the teachers and administrators are oriented and trained for proper implementation of curriculum. To implement curriculum without introductory or supporting courses would be quite a severe risk, it may lead to the use of new materials in unsatisfactory ways. Training of the personnel involved and provisions of all necessary facilities and resources are essential for successful implementation of any curriculum. Evaluation is necessary at the time when curriculum is implemented as well as each of the</p>

As the society and the social needs change from time to time there is need for revision of curriculum. No single curriculum is suitable for all the time. The curriculum has to change in accordance with the change in social strata due to individual growth, scientific process, technological innovation and social advancement.

PREFACE In a bid to standardise higher education in the country, the University Grants Commission (UGC) has introduced Choice Based Credit System (CBCS) based on five types of courses viz. core, discipline specific, generic elective, ability and skill enhancement for graduate students of all programmes at Honours level. This brings in the semester pattern, which finds efficacy in sync with credit system, credit transfer, comprehensive continuous assessments and a graded pattern of evaluation. The objective is to offer learners ample flexibility to choose from a wide gamut of courses, as also to provide them lateral mobility between various educational institutions in the country where they can carry acquired credits. I am happy to note that the University has been accredited by NAAC with grade 'A'. UGC (Open and Distance Learning Programmes and Online Learning Programmes) Regulations, 2020 have mandated compliance with CBCS for U.G. programmes for all the HEIs in this mode. Welcoming this paradigm shift in higher education, Netaji Subhas Open University (NSOU) has resolved to adopt CBCS from the academic session 2021-22 at the Under Graduate Degree Programme level. The present syllabus, framed in the spirit of syllabi recommended by UGC, lays due stress on all aspects envisaged in the curricular framework of the apex body on higher education. It will be imparted to learners over the six semesters of the Programme. Self Learning Materials (SLMs) are the mainstay of Student Support Services (SSS) of an Open University. From a logistic point of view, NSOU has embarked upon CBCS presently with SLMs in English / Bengali. Eventually, the English version SLMs will be translated into Bengali too, for the benefit of learners. As always, all of our teaching faculties contributed in this process. In addition to this we have also requisitioned the services of best academics in each domain in preparation of the new SLMs. I am sure they will be of commendable academic support. We look forward to proactive feedback from all stakeholders who will participate in the teaching-learning based on these study materials. It has been a very challenging task well executed, and I congratulate all concerned in the preparation of these SLMs. I wish the venture a grand success.

Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor

Block-1 Evaluation

Unit-1 Assessment, Measurement & Evaluation Structure 1.1 Objectives 1.2 Introduction 1.3 Evaluation: Concepts and Significance of Measurement, Assessment and Evaluation 1.3.1 Concepts and Significance of Measurement 1.3.2 Concepts and Significance of Assessment 1.3.3 Concepts and Significance of Evaluation 1.4 Measurement versus Assessment in Education: Purpose and Scope 1.5 Interrelationship among Assessment, Measurement and Evaluation in Education 1.6 Summary 1.7 Self Assessment Questions 1.8 References 1.1 Objectives After going through the unit the students will be able : To define measurement, assessment and evaluation in education. To understand the role and significance of measurement, assessment and evaluation in teaching learning. To classify different types of assessment, test, examination and evaluation. To categorize the purpose and scope of measurement and evaluation in today's teaching learning activity. To create a relationship between measurement, assessment and evaluation. 9

NSOU CC-ED-08 10 1.2 Introduction The knowledge of measurement, evaluation and assessment is essential for the teachers to make the teaching learning an effective one. The concept of measurement has been there since days immemorial. In education, measurement and quantification are very important. Measurement involves the process of quantification. The application of the principles of measurement in the field of education is known as educational measurement. Assessment is the process of documentation of the measurement. It precedes the final decision making stage of evaluation. Evaluation is a broader concept. It does not deal with only the classroom examination system; rather it deals with the evaluation of the cognitive, affective and psychomotor domain of the student.

W

As teachers become more familiar with data-driven instruction, they are making decisions about what and how they teach based on the information gathered from their students. In other words, teachers first find out what their students know and what they do not know, and then determine how best to bridge that gap. During the process of gathering information for effective planning and instruction, the words measurement, assessment and evaluation are often used interchangeably. These words, however, have significantly different meanings.

This unit will cover the various aspects of measurement, assessment and evaluation in details. The interrelationship of measurement, assessment and evaluation will also be discussed. 1.3 Evaluation: Concepts and Significance of Measurement, Assessment and Evaluation Measurement, assessment and evaluations are very often used interchangeably in education. In reality, these words are not all synonymous. All these have different scope and characteristic features. These are as follows; 1.3.1 Concept and significance of Measurement Generally, to measure and show the weight, length and volume of an object in definite units is called measurement; for example, to show the weight of a person in kilograms, length of cloth in metres and volume of water in litres. But the field of measurement is very wide. It includes defining any characteristic of any object or person or activity in words, symbols or units. As far as explaining the qualities of objects, persons and activities is concerned, it has been in vogue from very ancient times, of course, without any definite base of measurement. In the present times, the bases of most of NSOU CC-ED-08 11 the qualities of objects, persons and activities have been defined; their standards and units have been specified; measuring tools and methods have been devised and methods to demonstrate the results of measurement in brief have been decided. Now, a characteristic of an object, person or activity is described in definite words, symbols and units in brief. Many scholars have attempted to delimit the definition of this process. According to

75%

MATCHING BLOCK 2/224

SA

EDN-201-Educational Measurement and Evaluation.pdf (D141388331)

J.P. Guilford (n.d) "measurement is the assignment of numerals to objects or events according to certain rules". Norman E. Gronlund

has defined "

100%

MATCHING BLOCK 3/224

SA

EDN-201-Educational Measurement and Evaluation.pdf (D141388331)

measurement results are some score or numerical value and quantitative descriptions of the pupils".

Most scholars are in agreement with the definition given by James M. Bradfield (n.d). In his words :

Measurement is the process of assigning symbols to the dimension of phenomenon

in order to characterise the status of phenomenon as precisely as possible.

In this definition of measurement

only the measurement of qualities of objects and activities has been included, and not the measurement of qualities of persons. Though the persons are included in the objects of the universe; however, the objects are meant to include only concrete materials, so it is necessary to show the measurement of qualities of the persons separately. This definition of Bradfield does not point to any such basis

of measurement. Educationists opine that it should also be necessarily included in it and in that case measurement should be defined as: Measurement is the process by which a characteristic of an object, person or activity is perceived and understood on specific standards and is described in standard words, symbols or definite units.

Factors of Measurement: The above definition of measurement shows that there are four factors of measurement: (1)

The object, person or activity any of which characteristic has to

be measured. (2) The characteristic of that object, person or activity which has to be measured. (3) The tools and devices of measuring such characteristics. (4) The person who measures it.

Educational measurement is

known as mental measurement. It is concerned with the way to measure learning.

EDN-201-Educational Measurement and Evaluation.pdf (D141388331)

In the educational system, measurement is quantitative assessment of performance of the students in a given test. It can be used to compare performance between different students and

to indicate the strength and weaknesses of the students. It helps in classifying students into homogenous groups to assign educational and vocational guidance and to provide remedial measures to the low

NSOU CC-ED-08 12 achievers. There are four common levels of measurement. These are as follows: I. Nominal Scales:

Nominal scales are used to classify objects. It is the least precise or lowest order scale. Here, the numbers assigned to the individuals are not bound by any rules and there is no logical consideration. For example, the serial numbers given to the cricket players are only to identify the players. Nominal level is sometimes called the classification level and each class is represented by a letter, a name, a number or even a geometrical design. This scale is used for students' classification, job classification, for different types of classification etc. II. Ordinal scale: In this scale ranking or grading takes place. It indicates that one observation represents more or less of a variable than the other, without indicating how much more or less. Thus ordinal scale corresponds to quantitative classification of a set of objects with reference to some attribute or rule. For example, when we serially arrange five bags of cereals according to weight, the heaviest bag is represented by numeral 1, the next by 2 and so on. Accurate and precise comparison is not possible with ordinal scale. III. Interval scale: Interval scales have an arbitrary zero, not absolute zero. It is also known as equal interval scale because these scales show that a person or item is so many units larger or smaller, heavier or lighter etc. than the other one. The intervals are assumed to be equal over the scale. IV. Ratio scale: the ratio scale is most concrete and refined among the four basic scales. It has an absolute zero point representing complete absence of the property being measured. Measuring the height and weight of students and making student wise records, is an example of ratio scale. If students are 20 kg and 30 kg of weight

70%

MATCHING BLOCK 5/224

SA

Assessment and Evaluation - KSR -Corrected-1.doc (D26588141)

then the difference in their weight is 10kg and the weights are in the ratio 2:3.

Significance of Measurement: The significances of measurement are as follows: It measures students' achievement. Students' achievement can be determined whether he has reached the goals of the learning tasks or not through measurement. It evaluates instruction. The effectiveness or ineffectiveness of instruction is ascertained through measurement.

NSOU CC-ED-08 13 It motivates learning. Upon knowing the results of the achievement test, the student's interest is aroused especially if he gets a high score; otherwise, if his score is low, he strives hard to get a higher score in the next examinations. Measurement is an essential element of research. No research work in education and psychology is possible without some sort of measurement. It helps parents to understand student's growth, interests and potentialities. The major responsibility of school and teacher is to help the parents understand their children. Understanding a youth means understanding his progress in the various areas of the curriculum, his desires and motives and behavior they lead to, his potentialities for learning, as well as his achievement. It helps the learners in diagnosis of the nature of difficulties. The weakness of the learner can be identified through measurement. Measurement in general evaluates educational goals and purposes, determines the extent to which accepted educational objectives are implemented. It predicts success. Success and failure of the student is predicted through measurement. For instance, a student who always gets high scores in all his subjects may mean that he is sure to pass and passing means success. There are individual differences in the traits and qualities of different individuals. These differences can be ascertained by means of comparison. Comparison leads us to definite conclusions. It helps us to find out which one is superior and which is inferior. Thus, it helps us to select suitable people for a particular course. It generates information about how to improve programmes that do not meet criteria. 1.3.2 Concept and significance of Assessment

Assessment is an ongoing process aimed at understanding and improving student learning. It involves making expectations explicit and public; setting appropriate criteria and high

standards for learning quality; systematically gathering, analyzing, and interpreting evidence to determine how well performance matches those expectations and standards, and using the resulting information to document, explain, and improve performance.

A critical Dictionary of Education (1986) explains the concept of Assessment as "students may be assessed for a different number of reasons and in a

NSOU CC-ED-08 14 number of different ways. We may for example, wish to test the student attainment, to gather data to aid enquiry into our teaching or for purposes of accountability, to make predictions concerning the students' future, to set standards, or to motivate students. The range of types of assessment runs from the conventional written essay, through oral tests or practical projects, to various types of objective tests." Examinations and essays along with speeches and projects are forms of assessment. Assessment is a critical step in the learning process. It determines whether or not the course's learning objectives have been met. A learning objective is what students should know or be able to do by the time a lesson is completed. Assessment affects many facets of education, including students' grades, placement, and advancement as well as curriculum, instructional needs, and school funding. Significance of Assessment

Assessment is an integral part of instruction, as it determines whether or not the goals of education are being met.

96% MATCHING BLOCK 6/224

W

Assessment inspires us to ask these hard questions: "Are we teaching what we think we are teaching?" "Are students learning what they are supposed to be learning?" "Is there a way to teach the subject better, thereby promoting better learning?"

Hence, the significances of assessment are as follows:

99% MATCHING BLOCK 7/224

W

Today's students need to know not only the basic reading and arithmetic skills, but also skills that will allow them to face a world that is continually changing. They must be able to think critically, to analyze, and to make inferences. Changes in the skills base and knowledge our students require new learning goals; these new learning goals change the relationship between assessment and instruction. Teachers need to take an active role in making decisions about the purpose of assessment and the content that is being assessed.

Assessment and its associated feedback are essential to student learning. However, one may find that more time is taken up with the areas of assessment associated with quality assurance, rather than its potential to support students' learning. Well designed assessment has numerous benefits aside from the obvious one of providing a measure of students' progress as it can be a means to engage students with their learning. Ideally then, teacher should aim to support active learning rather than assessment of learning to ensure that the assessment process is an integral part of students' education. A student undertaking any form of study will be subject to assessment in one form or another. Similarly, NSOU CC-ED-08 15 any member of the teaching staff will be engaged at some point in assessment related work. For students it can be a significant determinant of what, when and how they learn. Getting assessment 'right' is therefore essential, both for students and the teacher. Well-designed assessment can encourage active learning especially when the assessment delivery is innovative and engaging. Peer and self-assessment, for instance, can foster a number of skills, such as reflection, critical thinking and self-awareness as well as giving students responsibility and insight into the assessment process. Discussing the ways in which the teacher is assessing with students can also help to ensure that the aims and goals of assessments are clear. Utilising assessment that makes use of technology, such as the use of online discussion forums or electronic submission of work, can teach students new skills. Well designed assessment can prevent plagiarism by reducing the ways in which students can gather and report information. At the end of the day, taking some time to think about why, what and how the teacher is going to assess students is a worthwhile investment of time. It can ensure assessing the skills and knowledge that are intended and it could open up new possibilities for different ways to assess students, some of which may be more efficient and effective than the current methods. Assessment is a key component of learning because it helps students learn. When students are able to see how they are doing in a class, they are able to determine whether or not they understand course material. Assessment can also help in motivating students. If students know they are doing poorly, they may begin to work harder. For example, Johnny is a chemistry student. He just took his first examination in his class. He earned a 56%; he needs a 79% to pass the class. The low test score lets Johnny know that he missed something important he should have learned. Perhaps, he did not understand the material, or maybe he did not study long enough or did not give best effort. Whatever the case, the assessment results let Johnny know that he did not successfully learn the material and that he must try something new in order to earn a better score. Just as assessment helps students, assessment helps teachers. Frequent assessment allows teachers to see if their teaching has been effective.

NSOU CC-ED-08 16 Assessment also allows teachers to ensure students learn what they need to know in order to meet the course's learning objectives. For example, a teacher after finishing one unit, gives a 50-point multiple-choice test. Upon grading the examination, he or she realized the average class grade was a 68%, far below the cutoff line for passing. The teacher can easily see that students didn't fully learn the unit. This tells the teacher that he or she needs to re-plan and re-visit the unit and determine why students failed the examination. Perhaps the teacher may need to try a different teaching strategy, or perhaps she did not spend enough time on difficult material.

1.3.3 Concept and significance

of Evaluation: We are aware that measurement is used to express a trait of an object, person or activity in standard words, symbols or units. In evaluation, these results are analysed and this analysis is done on the basis of certain social, cultural or scientific standards (Norms) and by this analysis, the relative condition of the trait of the object, person or activity is clarified. James M. Bradfield has defined this process of evaluation in the following words: "

Evaluation is the assignment of symbols to phenomenon in order to characterise the worth or value of the phenomenon usually with reference to some social, cultural and scientific standards" (

James M.

Bradfield, n.d).

If we want to further clarify this definition in simple terms, we can do it in the following words: Evaluation is the process in which the analysis of the result obtained from measurement of a trait of an object, person or activity is done on the basis of certain social, cultural or scientific standards (Norms), and the relative position of the object, person or activity is determined as relative to that trait.

In the field of education, generally, the measurement of educational achievements of the students is called evaluation. The first thing in this context is that the measurement is the first step of evaluation; it is not evaluation in itself. In evaluation, the results of measurement are analysed according to predetermined standards (Norms). Secondly, not only the measurement of educational achievements of the students is done, but their intelligence, interest, aptitude and personality, etc. are also measured and evaluated. Besides the traits of students, the activities of other people concerned with education such as administrators, teachers, other personnel and guardians are also measured and evaluated. The measurement and evaluation of educational policy, the aims of education, the curriculum at various levels and teaching methods are also carried out and suitable suggestions are given. Therefore, the evaluation in the field of education should be defined as follows:

NSOU CC-ED-08 17

Educational evaluation is the process in which measurement of the decisions related to education and of the traits and activities of the persons concerned with education is carried out and the results of such measurement are analysed on the basis of predetermined standards (Norms) and on its basis the relative results are declared and suggestions for improvement in them are given. Generally, people use the words educational evaluation and measurement in identical meanings. However, they have the difference of the whole and the part. Measurement is the first step of evaluation, evaluation is a process to analyse the results of measurement.

From the functional steps viewpoint, the process of measurement has only three steps - (i) selection or construction of suitable measurement tool or device, (ii) use of measurement tool or device, and (iii) recording of administration and result. Evaluation has three additional steps besides the above.

These are; (i)

100%

MATCHING BLOCK 8/224

W

Selection and use of suitable standards (Norms) for analysing the measurement results, (ii) analysis of measurement results on the basis of these standards (Norms), and (iii) prediction, suggestions or guidance on the basis of this analysis. The analysis of results of educational measurement under educational evaluation cannot be done as of the results of physical measurement, because the physical measures are whole measures, and educational measures are relative in nature.

Now statistical methods are used for their analysis.

Factors of Evaluation Two processes have to be undertaken in evaluation; first, the measurement and the second, analysis of the information or data obtained from measurement. We have already discussed that there are four factors of measurement;

now two more

factors of analysis of the data or result received from the measurement

are added for evaluation. Hence the factors of evaluation are as follows: (1)

The object, person or activity any of which characteristics has to be measured. (2) The characteristic of the object, person or process which has to be measured. (3) The tools and devices of measuring such characteristics. (4) And the person who measures it. (5)

96%

MATCHING BLOCK 10/224

W

Those standards (Norms) on the basis of which the results of measurement are analysed. (6) Those devices (logical, mathematical or statistical) with the use of which such analysis is carried out. NSOU CC-ED-08 18 Subjective and Objective Evaluation We know that in evaluation, the analysis of results obtained from measurement is carried out on the basis of certain social, cultural or scientific standards (Norms). The first thing to keep in mind in this context is that the social and cultural standards (Norms) are not fully clear and definite in themselves; and secondly, the persons take them according to their own views and use them accordingly. It is clear then, that the evaluation based on social and cultural standards (Norms) is subjective. On the other hand, the scientific standards (Norms) are always clear and definite by themselves and as such the evaluation done on their basis is objective. Formative Evaluation Formative evaluation is such evaluation which is conducted before giving final Shape to an educational policy or programme, curriculum, teaching method, teaching aid or evaluation method. For it, the evaluator first of all prepares the preliminary draft of the proposed educational policy, planning or programme, curriculum, teaching method or evaluation method; then he analyses each of its steps and receives approval of the specialists. This approval is received with the help of

an

interview, questionnaire or rating scale. Summative Evaluation Summative evaluation is such evaluation which is conducted in order to test the utility of an already existing educational policy, planning or programme, curriculum, teaching method, teaching aid or evaluation method. The evaluator constructs the most suitable measurement tool or method based on interview, questionnaire or rating scale for

evaluation

of the

educational policy, planning or programme, curriculum, teaching method, teaching aid or evaluation method.

After this, he

tests its utility on the basis

of related standards (Norms) and statistical calculations. Finally, he decides whether such educational policy, planning or programme, curriculum, teaching method, teaching aid or evaluation method should

continue or not, and if it is to continue, what should be its form. Significance of Evaluation The following significance of the Evaluation are observed:- (1) To test the educational importance of the activities of educational administrators, other personnel and guardians from time to time, and to suggest for improvement.

NSOU CC-ED-08 19 (2) For analysis of

the educational objectives, to test their utility, and to suggest for timely change. (3)

To

find out the effect of the curriculum at different levels in the achievement of educational objectives, to give suggestions for improvement and to enlighten for research. (4) For studying the effect of teaching methods being used from time to time, to find out useful/

or

useless methods, to suggest for improvement and to enlighten the field for research. (5) For finding out the utility of textbooks in the achievement of educational objectives, to give suggestions for improvement and to guide for research.

(6) For studying the effect of the use of various means in teaching as to their place and kind of use, and to suggest measures for improvement. (7)

It helps teachers to discover the needs of the students. The purpose of any programme of evaluation is to discover the needs of the pupils being evaluated and then to design learning experiences that will satisfy these needs. 1.4 Measurement versus Assessment in Education: Purpose and Scope Very often assessment and measurements are used interchangeably. According to M.Q.Panton (1985), "measurement implies assigning a numerical quantity. While instruments such as rulers' stopwatches can be used to determine height, speed and so on, any intellectual capacities or other quantities of educational interest must be measured indirectly. Thus tests are typically used on measures such as dimensions and levels of intelligence. It may be included in an assessment." Whereas, he has opined that "as far as possible the term assessment should be reserved for application to people. It covers activities included in grading (formal and non-formal) examining, certifying and so on. Students' achievement on a particular course may be assessed."

Purpose of Measurement The purpose of measurement are as follows:- (1) To measure the ability of students, finding out their interests and aptitude at the time of admission, and admit them on its basis.

NSOU CC-ED-08 20 (2) To measure their intelligence and personality after admission and accordingly divide them into specific classes, and to assist in their personality development. (3) To find out from time to time the effect of teaching on the students (educational achievements or change of behaviour), and to guide the students on its basis and to inspire them to learn. (4) To measure and evaluate the educational achievements of students from time to time and to provide them feedback. (5) To

96%

MATCHING BLOCK 13/224

W

find out the hindrances in the educational progress of the students and remedy them. **Scope of Measurement** Generally, it is understood that in the field of education only educational achievements of the students are measured, and are expressed in terms of marks. However, in the field of education, in present times, various variables, such as intelligence, interest, aptitude, attitude and personality of the students are also measured. Moreover, the aims of education, usefulness of the curriculum and of the teaching methods, basis of educational policy, the educational activities of the persons concerned such as administrators, teachers, and guardians, are also measured. There is no area in the field of education which is not subject to measurement in present times and the result of which is not expressed in more and more objective terms. Therefore, we can define educational measurement as follows: Educational measurement is that process by which the usefulness of various factors of educational process, the usefulness of various activities of persons concerned, and the intelligence, interest, attitude, aptitude, personality and educational achievements of the students are measured on the basis of definite standards and are expressed in definite words, symbols or units. Measurement is an extensive process which has several tools and devices. The physical aspects of a person, such as height, weight and temperature are measured with the help of scale, weights and thermometer respectively and his interest, aptitude, intelligence, personality and educational achievement are measured with the help of Interest Tests, Aptitude Tests, Intelligence Tests, Personality Tests and Achievement Tests respectively. Evidently, measurement is a process to measure the characteristic of an object, person or activity; and testing is only a device or method of measurement. They are different like

the whole and its part. Thorndike and Hagen (1979) have provided six propositions that seem to use us to provide the foundations for a contemporary view of educational and psychological measurement procedures and their role in our schools and our society.

NSOU CC-ED-08 21 These propositions are as follows: 1. Various types of decisions have to be made 2. The more relevant and more accurate the information, the better is the decision. 3. Measurement instruments and procedures provide an important set of tools for improving the information available for decision making. 4. The use of any type of information for decision making needs to know what that information signifies and how far it can be trusted. 5. The facts and values involved in any decision are complex. 6. The wisdom of the decision maker is crucial. Moreover, according to Thorndike and Hagen measurement in any field involves following three common steps. A. Identifying and defining the quality or attribute that is to be measured. B. Determining a set of operations by which the attribute may be made manifest and perceivable C. Establishing a set of procedures or definitions for translating observations into quantitative statements of degree or amount.

In the present age, measurement has influenced the progress in education and psychology too. Today, the age of theoretical education is over, and effort is being made to make education and psychology more and more practical. Under education and psychology different human behaviours and problems are studied. For this, it becomes necessary to measure human behaviours.

Educational measurement is not a new concept. The teacher has been testing students since times immemorial in order to know their progress in studies, and to see what type of behavioural changes have occurred in students, if they are optimal and

in what direction these behavioural changes have taken place.

A teacher wants to know the shortcomings of the method of teaching he uses, for which these tests have been found to be very important. These tests have become all the more important in the present age, and it is expected from the future teacher or pupil-teacher that he

or she

100%

MATCHING BLOCK 9/224

W

would gain skill in constructing several types of tools of measurement and evaluation. The introduction of evaluation in the educational world is comparatively new. In fact, it was introduced in this field in order to get rid of the serious shortcomings of measurement. From the beginning

NSOU CC-ED-08 22

of the twentieth century, three types of important progresses were noted down in the field of educational measurement, they were testing, measurement and evaluation. This progress in education is known as progress in measurement.

However, in the present times, evaluation is considered to be an important contribution of psychology and education.

Recently, the attention of educationists and psychologists has been drawn towards evaluation. Purpose of

Educational Assessment The purpose

of Educational assessment is as follows: (a) To prepare students for the new pattern of competency-based teaching and competency-based assessment. (b) To make evaluation an integral part of the teaching-learning process. (c) To make evaluation a cooperative and democratic process, involving various stake-holders of

the evaluation programme. (d) To collect more valid and reliable evidence

about total development of the learners. (e) To form sound judgements and take timely decisions about learners' instructions and learning environments. Scope of Assessment Comprehensiveness is the significant factor in the

assessment of the whole child vis-à-vis his total development to form the basis of assessment. Accordingly, the following areas of assessment will be included in the CCE. Assessment

can be of two types; assessment of scholastic aspect and non scholastic aspects of human behavior.

Assessment of Scholastic Aspects Use of the following tools will be made in assessment of scholastic aspects. Different

types of tests required for assessing the scholastic aspects are given below: (a) Readiness tests: For Standard V the prerequisite learning is indicated by Standard IV learning competencies. Before taking up teaching of a unit, a pretest

based on pre-requisite learning competencies will be used and inadequacies in students' entry behaviours would be analysed. Based on learning gaps remedial teaching is undertaken. This will also apply to Standards VI and VII, VIII, IX, X

etc.

NSOU CC-ED-08 23 (b) Unit-tests: Since unit teaching approach is envisaged, unit-test should be used at the end of each learning unit. It could be written or oral for review and reinforcement purposes. Each unit-test will be based on specific content elements of each unit, used for testing students on pre-determined learning outcomes formulated for each unit in terms of competencies. Focus of unit- tests will be on diagnosis of students' inadequacies in learning and improvement of their achievement through remedial action to enable most of the students to acquire mastery of concepts and skills. Sample criterion- referenced tests will be developed and supplied to schools and teachers oriented in unit testing. Assessment of Non-Scholastic Aspects: This would include assessment of the following aspects which may be introduced in the

94%

MATCHING BLOCK 11/224

W

second phase. 1. Physical health, covering basic understanding about nutrition and health, physical fitness, development of positive attitudes etc. Habits like health habits, study habits and work habits. 2. Interests in artistic, scientific, musical, literary and social service activities. 3. Attitudes towards students, teachers, class-mates, programmes, school property etc. 4. Character-building values like cleanliness, truthfulness, industriousness, cooperation, equality etc. 5. Participation in games, sports, gymnasium, literacy, scientific, cultural, social and community service activities.

Issues of Present System of Assessment (a) Unless protagonists of reform develop a deep conviction and full faith in teachers' assessments and conceptualise dichotomy observable in theory and practice, establishment of a pedagogically sound system of assessment would be difficult. (b) Unless a theoretically sound, indigenous, growth-oriented and functionally operative model of assessment is developed and made the basis of continuous and comprehensive evaluation; we are not likely to achieve the intended objectives of assessment to the desired extent. (c)

Until and

unless within a given state, board of school education or the

NSOU CC-ED-08 24

concerned examining agency where curriculum requirements are the same for a particular stage of school education, a common blueprint of CCE based on the same design of assessment is adopted in all schools under the same board, comparability of attainment targets and pupils' achievement across the schools would not be possible, which in turn would pass it difficult to pass valid norm-referenced judgments. (d) No system of school-based assessment would succeed unless we have full faith in the competency of practising teachers and provide them continued motivation, encouragement and recurrent training for empowering them to implement

school based assessment systems

effectively to achieve the desired attainment targets. (e) Extreme subjectivity in internal assessment reigns supreme in school based assessment,

95%

MATCHING BLOCK 12/224

W

which indeed is the stumbling block in implementing this scheme. Unless multiple scoring cooperative testing and quality question-banks are developed and used for assessment of scholastic achievement, and illuminative approach reflecting multiple views of participant observers are used in assessing non-cognitive outcomes and personal social qualities, it would not be possible for teachers to make objective assessment, form sound judgements and take right decisions. (f) Unless regular feedback of formative evaluation (which is an integral part of teaching) and functional research support are provided continually for diagnostic purpose and remedial teaching, further improvement in pupils' achievement and instructional strategies would not be possible. Current Trends in Educational Assessment 1. Visualise the context and background of the institution 2. Take cognizance of time frame, students' intake, input resources etc. 3. Study curriculum objectives of the prescribed courses of studies. 4. Formulate clearly subject-wise objectives in achievable and testable terms, covering both cognitive and non-cognitive domains. 5. Specify subject-wise objective in terms of intended learning outcomes, i.e. Essential Learning competencies and Desirable Learning Competencies. 6. Clarify the purpose and objectives of School-based Assessment. NSOU CC-ED-08 25 7. Delineate the areas and components of assessment for each subject. 8. Choose the relevant mode of assessment to be used at different stages of instruction and evaluation of pupils and programmes. 9. Identify relevant techniques and tools of assessment for measuring both scholastic and co scholastic attainments of pupils. 10. Ensure needed validity, reliability and usability while constructing measuring instruments and other assessment devices. 11. Apply relevant tools and techniques to collect needed evidence about pupils' attainments on cognitive and non-cognitive outcomes of learning. 12. Analyse evidence in terms of specified intended learning outcomes. 13. Interpret the evidence in terms of assessment objectives. 14. Form appropriate judgments about pupils' performance in terms of self- referenced, criterion referenced and norm-referenced judgements. 15. Summarise results and other evidence into meaningful individual and group profiles for different areas and aspects. 16. Report meaningfully and regularly to students, parents and other functionaries concerned, for timely feedback and correctives. 17. Take appropriate decisions about further diagnosis (if needed), remedial measures, grading, promoting, certification, programme budgeting and improvement of instructional, evaluation and implementation strategies. 18. Initiate development of institutional question banks for improving the quality of test material and maintain performance standards. 19. Use summative evaluation at school, school complex, block and district levels through cooperative testing and participative strategy for maintaining and comparing performance standards. 20. Undertake annual institutional self-evaluation involving teachers, principals, students, parents, and

community and evaluation experts to assess the efforts, efficiency and effectiveness of the school in terms of the scheme of SBA and review it for making the scheme more functionally operative.

NSOU CC-ED-08 26 1.5 Interrelationship Among Assessment, Measurement and Evaluation in Education

80%

MATCHING BLOCK 14/224

W

Assessment is the process of documentation, usually in measurable terms, knowledge, skills, attitude and beliefs.

It refers to the task of processes of estimation of something. As the dictionary meaning of the term is to 'estimate the value or quantity of something', it is used to estimate the amount of learning through any process may be instructional or otherwise. Assessment

55%

MATCHING BLOCK 15/224

SA

JSNR_SSOU_MBA_EA_Educational Evaluation.pdf
(D28924038)

has a narrower meaning than evaluation but broader meaning than measurement. Since the word assess means 'to assist the judge'.

So it seems appropriate in evaluation studies to the process of gathering the data and fashioning them into an interpretable form. Judgement can then be made on the basis of the assessment. It precedes the final decision making stage in evaluation.

94% MATCHING BLOCK 16/224

W

Relationship between Assessment and Measurement: Assessment, measurement, evaluation and research are part of the processes of science and issues related to each topic often overlap. Assessment refers to the collection of data to better understand an issue, while measurement is the process of quantifying assessment data and evaluation refers to the comparison of that data to a standard for the purpose of judging worth or quality. Whereas, research refers to the use of that data for the purpose of describing, predicting, and controlling as a means toward better understanding the phenomena under consideration. Measurement is done with respect to "variables" (phenomena that can take on more than one value or level). The collecting of data (assessment), quantifying those data (measurement) and developing understanding about the data (research) always raise issues of reliability and validity. Reliability attempts to answer concerns about the consistency of the information (data) collected, while validity focuses on accuracy or truth. The relationship between reliability and validity can be confusing because measurements (e.g., scores on tests, recorded statements about classroom behavior) can be reliable (consistent) without being valid (accurate or true). However, the reverse is not true: measurements cannot be valid without being reliable. The same statement applies to findings from research studies. Findings may be reliable (consistent across studies), but not valid (accurate or true statements about relationships among "variables"), but findings may not be valid if they are not reliable. At a minimum, for a measurement to be reliable a consistent set of data must be produced each time it is used; for a research study to be reliable it should produce consistent results each time it is performed. For

NSOU CC-ED-08 27

96% MATCHING BLOCK 17/224

W

example, the variable "gender" has the values or levels of male and female and data could be collected relative to this variable. Data on variables are normally collected by one or more of four methods: paper/pencil, systematic observation, participant observation, and clinical. Three issues are important for classroom assessment (data collection with regards to student learning that is under the control of the teacher.) The first relates to what data teachers will use for making judgements (qualitative or quantitative); a second issue revolves around when they will collect data (formative vs. summative assessment.) A third issue revolves around the reference to be used for making evaluations (criterion- versus norm-referenced); a fourth relates to how teachers will communicate their judgements to others (authentic assessment, portfolios, and grading).

Fig 1. Relationship between Measurement and Assessment Source: <http://ignoustudent2010.blogspot.com/p/bed-1st-year-es-333.html#:~:text=Assessment%20refers%20to%20the%20collection,for%20the%20purpose%20of%20describing%2C> As the above diagram

98% MATCHING BLOCK 19/224

W

shows, tests constitute only a small set of options, among a wide range of other options, for a language teacher to make decisions about students. The judgment emanating from a test is not necessarily more valid or reliable from the one deriving from qualitative procedures since both should meet reliability or validity criteria to be considered as informed decisions. The area circumscribed within quantitative decision-making is relatively small and represents a specific choice made by the teacher at a particular time in the course while the vast area outside which covers all non-measurement qualitative assessment procedures representing the wider

NSOU CC-ED-08 28

98%

MATCHING BLOCK 18/224

W

range of procedures and their general nature. This means that the qualitative approaches which result in descriptions of individuals, as contrasted to quantitative approaches which result in numbers, can go hand in hand with the teaching and learning experiences in the class and they can reveal more subtle shades of students' proficiency. This in turn can lead to more illuminating insight about future progress and attainment of goals. However, the options discussed above are not a matter of either-or (traditional vs. alternative assessment) rather the language teacher is free to choose the one alternative (among alternatives in assessment) which best suits the particular moment in his particular class for particular students. Based on the above discussion, grading could be considered a component of assessment, i.e., a formal, summative, final and product-oriented judgment of overall quality of worth of a student's performance or achievement in a particular educational activity, e.g., a course. Generally, grading also employs a comparative standard of measurement and sets up a competitive relationship between those receiving the grades. Most proponents of assessment, however, would argue that grading and assessment are two different things, or at least opposite poles on the evaluation spectrum. For them, assessment measures student growth and progress on an individual basis, emphasizing informal, formative, process-oriented reflective feedback and communication between student and teacher. Ultimately,

the conception probably depends more on teaching philosophy than anything else.

97%

MATCHING BLOCK 20/224

W

Assessment and measurement are closely linked concepts in education. Both can be used for a variety of purposes, including: Reporting to students, parents and the public; As a method for supporting students' understanding of educational goals and their own progress; As a means for teachers to understand the effectiveness of their own practice; Strengthening school-wide collaboration; Providing the data necessary to discern whether the system is working equitably for all students.

95%

MATCHING BLOCK 21/224

W

Assessment and measurement play a key role in informing educators' practice in classrooms, students' understanding of their own learning, parents' capacity to support their children's success in school, and policy-makers' decision-making. NSOU CC-ED-08 29 Competencies in creativity, social-emotional learning, citizenship, and health should be assessed for the same reasons that reading, writing, and mathematics are assessed to provide relevant, specific information about student learning in these vital areas. Assessment of these competencies is complex, and we cannot rely on the tools and strategies typically used to assess other skills or knowledge. At the classroom level, a range of assessment strategies can be used to understand students' growth in these areas. It is possible to assess these competencies at a jurisdictional level; however standardized assessments or surveys can only give information of limited quality about complex competencies.

Relationship between Assessment and Evaluation: Assessment is a methodical way of acquiring, reviewing and using information about someone or something, so as to make improvement where necessary. The term is interpreted in a variety of ways, i.e. educational, psychological, financial, taxation, human resource and so on. In general, assessment is an ongoing interactive process, in which two parties (assessor and assessee) are involved. The assessor is someone who assesses the performance based on the defined standards, while assessee is someone who is being assessed. The process aims at determining the effectiveness of the overall performance of the assessee and the areas of improvement. The process involves, setting up goals, collecting information (qualitative and quantitative) and using the information for increasing quality. The term 'evaluation' is derived from the word 'value' which refers to 'usefulness of something'. Therefore, evaluation is an examination of something to measure its utility. Therefore, evaluation is a systematic and objective process of measuring or observing someone or something, with an aim of drawing conclusions, using criteria, usually governed by set standards or by making a comparison. It gauges the performance of a person, completed project, process or product, to determine its worth or significance. The evaluation includes both quantitative and qualitative analysis of data and undertaken once in a while. It ascertains whether the standards or goals established are met or not. If they are met successfully, then it identifies the difference between actual and intended outcomes.

NSOU CC-ED-08 30 The significant differences between assessment and evaluation are discussed in the points given below: 1. The process of collecting, reviewing and using data, for the purpose of improvement in the current performance, is called assessment. A process of passing judgement, on the basis of defined criteria and evidence is called evaluation. 2. Assessment is diagnostic in nature as it tends to identify areas of improvement. On the other hand, evaluation is judgmental, because it aims at providing an overall grade. 3. The assessment provides feedback on performance and ways to enhance performance in future. As against this, evaluation ascertains whether the standards are met or not. 4. The purpose of assessment is formative, i.e. to increase quality whereas evaluation is all about judging quality, therefore the purpose is summative. 5. Assessment is concerned with process, while evaluation focuses on product. 6. In an assessment, the feedback is based on observation and positive & negative points. In contrast to evaluation, in which the feedback relies on the level of quality as per set standard. 7. In an assessment, the relationship between assessor and student is reflective, i.e. the criteria are defined internally. On the contrary, the evaluator and student share a prescriptive relationship, wherein the standards are imposed externally. 8. The criteria for assessment are set by both the parties jointly. As opposed to evaluation, wherein the criteria are set by the evaluator. 9. The measurement standards for assessment are absolute, which seeks to achieve the quintessential outcome. As against this, standards of measurement for evaluation are comparative, that makes a distinction between better and worse. So, after reviewing the points above, it would be clear that assessment and evaluation are completely different. While evaluation involves making judgements, assessment is concerned with correcting the deficiencies in one's performance. Although, they play a crucial role in analysing and refining the performance of a person, product, project or process.

NSOU CC-ED-08 31 Relationship between Measurement and Evaluation: Distinguishing between measurement and evaluation, Wrightstone has written: "

The emphasis

in measurement is upon single aspect of subject matter achievement or specific skills and abilities,

but the emphasis

in evaluation is upon

broad personality changes and major objectives of

an

educational programme.

These include not only subject matter achievement but also

attitudes, interests, ideals, ways of thinking, work-habits and personal and social adaptability,

e.g. by testing a child in mathematics we may measure his mathematical ability and nothing else. We may not have any idea about the interests, abilities etc. of the child in mathematics by administering this single test."

Difference between Educational Evaluation and Testing: Educational evaluation is an extensive concept which includes the

measurement and analysis of educational policy, educational planning educational objectives, educational curriculum, teaching methods, educational administration, activities of teachers and guardians, students' intelligence, interest, aptitude and personality, etc. and their educational achievements are carried out and on the basis of the results so received suggestions are given and predictions are made. On the other hand,

testing is only one of the methods of measurement.

Difference between Educational Evaluation and Examination: Educational evaluation is a

broad concept. Under it, the

measurement and analysis of educational policy, educational planning, educational objectives, activities of educational administrators, teachers and guardians, and students' intelligence, interest, aptitude and personality, etc. is

carried out, and in the end, predictions, suggestions and guidance are provided. On the other hand,

examination is used for measurement and evaluation of only educational achievements. Though there is a difference between measurement and evaluation, because measurement is a part of evaluation and is the first step of evaluation,

so now it is used as a joint concept in the field of education as 'measurement and evaluation'. Secondly, there is no significance of measurement in the field of education until its results are not analysed. When the results of measurement are analysed, it is called evaluation. Thirdly, whether we join measurement with evaluation or not, the process of measurement is included in it.

Generally the term 'measurement' is confused with 'Evaluation', while they are quite apart from each other. Measurement is a quantitative form of an object, while evaluation presents its qualitative together with its measurement. In brief, measurement is numerical and evaluation

is

quantitative.

Measurement tells us how much of an object, while evaluation tells us how good it is.

Besides, evaluation pays attention to the fact of realization of

NSOU CC-ED-08 32 objectives, while by measurement is meant only the number of specific objectives that have been realized. Measurement is incomplete without evaluation. Difference between Measurement and

Evaluation: 1.

Measurement does not express any clear assumption about a student. Clear assumptions about a student can be formed on the basis of evaluation. 2. Measurement does not require much energy and time.

Evaluation requires more energy and time. 3. Measurement is objective, evaluation is subjective by large. 4. Measurement is concerned with only the amount, quantity or frequency of a variable. Evaluation matches such an amount, quantity or frequency with relevant criteria for the purpose of making some value judgement about measured amount. 5.

Measurement is static at the most periodical. Evaluation is a continuous and never ending process. 6. At a time measurement involves a single aspect of achievement, a single variable that is mathematical ability or scientific skill etc.

whereas, evaluation is a more comprehensive concept. It involves not only achievement but also the

83%

MATCHING BLOCK 26/224

SA

Full Book- Measurement and Evaluation in Educa ...
(D112222652)

attitudes, interests, ideas, way of thinking, work habits, personal and social adaptability. 7.

The scope of measurement is limited, only some dimensions of personality can be tested under measurement.

The scope of evaluation is wide, in it; the entire personality of a student is tested. 8. Measurement is content-oriented.

Evaluation is objective-oriented. 9. Measurement is a means, and not an end in itself.

Evaluation is an

end in itself. 10. The purpose of measurement is to gather evidence. Evaluation is to deduce inferences from evidence, that is, its work is appraisalment of evidence. 11. Measurement may not be an essential part of education. Evaluation is the integrated or necessary part of education. 12. Measurement answers the question 'how much', such that Sunanda has scored 56 marks in

English. Therefore, measurement is quantitative.

NSOU CC-ED-08 33

34%**MATCHING BLOCK 22/224****W**

Evaluation answers the question 'what value' like Sunanda has scored 50% marks in English and passed second division in the class. Therefore, evaluation is qualitative. 13. Prediction cannot be made meaningfully on the basis of measurement. Evaluation can predict meaningfully. 14. Measurement acquaints with a situation. This is isolated from the entire situation.

Evaluation acquaints us with the entire environment. It judges its worth or value. 15.

Measurement indicates those observations which are displayed numerically.

Evaluation comprises of both quantitative and qualitative observations. 16. Measurement can be conducted at any time.

Evaluation is a continuous process. 17.

Measurement is absolute, evaluation is relative. 18. Measurement does not look before and after. Evaluation on the other hand takes into account the past achievements and also the future goals. 19. The unit of measurement is fixed and constant throughout measurement. In evaluation, the unit of measurement is not fixed and varies during the process of evaluation. 20. Measurement is more accurate because of its true zero point. Evaluation is less accurate because of its arbitrary zero point. 21. Measurement is direct, evaluation is indirect.

Relevance between Measurement and Evaluation: Measurement and Evaluation both are used for assessing the internal qualities like I.Q., aptitude, attitude and intelligence of students. The main purposes of measurement and evaluation are:- Placement of students which involves bringing students appropriately in the learning sequence and classification or streaming of students according to ability or subjects. Selecting the students for courses; general, professional, technical, commercial etc.

Both help

to certify that a student has achieved a particular level of performance.

NSOU CC-ED-08 34 Both help in

stimulating learning. This can be motivation of the student or teacher, providing feedback, suggesting suitable practice etc.

Both help in improving teaching by reviewing the effectiveness of teaching arrangements.

MATCHING BLOCK 23/224

W

The word measurement, as it applies to education, is not substantially different from when it is used in any other field. It simply means determining the attributes or dimensions of an object, skill or knowledge. We use common objects in the physical world to measure, such as tape measures, scales and meters. These measurement tools are held to standards and can be used to obtain reliable results. When used properly, they accurately gather data for educators and administrators. Some standard measurements in education are raw scores, percentile ranks and standard scores. One of the primary measurement tools in education is the assessment. Teachers gather information by giving tests, conducting interviews and monitoring behaviour. The assessment should be carefully prepared and administered to ensure its reliability and validity. In other words, an assessment must provide consistent results and it must measure what it claims to measure. Creating valid and reliable assessments is critical to accurately measuring educational data. Evaluating the information gathered, however, is equally important to the effective use of the information for instruction. In education, evaluation is the process of using the measurements gathered in the assessments. Teachers use this information to judge the relationship between what was intended by the instruction and what was learned. They evaluate the information gathered to determine what students know and understand, how far they have progressed and how fast and how their scores and progress compare to those of other students. According to educator and author, Graham Nuthall, in his book *The Hidden Lives of Learners*, "In most of the classrooms we have studied, each student already knows about 40-50% of what the teacher is teaching." The goal of data-driven instruction is to avoid teaching students what they already know and teach what they do not know in a way the students will best respond to. For the same reason, educators and administrators understand that assessing students and evaluating the results must be ongoing and frequent. Scheduled assessments are important to the process, but teachers must also be prepared to re-assess students, even if informally, when they sense students are either bored with the daily lesson or frustrated by material they are not prepared for.

Teachers can improvise or re design instruction, using the

W

measurements of these intermittent formative assessments, to meet the needs of their students on a daily and weekly basis. 1.6

Summary Measurement is the use of rules to assign a number to a specific observation of a variable. The rule of measuring length, for example, is to assign a number equal to the number of lengths of a standard ruler that fit exactly from one end of the desk to the other. Here, variable being measurement length and the observation is the length of a specific desk. In education measurement typically denotes how much of some cognitive or affective attribute is possessed by an individual or group of individuals. Measurement refers to the task of determining the amount of quantity in some determined units. As this is applicable in any field, determining student achievement as a quantitative measure is called educational measurement. Measurement scales differ in four levels of measurement, such as Nominal scale, Ordinal Interval Scale and Ratio scale. Whereas,

71%

MATCHING BLOCK 25/224

W

assessment is the process of documentation usually in measurable terms, knowledge, skill, attitude and beliefs.
Assessment

is a process by which one attempts to measure the quantity and quality of learning and teaching using various assessment techniques, assignments, projects, objective type tests. It covers activities included in grading (formal and informal), examining, certifying and so on. Students' achievement on a particular course may be assessed. Assessment should be valid and reliable. Formal assessments are usually written documents such as tests; quizzes etc. informal assessment usually occurs in a more casual manner, including observation, inventories, participation, peer and self evaluation and discussion. Assessment can be either objective or subjective. Tests are systematic procedures for observing persons and describing them with

67% MATCHING BLOCK 27/224

W

either a numerical scale or a category system. Thus tests may give either qualitative or quantitative information.

Two forms of mark referencing schemes are generally used; Norm Referenced Test and Criterion Referenced Test. An examination is a detailed inspection or analysis of an object or person. In academic context examinations are tests which aim to determine the ability of a student or a prospective practitioner. Examinations can be of different types, like essay type or written, objective type, oral type etc. "Value" is

86% MATCHING BLOCK 28/224

W

the inherent idea of evaluation. When we evaluate, what we are doing is engaging in some process that is designed to provide information that will help us make judgement about a given situation.

It pertains to the estimation of quality. In the instructional context, this term is used widely to indicate the quality of learning. Instructional process has the purpose of NSOU CC-ED-08 36 enabling each pupil to actualise one's capacities to the optimum possible extent. Evaluation can be classified into two groups; formative and summative. Assessment made during the instructional phase is formative in nature. On the other hand, summative evaluation is the terminal assessment of performance at the end of the instruction. Evaluation is a continuous process for improving the quality. It includes both academic and non academic subjects. Evaluation differs from measurement in a number of ways. Measurement is a quantitative determination of how much an individual has performed. Whereas, evaluation is a qualitative judgement of how good or how satisfactory an individual has performed. Measurement implies only a precise quantitative assessment of instructional outcomes. But

84% MATCHING BLOCK 29/224

NSOU CC-ED-08 39 to identify the features, advantages and disadvantages of different types of tests. to discuss features of different techniques of Evaluation to compare the different techniques of evaluation and apply them in suitable situation 2.2 Introduction Various tools and techniques are applied in the classroom situation to assess students' progress.

All the four basic techniques of assessment, i.e. testing, observation, inquiry and analysis, are employed in different situations to collect the relevant evidence about pupils' growth and development in both cognitive and non-cognitive areas.

Two types of Achievement tests are applied by teachers; Teacher made tests and Standardised Tests. Depending on the purpose and mode or nature of the tests teacher made tests can be classified into several types. Essay type, short Answer type and Objective type tests will be discussed in this unit. Moreover, different techniques of educational evaluation such as Viva Voce, Interview, Group Discussion and Observation will also be discussed in detail. 2.3 Tools and Techniques in Educational Assessment Evaluation and assessment are intimately associated with the teaching-learning process. Continuous and comprehensive

76%
MATCHING BLOCK 30/224
W

assessment (CCA) emphasizes on two fold objectives. These are continuity in assessment and assessment of

all aspects of learning. Thus the term 'continuous' refers to assessment on an intermittent basis rather than a one-time event. When the assessment exercises are conducted in short intervals on regular basis, the assessment tends to become continuous. In other words, it can be said that if the time interval between two consecutive assessment events can be lessened or minimized then the assessment will become continuous. In order to make the assessment process continuous, the assessment activities must be

54%
MATCHING BLOCK 32/224
SA

CC-10 Assessment for Learning (Eng).pdf (D125371049)

spread over the whole academic year. It means regularity of assessment, frequent unit testing; diagnosis of the learning difficulty of the learners, using corrective measures,

providing feedback to the learners regarding their progress etc will have to happen maximally. The second term 'comprehensive' means assessment of both scholastic and co scholastic aspects of student's development. Since all the abilities of the learners development cannot be assessed through written and oral activities, there is a need to employ variety of tools

NSOU CC-ED-08 40 and techniques (both testing and non-testing techniques) for the assessment of all the aspects of learners' development. There is a wide choice of methods or tools and techniques which can be used by the teacher to assess different dimensions of a child's learning in different subjects. Apart from the traditional paper pencil test and oral tests, the teacher can use other modes of observation, self reporting, assignments, projects, portfolio, checklists, rating scales, anecdotal records, interview, questionnaire, projective, sociometric techniques etc. Use of multiple tools are required to enable the teacher to assess the learners in a more comprehensive and objective manner. The various tools include achievement test, psychological test, written test, oral test, diagnostic test. Achievement test: An achievement test is a test of developed skill or knowledge. Achievement is a term used to specify learning outcomes.

Assessment for Learning - Book-KSR.docx (D110721227)

tests are designed in such a way that the questions, conditions for administering, scoring procedures and interpretations are consistent and are administered and scored in a predetermined standard manner. Psychological test:

Psychological tests are survey tools that gauge certain traits, aptitude, habits or needs. In our educational system most commonly used psychological tests are intelligence test, personality test, interest inventories, aptitude test etc. these tests assess and evaluate information that an individual gives to the examiner. Written test: Written tests contain questions requiring the students to respond in writing. This is the most popular test because of its ease of administration. It can be classified into essay type, short answer type and objective type. Oral test: In oral tests, the examiners ask questions, the answer of which the

NSOU CC-ED-08 41 students have to give orally. Oral tests are more flexible than other types of tests for the examiner can build upon the answers of the students. The students also get a chance to explain their answer and clarify points to the examiner. Diagnostic tests: A test designed to determine the specific learning needs of an individual, or a test used to diagnose, analyse or identify specific areas of weakness and strength, to determine the nature of weakness or deficiencies of an individual is known as diagnostic test. There are diagnostic achievement tests which are used for skills like reading, mathematics; spelling etc. questioning is a type of verbal diagnostic test before the lesson. Besides these tools various techniques for conducting assessment and evaluation exercises have been developed and are in use among educational practitioners. Some of the most commonly used techniques of evaluation are as follows: Observing Children's learning Activities: Observing the children during the course of teaching is a technique of assessment for learning or formative assessment. Through observation information can be gathered about children in natural settings. Some observations can be done in course of teaching from the behaviours like how the child is answering the questions asked to him/ her, how he is describing the facts, how he is responding to the answers of other children, what type of questions he is asking the teacher, how he is presenting the group reports, how he is participating in the discussions etc. The teacher could record the number of questions asked by distinct students during the activity. There will be valuable information indicating whether learning was taking place. Through observation various aspects of the child's personality development can be assessed. It can be used to assess individuals and groups. Through observation, the teacher can get evidence of the child's performance based 'on-the-spot' record. Over time, detailed observations of behaviour as well as interests, challenges-patterns or trends emerge which allow teachers to create a comprehensive picture of the child. So observations are to be made by the teacher over a period of time, across different activities and settings. When the child is engaged in a number of tasks or activities, it will be easier on the part of the teacher to observe the child and assess him. So teaching based on the lecture method cannot create scope for the child to do much work. Thus, the child may be engaged in a lot of activities either individually or in a group which will help the teacher to assess the child's learning as well as enable the child to identify his own weaknesses and rectify them. For example, if the class is divided into small groups and told that they are going to use measurement to find some secret objects inside the school campus. Each group may be provided the name of a set of objects including the secret objects. The measurement of the secret objects may also be given to the children such as- the length of the object is 2 m 15 cm and its width is 1m 10 cm etc. Each group must measure objects provided to them until they identify the objects described by the measurement. While the child is busy in the activity teacher can observe him/her from a very close quarter without disturbing their attention on the activity. This would provide information on the children's style of learning and their learning difficulties. The teacher can observe the level of participation of students in the activities in the classroom. Many students are afraid of learning and do not like to get involved in group activities. Detecting their reservations, teachers can take appropriate actions to improve their participation in classroom activities. Observation provides a better opportunity to detect the degree of involvement of each child in the activities, several personality characteristics, the strengths and weaknesses of students on the topics of concern. Observing students in class, teachers may gain insight into several aspects of their learning of concepts like interest for activity, aesthetic sense, symptoms of anxiety and phobia, typical errors committed, alternative methods applied for solution of problems, specific points of difficulty etc. Checklist, rating scales, score cards etc are some of the examples of devices generally used for observation technique. Self reporting technique: Self reporting technique may include use of anecdotal record, interview, questionnaire, sociogram etc. Interview: An interview may be defined as a face to face verbal exchange. It refers to seeing and talking with an individual for some time with some definite purpose. Personal interview enables an interviewer to know an individual student. At the time of interview through friendly conversation and some skillful questions the interviewer tries to explore ideas, felt needs and problems of the students. Anecdotal records: An anecdotal record is a written record kept in a positive tone of a student's progress based on milestones particular to that student's social, emotional, physical, aesthetic and cognitive development. The teacher

NSOU CC-ED-08 43 observes and then records a student's action and work throughout the while the activities are occurring. Recording is informal and typically based on notes or a checklist with space for writing comments over a span of period at frequent intervals. Sociogram: Sociograms are the charts or tools used to find the sociometry of a social space, especially in the classroom environment they are a useful tool. It is also known as a friendship chart, as it is a diagram that allows the teacher to analyse the social makeup of the class. A sociogram is constructed after students answer a series of questions that illustrate the student's preferences about classmates. A sociogram is an important tool in the social discipline model that allows a teacher to provide misbehaving students opportunities for social acceptance. As a result the misbehavior will no longer occur. Question bank: We need a question bank in each class of each school for the purpose of collecting questions from various sources, arranging and keeping (storing) them properly and using them as and when required. Preparing objective based test items of different types is quite important on the part of a teacher and at the same time, it is also not an easy task. But with a stock of quite a large number of items (questions) at hand, it will have little difficulty in using appropriate test students at different times. The question bank is useful for the teachers in bringing reform in the traditional evaluation system. The National Curriculum Framework (2005) rightly observed that, the present evaluation system can be described as "one-exam fits-all", as one question paper is employed to all students during the examination. This is because the teacher has no other options but to use some questions which are available with him. But, if the teacher has a variety of questions in the question bank then he can prepare different question papers and use them for different learners as per their requirement. The other purposes of question bank are: Question bank is useful to prepare a test for instant testing of the learners Objective based test items in a question bank are helpful for the teachers to evaluate the learning progress with respect to learning objectives. The learners can prepare themselves for the questions available in the question bank.

NSOU CC-ED-08 44 The learners can also self-evaluate themselves by using the question bank. Questions not only help in assessment of learning, but also aid in classroom transactions for helping the students to learn better. Therefore, a variety of items on different learning outcomes should be available to both teachers and students in the classroom. Question banks in the classroom serve this purpose effectively. Every school should prepare question banks on their own. This brings ownership of the materials by the teachers and students of that school. While preparing the question bank and their proper use the following points should be taken into consideration. Both oral and written items on each chapter should be prepared. In each chapter, test items from knowledge, understanding, application and skill based objectives may be developed. Besides, project activities and practical activities should be there. After preparation and collection of questions those should be edited by the experts. Teachers from different schools or a cluster may sit and discuss each item and finalize them. It is better to write one or two questions on an item card - a postcard size paper, instead of a register. Cards have several advantages in developing, sorting, using and storing questions. Sometimes different cards containing questions may be supplied to different students in the class to engage everyone in learning. Different colour cards may be used for questions on different objectives and subjects. It will help the teachers to select and use the questions as per the purpose. For example-red colour cards may be used for knowledge type of items while blue and yellow colour cards may be used for comprehension and application objectives. The teacher may use different colours of cards for different purposes, like- different colours of cards may be used for extended response type of items (essay type of items), restricted response type of items (short answer type and objective type) and open ended items. Project method: Project method is a tool as well as a technique of educational assessment that is carried in a natural setting. Project creates

NSOU CC-ED-08 45 scope for learning concepts in a real life situation. This involves the application of knowledge. Projects are undertaken over a period of time and generally involve collection and analysis of data. Those provide opportunities to explore, work with one's hands by undertaking projects, the learners observe any situation or phenomena, collect data, analyse, organize and interpret data and draw generalizations. Project works provide opportunity to work in groups and real life situations. Projects help the learners to learn in an integrated approach. Here the assessment becomes an integral part of the routine classroom activities and the teaching learning process. The teacher has to observe the behaviour of the child during the execution of the project, his interest towards the work, process of collection, recording, interpreting the data. Accordingly the teacher can assist the learner and helps in improving the learning. Portfolio: Only the pencil-paper tests cannot assess all dimensions of learner's development, rather other modes of assessment are quite useful both for assessment of learner's progress as well as to ascertain the needs of the learner for further learning. Portfolio is one of the tools which can be used in assessment for learning. The students are encouraged to write or collect essays, poems, stories, collect paper cutting and give their own remarks on the articles/ issues, narrative or descriptive piece communicating a significant experience, riddles, mathematical puzzles, teaching-learning materials etc involving the concept. The students are also engaged in creating and collecting different products to complete the task. After a certain period all the students display their creations and describe them in detail in front of the teacher. "Portfolio is

63%

MATCHING BLOCK 36/224

W

a purposeful collection of students' work that exhibits the students' efforts, progress, or achievement in a given area.

This collection must include students' participation in selection of portfolio content, the criteria of selection, the criteria of judging merit, and the evidence of student self-reflection."(Reckase,1995). Thus, a portfolio provides an opportunity to the child to express his or her feelings and for the teacher to understand what is happening to the child outside the class. It is a collection of children's work over a period of time. It could be a day to day work or selection of the child's work. It provides a cumulative record. In the process emerges a picture of how a skill or knowledge develops. It encourages the child to show and tell

NSOU CC-ED-08 46 what they know and think about what they have included in their portfolio. The child becomes an active participant in learning and assessment. Exhibition: We can also use exhibitions to share and assess student's learning. Exhibition creates opportunities for the learners to show their talent in different subjects outside the formal classroom activities. Such type of activity not only fosters awareness among the learners but helps in skill building, developing positive attitudes among the learners. In the exhibition, the students learn certain concepts using concrete objects and verify many facts and properties using models, measurements and other activities. Thus, Spenser and Angus (1998) point out that student exhibitions involve complex cognitive skills as they must "collaboratively synthesize and evaluate information, and effectively communicate their ideas to others." Before organizing an exhibition, the teacher should discuss the time and venue of the exhibition. The children should be intimated well in advance of the exhibition so that they will get sufficient time to share among themselves, teachers and their guardians regarding their materials to be demonstrated in the exhibition. The children may prepare different models, materials, charts and interesting facts, puzzles etc. in the exhibition. The parents may also be given scope to participate. Different types of activities may be organized during the exhibition like demonstration of models, charts by the students and teachers. Photo exhibition(photograph of academicians reflecting their contribution) ,Teaching-learning material(TLM) preparation, popular talk on different concepts by the teacher or invited experts, demonstration of reference books in mathematics, activities for parents to show their talents and participate in different activities, different recreational activities for the students. This clearly indicates that exhibition can become helpful in formative assessment as well as in assessing the learner's ability to apply the acquired knowledge in different situations. Observing the nature of learners' participation during different activities of the exhibition, the teacher can assess the learners' understanding on a particular concept, his/her attitude towards learning. Further the teacher has to plan for further learning of the individual learner on the basis of the assessment findings. Moreover, it creates scope for learning from each other in an informal situation as well as peer assessment.

NSOU CC-ED-08 47 Quiz: The dictionary meaning of the term quiz is 'series of questions testing people's general knowledge especially as a form of entertainment'. Normally in the quiz programme oral questions were asked to the participants and those were responded orally. But sometimes the respondents were allowed to use paper-pencil to get the answer. The question may be asked to an individual participant or to a group of participants (preferably 2 or 3). While conducting quiz the following points may be kept in mind: After teaching some concepts the quiz programme may be arranged, this will enable the learners to practice the concept and apply those in different situations. Questions based on real life situations may be asked to the learners Different rounds of answering like-answering using paper pencil, answering without paper-pencil, answering with clue and quick answer round may be conducted. Questions based on audio-visual support may be used to arouse interest among the learners. Questions prepared by the learners during the course of the teaching- learning process may also be used during quiz programmes. All the children may be allowed to participate in the quiz programme. Quiz programme enables the teacher to understand the student's progress in learning. It helps the teacher to know the learners interest towards learning. The teacher will observe how the students choose the answer and how they respond to the questions. Games: Game is a spontaneous activity for the children in which they participate naturally without any fear. Normally academic subjects are associated with fear and failure. But participation of the child in different types of games and interesting puzzles removes the fear from the child. Such games and puzzles enable the child to understand the concept thoroughly.

NSOU CC-ED-08 48 2.4 Teacher made Test in Educational Evaluation: Essay type, Short Answer type and Objective type Teacher made tests are an important part of the teaching learning process. How far the instructional objectives, set by the teacher, are achieved by the student can be known by testing them. As we know, before starting the teaching-learning process, objectives are to be formulated and by employing an appropriate teaching learning process, the teacher and students jointly try to achieve the predetermined set of objectives. The objective based test item is supposed to measure a specific objective of instruction (learning outcomes). Such types of items describe the learners' achievement more accurately. The items are based on the specific objectives of a particular concept. Objective type of item is suitable for assessment of all the subjects. It is the nature of learning outcomes (specific objective) that determines the type of item to be used for assessment. For example, let us consider the following situations of assessing the objectives of mathematics learning. Use of open-ended items is now considered more effective in assessment for learning than the objective types. It is to be observed that the objective type of test item has a definite and unique answer that helps scoring the response easily and objectively. Such types of items are described as closed ended items. But there are test items which allow a variety of correct responses and elicit different kinds of students thinking. Such types of items are known as open ended items. This enables teachers with valuable information regarding individual students' way of thinking and way of solving problems and also helpful in enhancing students' creativity, reasoning and communicating skill. For the purpose of testing teacher follow different types of tests. These are as follows: 2.4.1 Essay type test The essay type items are

81%

MATCHING BLOCK 39/224

SA

Pradip Kr MochaharyBlock-2.doc (D144505377)

used to assess skills in organising and summarising the information and explaining the events of places.

There is freedom in response in case of essay type tests. Essay questions are used primarily to measure those learning outcomes that cannot be readily measured by objective test items. Essay items assess students' understanding and ability to organise and apply information in a content area such as Literature and Language, Social Sciences like Geography, History, Psychology, Education, Economics, Political Science, and Sociology etc. the essay items also assess students' writing skill, knowledge of Grammar, knowledge of structuring a sentence and paragraph etc. The essay type tests are less valid and less reliable in comparison to the objective type tests. But if the essay type tests are prepared

NSOU CC-ED-08 49 consciously and scored with the help of scoring key, it will also achieve validity and reliability to a great extent. It is very difficult to standardise essay type tests. Types: Essay type questions are classified into two types: A. Restricted-Response essay questions: when dealing with the restricted response essay type questions, the students need to be very particular in their responding. These types of questions generally limit the content and response. The questions are followed with certain word limits. The restricted response essay type items are more structured and they are also most useful for measuring learning outcomes requiring the interpretation and application of data. For example, explain two most important effects of rotation of earth. The restricted response essay question also has its own limitations. It restricts the students' original way of expression, thinking. Organising and integration. B. Extended-Response essay questions: This type of items need the students' response according to their freedom of organisation, integration, thinking and judgement. This type of freedom helps them to show their skill of analysing a problem, logically think over it, and finally describe it in their own words. This extended response essay items facilitates creativity, convergent and divergent thinking within the students. For example, explain the present day online education in India. Advantages: The merits or advantage of essay type questions are as follows: 1. It measures complex learning outcomes that cannot be measured by other type of items. 2. It gives more importance on

100% MATCHING BLOCK 37/224

W

the integration and application of thinking and problem solving skills

of the students. 3. It is easier to construct essay types of questions. 4. It evaluates the style of expression and the language knowledge of the students. It facilitates extensive study, convergent thinking and divergent thinking. 5. It develops the judgement ability of the students. Disadvantages: Following demerits or disadvantages are also evident in essay type tests. 1. This type of question is less valid and less reliable in comparison to objective type of items. NSOU CC-ED-08 50 2. Essay type items are subjective. 3. It encourages guess making tendencies within the students. 4. It facilitates cramming and rote memorisation. 5. It makes the total teaching learning situation a dictation work. 6. It is more time consuming at the time of scoring. 7. Examiners' physical health and mental health condition affects the scoring of the essay type items. 2.4.2 Short Answer Type Test In the teaching learning situation, besides essay type and objective type questions we use the short answer type question to measure and evaluate students' performance. In this case the answer of students should be limited within a little limit of words. As it is difficult to ask essay type questions to the student over the whole content, the learning outcomes expected from the short answer type items are easier.

100% MATCHING BLOCK 40/224

Unit-9 Dr. Kaushal Kishore Chaudhary.docx (D31065396)

Except for the problem solving outcomes measured in Mathematics and Science, the

short answer item is

100% MATCHING BLOCK 41/224

SA

Unit-9 Dr. Kaushal Kishore Chaudhary.docx (D31065396)

used almost exclusively to measure the recall of memorized information.

For example, write two effects of the industrial revolution. Although it is very difficult to measure the complex learning outcomes through short answer type tests. These are less time consuming in construction, administration and scoring. Advantages: The advantages of short answer type questions are listed below: 1. It is easy to construct. 2. It is easy to score. 3. These items are mostly used to measure the recall of memorized information. 4. It reduces the possibility that the students will obtain the correct answer by guessing. 5. Possibility of content coverage is higher 6. It is more valid as well as reliable than essay type questions. 7. The scope of short answer type items is more important than essay type items.

NSOU CC-ED-08 51 8. The discriminating power of short answer type items are more in comparison to the essay type items. 9. The administration of short answer type questions is easy in comparison to essay type questions. Disadvantages: The limitations of short answer type questions are listed below: 1. Short answer type items cannot measure the attitude and skills of the students. 2. The language skill and writing skill of students cannot be evaluated by short answer type items. 3. It gives more importance upon collection of information rather than understanding. 4. Short answer type items are not suitable for measuring complex learning outcomes. 5. This type of questions cannot be framed for all the objectives; cognitive, affective and psychomotor abilities. 6. It lacks in measuring the comprehension ability of students. 2.4.3 Objective Type Test Objective

100% **MATCHING BLOCK 42/224** **SA** Unit-9 Dr. Kaushal Kishore Chaudhary.docx (D31065396)

type items are suitable for measuring a wide variety of relatively simple learning outcomes.

Objective type items are more valid and more reliable than essay type and short answer type items. In case of objective type items the students are supposed to answer with a word, a digit, or a sentence. These

95% **MATCHING BLOCK 46/224** **SA** JSNR_SSOU_MBA_EA_Educational Evaluation.pdf (D28924038)

are easy to construct, easy to administer and easy to score.

The subjectivity in the form of personal preference of teachers or examiners does not affect the evaluation of objective type of tests. For example, who was the first prime minister of independent India? There are different forms of objective type items, the way of administration, the way of responding and the way of scoring is different in case of all the types of items. These are as follows: a. Simple recall type question b. Sentence completion type question c. Classified question d. True and false type question

NSOU CC-ED-08 52 e. Multiple choice type question f. Matching type question g. Analogy type questions Advantages: The merits or advantages of such type of items are: 1. These are more valid and reliable in comparison to other types of tests. 2. The usefulness of the test is higher 3. The discrimination index of this type of test is higher. 4. The major functions of these tests are measuring achievement, diagnosis, prognosis, research, counselling and guidance. 5. Scoring is simple and easy, mastery over subject for the evaluator is not necessary. 6. Items are standardised by developing norms. 7. Language and handwriting of the students do not have influence on scores. 8. Personal preference of teachers does not affect the scores. 9. It has high content coverage because a large number of items is included in this list. 10. In this type of test, students are supposed to study thoroughly all the contents. Disadvantages: The demerits of objective type tests are as follows: 1. Probability of guessing is higher 2. This type of test cannot be used effectively for affective and psychomotor learning objectives. 3. The students feel restless, when answering the question because in a short period of time a large number of questions are to be answered. 4. The language ability cannot be known through this test. 5. It gives importance to rote memory and cramming.

NSOU CC-ED-08 53 6. Understanding aspects are neglected in this type of test. 7. The adoption of unfair means by students sometimes affects the evaluation system. 8. The instruction should be prepared for each type of question cautiously. 2.5 Techniques of Educational Evaluation Viva voce, Interview, Group Discussion and Observation: 2.5.1 Viva voce

83% **MATCHING BLOCK 43/224** **W**

The oral examination, also called oral test or viva voce, is a practice in many schools and disciplines

in which

100%
MATCHING BLOCK 44/224
W

an examiner poses questions to the student in spoken form.

95%
MATCHING BLOCK 45/224
W

The student has to answer the question in such a way as to demonstrate sufficient knowledge of the subject to pass the

test. Literally, "viva voce" means by or with the living voice - i.e., by word of mouth as opposed to writing. Normally viva voce is taken either by internal or external examiner where no one else is present in the examination hall except the examiner and examinee. Purpose of the test: The purpose of the viva test is to: Demonstrate that the work or project is done by the examinee. Test the verbal communication skill, presence of mind and self confidence of the examinee. confirm that the examinee understands what he or she has written and can defend it verbally Investigate the originality of the project work. Viva voce also reduces time and chances of adopting unfair means, chances of guessing habits. Beside the content knowledge of the examinee it also tests his or her command over the vocabulary and language development.

2.5.2 Interview Interview is an important technique to elicit personal information from the subject. It is nothing but the face to face verbal exchange between interviewer and the interviewee. One-on-one interviews can be used effectively to assess students, especially when the

NSOU CC-ED-08 54 teacher wants to control the negotiating environment to test for certain skills and to assess students using an array of methods that do not overly bias grading towards students with strong writing skills. Furthermore, if assessment is also considered as a teaching moment, an interview of this type can provide an important simultaneous opportunity to explore what the students have learned, from the interview itself as well as from their ongoing real-time and real-life negotiations associated with the course. Interviews are normally tape recorded. If analysis, rather than just impression is required, then transcripts have to be produced. The transcripts are normally analysed by searching for responses or themes which commonly occur. Quotations from the transcripts can be used to illuminate or illustrate findings reported in reports and papers. Purpose of Interview: For finding out the status of development of one's personality the personality assessment interview is conducted. For obtaining some information about the home, environment and school situation of the student the diagnostic interview is necessary. For determining the fitness of a person for admission, for a job, for scholarship etc assessment or evaluation interview is conducted. For helping the counselee or the student in gaining insight into the problem and assisting him or her while solving that problem the counseling interview is important. Interviews are of two types: the structured interview and the unstructured interview. In a structured interview the interviewer is free to ask the candidates any question on any subject relevant to the situation in an unstructured interview. A systematic predetermined approach is adopted and all the subjects are asked similar questions in structured interviews. This type of interview has evolved to reduce the bias and unreliability of the interviewer. Usually it is a list of questions prepared beforehand and all the subjects are to answer these preplanned questions. In addition to this, Boyd Fuller of National University of Singapore argues for using interviews for assessment. In a series of experiments, he finds that three distinct kinds of interview support assessment of different skills, different methods of testing those skills, and different lessons drawn from the experience by the student. One of the three, Fuller concludes, largely failed his goals for it; but the other two are more

NSOU CC-ED-08 55 promising. In common, the three approaches seek to assess students' skills in and/or understanding of negotiation through oral interaction rather than written product. They all differ from graded inter-student simulated negotiations in: 1) the students' performance is not dependent on their peers' actions; and, correspondingly, 2) the teacher can influence how the negotiation proceeds, in order to test certain skills. The first two methods were applied in the basic negotiation course; the third method, coaching interviews, has been applied only in an advanced negotiation course. Mixed Scenario Interview Assessments: This interview assessment presented one or two brief negotiation scenarios, in which the teacher would ask the student to negotiate with him for five minutes. The other parts of the interview presented students with different scenarios and asked them to present their analysis of the situation, what they might do about it and why. During the exercise, no debriefing was provided, so that the answers were not being shared with other students. These interviews did provide some sense of how easily students could apply concepts and skills. It was clear, for example, that some students were quite familiar with the concepts and could use them to diagnose situations presented to them on the spot. Similarly, some students could apply the negotiation skills even when put on the spot while others struggled to do the same. Furthermore, there was some differentiation between what students achieved in their written assignments and what they demonstrated during the interview. Since one of the main purposes of the interview method is to provide people with weaker writing skills with a different medium for demonstrating their understanding. This outcome supported use of the tool. On the other hand, the students' negotiation skills were not truly tested. While the interview did allow students with better oral than written fluency to show their understanding, it still seemed to favour those who can think quickly. The negotiation scenarios were too short for them to move beyond a simple opening phase of a negotiation, and did not provide a chance for "warming up," including relationship building, the negotiation of communication dynamics, and so on. Simulated Negotiation Interviews: Unsatisfied with the efficacy of the mixed scenario interview assessment, Boyd Fuller (2013) tried focusing the interview around a single negotiation scenario. The rationale here was: 1) to focus the interview assessment around skills rather than analysis; 2) to give some students the opportunity to "warm up," with their cognition that not all can start negotiations at the same speed; 3) to test a wider array of skills; and 4) to give students the opportunity to show their skills in more depth during a more difficult and complex negotiation. To

NSOU CC-ED-08 56 meet these objectives, instead of mixing the assessment of practice and analysis skills in one interview, he decided to focus on the practice skills, and assess students' analytical abilities through other assessment tools such as by assigning a quiz, or asking students to write a strategy memo or an analytical paper. The outcome of this interview assessment was satisfactory for him. The length of the interviews was sufficient to measure how the students were meeting the grading criteria. The focus on one negotiation as compared to multiple scenarios allowed people who were clearly slow starters to build momentum and show their skills over the duration of the negotiation. The set of skills that was tested turned out to be measurable by this scenario; they were distinctly different from what one sees in papers, examinations. It clearly distinguished some students from others. The debriefing after these interviews was also valuable. He could use his own direct observations of how they negotiated to provide comments. Coaching Interview Assessments: This advanced course is in part designed around forcing students to apply their negotiation thinking and practice in intensive practice over the four years with fewer students, usually around a dozen. The coaching interview has two primary purposes. The first purpose is to get students to reflect on and design experiments to improve one or two aspects of their negotiation and facilitation repertoire of skills and behaviors. The second purpose is, of course, to assess those same skills. The first of the three coaching interviews is not assessed. One third of the assessment occurs during the second interview and two thirds during the third interview. This allows the students to develop their skills as reflective practitioners as the assessment increases. Each of the three interview sessions lasts approximately for forty five minutes. During the first interview, students were asked to identify a skill that they would like to improve and then a specific experiment or strategy that they will attempt as part of improving that skill or behavior. In the second interview, they were asked to analyze what happened during their experiment, why those reactions or outcomes occurred, and what they learned from that experience about why things can happen and what they can do better. The second half of the second interview then focuses on designing a new strategy or experiment, either for improving the same skill or another one that they have subsequently identified as something they want to work on. The third interview follows the format of the second, with the last five minutes focusing on terminating the class and coaching relationship while (again) encouraging the students to continue to be reflective negotiation practitioners. For this course, with its smaller numbers and greater focus

NSOU CC-ED-08 57 on skill and reflective practice, this assessment and teaching tool is an essential component. As a learning tool, these coaching interviews are the most effective. While not all students make good use of them, those students who do commit to applying the strategies they develop report and demonstrate much greater negotiation skill afterwards. Significant improvements have been visible over the three sessions, as well as during the class negotiation sessions and in real-life negotiation scenarios where students conduct their experiments elsewhere. As an assessment tool, they are useful for assessing pedagogical goals of helping students become reflective practitioners. It is clear by the third interview which students have begun to analyze their negotiation experiences on their own and which students are more capable at it 2.5.3

MATCHING BLOCK 47/224

W

Group Discussion "Group" is a collection of individuals who have regular contact and frequent interaction and who work together to achieve a common set of goals. "Discussion" is the process whereby two or more people exchange information or ideas in a face-to-face situation to achieve a goal. The goal, or end product, may be increased knowledge, agreement leading to action, disagreement leading to competition or resolution or perhaps only a clearing of the air or a continuation of the status-quo. ``Group Discussion", popularly labeled as GD, is a popular methodology used by educational institutes and many organizations (company, institute, business school, etc.) these days to gauge whether the candidate has certain personality traits such as interpersonal communication skills, confidence in public speaking, team spirit, leadership abilities, social behaviour and problem-solving skills. GDs form an important part of the short-listing process for recruitment or admission in a company or institution.

88%

MATCHING BLOCK 53/224

W

In this methodology, there are usually 7-12 participants in a group. The group of candidates is given a topic or a situation which could be either factual, abstract or case based, and typically given some time to think and make notes about the same. After this, the group of candidates is asked to discuss the topic among them for a specific duration ranging between 10- 40 minutes. While the group discusses the pertaining issue at hand, the Moderators or Panelists silently observe each candidate on various predetermined parameters. The Panelists assign scores to every candidate based on his

or

GD is based on teamwork, incorporating views of different team members to reach a common goal. So, a group discussion refers to a communicative situation that allows its participants to share their views and opinions with other participants. It is

NSOU CC-ED-08 58

92%

MATCHING BLOCK 49/224

W

a systematic exchange of information, views and opinions about a topic, problem, issue or situation among the members of a group who share some common objectives. Over the recent years, Group Discussion became a popular method of assessing students' soft skills. The contenders who are shortlisted on basis of written examination have qualified with their intelligence quotient, i.e., aptitude and knowledge. However, since the significance of emotional quotient arose, new tools such as GD were devised to gauge candidates' social and interpersonal skills. Organizations conduct GDs to find out whether you possess the critical qualities or skills to contribute effectively to the goal accomplishment process.

Purpose of Group Discussion: It helps to

95%

MATCHING BLOCK 50/224

W

assess how a participant performs under different situations in a group. It helps to judge how one conceptualizes and establishes his ideas through the discussion. It helps in analysing the students' attitude towards fellow members through one's communication and interpersonal skills, listening ability, humility and tolerance to others ideas. It helps in shedding light on candidate's leadership and managerial skills, problem-solving aptitude, creative thinking and knowledge on diverse topics.

It helps evaluate whether a candidate is the right fit for the organization.

100%

goals. The examiner can evaluate both the personality and group skills of

the candidate participating in a group discussion. 2.5.4 Observations Observation can be invaluable when conducting an evaluation or it can also be of limited value if it is not done well. Those who study human behaviour indicate that there is often a gap between what people say they do and what they actually do. The observed behaviour is often a more dependable indicator than what is self-reported. Observation is used in a variety of ways in evaluation. Often it is a gateway method that leads to others methods. Careful observation is distinctive in three important ways: the person doing the observation is (1) trained, (2) prepared, and (3) systematic.

NSOU CC-ED-08 59 Training helps the evaluator know what to observe, when to conduct the observation, and how to document the observations. The evaluator must be prepared mentally and physically for the rigors and demands of observation. And the evaluator systematically captures the observation data often using multiple methods such as field notes, checklists, audio memos, etc. Observation can be time consuming and difficult. Here are four factors that limit our ability to observe: 1. Fatigue - Observation is tedious and tiring work. Being attentive takes energy and the observer needs to develop strategies for remaining alert for potentially lengthy periods of time. 2. Emotional stress - Sometimes the observation itself causes stress and other times the person doing the observation is stressed about other things. Stress tends to erode our ability to observe. 3. Disruptions and distractions - Observation takes time. Therefore, disruptions and distractions should be expected in the course. 4. Time - The length of the observation is specified in the evaluation plan and is based on a thoughtful assessment of what is being observed, the expected occurrence of meaningful events, and the available resources. In general it is better to have a longer period of observation because it increases the odds of observing activities or events that occur less frequently. A teacher needs observation techniques to improve teaching and learning, as it has an important role in collecting data and evidence about the teaching process and student learning. Followings are some of the techniques which can be used for the said purpose. Student Assessment: Tests, examinations and continuous assessment can provide valuable data for observation. For teaching courses, we have to set up a method of student assessment and students have to be assessed. We should, however, be clear about the nature of the information we can obtain from examination results or assessment grades. Comparison of one set of results with another often has limited validity as assignments, examinations, markers and marking schemes are rarely held constant. In addition most assessment is norm referenced rather than criterion referenced. We also need to be very clear as to what is being assessed. Examination grades may bear little relationship to specific qualities we could be investigating. Interviews: Interviews can provide even more opportunity for respondents to

NSOU CC-ED-08 60 raise their own issues and concerns, but are correspondingly more time-consuming and can raise difficulties in the collation and interpretation of information. The format can be on a spectrum from completely open discussion to tightly structured questions. Semi-structured interviews have a small schedule of questions to point the interviewee towards an area of interest to the researcher, but then allow interviewees to raise any items they like within the general topic area. Since interviews give an opportunity for students to raise their own agenda they are useful when issues are open, or at an exploratory stage. A small number of interviews can be useful to define issues for subsequent more tightly structured questionnaires. Closed Ended Questionnaires: Closed ended questionnaires are ones which constrain the responses to a limited number chosen by the researcher; essentially it is a multiple choice format. Usually respondents are asked the extent to which they agree or disagree with a given statement. Responses are recorded on a Likert scale which ranges from 'definitely agree' to 'definitely disagree'. Questions should be carefully constructed so the meaning is clear and unambiguous. It is a good idea to trial the questionnaire on a limited number of students before giving it to a whole group. Closed questionnaires are easy to process and evaluate and can give clear answers to specific questions. However, the questions are defined by the researcher or teacher so could completely miss the concerns of the respondents. Therefore we can include some open-ended questions to give respondents a chance to raise other issues of concern. Most institutions now have some form of standard teaching evaluation questionnaire available. These may be of some help in evaluating a project but in most cases the questions will not be sufficiently specific to the particular type of innovation which has been introduced. What might be more helpful are the data banks of optional or additional questions which are available. These can be used to pick or suggest questions which might be included in a more tailor-made questionnaire. Traditionally, collecting questionnaires, survey data is done by using copies of paper questionnaires and answer sheets. With the availability of web technology, there is now the option of collecting survey data online. Open Ended Questionnaires: Open questionnaires have a series of specific questions but leave space for respondents to answer as they see fit. Teachers are therefore more likely to find out the views of students but replies are more difficult to analyse and collate. The usual procedure is to search for categories of common responses. It is not necessary to have separate questionnaires for open and closed items. The most successful questionnaires often have both open and closed items.

NSOU CC-ED-08 61 Diary: Every teacher, involved in an action learning project should keep a diary or journal in which they record their initial reflections on the topic of concern, the plans that were made, a record of actions which were taken, observation of the effects of the actions, impressions and personal opinions about the action taken and reactions to them, results obtained from other observation techniques, references for, and notes on, any relevant literature or supporting documents which are discovered. By sharing observations and reflections it is possible to fine-tune the innovation. Sympathetic but critical discussion can also heighten awareness and contribute to changing perspectives.

Supporting Documents: Teacher should keep copies of any documents which are relevant to the courses that teacher is examining. These can include documents for the course development and accreditation process, minutes of course committees, the course syllabus, handouts to students, copies of tests and examinations, lists of test results and student grades.

Student Learning Inventories: Student learning inventories are examples of empirically derived measuring instruments. There are many number inventories which measure a wide range of characteristics. Student learning inventories have been highlighted because they examine the quality of learning. In particular they look at the categories of deep and surface learning. The inventories can be used to compare groups of students, examine approaches before and after changes to teaching methods, and to examine correlations with other variables.

Diagnosis of Student Conceptions: A good basis for improving teaching is to diagnose students' understanding of key concepts in a course. The usual method of diagnosing student conceptions is to ask a question which applies the concept to an every-day situation: one which cannot be answered by reproduction or by substitution into formulae. Answers are drawn from the students in interviews or in written form. The students' answers can usually be classified into a small number (usually two to five) of conceptions or misconceptions about the phenomenon. As with the analysis of interview data care needs to be taken when deriving classifications.

Interaction Schedules: Interaction schedules are methods for analysing and recording what takes place during a class. A common approach is to note down at regular intervals (say every minute) who are talking, and to categorise what they were saying or doing. An alternative to time sampling is event sampling in which behaviour is noted every time a particular event occurs. Examples of categories could be; tutor asking question, tutor giving explanation, tutor giving instruction, student answering question or student asking question. The analysis can be made by an observer at the class or can be made subsequently from a tape or video recording. There are other approaches to recording and analysing happenings in a classroom situation. McKernan (1991) discusses an extensive range of techniques, gives examples of each and considers how the data gathered should be analysed. Flanders Interaction Analysis category is another method of evaluation of students' behavior in the classroom which is as follows:

Behaviour type	Category	Verbal behaviour
Teacher Talk Indirect/ response	1 Accept feeling	2 Praises/encourages
	3 Accepts /uses ideas	4 Asks questions
Direct/ initiation	5 Lecturing	6 Give directions
	7 Criticising or justifying authority	Pupil Talk Indirect/response
	8 Pupil talk response	Direct/ initiation
	9 Pupil talk initiation	Silence/confusion
	10 Silence or confusion	

Tape Recording: Making tape recordings is a way of collecting a complete, accurate and detailed record of discussions in class, conversations in interviews or arguments and decisions at meetings. It is easy to obtain the recording; we simply take along cassettes and a portable recorder, and switch it on. However, the presence of a tape recorder can inhibit discussion or influence people's behaviour. There are a number of ethical issues which need to be addressed over the use of tape recordings.

NSOU CC-ED-08 63 The group being taped should establish the purpose of making the recording and the way in which the tapes will be used. If any quotations are made in subsequent reports it is customary to maintain the anonymity of the source. If we need to do a detailed analysis of the conversations then it will be necessary to produce a transcript. This is a time-consuming and painstaking process, so limit the use of tape recordings to situations where it is really necessary. 2.6 Summary The teacher needs to assess the students' progress in learning and to help him for further learning on the basis of the assessment results. There are different tools and techniques available for educational assessment. The teacher may use different types of test items as useful tools for this purpose. Teacher made tests which are constructed by the teachers for use within their classroom are quite useful for this purpose. The progress and achievement of learners can be known by assessment, as well as the effectiveness of the teaching-learning process, materials can also be ascertained by assessment. Assessment should not be a one time event, rather be a continuous one. Use of unit tests, giving assignments, observing the child during the teaching-learning process and preparation of TLM, project work and portfolio makes the assessment process continuous. Comprehensive assessment means assessment of both scholastic and co-scholastic areas of the curriculum. To assess both the areas the teacher has to use a variety of tools and techniques. The objective based test items are supposed to measure a specific objective of instruction (learning outcomes). Such types of items describe the learner's achievement more accurately. The teacher should prepare and use knowledge, comprehension, application and skill based questions. Question bank can help the teacher to conduct a test instantly and also enables the learners for self study and self evaluation. Participation of the learners in activities like project, portfolio, exhibition, quiz, games helps the learner to learn in an informal way. Such activities help the teacher to assess the learner in an informal situation. There are also standardized tests, psychological tests, written tests, oral tests, diagnostic tests. Written

tests may be of different types; essay type, short answer type and objective type.

Usually an

100% **MATCHING BLOCK 56/224**

SA JSNR_SSOU_MBA_EA_Educational Evaluation.pdf (D28924038)

essay test refers to any written test that requires an examinee to write

several paragraphs, asks the students to write long answers to one question. This gives the students training in self expression, use of proper word, organizing subject matter, and arguing logically. Short answer type questions require very short answers generally one or two sentences. While, objective test is a test containing questions requiring the student to work or select a correct answer. For educational evaluation we depend on techniques like viva voce, interview, group discussion and observation. The teacher has to observe the learners during activity and assess to what extent the learner has acquired the knowledge in a particular concept. Classroom observation is another form of ongoing assessment. Most teachers can "read" their students; observing when they are bored, frustrated, excited, motivated, etc. As a teacher picks up these cues, she or he can adjust the instruction accordingly. It is also beneficial for teachers to make observational notes (referred to as anecdotal notes). These notes serve to document and describe student learning relative to concept development, reading, social interaction, communication skills, etc. Other than this use of diary, journal, tape recorder, questionnaire, students' learning inventories, interaction schedules are also used by teachers for observation purposes. Through those activities the assessment process can be made child friendly. The principles of construction of teacher made tests will be discussed in the next subunit. 2.7 Self Assessment Questions 1. Name the tools commonly used by teachers for educational evaluation. 2. Classify essay type tests with examples. 3. State any four utilities of question banks in mathematics. Write two more utilities which have not been stated here. 4. Enlist three Social Science projects you want to give learners at secondary level. 5. Prepare a list of different materials that can be put together while preparing a portfolio. 6. Write some of the usefulness of an exhibition for the learners? 7. Write down the disadvantages of short answer type tests. 8. State the purpose of viva voce for educational evaluation. 9. Why is group discussion popular? 10. State the importance of anecdotal records as an observation technique of evaluation.

NSOU CC-ED-08 67 3.2 Introduction A test is a particular type of assessment that typically consists of a set of questions to be answered that are administered under reasonably comparable conditions for all students. A test is advice or systematic procedure for assessing a sample of behaviour by asking a set of questions in a uniform manner. The scientific phase of testing and measuring movement starts with the work of E.L.Thorndike. Thorndike constructed and published a pioneer psychological test. Then, the followers like Stone published tests measuring achievement in Elementary Arithmetic in 1908 and Courts published it in 1909. The testing movement seems to have reached its zenith in the twentieth century. The characteristics of a good test will be discussed in this unit. Along with that the problems of the teacher made test and principles of construction of achievement test will also be discussed. 3.3 Characteristics of a Good Test: Objectivity, Validity, Reliability, Usability and Norms A test is a form of assessment. Psychological and educational tests are a standardized procedure to measure quantitatively and qualitatively one or more than one aspect or

100%

MATCHING BLOCK 58/224

MA 2nd Sem, Paper-2, Block-1.pdf (D165079802)

trait by means of a sample of verbal or non verbal behaviour.

A test consists of a standard set of questions, to be answered or a task to be performed.

EDN-201-Educational Measurement and Evaluation.pdf (D141388331)

Items of a test are placed in increasing order of difficulty and its procedure

of administration is standardized to ensure maximum objectivity. In the teaching learning situation, psychological and educational tests are used to know about the level of achievement of the students. A Dictionary of Education (1981) defined as "a test is a compact task or series of tasks designed to ascertain the merit or quantity of something. Educational tests constitute a series of items for which a score is obtained. Depending on how they are constructed, they can serve a purpose." A good test must have the following five characteristics. 3.3.1 Objectivity A test must have the trait of objectivity in terms of both item and scoring. It means it must be free from the subjective elements so that there can be complete interpersonal agreement among the experts regarding the item and scoring of the test. Objectivity of items refers to the phrasing of items in such a manner that they are interpreted in exactly the same way by all those who take the test. For that, items

NSOU CC-ED-08 68 must have uniformity of order of presentation. It should be placed either in ascending or descending order. On the other hand, objectivity of scoring means that the scoring method of the test should be standard one to maintain complete uniformity when the test is scored by different experts at different times. A test is said to be an objective if the same scores of results are obtained by administering the test to a particular group or students on different occasions and scored either by the same scorer or different scorer. A test that is objective measures without reference to outside influences. For example, an objective test of personality will return the same answers regardless of whether the person completing the test uses a pen or pencil. Irrelevant, unrelated factors do not influence the test results if a test is objective. In objective type tests the resulting scores are in no way influenced by the mental condition, judgment, personal bias or feelings of the scorer. Items are prepared in such a way that there will be only one correct answer of the scorer. Whoever may administer or score a test on a group of students the test score will always tend to be the same. This particular characteristic is said to be the objectivity of the test. For example, name the present capital city of West Bengal. The obvious and one and only correct answer is Kolkata. The score will always be the same under any circumstances. Therefore, it is essential to preserve and maintain the objectivity of the test. Sometimes it becomes difficult to retain this characteristic. Following are the causes of low objectivity of a test Lack of comprehensiveness and too much generalisation reduce the objectivity Ambiguity in question framing leads to confusion and misinterpretation which may reduce objectivity of the item. Sometimes a student who gives the best answer at the beginning of the test is likely to get more marks in the subsequent questions and vice versa. Sometimes a particular student gets marks not only on the basis of his or her writing ability but in comparison to ability of the previous students. Lack of uniformity in scoring by the examiners in absence of a scoring key can be detrimental for objectivity. Lack of consistency in judgment even among competent examiners may lead to subjectivity. Subjectivity may also occur due to application of language, quality of handwriting of the examinee.

NSOU CC-ED-08 69 Sometimes the examiners are influenced by the volume and length of the answer rather than depth of the content. To minimize these subjective elements it is required to reform the conventional essay type questions and to introduce new types of objective tests. The term essay implies a written response that may consist of many sentences to several pages. The students are allowed to enjoy freedom with respect to the content, construction, wording, length and organization. Essay type questions, therefore, definitely have some unique characteristics to judge several qualities of students that otherwise are difficult to evaluate. These are the ability to select relevant facts from a body of acquired knowledge, establish relationships between various aspects of knowledge, analysis, synthesis, assimilation, expression, interpretation, organization, critical thinking and so on. In spite of so many advantages essay type questions are discarded due to its lack of objectivity in both item and scoring process. However, some precautions can be taken to reduce the subjectivity of a test. a. Construction of question: The scope and range of wording should be clear. It is needed to define and restrict the area to be covered by the question. The questions must be related with the instructional objectives of the units in order to achieve maximum content validity. The value points in a question should be intimated to students. Optional questions should not be provided because it reduces the comparability and also makes it difficult to score papers on a common basis. b. Scoring system: An answer key should be provided by the paper setter with which all answers can be compared for evaluation. For each question the factors to be considered in evaluating the response should be given. The students' identity should not be disclosed in order to avoid subjectivity.

3.3.2 Validity Validity is another characteristic of a scientific instrument.

The term "validity" means truth. Thus, validity refers to

88% MATCHING BLOCK 60/224

SA MA 2nd Sem, Paper-2, Block-1.pdf (D165079802)

the degree to which a test measures what it claims to measure. Validity

is not the self correlation of tests like reliability; rather it is correlation with some outside independent criteria. Concept: Validity has been defined in different ways. Anastasi (1968) has defined "

100% MATCHING BLOCK 61/224

SA EDN-201-Educational Measurement and Evaluation.pdf (D141388331)

the validity of a test concerns what the test measures and how well it does so."

Lindquist (1951) has defined validity of a test "as

85% MATCHING BLOCK 62/224

SA JSNR_SSOU_MBA_EA_Educational Evaluation.pdf (D28924038)

the accuracy with which it measures that which is intended to measure or as the degree to which it approaches infallibility NSOU CC-ED-08 70 in measuring what it purports to measure."

These two definitions reveal the fact that for determining the validity of a test the test must be compared with some ideal independent measures of criteria. Thus, correlation coefficient computed between the test and the ideal measures of criteria is known as the validity coefficient. As we have already noticed that Validity reflects the degree to which an evaluation device approaches infallibility in measuring in what it intends to measure. It means to determine how valid a tool is one should compare the reality of what it does measure with some ideal conception of what it ought to measure. The measurement should be consistent. Thus, validity has two aspects: Reliability and Relevance. Reliability is discussed earlier. It appears

that reliability is a necessary, though not a sufficient, condition for validity.

An evaluation tool cannot be valid unless it is reliable, but it may be reliable still not valid. The latter may happen if the tool lacks relevance. Relevance concerns the closeness of the agreement between what the device measures and the function it is used to measure. Generally we need a criterion to define what the evaluation instrument should measure. The validity of the tool can be estimated by the correlation between the raw scores from it and the true criterion scores. The relevance of the test is an estimate of the correlation between the true scores from the evaluation device and the true criterion scores. It is interesting to note that no device is valid for all purposes in all situations and for all groups of students. In fact, validity is always related to the purpose. A device which is valid for one purpose may not be equally valid for any other purpose. Validity is not a problem in physical measurement. The relevance is not questionable because the features and traits are well defined. So, they are concerned with reliability of measurement. But in behavioural science like Education and Psychology, relevance becomes tremendously important as the functions to be measured can seldom be well defined and measurement has to be mainly indirect. In a broader sense, validity is concerned with generalization. When a test is a valid one its conclusion can be generalized in relation to the general population. From the above discussion it can be said that Validity has three important properties. These are: Validity is a relative term. A test is valid for a particular purpose. For example, a test of mathematical ability will be worthless for measuring the knowledge of History. Validity is not a fixed property of the test. Validation is a changing and unending process. The old content of the test becomes less meaningful with

NSOU CC-ED-08 71 the discovery of new concepts and formulation of new meanings. Therefore, they need to be modified radically in the light of the new meaning. Validity, like reliability, is a matter of degree and not an all-or-none property. A test meant for measuring a particular trait or ability cannot be said either perfectly valid or not valid at all. 3.3.3 Reliability Reliability refers to the consistency of a measure. A test is considered reliable only if we get the same result repeatedly. If a test is applied to an individual or to a group of students on two or more occasions and the results obtained in all occasions do not differ at all or differ in a very little degree it can be said that the test is a reliable one. Concept: Reliability in statistics, Education

97%

MATCHING BLOCK 63/224

W

and psychometrics is the overall consistency of a measure. A measure is said to have a high reliability if it produces similar results under consistent conditions. It is the characteristic of a set of test scores that relates to the amount of random error from the measurement process that might be embedded in the scores. Scores that are highly reliable are accurate, reproducible, and consistent from one testing occasion to another. That is, if the testing processes were repeated with a group of test takers, essentially the same results would be obtained. Various kinds of reliability coefficients, with values ranging between 0.00 (much error) and 1.00 (no error), are usually used to indicate the amount of error in the scores. For example, measurements of people's height and weight are often extremely reliable.

According to

92%

MATCHING BLOCK 65/224

SA

Full Book- Measurement and Evaluation in Educa ...
(D112222652)

Anastasi (1968) reliability refers to the "consistency of scores obtained by the same individuals when re-examined with test on different occasions or with different sets of equivalent items, or under other variable examining conditions".

Consistency in results obtained in a single administration is the index of internal consistency of the test. Whereas, consistency in results obtained upon testing and retesting is an index of temporal consistency. Reliability thus includes both internal consistency as well as temporal consistency. A test can be called sound only when it is reliable because reliability indicates the extent to which the scores obtained in the test are free from such internal defects of standardization that are likely to produce errors of measurement. In other words, the test is free from variable errors. Therefore, a serviceable degree of reliability is another essential criterion of a good test.

100%

MATCHING BLOCK 66/224

W

There are several general classes of reliability estimates: Inter-rater reliability assesses the degree of agreement between two or more raters in their appraisals.

NSOU CC-ED-08 72

100%

MATCHING BLOCK 64/224

W

Test-retest reliability assesses the degree to which test scores are consistent from one test administration to the next. Measurements are gathered from a single rater who uses the same methods or instruments and the same testing conditions. This includes intra-rater reliability. Inter-method reliability assesses the degree to which test scores are consistent when there is a variation in the methods or instruments used. This allows inter-rater reliability to be ruled out. When dealing with forms, it may be termed parallel-forms reliability. Internal consistency reliability assesses the consistency of results across items within a test.

Reliability in its simplest sense refers to the precision or accuracy of the measurement or score. A well constructed scientific instrument should yield accurate results both at present as well as over time. reliability is actually a type of consistency.

85% MATCHING BLOCK 67/224

SA JSNR_SSOU_MBA_EA_Educational Evaluation.pdf
(D28924038)

a test is said to be consistent over a considerable period of time when all the examinees retain their same

relative ranks of two separate testing with the same test. Reliability is never the property of the test itself. Rather, it is the property of a test when it is administered to the examinees. In other words, it is the property of test scores. Thus, Reliability

100% MATCHING BLOCK 68/224

SA JSNR_SSOU_MBA_EA_Educational Evaluation.pdf
(D28924038)

refers to the results obtained with an evaluation instrument and not to the instrument itself.

The correlation coefficient of internal stability is called coefficient of stability. Similarly, the correlation coefficient indicating internal consistency is called coefficient of internal consistency or alpha coefficient. Any statistical measure of reliability must indicate both the coefficient of stability as well as the alpha coefficient. That is why reliability refers to self correlation of the test. Reliability of a device is the degree to which the device and its scores reflect true or non-error variance. Or it can be said that it reflects the degree to which the scores are free from chance or random errors. To make the devices more reliable we should avoid the occurrence of chance error in the scores. This nature of reliability also subsumes objectivity because the latter is due to one type of chance errors at the time of passing judgement. That is why objectivity of measurement is studied with reliability. Reliability and validity are the two dimensions of test efficiency. Reliability is a matter of stability of test scores whereas; validity is the correlation of the test with certain outside independent criteria. Therefore, Reliability is a necessary but not a

NSOU CC-ED-08 73 sufficient condition for validity, because tests possessing poor reliability will yield low validity. Again, a test may be reliable but not valid. It may yield a consistent score but the score need not be representing what exactly we want to measure. Reliability merely provides the consistency that makes validity possible. Factors of low Reliability:

The Reliability of test scores is influenced by a large number of factors. These factors can be categorized into three heads: Extrinsic, Intrinsic and method used for determining reliability. 1. Extrinsic factors: Extrinsic factors are those which lie outside the test itself but tend to make the test reliable or unreliable. These are as follows: a. Group variability: When the group of examinees being tested is homogeneous in ability, the reliability of the test scores is likely to be lowered. The effect of variability on reliability can be examined by seeing what happens when variability is zero. In that case, individuals receive the same score; standard deviation and Z score become zero. b. Guessing and chance error: Guessing in a test is an important source of unreliability. In two alternative response options there is a 50 percent chance of answering the items correctly on the basis of the guess. In multiple choice items the chances of getting the answering correct purely by guessing are reduced. Guessing has two important effects upon the total test score. First, it tends to raise the total score making reliability coefficient high. Second, guessing contributes to the measurement error since the examinees differ in exercising their luck over guessing the correct answer. c. Environmental conditions: It is preferable to maintain a uniform testing environment. Infrastructure facilities like light, sound and other comforts should be arranged equally and uniformly to all the examinees. Otherwise, it will tend to lower the reliability of the test scores. d. Momentary fluctuations: Momentary fluctuations in the examinees influence the test score. Hence, they tend to affect reliability. A broken pencil, momentary distraction by the sudden sound of some microphone, anxiety regarding the non completion of test, mistake in giving answer, feeling fatigue or other emotional and physical problem are some of the factors that explain momentary fluctuation in the examinee, leading to lower reliability of test.

NSOU CC-ED-08 74 2. Intrinsic factors: It refers to those factors which lie within the test itself and influence

54%

MATCHING BLOCK 69/224

SA

Full Book- Measurement and Evaluation in Educa ...
(D112222652)

the reliability of the test. These are as follows: a. Length of the test: The length of the test or size of the

sample is directly proportional with the reliability coefficient. Generally, shorter tests lead to lower reliability due to increasing sampling error. Lengthening the test or averaging the total test scores obtained from several repetitions of the same test tends to increase the reliability. b. Homogeneity of items: Homogeneity of items is an important factor in reliability. The concept of homogeneity of items includes two things.-item reliability and homogeneity of function or trait measured from one item to another. When the test is a heterogeneous one the reliability is zero or very low. c. Range of the total score: If the obtained total scores on the test are very close to each other or if there is lesser variability among them the reliability of the test is lowered. The standard deviation of the total score is low, the reliability is also low. d. Difficulty value of items: In general items having indexes of difficulty at 0.5v or close to it, yield higher reliability than items of extreme indexes of difficulty. When items are too easy or too difficult the test yields very poor reliability, as these items do not contribute to the reliability. e. Discrimination value: when items do not discriminate well between superior and inferior, or when items have poor discrimination values the item total correlation is affected, this leads to low reliability of the test. f. Scorer reliability: It, also called reader reliability, is an important factor which affects the reliability of the test. It means how closely two or more scores agree in scoring or rating the same set of responses. If they do not agree, the reliability is likely to be lowered. g. Ambiguity of language: Vague language coupled with unstructured nature of tasks presented to the students with no or improperly planned directions for scoring become the root cause of personal errors and subjectivity. The degree of seriousness of the problem obviously varies from subject to subject. For example, it is definitely less serious in Mathematics than in Social Science.

NSOU CC-ED-08 75 3.3.4 Usability/ Practicability Practicability is another important characteristic of a good tool. It stands on a different area from the technical considerations discussed so far, but it has its own significance. Practicability imposes conditions on reliability and validity. In other words, reliability and validity depends on practicability. As we go on increasing the length of the test the reliability of the test goes on increasing. Although we may not be able to increase the length of the test beyond a certain level due to practical limitations. Thus the evaluation tools and techniques are likely to be ineffective if it lacks practicability. Some of the aspects of practicability which are to be taken into consideration at the time of construction of the test are economy, administrability, scorability, interpretability, utility and acceptability. These are discussed in detail in the following paragraphs. Economy: Economy related to time, cost and effort should be kept in mind during construction of the test. The device should undoubtedly be prepared by the teachers. A difficult tool will immediately invite resistance from the teachers for its use. It should not take away too much of teaching time so that the instruction itself suffers. As far as printing and other charges are concerned the device should be well within the easy reach of the budget of the institution. Administrability: The tools and techniques of evaluation should be easy to administer. They should not require expertly trained personnel to administer the test. It should be teacher friendly. So that the classroom teachers are able to handle the test efficiently. Moreover, the device should be such that it can be administered within the framework of the institution's timetable. It should have clear and unambiguous directions both for examiners and pupils. It should be in conformity with the format. Scorability: Objectivity and ease are the two aspects of scorability. Objectivity of scoring is an important part of reliability and therefore, should be taken into consideration while ensuring reliability as already discussed earlier. Steps will have to be taken to make easy scoring in the evaluation tool. This is mainly concerned with degree of expertness and time required for scoring. The degree of expertness is determined by the form of questions. Form of question is controlled by the instructional objectives, based on which the tool is constructed. It also depends on the purposes of evaluation. Therefore, the constructor has to determine the difficulty level of the tasks keeping in mind the purpose, ability of the pupils and instructional objectives of the test. Some steps can be carefully taken to reduce the time for scoring.

NSOU CC-ED-08 76 Interpretability: Ease of interpretation of the score is another crucial factor that must be considered at the time of construction of the test. A good device possesses interpretability only when its scores can be given meaning in objective terms by the use of derived scores, norms, ratings or other methods. This is an essential feature of standardization of the test. Utility: An evaluation tool will have utility if it gives rich dividends to the users for example students, teachers, institutions etc. If the scores can be employed effectively for the guidance of pupils, improvement of instruction, improvement of educational programme, management, administration and betterment of the institution. Acceptability: Acceptability of the evaluation device among students, teachers, administrators, policy makers and the public at large is a very important consideration under practicability of a test. Evaluation is visualized as a cooperative process. The test may have an excellent technical and academic base, but if the teachers, students and other concerned stakeholders express resistance to accept a certain evaluation device, it certainly loses its practicability. For example, internal assessment procedures, although theoretically technically and academically very sound, are not always acceptable to students, teachers and the public in general. Acceptability is mainly a function of the environment. The use of certain types of evaluation devices or certain forms of question in them should be governed by the prevalent socio economic condition and reactions. For example, if general atmosphere of malpractice prevails, multiple choice question tests should be avoided as they are highly amenable to code signaling. 3.3.5 Norms A test must also be guided by certain norms. Norms refer to the average performance of a representative sample on a given test. Norms increase the usability of a test. Two important definitions are discussed here. According to Frank S. Freeman, norm is the average or standard score in a particular test made by a specified population. Thorndike and Hagen defined norm

100% MATCHING BLOCK 70/224

SA

JSNR_SSOU_MBA_EA_Educational Evaluation.pdf (D28924038)

as the average performance on a particular test made by a standardization sample.

Norms help in interpretation of scores. The term norm conveys several meanings. Some important meanings are enumerated below:

(D37396357)

The performance or score of an individual is compared against

a determined level. There are four common types of norms-age norm, grade norm, and percentile and standard score norms. A test constructor prepares any one of these norms depending upon the purpose and use for his test. Age norms are based on average scores earned by pupils at different ages. They are interpreted in terms of age equivalent. Test performance is expressed in age level. Age norms are used in mental ability tests (mental age), achievement test in arithmetic (arithmetic age). Age norm represents test performance in unequal units. The school year is divided into 12 months. Age units do not have uniform meaning due to variation in growth pattern in different age levels. Age norms can be more meaningful in elementary level, where growth of children's ability is more regular and continuous, than at the secondary level of education. Age norms do not always represent the child's mental ability as the child's mental age does not always confer its chronological age. Grade norms are widely used in standardised achievement tests as the tests are employed within academic settings. These educational tests are based on average scores earned by pupils in each grade and interpreted in terms of grade equivalence. Grade equivalence is expressed in two numbers. The first is year and second is month. The school year is divided into 10 months assuming little or no changes occur during vacation. Therefore, grade equivalence for grade 4 ranges from 4.0 to 4.9. During interpretation, we should always remember that grade equivalent indicates the average performance of the pupil in each grade level. For every grade level, 50 percent of the pupils in the standardization groups are above and 50 per cents are below. Therefore, we should not interpret this particular grade norm as something all our students should attain.

87%

MATCHING BLOCK 76/224

Assessment for Learning - Book-KSR.docx (D110721227)

The percentile rank of a score is the percentage of scores in its frequency NSOU CC-ED-08 78 distribution that are equal to or lower than it. For example, a test score that is greater than or equal to 75% of the scores of people taking the test can be said to be at the 75th percentile, where 75 is the percentile rank.

Percentile norms are more convenient to use than age norm or grade norm as they are easy to understand. A percentile rank indicates the percentage of individuals who fall below a particular score. The only problem with this norm is percentile units are unequal and therefore, not easily comparable. Standard scores are used in norm-referenced assessment to compare one student's performance on a test to the performance of other students of her age. Standard scores estimate whether a student's scores are above average, average, or below average compared to peers. Standard scores indicate the number of standard deviation units a raw score falls above or below the mean that can be converted to percentile.. In a distribution, deviations of the scores from its mean expressed in sigma (symbol of sigma to be inserted) are called standard scores. Observed values

65%

MATCHING BLOCK 77/224

W

above the mean have positive standard scores, while values below the mean have negative standard scores. The standard score is a dimensionless quantity obtained by subtracting the population mean from an individual raw score and then dividing the difference by the population standard deviation. This conversion process is called standardizing or normalizing.

Standard scores are also called z-values, z-scores, normal scores, and standardized variables. They are most frequently used to compare an observation to a standard normal deviate, though they can be defined without assumptions of normality.

90% MATCHING BLOCK 78/224

W

Computing a z-score requires knowing the mean and standard deviation of the complete population to which a data point belongs.

The standard score of a raw score x is

94% MATCHING BLOCK 79/224

W

Where: μ is the mean of the population. σ is the standard deviation of the population. The absolute value of z represents the distance between the raw score and the population mean in units of the standard deviation. z is negative when the raw score is below the mean, positive when above. 3.4

Problems of Evaluation through Teacher made Test

94% MATCHING BLOCK 80/224

W

Meaning of Teacher Made Test: Carefully constructed teacher-made tests and NSOU CC-ED-08 79 standardised tests are similar in many ways. Both are constructed on the basis of a carefully planned table of specifications, both have the same type of test items, and both provide clear directions to the students. Still the two differ. They differ in the quality of test items, the reliability of test measures, the procedures for administering and scoring and the interpretation of scores. No doubt, standardised tests are good and better in quality, more reliable and valid. But a classroom teacher cannot always depend on standardised tests. These may not suit his local needs, may not be readily available, may be costly, and may have different objectives. In order to fulfill the immediate requirements, the teacher has to prepare his own tests which are usually objective in nature. Teacher-made tests are normally prepared and administered for testing classroom achievement of students, evaluating the method of teaching adopted by the teacher and other curricular programmes of the school. Teacher-made test is one of the most valuable instruments in the hands of the teacher to solve his purpose. It is designed to solve the problem or requirements of the class for which it is prepared. It is prepared to measure the outcomes and content of

the

96% MATCHING BLOCK 83/224

W

local curriculum. It is very much flexible so that it can be adapted to any procedure and material. It does not require any sophisticated technique for preparation. Taylor has highly recommended the use of these teacher-made objective type tests, which do not require all the four steps of standardised tests nor need the rigorous processes of standardisation. Only the first two steps planning and preparation are sufficient for their construction. Features of Teacher-Made Tests

are as follows: 1.

100% MATCHING BLOCK 84/224

W

The items of the tests are arranged in order of difficulty. 2. These are prepared by the teachers which can be used for

both

98%

MATCHING BLOCK 81/224

W

prognosis and diagnosis purposes. 3. The test covers the whole content area and includes a large number of items. 4. The preparation of the items conforms to the blueprint. 5. Test construction is not a single man's business; rather it is a co-operative endeavour. 6. A teacher-made test does not cover all the steps of a standardised test. 7. Teacher-made tests may also be employed as a tool for formative evaluation. 8. Preparation and administration of these tests are economical.

NSOU CC-ED-08 80 9.

100%

MATCHING BLOCK 82/224

W

The test is developed by the teacher to ascertain the student's achievement and proficiency in a given subject. 10. Teacher-made tests are least used for research purposes. 11. They do not have norms whereas providing norms is quite essential for standardised tests.

Problems or disadvantages through teacher made tests are as follows. 1. Ambiguity: Teacher made tests are often ambiguous and unclear. 2. Length of the test: Tests are either too short or too lengthy. 3. Duration: Tests are usually hurriedly conducted. 4. Supervision: Supervision is not proper. There is a lot of scope for copying 5. Evaluation: Answer books are not marked carefully. 6. Coverage

96%

MATCHING BLOCK 88/224

W

of content: Teacher-Made Tests Designed to Measure Achievement of a Particular Unit of Work,

therefore content area is lesser compared to standardized test. 7. Purpose: Teacher-made tests are aimed to be used in a classroom or local situation only. Teacher-made test is only valid for that situation as it is specifically prepared for that situation. 8. Reliability: In teacher-made tests reliability is unknown, typically having moderate to low reliability. Tests are

100%

MATCHING BLOCK 85/224

W

developed usually by one teacher with little or no outside help

without the skill of professional writers, reviewers and editors of test items. Although reliability can be high if items are carefully constructed. 9. Technical qualities: Teacher made tests are technically inferior. Teacher- made tests may be carelessly planned and executed that may lead to disastrous consequences. The reliability of teacher made tests is not ensured. Here test items are not expertly written, properly pretested, rigorously analyzed and scientifically retired. Therefore, the procedure in administration and scoring of the teacher-made tests are not dependable. 10. Administration and scoring: In teacher-made tests uniform procedure of administration and scoring may be possible and usually flexible and not standardized, leading to unscientific results.

NSOU CC-ED-08 81 11. Learning outcomes and content measured: Teacher-made tests are used to evaluate the outcomes and content of only what has been taught in the classroom. Therefore the scope is narrow. 12. Interpretation of results: The teacher-made tests are prepared keeping in view a particular class which is composed of 40 to 50 students maximum. The results of such students are compared with reference to that particular group. As no norm is accompanied this test lacks the ability to judge the position of the individual students in relation to all students of his own age or grade. 13. Practical utility: One important principle of good evaluation is that it should be well integrated with instruction and should be continuous. The students are required to be evaluated periodically and if possible after covering each unit. In this connection, teacher-made tests are useful but use items that have rarely been tried out, analysed or revised before becoming part of tests. 14. School specific: Based on content and objectives specific to the teacher's own class or school, lacks universal recognition, lacking generalization. These are

100% MATCHING BLOCK 86/224

W

limited usually to the class or a single school as a reference group,

and does not

100% MATCHING BLOCK 87/224

W

provide norms for various groups that are broadly representative of performance throughout the country. 15.

Others: Tests are cursory and conducted as rituals only. 3.5 General Principles of Achievement Test Construction An achievement test

100% MATCHING BLOCK 89/224

SA

Book-Assessment for Learning.docx (D158480135)

has a great significance in all types of instructional progress of the individual.

A classroom

87% MATCHING BLOCK 90/224

SA

Book-Assessment for Learning.docx (D158480135)

teacher depends upon the achievement test for measuring the progress of his students in his subject area. Several educational and vocational decisions about students are taken on their performances in the achievement

test. It is, therefore, necessary that the teachers should be well acquainted with the meaning and characteristics of achievement tests.

Thorndike and Hagen (1969) observed, "

89% MATCHING BLOCK 97/224

SA

Book-Assessment for Learning.docx (D158480135)

The type of ability test that describes what a person has learned to do is called achievement test". Gronlund (1977) defines an achievement test as "a systematic procedure for determining the amount of student has learned through instruction". The

following principles should be taken into consideration for achievement test construction.

NSOU CC-ED-08 82 Mastery of knowledge: It will be general and comprehensive enough to test thoroughly the pupil's mastery of the desired skills or grasp of a subject matter. It will make it impossible for a pupil to get a good mark just because he got a few common questions and will not fail a good pupil just because of a few uncommon questions. Grading based on ability: It should reliably grade the pupil into at least six to ten or more different classifications according to their ability. Objectivity and practicability: It will be as objective as practicable. Some questions which are of discussion nature can be given advantage but there should also be some work which compels the examinee to answer that can be quite objectively scored. Even in the essay type examination, the objectivity can be greatly increased with study and care. Size and duration: Other things being equal, the test which examines most intensively or extensively in the least time and with the least figures on the part of the pupil is the best. Enhancing creativity: The test should encourage creative and self reliant work and discourage mere mechanical rote memory work. Increase motivation: The test should encourage the pupil to put forth his best effort. Self appraisal: The test should convincingly reveal to the pupil his deficiencies and encourage him to remove them. Objectivity: The test should examine exactly what it pretends to examine and not handicap pupils for deficiencies in unrelated subjects. The more a test tries to examine in subjects extraneous to the avowed subject, the less efficiently it examines its own. Cultural performance: The standards of a test should be based on cultural performance and not upon mere opinion of what a standard should be or on an arbitrary percentage work. The more a test makes it possible to compare the performance of a certain group of pupils to that of other pupils the more revealing it is. Importance of habits: One should keep in mind that no test is infallible. The daily work of the pupil and an observation of his habits of work are equally important in appraising the work and ability of a pupil.

NSOU CC-ED-08 83 Interpretation of score: Nevertheless one must remember that poor results on the part of a group of pupils indicate a faulty test or one that is not graded to the ability of the pupil or deals with matters the children have not been taught. Norms to be calculated: Taking into consideration the performance of the group norms for the group should be calculated. Different types of norms are calculated like grade norms, sex norms, local norms, standard score norms and percentile norm. Validity determination: To determine content validity proper analysis of content and objectives must be made. By the help of item analysis each item should be validated. The validity of the test is indicated by the coefficient of correlation between two sets of scores. Higher the correlation co-efficient higher is the validity. Reliability determination: To determine reliability we can take the help of methods like test-retest, parallel form of equivalent, split-half and Kuder- Richardson method. Preparation of the manual: At the final stage a booklet is prepared, containing all details of the scope of the test, instructions in connection with administration, details of different norms, validity, reliability etc. A good test must be valid, reliable and objective in nature. Thus,

100%

MATCHING BLOCK 98/224

SA

Development of a scholastic achievement test i ...
(D35728002)

test construction remains largely an art rather than a science

for which the teacher has to follow a series of steps. These are as follows: A. Planning the test: The teacher will have to understand the objectives to be assessed, the examinees to be examined and their test taking behavior. Therefore, careful planning is needed for better test construction. To obtain better result of test construction the following steps should be taken into consideration: Determining the purpose of the test: While planning the test the teacher has to determine whether the test is meant for placement or formative or diagnostic or summative evaluation. Indicating the conditions which the test has to serve: It is very much important to pay attention to the conditions under which it will be administered, how much time is needed for the test, the facilities available to repeat the test, age and experience of the individual to be tested.

NSOU CC-ED-08 84 Defining the objective to be measured: In the entire planning process the most important step is to define the important objectives that are to be appraised. The objectives must be clearly listed, classified in terms of pupil behavior. Each objective should also be given weightage according to its relative importance. Outlining the content area to be covered: The test should reflect proportionate emphasis on the different content area or units to which the objectives are to be achieved. The weightage should be based on the relative importance and time devoted to each content area. Selecting the appropriate item to be included: While testing the teacher has to make certain major decisions regarding the type of test items to be used. The decisions will be made on the basis of objectives of the test, availability of time and nature of test. Deciding the difficulty level of the test: Every test item has a certain difficulty level. Unless it is decided at the right moment it will be very difficult to construct the test. Moreover, in order to discriminate between the high achievers and the lower one the teacher should also set questions such as, very easy, moderately difficult, difficult etc. Preparing the table of specification or Blue print: Blue-print is a chart which specifies the content deemed important by the teacher and indicates what the student is supposed to be able to do with that content. Thus blueprint may be two dimensional, three dimensional or four dimensional chart containing objectives, content area, forms of question and level of difficulties. B. Preparing the test: Like planning the test maker has to perform some important activities in preparing the test and shall follow the following steps: Recording of test items: If the test items are recorded properly they can be profitably utilized writing the test items simplifies the task of reviewing, selecting and arranging the test items in final test forms. It also facilitates the elimination of defective items. Flexibility is an important part of planning test items. Review of the test items: The tests are not free from errors even if constructed very carefully. There is a possibility of introducing ambiguous items while

NSOU CC-ED-08 85 increasing the difficulty of the test items. Two specific ways have been suggested by the experts to get rid of these technical defects. These are: (a)

93%
MATCHING BLOCK 91/224
W

reviewing the items after they have been set aside for a few days. (b) Asking a fellow teacher to review and criticize the items.

Arrangement of the test item in the test: Tests are mostly used in classrooms. Therefore, satisfactory arrangement of test items is very essential. The arrangement of the test items should be made item wise. To facilitate the pupils to retain the idea easily and it also facilitates the test maker for the sake of scoring. Test items can proceed from simple to complex, which may include true-false, then matching items, then short answer, multiple choice, interpretive exercise and lastly essay questions. Preparation of directions for the test: The vital point is preparation of direction for the test. Whenever the test items are prepared they should be accompanied with necessary directions to facilitate the learners to answer effectively. Therefore, written directions in the test items must be given. Reproduction of the test: When the test materials are ready for production it is important that the test items should be spaced and arranged in such a manner that they can be easily read, answered and scored. It is not possible to cram a large number of test items. Therefore, the number of test items should be printed or written by hand or memographed or typed. Introductory materials should be placed on a facing page or separate sheet with all of the items referring to it on a single page. Test scoring procedures: The test maker should create a proper environment for this purpose. The psychological, physical and time factors influence

66%
MATCHING BLOCK 92/224
W

test results. Scoring is nothing but a matter of comparing the columns of answers on

each paper used by the student. When we need to record the answer of the people

54%
MATCHING BLOCK 93/224
W

on the test paper itself we need a scoring key by making the correct answer on a blank copy of the

tests. C. Trying-out the test: The third phase in test construction is trying out the test. The trying out is of two types. These are as follows: a. Preliminary try-out: The purpose of preliminary try out is to ascertain the effectiveness of the test items. In this the following points should be specially paid attention to:
NSOU CC-ED-08 86 Selection of sample: The sample for administration can be randomly or purposefully selected.
Administration of the test:

100% MATCHING BLOCK 94/224

W

All pupils must be given a fair chance to demonstrate their achievement of the learning outcomes

to be measured in a favourable atmosphere. Scoring: It should be done in accordance with the key prepared for the test, using the simplest method. Item analysis: The process followed for ascertaining the effectiveness test item is known as test analysis. Generally the effectiveness suitability of items is ascertained on the basis of the difficulty level and discriminating power of the items. The formula used for this purpose are $U + L$ $U - L$ 1. $Di = \frac{U - L}{2N}$ 2. $Dp = \frac{U - L}{2N}$ [Where, Di = Difficulty Index, Dp = Discriminating Power, U =number of correct responses in upper group, L = the number of correct responses in lower group, N = Total number of cases in each group] Selection of items: On the basis of the difficulty index and discriminating power considered at the same time items will be rated. Generally the difficulty index of a good item is considered to lie between 0.4 and 0.6. Preparation of the final test: After finalizing the items to be included in accordance with the blue print, these may be arranged in the order of difficulty and the instruction and other details added to get the final draft of the test. b. Try-out proper: This is an important test which includes the following steps: Selection of sample: A convenient sample that represents the population is selected for the purpose. The size of the sample depends upon the size of the population Administrations: The test should be administered in accordance with the principle of test administration. Scoring: The scoring of the script strictly in accordance with the scheme of valuation prepared in advance by the paper setter or the team who finalized

60% MATCHING BLOCK 95/224

W

the test. This can be done with the help of the scoring key. NSOU CC-ED-08 87 D. Evaluating the test:

It is the final step in construction. The test can be discussed in two different ways: A. Analysis from a diagnostic point of view which helps the teacher for re- teaching and remedial teaching. B. Inferences can be drawn about the effectiveness of the tests and also about its function. 3.6 Summary Tests are systematic procedures for observing persons and describing them with

67% MATCHING BLOCK 96/224

W

either a numerical scale or a category system. Thus tests may give either qualitative or quantitative information.

Further by its denotation, the term test refers to any tool or mechanism through which assessment can be made. A good measurement instrument possesses five major characteristics, such as, objectivity, validity, reliability, usability and norms. A test is said to be an objective if the same scores or results are obtained by administering the test to a particular group of students on different occasions and scored either by the same scorer or different scorer. Tests should be made free from errors.

A test is

said to be valid when it measures that it intends to measure.

There are three types of validity; content validity, construct validity,

criterion related validity. Criterion validity may be classified into concurrent and predictive validity. A test also may suffer

from other forms of variable error or chance error. Reliability refers to the consistency of a measure. A test is considered reliable if we get the same result repeatedly. That is, if a test is applied to an individual or to a group of students on two or more occasions and the results obtained in all occasions do not differ at all or differ to a very little degree, we say that the test is a reliable one or the test is free from variable errors.

A test has utility if it provides the test condition that would facilitate realization of the purpose for which it is meant.

Finally norm is a device of transforming new scores into standard scores in a group. The norms of any educational test represent the average

88%

MATCHING BLOCK 99/224

SA

John Bennet Raj, D. English, Reg.No.9025 Chap ...
(D37396357)

test performance of the standardized group or sample selected from a specific population.

In this an individual score is compared with the standardized sample as a reference group. Teacher made tests are frequently the basis of evaluating the progress of students in the class. These tests are of great value to the teachers, the students and their parents and administrators and educators. Although teachers made tests have some limitations. These are often ambiguous and unclear; either too short or too long, does

NSOU CC-ED-08 88 not cover the entire content, cursory, improper supervision, careless marking etc. A classroom teacher depends mostly on achievement tests for measuring the progress of students. An achievement test possesses some general principles and steps of Planning, preparing, trying out and evaluating the test. 3.7 Self Assessment Questions 1. What are the characteristics of a good test? 2. Name the forms of reliability. 3. What are the factors of reliability? 4. Define validity. 5. What are the properties of validity? 6. Discuss the different types of norms. 7. What are the different aspects of usability of a test? 8. Identify the problems of teacher-made tests in educational evaluation. 9. State the major principles of achievement test construction. 10. Discuss the steps of achievement test construction. 3.8 References Books Aggarwal, J.C. It

77%

MATCHING BLOCK 101/224

W

is a systematic determination of a subject's merit, worth and significance, using criteria that are governed by a set of standards. It can assist an organisation, programme, project or any other intervention or initiative to assess any aim, realisable concept or NSOU CC-ED-08 93 proposal, or any alternative, to help in decision making or to ascertain the degree of achievement or value with respect to the aims and objectives and results of any such action that has been completed. The primary purpose of evaluation is to enable reflection and assist in the identification of future change. Evaluation is often used to characterise and apprise subjects of interest in a wide range of human enterprises.

100%

MATCHING BLOCK 102/224

W

It is long term and done at the end of a period of time.

Contemporary education recognises evaluation as an integral part of the instructional process. Modern educational process has given equal importance to planning, directing and evaluating instruction. Even the most skilful teacher has to evaluate the actual results of his instructional procedure in terms of pupil achievement to carry his task to its ultimate conclusion. Therefore, the evaluation process, its types, methods will be discussed in this unit.

In today's policy environment, testing has become a critical component of education reform. Policy makers and education administrators often view test scores as a measure of educational quality and use test scores to hold schools accountable for teacher performance. Continuous

and comprehensive assessment offers

a methodology for measuring pupil performance and using those findings to improve the success of pupils.

CCE

is a classroom strategy implemented by teachers to ascertain the knowledge, understanding, and skills attained by pupils. This process is much more than an examination of pupil achievement. It is also a powerful diagnostic tool that enables pupils to understand the areas in which they are having difficulty and to concentrate their efforts in those areas and

also allows teachers to monitor the impact of their lessons on pupil understanding.

The concept, characteristics and significance will be discussed in this unit. Lastly, Peer or participatory evaluation in education will be discussed in this unit. Participatory evaluation, as we shall see, is not simply a matter of asking stakeholders to take part. In education peer or participatory evaluation is very important today. The concept and significance will be discussed in detail. 4.3 Formative and Summative Evaluation: Characteristics and Significance

Assessment and Evaluation - KSR -Corrected-1.doc
(D26588141)

Evaluation is a continuous process. It is concerned with more than the academic achievement of students. It tends to develop the individual in terms of desirable behavioural changes in relation to feeling, thinking and action.

Effective learning must bring about some behavioural changes in students. These desired changes are set during planning of instructional objectives. Educators were interested previously in measuring the achievement of students based on students' scores. Today, educational NSOU CC-ED-08 94 measurement is considered as an important aspect of evaluation.

87% MATCHING BLOCK 109/224

W

Educational evaluation is the evaluation process of characterizing and appraising some aspects of an educational process.

100% MATCHING BLOCK 103/224

W

Evaluation is inherently a theoretically informed approach (whether explicitly or not), and consequently any particular definition of evaluation would have been tailored to its context - the theory, needs, purpose, and methodology of the evaluation process itself.

Keeping in mind

90% MATCHING BLOCK 105/224

W

this, evaluation has been defined as: A systematic, rigorous, and meticulous application of scientific methods to assess the design, implementation, improvement, or outcomes of a programme. It is a resource-intensive process, frequently requiring resources, such as, evaluates expertise, labour, time, and a sizable budget.

According to St Leger and Wordsworth-Bell "

88% MATCHING BLOCK 106/224

W

The critical assessment, in as objective a manner as possible, of the degree to which a service or its component parts fulfils stated goals". The focus of this definition is on attaining objective knowledge, and scientifically or quantitatively measuring predetermined and external concepts.

According to Stufflebeam and others (1971) evaluation is providing information for decision making. Stufflebeam defines evaluation is "

91% MATCHING BLOCK 107/224

W

A study designed to assist some audience to assess an object's merit and worth". In this definition the focus is on facts as well as value laden judgements of the programs outcomes and worth.

Today we do not only test but also evaluate for appraisal of the effects of the learning experiences. Evaluation designates a process of appraisal which involves the acceptance of specific values and the use of a variety of instruments of observation, including measurement, as the basis of value judgement. From the functional point of view it involves identification and formulation of a range of major objectives of a curriculum, their definition in terms of students' behaviour and construction of valid, reliable and practical instruments. These instruments or tools are used for observing the specific phases of students' behaviour such as knowledge, skill, attitude, appreciation, personal and social adaptability, interest and work habits. While the child is acquiring knowledge and skill, learning in attitude, appreciation and interest are also taking place. This approach indicates a shift from a narrow conception of subject matter outcomes to a broader, conception of growth and development of individuals. Evaluation refers to the assessment of students' progress toward stated objectives, efficiency of our teaching as well as effectiveness of the curriculum. Therefore, evaluation has three dimensions, which are represented diagrammatically:

NSOU CC-ED-08 95 Fig1: Dimensions of Evaluation Fig 2: Cyclic process of evaluation The nature of evaluation as a continuous process is illustrated in the above diagram. Evaluation plays an important role in the field of education. We evaluate student's skills and abilities in order to select students for a special programme and to diagnose a student's weakness and strength. We also take the help of evaluation to determine the effectiveness of instruction, usefulness of a special programme or a new curricular, and mastery of certain learning objectives.

100% MATCHING BLOCK 108/224

W

So evaluation can be formative that is taking place during the development of a concept or proposal, project or organization, with the intention of improving the value or effectiveness of the proposal, project, or organisation. It can also be summative, drawing lessons from a completed action or project or an organisation at a later point in time or circumstance.

Honer,

NSOU CC-ED-08 96 M. Seriven (1967) coined the terms of summative and formative evaluation. Evaluation also helps the teachers to report student progress to parents. The report is also used for guidance by counselors in career counseling. Evaluation helps the researcher to investigate the effectiveness of teaching methods used by classroom teachers. Evaluation can also be diagnostic in nature. Depending on the purpose of evaluation a classroom teacher usually uses four types of evaluation; placement, formative, summative and diagnostic. The two major evaluation types are discussed here. 4.3.1 Formative Evaluation Formative evaluations evaluate a programme during development in order to make early improvements that help to refine or improve programme. Different scholars have defined formative evaluation. Such as,

86% MATCHING BLOCK 110/224

formative evaluation occurs over a period of time and monitors

students' progress." Characteristics: After going through definitions by different scholars some characteristic features of formative evaluation as follows: 1. Formative evaluation is done during an instructional programme. NSOU CC-ED-08 97 2. The instructional programme should aim at attainment of certain objectives also during the implementation of the programme. 3. Formative evaluation is cause seeking. 4. It relatively focuses on molecular analysis. 5. It is interested in the broader experiences of the programme users. 6. Its design is exploratory and flexible in nature. 7. It often ignores the local effects of a particular programme. 8. It seeks to identify influential variables. 9. Formative evaluation is used to monitor learning and modifying the programme if needed before its completion. 10. It requires detailed analysis of instructional material for mapping the hierarchical structure of the learning tasks and actual teaching of the course for a certain period of time. Significance: Following are the significance of formative evaluation for the classroom teacher.

Formative Evaluations provide the information on improving a product or a process. Formative

90%

MATCHING BLOCK 113/224

W

evaluations serve a monitoring function rather than focusing solely on measurable programme outcomes or evaluation findings

Formative evaluation is used for current students. This type of evaluation provides continuous information that can be used to modify the programme to improve its effectiveness and efficiency. In a classroom situation,

80%

MATCHING BLOCK 116/224

SA

JSNR_SSOU_MBA_EA_Educational Evaluation.pdf
(D28924038)

the purpose of formative evaluation is to provide feedback to the teacher and

students about progress in unit tests, measures of interest and attitude. Interviews or conferences with students and parents during the programme can provide important indications for improvement and betterment of the programme by redirecting it. These are mostly teacher made tests. At the end of the teaching of a chapter the teacher takes a test or quiz. Then the teacher reviews the test result to determine which material requires further discussion.

NSOU CC-ED-08 98 4.3.2 Summative Evaluation Summative evaluation provides information on programme effectiveness normally conducted after the completion of the programme design. Following definitions are provided by different scholars.

82% MATCHING BLOCK 117/224

of instruction. It is designed to determine the extent to which the instructional objectives have been achieved and is used primarily for assigning course grades or certifying pupil mastery of the intended learning outcomes."

R.L. Ebel and D.A. Frisbie (1986) defined that "

100% MATCHING BLOCK 120/224

SA

JSNR_SSOU_MBA_EA_Educational Evaluation.pdf
(D28924038)

summative evaluation is conducted at the end of an instructional segment to determine if learning is sufficiently complete to warrant moving the learner to the next segment of instruction."

Gilbert Sax (1989) stated that "

98% MATCHING BLOCK 122/224

SA

JSNR_SSOU_MBA_EA_Educational Evaluation.pdf
(D28924038)

a summative evaluation can provide evidence that the programme is satisfactory and should be continued for next year students or that student learning and learning attitudes are so negative that a new programme is needed."

W. Wiersma and S.G.Gurs have opined that "

97% MATCHING BLOCK 123/224

SA

JSNR_SSOU_MBA_EA_Educational Evaluation.pdf
(D28924038)

summative evaluation is done at the conclusion of instruction and measures the extent to which students have attained desired outcomes".

Characteristics: After going through definitions by different scholars the following characteristics of the summative evaluation are identified: Summative evaluation takes place at the end or completion of a particular programme whose duration may vary from semester to whole year. Summative evaluations should check whether there has been learning or not. If the learning is found to take place the quantity and quality of that learning in relation to predetermined objectives should be kept in mind. Summative evaluations provide feedback to the classroom teacher for the success or failure of the programme or of the student. There must be some instructional programme prior to summative evaluation. The instructional programme should be set for attainment of some objectives.

NSOU CC-ED-08 99 Summative evaluations use well defined evaluation designs. It also focuses on analysis. It provides descriptive analysis. It takes into account the local factors. It is non-reactive and unobtrusive as far as possible. It is concerned with a broad range of issues. Reliable and valid instruments are used here. Significance :

100% MATCHING BLOCK 121/224

W

Summative Evaluations provide information of short-term effectiveness or long-term impact to deciding the adoption of a product or process.

Summative evaluation usually occurs after instruction. It is designed to determine how well the instructional objectives are met. Formal classroom tests, such as unit tests or final examinations are the most frequently used tools used in this evaluation. The term summative means summing up all the available information regarding a programme at its terminal point. Such information can be a valuable way of assessing the effectiveness of the whole programme. It also provides correction if the programme continues. The techniques used here are teacher made, evaluation product such as achievement test, research, report, themes, drawing etc. it also depends on rating of different types of performances such as oral report, laboratory experiments etc. It is scientific as reliable and valid instruments are used here. Summative evaluations provide feedback to the classroom teacher for the success or failure of the programme or of the student. This helps the teacher to evaluate his or her standard of teaching. Based on this evaluation teacher can change plans, teaching methods, tools and techniques subsequently. 4.3.3 Difference between Formative and Summative evaluations Initially the terms were applied for evaluation of curricular work only. M. Seriven in his book Evaluation Thesaurus (1980) differentiated between these terms. Formative evaluations are conducted during development or improvement of a programme or NSOU CC-ED-08 100 product. It is conducted for internal or in-house staff and normally done by an internal or combination of internal and external evaluators. Whereas, summative evaluation

83% MATCHING BLOCK 124/224

SA

1-3 CHAPTER.pdf (D133020716)

is conducted after completion of a programme or a course of study.

It is done

100% MATCHING BLOCK 125/224

SA

1-3 CHAPTER.pdf (D133020716)

for the benefit of some external audience or decision maker

by an internal or external evaluator or a combination of both. Following are the main differences between these two types of tests: The tests differ in purpose, nature and timing. Summative evaluation is the terminal assessment of performance

78% MATCHING BLOCK 126/224

SA

JSNR_SSOU_MBA_EA_Educational Evaluation.pdf (D28924038)

at the end of the instruction, whereas formative evaluation is the assessment made during the instructional phase to inform the teacher about progress in learning

and taking necessary steps. The use of record and profile of achievement are frequently used in formative evaluation, lesser used in summative evaluations. The formative evaluation is termed as process and the summative evaluation is termed as product evaluation. Summative evaluations determine the extent to which the examinee has mastered the knowledge and skill associated with the course, but Formative evaluations deals with the process by which the examinee achieved these outcomes. In formative evaluation both students and teachers are being evaluated. Whereas, in summative evaluations, assessment is done to test the learning outcomes of the students against a set of pre-determined criteria without revealing the route to the teacher which the students followed in reaching the point. Formative evaluations use a variety of instruments which are either locally developed or standardized. It relies on observation and informal data collection devices. In contrast to this, summative evaluations tend to use well defined evaluation devices. These are non-reactive, comparative and concerned with a broad range of issues. These are publicly accepted, reliable and valid instruments. In formative evaluation scoring is based on criterion referenced approach, but in summative evaluation scoring is normally based on norm referenced approach. Criterion referenced test can also be applied in summative evaluation. The method used in formative evaluation of reporting score is the individual NSOU CC-ED-08 101 pattern of pass-fail scores in each task in hierarchy, whereas in summative evaluation attainment is reported in terms of total score. In formative evaluation immediate and continuous feedback is provided to the students. Thus it forces and reinforces learning mastery by providing data that can direct remedial teaching. Summative evaluations are in real sense 'final' tests of students' achievement typically covering large blocks of instructional materials.

Table-1: Broad differences between Formative and Summative evaluations criteria

Formative	Summative	Purpose
To monitor progress of	To check final status of students by collecting feedback of students	Content focus
Detailed, narrow scope	General, broader scope	Methods used
Daily assignments, Tests, projects	teachers observation	Tools used
Teacher made test	Standardized test	Frequency
daily	Weekly, quarterly, monthly, half yearly, annual term examination	

4.4 Continuous and Comprehensive Evaluation (CCE): Characteristics and Significance Evaluation experts have strongly felt that the traditional procedures and practices in the examination are more harmful to our students. It has given rise to a number of malpractices including frequent use of unfair means, misuse of result, huge mental pressure etc. At present there is an imperative need to make evaluation an integral part of the total teaching learning process. This means that evaluation should be a continuous process and there is also a need to make it comprehensive. Hence the Continuous Comprehensive Evaluation has evolved. Continuous comprehensive evaluation or CCE is a classroom strategy implemented by teachers to ascertain the knowledge, understanding, and skills attained by pupils throughout the year.

Teachers administer assessments in a variety of ways over time

NSOU CC-ED-08 102 to allow them to observe multiple tasks and to collect information about what pupils know, understand, and can do. These assessments are curriculum-based tasks previously taught in class. CCE occurs frequently during the school year and is part of regular teacher-pupil interactions. Pupils receive feedback from teachers based on their performance that allows them to focus on topics they have not yet mastered. Teachers learn which students need review and remediation and which pupils are ready to move on to more complex work. Thus, the results of the assessments help to ensure that all pupils make learning progress throughout the school cycle thereby increasing their academic achievement.

The addition of continuous and comprehensive evaluation in the instructional and testing process is intended to achieve two major purposes: to improve both the validity and reliability of the results of pupils' performance on tests and exercises, and secondly to help the pupil to develop effective learning and work habits. The present CCE system is essentially based on frequent test taking and does not really serve the two critical purposes of continuous comprehensive evaluation.

Classroom tests are based on assessment of lower level abilities and rote memorization, here assessments are based on low level thinking skills i.e., "Knowledge" and "Comprehension".

As a result pupils complete their education but still they are unable to analyze and apply their knowledge to solve problems. This education is considered ineffective as it

is unable to transform the pupil from the stage of "knowledge recipient" to the status of "knowledge producer and problem solver". The central purpose of CCE is to help the pupil to become a better learner and producer by encouraging pupils to improve their knowledge and skills through learning, test taking and project undertaking in the critical and important objectives of the school curriculum. Characteristics of Continuous and Comprehensive Evaluation: The features of continuous comprehensive evaluation are: 1. Integral part of teaching learning: Continuous Comprehensive

100%

MATCHING BLOCK 131/224

SA

Assessment and Evaluation - KSR -Corrected-1.doc
(D26588141)

evaluation is an integral part of the teaching learning process.

More valid and reliable evidence about scholastic and non scholastic growth of learners can be collected. CCE can help to maintain desired performance standards through quality control measures at regular intervals. 2. It is a feedback device: CCE is also used as a feedback device to improve teaching and learning. On the basis of CCE more sound judgments and timely decisions about teaching and learning are provided.

NSOU CC-ED-08 103 3.

92%

MATCHING BLOCK 127/224

W

Longer time for collecting assessment information: To obtain accurate and reliable assessment data on a pupil, the assessments are spread over a longer time, allowing the pupil to take tests and other assignments at different times throughout the course. The average of the scores for the various assessments is a more reliable indicator of the pupil's performance in the subject than the score the pupil obtains in a one-shot examination. 4. Use of different testing tools and techniques: By extending the time span for collecting assessment information throughout the duration of a course, different forms of testing and different assessment situations including acquisition and demonstration of practical skills can be introduced in this process. Practical skills such as the skills and competencies involved in conducting interviews, writing and presenting reports, presenting and analyzing data in graphical forms, and production of three-dimensional objects in a variety of subjects could be encouraged in schools to provide a more comprehensive and more valid assessment of pupil's ability. 5. Inclusion of high complex thinking skills in the testing programme: By extending the period for collecting assessment data, forms of knowledge and competencies that cannot be easily assessed under strictly timed conditions can also be assessed. High level thinking skills involving analytical thinking and problem solving skills and other competencies that require extended time for learning and for test response can then be added to the continuous assessment programme. The addition has the effect of helping pupils to acquire the habit of using high level thinking skills in a variety of situations rather than using pure memorization and other low level thinking processes. 6. Teacher assistance and guidance: Another feature of the continuous

and comprehensive evaluation

process is to foster cooperation between the pupil and teacher especially in the area of pupils' class projects. The process requires the teacher to provide assistance in the form of advice on various aspects of pupils' projects. The pupil learns to consult the teacher, classmates and other sources on aspects of his/her project work, while maintaining his/her position as the leader in the project undertaking. This is the normal work procedure in the adult world where production is essentially based on cooperation and not on timed test situations. 7.

Appreciative Inquiry: CCE uses the principles of appreciative inquiry as a
NSOU CC-ED-08 104

basis for the development of the activities in each unit. Appreciative inquiry is a method of figuring out how an organization or group can best undergo positive change. With appreciative inquiry, the starting point of change is acknowledging the strengths and skills one already has. The process of change begins by identifying assets (strengths) rather than problems. CCE activities ask teachers and other educators to identify their strength. The next stage of appreciative inquiry which is also incorporated into many of the activities is the dreaming or aspiration

stage. In this part of appreciative inquiry, those involved in the change are asked to think about how they might see their classroom, their teaching, or school in the future. The third stage of appreciative inquiry is designing the future. This is where teachers describe what they will do in order to make the changes they want to bring out. In this way CCE can provide a road map or action plan for accomplishing the goals they have described. 8. Adult Learning:

As

each unit focuses on activities, many of the activities include working together with colleagues. A series of discussion questions and actions that will help teachers to analyze their own teaching context in light of the information provided are included. Teachers, head of the institution, district supervisors, and parents have important perspectives about their school's particular situation. These adults offer a rich source of ideas and talents that may be used to help their schools for improvement. 9.

Experiential Learning: Adults learn through experience and reflection on that experience. CCE asks teachers to try new techniques in their classrooms (experience) and then discuss what happened (reflection) with colleagues. The many activities

with experiences will lead them to new ways of teaching and thinking about teaching. Teachers are encouraged to carry out the activities and answer the questions for each activity. In this way teachers will gain a deeper understanding of the teaching and learning strategies and ideas. 10. Understanding Reasons for Change: It is important that teachers have opportunities to analyze reasons for change. Most teachers resist being told what to do. For teachers, theory and reasons for implementing new strategies and concepts are an important part of making a decision to try new techniques. Teachers need to understand why a particular innovation is beneficial to the learners.

NSOU CC-ED-08 105 11. Responsibilities for applying new learning: Ultimately, teachers

themselves decide whether or not to apply their new learning to the classroom. They may need to adapt their new skills and knowledge to fit their particular situation. Teachers are the agents of their own change and the students as well through CCE. Types

of Continuous and Comprehensive Evaluation: Continuous and Comprehensive Evaluation

100%

MATCHING BLOCK 128/224

W

is more likely to be formative, process- oriented, informal, internal, learner involved, and/or self- referenced in nature. It can take the form of daily work (e.g. essays, quizzes, presentation and participation in class), projects/term papers and practical work (e.g. laboratory work, fieldwork, clinical procedures, drawing practice). Daily work:

Experience indicates that students learn faster and have less confusion when provided with more feedback. This is why daily work seems to be the most sustained and extensive means of testing, and in providing relatively prompt feedback, it serves to reinforce or correct learned responses. It assists in pacing learning. If a course is broken into units, each assessed on completion, students have regular feedback of what they have mastered (and what they need additional work on). As the most extensive means of assessment, it has a sustained impact on and improves the quality of student learning. As it is fairly labour intensive for both students and the teacher, decisions will have to be taken regarding an optimum level of task. Too many assignments may become overburdened for all of them. It is probably better to have regular but smaller assignments than large scale but infrequent ones. Vigilance is needed to ensure the prohibition of plagiarism and other forms of cheating. Students should be aware of the punishment against such offences. As a counter check, some of the assignments are to be arranged to be done in the class. Projects or term papers: This provides freedom to the students as well as a measure of the students' ability to identify, define, collect, select and use data or information, undertake independent study and enquiry, plan and follow through a fairly large-scaled piece of work, integrate theory and practice, work with others, when the exercise involves teamwork. It is difficult to ensure parity in the projects. Careful coordination in the setting of topics is important. Project work may lead to over-involvement at the

NSOU CC-ED-08 106 expense of other aspects of the course. Teachers or supervisors should therefore guide students in defining tasks and in being selective with regards to content. It may be difficult to maintain consistency and fairness in marking across a range of projects/papers. To mitigate this, project objectives should be clearly identified and some broad criteria for assessment

are

set. Wherever possible, two examiners should be used. Students may receive unequal supervision and this may affect the quality of the completed project. Agreement should be made among

teachers or

supervisors to standardise the degree of direction and guidance to be given to students. Criteria for evaluation should be available to students in advance as these provide direction. It may be difficult to assign individual marks to students

working in a group project, but this may be resolved by orally examining each student

through viva voce

to establish their knowledge of the subject and the degree of his/her contribution. Alternatively, students

should have work on projects individually. Practical work: It is important as it provides the opportunity for applying the learning by students.

It provides a measure of ability to relate theory to practice, students' techniques, procedures and practical skills.

94%

MATCHING BLOCK 129/224

W

Too much emphasis may be given to the written report without sufficient consideration to the actual process and performance. To avoid this, instructors should scrutinise practical work closely and question students about their organisation of the work and their findings. The theoretical and practical aspects of the course may not be sufficiently linked. Obviously, it is important to communicate frequently with those involved in managing different parts of the course.

Tools and Techniques of CCE: CCE involves the following tools and techniques for evaluating scholastic and non scholastic aspects of students' development. A. Evaluation of scholastic aspects: Both testing and non testing techniques can be used for evaluation of scholastic aspects of students' development. In the case of testing, following types of tools are usable: I. Readiness test II. Diagnostic test

NSOU CC-ED-08 107 III. Term test IV. Annual test In the case of non-test devices the following are usable for judging students' scholastic attainment. I. Performance on assignments II. Performance on orals III. Performance on practical work IV. Students' products B. Evaluation of non-scholastic aspects: The following non-test devices are used for students' non scholastic aspects of development. I. Observation schedule for practical work, participation in games etc. II. Rating scales for social qualities, interest, attitude etc. III. Checklist for health habits, work habits, study habits etc. IV. Questionnaire for opinion of experts, teachers etc. V. Interview schedule to conduct an interview. VI. Opinionnaire to seek face to face opinion and views. VII. Sociogram to identify social relationships among peers. VIII. School records to record evidence about students' attainments, progress cards, anecdotal records, etc. In addition to this, standardized tests like personality tests, interest inventories, attitude scales can also be used for assessing students' development in non-scholastic areas. Significance

of Continuous Comprehensive Evaluation: The CCE process is much more than an examination of pupil achievement. It is also a powerful diagnostic tool that enables pupils to understand the areas in which they are having difficulty and to concentrate their efforts in those areas. Continuous

and comprehensive evaluation

also allows teachers to monitor the impact of their lessons on pupil understanding. Teachers can modify their

NSOU CC-ED-08 108

pedagogical strategies to include the construction of remediation activities for pupils who are not working at the expected grade level and the creation of enrichment activities for pupils who are working at or above the expected grade level. Hence, the continuous and comprehensive evaluation

process supports a cycle of self-evaluation and pupil-specific activities by both pupils and teachers. Frequent interactions between pupils and teachers imply that teachers know the strengths and weaknesses of their learners. These exchanges foster a pupil-teacher relationship based on individual interactions. Pupils learn that the teacher values their achievements and that their assessment outcomes have an impact on the instruction that they receive. Teachers can provide individual attention to the students. In CCE as teachers assess the curriculum as implemented in the classroom, it also allows teachers to evaluate the effectiveness of their teaching strategies relative to the curriculum, and to change those strategies as dictated by the needs of their pupils. In addition, continuous and comprehensive evaluation provides information on achievement of particular levels of skills, understanding, and knowledge rather than achievement of certain marks or scores. Thus, CCE enables pupils to monitor their achievement of grade level goals and to visualize their progress towards those goals before it is too late to achieve them.

Advantages of Continuous and Comprehensive Evaluation: One of the expected advantages of continuous and comprehensive evaluation lies in its being guidance oriented. Since it will involve data gathering over a long period of time, it will yield more accurate data reaching the teachers early enough to modify instruction. This could play a vital role in diagnosing and remediating areas of learners' weaknesses if properly anchored in what occurs in classrooms. CCE is an approach that would capture the full range of learners' performance. Teachers and administrators would thus be able to assess learners' progress and would have time to correct the problems. Another advantage of continuous and comprehensive evaluation is that it places teachers at the centre of all performance-assessment activities. It

NSOU CC-ED-08 109

98%

MATCHING BLOCK 130/224

W

encourages more teacher participation in the overall assessment or grading of his/her learners. Teachers must be given opportunities to select and review assessments so that they become involved and knowledgeable in the process. Through this approach, teachers would be able to integrate assessment and assessment results into instructional practice. Teachers will be expected to incorporate assessment into the larger learning framework and possibly to provide evidence regarding how assessment information is used to inform and guide instruction for individual learners. According to Lewis (1997), with continuous assessment teachers must embed the assessment in their instructions, score the assessments and discuss standards for good learners' work with colleagues, parents and learners. One of the important aspects of continuous comprehensive evaluation is the availability of valid and reliable tests which could be used in all schools. There is a need to construct these tests following established procedures and practices. To make the results comparable across all the schools, teachers need to be equipped with skills of test construction and administration. This could be done through teacher training institutions so that teachers are equipped with such skills as part of their training and certification.

Both scholastic and non-scholastic abilities are assessed through CCE. Apart from the skills of test construction measuring cognitive aspects of learning, teachers should also be able to measure the learners' affective attributes such as attitudes, motives, interests, values and other personality characteristics. Such characteristics could be as important as others associated with intelligence. They could assist the teachers and administrators in understanding the learners better, both in the process of education and in the practical affairs of everyday life. They could help us answer questions such as why learners do not do well in schools in spite of being perceived to have high academic abilities. They also provide clues about the interest patterns of learners which could be used in their placement into schools of higher learning and for employment purposes. It is believed that anti-social behaviours such as truancy, lying, cheating, stealing and poor attitude to work could be corrected by providing effective education in schools.

Limitations of Continuous and Comprehensive Evaluation: We should keep in mind for successful implementation of the CCE; teachers

NSOU CC-ED-08 110 need to give most tests, which means more reliance on

marking. They need to observe the learners more keenly to assess their affective outcomes, and there will be more records to be kept on the learners. All these could mean more work to the teacher, more demand on his or her time and more responsibility on him or her. This means they must be professionally and attitudinally prepared for operating the system. If the teacher is not adequately prepared for operating the system, it may lead to a tendency to merely 'cook up' scores in the name of continuous assessment. Thus, teachers should be encouraged adequately trained

to form favourable attitudes toward the practice. They should be made aware of the requirements of the system, its importance and how to implement it. Another problem with CCE is the issue of record keeping. Learners' records have to be adequately and meticulously kept over a long period of time. They should be properly stored and easily retrievable. A related issue is that of collation. Scores may have to be combined from different sources using various weights. Teachers will need basic arithmetical operations of addition and multiplication. 4.5

Peer (Participatory) Evaluation in Education: Concept and Significance

90% MATCHING BLOCK 132/224

W

When most people think of evaluation, they think of something that happens at the end of a project that looks at the project after it is over and decides whether it was effective or not. But evaluation actually needs to be an integral part of any project from the beginning. Participatory evaluation involves all the stakeholders in a project that are directly affected by it or by carrying it out in contributing to the understanding of it, and in applying that understanding to the improvement of the work.

Involving everyone affected may change

100% MATCHING BLOCK 155/224

making sure that their real needs and those of the community are recognized and addressed.

The essence of participatory evaluation is that

100% MATCHING BLOCK 134/224

W

professional evaluators, project staff, project beneficiaries or participants, and other community members all become responsible and active to improve the community's quality of life. Now this participatory principle can also be applied in educational evaluation.

NSOU CC-ED-08 111 Peer/ participatory or peer review in education provides a structured learning process for students to criticise and provide feedback to each other on their work. It helps students develop lifelong skills in assessing and providing feedback to others, and also equips them with skills to assess and improve their own work.? Concept of peer evaluation in education: It is often observed that group work can be more successful when students are involved in developing the assessment process. This may include establishing their own assessment criteria through consultation with teaching staff. Alternatively students can be provided peer evaluation criteria. The main aims of peer evaluation are to: increase student responsibility and autonomy strive for a more advanced and deeper understanding of the subject matter, skills and processes lift the role and status of the student from passive learner to active learner and assessor that also encourages a deeper approach to learning involve students in critical reflection develop in students a better understanding of their own subjectivity and judgement.

92% MATCHING BLOCK 135/224

W

This approach to planning and evaluation is not possible without mutual trust and respect. These have to develop over time, but that development is made more probable by starting out with an understanding of the local culture and customs.

77% MATCHING BLOCK 136/224

W

Respecting students and the knowledge and skills they have will go a long way towards promoting long-term trust and involvement. The other necessary aspect of any participatory process is appropriate training for everyone involved. Peer group members should be aware that

evaluation takes place.

93% MATCHING BLOCK 137/224

W

The real purpose of an evaluation is not just to find out what happened, but to use the information to make the evaluation better.

Peer evaluation can: Empower students to take responsibility for and manage their own learning. Enable students to learn to assess and give others constructive feedback to develop lifelong assessment skills. Enhance students' learning through knowledge diffusion and exchange of ideas. Motivate students to engage with course material more deeply. NSOU CC-ED-08 112 Fig: A framework for participatory Environment in School Considerations for using peer evaluation in evaluation: For successful execution of peer participatory evaluation the following preparations are necessary. Students should know the rationale for doing peer review. They should explain the expectations and benefits of engaging in a peer review process. Students should be considered having evaluated anonymous assignments for more objective feedback. Teachers should be prepared to give feedback on students' feedback to each other. Some examples of feedback of varying quality must be displayed and discussed which kind of feedback is useful and why. Students should be given clear directions and time limits for in-class peer review sessions and set defined deadlines for out-of-class peer review assignments. Teachers should listen to group feedback discussions and provide guidance and input when necessary. Student familiarity and ownership of criteria tend to enhance peer assessment validity, so students should be involved in a discussion of the criteria used. Teachers should identify assignments or activities for which students might benefit from peer feedback.

NSOU CC-ED-08 113 Teachers must consider breaking a larger assignment into smaller pieces and incorporating peer assessment opportunities at each stage. For example, assignment outlines first draft, second draft, etc. Teachers should design guidelines with clearly defined tasks for the reviewer. Teachers should introduce rubrics through learning exercises to ensure students have the ability to apply the rubric effectively. Teachers should determine whether peer review activities will be conducted as in-class or out-of-class assignments. Teacher helps students learn to carry out peer assessment by modeling appropriate, constructive criticism and descriptive feedback through his or her own comments on student work and well-constructed rubrics. Teachers should incorporate small feedback groups where written comments on assignments can be explained and discussed with the receiver. Significance of peer/participatory evaluation in education: Peer or participatory evaluation in education carries the following significances; Perspective

78%

MATCHING BLOCK 138/224

W

evaluation: It gives us a better perspective on both the initial needs of the students' evaluation, and on its ultimate effects. If students are involved from the beginning in determining what needs to be evaluated and why

they are

90%

MATCHING BLOCK 139/224

W

much more likely to aim their work in the right direction, to correctly determine whether

the evaluation

46%

MATCHING BLOCK 140/224

W

is effective or not, and to understand how to change it to make it more so. Generates reliable information: It can find out information one would not get otherwise. When evaluation depends, at least in part, on information from

a peer group,

75%

MATCHING BLOCK 141/224

W

that information will often be more forthcoming if it is asked for by someone familiar. Peer group members interviewing their friends may get information that an outside person

would not be offered. Point out the loopholes:

75%

MATCHING BLOCK 142/224

W

It tells us what worked and what did not from the perspective of those most directly involved. Those implementing the evaluation and those who are directly affected by it are most capable of sorting out the effective from the ineffective. It also points out why something does or

does not work properly. Students are often able to explain exactly why they did not

NSOU CC-ED-08 114 respond to a particular technique or approach, thus giving the teacher a better chance to adjust it properly. Effective evaluation: It brings out a more effective result. Students are

91% MATCHING BLOCK 143/224

W

much more apt to start out in the right direction, and to know when they need to change direction. The consequence is a project that addresses the appropriate issues in the appropriate way, and accomplishes what it sets out to do.

Increases students' responsibility: It empowers students that also brings a sense of responsibility. Participatory evaluation gives those who are often not consulted, particularly the students,

100% MATCHING BLOCK 144/224

W

the chance to be full partners in determining the direction and effectiveness of a

teaching learning. Brings out sense of involvement:

100% MATCHING BLOCK 145/224

who seldom have and often do not think they have a right to the chance to speak for themselves, by involving them from the beginning in evaluation, teachers assure that their voices are heard, and they learn that they have the ability and the right to speak for

them. Training for real life practices:

100% MATCHING BLOCK 147/224

W

It teaches skills that can be used in employment and other areas of life. In addition to the development of basic skills and specific research capabilities, participatory evaluation encourages critical thinking, collaboration, problem-solving, independent action; meeting deadlines

and

91% MATCHING BLOCK 148/224

W

all other skills valued by employers, and useful in family life, education, civic participation, and other areas.

Fulfills self esteem needs:

93% MATCHING BLOCK 149/224

W

It bolsters self-confidence and self-esteem in those who may have little of either. This category can include those students who may, because of circumstance, have been given little reason to believe in their own competence or value to society. The opportunity to engage in a meaningful and challenging activity, and to be treated as a colleague by professionals, can make a huge difference for folks who are seldom granted respect or given a chance to prove themselves.

Build up dynamic attitude:

88% MATCHING BLOCK 150/224

W

It demonstrates to people ways in which they can take more control of their lives. Working with professionals and others to complete a complex task with real-world consequences can show people how they can take action to influence people and events. Enhances leadership: It encourages students' leadership of the

academic

NSOU CC-ED-08 115 activity.

95% MATCHING BLOCK 151/224

W

If those involved feel the project is theirs, rather than something imposed on them by others, they will work hard both in implementing it, and in conducting a thorough and informative evaluation in order to improve it.

Nurturing creativity:

98% MATCHING BLOCK 152/224

W

It can spark creativity in everyone involved. For those who have never been involved in anything similar, a participatory evaluation can be a revelation, opening doors to a whole new way of thinking and looking at the world. To those who have taken part in evaluation before, the opportunity to exchange ideas with people who may have new ways of looking at the familiar can lead to a fresh perspective on what may have seemed to be a settled issue.

Enhances collaborative working:

92% MATCHING BLOCK 153/224

W

It encourages working collaboratively. For participatory evaluation to work well, it has to be viewed by everyone involved as collaboration, where each participant brings specific tools and skills to the effort, and everyone is valued for what he or she can contribute. Collaboration of this sort not only leads to many of the advantages described above, but also fosters a more collaborative spirit for the future as well, leading to other successful community projects. Community involvement: It fits into a larger participatory effort.

86% MATCHING BLOCK 154/224

W

In order to conduct a good evaluation, its planning should be part of the overall planning of the evaluation project. Furthermore, the participatory process generally matches well with the philosophy of community-based or grassroots groups or organizations

outside the school. Advantages: Peer or participatory evaluation has following advantages Agreed marking criteria means there can be little confusion about assignment outcomes and expectations. Encourages student involvement and responsibility. Encourages students to reflect on their role and contribution to the process of the group work. Focuses on the development of student's judgment skills. Students are involved in the process and are encouraged to take part ownership of this process. Provides more relevant and authentic feedback to students as it is generated by their peers.

NSOU CC-ED-08 116 It is considered fair by some students, because each student is judged on their own contribution. When operating successfully can reduce a lecturer's marking load. Can help reduce the 'free rider' problem as students are aware that their contribution will be graded by their peers. Disadvantages: Limitations or disadvantages are also there Additional briefing time can increase a lecturer's workload. The process has a degree of risk with respect to reliability of grades as peer pressure to apply elevated grades or friendships may influence the assessment, though this can be reduced if students can submit their assessments independent of the group. Students will have a tendency to award everyone the same mark. Students feel ill equipped to undertake the assessment. Students may be reluctant to make judgments regarding their peers. At the other extreme students may be discriminated against if students 'gang up' against one group member. Chances of bullying and a sense of rivalry may increase among peer groups. Students may have little exposure to different forms of assessment and so may lack the necessary skills and judgements to effectively manage self and peer evaluation. There may also be a perception amongst students that the academic is 'shirking' their responsibilities by having students undertaking peer evaluation. In this situation students may be reminded of the Graduate Student Attributes. This also highlights the need to fully prepare and equip students for their own assessment and for the assessment of others. It is helpful to introduce students to the concepts and elements of assessment against specified criteria in the first weeks of class when teachers explain the unit of study outline. This requires taking time at the outset of the group activity or unit of study to discuss what is required, and to provide guidance on how to judge their own and others' contributions. Students will need to be assisted to develop criteria that match the learning outcomes with regards to the output and process of the group work. If assessment criteria for each element are set up and clearly communicated, the teacher's role will also change to one of facilitator.

Assessment and Evaluation - KSR -Corrected-1.doc
(D26588141)

Evaluation is a continuous process that is concerned with more than the academic achievement of students.

98%

MATCHING BLOCK 156/224

W

There are two common purposes in educational evaluation which are, at times, in conflict with one another. Educational institutions usually require evaluation data to demonstrate effectiveness to funders and other stakeholders, and to provide a measure of performance for marketing purposes. Educational evaluation is also a professional activity that individual educators need to undertake if they intend to continuously review and enhance the learning they are endeavoring to facilitate. Educational evaluation

can be broadly categorized into two types; Formative evaluation and Summative evaluation. Formative evaluation of a programme is designed to monitor the instructional process to determine whether the learning is actually taking place as planned earlier. This type of evaluation provides continuous information that can be used to modify the programme to improve its effectiveness and efficiency. In a classroom situation,

80%

MATCHING BLOCK 158/224

SA

JSNR_SSOU_MBA_EA_Educational Evaluation.pdf
(D28924038)

the purpose of formative evaluation is to provide feedback to the teacher and

students about progress in unit tests, measures of interest and attitude. Interviews or conferences with students and parents during the programme can provide important indications for improvement and betterment of the programme by redirecting it. These are mostly teacher made tests. At the end of the teaching of a chapter the teacher takes a test or quiz. Then the teacher reviews the test result to determine which material requires further discussion. Whereas, Summative evaluation usually occurs after instruction. It is designed to determine how well the instructional objectives are met. Formal classroom tests, such as unit tests or final examinations are the most frequently used tools used in this evaluation. The term summative means summing up all the available information regarding a programme at its terminal point. Such information can be a valuable way of assessing the effectiveness of the whole programme. It also provides correction if the programme continues. The techniques used here are teacher made, evaluation product such as achievement test, research, report, themes, drawing etc. it also depends on rating on different types of performances such as oral report, laboratory experiments etc. Traditional evaluation system is criticized by modern educationists. As a substitute to traditional evaluation, Continuous Comprehensive Evaluation or CCE is very popular. In CCE teachers not only

assess the curriculum as implemented in the classroom, it also allows teachers to evaluate the effectiveness of their teaching strategies relative to the curriculum, and to change those strategies as dictated by the needs of their NSOU CC-ED-08 118 pupils. The addition of CCE in the instructional and testing process is intended to achieve two major purposes: to improve both the validity and reliability of the results of pupils' performance on tests and exercises, and secondly to help the pupil to develop effective learning and work habits.

Classroom tests are based on assessment of lower level abilities and rote memorisation.

Where assessments are based on low level thinking skills i.e., "Knowledge" and "Comprehension", pupils complete their education still unable to analyze and apply their knowledge to solve problems. The central purpose of CCE is to help the pupil to become a better learner.

Peer or participatory evaluation in education is a modern day concept. In peer or participatory evaluation students individually assess each other's contribution using a predetermined list of criteria. Grading is based on a predetermined process, but most commonly it is an average of the marks awarded by members of the group. The objective of such evaluation is making students aware, responsible, and cooperative and motivating in evaluation of the teaching learning process. Peer or participatory evaluation can be effective if some precautions are taken carefully before execution. 4.7 Self Assessment Questions 1. State the characteristics of formative evaluation 2. What is the significance of summative evaluation? 3. Differentiate between formative and summative evaluation. 4. Differentiate between process and product evaluation. 5. What are the types of Continuous Comprehensive evaluation? 6. Discuss the significance of Peer evaluation in education. 7. What are the advantages and disadvantages of Peer evaluation in education? 8. Name the tools and techniques used in CCE. 9. What are the limitations of CCE? 10. Discuss the considerations needed for preparation of peer or participatory evaluation in education. 4.8 References Books Aggarwal, J.C. (1997): Essentials of examination System: Evaluation, test and

MATCHING BLOCK 159/224

W

Unlike traditional closed book examinations where students are required to rely solely on their recall of topics, open book tests allow students to consult reference materials (notes, textbook, etc.) in the course of completing the examination. But it is not any easier just because the test is an open book or any less challenging, than a closed book examination. In fact, the opposite is often true. While closed book tests place emphasis NSOU CC-ED-08 121 on rote memorisation and recall, open book tests place focus on higher level learning and typically require students to evaluate, analyze, or synthesize information, rather than simply remember it. The strategies outlined below will help improve students' performance on open book tests

in this unit. According to Robert Glaser's point of view, tests are of two types; Norm Referenced Test and Criterion Referenced Test.

100%

MATCHING BLOCK 160/224

SA

JSNR_SSOU_MBA_EA_Educational Evaluation.pdf
(D28924038)

A test designed to provide a measure of performance that is interpretable in terms of an individual's relative standing in some known group

is called Norm Referenced Test. On the other hand,

93%

MATCHING BLOCK 161/224

SA

JSNR_SSOU_MBA_EA_Educational Evaluation.pdf
(D28924038)

a test designed to provide a measure of performance that is interpretable in terms of a clearly defined and delineated domain of learning

task is called Criterion Referenced Tests. In this unit the characteristics and significance of both the tests will be discussed in detail. 5.3 Open Book Testing: Concept and Characteristics An "open book testing" is an assessment method designed in a way that allows students to refer to class notes and summaries or a "memory aid", textbooks, or other approved material while answering questions. An open book test may also mean that students are provided with the examination questions prior to sitting the formal examination or are to complete as a 'take-home' examination. Concept: Open-book tests allow one to take notes, texts or resource materials into an examination situation. They test the ability to find and apply information and knowledge, so are often used in subjects requiring direct reference to written materials, like law statutes, statistics or acts of parliament. Open-book examinations usually come in two forms: Traditional sit-down / limited-time tests, with varying degrees of access to resources and references. Take home open-book tests are conducted at home. Questions are handed out, answers are attempted without help from others, and the answer script is returned within a specified period of time usually the next day. In an open book examination, it is meaningless to ask questions like "Define the term education", since all that the student has to do is copy the relevant information from the textbook directly into the answer book. In a closed book examination, the student first copies the information from the textbook to his memory, and then copies it into the answer book. Open book test attempts to eliminate this intermediate stage of memorization. Given the availability of textbooks in the examination room, teachers will not ask questions that require the mere transfer of information from the textbook to the examination book. Needless to say, indirect problem solving questions that test the students' thinking skills can be used in closed book examinations as well.

NSOU CC-ED-08 122 The essential difference between closed book examinations and open book examinations is that the former can still be used to evaluate how much the students have memorised, while the latter cannot. If the purpose is not only testing memorised information closed book examinations should not be used. It is needless to say that memory has no value in education, but there are differences between passive and static memory, involved in rote learning, from active and dynamic memory, involved in accessing memory as part of creative and critical thinking. Memorization without understanding involves mechanical memorisation. The materials one can take into open-book tests vary depending on the examination authority. Some restrict the type of materials, e.g. formula sheets, tables or a limited number of texts, while others may be totally unrestricted (any quantity of any material). Materials might be notes, readings, reference materials or textbooks, equipment like calculators; drafting tools etc. Materials used in take-home tests are usually unrestricted. Students are allowed to work with materials on their own without any help from others. But there are some misconceptions about open book testing. These are as follows; 1) Open-book tests are a breeze: Open-book tests are not an easy option. Answering the questions well requires more than just copying information straight from texts. For example, having access to a textbook can stop one from giving a wrong answer if the examinee cannot remember a fact or formula, but just getting that fact correct would not score good marks here. In open-book examinations, it is how one can locate, apply and use the information that is important. Open Book tests basically emphasise on the comprehension and application ability of the student. 2) No requirement of study: Probably the biggest misconception about open- book examinations is that there is no need to study. One should study just like any other examinations. Having books and notes to refer may help students not to memorise as much information, but still they need to be able to apply it effectively. This means they must fully understand and be familiar with the content and materials of course so they can find and use the appropriate information. In open-book tests, students need to quickly find the relevant information in the resources they have. Without study no one would be able to find out the information. 3) Copying is allowed from the book: Examinees cannot copy chunks of text

NSOU CC-ED-08 123 directly from textbooks or notes in any open book test. Copying without acknowledgement is called plagiarism. In open-book examinations, the resource materials are made available to students, so they are expected to do more than just reproduce them. They must be able to find, interpret and apply the information in sources to the examination questions. One usually needs to reference as well, just as one would for any other assignment. 4) The more materials the better: This is another misconception with students. Because one should not get carried away and overload with materials and resources in the examination, they should take only what they need. Stacks of books would not necessarily guarantee good performance, and there will not be time for extensive reading. Types of Open Book tests:

87%

MATCHING BLOCK 162/224

SA

JSNR_SSOU_MBA_EA_Educational Evaluation.pdf
(D28924038)

One may think of two kinds of open book examinations; the restricted type and the unrestricted type. I. Restricted Open Book

Test:

100%

MATCHING BLOCK 167/224

SA

JSNR_SSOU_MBA_EA_Educational Evaluation.pdf
(D28924038)

In the restricted type of open book examinations, students are permitted to bring into the examination room one or more specific documents approved by the course instructor.

Here students may be permitted to consult printed documents such as the logarithmic tables, dictionaries, or complete works of Shakespeare, but no handwritten material or printed documents which did not have prior approval. One may also need to make sure that the printed documents that students bring do not contain any scribbles on the margin. In this type of examination, the approved documents function more or less as appendices to the question paper itself. These examinations are not radically different from closed book examinations. They do not present any special problems, irrespective of the nature of the course. II. Unrestricted Open Book Test:

100%

MATCHING BLOCK 172/224

SA

JSNR_SSOU_MBA_EA_Educational Evaluation.pdf
(D28924038)

In the unrestricted type of open book examinations, students are free to bring whatever they like.

Here questions are set in such a way that no prepared material will be of any use. So there are no restrictions on what the students can bring in an unrestricted open book examination. They may bring any books (with or without scribbles on the margin), lecture handouts of the course instructor, or their own handwritten notes. The use of such examinations presupposes certain teaching strategies and types of questions. In particular, it demands that the course focuses on a set of intellectual skills, rather than on the information content, and that no content based questions be asked in the examination. When used properly, it

NSOU CC-ED-08 124 will be pointless for students taking the unrestricted open book examinations to consult any material they have brought, because the questions will be designed in such a way the answers will not be found in the textbooks, handouts or class notes. The use of these examinations then acts as a symbolic gesture that makes the students realise the nature of the course and the examinations, and indulge them into a mode of studying that does not involve cramming. Need of Open Book Testing: The main premise for open book tests is that teachers can set questions that require students to answer in more critical and analytical ways thus encouraging high-order thinking skills in their students; as compared to closed book or traditional examinations that tend to encourage rote learning and more superficial application of knowledge. Open-book tests are used for more than just rote-learning as it does not emphasise on memory level learning. At higher studies simply memorising and repeating information is not enough to score high. Higher education is supposed to equip students with intellectual abilities and skills. Open-book tests judge ability to quickly find relevant information and then to understand, analyse, apply knowledge and think critically. Open-book tests also evaluate memory; ability to find and use information for problem solving, and to deliver well-structured and well-presented arguments and solutions. Open-book test questions usually require applying knowledge, and they may be essay type questions or involve problem solving or delivering solutions. The style of question depends on the faculty or school setting the test. Characteristics: Following characteristic features are observed in

65%

MATCHING BLOCK 163/224

W

Open Book Testing. Preparation is important: Open book testing focuses on "higher level learning". It means that focus is shifted from rote memorization or recall to understanding and application. The purpose of the open book testing is to test students' understanding of a subject matter. Students will be asked to formulate, compare, analyze, evaluate, or synthesize information, rather than just recall it. Consequently, open book examinations are often more challenging than NSOU CC-ED-08 125 other types of tests even with a plethora of reference materials at fingertips. Since open book tests can be more challenging than other types of test, students must adequately prepare.

Reference materials are not emphasized:

65%

MATCHING BLOCK 164/224

W

During an open book test, especially a timed examination, extensive notes, text books and other reference materials can quickly become a liability rather than an asset. Students do not have time to review notes, re-read text books, or discover new information during an open book

examination. Heavy dependence on study material reduces the time. Reference materials are well organized:

50%

MATCHING BLOCK 165/224

W

All reference materials brought to the examination centre should be carefully organized and that one should know ahead of time exactly where all information is

available in answering questions. The main purpose is locating information from class lecture notes, books.

69% MATCHING BLOCK 166/224

W

In the case of open book mathematics and science tests, important data and formulas are listed separately for easy access during the test.

Major concepts are familiarized:

82% MATCHING BLOCK 168/224

W

Open book tests usually cover more information and take longer to complete than traditional tests. Students will likely run out of time if they rely on books for every answer. Books and notes should only be used as reference resources for difficult questions or questions that require specific information.

Plagiarisation is prohibited: Students are not expected to

83% MATCHING BLOCK 169/224

W

copy information directly from the book and write answers on an open book test. Teachers are concerned with what their students have learned, not whether they can locate information in a book. It is permissible to use quotes from the book, or lecture notes, to support viewpoint or analysis, but

heavy reliance on them is not expected. Effective

94% MATCHING BLOCK 170/224

W

time management: The same time management rules that apply to general test taking also apply to taking open book tests. First, at the offset of the test

one must

85% MATCHING BLOCK 171/224

W

review how many questions there are and determine how much time one can spend on each question. Then questions are

answered according to preference of familiarity. Finally, concise, accurate, yet thorough answers are written. Importance of Open Book Testing in Teaching:

84% MATCHING BLOCK 173/224

SA

Book-Assessment for Learning.docx (D158480135)

An "open book examination" NSOU CC-ED-08 126 is one in which examinees are allowed to consult their class notes, textbooks, and other approved material while answering questions. This practice is common in law examinations, but in other subjects, it is mostly unheard of till date. Although the idea may sound puzzling to those who are used to conventional examinations, it is ideally suited to teaching programmes that especially aim at developing the skills of critical and creative thinking.

Teaching as Transmitting Information: In order to appreciate the merits of open book testing, it is first of all necessary to understand the nature of teaching programmes. Traditionally teaching was "dissemination of knowledge". This approach to education treats the information content of a subject to be the most important and memory level teaching was emphasized. But in modern times the teacher's role is viewed as facilitating the transfer of information from the textbook to the students' minds. Today students are expected to understand this information, retain it, and retrieve it during the final examination. Based on the above approach, most conventional examinations test how much information the students have been able to store in their minds. In order to fulfill this expectation, students develop a habit of storing and cramming information where they can only memorise the information in class notes and textbooks, and transfer it to answer books during the examination. In this type of examination, success depends on the quantity of information memorised, and the efficiency with which it is reproduced. In this case a restricted type of open book examination is preferred.

Teaching as fostering Mental Development: Constructivists claim that students construct their own knowledge. Therefore, an alternative view is that teaching should not be just transferring information from the library or textbooks to the students' minds. Rather, true teaching is teaching students how to learn. Today learning is being emphasized and eventually lesson plans are being replaced by learning designs. That is why teaching should equip students with the ability to acquire knowledge, to modify existing knowledge on the basis of new experience, to build new knowledge, and to apply available knowledge to solve problems and make wise decisions. Education is not only meant for obtaining a degree, but the lifelong process of mental development that does not terminate with any degree. If this view of education is accepted, then the main focus of teaching will be shifted on the skills of acquiring, modifying and creating knowledge, that is, on processing information, rather than on the information content itself. In other words, the focus shifts from rote learning to the development of certain mental faculties. The teacher's function then is not summarising the information in the textbook but ensuring an environment that triggers the development of these creative and critical faculties. This can be done by activating learning through questions, exercises, projects, assignments, and so on, and sustaining and guiding it by providing comments, criticisms, and other forms of feedback. We may say that subjects taught in a high school or university should aim to develop the students' intellectual fitness, intellectual stamina, and intellectual flexibility. Conventional memory testing must give way to examinations that test the intellectual skills of the student. This is where open book examinations come in. questions based on information can be easily answered from books, but questions based on concepts need to be answered from their own critical appraisal skill. On the other hand, if the examination tests the skills of problem solving and critical thinking, then there is no harm in students consulting their text books and class notes. If students have to evaluate a conclusion that crucially involves their understanding of the concept, reproducing what the textbook says would be pointless. While open book examinations are not suited to testing rote learning, they can be used effectively to train students in the use of active memory.

Impact on joyful Learning Strategies A more important reason for using open book examinations is that they have a tremendous impact on promoting the right mental sets in both learning and teaching. The most immediate result for students will be that they will stop "mugging" or cramming information or rote learning. Most students prepare for conventional examinations by mechanical memorisation of information in textbooks and class notes in order to reproduce it in examinations. Open book examinations will effect a fundamental change in this attitude and study habit. If textbooks can be consulted in the examination rooms, no one would bother to memorise them. They will study not to memorise, instead, it should be understanding concepts, and using these concepts (along with available information) to practise the skills of modifying and building knowledge, thinking critically, and solving problems. In acquiring the right strategies of studying, nothing is as effective as the shocking realization that mugging is of no use in the examinations. Learning will be free of the burden of just storing information; education can

NSOU CC-ED-08 128 be a pleasurable activity, not a painful drudgery. What is learnt with pleasure is learnt more effectively, and retained better. Impact on Teaching Strategies The effects of open book examination is not only effective on learning but equally effective on teaching strategies. For this purpose the question pattern will be changed. Instead of using action verbs like writing an essay, explaining the term, defining something, we will have to frame questions carefully and intelligently to test the students' understanding, and the skills of applying that understanding. With the changing question pattern, strategies for preparing students to take those examinations will also have to change. It will no longer be enough to paraphrase or simplify the content of the text books in the classroom. Teachers will have to design tasks that will provide exercises for the appropriate mental skills required in each subject. Instead of the teacher talking and students taking down notes throughout the class, classes will have discussions, questions, and other active processes. In other words, teaching will no longer be the transfer of information from the teacher to student. Rather it will be the training of the mind in certain intellectual skills. Thus, open book examinations can restore the true meaning of the word education for both teachers and students. It will surely demand more time, energy and effort from both teachers and students to adapt themselves to the demands of open book examinations. But the changes will be inevitable. When combined with the mode of teaching that focuses on thinking skills, they will make education an exciting and enjoyable intellectual adventure and the beginning of a lifelong thirst for knowledge. Precautions for Open Book Testing: As open book testing is not common in schools teachers and students need to prepare for this. The main issues that arise when making use of open book testing is that teachers may not know how to develop and devise effective examination questions that require students to apply their knowledge through analysis and critical thinking; and students may fail to properly prepare for an open book testing. Students may falsely assume that the testing will be easy, and they will be able to find all the answers in the textbook or on their memory aid. Following are the considerations when designing open book testing. Questions in open book tests need to be devised to assess the interpretation and application of knowledge, comprehension skills, and critical thinking skills rather than only knowledge, recall. NSOU CC-ED-08 129 Case-based examination questions are needed to be designed that require students to apply critical thinking, reasoning skills in response to a trigger scenario Clear and unambiguous questions are to be devised to limit student confusion and time spent interpreting the question so students can spend their time making use of their textbook or memory aid to effectively answer the questions Questions should be framed in such a way that require students to apply and make use of the information from their textbook or notes rather than simply requiring them to locate and re-write this information Questions should be designed keeping in mind the learning outcome. i.e. what skills and knowledge are being assessed from students. Questions should be problem-based scenarios or real-world cases, requiring students to apply their skills and knowledge to the given problem or scenario Information or background information on a given topic or area of study should be provided. Relevant qualitative or quantitative data must be presented first and then students should be asked interpretative and application questions. Content or topic questions should be structured in a way that tests for an ability to apply, analyse, evaluate, create, analyse, synthesise, interpret etc. When devising questions to probe student understanding, skills and knowledge, the Socratic questions and questions reflective of levels and stages of learning may be useful. Combating academic dishonesty is among the most challenging of the many obstacles that web-based technologies present in the recent past.

100% MATCHING BLOCK 174/224

W

Cheating becomes an appealing option when the response to a question is one that can be easily Googled. A student need not read a single chapter or attend any classes, if they know their smartphone will come to their rescue. An open-book test, with challenging application questions that relate directly to the course material, can help minimize the problem

even with smartphone or laptop and internet connection. With limited time students would not

100% MATCHING BLOCK 175/224

W

be able to blindly scavenge the course notes for the answer. They will recognize the need to prepare and have some familiarity with the material or they will simply run out of time.

NSOU CC-ED-08 130 5.4 Norm Referenced Testing: Concept and Characteristics Generally we get a score after administering a test. On the basis of scores higher achievers are praised and lower achievers are identified for improvement. Marks obtained by a student in an achievement test are called raw scores. Raw scores do not indicate the merit of a student. From raw scores we cannot determine that children in school A are better in English than children in school B. For this comparison we need some broader, uniform, objective and stable standard of reference or unit of measurement in educational and psychological testing. The establishment of such reference points is important for both standardized tests and teacher made achievement tests. It is important for all sorts of tests, like intelligent tests, mathematical aptitude, personality tests etc. If the scores need value that is meaningful, significant, objective and stable we require comparing an individual pupil's performance with that of a group, either with a teacher made test or a standardized test, a group similar to his upon whom the test was developed. A score is not high or low, it is higher or lower than other scores. The better type of unit to express test results than raw score of a crude percentage is called norms. In other words, the medium or average performance on standardized tests of pupils of a teenage group or a placement or of a school group is termed as Norm. Such an average is obtained by administering the test to a large group of students who represent different geographical areas in a country comprising both boys and girls, rural and urban. Among these students there may be children from private and public schools. Such a group will provide a frame of reference for interpreting individual scores. Robert Glaser originally coined the terms Norm- Referenced Test and Criterion-Referenced Test. Concept of Norm-Referenced Test (NRT): In the last four decades revolutionary changes have taken place in the field of teaching and learning processes. As individual instruction has gained importance tests should be designed in such a way that reflects the changes in what the individual has learned. In the case of Norm Referenced Test (NRT) one interprets learners' test performance according to the performance of others. A norm-referenced test is not measured against defined criteria. This type of test is relative to the student body undertaking the assessment. It is a very effective method of comparing students. The IQ test is the best known example of NRT. Many entrance tests are examples of NRT, permitting a fixed proportion of students to pass. Meaning and definition of NRT:

(D37396357)

the average performance on a particular test made by a standardization sample. A standardization sample is the true representative of the population. It takes the test to provide data for comparison and subsequent interpretation of the test scores.

To have an adequate representation the sample must include cross sectional representation of different parts of the population with a view to compare the raw scores with performance of the standardization sample. When these are converted they are called derived scores. Gronlund (1976) defined NRT as the

100% MATCHING BLOCK 180/224

Full Book- Measurement and Evaluation in Educa ...
(D112222652)

is designed "to measure the growth in a student's attainment and to compare his level of attainment with levels reached by other students

and norm groups".

81% MATCHING BLOCK 185/224

W

This test is primarily used for comparing achievement of an examinee to that of a large representative group of examinees at the same grade level. The representative group is known as the 'norm group'. Norm group may comprise of examinees at the local, district, state or national level. Since the development of NRT is expensive and time consuming

they are produced by commercial test publishers. The following derived scores are generally reported for

82% MATCHING BLOCK 181/224

W

these published tests: Percentile Rank: A number telling the percentage of examinees in a defined group scoring lower than the particular raw score. Linear standard score: A number indicating the location of a particular raw score in relation to the mean and standard deviation of a defined group. Normalized Standard Score: A number showing the location of the particular

raw

98% MATCHING BLOCK 183/224

W

score in relation to a normal distribution defined in terms of a particular group. Grade Equivalent Score: A number telling the grade placement for which the particular raw score is the average for a defined group.

Chief characteristics of NRT: Following characteristic features are observed in NRT;

NSOU CC-ED-08 132 1. The basic purpose of NRT is to measure students' achievement in curriculum based skills. 2.

Most achievement NRTs are multiple-choice tests. Some also include open- ended,

short-answer questions. The questions on these tests mainly reflect the content of nationally-used textbooks, not the local curriculum. This means that students may be tested on things

that

local schools or state education department decided were not so important and therefore were not taught. 3.

Generally

87% MATCHING BLOCK 184/224

W

it is reported in the Percentile Rank, Linear standard score, Normalized Standard Score, Grade Equivalent Score.

Scores are usually reported as percentile ranks. The scores range from 1st percentile to 99th percentile, with the average student score set at the 50th percentile. If John has scored at the 23rd percentile, it means he scored higher than 23% of the test takers in the norming group. Scores also can be reported as "grade equivalents," "stanines," and "normal curve equivalents." 4.

EDN-201-Educational Measurement and Evaluation.pdf
(D141388331)

Norm-Referenced Tests (NRTs) compare a person's score against the scores of a group of people who have already taken the same test, called the "norming group."

For example, someone has scored at the 63rd percentile. 5.
NRTs are designed to "rank-order" test takers to compare students' scores. A commercial norm-referenced test does not compare all the students who take the test in a given year. Instead, test-makers select a sample from the target student population (say, ninth graders). The test is "normed" on this sample, which is supposed to fairly represent the entire target population (all ninth graders in the nation). Students' scores are then reported in relation to the scores of this "norming" group. 6.
The result looks like a bell-shaped curve. Test makers make the test so that most students will score near the middle, and only a few will score low (the left side of the curve) or high (the right side of the curve). 7.
One more question right or wrong can cause a big change in the student's score. In some cases, having one more correct answer can cause a student's reported percentile score to jump more than ten points. It is very important to know how much difference in the percentile rank would be caused by getting one or two more questions right. 8.
Selection of questions is important because that sort people along the curve
NSOU CC-ED-08 133
than it is to make sure that the content covered by the test is adequate. The tests sometimes emphasize small and meaningless differences among test takers.
Since the tests are made to sort students, most of the things everyone knows are not tested. Questions may be obscure or tricky, in order to help the test taker in ranking order. 9. Tests can bring about biased results. Some questions may favour one kind of student or another for reasons that have nothing to do with the subject area being tested. Non-school knowledge that is more commonly learned by middle or upper class children is often included in tests. To help make the bell curve, test makers usually eliminate questions that students with low overall scores might get right but those with high overall scores get wrong. Thus, most questions which favour minority groups are eliminated. 10. NRTs usually have to be completed in a time limit. Some students do not finish, even if they know the material. This can be particularly unfair to students

whose first language is not English or who have learning disabilities. This "speediness" is one way test makers sort people out. 11.

All tests have "measurement error." There are many possible causes of measurement error. Sub-scores on tests are even less precise. Scores for young children are much less reliable than for older students. Teaching to the test explains why scores usually go down when a new test is used. 12.

It is

for a particular grade level. 13. It is administered after instruction. 14. It is used

to form homogeneous or

100% MATCHING BLOCK 187/224

W

heterogeneous class groups. 15. It classifies achievement as above average, average

and below average for a given grade. Reliability of NRT: The following factors can increase the reliability. As we know that test length affects reliability, other things being equal, the reliability of the test can be increased by increasing its length. Homogeneous items in content increases reliability. Moderate difficulty value of items increase reliability over the extremely easy or difficult value

NSOU CC-ED-08 134 Increased range of performance of the examinees being tested tends to increase reliability Validity of NRT: The validity of NRT can be increased by: Constructing items of proper difficulty level Increasing the test length.

Increasing the heterogeneity of the group which is being tested. Administering the test under proper conditions.

Interpretation of NRT: If the scores obtained by students deviate largely from expected scores by a regular classroom teacher, then the teacher should explore by instructional implication. If the range of scores obtained by the student in different subjects varies largely the teacher should try to locate the reason for it motivation, special interest and abilities or difficulties. If the test results do not match the expectation of the teacher for individual students the validity of the test is said to be threatened. Small differences in sub-test scores may be due to chance error also for which the standard error of measurement should be used. Information collected from various tests should be used to explain performance on other tests. Uses of NRT: N. Vasantha Ram Kumar and K.N. Lalithamal (1990) stated that NRT is useful in the following test: 1.

100% MATCHING BLOCK 188/224

W

In aptitude testing for making differential prediction. 2. To get a reliable rank ordering of the pupils with respect to the achievement

that is measured. 3.

100% MATCHING BLOCK 189/224

W

To identify the pupils who have mastered the essentials of the course more than others. 4. To select the best of the applicants for a particular programme. 5. To find out

the effectiveness of a programme in comparison to other programmes.

NSOU CC-ED-08 135 Application of NRT: Many college entrance examinations and nationally used school tests use Norm-Referenced Tests. The SAT, Graduate Record Examination (GRE), and Wechsler Intelligence Scale for Children (WISC) compare individual student performance to the performance of a normative sample. Test takers cannot "fail" an NRT, as each test taker receives a score that compares the individual to others that have taken the test, usually given by a percentile. This is useful when there is a wide range of acceptable scores, and the goal is to find out who performs better. California Achievement Test, the Iowa Test of Basic Skills (Riverside), and the Metropolitan Achievement Test (Psychological Corporation) are formed using a national sample of students. Because norming a test is such an elaborate and expensive process, the norms are typically used by test publishers for years.

NRTs

compare a person's score against the scores of a group of people who have already taken the same examination, called the "norming group."

IQ tests are Norm-Referenced Tests, because their goal is to see which test taker is more intelligent than the other test takers. The median IQ is set to 100, and all test takers are ranked up or down in comparison to that level. Theatre auditions and job interviews are examples of NRT, because their goal is to identify the best candidate compared to the other candidates, not to determine how many of the candidates meet a fixed list of standards. Advantages and limitations: NRTs possess some advantages and limitations as well. The primary advantage of NRT is that they can provide information on an individual's performance on the test compared to others in the reference group. The limitations are as follows; A serious limitation of NRT is that the reference group may not represent the current population of interest. The Oregon Research Institute's International Personality Item Pool website has notes that, one should be very wary of using canned "norms" because it is not obvious that one could ever find a population of which one's present sample is a representative subset. Most "norms" are misleading, and therefore they should not be used. Far more defensible are local norms, which one develops oneself. For example, if one wants to give feedback to members of a class of students, one should relate

NSOU CC-ED-08 136 the score of each individual to the means and standard deviations derived from the class itself. To maximize informativeness, one can provide the students with the frequency distribution for each scale, based on these local norms, and the individuals can then find (and circle) their own scores on these relevant distributions. Test items that are answered correctly by most of the pupils are not included in these tests because of their inadequate contribution to response variance. They will be the items that deal with important concepts of course content. There is a lack of congruence between what the test measures and what is stressed in a local curriculum. Norm-referencing does not ensure that a test is valid (i.e. that it measures the construct it is intended to measure). Norm referencing promotes unhealthy competition and is injurious to self concepts of low scoring students. Another disadvantage of norm-referenced tests is that they cannot measure progress of the population as a whole, only where individuals fall within the whole. Rather, one must measure against a fixed goal, for instance, to measure the success of an educational reform programme that seeks to raise the achievement of all students. With a Norm-Referenced test, grade level was traditionally set at the level set by the middle 50 percent of scores. By contrast, the National Children's Reading Foundation believes that it is essential to assure that virtually all children read at or above grade level by third grade, a goal which cannot be achieved with a norm-referenced definition of grade level. Norms do not automatically imply a standard. A Norm-Referenced Test does not seek to enforce any expectation of what test takers should know or be able to do. It measures the test takers' current level by comparing the test takers to their peers. A rank-based system produces only data that tell which students perform at an average level, which students do better, and which students do worse. It does not identify which test takers are able to correctly perform the tasks at a level that would be acceptable for employment or further education.

NSOU CC-ED-08 137 5.5 Concept and characteristics of Criterion Referenced Test (CRT) Criterion Referenced Test is

100%

MATCHING BLOCK 191/224

SA

JSNR_SSOU_MBA_EA_Educational Evaluation.pdf
(D28924038)

a test designed to provide a measure of performance that is interpretable in terms of a clearly defined and delimited domain of learning tasks.

The word criterion refers to a domain of behaviour. In CRT one is interested in referencing an examinee's test performance to a well defined domain of behaviour measuring an objective or skill. It is often, but not always, used to establish a person's competence. Concept of Criterion Referenced Test: When we follow a

63% MATCHING BLOCK 192/224

SA

John Bennet Raj, D. English, Reg.No.9025 Chap ...
(D37396357)

second method of interpreting a test score is to establish an external standard or criterion and compare the examinee's test score with it this process is known as Criterion Referencing. In this test there is

a fixed performance criterion against which the candidates are measured. When

90% MATCHING BLOCK 193/224

SA

John Bennet Raj, D. English, Reg.No.9025 Chap ...
(D37396357)

an examinee passes some predetermined number of items or answers them correctly, it is said that it is capable of the total performance demanded by the test.

Glaser (1963) first used the term CRT to highlight the need for tests that can describe the position of a learner on a performance continuum, rather than the learner's rank within the group.

95% MATCHING BLOCK 194/224

W

A Criterion Referenced Test is a style of test which uses test scores to generate a statement about the behaviour that can be expected of a person with that score.

Most tests and quizzes that are written by school teachers can be considered as CRT. In this case,

96% MATCHING BLOCK 195/224

SA

JSNR_SSOU_MBA_EA_Educational Evaluation.pdf
(D28924038)

the objective is simply to see whether the student has learned the material.

Criterion-referenced assessment can be contrasted with norm-referenced assessment. Criterion-referenced testing was a major focus of psychometric research in the 1970s. Meaning and definition of CRT: We can define CRT as one in which the test performance is linked or related to some behavioural measures. An obvious question may come to our mind is that from where do the criteria come with which a test is referenced? According to Cox and Vargas, a major criterion for referencing a test is the training that increases the skill or proficiency. The test scores of results can be interpreted as an indication of increased skill or proficiency. A common misunderstanding regarding the term is the meaning of criterion. Many, if not most, CRT involves a cut score, where the examinee passes if their score exceeds the cut score and fails if it does not (often called a mastery test). The criterion is not the cut score; the criterion is the domain of subject matter that the test is

NSOU CC-ED-08 138 designed to assess. For example, the criterion may be "Students should be able to correctly add two single-digit numbers," and the cut score may be that students should correctly answer a minimum of 80% of the questions to pass. The criterion-referenced interpretation of a test score identifies the relationship to the subject matter. In the case of a mastery test, this does mean identifying whether the examinee has "mastered" a specified level of the subject matter by comparing their score to the cut score. However, not all criterion-referenced tests have a cut score, and the score can simply refer to a person's standing on the subject domain. Examples can be cited from assessment where there is no cut score, it simply is an assessment of the student's knowledge of high-school level subject matter. Because of this common misunderstanding, CRTs have also been called standards-based assessments by some education agencies, as students are assessed with regards to standards that define what they "should" know, as defined by the state. Gronlund, N.E. (1985) stated that CRT is

100% MATCHING BLOCK 196/224

SA

JSNR_SSOU_MBA_EA_Educational Evaluation.pdf
(D28924038)

a "test designed to provide a measure of performance that is interpretable in terms of a clearly defined and delimited domain of learning tasks.

Ivon (1970) defines a CRT as "one consisting of items keyed to a set of behavior objectives." Glaser and Nitko in the book 'Educational Measurement' (1971) stated that "a CRT

92% MATCHING BLOCK 197/224

SA

Full Book- Measurement and Evaluation in Educa ...
(D112222652)

is one that is deliberately constructed to yield measurements that are directly interpretable in terms of special performance standards".

From above definitions it is concluded that CRT

95% MATCHING BLOCK 204/224

SA

JSNR_SSOU_MBA_EA_Educational Evaluation.pdf
(D28924038)

is meant to measure the achievement of an examinee on a certain domain to find out his level of achievement in that domain. It has nothing to do with the achievement level of other examinees.

Chief characteristics of CRT: The characteristic features of CRT are as follows; 1. Its main objective is to measure students' achievement of curriculum based skills.

Criterion-referenced tests place a primary focus on the content and what is being measured. 2.

Content validity plays an important role in CRT development. Item statistics play less of

a role in item selection though highly discriminating items are still greatly valued, and sometimes item statistics are used to select items that maximize the discriminating power of a test at the performance standards of interest on the test score scale. A good

criterion-referenced test will permit

NSOU CC-ED-08 139

100% MATCHING BLOCK 198/224

W

content-referenced interpretations and this means that the content domains to which scores are referenced must be very clearly defined. 3. Each type of test can serve the other main purpose (norm-referenced versus criterion-referenced interpretations), but this secondary use will never be optimal. For example, since criterion-referenced tests are not constructed to maximize score variability, their use in comparing candidates may be far from optimal if the test scores that are produced from the test administration are relatively similar. Because the purpose of a criterion-referenced test is quite different from that of a norm referenced test, it should not be surprising to find that the approaches used for reliability and validity assessment are different too. 4.

In

criterion-referenced tests, scores are often used to sort candidates into performance categories. Consistency of scores over parallel administrations becomes less central than consistency of classifications of candidates to performance categories over parallel administrations. Variation in candidate scores is not so important if candidates are still assigned to the same performance category. Therefore, it has been common to define reliability for a criterion-referenced test as the extent to which performance classifications are consistent over parallel-form administrations. For example, it might be determined that 80% of the candidates are classified in the same way by parallel forms of a criterion-referenced test administered with little or no instruction in between test administrations. 5.

With criterion-referenced tests, the focus of validity investigations is on (1) the match between the content of the test items and the knowledge or skills that they are intended to measure, and (2) the match between the collection of test items and what they measure and the domain of content that the tests are expected to measure. The "alignment" of the content of the test to the domain of content that is to be assessed is called content validity evidence. This term is well known in testing practices. 6. Many criterion-referenced tests are constructed to assess higher-level thinking and writing skills, such as problem solving and critical reasoning. Demonstrating that the tasks in a test are actually assessing the intended higher-level skills is important, and this involves judgments and the collection of empirical evidence. So, construct validity evidence too becomes crucial in the process

NSOU CC-ED-08 140 of evaluating a criterion referenced test. 7. Probably the most difficult and controversial part of criterion-referenced testing is setting the performance standards, i.e., determining the points on the score scale for separating candidates into performance categories such as "successful" and "unsuccessful." The challenges are great because with criterion-referenced tests in education, it is common on state and national assessments to separate candidates into not just two performance categories, but more commonly, three, four, or even five performance categories. With four performance categories, these categories are often called failing, basic, proficient, and advanced. 8. CRT is prepared for a particular course or grade level. 9. It has a balanced representation of both goals and objectives. 10. It is used to evaluate the curriculum plan instruction progress and group students' interaction. 11. It

77% MATCHING BLOCK 199/224

W

can be administered before and after instruction 12. It is normally reported in terms of minimum scores for partial and total mastery of main skill areas, number of correct items,

and percent of correct items 13. Derived scores are based on correct items and other factors in case of CRT Reliability of CRT: Reliability can be increased by taking the following measures; Test length should be sufficient enough to find out test score reliability. The sample of examinees in finding out reliability should be adequate and representative. The reliability information should be provided in the test for each intended use of the test score The reliability information provided in the test should be appropriate for the use of the scores of the test. Validity of CRT: The validity evidence should be adequate for the intended use of the test score.

NSOU CC-ED-08 141 The test manual should provide an appropriate discussion on the factor affecting the validity of the scores. Interpretation of CRT: Interpretation should be based on what the items actually measure For each type of interpretation there should be sufficient items. If these are less than 10 items, they should be combined with other items through lengthening content items. The test should contain both easy and difficult items. Otherwise it would be difficult to describe what low achievers could do. Uses of CRT: CRTs can be used in the following ways; To discover the weakness,

82% MATCHING BLOCK 200/224

W

inadequacies in learners are learned and assist the weaker section of learners to reach the level of other students through a regular programme of remedial

teaching or instruction. To identify the master learners and average and slow learners in a class for modification in teaching strategy.

100% MATCHING BLOCK 201/224

To find out the level of attainment of various objectives of instruction

and re- plan accordingly.

100%

MATCHING BLOCK 202/224

W

To find out the level at which a particular concept has been learnt.

For better placement of concepts at different grade levels. To make instructional decisions for teaching a learner in an individually prescribed instruction programme. Advantage of CRT: CRT has certain advantages. These are as follows: The most important advantage of CRT is assessment of mastery of Subject Matter.

Criterion Referenced Tests are more suitable than Norm Referenced Tests for tracking the progress of students within a curriculum.

Test items

are designed in such a way that can

match specific objectives. The scores on CRTs indicate how well the individual can correctly answer questions on the material being studied, while the scores on a NRT report how the student scored relative to other students in the group.

Moreover, Criterion-Referenced Tests can be managed locally.

Every teacher must assess students' progress. Criterion Referenced Tests can be developed

NSOU CC-ED-08 142

at the classroom level. If the standards are not met, teachers can specifically diagnose the deficiencies, weakness of

68%

MATCHING BLOCK 203/224

W

the student. Scores for an individual student are also independent of how other students perform. In addition, test results can be quickly obtained to give students effective feedback on their performance. Although NRTs are most suitable for developing normative data across large groups, CRTs can produce some local norms. Limitations of

CRT: According to Chase (1974) CRT has following limitations: CRT only shows whether a learner has reached proficiency in a task area but it does not indicate the extent of quality of learner's ability level. Tasks included in the CRT may be highly influenced by a given teacher's interest or biases, leading to general validity problems. CRT includes partial areas for listing behavioural objectives and this may be a constructing element for teachers. CRT is important for only a small fraction of important educational achievements. On the contrary, for promotion and assessment of various skills that are important functions of school need NRT. Similarities between NRT and CRT: NRT and CRT have the following similarities: Both the tests require validity and reliability Achievement domain is measured in both the tests. Both the tests demand relevant and representative sample of test items Same types of items can be used in both tests. Same rules are followed for writing items in both accepting the item of difficulty. Difference between CRT and NRT: Sl. no NRT CRT 1 NRT covers a large domain of learning CRT focuses on a delimited tasks with just a few items measuring domain of learning tasks with a each specific task relatively large number of items measuring each specific task

NSOU CC-ED-08 143 2 It gives emphasis on discrimination It stresses what examinees among individuals can do and what cannot do 3 Contains items of average difficulty Contains both easy and difficult items 4 Interpretation of test needs a defined Interpretation needs group defined as well as delimited achievement domain 5 In NRT student is tested after each unit In CRT the student is tested after of the new material presented each unit for mastery of objectives 6 Students are assigned marks or grade to Students are allowed to indicate its performance proceed to new material if mastery is obtained 7 A student is allowed to go to the next A student is allowed to proceed unit and presented new materials along to the next unit if mastery with the whole class is obtained after remedial instruction. In India work on CRT is yet in the stage of infancy. There seems to be more emphasis on NRT in the evaluation of students. In spite of the dissimilarities among NRT and CRT, the tests also possess some common elements. Both the tests need reliability, validity, measured achievement domain, similarity of items; same rules are followed for writing items excepting the items of difficulty. Moreover, samples of test items should be relevant and representative in both the tests. Therefore, we cannot develop a clear distinction between NRT and CRT. Therefore, these two types of test may be considered as complementary. The only difference between these two tests is that CRT is always based upon a predetermined cutoff score whereas a NRT is always based upon the performance of a normative group or standardization sample. 5.6 Summary Open Book testing is common in Law examinations, but it is still uncommon in the general stream of education. In this type of test students are allowed to take study

NSOU CC-ED-08 144 materials, text books and other reference books and equipment at the examination hall. It does not mean students do not have to study or they can directly copy from the books. If the purpose of an examination is to test the information that students have memorised, open book examinations are inappropriate, since students can easily transfer the information in the textbook or lecture notes to the examination paper. Therefore, the question pattern and objectives are important in Open Book Tests that normally differ from traditional closed book tests. Informative questions are generally avoided to test the critical thinking ability of the students. Glaser (1963) has classified tests into Norm referenced test and Criterion referenced tests categories. NRT determines a student's placement on a normal distribution curve. Students compete against each other on this type of assessment.

The major reason for using a norm-referenced test is to classify students.

NRTs are designed to highlight achievement differences between and among students to produce a dependable rank order of students across a continuum of achievement from high achievers to low achievers.

Most achievement

NRTs are multiple-choice tests.

NRTs are designed to "rank-order" test takers, that is, to compare students' scores.

To make comparing easier, test makers

create examinations in which the results end up looking at least somewhat like a bell-shaped curve.

Scores are usually reported as percentile ranks. As

one more question right or wrong can cause a big change in the student's score,

it is often more important to choose questions that sort people along the curve than it is

to make sure that the content covered by the test is adequate. Tests can be biased. The items on the test are only a sample of the whole subject area.

It is often easiest to use a norm-referenced test because they were created to rank test-takers. NRTs

are a quick snapshot of some of the things most people expect students to learn.

Any one test can only measure a limited part of a

subject area or a limited range of important human abilities.

On the other hand, in Criterion Referenced Tests

questions are written according to specific predetermined criteria. A student knows what standards are set

for passing and only competes against him or herself while completing.

A criterion-referenced test is designed to measure how well test takers have mastered a particular body of knowledge. The term "criterion-referenced test" is not part of the everyday vocabulary in schools, and yet, nearly all students take criterion-referenced tests on a routine basis. Criterion-referenced tests place a primary focus on the content and what is being measured, ensuring content validity where item statistics play less a role in item selection though highly discriminating items are still greatly valued, and sometimes

NSOU CC-ED-08 145

item statistics are used to select items that maximize the discriminating power of a test at the performance standards of interest on the test score scale.

With criterion-referenced tests, scores are often used to sort candidates into performance categories.

Many criterion-referenced tests are constructed to assess higher-level thinking and writing skills, such as problem solving and critical reasoning.

Anyway, the

most difficult and controversial part of criterion-referenced testing is setting the performance standards, i.e., determining the points on the score scale for separating candidates into performance categories such as "successful" and "unsuccessful." The challenges are great because with criterion-referenced tests in education, it is common on state and national assessments to separate candidates into not just two performance categories, but more commonly, three, four, or even five performance categories.

Criterion-referenced tests are more suitable than norm-referenced tests for tracking the progress of students within a curriculum

and diagnose the weakness in the classroom. Test items can be designed to match specific programme objectives.

Criterion-referenced tests also have some built-in limitations. Both valid and reliable test construction requires fairly extensive and expensive time and effort. In addition, results cannot be generalized beyond the specific course or program.

Criterion-referenced tests are used in many ways. Classroom teachers use them to monitor student performance in their day-to-day activities. States find them useful for evaluating student performance and generating educational accountability information at the classroom, school, district, and state levels. 5.7

Self Assessment Questions 1. What is Open Book testing? 2. State the importance of Open Book testing in teaching learning. 3. Mention a few precautionary measures to be adopted during Open Book testing. 4.

What is meant

by norm referenced test? 5. What are the features of norm referenced tests? 6. Give the disadvantages of norm referenced tests? 7. What is the need of

a

norm referenced test? 8. What do you mean by criterion referenced test?

NSOU CC-ED-08 146 9. Give the advantages of the

criterion referenced test. 10. Explain the feature of the criterion referenced test. 11. What are the applications of criterion referenced test 5.8

Introduction Almost all the Commissions on education as also the National Policy on Education (1986), Programme of Action (1992) and National Curriculum Framework (2000) of NCERT have all stressed the need for a more continuous and comprehensive evaluation of students in order to pass more sound judgments about students' learning and NSOU CC-ED-08 148

growth. Regular Testing assessment through pupils' lives in school is considered essential for remedial treatment of those who fall below the acceptable performance level. It is in this context that the role of Continuous and Comprehensive Evaluation (C.C.E.) is highlighted in appraising the whole child and recognising it as a complement of external examination by providing due weightage to C.C.E. in the final assessment of the total development of the child. This current trend in educational evaluation has also changed the traditional marking and scoring system. Traditional system of absolute scoring is replaced by normalized scoring particularly in national level competitive examinations. Online assessment has become order of the day. Therefore, modern techniques like percentile ranking, grading, credit based cumulative grade point, averaging, transcription are invariably used in educational evaluation. In this unit all these new techniques will be discussed. 6.3 Current trends in evaluation: Shifting from traditional absolute scoring system to normal scoring system: Evaluation is based on scoring. Scoring is the procedure used for training teachers to score students' work reliably within and across schools, and the processes used to evaluate score reliability and comparability across teachers and schools. Test scores often produce ordinal scales with some amount of meaning in their intervals. The particular rules for assigning values within these scales depend on the type of scoring mechanisms used. The two most common scoring mechanisms are dichotomous and polytomous, which are used to create rating scales and composite scores. Dichotomous scoring: Dichotomous scoring refers to the assignment of one of two possible values based on a person's performance or response to a test question. A simple example is the use of correct and incorrect answers to score a cognitive item response. These values are mutually exclusive, and describe the correctness of a response in the simplest terms possible, as completely incorrect or completely correct. Most cognitive tests involve at least some dichotomously scored items. Multiple- choice questions are usually scored dichotomously. Dichotomous scoring could involve different score values, besides correct and incorrect. The most common example is scoring that represents a response of either yes or no. When we intend to measure affective domains, such as attitude surveys and behavior checklists, often use this type of dichotomous scoring. Opinionnaires or expression inventories, for example, may present individuals with lists of statements that people with depression typically identify

NSOU CC-ED-08 149 strongly with. Individuals then respond to each statement by indicating whether or not the statements are characteristic of them. Polytomous scoring: Polytomous scoring is more subjective in nature than the previous one. It simply refers to the assignment of three or more possible values for a given test question or item. In cognitive testing, a simple example is the use of rating scales to score written responses such as essays. In this case, score values may still describe the correctness of a response, but with differing levels of correctness, for example, incorrect, partially correct, and fully correct. Therefore, Polytomous scoring with cognitive tests can be less straightforward and less objective than dichotomous scoring, primarily because it usually requires the use of human raters with whom it is difficult to maintain consistent meaning of assigned categories such as partially correct.

Problems of traditional scoring system: At present we assess students on their learning for three different purposes: (a) with reference to his own progress (self-referenced), (b) With reference to his peer group (norm-referenced), and (c) with reference to criteria set up in terms of Intended Learning Outcomes (criterion-referenced). In all these cases the purpose may be different but the students are always awarded numerical marks on an interval scale of 0-100 marks. However, artificially created zero represents 'nothingness' and 100 represents 'perfection' in achievement. Both are fallacious, since zero does not mean that the student does not know anything, and 100 does not mean that the student knows everything about the subject. This makes comparison of scores difficult from test to test as well as from subject to subject. Moreover, there are chances of

98%
MATCHING BLOCK 206/224
W

many types of measurement errors due to intra-examiner's and inter examiner's subjectivity in marking, inadequacy in sampling of content and competencies implied in instructional objectives, poor quality of evaluation tools (question papers), arbitrary time limit and variations in testing situations. Some of these errors are identifiable but others are not. The magnitude of such errors according to research reports varies from 7 to 15%.

The 101 (0-100)

point numerical scale cannot serve to discriminate individuals on the basis of a single score, i.e. 50, 51, 52 etc. If the standard error of measurement is 10, then the true score of 50 is likely to be between 40 and 60 in 2 out of 3 cases. It is therefore difficult to measure precisely an individual on a 101

point scale, when measurement errors are known to exist from 7 to 15%.

However, from Kothari Commission (1964-1966) to National Curriculum

NSOU CC-ED-08 150 Framework (2005) have emphasized on the inadequacies of evaluation system specially the

Assessment for Learning - Book-KSR.docx (D110721227)

lack of full disclosure and transparency in grading and mark reporting.

In any educational process reporting of the results is very important. The symbols and signals of such reporting are usually marks. Preceding the recommendation of NPE, 1986 the marks were replaced by grading system. There are factors responsible for unreliability of traditional absolute scoring systems. 1. Different standards of excellence both among different teachers and the same teacher on different occasions. 2. Psychological factors, such as due to fatigue unable to differentiate between closely allied degrees of merit. 3. Systematic changes. 4. Influence of handwriting. 5. Marks may carry different meanings to different persons in different countries and subjects. Absolute grading is a mode of grading where grades are given based on predetermined cutoff levels. Here, each point value is assigned a letter grade. Most schools adopt this system, where it is possible for all students to receive an A. In the U.S.A, an absolute grading system assigns an A for points 90-100, a B for points 80- 89, a C for 70-79, a D for points 60-69 and an F for points 59 and below. Absolute grading refers to a marking system where instructors pre-specify performance standards. But absolute grading is also inflexible, meaning that if everyone gets below 59 percent, all students in a class fail and a teacher would not make any adjustments to grades. Absolute grading is based around fixed percentage scales that may be constraining for students who all receive a low grade, for instance. Unlike absolute grading, in relative grading students' marks fluctuate depending on how they did in comparison to others in class. Relative grading refers to a system of evaluation that allows educators to convert the outcomes of a student's test, project or assignment and adjust that final grade in relation to grades from other students in the course. Relative grading is similar to bell curving or grading on a curve, and considers the highest score as the baseline (A+), relatively adjusting all others compared to that score. In the recent past there is a shift from traditional absolute scoring to normal scoring in public examinations in India. The concept of normalisation of marks was

NSOU CC-ED-08 151 introduced because the level of difficulty of government examinations conducted in various shifts or boards/councils is different from each other. For example, a student who has appeared in the first session or shift of the examination might have scored low marks. However, the same student would have scored more or even higher marks if he had appeared in any of the latter shifts or other boards of the same examination. To eradicate this discrepancy the examination conducting Governing boards of India have introduced the concept of normalisation of marks in examinations. Normalisation of marks means increasing and or decreasing the marks obtained by students in different timing sessions to a certain number. By that as it may, students who have scored 30 marks in session 1 because of a hard level of test will get 60 marks. Similarly, students who have scored 90 marks will also be marked as 60 marks following the normalisation process as followed by CBSE. The normalised average could also vary if the minimum or maximum marks are increased or decreased. The process and concept of normalisation of marks would also vary depending on the examination board of India. Normalisation as used in the Indian context is a process for ensuring that students are neither advantaged or disadvantaged by the difficulty of examinations that they do for the Boards. This process is used in other countries with similar issues as in India. Normalisation Process requires us to know the following Percentile Score of a Candidate in a Board or JEE (Main) will reflect what Percentage of Candidates have scored below that Candidate in that Board or JEE (Main) Examination. A Percentile score is the value of below which a certain Percent of observations fall. For example, the 20th Percentile is the value (or score) below which 20 Percent of the observations may be found. The Percentile of a Candidate will be calculated as follows $100 \times \frac{\text{no of candidates in the group with aggregate marks less than the candidate}}{\text{total no of candidates in the group}}$

86%

MATCHING BLOCK 209/224

W

Most people have different traditions about what grade constitutes an A, B etc. Working to this scale requires an instructor to make many more subjective judgments; every assignment, quiz, or other graded item must be designed beforehand to try to yield the desired level of numeric performance. This is an extremely difficult task, which is why so many instructors wind up applying arcane and often arbitrary "curves" afterwards. Instead one can normalize all scores so that, no matter how easy or hard the assignment, the class's scores get mapped into a comparable range. This is essentially the same technique that is used on the SATs, ACTs, GREs and other national standardized tests. NSOU CC-ED-08 152 There are different techniques for normalizing scores, and the topic of how to do so properly belongs in a class on statistics. The best-known normalization formula used for examinations and other situations where the number of scores above and below the average is likely to be equal, is the "z-score": Where x is the student's score, the class average, and sd is the class standard deviation (a measure of how widely spread the class scores have been).

The score normalization techniques aim, generally, to reduce the scores variabilities in order to facilitate the estimation of a unique speaker-independent threshold during the decision step. In terms of actual score, the impact of normalisation would lead to decrease in the marks of candidates who have scored higher in the examination. However, such candidates should not worry about their scores because they would have cleared their examination. They should just follow the next steps in their selection process. Similarly, students who think they might have scored less, but would have received higher marks should not be amazed. They should understand that their actual result varied because of normalisation of marks and following their next steps to the selection process. Major effects due to Normalisation of marks: It is evident that normalisation of marks would have a drastic effect in government examinations. Here are some of major effects caused due to normalisation of marks: Students who think they have scored the minimum marks in their shift might receive higher scores. Students who think they might have scored high marks would actually get lower normalised marks. Selection of candidates would become a much faster and easier process for all governing boards of India. Students who have appeared in examinations with difficult and easier levels would now be considered on a single platform. There will be no disregard of marks based on different shifts. Conclusively, it can be said that normalisation of marks would have a drastic impact on all the upcoming government examinations.

NSOU CC-ED-08 153 6.4 Online Assessment and Percentile Ranking Online assessment: Assessment can be focused on the individual learner or all individuals together, like the whole class, an institution or specific programme. Formative assessment will give us an overview of students in the very beginning of the instruction. It gives us the opportunity to still have the chance to improve our instruction. While, summative will give us the outcome of the whole instruction. Online assessments are very popular in the 21st century. One of the best blessings of globalization is the use of Information Communication Technology (ICT) in education. Starting from teaching learning to evaluation of the students' online mode is very effective. In very simple terms, an online assessment may be defined as an evaluation of a person's abilities, behaviours and or characteristics when a test is conducted over the Internet by using available web technologies. An online assessment may set out with clear objectives such as: To test the knowledge or learning of a student To select suitable candidates from a huge pool of applicants. To identify the strengths and weaknesses of the student To identify specific personality and character traits To provide clues in educational, vocational or career counseling and identify the suitable training, job or career for the test taker. Need of Online Assessment: Online assessments are becoming quite popular and are being used quite extensively in various sectors including education, government and corporate companies. The educational institute has taken up online assessments with quite a lot of enthusiasm and in a huge way specially. These online tests have some clear benefits over the traditional methods of assessment both for the institution and students. Online assessment tools are scientifically designed to help in testing aptitude, cognitive ability, communication, and many other skills. These tools come with auto- evaluation, report generation, and even grading features that transform a slow assessment process into a fast-paced one. The tests also enable teachers to diagnose the weaknesses and strengths of the students. The test results can also be used by teachers and educational or vocational counselors to provide training required for upskilling or re skilling the ability.

NSOU CC-ED-08 154 An online assessment provides the advantage of speed and accuracy when compared with a traditional assessment method. The robust online tools eliminate any chances of malpractice, streamline hiring, and guarantee a positive candidate experience. Online assessment platforms: There are different types of online assessment. Online assessment is used in different working areas and all of them have their own goal to achieve.

CC-10 Assessment for Learning (Eng).pdf (D125371049)

Educational assessment is the systematic process of documenting and using empirical data on the knowledge, skills, attitudes and beliefs.

By taking the assessment, teachers try to improve student learning. There are more than 20 different types of online assessment tests. A few of the most popular tests cover skill assessment, communication assessment, cognitive assessment, behavioral assessment, etc. The tests are conducted over the internet to measure skills and personality of the students. Compared to pen and paper methods of assessments, online or e-assessment methods are less labour-intensive and more secure. Online assessment platforms contain all the tools required to administer the examination, measure talent, assess domain-specific skills, create comprehensive test reports, and more. Most of the platforms come with a plug and play feature and can be used on multiple devices. The type of questions varies from one assessment to the other depending on the domain and the expertise required of the job role. The questions are presented as MCQs, MAQs, fill in the blanks, true or false, etc. Some tests offer a vast library of tests that feature questions created by subject-matter experts and psychometricians.

Use of Online assessment in education: The educational sector has been able to streamline their test preparation and examination processes with online assessments in following ways:

Entrance examinations: Online assessment is very effective to conduct entrance examinations. Huge number of applicants can go through this test sitting at their home. It will save time, energy, and money both for the institution and the students. Based on the result of online screening selected candidates may appear for counseling or admission.

Semester examinations: Semester examinations can also be conducted with the help of online assessment. It is convenient for both teachers and students. It saves a lot of time, energy. It is also eco friendly as it is almost paperless.

NSOU CC-ED-08 155 Guidance and counseling: At an individual level, an online assessment can be used to assess a student and plan his/her career progression.

Campus recruitment: Companies tend to conduct campus recruitment to hire fresh talent for entry-level positions. An online assessment can help them manage the huge numbers by acting as a first-level screening. At the end of this screening, the recruiters will have a manageable size of candidate pool with the right talent for them to select the job-fit candidates for open positions.

Walk-ins: Similarly, when open positions are notified and a huge number of applicants apply, an online assessment can prove useful in quickly selecting the candidates with the right skill sets.

Advantages of online assessments: The use of online assessments saves institutions a lot of time and money. Often the assessments can be completed in less time, multiple candidates can complete the online assessment at the same time and there is no need for specialized (and expensive) personnel. Also, the test takers are able to take the assessment during class, or at home, using their own devices. They get to see their results and answers and get instant feedback about their chosen topic. That helps us, a researcher, recruiter, teacher or trainer, to learn more about our users and adapt to their needs, strengths and weaknesses.

Disadvantages of online assessments: Not much can be said about the disadvantages of online assessments, since the advantages outweigh them by far. But there might be some, for example, one needs to be computer literate (or able to use a computer well) in order to create and take an assessment. Technology is not always reliable; there might be connection or internet problems, energy breaks and other things like that. Also, there is a cost involved in online assessment software and affordability of data by students especially in countries like India.

Percentile Ranking: A percentile is a measure that tells us what percent of the total frequency scored at or below that measure. In other words, percentile is a point on a rank ordered scale, found by dividing a group of observations into parts in the order of magnitude from lowest to highest. A percentile rank is defined as the proportion of scores in a distribution that a specific score is greater than or equal to. For example, if someone has received 90 on a mathematics test and this score was greater than or equal to the scores of 85 percent students taking the test then the percentile rank of the student would be 85

NSOU CC-ED-08 156 and he or she would be placed in the 85th percentile. Alternatively, percentile rank is sometimes defined as "the proportion of a distribution that a score is greater than". Same grade in two classes does not necessarily mean that one did equally well in both the classes. By the help of Percentile Ranking we can precisely measure the difference. Features of Percentile Ranking: Percentile ranking has the following features: Percentile rank is a number between 0 and 100 indicating the percent of cases falling at or below that score. Percentile ranks are usually written to the nearest whole percent. For example, 70.5%=71%=71st percentile Scores are divided into 100 equally sized groups Scores are arranged in rank order from lowest to highest. There is no 0 percentile rank. The lowest score is the first percentile. There is no 100th percentile as well. The highest score is at the 99th percentile. Methods used to find Percentile Ranking: Linear interpolation method is used to calculate the Percentile rank. The formula is as follows; $PR = [C + fp \times (S - L/i)] \times 100/N$ Where, C = sum of all scores below the classes in which the PR is present. Fp= Frequency in that class in which the percentile rank falls S = The score whose PR has to be determined L = exact lower limit of the class interval upon which PR lies i = Class interval N = total number of scores Illustration: Let us calculate the Percentile rank of a student whose score is 55 in the following distribution scores 90-99 80-89 70-79 60-69 50-59 40-49 f 2 10 15 16 3 4

NSOU CC-ED-08 157 Scores Class limits Frequency (f) Cumulative Frequency (C) 90-99 89.5-99.5 2 50 80-89 79.5-89.5 10 48 70-79 69.5-79.5 15 38 60-69 59.5-69.5 16 23 50-59 49.5-59.5 3 7 40-49 39.5-49.5 4 4 Here, C=4, fp= 3, S=55, L= 49.5, i=10, N=50 $PR = [4 + 3 \times (55 - 49.5/10)] \times 100/50 = [4 + 3 \times 0.55] \times 2 = 11.3 = 11$ Therefore, the PR of the student is 11 whose score is 55. 6.5 Grading, Credit Based Cumulative Grade Point, Averaging and Transcription

Grading: Grading in education is the process of applying standardized measurements of varying levels of achievement in a course.

100% MATCHING BLOCK 211/224

W

Grades can be assigned as letters (generally A through F), as a range (for example 1 to 6), as a percentage of a total number of questions answered correctly, or as a number out of a possible total (for example out of 20 or 100).

Grading is a means of reporting the result of evaluation. It is a better means than the traditional marking system which is very common in use to report results. We award individual students for their performance by giving marks. But marks do not indicate anything about the quality of the performance, rather it shows only quantity. Grades provide the quality of performance. Grading is done either using symbols (A, B, C, D, E) or using verbal description (very good, good, average, poor, failure). There are different scales which can be employed in the grading system. Five point scale-A, B, C, D and E Seven point scale-O, A, B, C, D, E and F

NSOU CC-ED-08 158 The five point scale provides wide variation within the grade points. Whereas, the seven point scale keeps the evaluation within reasonable limits of accuracy and 'spacing' within a grade point. Objectives of grading: The grading system has the following objectives: To indicate the quality of performance of students in examination To ensure greater uniformity in the assessment of students' performance. To facilitate better comparability of students' performance in various subjects and among various universities. To facilitate the inter university migration of students To enable students to make the correct choice of subjects in accordance with their abilities. To remove the defects of marking system Significance of grading: Grading system is meant to replace the traditional marking system. Grading system is superior due to following reasons: The traditional marking system employs 0-100 scale. Based on the performance of a student the examiner has to place the student on a suitable point in the 0-100. The logic behind placing a student securing 59 in second division or class and just 60 in first division or class is not justified. The grading system reduces 101 (0-100) point scale to a variable short range of five points or seven point scale. The traditional marking system suffers from lack of objectivity, reliability and validity. There lies 50 percent chance of error in marking. Grading helps in removing errors in marking. The lack of reliability clearly indicates that the cut off marks used for award for division or class and for determining pass or fail is completely arbitrary. Yet so much importance is given to the percentage of marks, class or division for the entire academic career of the student. Grading system also solves this problem. There is no uniformity in computing cut off points for declaring students pass or fail or placing them in divisions and classes. Different universities use different cut off points as minimum qualification for entrance examination. NSOU CC-ED-08 159 This creates a lot of complications during migration from one university to others. On the contrary, grading system provides uniformity in terms of the scale adopted by them Marking system creates problems for inter subject comparison. For example a score of 60 is pretty good in literature, but the same score may not be considered very well in Mathematics. Grading system helps us to compare the performance of a student in different subjects.

Computation

96%
MATCHING BLOCK 212/224
W

of CGPA: In some countries, all grades from all current classes are averaged to create a grade point average (GPA) for the marking period. The GPA is calculated by taking the number of grade points a student earned in a given period of time of middle school through high school. GPAs are also calculated for undergraduate and graduate students in most universities. The GPA can be used by potential employers or educational institutions to assess and compare applicants. A cumulative grade point average (CGPA) is a calculation of the average of all of a student's total earned points divided by the possible number of points. This grading system calculates for all of his or her complete education career.

Grade point averages can be unweighted (where all classes with the same number of credits have equal influence on the GPA) or weighted (where some classes are given more influence than others). Credit Based Cumulative Grade Point: Currently an important concern which is strongly mentioned in recent times by the University Grants Commission (UGC), the National Assessment and Accreditation Council (NAAC), is the need to develop a Choice-Based Credit System (CBCS) in tune with global trends and the adoption of a proper grading system for measuring performance of the learner. The major system engaged in Higher Education in the global scenario is operating a system of credits. The European Credit Transfer System (ECTS), the 'National Qualifications Framework' in Australia, the Pan-Canadian Protocol on the Transferability of University Credits, the Credit Accumulation and Transfer System (CATS) in the UK as well as the systems operating in the US, Japan, etc are already in a system of credit to measure the level of competency. In tune of the above scenario the Indian Universities have adopted a credit-based-grading- system for the purpose of assessment of the students, which will be acceptable to the global universities. Concept of Credit System: The credit system is basically a system for simplifying the process of 'academic book keeping'. The definition of credits in higher education

NSOU CC-ED-08 160 systems may be based on different parameters, such as student workload, learning outcomes and contact hours. A student earns his diploma by accumulating a specified number of academic credits instead of attending for a specified number of years. Thus, a part time student may spread out his studies over several more years than normal, keeping beside his other activities. While a brilliant student may take a heavier load than normal and shorten his education by a semester or so. A university usually prescribes that a certain number of minimum credits must be obtained in the students' main department. The remaining credits may be distributed as unrestricted or may be restricted in accordance with any scheme designed by the university. Credit system has the effect of adding considerably to the flexibility allowed by the semester organization of the academic schedule. The semester credit hour is defined as a unit for expressing quantitatively the content of a course at the level of higher education. The most widely accepted meaning of a credit is that a student earns one credit by attending one period of 50 minutes of lecture class instructions and doing 2 to 3 hours of home study, each week throughout one semester (15 to 18 weeks). Thus the terms credit and semester hours are often used interchangeably. The credit system allows greater flexibility in fitting course time to the particular subject taught. Most semester courses carry 2 to 4 credits each. Credits do not always require a particular number of class periods. Since one hour of theory class is expected to be supplemented by 2 to 3 hours of home study, it is considered equivalent to 3 hours of laboratory practical work. Similarly, 2 to 3 credits per week may be allowed for a thesis that involves no class attendance at all. A full time student making pace at a normal pace will complete 30 to 32 semester credit hours of coursework in an academic year of 9 months. To obtain a Bachelor's degree in a three year college, students must normally accumulate 90 to 94 semester hours. Another important feature of this system is greater reliance on home study. The most important feature is perhaps the flexibility it permits to students intensively as well as extensively to cover a wide range of subjects, coping up with needs and abilities of the individual students. The selection of course is done with utmost care and in consultation with the adviser concerned. It is also ensured that nearly 2/3rds of course credits is from the subject in which the students intend to major (honours) at the end of the first 2 years of general education programme. The students may also allow offering some courses for which no credit may be given. Generally, a student is required to offer not less than 9 credit courses and not more than 16 credit courses in one semester.

In assessing the performance of the students in examinations, the usual approach is to award marks based on the examinations conducted at various stages (session, mid-term, end-semester etc..) in a semester. Some of the higher education institutions convert these marks to letter grades based on absolute or relative grading system and award the grades. There is a marked variation across the colleges and universities in the number of grades, grade points, letter grades used, which creates difficulties in comparing students across the institutions. The UGC recommends the following system to be implemented in awarding the grades and CGPA under the credit based semester system. Letter Grades and Grade Points: Two methods

of grading;

93%
MATCHING BLOCK 216/224
W

relative grading or absolute grading, have been in vogue for awarding grades in a course. The relative grading is based on the distribution (usually normal distribution) of marks obtained by all the students of the course and the grades are awarded based on a cut-off marks or percentile. Under the absolute grading, the marks are converted to grades based on pre-determined class intervals. To implement the following grading system, the colleges and universities can use any one of the above methods. The UGC recommends a 10-point grading system with the following letter grades as given below: Letter Grade Grade Points O (Outstanding) 10 A+(Excellent) 9 A(Very Good) 8 B+(Good) 7 B(Above Average) 6 C(Average) 5 NSOU CC-ED-08 162 P (Pass) 4 F(Fail) 0 Ab (Absent) 0 (

Computation of SGPA and CGPA: The UGC recommends the following procedure to compute the Semester Grade Point Average (SGPA) and Cumulative Grade Point Average (CGPA). The SGPA is the ratio of sum of the product of the number of credits with the grade points scored by a student in all the courses taken by him or her and the sum of the number of credits of all the courses undergone by a student, i.e. $SGPA (S_i) = \frac{\sum (C_i \times G_i)}{\sum C_i}$ where C_i is the number of credits of the i th course and G_i is the grade point scored by the student in the i th course. The CGPA is also calculated in the same manner taking into account all the courses undergone by a student over all the semesters of a programme, i.e. $CGPA = \frac{\sum (C_i \times S_i)}{\sum C_i}$ where S_i is the SGPA of the i th semester and C_i is the total number of credits in that semester. The SGPA and CGPA are rounded off to 2 decimal points and reported in the transcripts. Computation of SGPA and CGPA: Illustration for SGPA Course Credit Grade letter Grade point Credit Point (Credit x Grade) Course 1 3 A 8 3x8=24 Course 2 4 B+ 7 7x4=28 Course 3 3 B 6 3x8=18 Course 4 3 O 10 3x10=30 NSOU CC-ED-08 163 Course 5 3 C 5 3x5=15 Course 6 4 B 4 4x4=16 20 130 Thus, $SGPA = \frac{139}{20} = 6.95$ Illustration for CGPA Semester 1 Semester 2 Semester 3 Semester 4 Semester 5 Semester 6 Credit:20 Credit: 22 Credit : 25 Credit:26 Credit: 26 Credit : 25 SGPA:6.9 SGPA:7.8 SGPA: 5.6 SGPA:6.0 SGPA:6.3 SGPA: 8.0 Thus, $CGPA = \frac{20 \times 6.9 + 22 \times 7.8 + 25 \times 5.6 + 26 \times 6.0 + 26 \times 6.3 + 25 \times 8.0}{144} = 6.73$

Advantages of the Credit-Based-Grading-System: The flexibility it permits students to cover a wide range of subjects is perhaps the most important advantage of the credit system in education. Credits do not always require any particular class period. Moreover, it offers more flexibility to the students allowing them to choose inter-disciplinary courses along with major/ Honours courses, which makes education more broad-based. The course can be adjusted keeping in mind the needs and abilities of the individual student. The selection of courses is done with utmost care and in consultation with the advisor who ensures that preparatory courses are taken in the first or second semester. It is beneficial for the part time students who can spread out his studies over several more years than normal according to his convenience. Especially brilliant students also may shorten his education by a semester based on his need and ability. It respects 'Student Autonomy' and individual differences. It represents

84%

Full Book- Measurement and Evaluation in Educa ...
(D112222652)

a shift in focus from teaching based to learning education since the workload is based on the investment of time in learning.

It records student's workload realistically. It calculates not only the time spent

NSOU CC-ED-08 164 by the students in lectures or seminars but also the time they need for individual learning and the preparation of examinations etc. Students may undertake as many credits as they can cope with without repeating all the courses (papers) in a given semester if they are unsuccessful in one or more courses (papers). It also facilitates students' mobility. Providing opportunity to transfer the credit earned at one institution to another. Provide more transparency and compatibility between different educational structures. Finally, an important advantage associated with the credit system is ample opportunity for home study. This system encourages self-learning.

Averaging: An average test score is the sum of all the scores on an assessment divided by the number of test-takers. For example, if three students took a test and received scores of 69, 87, and 92, these numbers would be added together and then divided by three to get an average of 82.6. Public schools rely on average, below average, or above-average test scores to identify how well a group of students learns. In some cases, students may be compared to their peers in the class, schools, district, county or state. With the rollout of the Common Core State Standards, which established a common set of academic guidelines for states across the country, students may more frequently be compared to their peers nationally. Other times, school officials distinguish average students from others to see who is on grade level or how well an individual child performs in school compared to classmates on nationally normed tests. Averaging is very important in special education, particularly useful in standardized evaluations and in tests designed by teachers. Educators determine the average by adding a set of numbers and dividing the sum by the total number of numerals used in calculating that sum, also known as the mean. Teachers and specialists can use averages to determine the "middle" group of test-takers. Statistically, on a normal curve about 68 percent of any large group of students will score within the low average to high average range on most tests. The other 32 percent will be in either the above average or below average group. Teachers may use averages to monitor the rate at which the class is learning the material. Teachers also use averages to estimate where an individual student's scores place them in relation to the rest of the class. Educators may also use averages to measure how an individual students' abilities rate on tests used to diagnose learning disabilities.

NSOU CC-ED-08 165 Sometimes educators and analysts use other methods to identify an average score. Rather than the mean, they may refer to the median, or the 50th percentile, which represents the score in the exact middle of the list of numbers. If anyone has scored in the 60th percentile, then he or she has performed better than 60 percent of test-takers. Very often mean and median are used interchangeably with the term "average," but mean and median can be very different numbers, so care must be taken when calculating. For example, six students scored 72, 75, 78, 82, 84, and 92 on a test. To calculate the average, the test scores are added together and divided the sum (483) by six. The average score would be 80.5. If we are trying to find the median of the same set of numbers, we would identify the exact middle score. Since there is an even amount of numbers and thus no exact middle, we average the two middle scores (78 and 82) to arrive at a median of 80. In this case, the mean and median are very close, but that is not always the case.

Transcription: In education, a transcript is a certified record (inventory) of a student throughout a course of study having full enrolment history at educational institute including all courses (or subjects) attempted, grades earned and awards conferred. A transcript is sometimes referred to as a marksheet, marklist or report card. In the United States, a transcript is also called Cumulative Record File (CRF), permanent record, or simply record. In the European ECTS system, transcripts are called Transcript of Records (ToR). Therefore, a transcript can be defined as documentation of a student's permanent academic record, which usually means all courses taken, all grades received, all honours received, and degrees conferred to a student. Transcripts can be official and unofficial. Official transcripts often bear a security watermark in the paper on which the transcript is printed and bear the signature of the counselor, principal, or registrar who certifies the document. When employers require an official transcript, it must be requested by the student or alumnus and sent directly from the high school or college or university registrar's office to the Human Resources Office. If an unofficial transcript is requested, it is acceptable to send a photocopy, faxed copy, or a downloaded copy of a transcript as long as the copy is legible and contains the required information.

Transcript evaluation: Since transcript evaluation is an assessment of academic performance, preparing this type of an evaluation requires an understanding of the message conveyed by grades. This information is required regardless of grading scale

NSOU CC-ED-08 166 type, whether letter, number, percentage, description, or any combination thereof. Moving forward, it becomes necessary to identify any perceivable performance categories and matching them with the categories contained in the US A-F scale accordingly. Stratification or categorization of different levels of performance is frequently included on the credentials themselves, while many resources on international education systems contain this information as well as recommendations for conversion to the US grading scale. The final step in the basic principles of credential evaluation is converting a grade point average (GPA). Transferring post-secondary credit from international academic credentials requires the same type of detailed credential evaluation as for an initial admission decision. To be effective, it requires the accurate conversion and quantification of foreign academic coursework to the indigenous system used by the institution. At the post-secondary level, transfer credit is typically granted according to institutional policy for coursework completed at the same level at domestic institutions. The challenge, therefore, becomes consistency across campus in converting foreign credential outcomes to credits and making transfer recommendations. There is no universal recommendation on transfer credit for such programmes. In summary, transferring credit is a complex process. It begins with consistently thorough and accurate credential evaluation, but affects many stakeholders beyond the admissions office including registrars, academic faculty, study-abroad offices, prospective applicants, and current students themselves. As such, one of the most important aspects in the process becomes consistency: consistency in the application of evaluation policies on campus, consistency with transferring credit across university offices, and consistency with peer institutions.

6.6 Summary

The traditional examination system is being replaced by modern evaluation processes. Grading is one of the important methods of replacing the traditional marking system. Grades describe the level of achievement. It addresses the limitations on the marking system. Marks denote a qualification of a performance, while grades denote qualitative banding of clustering of performance. The grading can be done by using five points or seven point scales. In the recent past grading system is normalized to reduce the scores variability in almost all major public examinations in India. A pen-and-paper assessment requires extensive human effort, time and money in order to maintain the reliability, integrity and accuracy of the assessment. An online NSOU CC-ED-08 167 assessment once properly designed can quickly deliver accurate and reliable results with minimum human intervention. Whereas, an online assessment acts as a first-level screening to select the right talent from the pool of applicants. It delivers quick, reliable and credible results, making the whole admission process absolutely convenient for the institution. Therefore an online assessment helps candidates perform their best and saves them from unnecessary travel and expense. Online assessments have some pros and cons. Although some financial investment in online assessment software is needed, the benefits outweigh the costs by far. It is a value for money acquisition and inevitable in the post pandemic era. Online assessments also allow the test takers to take on mobile learning, which means, they are able to take the assessments anywhere, anytime. And they receive their results immediately by email or Google form. They can see their results and download them into an Excel file. A percentile rank is defined as the proportion of scores in a distribution that a specific score is greater than or equal to. Same grade in two classes does not necessarily mean that one did equally well in both the classes. Percentile Ranking can help us in precisely measuring the difference. Grading is an abstract concept which we attempt to quantify. This is done by isolating the few absolute criteria in any type of assessment system - the highest level of achievement and the lowest level of achievement required to 'pass'. A GPA is the mathematical average of all grades received, with consideration for the weighting of each course. Unlike overall grades used in foreign systems, a GPA is purely a mathematical average and does not place any arbitrary weighting on specific subjects or terms of study beyond the weighting indicated by the credit values. This is the standard by which domestic students' academic performance is compared, necessitating a similar calculation for a consistent assessment of international applicants. Semester credit system is another important method of the modern evaluation process. A credit system is a systematic way of describing an educational programme by attaching credits to its components. The semester credit hour is defined as a unit for expressing quantitatively the content of a course at the level of higher education. Averaging is a process of dividing the sum total of scores by the number of test takers. Central tendency measures help us in calculating average. Averaging helps teachers to identify the gifted and problem children in the class. A transcript is basically a marksheet, marklist or report card of a student that contains the full history at educational institution throughout the course.

The first thing to keep in mind in this context is that the social and cultural standards (Norms) are not fully clear and definite in themselves; and secondly, the persons take them according to their own views and use them accordingly. It is clear then, that the evaluation based on social and cultural standards (Norms) is subjective. On the other hand, the scientific standards (Norms) are always clear and definite by themselves and as such the evaluation done on their basis is objective. Educational Measurement and Evaluation 24 Notes LOVELY PROFESSIONAL UNIVERSITY Formative Evaluation Formative evaluation is such evaluation which is conducted before giving final Shape to an educational policy or programme, curriculum, teaching method, teaching aid or evaluation method. For it, the evaluator first of all prepares the preliminary draft of the proposed educational policy, planning or programme, curriculum, teaching method or evaluation method; then he analyses each of its steps and receives approval of the specialists. This approval is received with the help of

Relationship between Assessment and Measurement: Assessment, measurement, evaluation and research are part of the processes of science and issues related to each topic often overlap. Assessment refers to the collection of data to better understand an issue, while measurement is the process of quantifying assessment data and evaluation refers to the comparison of that data to a standard for the purpose of judging worth or quality. Whereas, research refers to the use of that data for the purpose of describing, predicting, and controlling as a means toward better understanding the phenomena under consideration. Measurement is done with respect to "variables" (phenomena that can take on more than one value or level). The collecting of data (assessment), quantifying those data (measurement) and developing understanding about the data (research) always raise issues of reliability and validity. Reliability attempts to answer concerns about the consistency of the information (data) collected, while validity focuses on accuracy or truth. The relationship between reliability and validity can be confusing because measurements (e.g., scores on tests, recorded statements about classroom behavior) can be reliable (consistent) without being valid (accurate or true). However, the reverse is not true: measurements cannot be valid without being reliable. The same statement applies to findings from research studies. Findings may be reliable (consistent across studies), but not valid (accurate or true statements about relationships among "variables"), but findings may not be valid if they are not reliable. At a minimum, for a measurement to be reliable a consistent set of data must be produced each time it is used; for a research study to be reliable it should produce consistent results each time it is performed. For

relationship between Measurement, Assessment and Evaluation with examples. (250 words) INTRODUCTION : Assessment, measurement, evaluation and research are part of the processes of science and issues related to each topic often overlap. Assessment refers to the collection of data to better understand an issue, measurement is the process of quantifying assessment data, evaluation refers to the comparison of that data to a standard for the purpose of judging worth or quality, and research refers to the use of that data for the purpose of describing, predicting, and controlling as a means toward better understanding the phenomena under consideration. example, the variable "gender" has the values or levels of male and female and data could be collected relative to this variable. Data on variables are normally collected by one or more of four methods: paper/pencil, systematic observation, participant observation, and clinical. Three issues are important for classroom assessment (data collection with regards to student learning that is under the control of the teacher.) The first relates to what data teachers will use for making judgements (qualitative or quantitative); a second issue revolves around when they will collect data (formative vs. summative assessment.) A third issue revolves around the reference to be used for making evaluations (criterion- versus norm-referenced); a fourth relates to how teachers will communicate their judgements to others (authentic assessment, portfolios, and grading).

range of procedures and their general nature. This means that the qualitative approaches which result in descriptions of individuals, as contrasted to quantitative approaches which result in numbers, can go hand in hand with the teaching and learning experiences in the class and they can reveal more subtle shades of students' proficiency. This in turn can lead to more illuminating insight about future progress and attainment of goals. However, the options discussed above are not a matter of either-or (traditional vs. alternative assessment) rather the language teacher is free to choose the one alternative (among alternatives in assessment) which best suits the particular moment in his particular class for particular students. Based on the above discussion, grading could be considered a component of assessment, i.e., a formal, summative, final and product-oriented judgment of overall quality of worth of a student's performance or achievement in a particular educational activity, e.g., a course. Generally, grading also employs a comparative standard of measurement and sets up a competitive relationship between those receiving the grades. Most proponents of assessment, however, would argue that grading and assessment are two different things, or at least opposite poles on the evaluation spectrum. For them, assessment measures student growth and progress on an individual basis, emphasizing informal, formative, process-oriented reflective feedback and communication between student and teacher. Ultimately,

The word measurement, as it applies to education, is not substantially different from when it is used in any other field. It simply means determining the attributes or dimensions of an object, skill or knowledge. We use common objects in the physical world to measure, such as tape measures, scales and meters. These measurement tools are held to standards and can be used to obtain reliable results. When used properly, they accurately gather data for educators and administrators. Some standard measurements in education are raw scores, percentile ranks and standard scores. One of the primary measurement tools in education is the assessment. Teachers gather information by giving tests, conducting interviews and monitoring behaviour. The assessment should be carefully prepared and administered to ensure its reliability and validity. In other words, an assessment must provide consistent results and it must measure what it claims to measure. Creating valid and reliable assessments is critical to accurately measuring educational data. Evaluating the information gathered, however, is equally important to the effective use of the information for instruction. In education, evaluation is the process of using the measurements gathered in the assessments. Teachers use this information to judge the relationship between what was intended by the instruction and what was learned. They evaluate the information gathered to determine what students know and understand, how far they have progressed and how fast and how their scores and progress compare to those of other students. According to educator and author, Graham Nuthall, in his book *The Hidden Lives of Learners*, "In most of the classrooms we have studied, each student already knows about 40-50% of what the teacher is teaching." The goal of data-driven instruction is to avoid teaching students what they already know and teach what they do not know in a way the students will best respond to. For the same reason, educators and administrators understand that assessing students and evaluating the results must be ongoing and frequent. Scheduled assessments are important to the process, but teachers must also be prepared to re-assess students, even if informally, when they sense students are either bored with the daily lesson or frustrated by material they are not prepared for.

Longer time for collecting assessment information: To obtain accurate and reliable assessment data on a pupil, the assessments are spread over a longer time, allowing the pupil to take tests and other assignments at different times throughout the course. The average of the scores for the various assessments is a more reliable indicator of the pupil's performance in the subject than the score the pupil obtains in a one-shot examination. 4. Use of different testing tools and techniques: By extending the time span for collecting assessment information throughout the duration of a course, different forms of testing and different assessment situations including acquisition and demonstration of practical skills can be introduced in this process. Practical skills such as the skills and competencies involved in conducting interviews, writing and presenting reports, presenting and analyzing data in graphical forms, and production of three-dimensional objects in a variety of subjects could be encouraged in schools to provide a more comprehensive and more valid assessment of pupil's ability. 5. Inclusion of high complex thinking skills in the testing programme: By extending the period for collecting assessment data, forms of knowledge and competencies that cannot be easily assessed under strictly timed conditions can also be assessed. High level thinking skills involving analytical thinking and problem solving skills and other competencies that require extended time for learning and for test response can then be added to the continuous assessment programme. The addition has the effect of helping pupils to acquire the habit of using high level thinking skills in a variety of situations rather than using pure memorization and other low level thinking processes. 6. Teacher assistance and guidance: Another feature of the continuous

<p>Most people have different traditions about what grade constitutes an A, B etc. Working to this scale requires an instructor to make many more subjective judgments; every assignment, quiz, or other graded item must be designed beforehand to try to yield the desired level of numeric performance. This is an extremely difficult task, which is why so many instructors wind up applying arcane and often arbitrary "curves" afterwards. Instead one can normalize all scores so that, no matter how easy or hard the assignment, the class's scores get mapped into a comparable range. This is essentially the same technique that is used on the SATs, ACTs, GREs and other national standardized tests. NSOU CC-ED-08 152 There are different techniques for normalizing scores, and the topic of how to do so properly belongs in a class on statistics. The best-known normalization formula used for examinations and other situations where the number of scores above and below the average is likely to be equal, is the "z-score": Where x is the student's score, the class average, and sd is the class standard deviation (a measure of how widely spread the class scores have been).</p>			<p>most people have different traditions about what grade constitutes an A, a B etc. Working to this scale requires an instructor to make many more subjective judgements - every assignment, quiz, or other graded item must be designed beforehand to try to yield the desired level of numeric performance. That's an extremely difficult task, which is why so many instructors wind up applying arcane and often arbitrary "curves" afterwards. Instead I normalize all scores so that, no matter how easy/ hard the assignment or how picky/lax the grading, the class's scores get mapped into a compatable range. This is essentially the same technquie that is used on the SATs, ACTs, GREs and other national standardized tests. There are different techniques for normalizing scores, and the topic of how to do so properly belongs in a class on statistics. The best-known normalization formula, and the one I use for exams and other situations where the number of scores above and below the average are likely to be equal, is the "z-score": $(x - \text{avg}) / \text{sd}$ where x is the student's score, avg the class average, and sd is the class standard deviation (a measure of how widely spread the class scores have been).</p>

Computation of SGPA and CGPA: The UGC recommends the following procedure to compute the Semester Grade Point Average (SGPA) and Cumulative Grade Point Average (CGPA). The SGPA is the ratio of sum of the product of the number of credits with the grade points scored by a student in all the courses taken by him or her and the sum of the number of credits of all the courses undergone by a student, i.e $SGPA (Si) = \sum (Ci \times Gi) / \sum Ci$ where Ci is the number of credits of the i th course and Gi is the grade point scored by the student in the i th course. The CGPA is also calculated in the same manner taking into account all the courses undergone by a student over all the semesters of a programme, i.e. $CGPA = \sum (Ci \times Si) / \sum Ci$ where Si is the SGPA of the i th semester and Ci is the total number of credits in that semester. The SGPA and CGPA are rounded off to 2 decimal points and reported in the transcripts. Computation of SGPA and CGPA: Illustration for SGPA Course Credit Grade letter Grade point Credit Point (Credit x Grade) Course 1 3 A 8 3x8=24 Course 2 4 B+ 7 7x4=28 Course 3 3 B 6 3x8=18 Course 4 3 O 10 3x10=30 NSOU CC-ED-08 163 Course 5 3 C 5 3x5=15 Course 6 4 B 4 4x4=16 20 130 Thus, SGPA = $139/20 = 6.95$ Illustration for CGPA Semester 1 Semester 2 Semester 3 Semester 4 Semester 5 Semester 6 Credit:20 Credit: 22 Credit : 25 Credit:26 Credit: 26 Credit : 25 SGPA:6.9 SGPA:7.8 SGPA: 5.6 SGPA:6.0 SGPA:6.3 SGPA: 8.0 Thus, CGPA = $20 \times 6.9 + 22 \times 7.8 + 25 \times 5.6 + 26 \times 6.0 + 26 \times 6.3 + 25 \times 8.0 / 144 = 6.73$

Computation of SGPA and CGPA The UGC recommends the following procedure to compute the Semester Grade Point Average (SGPA) and Cumulative Grade Point Average (CGPA): • The SGPA is the ratio of sum of the product of the number of credits with the grade points scored by a student in all the courses taken by a student and the sum of the number of credits of all the courses undergone by a student, i.e $SGPA (Si) = \sum (Ci \times Gi) / \sum Ci$ where Ci is the number of credits of the i th course and Gi is the grade point scored by the student in the i th course. • The CGPA is also calculated in the same manner taking into account all the courses undergone by a student over all the semesters of a programme, i.e. $CGPA = \sum (Ci \times Si) / \sum Ci$ where Si is the SGPA of the i th semester and Ci is the total number of credits in that semester. • The SGPA and CGPA shall be rounded off to 2 decimal points and reported in the transcripts. PREFACE In a bid to standardize higher education in the country, the University Grants Commission (UGC) has introduced Choice Based Credit System (CBCS) based on five types of courses viz. core, generic, discipline specific, elective, ability and skill enhancement for graduate students of all programmes at Honours level. This brings in the semester pattern which finds efficacy in sync with credit system, credit transfer, comprehensive continuous assessments and a graded pattern of evaluation. The objective is to offer learners ample flexibility to choose from a wide gamut of courses, as also to provide them lateral mobility between various educational institutions in the country where they can carry their acquired credits. I am happy to note that the university has been recently accredited by National Assessment and Accreditation Council of India (NAAC) with grade "A". UGC (Open and Distance Learning Programmes and Online Programmes) Regulations, 2020 have mandated compliance with CBCS for U.G. programmes for all the HEIs in this mode. Welcoming this paradigm shift in higher education, Netaji Subhas Open University (NSOU) has resolved to adopt CBCS from the academic session 2021-22 at the Under Graduate Degree Programme level. The present syllabus, framed in the spirit of syllabi recommended by UGC, lays due stress on all aspects envisaged in the curricular framework of the apex body on higher education. It will be imparted to learners over the six semesters of the Programme. Self Learning Material (SLMs) are the mainstay of Student Support Services (SSS) of an Open University. From a logistic point of view, NSOU has embarked upon CBCS presently with SLMs in English / Bengali. Eventually, the English version SLMs will be translated into Bengali too, for the benefit of learners. As always, all of our teaching faculties contributed in this process. In addition to this we have also requisitioned the services of best academics in each domain in preparation of the new SLMs. I am sure they will be of commendable academic support. We look forward to proactive feedback from all stakeholders who will participate in the teaching-learning based on these study materials. It has been a very challenging task well executed, and I congratulate all concerned in the preparation of these SLMs. I wish the venture a grand success.

Guidance and Counselling ii. Understand the concept of Guidance and Counselling iii. Name the types of guidance and counselling iv. State the scope of Guidance and Counselling 1.2

Introduction Teaching is not about imparting information, even not about cognitive development only. Holistic development of the student has always been that desired goal teacher perused from the very beginning. Only difference in modern education is that here teacher is made aware of the tools and skills needed to achieve that goal. That is exactly why "Guidance and Counselling" became so important in the realm of education. Here in this chapter we will define all the actions and tools and techniques of Guidance and Counselling so that a teacher is aware of the variety of needs of students and guide accordingly. ESSENTIAL PRIOR KNOWLEDGE REQUIRED TO LEARN Guidance and counselling is an essential area of knowledge for any teacher or person working in development of another person. It is needless to say that Guidance and counselling

10 NSOU ? CC-ED-10 is a specialized area hence there are some prior requisite to understand and execute its demands and implement it properly. Below is a diagram which shows the areas involved in Guidance and Counselling and are mandatory to have as an entry level behaviour. Concept of Ethics Conflict Empathy Personality Guidance and Counselling Individual Difference Coping Mental Hygiene Developmental Theory As the table shows student must acquaint themselves with specific concept of psychology and philosophy before embarking into this quest and practicing Guidance and Counselling. 1.3 The Self : Psycho-Social View The very basis of all human interaction is "the self". Primarily self seems to be our sense of identity, who we are and how we are different from the rest. Self is the fundamental part of every human being, the construct which holds the unique identity of consciousness much like any ID card for physical identity. So, What is "Self"? Online Oxford Dictionary would describe "Self" as "a person's essential being that distinguishes them from others, especially considered as the object of introspection or reflexive action." American Psychological Association addresses self as "the totality of the individual, consisting of all characteristic attributes, conscious and unconscious, mental and physical. Apart from its basic reference to personal identity, being, and experience, the term's use in psychology is wide-ranging. According to William James, self can refer either to the person as the target of appraisal (i.e., one introspectively evaluates how one is doing) or to the person as the source of agency (i.e. one attributes the source of regulation of perception, thought, and behaviour to one's body or mind). Carl Jung maintained that the self gradually develops by a process of individuation, which is not complete until late maturity is reached." In modern days Heinz Kohut's idea of self to denote the sense of a coherent, stable yet dynamic, experience of one's individuality, continuity in time and space, autonomy, efficacy, motivation, values, and desires; he believed that this sense emerges through healthy narcissistic development empathically supported in early life.

NSOU ? CC-ED-10 11 Psychosocial view of Self – As Bertocci explains in his write up "The psychological self, the ego, and personality" that the The psychological self may be conceived of as an enduring, unique, complex unity of knowing-wanting activities. This serves to unify diverse descriptions of the ego and to clarify the function of the ego in personality-organization." James, almost 130 years ago distinguished between two concepts "I" and "Me" where I is the subjective term and later is more of a object of experience. From then on to current concept of cognitive psychology and concept of self has travelled a lot and changed many forms. It must be stated that the concept of self is in the domain of consciousness which includes both arguments as "objective or "subjective" experience. James's distinction perseveres in the interest that self-theorists accord to how people acquire self-knowledge and how this knowledge is manifested in behavior. The major topics related to self- functioning that social and personality psychologists address concern the ways in which people understand and define their characteristics (self-knowledge), how people use task and social feedback to monitor their goal progress (self-regulation), the influence of personal standards, expectations, and values on perception of others (self in social judgment), and how people maintain desired self-images. For any value related education / development, self-exploration becomes the only tool available to human being. In philosophical understanding, as referred in e-handbook of "Value education" in AICTE "Universal value education", self can be explained with following activities – Activities of the Self The activities of the Self can be seen in terms of desire, thought and expectation. Desire is the name given to the activity of imaging. You are making an image in the Self. Desire is in the form of an image which you have created within. Thought is the power for the activity of analysing based on comparing various possibilities to fulfil your desire. Expectation is the power for the activity of selecting based on tasting. Activities of the Self are Continuous. These powers of desire, thought and expectation are inexhaustible, and the activities are continuous. The activities of imaging, analyzing-comparing and selecting-tasting are always going on, whether we are aware of them or not. These Activities Together Constitute Imagination. These activities are together called imagination. We may not immediately be able to observe our desire, thought and expectation distinctly, but it may be easier to see that something is going on within. One imagination or the other is going on in us all the time.

12 NSOU ? CC-ED-10 Happiness and unhappiness depend on the state of imagination. If your imagination is in harmony with your natural acceptance, you are in a state of happiness. When it is in contradiction with your natural acceptance, you are in a state of unhappiness. Imagination is expressed to the world outside, in terms of behaviour with human being and work with the rest of nature. We have also referred to imagination as "what I am" and the natural acceptance as "what I really want to be". State of Imagination: Once you start looking at your imagination, you will be able to find out the state of your imagination. Your imagination could be well organised, in harmony or it could be a random mixture of harmony and contradiction. Possible Sources of Imagination: There are three possible sources of motivation for imagination: 1. Preconditioning, 2. Sensation and 3. Natural Acceptance A dominant source of imagination is preconditioning. Preconditioning means the beliefs, notions, norms, ideas, views, dictums, goals, etc. prevailing in the family, in the society which we have assumed without knowing. They may influence our imagination. Another major source of our desire, our imagination is the sensation. Sensation is the information we get from the Body through the five sense organs – of sound, touch, sight, taste and smell. The third source of imagination is our natural acceptance. It can also be referred to as the inner voice or conscience. Self-verification on the basis of our natural acceptance can be the third possible source. It may or may not be the predominant source of motivation currently, but it can be the real source for deciding our desire, our imagination. Consequences of Imagination from the three Sources – Self-organisation or Enslavement? If your imagination is motivated by preconditioning or sensation, you may or may not be in harmony with the natural acceptance. Therefore, you may be in a state of happiness within or unhappiness within. Your happiness is dependent or enslaved by your preconditioning and sensation. The Way Ahead – Ensuring Harmony in the Self by way of Self-exploration

NSOU ? CC-ED-10 13 To achieve this harmony in the Self, we need to start self-exploration. In the process, we need to: ? Know our natural acceptance ? Be aware of our imagination ? Find out the source of imagination ? Work out a way to sort out our imagination till it is fully in line with our natural acceptance When the imagination is in harmony with the natural acceptance, there is harmony in the Self. This harmony is happiness This is why concept of self is important to Guidance and Counselling. Especially in counselling, in professional term,

100% MATCHING BLOCK 3/64

W

counselling is the scientific process of helping the individual to understand him/herself better in relation to his/her environment so that he/she becomes self-dependent, self-directed and self-sufficient and is able to lead a better and meaningful life. Counselling is aimed at helping the individual in solving problems that are already present, preventing the occurrence of problems in future and also enhancing personal, social, emotional, educational and vocational development.

All these are very much involved with the concept of self. 1.4 Guidance : Concept, Types and Scope Guidance literally means "to direct", "to point out", "to show the path"

etc. In Online Oxford English Dictionary "Guidance" is described as "help or advice that is given to somebody, especially by somebody older or with more experience". Definition – According to C.V.

Good "Guidance is a process of dynamic interpersonal relationship designed to influence the attitude and subsequent behaviour of the person".

In education, that person is ofcourse the learner and the part played by teachers are considered to be of a guide. That idea was always present in education. But in modern education guidance became well defined with specific nature and principles mainly aimed at helping students to be what the can in an optimum productive way. Arthur Jones stated "guidance is a personal help that is designed to assist a person to go somewhere and do something". According to Crow and Crow, "

V.M. Proctor, "Guidance is a process through which an individual or groups of individuals are helped to make necessary adjustment to the environment – inside or outside the school."

The idea of a teacher and the process of teaching was never excluded of the idea of guidance. Even in traditional form of education teachers are always looked as " Friend , Philosopher and Guide". It is only through time that process of teaching became more well defined and so is the idea of "Guidance". The provision for a teacher to be able to perform like a professional guidance practitioner is modern in its application. Accepting that premise immediately opened up certain possibilities and actions to take. Such as training , practice , ethics , limitation etc. therefore the concept of guidance in educational process is consciously incorporated with systematic development and modification. Hollis and Hollis proposed that guidance programme is based on eight principles 1.

100%

MATCHING BLOCK 13/64

W

Educational guidance should receive much greater attention on the part of educational authorities. (ii) Guidance service should be the work of various personnel's like parents, teachers, headmasters/headmistress, and principals. (iii) In order to broaden the pupil's understanding of the nature, scope and significance of the occupation or industries, film should be prepared to show the conditions of industrial, technical, agricultural or vocational aspects and this should be supplemented by actual visits. (iv) The services of trained guidance officers and career masters should be made available gradually and in an increasing measure to all educational institutions. (v) There should be opening up training centres in different regions for training of guidance officers and career masters to which each state may send a number of teachers and other suitable persons for training. (vi) A Central Research organisation may be established for carrying out research in educational guidance and for the preparation of tests with particular reference to Indian conditions and the needs of pupils. (vii) In every state there should be a Bureau of educational and vocational guidance to plan and co-ordinate various activities which have been recommended as above.

Overall the characteristics of Guidance are – 1. it is a continuous process 2. It is an assisting process rather than a directing process 3. This service is meant for all and includes generalized and specialised services 4. This is mostly a pre-planned , well organized service and not incidental 5. Guidance has its roots in education and centered around the needs and aspirations of students. Scope: Scope of guidance as a whole and in education are both wide and complex. It has broader meaning and wider connotation. Scope of guidance covers functionally all aspects of life. ? Guidance is meant for personal needs ? Guidance needs may vary from vocational, educational and personal ? Guidance is for holistic individual development and not a partial approach ? Guidance is for adjustment of individual through socialized, curricular, co-curricular activities, group life, vocational opportunities

16 NSOU ? CC-ED-10 ? Counselling services or technique ? Devices for collecting data through testing and non-testing devices like achievement test, intelligence, attitude scale, interview schedule etc. It must be added that scope of guidance increases immensely with the variety of types of guidance one is familiar with so that insightful knowledge increases. This is particularly useful for the area of education. Types : There are different types of guidance based on different criteria. According to the nature or form of guidance there are two types of guidance, namely – a) Informal guidance b) Formal guidance Informal guidance: It is a discontinuous process which can occur unexpectedly without any plan. It mainly occurs between two persons who have an established relationship. It is not an organized or systematic guidance. In informal guidance any responsible person who have little or no training can guide, advice or help to another person in a situation. Talk, chat, discussion, conversation, debate etc. are the techniques of informal guidance. Formal guidance: In formal guidance a trained professional person guides or helps another person to take decision in personal or educational or vocational areas. This process is more systematic and organized. According to the strategies of guidance there are two types of guidance, namely – a) Individual guidance b) Group guidance Individual guidance: It is a process of providing advice to a particular person to help him/ her to solve a problem.

There are several strategies for individual guidance. Spheres of influence strategy highlights the strengths and weaknesses of a person.

Immediacy strategy helps to aware a person about the current situation which helps him/her to do better. Proxemics strategy helps to study the body language of a person. Congruence strategy helps to provide feedback for finding possible ways to solve the problem. Hierarchy of needs helps to identify an individual's need to improve the situation. Group guidance: It is a process of providing advice to a group of people to help them to solve a common problem of that group. This process is very effective in educational plan, job finding and adjustment. There are several strategies for group guidance. Lecture or talk

is the primary way to solve a common group problem.

Demonstrations and role-plays are more engaging strategies and it takes less time. Orientation class is an effective strategy to guide a group in a new environment or to perform a specific task.

NSOU ? CC-ED-10 17 According to the area of guidance there are three types of guidance namely a) Vocational b) Educational and c) Personal In modern days students are presented with not only educational but all kind of challenges and expectations are mounting high too. Therefore all the three kind of guidance are relevant for a student and needed in an educational process. Let us briefly discuss concepts of all three guidance areas. Vocational : Inducting students in modern ideas of vocation and train is a mandatory part of education. But without a skilled guide the means to achieve the end result won't be fulfilled, hence the requirement of

85% MATCHING BLOCK 14/64

SA Arti kaushik (j_vision).docx (D110736592)

vocational guidance in education. Vocational guidance is a process of assisting the individual to choose an occupation, prepare for it,

and

enter upon it and progress in it.

It is concerned primarily with helping individuals make decisions and choices involved in planning a future and building a career.

100% MATCHING BLOCK 16/64

SA report file full.docx (D110690450)

According to John D. Crites, "Vocational guidance is a facilitative process, a service rendered to the individual to aid him in choosing and adjusting to an occupation."

According to Dale Yoder, "Vocational guidance refers to the inevitable direction given to the care of new employees in the selection process and in their assignment to particular types of work."

The purpose behind assisting the youth to choose, prepare, enter and progress in a vocation is the optimum growth of the individual. Some of the aims and objectives of vocational guidance are: ? Assisting pupil to discover his/her own abilities and skills

so that they get ready for the

general requirements of the occupation under consideration. ?

Helping the individual to develop an attitude towards work that will dignify whatever type

of occupation s/he may wish to enter. ?

Assisting the individual to think critically about various types of occupations and to learn a technique for analyzing information about vocations. ? Assisting

pupils

to secure relevant information about the facilities offered by various educational institutions engaging in vocational training ?

At the elementary stage, although no formal guidance programmes are needed, the orientation to vocation can be initiated at this stage. At this stage some qualities and skills which have grater vocational significance viz. (i)love and respect for manual

18

NSOU ? CC-ED-10

work (ii) training in use of hands (iii) spirit of cooperative work (iii) sharing (vi) appreciation for all works (vii) good interpersonal relationship are to be developed

Educational :

Educational guidance is related to every aspect of education school / colleges, the curriculum, the methods of instruction, other curricular activities, disciplines etc. Educational guidance is the assistance given to the individual (i) to understand his/her potentialities (ii) have a clear cut idea of the different educational opportunities and their requirements (iii) to make wise choices as regards to school, colleges, the course.

According to Brewer, "Educational Guidance is a conscious effort to assist in the intellectual growth of an individual- anything that has to do with instruction or with learning may come under the term of guidance."

90%

MATCHING BLOCK 15/64

SA

II B.Ed. Guidance and Counselling (Eng).pdf (D125473247)

Personal Guidance refers to help given an individual toward a better adjustment in the development of attitudes and behaviour in all areas of life."

The aims and objectives of personal guidance are: ? To assist the individual in understanding himself/herself. ? To assist the individual involving the personal problems. ? To assist the individual in taking independent decisions and judgments. ? To assist the individual to view the world and the social environment in right perspective. ? To assist the individual in making sound adjustments to different problems confronted in life. 1.5

Counselling : Concept, Types and Scope When have you heard of a counsellor? Not in your regular life when all is going good and normally right? Counselling is a process in which clients learn how to make decisions and formulate new ways of thoughts and behaviour. It is a goal based action where clients explore their personal focus and ways to achieve that goal. Thus counselling involves both choice and change, evolving through distinct stages such as exploration, goal setting and action (Brammer, 1993) . Therefore counselling can be defined

84%

MATCHING BLOCK 21/64

SA

Unit 16-BPCG 175-Swati.pdf (D107418869)

as relatively short-term, interpersonal, theory based process of helping people who are

in a developmental or situational psychology based problem. Areas of counselling can be personal, vocational, social, educational etc. Characteristics: 1. It is a professional activity. Not anyone or everyone can try their hand in counselling unless they have developed that skill. 2. It is a process which require interactive sessions and therefore inter personal skills from the experts end. 3. This is based on one to one relation as it occurs between counselee and counsellor. 4. It is concerned with decision making skills and problem solving.

20 NSOU ? CC-ED-10 5. This is a process of helping a person with a problem. It could be about helping a regular person handling usual daily life problems , opportunities or choices to make According to

II B.Ed. Guidance and Counselling (Eng).pdf (D125473247)

understand and clarify their views of their lifespaces, and to learn to reach their self-determined goals through meaningful, well-informed choices and through resolution

of

problem". Shoben (1953) defined counselling as a "warm, permissive, safe, understanding, but limited social relationship within which therapist and patient discuss the affective behavior of the latter, including the ways of dealing with his emotionally toned needs and the situations that give rise to them". Who is a Counsellor ? Ofcourse counsellor is the person who would be counselling. S/he is a

76% MATCHING BLOCK 25/64

SA

II B.Ed. Guidance and Counselling (Eng).pdf (D125473247)

professionally competent person in relevant psychological skill and knowledge, seeks to assist the client by methods appropriate to the counselee's (

client's) need. In practice the counsellor does the following jobs - ? Understands the feeling of the client and treat it as fact ? Keep confidentiality ? Builds self-esteem of the client ? Shows patience ? Avoid behaving like and expert / do not intimidate ? Solicits clients feelings ? Reassures the client where necessary ? Works as a facilitator Types of Counselling : Counselling can be of various types according to the need and area of counselling. As for example there can be the following types of counselling as far the variety of aim in counselling goes ? Guidance and career counselling NSOU ? CC-ED-10 21 ? Marriage and family counselling ? Mental Health and wellbeing related counselling ? Educational Counselling Other than that counselling can be viewed as following types on the basis of process used A comparative account of the above three types of processes are given below – A. DIRECTIVE B. NON-DIRECTIVE C. ECLECTIC A. Directive : Directive Counseling was given by E.G. Williamson – Counsellor centered Counseling i.e. Counsellor plays a major role he direct the counselee to think by informing, explaining, interpreting and advising B. Non -Directive : Carl Roger's gave non directive counseling client centered counseling – with the help of Counsellor, he understands the nature and cause of his problem, become independent. The duty

60% MATCHING BLOCK 26/64

SA

II B.Ed. Guidance and Counselling (Eng).pdf (D125473247)

of the Counsellor is not only to make the client understand himself but also to create an atmosphere in which the client can work out his own understanding.

C. Eclectic : F.C. Throne gave eclectic counseling the Counsellor can alternate between directive and non directive methods Counsellor study the personality of the client needs, situation, etc. selects suitable method start with directive counseling then change to non directive counseling use reassurance, giving, information, testing, etc. It is economical and effective technique. Areas Directive Non-Directive Eclectic Meaning Counselling controlled Counselling controlled Both counsellor and by counsellor by client counselee cooperate Cost Economic Costly Moderate Focus On Problem Emotional aspect of Personality and needs client of counselee Relationship Counsellor centric Counselee centric Both are active Time Economical on time Time consuming Moderately time consuming Merit Direct involvement of Freedom to the client Better insight into counsellor weakness and strength Demerit Lack of direction Not suitable for Sometime vague and from counselee immature person opportunistic

22 NSOU ? CC-ED-10 Scope : According to American Psychological Association "Counseling psychology is a general practice and health service provider specialty in professional psychology. It focuses on how people function both personally and in their relationships at all ages. Counseling psychology addresses the emotional, social, work, school and physical health concerns people may have at different stages in their lives, focusing on typical life stresses and more severe issues with which people may struggle as individuals and as a part of families, groups and organizations. Counseling psychologists help people with physical, emotional and mental health issues improve their sense of well being, alleviate feelings of distress and resolve crises." Therefore scopes of counselling includes ? Sometime vague and School and career/work adjustment concerns. ? Making decisions about career and work, and dealing with school work retirement transitions. ? Relationship difficulties including marital and family difficulties. ? Learning and skill deficits. ? Stress management and coping with negative life events. ? Organizational problems. ? Dealing with and adjusting to physical disabilities, disease or injury. ? Personal/social adjustment. ? The development of one's identity. ? Persistent difficulties with relating to other people in general. ? Mental disorders. (APA) In general we can state that the following are the scopes of Educational Counselling : 1. Enhancing coping skills – Students attain adulthood while they were pursuing education and preparing for the future. Being adult means you have to own up to the difficulties of life and that doesn't mean hiding all the emotions. How to do that is what coping mechanism teaches us and which is a major area of counselling process. Especially for students counselling helps them to learn new coping methods which lets them grow up in a healthy way. 2. Improving relationships – student life consists of many challenging phases of development in human. One part which counselling helps immensely is relationship in this termolting times. Through counselling they can know themselves better, also knowing others better. Typical relationship related issues can be seen in families and in peer group NSOU ? CC-ED-10 23 which when not resolved may go on to do permanent damage in inter personal relationship and also relationship with self. 3. Facilitating student's potential – counselling makes students more in control of their environment. Student's through counselling sessions realizes their true abilities and skills with less interference of outside judgment or influence and act accordingly. 4. Helping behaviour change – learning is positive change in behaviour and counselling helps to resolve issues with behaviour.

88% MATCHING BLOCK 28/64

SA

470E2310-MSW-Counselling and Guidance - Final ...
(D165249716)

According to Roger behaviour change is a necessary result of the counselling process,

even though specific behaviour receive little or no emphasis during the process. 5. Promoting decision making – Higher aim of education is to make student's ready for real life problem solving and decision making is most important part of that aim. Counselling process helps students to understand their strength and weaknesses and through that they learn to make decision , a vital quality for future living. 1.6 Summary – Self as "a person's essential being that distinguishes them from others, especially considered as the object of introspection or reflexive action – Ensuring Harmony in the Self by way of Self-exploration – To achieve this harmony in the Self, we need to start self-exploration. In the process, we need to: ? Know our natural acceptance ? Be aware of our imagination ? Find out the source of imagination ? Work out a way to sort out our imagination till it is fully in line with our natural acceptance When the imagination about self is in harmony with the natural acceptance, there is harmony in the Self. This harmony is happiness Self is the fundamental part of every human being, the construct which holds the unique identity of consciousness. Self is very important in Guidance and Counselling. It helps

a professional relationship between a trained Counsellor and a client

or counselee. It is a professional activity which requires interactive sessions for helping an individual to decide upon a course of action or to understand or change patterns of behaviour which distress, disturb or affect his social behaviour in a friendly and trustworthy environment. Professionally competent person for counselling is called counsellor. There are different types of counselling such as career counselling, marriage and family counselling, mental health and wellbeing related counselling, educational counselling etc. Three types of counselling process are there which are directive, non-directive and eclectic. Directive counselling is counsellor centered, where non-directive counselling is client centered. In eclectic counseling the counsellor can alternate between directive and non directive methods. There are several scopes of counselling in different areas such as making decisions about career and work, relationship difficulties, learning and skill deficits, stress management and coping with negative life events, personal/social adjustment, behaviour modification etc. 1.7 Self-Assessment Questions 1. Define self. 2. What is the psycho-social view of self?

NSOU ? CC-ED-10 25 3. Name some activities of self 4. Define guidance. 5. State two scope of guidance in education. 6. Write two merits of non-directive counselling . 7. Why eclectic counselling is important ? 8. Write two scopes of counselling . 9. Who is a counsellor in educational counselling ? 10. Write two demerits of directive counselling. 1.8 Reference 1. Unit 2 ? Adjustment & Maladjustment Structure 2.1 Objective 2.2 Introduction 2.3 Development, Maturity, Crisis of Life and Role of Education 2.4 Interpersonal Relationships: Basis, Friendship, Love, Communication, Relationship and Social Perception 2.5 Gender, Gender Identity and Gender Role Development 2.6 Summary 2.7 Self-Assessment Questions 2.8 Reference 2.1 Objectives After completion of the unit students will be able to i. understand role of education in crisis of life ii. follow the basis of interpersonal relationship iii. comprehend the importance of gender issues in general iv. understand her/his role as an educator to deal with issues mentioned above 2.2 Introduction Issues like development , maturity, crisis of life, interpersonal relationship, gender issues were always an important part in educational process. But only in recent time , in course structure of formal education these are included with an intention to give its due place in human life. No development will be effective if we fail to conduct ourselves worthy of that knowledge. That conduct is shaped with the process of maturity, how to face crisis in life, understanding place of love, friendship, how to communicate well etc. clearly these issues are not only important for an individual life but society too. Social perception plays both the role of influencer and

NSOU ? CC-ED-10 27 2.3 Development, Maturity, Crisis of Life and Role of Education Dictionary meaning of development is “an event constituting a new stage in a changing situation”. In human psychology development is “a process of qualitative improvement of human beings’ cognitive, emotional, intellectual, and social capabilities and functioning over the course of a normal life span, from infancy through old age. According to APA development is “the progressive series of changes in structure, function, and behavior patterns that occur over

72%

There are eight basic needs for a healthy emotional development of a child which are love, security, acceptance, self-respect

or self-esteem, achievement, recognition, independence and authority. Development refers to both qualitative and quantitative changes. There are three domains of development – a) Physical Development or motor development b) Cognitive Development c) Psycho-social Development Physical Development includes development of fine motor skills and gross motor skills. Development of fine motor skills is the development and control of smaller muscles of the hands, fingers and feet so that a child can do more delicate tasks e.g. drawing, fastening buttons and threading beads. Development of gross motor skills is the development and control of the whole body and the larger muscles. Children need this control to be able to balance, walk and climb. Cognitive development is how a person perceives, thinks, and gains understanding of their world through the relations of genetic and learning factors. Piaget proposed four stages of cognitive development i.e., the sensorimotor, preoperational, concrete operational and formal operational period. The relationship between mental and emotional wellbeing and the environment was first commonly applied by Erik Erikson in his description of the stages of psychosocial development. According to Erikson's theory the results from each stage, whether positive or negative, influences the results of succeeding stages. Erikson was originally influenced by Sigmund Freud's psychosexual stages of development. Erikson's stage theory characterizes an individual advancing through the eight life stages as a function of negotiating their biological and sociocultural forces. The two conflicting forces each have a psychosocial crisis which characterizes the eight stages. On the other hand maturity is defined in APA as "a state of completed growth or development, as in adulthood." To compare maturity with development it can be said that 28 NSOU ? CC-ED-10 development has three major component namely growth, maturation and learning. Growth is the physical part of development and has a time bound factor to it whereas maturation is physical, mental, emotional etc. Maturation is often not quantifiable, and it too is mostly influenced by genetics. While growth is physical, maturation is physical, intellectual, or emotional. Often, maturation involves two or even all three. As the person's brain physically develops or grows they are able to understand intellectually what others are going through and how they might feel and that allows them to emotionally feel empathy for others. Maturation is an automatic, inherent and universal process. This biological process is not a lifelong process, but it continued to a certain age. According to Baldwin, "Maturation is an increase in competency and adoptability." Gates and Jersild defined described "Maturation is growth that proceeds regularly within a wide range of environmental conditions, or that takes place without special conditions of stimulation, such as training and practice." According to Garry and Kingsley, "Maturation is the process whereby behaviour is modified as a result of growth and development of physical structures." Crisis of life: in general , crisis of life includes any kind of crisis faced by a living human being. But in this case we particularly refer crisis which comes normally in the path of development and maturation. A disruption or breakdown in a person's or family's normal or usual pattern of functioning is known as crisis. A crisis cannot be resolved by a person's customary problem-solving resources/skills. No human is excluded from that. APA defined life crisis as "a period of distress and major adjustment associated with a significant life experience, such as divorce or death of a family member. In studies relating health to life crises, individuals experiencing recent major stress-producing experiences are more likely than others to show significant alterations in mental and physical health status." Sometime life crisis consist such events in life which are stressful to the extent that normal coping mechanism seems insufficient. In these cases guidance and counselling provide appropriate resources to overcome crisis. In a life of student, crisis can be of different types namely – Aberrant behaviour, abuse of any kind, anxiety, delusional behaviour, depression, willful disobedience, disruptive behaviour, harassment, misconduct, unstable performance, post traumatic disorder, rape, substance abuse, suicide potential, passive behaviour, violence in nature etc. there Are other few triggers which make a life crisis more severe that is denial and panic. Denial refers to the act of refusing to acknowledge either imminent harm or harm that has already occurred. Denial occurs for a variety of reasons. On the other hand panic is lack of crisis management. It is the counter reaction to lack of stability. **ROLE OF EDUCATION:** in developmental psychology how these issues are related with stages of human life is clearly explained. As for example in Erickson's Psycho-social development one of the life crisis, mid – life crisis is explained in the stage of 45 to 65 years of human life. What is the way to hand crisis in life?

NSOU ? CC-ED-10 29 The answer is to take an educational journey with specialized knowledge. One needs to know to unfurl crisis. This education is lifelong in nature and inclusive in philosophy. A truly educated person won't shy away from the challenges of life or deny the existence of crisis in life. But education is the best therapy to know self and guide through self in these times of crisis. There are three basic elements of a crisis – a) a stressful situation b) difficulty in coping and c) timing of intervention. Steps to be taken : 1. Quick inventory of the situation 2. Identify the type of crisis 3. Take action 4. Attempt to not repeat the situation with further care for the person in crisis (community support) Role of education is to guide and counsel a person in crisis. Some basic features of that are a) Focus on what's Important b) Find support c) Processing the emotional part of crisis d) Focus on self-care (with the understanding of self) e) Developing coping skill It must be stated that person in crisis needs information about their current condition and the steps they may follow to minimize the damage. A different stream of counselling has emerged from this which is called crisis counselling. Crisis Counselling : Crisis counseling involves providing support and guidance to an individual or a group of people such as a family or community during a crisis. The purpose of crisis counseling is to decrease emotional pain, provide emotional support, make sure that the person in crisis is safe, and help develop a plan for coping with the situation. Sometimes it also involves connecting a person to other community or health services that can provide long-term support. Crisis counseling can be linked to health education if it is used to increase knowledge of how to avoid or cope with a crisis in the future. It can also be used to change people's attitudes and beliefs about people in crisis, and to provide people with information about help available in their community. Crisis counseling is also related to health promotion. People can be taught useful skills that will help them to anticipate and cope with a crisis. Skills, information, and support services gained through crisis counseling can also help a person or a group of people to improve their health and quality of life. Crisis counseling

30 NSOU ? CC-ED-10 can also be tied to health promotion through the development of health-related public policy and supportive environments. 2.4 Interpersonal Relationships: Basis, Friendship, Love, Communication, Relationship and Social Perception The value or role of a human being is its participation in the larger order. E.g. my role in living with the other human being is to ensure the feeling of respect in the relationship. Interestingly, I feel happy in fulfilling my role; and it is fulfilling for the other as well. Hence, to understand human values, we need to study the human reality along with all that is there in the entire nature/existence which constitutes the larger order. We need to explore and understand things as they are; so that we are able to recognise and fulfil our participation with them. For the human being physical facility is important but relationship is also necessary. We can begin to classify key relationships we have by distinguishing between our personal and our social relationships (Van Lear, Koerner, & Allen, 2006). Personal relationships meet emotional, relational, and instrumental needs, as they are intimate, close, and interdependent relationships such as those we have with best friends, partners, or immediate family. Social relationships are relationships that occasionally meet our needs and lack the closeness and interdependence of personal relationships. Examples of social relationships include coworkers, distant relatives, and acquaintances. Another distinction useful for categorizing relationships is whether or not they are voluntary. For example, some personal relationships are voluntary, like those with romantic partners, and some are involuntary, like those with close siblings. To understand interpersonal relationship we have to explore the four important aspects of relationship: a. Relationship is – between one Self and another Self b. There are feelings in relationship – in one Self for the other Self c. These feelings can be recognised – they are definite d. The fulfilment of these feelings and their right evaluation lead to mutual happiness a. Relationship is – between one Self and another Self Relationship is already there. We do not have to construct or create relationship. All we need to do is to understand relationship and fulfil it. Relationship is between one Self and the other Self. It is the Self which is recognizing the relationship, and not the Body. It is the Self which relates to the other, and not the Body.

NSOU ? CC-ED-10 31 b. There are feelings in relationship – in one Self for the other Self The important issue in human relationship is that of the feelings. We can see that feelings are in the Self, not in the Body. It is the Self which has the feelings and which recognises the feelings. To understand relationship, one has to understand the Self and the naturally acceptable feelings in the Self. c. These feelings can be recognised – they are definite These feelings can be recognised, they are definite. There are nine feelings in relationship. These are the feelings which we can understand, which we can ensure within ourselves, which we can share with others and thus ensure mutual fulfilment in relationship. These are the feelings which are naturally acceptable to us in the relationship with the other human being. Feelings (values) in relationship: 1. Trust (foundation value) 2. Respect 3. Affection 4. Care 5. Guidance 6. Reverence 7. Glory 8. Gratitude 9. Love (complete value) d. Fulfilment of feelings in relationship and their evaluation leads to mutual happiness. When we have these naturally acceptable feelings in the Self, we share them with the other and when we are both able to evaluate the feelings rightly, it leads to mutual happiness, i.e. the happiness of oneself as well as the happiness of the other.

Friendship: Friendships are voluntary interpersonal relationships between two people who are usually equals and who mutually influence one another. Friendships, like most relationships, have a life span ranging from formation to maintenance to deterioration/dissolution. Friendships have various turning points that affect their trajectory. While there are developmental stages in friendships, they may not be experienced linearly, as friends can cycle through formation, maintenance, and deterioration/dissolution together or separately

32 NSOU ? CC-ED-10 and may experience stages multiple times. Friendships are also diverse, in that not all friendships develop the same level of closeness, and the level of closeness can fluctuate over the course of a friendship. Changes in closeness can be an expected and accepted part of the cycle of friendships, and less closeness doesn't necessarily lead to less satisfaction (Johnson et al., 2003). Love: Love is the feeling of being related to everyone, to all. It starts from affection, which we have already explored. If this feeling expands to many and ultimately to all, it is the feeling of love. So, we begin with the feeling of affection, and complete it with the feeling of love. That is why, Love is called complete value. Love is the feeling of being related to all. Love is expressed in the form of compassion. The feeling of love is for all and it is expressed to whosoever comes in contact. Distinguishing Between Love and Infatuation: The feeling of love is not something which is based on sensation. If there is a feeling on the basis of sensation, this is the case of infatuation where the sensual pleasure becomes the major goal. Infatuation is conditional – it may last only as long as you are able to get the sensation or you have hope of getting happiness through sensation. It is very temporary; it does not last for long. Once the effect wears off, then the long-term issues of feelings become prominent. Communication Communication is a complex process, and it is difficult to determine where or with whom a communication encounter starts and ends. Models of communication simplify the process by providing a visual representation of the various aspects of a communication encounter. Some models explain communication in more detail than others, but even the most complex model still doesn't recreate what we experience in even a moment of a communication encounter. In communication models, the participants are the senders and/or receivers of messages in a communication encounter. The message is the verbal or nonverbal content being conveyed from sender to receiver. For example, when you say "Hello!" to your friend, you are sending a message of greeting that will be received by your friend. The internal cognitive process that allows participants to send, receive, and understand messages is the encoding and decoding process. Encoding is the process of turning thoughts into communication. As we will learn later, the level of conscious thought that goes into encoding messages varies. Decoding is the process of turning communication into thoughts. Relationship and social perception Perception is the process of selecting, organizing, and interpreting information. This process

NSOU ? CC-ED-10 33 affects our communication because we respond to stimuli differently, whether they are objects or persons, based on how we perceive them. Given the massive amounts of stimuli taken in by our senses, we only select a portion of the incoming information to organize and interpret. We select information based on salience. We tend to find salient things that are visually or aurally stimulating and things that meet our needs and interests. Expectations also influence what information we select. We organize information that we select into patterns based on proximity, similarity, and difference. We interpret information using schemata, which allow us to assign meaning to information based on accumulated knowledge and previous experience. Social perception on relationship is no different than the above.

"David Kenny's interpersonal perception: a social relations analysis" is an ambitious work that presents a comprehensive review and analysis of existing work to date using the social relations model. SRM is one of the most innovative and useful accomplishments in the area of social perception it has addressed major long standing issues in the field of social perception such as social perceptual assimilation, consensus, reciprocity, various types of accuracy, reflected appraisals, assumed similarity etc. Social Relation Model David Kenny described his model on Social relation as follows- The Social Relations Model is a model for dyadic data. Data from two-person interactions and rating or sociometric studies can be used. The level of measurement should be interval (e.g., seven-point scales) and not categorical (e.g., yes or no). Generally the data are collected from people but the dyadic units can be animals, groups, organizations, cities, or countries. There are three major types of effects in the Social Relations Model: actor, partner, and relationship effects. The actor effect represents a person's average level of a given behaviour in the presence of a variety of partners. For example, Rana's actor effect on the variable of trust measures the extent to which he tends to trust others in general. The partner effect represents the average level of a response which a person elicits from a variety of partners. Rana's partner effect measures the extent to which other people tend to trust him. The relationship effect represents a person's behaviour toward another individual in particular, above and beyond their actor and partner effects. For example, Rana's relationship effect toward Soma on the variable of trust measures the extent to which he trusts her controlling for his general tendency toward trusting others and her general tendency to be trusted by others. Relationship effects are directional or asymmetric, such that Rana may trust Soma more, less, or the same as she trusts him. To differentiate relationship from error variance, multiple indicators of the construct, either across time or with different measures, are necessary.

34 NSOU ? CC-ED-10 Actor and partner are generic terms. In social perception data, actor might be more appropriately called perceiver and partner might be called target. In nonverbal communication, the actor might be called a receiver and the partner a sender. In studies of liking, the actor effect measures how much the person likes others, and the partner effect measures how much a person is liked, i.e., popularity. The focus in Social Relations modelling is not on estimating the effects for specific persons and relationships but in estimating the variance due to effects. So there is a study of how intelligent people see each other, the interest is in whether there is actor, partner, and relationship variance. Actor variance would assess if people saw others as similar in terms of intelligence, partner variance would assess whether people agree with each other in their ratings of intelligence, and relationship variance would assess the degree to which perceptions of intelligence are unique. It is safe to say that relationship on interpersonal basis has a complex character and recently with the development of research tool and technique new light is shed on the dynamics. But there is no denying that to understand "Self" interpersonal relationship is vital and so can be said vice-versa.

2.5 Gender, Gender Identity and Gender Role Development Gender: The concept of gender is inherently related with the idea of identity. When you are born how you are identified? even if you are not in a position to identify it by yourself ! you are Human, Indian/other, Bengali/other, boy/girl is central to who we are in the eyes of others around us. But the question stays as we continue to grow up – who am I? Gender is a social construction. Social constructions are groups of related ideas that the societies create to describe, understand and regulate behaviour and changes in societies. What it represents to be a man or to be a woman is an identity that impacts our future. Similarly, we have our regional, linguistic, community and national identities. Accordingly, our normative behaviour, our social and interpersonal interactions and our decisions change. Secondly, because our identities relate to social structures, it's norms and rules, our identity puts constraints and enables/facilitates certain process of growing up, developing of certain thoughts, emotions, actions and behaviour. The interesting question is, when certain identities and socialization processes contradict each other or create dissonance, how does the person react or respond? Gender Identity: Various definitions of Gender Identity have ranged from recognition of one's biological sex to an individual's sense of masculinity or femininity. Fleishman's (1983) psychodynamic definition provides an example of one end of this continuum: "Gender

NSOU ? CC-ED-10 35 identity refers to an individual's belief that he or she is either male or female". Representative of a definition falling more toward the middle of the continuum is (O'Heron, C. & Orlofsky, J. L., 1990) the definition of gender identity as that which "refers not only to an individual's sense of self as a man or a woman but also to his or her global sense of masculinity or femininity". Thus, although most definitions do fall somewhere between these two, discussions of gender identity may directly encompass biological sex, conformity to social stereotypes, sexual preference, political ideology and activism explicitly or implicitly. Therefore, in order to understand gender as an identity, we distinguish between our biological given sex and gender as a social construction. We are assigned a biological given sex based on the primary sexual characteristics we are born with. If we are born with a penis and testicles, then we are assigned a biological sex of a man/boy. If we are born with a vagina and a womb, we are assigned a sex of a girl/woman. However, it is the social construction of 'Gender' that defines, describes, makes us understand and regulates our interpersonal and social performance as a boy or a girl. GENDER ROLE DEVELOPMENT: In the famous words of Simone de Beauvoir, "Women are not born, they are made." The same is true of men. The making of a man or a woman is a never-ending process that begins before birth – from the moment someone begins to wonder if the pending child will be a boy or a girl. And the dichotomy of male and female continues with a process of learning to be a boy or a girl. All the symbols and nuances of life helps a person build that and human being starts playing the gender role. The language plays a huge role in this built up. As explained in the Stanford book of "Language and Gender" - "If gender flowed naturally from sex, one might expect the world to sit back and simply allow the baby to become male or female. But in fact, sex determination sets the stage for a lifelong process of gendering, as the child becomes, and learns how to be, male or female. Names and clothing are just a small part of the symbolic resources used to support a consistent ongoing gender attribution even when children are clothed. That we can speak of a child growing up as a girl or as a boy suggests that initial sex attribution is far more than just a simple observation of a physical characteristic. Being a girl or being a boy is not a stable state but an ongoing accomplishment, something that is actively done both by the individual so categorized and by those who interact with it in the various communities to which it belongs." It can safely be said that the force of gender categories in society makes it impossible for us to move through our lives in a nongendered way, and impossible not to behave in a way that brings out gendered behavior in others. At the same time, the maintenance of gender categories depends on reinforcement in day-to-day behavior. Male and female could not

36 NSOU ? CC-ED-10 persist as structurally important social categories if we did not perform enough gendered and gendering behaviour. Because structure and practice are in this dynamic relationship, there will always be room for change. Every time a girl picks up a doll or a boy goes to outdoor sports may seem conforming the social perception of gender, but there will always be that part where a girl would love her truck and boy would like dressing up. Life and daily living are about change – about things happening, about creativity and intelligence at work in the space left open by the incomplete hold of ideologies and institutions. 2.6 Summary ? development is "an event constituting a new stage in a changing situation". ? maturity is defined in APA as "a state of completed growth or development, as in adulthood." ? crisis of life includes any kind of crisis faced by a living human being. But in this case we particularly refer crisis which comes normally in the path of development and maturation ? One needs to know to unfurl crisis. This education is lifelong in nature and inclusive in philosophy ? Role of education is to guide and counsel a person in crisis. Some basic feature of that is a) Focus on what's Important b) Find support c) Processing the emotional part of crisis d) Focus on self-care (with the understanding of self) e) Developing coping skill

Development is progressive acquisition of various skills (abilities) such as head support, speaking, learning, expressing the feelings and relating with other people.

There are three domains of development which are physical development or motor development, cognitive development and psycho-social development. Physical development includes fine and gross motor skills. Cognitive development is how a person perceives, thinks, and gains understanding. The relationship between mental and emotional wellbeing and the environment is the part of psychosocial development. Maturation is an automatic, inherent and universal biological process continued to a certain age. Crisis of life includes any kind of crisis faced by a living human being such as disruption or breakdown in a person's or family. Educational

NSOU ? CC-ED-10 37 journey with specialized knowledge is the way to hand crisis in life. Crisis counselling involves providing support and guidance to an individual or a group of people such as a family or community during a crisis. There are two types of relationship. Personal relationships meet emotional, relational, and instrumental needs. Social relationships are relationships that occasionally meet our needs. There are four aspects of relationship – relationship between one self and another self, feelings, recognition, fulfilment and evaluation. Friendships are voluntary interpersonal relationships between two people who are usually equals and who mutually influence one another. Love is the feeling of being related to everyone, to all. If there is a feeling on the basis of sensation, this is the case of infatuation, not love. Communication is the process that allows participants to send, receive, and understand messages by encoding and decoding. However, David Kenny described his model on Social relation. There are three major types of effects in the Social Relations Model: actor, partner, and relationship effects. In nonverbal communication, the actor might be called a receiver and the partner a sender. Gender is a social construction. Gender identity encompasses biological sex, conformity to social stereotypes, sexual preference, political ideology and activism explicitly or implicitly. Gender makes us understand and regulates our interpersonal and social performance as a boy or a girl. All the symbols and nuances of life helps a person build that and human being starts playing the gender role.

2.7 Self-Assessment Questions

1. What is gender?
2. What is gender identity ?
3. What is gender conformity ?
4. Is gender dichotomous?
5. Why the knowledge of gender identity is important ?
6. What is life crisis ?
7. How education helps to solve crisis?
8. How development is qualitative in nature ? Site one example.
9. Do you think teacher should know life crisis of students?
10. Why interpersonal relationship is related with education?

- 3.4 Development of Life – Skills, Ethics and Values
- 3.5 Achieving Highest Potential of the Individual
- 3.6 Summary
- 3.7 Self-Assessment Questions
- 3.8 Reference

3.1 Objectives After completion of the unit students will be able to-

- ? understand harmony in the society ? identify their working self ? state the difference among skills, ethics and value ? select what is important to achieve highest potential of an individual

3.2 Introduction Human existence is confined to the self but self is expressed through relationships and that relationship extends not only within family but to the professional life of a human being. Therefore adjustment with family, school, peers and community is an important part for the existence of a human being. We often hear successful person is referred to as "self-made". But does that really exist? To be a human we need each other and we need that relationship to work we need harmony with self-within and self-manifested. Ethical values depends on culture, family and life experience. There are important role of life skills, ethics and values in the process of adjustment. A skill is the learned ability to perform an action.

Life skills are abilities for adaptive and positive behavior that enable humans to deal effectively with the demands and challenges of life.

Ethics are the moral

40 NSOU ? CC-ED-10 principles that govern a person's right behavior. Ethics are consistent, whereas values are different for different persons. Ethics and Values together lay the foundation for sustainability. 3.3 Working Self : Adjustment with Family, School, Peers and Community Every human being is born in a family and is part of a family. The family is the basic unit or building block of human organisation. It provides a base for appreciating, accepting, understanding and practicing to live in relationship and harmony. Adjustment with family is primarily dependent on the relationship the person has with the family. The fulfilment of relation in family is later on reflected on the other relationships of the human being which finally construct the " working self " of the person. Before we embark into the investigation of working self, lets understand what are the "feelings" relationship encompasses of- Feelings (values) in relationship: 1. Trust (foundation value) 2. Respect 3. Affection 4. Care 5. Guidance 6. Reverence 7. Glory 8. Gratitude 9. Love (complete value) Among the above list trust is the foundation of any relationship. Trust in intention is the basic requirement to have strong relationship and only that can ensure well-adjusted human being , be it in family, school, peers or community. With trust our desire move on to respect. This is especially important for adjustment in school, peers and community. On the other hand disrespect arises out differentiation and discrimination. Discrimination in society is present in form of age, gender, race, beliefs, wealth etc. Now to address adjustment with family, peers, society we need to bring the above mentioned concept of relationship as human being live to fulfil some goals and harmony in those can only lead to adjustment with the rest. Education provides the commitment, preparation and practice of living in harmony at all levels. Preparation includes learning the skills and technology for living in harmony. Our living is an expression of our education. Therefore NSOU ? CC-ED-10 41 in achieving harmony or adjustment conflict of choice will always be there and only a proper education can guide those choices to be well adjusted. Some of those questions/ choices may include – ? Right understanding in every human being or only a few to have right understanding and others to follow them? ? Prosperity in every family or few families to have accumulation, and others to be deprived and dependent on the few? ? Fearlessness, based on trust and affection, in the society or a state of fear, based on mistrust and jealousy in the society? ? Co-existence (mutual fulfilment) in nature or exploitation and domination of nature? Process of Development to have adjustment with family, peer, society requires a Child to be in an environment of Relationship : A child intrinsically has a desire to understand what is right, to learn right skills and to do what is right. This desire to understand is innate in every Self. This is the guidance that is expected by the child. The child wants to know about everything, so asks lots of questions, wants to relate to people around, picks up the language, the accent, the mannerisms... The thoughts and actions unhappiness, are not satisfying for her/him, and hence the child makes a lot of effort in this direction from a very early age. It expects others to help him/her in learning and in understanding with a feeling of affection. In this process, the child starts with imitating, and then following. If (s)he is able to find answers and is able to validate them to be right, it leads to self-discipline and self-confidence in the child. The child's conduct is definite and it is human. On the other hand, if the child finds that the inputs are not right, it starts to have doubts on elders, teachers and hence tries out something on his/her own. If the knowing does not take place, the child's conduct remains indefinite and inhuman. The people around the child then try to restrain the child by more instructions, more domination. Many of the bad habits form during this stage. It is basically that the child is trying ways and means of happiness or escaping from unhappiness. This further aggravates the state making way for dissatisfaction, lack of confidence, opposition, revolt, struggle and war. So, one has to find out where do we stand today? And what is the naturally acceptable way? (Universal Human Value, AICTE)

42 NSOU ? CC-ED-10 3.4 Development of Life – Skills, Ethics and Values Let's start the discussion by defining what are life-skills. Life –skills:

96%

MATCHING BLOCK 37/64

SA

report file full.docx (D110690450)

World Health Organization defined life skills as “the abilities for adaptive and positive behaviour that enable individuals to deal effectively with the demands and challenges of everyday life”. UNICEF defines life skills as “a behaviour change or behaviour development approach designed to address a balance of three areas: knowledge, attitude and skills”. The UNICEF definition is based on research evidence that suggests that shifts in risk behaviour are unlikely if knowledge, attitudinal and skills based competency are not addressed.

There are ten core life skill strategies and techniques as: problem solving, critical thinking, effective communication skills, decision-making, creative thinking, interpersonal relationship skills, self-awareness building skills, empathy, and coping with stress and emotions. Self- awareness, self-esteem and self-confidence are essential tools for understanding one’s strengths and weaknesses. Consequently, the individual is able to discern available opportunities and prepare to face possible threats. This leads to the development of a social awareness of the concerns of one’s family and society. Subsequently, it is possible to identify problems that arise within both the family and society. United Nations office on drugs and crime has developed an activity with students to explore the idea of life skill with them. The example is given below- What Skills Do I Have? Objective To explore the concept of life skills. To know the life skills used by the participants in their day-today life. Materials Flash cards, markers, flip charts, gum/ tape. Time 1 hour. Process Invite the participants to sit in a circle. Ask them if they have heard of the term “life skills”? What do they know about it? Explain that all of us possess certain skills that allow us to live our lives. For example, the skill to write, work with others or make a decision. Pass out one flash card to each participant, and ask him/her to write the most important skill he/she possesses. Allow the participants 5 minutes to do this exercise.

NSOU ? CC-ED-10 43 Invite the participants to display their cards on the floor. Ask them to group similar cards. Ask if the cards represent most of the skills required for leading a healthy and productive life. If not, ask them to add the remaining skills. While the participants are busy doing their work, prepare three flash cards with the headings – “All of us have”, “Some of us have” and “None of us have”. After the participants finish writing and grouping the flash cards, ask them to arrange the flash cards in a horizontal line on the floor. Place the three cards, which you have prepared, in a vertical line next to the horizontal line of cards. Once this is done, you should be able to draw a matrix of rows and columns on the floor. You should have 4 rows and as many columns as there are skill cards. Now, ask the participants to start from the top and fill the matrix. Move from the left to the right. Once the matrix is complete, ask the participants to discuss the reasons for its outputs. For example, why is it that only some people have certain skills, and why are certain skills absent? Request volunteers to copy the matrix on a chart, and put it up on the wall. Summarize and close the discussion by using the WHO definition of life skills. Ethics: ethics is a set of moral issues and aspects. It is based on well founded standards of right and wrong that says what is right and what is wrong. We often say ethics is what “I feel is right or wrong”. But ethics is certainly not “what I feel”. Ethics is better explained as what it is not. It is not religion, same as law or what society prescribes. Ethics is two things. First, ethics refers to well-founded standards of right and wrong that prescribe what humans ought to do, usually in terms of rights, obligations, benefits to society, fairness, or specific virtues. Ethics, for example, refers to those standards that impose the reasonable obligations to refrain from rape, stealing, murder, assault, slander, and fraud. Ethical standards also include those that enjoin virtues of honesty, compassion, and loyalty. And, ethical standards include standards relating to rights, such as the right to life, the right to freedom from injury, and the right to privacy. Such standards are adequate standards of ethics because they are supported by consistent and well-founded reasons. Secondly, ethics refers to the study and development of one’s ethical standards. As mentioned above, feelings, laws, and social norms can deviate from what is ethical. So it is necessary

44 NSOU ? CC-ED-10 to constantly examine one's standards to ensure that they are reasonable and well-founded. Ethics also means, then, the continuous effort of studying our own moral beliefs and our moral conduct, and striving to ensure that we, and the institutions we help to shape, live up to standards that are reasonable and solidly-based. Development of ethics therefore involves recognising value issues, careful analyse and reflect. Reflection must end in application and practice. Values: values are principles and fundamental convictions which act as general guides to behavior, enduring beliefs about what is worthwhile, ideals for one strives , standards by which particular beliefs and actions are judged to be good or desirable. Sociologist M. M. Massey stated value development in following stages – i. The imprint period : from birth to age 7. An individual accepts everything as truth, especially when it comes from parents. ii. The modeling period: age between 8 to 13. Individual copies others , often parents but also idols, teachers celebrities etc. experimentation starts and some time that give results to new ideas. iii. The socialization period: period between 13 to 21. Age influenced by peer groups. Preference is given to similarity in character, choices, attitude etc. The question is what a parent or teacher can do to facilitate good values inculcation in a student? ? Induction that involves the use of explanations or reasoning with a child in order to convey parental standards. ? Nurturing and support ? Through modeling ? Through democratic family decision-making ? Helping children develop good reading habit ? Through significant identification It must be added that value of an unit is depended on how it participates in higher order. A pen can be a show piece. But value of it lies in being a tool for writing. Similarly universal values of human being can be explained as below – Values of your activities (desire, thought, expectation) is participation in the harmony within Value of your body is participation in your activities as a human being Your value in the family is your participation in the harmony in the family Your value in the society is your participation in the harmony in the society NSOU ? CC-ED-10 45 Your values in the nature is your participation in the harmony in the nature Your values in the existence is your participation in the harmony in the co-existence (Universal Human Value, AICTE) 3.5 Achieving Highest Potential of the Individual One of the favourite phrases in modern education is defining education as a process of "achieving highest potential of an individual". No doubt the idea is alluring and equally challenging as each "individual" is different and so is their potential and secondly, "What is highest potential?" Potential of an individual in educational term can be explained as "Manifestation of perfection already in man". Human potential is the capacity for humans to improve themselves through studying, training, and practice, to reach the limit of their ability to develop aptitudes and skills. Measurement of human potential often rests on issues like talent, intent, ability etc. As for example, in "outcome based education" graduate attributes are based on this aim. What does graduate attributes say about "reaching highest potential"? As explained by UGC- "The graduate attributes reflect the particular quality and feature or characteristics of an individual, including the knowledge, skills, attitudes and values that are expected to be acquired by a graduate through studies at the higher education institution (HEI) such as a college or university." Those are – i. Disciplinary knowledge ii. Communication skills iii. Critical thinking iv. Problem solving v. Analytical reasoning vi. Research – related skills vii. Cooperation/team work viii. Scientific reasoning ix. Reflective thinking x. Information/digital literacy xi. Self-directed learning xii. Multicultural competence

46 NSOU ? CC-ED-10 xiii. Moral and ethical awareness/reasoning xiv. Leadership readiness/quality xv. Lifelong learning But it must be clearly stated that achieving highest potential of an individual should not be read as “achieving highest potential by competing and defeating to mark the highest position”. A competition may work as a tool, but as a motivation it inculcates fear, unfair means and demoralisation. There is a basic difference between working for excellence and competition . If you have achieved excellence, you would naturally make effort for helping others to achieve excellence. On the other hand, in competition, we not only do not help rather we hinder the other to reach to our level. Therefore to achieve highest potential of an individual the following pathway may be followed- 1. Self-exploration: Verifying the proposals on our own right and living accordingly 2. Self-awareness: Being aware of one’s desires, thoughts and expectations every moment 3. Self-evaluation- Evaluating one’s competence vis-à-vis the natural acceptance every moment. A mere skill development without any “value” is worthless. 3.6 Summary ? A child intrinsically has a desire to understand what is right, to learn right skills and to do what is right. This desire to understand is innate in every Self. This is the guidance that is expected by the child. The child wants to know about everything, so asks lots of questions, wants to relate to people around, picks up the language, the accent, the mannerisms ? There are ten core life skill strategies and techniques as : problem solving, critical thinking, effective communication skills, decision-making, creative thinking, interpersonal relationship skills, self-awareness building skills, empathy, and coping with stress and emotions. Self-awareness, self-esteem and self-confidence are essential tools for understanding one’s strengths and weaknesses. ? achieving highest potential of an individual should not be read as “achieving highest potential by competing and defeating to mark the highest position”. A competition may work as a tool, but as a motivation it inculcates fear, unfair means and demoralisation. There is a basic difference between working for excellence and competition .

NSOU ? CC-ED-10 47 Foster et al (2017) identified in their study that youth who are more connected to parents reported lower levels of depressive symptoms, suicidal ideation, non-suicidal self-injury, and conduct problems, higher self-esteem and more adaptive use of free time. Youth who felt more connected to their school reported lower levels of depressive symptoms, suicidal ideation, social anxiety, and sexual activity, as well as higher levels of self-esteem and more adaptive use of free time. Community connectedness was also associated with less social anxiety but more sexual activity. Blaževič (2016) identified a strong influence of family, peer and school on children’s social development. The parents who have caring, sensitive relation, provides the

MODULE - 2 Mental Health & Role of Teacher

Unit 4 ? Mental Health Assessment Structure 4.1 Objective 4.2 Introduction 4.3 Pre-Requisites for Guidance Programme 4.4 Tools of Data Collection : Use of Psychological Tests (Intelligence, Aptitude, Interest) 4.5 Techniques of Data Collection 4.6 Summary 4.7 Self-Assessment Questions 4.8 Reference 4.1 Objectives After completion of the unit, students will be able to ? Define guidance ? State its difference with counselling ? Reflect his or her role as a guide in educational process ? Apply some tools and techniques in their teaching and guidance 4.2 Introduction Guidance can be explained as

assistance made available by competent counsellors to an individual of any group to help him/her direct the life course, develop a point of view, make decisions and be better adjusted. Guidance does not mean giving directions, nor is it an imposition of one's point of view on another person. The person, who is guiding another does not take the onus (responsibility) of making decisions on behalf of the client. We can see that guidance is more about assisting people to find their way rather than giving instructions or ready-made solutions.

52

NSOU ? CC-ED-10 4.3 Pre-Requisites for Guidance Programme Guidance programme needs preparation and before even planning the actual action there are some pre-requisite which must be ensured before proceeding ahead. These requirements does not always involve only the institute itself but might need the social or outside help if needed. Therefor various personnel may be needed within and from outside of the educational institute. Some of the preliminary tasks needed to be taken in order to organize a guidance programme are 1. Formation of a guidance committee, which comprises of atleast seven to eight members. The committee would constitute of various personnel such as atleast two parents, two teachers, a counsellor and a career master. The principal could be represented as the chair person of

91% MATCHING BLOCK 43/64

SA Final.docx (D111786616)

the committee. 2. Decisions and arrangements must be made regarding the allotment of budget for conducting the various services.

The expenses could be determined also keeping in view the payment of honorium for guest lecturers. Conveyance to specialists or professional such as educationists doctors etc. 3. Suitable arrangements need to be made to acquire minimum infrastructural and physical facilities such as a

90%

MATCHING BLOCK 44/64

SA

Final.docx (D111786616)

guidance cell or room, tables, chairs, various psychological tests and other required literature. 4. Support from

the

77%

MATCHING BLOCK 45/64

SA

Final.docx (D111786616)

parents and community could be obtained by orienting them to the significance of a guidance programme. 5. The school staff and students also need to be briefed on the purposes and importance of the guidance programme and encourage them to participate. (

Egyankosh. Guidance and counselling. Unit 6) Planning for Guidance Programme: Assessing students' social, educational, personal and vocational needs and planning to guide according to that so that educational aim, vision and mission of the institution is achieved is the chief objective of planning phase of any guidance programme. Asking the students, their parents and prospective employers about what they think their needs are and if these needs are being adequately met helps in planning of guidance programme. Issues may include drug education, bullying prevention, personal safety, crisis response, and mental health and wellness. Once the gap is identified the guidance team has to design the process which will be carried out for the institutes guidance programme. These programmes must be in alignment with the higher bodies planning and rules- regulations as far as guidance go.

NSOU ? CC-ED-10 53 Stages of guidance plan : ? Development of rationale / aims ? Target group ? Developing objectives for guidance plan ? Selecting guidance activities ? Resource identification ? Monitoring and review Institutes guidance plan is an integral part of institute's developmental plan. Therefore, after the draft is made all staff and educational stakeholders representatives must be able to study and make their observation which should be presentation to the institute's board of management for due consideration. 4.4 Tools of Data Collection : Use of Psychological Tests (Intelligence, Aptitude, Interest) When do you need a tool? When you want to fix something or want to get more information out of something. As we write it we do understand tools must have some pre set aim and also they have specific area of application. A measuring tape can only be used to measure length and you would need a weighing machine to know the weight of that same object. That tape wont do. Exactly same logic is applied for Counselling tools. They help in data collection for sure. But counselling itself has various type of data. Hence you would need variety of tools to collect the data. Here we must also acknowledge that tools are only good for collecting data and not analysis. Psychological tests Psychological tests are designed to measure criterion related to psychological domain be it intelligence, attitude or interest. As these names already suggest psychological tests are of wide spectrum as far as method and nature of data goes. As Anastasi (2003) defined it these are samples of an individual's behaviour, obtained under standard conditions and scored according to a fixed set of rules that provide a numeric score. In a standardized test, individual scores are compared with a norm or standard arrived at on the basis of performance of sample of individuals of the same age or grade level from around the country who took the same test when it was first developed. Good standardized tests are the result of years of research. Tests may take many forms. Usually, they comprise of a series of items / questions with well-defined correct answers

54 NSOU ? CC-ED-10 such as in case of tests of intelligence or achievement, while others such as personality inventories, do not have right or wrong answers, but are designed to assess person's pre- dispositions, tendencies and preferences. A good psychological test has five main characteristics. It should be objective, reliable, valid, norms oriented and practicable. Objectivity – A psychological test will be free from any bias or subjective judgment when it measure or assess some construct or variable. When a test result provides same score by different assessors without any influence of their own belief, it can be said that the test has high objectivity. Most of the standardized tests of aptitude and achievement are with high objectivity. Generally assessors or evaluator provide judgmental scoring for an essay- type test. But, most essential criteria of a standardized test is objectivity. Objectivity of a test reduce biases and ensure reliability. Reliability – It generally refers consistency of test result. A standardized test should provide consistent result, then it will be considered as trustworthy. Internal reliability assesses the consistency of results across the items within a psychological test. On the other hand,

the extent to which a measure varies from one use to another is called external reliability. Internal consistency can be assessed by split-half method. For external reliability, test stability over time can be measured by test-retest method and consistent estimates of the same behavior by different raters can be assessed by inter-rater method. Validity – Any psychological test can be considered as valid when it measures the same which it claims to measure. By face validity (the test appears to measure that it claims) and construct validity (the test relates underlying theoretical concepts) ensures whether the test has appropriate content or not. It is called content validity. On the other hand, concurrent validity (comparison with a currently existing criterion) and predictive validity (test accurately predicts a criterion that will occur in the future) help to relate the test with other. This is called criterion validity. Norms – A good psychological test should have certain norms as the future assessors can compare their results to the norms. It will help them to determine the level of their sample. Actually norms of a test are average standard scores of a specific sample. Practicability – The difficulty level, length of a test should be considered. The length or number of items should be applicable practically. The test should not be too long or difficult to answer or score. A. Psychological tests – Intelligence : to define intelligence “Intelligence is a general capacity of an individual consciously to adjust his thinking to new requirements...” (Stern,1949) . Wechsler on the other hand stated that “

70%

MATCHING BLOCK 46/64

SA

report file full.docx (D110690450)

intelligence is the global NSOU ? CC-ED-10 55 capacity of an individual to act purposefully, to think rationally, and to deal effectively with his environment” .

Apart from these two there are numerous other definitions of intelligence which presents intelligence in very different light. Therefore it is important to keep this diversity in mind while testing intelligence. Intelligence test must have variety in them which reflects the difference of opinion about how intelligence is seen as a psychological entity. Some variety of intelligence tests are discussed below-

99%

MATCHING BLOCK 47/64

SA

report file full.docx (D110690450)

Individual or Group Tests: An individual intelligence test is one which can be applied to one person at a time. A group intelligence test can be administered to several persons simultaneously. Individual tests require the test administrator to establish a rapport with the subject and be sensitive to her/his feelings, moods and expressions during the testing session. Group tests, however, do not allow an opportunity to be familiar with the subjects’ feelings. Individual tests allow people to answer orally or in a written form or manipulate objects as per the tester’s instructions. Group tests generally seek written answers usually in a multiple-choice format. Verbal, Non-Verbal, or Performance Tests An intelligence test may be fully verbal, fully non-verbal or fully performance based, or it may consist of a mixture of items from each category. Verbal tests require subjects to give verbal responses either orally or in a written form. Therefore, verbal tests can be administered only to literate people. The non-verbal tests use

no verbal items and meant for person without any reading writing skill. The following table shows variety of intelligence tests. Tests Individual Group Verbal 1. Stanford-Binet Test of 1. Jalota’s Scale of Intelligence Intelligence. 2. Wechsler Intelligence 2. Desai’s Verbal Group Test Scale for Children of Intelligence (Verbal Scale). Non-Verbal 1. Wechsler Intelligence 1. Raven’s Progressive Matrices Scale for Children test (performance scale) 2. Pintner Paterson’s Scale 2. Cattle’s Culture Free Test IQ Test: In the early 1900s, the French psychologist Alfred Binet (1857-1914) and his colleague Henri Simon (1872-1961) began working in Paris to develop a measure that would

56 NSOU ? CC-ED-10 differentiate students who were expected to be better learners from students who were expected to be slower learners. The goal was to help teachers better educate these two groups of students. Binet and Simon developed what most psychologists today regard as the first intelligence test which consisted of a wide variety of questions that included the ability to name objects, define words, draw pictures, complete sentences, compare items, and construct sentences. Binet and Simon (Binet, Simon, & Town, 1915; Siegler, 1992) believed that the questions they asked their students, even though they were on the surface dissimilar, all assessed the basic abilities to understand, reason, and make judgments. And it turned out that the correlations among these different types of measures were in fact all positive; students who got one item correct were more likely to also get other items correct, even though the questions themselves were very different. Once the standardization has been accomplished, we have a picture of the average abilities of people at different ages and can calculate

83%

MATCHING BLOCK 48/64

SA

Arti kaushik (j_vision).docx (D110736592)

a person's mental age , which is the age at which a

person is performing intellectually . If we compare the mental age of a person to the person's chronological age, the result is the IQ, a measure of intelligence that is adjusted for age . A simple way to calculate IQ is by using the following formula: $\text{IQ} = \text{mental age} \div \text{chronological age} \times 100$. Thus a 10-year-old child who does as well as the average 10-year-old child has an IQ of 100 ($10 \div 10 \times 100$), whereas an eight-year-old child who does as well as the average 10-year-old child would have an IQ of 125 ($10 \div 8 \times 100$). Most modern intelligence tests are based the relative position of a person's score among people of the same age, rather than on the basis of this formula, but the idea of an intelligence ratio or quotient provides a good description of the score's meaning. A number of scales are based on the IQ. The Wechsler Adult Intelligence Scale (WAIS) is the most widely used intelligence test for adults (Watkins, Campbell, Nieberding, & Hallmark, 1995). On the basis of these results, the psychologist Charles Spearman (1863-1945) hypothesized that there must be a single underlying construct that all of these items measure. He called the construct that the different abilities and skills measured on intelligence tests have in common the general intelligence factor (g). Virtually all psychologists now believe that there is a generalized intelligence factor, g, that relates to abstract thinking and that includes the abilities to acquire knowledge, to reason abstractly, to adapt to novel situations, and to benefit from instruction and experience NSOU ? CC-ED-10 57 (Gottfredson, 1997; Sternberg, 2003). People with higher general intelligence learn faster. From then on variety of intelligence test were made. B. Psychological tests – Aptitude : People often remark that a particular child has a talent or gift for music, art or painting. This is what is implied by aptitude. Aptitude is a special potential in a certain field of performance. It indicates a special ability, acquired or innate, to learn or develop knowledge of a skill in some specific area. The aptitude of an individual is the result of both inherent and the environmental factors. An aptitude is more than mere potential ability. It involves the following: 1. Readiness to acquire some skill or knowledge. 2. Ability to acquire those skills/knowledge. 3. Ability to derive satisfaction from those activities. So aptitude refers to a combination of characteristics that indicate an individual's capacity to acquire some specific knowledge or skill after learning. Knowledge of aptitude can help us to predict an individual's future performance. With proper training these abilities can be enhanced. Aptitude can be assessed. Aptitude tests are available in two forms – specialized aptitude tests and general aptitude tests. Example of specialized aptitude tests are Mechanical Aptitude Test and Musical Aptitude Test. Multiple aptitude tests exist in the form of Test Batteries, which measure aptitude in several separate but homogeneous areas. Differential Aptitude Tests (DAT) and General Aptitude Tests Batteries (GATB) are well known Test Batteries. Aptitude tests may potentially be used by Counsellors and others because- ? They may identify potential abilities of which the individual is not aware; ? They may encourage the development of special or potential abilities of a given individual. ? They may provide information to assist on individual in making educational and career decisions or other choices between competing alternatives ? They may serve as an aid in predicting the level of academic or vocational success on individual might anticipate ? They may be useful in grouping individuals with similar aptitudes for development and other educational purposes. C. Psychological tests – Interest : Interest may be defined as a tendency to choose one activity in preference to another, or to seek out an activity or object. It implies preferences or likes and dislikes for specific activity or a group of specific activities such as lawyer, physician, engineer, musician, artist etc. Interest is generally manifested

58 NSOU ? CC-ED-10 in the way one likes to spend one's leisure time. Interest is a preference for a particular activity. Interest provides emotional pleasure. Hobbies are based on interests. In a broad sense interests can be classified in two categories: extrinsic interests and intrinsic interests. Interest tests are done to achieve the following goals – ? To provide teachers and Counsellors some standardized information regarding the students preference and dislikes ?

To aid in the selection of the right person for the right

job. This not only helps the employer but also beneficial for the person in a long run. ? To enable the teacher and parent to assist the pupil to prepare her or his educational and vocational aim Interest inventories are formal techniques for measuring interests. They are considered more reliable at discovering on individuals interest than interviews as the inventories address a large number of questions representing a broad range of carriers. There are many inventories now in use and majority of them deal with occupational interest. Three notable formal methods universally employed are: 1. Strong Vocational Interest Blank 2. Kuder Preference Record 3. Thustone's Vocational Interest Schedule. A brief description of each is given below- 1. Strong Vocational Interest Blank: Prof. Strong of Stanford University California designed and standardised this check list. The check list contains 400 separate items. It is presented to the individual and she/ he is simply asked to indicate whether she/ he likes, dislikes or is indifferent, on a three point scale. The test reveals the interest maturity of the individual, his masculinity and her femininity, and her/his occupational level. The 400 items include 100 occupations, 49 recreations, 36 school subjects, 48 activities and 47 peculiar interests. As such it is useful for both educational and vocational guidance. 2. Kuder Preference Record: This has been prepared by G. Frederic Kuder. This test covers a wider field, comprising of nine separate scales of occupations, viz. mechanical, computational, scientific, persuasive, artistic, literary, musical, social and clerical. Kuder presupposes three major interests viz. mechanical, literary and artistic. So when the same task is presented to the subject, with three related activities, the subject will select the activity that relates one of the three interests

NSOU ? CC-ED-10 59 that he possesses. For instance, three choices are given about one item viz. building a bird house, writing articles about birds and drawing sketches about birds. If the subject opts for the first, his interest is mechanical. 3. Thurston's Vocational Interest Schedule: This test has been devised by Thurstone. He administered a comprehensive test to 3400 college students who expressed their Likeness (L), Indifference (I) and Dislike (D) to each of the items in the test. He analysed the test scores and through the techniques of factor analysis, arrived at 8 factors of interest viz.: (i)

Commercial Interest, (ii) Legal, (iii) Athletic, (iv) Academic, (v) Descriptive, (vi) Biological, (vii) Physical Science, (viii) Art. 4.5 Techniques of Data Collection A. OBSERVATION: it is defined as the selection, provocation, recording and encoding that set of behaviour and setting concerning an organism "in situ" which is consistent with empirical aims. It is the way of "seeing" and gathering the data. It can be covert or overt. Let us study a little more. Characteristics – ? A basic tool of information gathering ? To apprehend things and events with their attributes ? Concrete relationship ? An act of recognizing and noting some facts or occurrence ? Awareness of the observers own mental status ? Data are generally related to real life features ? Observation includes what to observe, how to record, how to ensure matter to be observed and the relation between observer and observed ? The main idea is not to involve directly through questioning in any form Types - ? Participant observation : ? Observer hides the real purpose ? Observer is a member of the group or community ? True feelings of all the activities through participation ? Record natural bahviour

60 NSOU ? CC-ED-10 ? Non- Participant observation : ? Physical isolation ? Psychological isolation ? Natural state ? Completely scientific and objective method of data collection ? Best in quasi-participant detail ? Controlled Observation ? Standardized technique ? Any biasness is removed and made objective as far possible ? Mostly used in experimental research design ? Helps in verification of data ? Uncontrolled observation ? Natural condition ? Suitable for exploratory researches ? Chance of biasness ? Advantages: ? Observation allows the researcher to study people in their natural setting/s without their behaviour being influenced by the presence of a researcher. ? Observation data usually consists of detailed information about particular groups or situations. ? Some groups of peoples, such a school truants, may not agree to cooperate with methods of research such as interviews. Sometimes Observation is the only way of finding out about such groups. ? A lot of what people do, they "take for granted"; they do it 'naturally', they aren't aware of it. ? An interview, for instance, only show a person's views at one time. Observation involves the study of groups or situations over time, thus, revealing changes. ? Some methods only allows for the study of one individual at a time. Observation enables the research to study groups of people together, that is, it allows for the study of interaction between the members of a group.

NSOU ? CC-ED-10 61 Disadvantages : ? Chances of biasness is high ? Can be expensive and time consuming ? Sometime fail to answer "why" of the situation B. INTERVIEW: According to Good and Hatt "Interview is a process of social interaction between interviewer and interviewee. Psychologists use this in order to gain information in an efficient and narrowed down purpose. This is the age old method with wide use. Characteristics: ? The authority should feel the need of interview and counseling. ? The counsellor should have all relevant data about the client before she/he starts counseling. ? A rapport should be established between the counsellor and the counselee. ? Discussion should be restricted to issue at hand. ? When the counselee expresses herself/himself he should be accepted. The counsellor will gain nothing by antagonizing or embarrassing the counselee. ? The counselee should be allowed to take the lead in making decisions. ? The interview should end with a constructive note Types: there can be various forms of interview according to the requirement. Some of those are as follows – Structured interview: Interviewer asks predetermined questions. Questions are planned and all candidates get same questions in same order. It uses highly systematized technique for recording. Generally close ended questions are asked for specific piece of information Open ended interview: here also Interviewer asks predetermined questions. Questions are planned and all candidates get same questions in same order but questions are open ended. This reduces the possibility of biases that come from having different types of interviews with different people. Data obtained from such interviews are systematic and thorough for each client but it reduces flexibility and spontaneity because the questions are predetermined thus leaving little scope for issues that may emerge during the course of the interview. The advantage of these type of interview is that it is the most structured and efficient of the qualitative interviewing techniques. Focus group Interview : In the interview the Counsellor becomes a facilitator among the interviewees in a group setting where they hear and react to one another's responses. 62 NSOU ? CC-ED-10 Focus groups can be used by Counsellors to assess the needs of a student group, obtain general background information about a topic or diagnose the potential problems of a group of students. In this type of interview the counsellor's role is of a moderator, directing the interaction and inquiry in a manner that the purpose of interview is served. Advantages : ? Useful to obtain detailed in-depth information ? Respondent can record their own word. So no question of data manipulation ? Done in a amicable condition ? Interviewees are not expected to be influenced ? Usually achieve high response Disadvantages : ? Time consuming ? Can be costly ? Transcription of interview may suffer biasness ? Interpretation is difficult ? Has language barrier ? Preplanning is mandatory C. RATING SCALE:

86% MATCHING BLOCK 49/64

W

A rating scale is an instrument on which the magnitude or degree of some criteria of performance is estimated. Such forms may use a numerical continuum or a descriptive continuum .

93% MATCHING BLOCK 52/64

W

ratings are usually based on scale definitions, scoring rubrics, and benchmarks, not in relation to the performance of other individual being assessed.

Likert scale is the most popular form of rating scale in which subject are given continuum form of qualitative responses to choose from

100% MATCHING BLOCK 50/64

W

e.g. strongly agree to strongly disagree , frequently to never

etc. Advantages – ? Helps to measure specified outcome ? Supplements other sources ? Good for reporting to parents about children's progress ? Self rating is encouraged with the method ? Students need is clearly understood through Disadvantages – ? Some characters are difficult to rate

NSOU ? CC-ED-10 63 ? Error for subjectivity is high ? Generosity error is high D. RECORD CARD : Here Record Card is understood as Cumulative Record Card (CRC) which is different from anecdotal record card. A CRC is a record of students entire activity through the sessions. It is most extensive longitudinal and vertical record of any pupil's educational life. This contains various aspects of students life. As stated by the Secondary Education Commission - "But neither the external examination nor the internal examination, singly or together can give a correct and complete picture of a pupil's all round progress at any particular stage of his education. Yet it is important for us to assess this, in order to determine his/her future course or study of future vocation." For this purpose a proper system of school records from day to day, month to month, and term to term and year to year in the school should be followed. Characteristics of CRC : i) CRC is maintained by the educational institution ii) Contains detailed information about the student iii) Record contains social, mental, physical, emotional, moral aspects of the child iv) Each student have their own CRC indicating her/his progress Records to be kept in CRC : a. General data like name, DoB, Address etc. b. Attendance record c. Earlier institutional record if any d. Family background e. Physico-Medical Report f. Scholastic Achievement g. Notable Interest Rating h. Scholastic activity i. Co-curricular activity j. Any other performances or mentions in activity k. Pupils preferences (Attitude and Aptitude) l. Remark by class teacher m. Remarks by Headmaster Advantages of CRC : a. This serves as teachers manual to know her/his students

64 NSOU ? CC-ED-10 b. Help understand students future vocational possibilities c. Helps student understand her/his own personality d. Clearly shows the changes a student goes through with time e. Give a reliable information on student's progress f. Students find her/his area of strength and weakness and can work on it g. Helps teacher understand the individual difference among her/his students E. ANECDOTAL RECORD : It

95%

MATCHING BLOCK 51/64

W

is a short narrative report or summary of any event or activity that may be used to document or support generalizations about the performance of an individual or a group or

for any situation. A short report after a project submitted by the project coordinator can be considered as anecdotal record. In educational institute after any cultural event the coordinator might submit such report so that qualitative generalized comment can be made with evidenced based data. In guidance and counselling these helps to understand certain situation and how an individual reacted in that. Anecdotal record in educational process generally give the following information – ? Social interaction ? Literacy exchanges ? Change in behaviour ? Breakthroughs in development ? Learning style ? Pattern of understanding ? Qualities such as leadership A sample of Anecdotal record card is given below - Anecdotal record card Sl. No. Date : Class: Lesson : Observation made by teacher : Comment on observation: Recommendation : Signature of Teacher

NSOU ? CC-ED-10 65 F. SOCIOMETRY: This is the science to study the inter-relationship of members of a group, their attitude, values acceptance to each other and role of every individual in the group.

100%

MATCHING BLOCK 53/64

SA

II B.Ed. Guidance and Counselling (Eng).pdf (D125473247)

The purpose of this technique is to study the nature of social relationship of individual within a group. It offers an opportunity to identify personality problems, especially in isolates and the rejected. Isolates are students who remain alone with no relationships in the class. Rejected students are disliked by other students. The technique is a useful source of information for appraisal of social behaviour of students.

Types: according to the technique, sociometry is classified in three types The nomination: here teacher ask students to select their peers according to the criteria set by teachers. Like three best friends they have in class. The social acceptance: in this case students are asked to select their choice according to a given level of social relationship. Level is preset here. The 'who's who' or guess who : here teachers state certain "types" of students and students are asked to name their peers who fit in that. Like peer who would start a fight first. Advantage of sociometry : ? Easy to administer ? Gives a clear idea on relationship status among group members ? Shows who is popular and who is not ? Identifies isolates and rejected members among group which helps in educational counselling and guidance ? Identifies subgroups among groups ? Various kind of data can be gathered through some simple sociometry ? Cost effective and do not require much training for administering 4.6 Summary ? Assessing students' social, educational, personal and vocational needs and planning to guide according to that so that educational aim, vision and mission of the institution is achieved is the chief objective of planning phase of any guidance programme. Asking the students, their parents and prospective employers about what they think their needs are and if these needs are being adequately met helps in planning of 66 NSOU ? CC-ED-10 guidance programme. Issues may include drug education, bullying prevention, personal safety, crisis response, and mental health and wellness. · Psychological tests are designed to measure criterion related to psychological domain be it intelligence, attitude or interest. As these names already suggest psychological tests are of wide spectrum as far as method and nature of data goes. As Anastasi (2003) defined it these are samples of an individual's behaviour, obtained under standard conditions and scored according to a fixed set of rules that provide a numeric score. ? There are various techniques of data collection such as observation, interview, record card etc. 4.7 Self-Assessment Questions 1. What are the rationale of guidance programme in educational institute? 2. Who are the target group of any guidance programme in educational institute? 3. What are the resources of guidance activity in an educational institute? 4. Give some examples of issues included in guidance programme? 5. What is the role of parents in an institute's guidance programme? 6. What are various tools of evaluation? 7. Differentiate between rating scale and anecdotal record 8. Mention two uses of interview. 9. How subjectivity is controlled in observation? 10. What is record card? 4.8 Reference 1. Aptitude, Interest and Job Requirements. NIOS. Guidance & Counselling Structure 5.1 Objective 5.2 Introduction 5.3 Counselling Process 5.4 Organizing Guidance and Counselling Programmes 5.5 Difference Between Guidance and Counselling 5.6 Summary 5.7 Self-Assessment Questions 5.8 Reference 5.1 Objectives After completion of the unit students will be able to ? Define counselling process ? State its importance in education ? Reflect their role as an educator – counsellor ? Organize guidance and counselling programme 5.2 Introduction Counselling may be concerned with addressing and resolving specific problems, making decisions, coping with crisis, improving relationships and developing personal awareness. It also involves working with feelings, thoughts, perceptions and conflicts. The overall aim is to provide counsellees with opportunities to work in positive ways so as to live with essence of well-being as individuals and as members of the larger society. The role of counselor and client or counselee is very important in the counseling process. It

55%

MATCHING BLOCK 55/64

SA

470E2310-MSW-Counselling and Guidance - Final ... (D165249716)

is a planned, structured dialogue between a counsellor and a client. It is a co-operative process where a professionally trained skilled counselor helps a client to identify

the causes of the problem and to find out the ways to solve it. Relationship building, problem assessment, goal setting, counselling intervention, evaluation and termination are several

68 NSOU ? CC-ED-10 steps of a counselling process. In the first step, establishment of an effective counselor- client relationship with empathy, genuineness and unconditional caring is very important for initial disclosure. For in depth exploration and problem assessment the counselor collects client's life style, family history, personal history etc. in the second stage. In the third step, counselor sets clear goal with appropriate interventions. 5.3 Counselling Process

97%

MATCHING BLOCK 56/64

SA

report file full.docx (D110690450)

Counselling is face to face relationship in which growth takes place in the counsellor as well as the counselee.

As briefly discussed above, counselling can be categorized into three types of approaches namely - A. DIRECTIVE B. NON-DIRECTIVE C. ECLECTIC A. Directive Counselling: In this counselling process counsellor directs the steps to be taken by the counselee to resolve her/his conflict. This is done on the assumption that counselee will not be able to take steps in order to resolve their conflict/problem. That is why this is also known as Counsellor centered counselling. In this counselling counsellor plays the most important role. Counsellor Direct the client's thinking by Informing, Explaining, Interpreting and Advising. It gives more Importance to intellectual aspect then Emotional Aspect. Characteristics- There are some characteristics of directive counseling process which are as follows– a) The Counsellor has competency to provide advice or suggestion to solve a problem. b) Directive counseling focus on intellectual aspects of a person instead of emotional aspects. Thus, this process is considered as intellectual process. c) Client is incapable to solve the problems. d) All the efforts concentrate on the problem of the counselee or client. e) Counsellor plays the most active role than the client. Steps of Directive counselling – 1. Analysis – In this step Counsellor ask a series of question to the client, conduct case studies, and check past records and documents. The Counsellor collects detail information about the client through interview, test, observation etc.

NSOU ? CC-ED-10 69 2. Synthesis – All the collected data gathered and organized in a manner, that it could help the Counsellor to determine the personality, background, and environment of the counselee. 3. Diagnosis – This process involves in identifying the main problem, its nature and causes. 4. Prognosis – After diagnosis, the Counsellor predict about problem based on his/ her observation. He/she can forecast whether the problem is going to be worse or will improve over time. 5. Counselling – In this fifth step the Counsellor direct the probable way out or suggest the solution of the problem. This process helps the client to adjust and readjust with the situation and cope up with the problem. 6. Follow up – In directive counseling follow-up is the most important step. It involves the observation and consultation about the problems, issues, challenges and improvement over the time. It helps the counselee to adjust with his/her environment by solving the problem. Figure: Steps of Directive counselling

70 NSOU ? CC-ED-10 Merits – a) In this process the Counsellor focuses on problems than the person. That's why the problem is being identified quickly. b) This process saves time. The Counsellor drives the whole process with his/her planning. c) As the Counsellor directly help the counselee, it is easier to cope up with the situation by the counselee. d) As it focuses on intellectual aspects, it helps to solve the materialistic problems easily. Demerits – a) Counselee has no active role. He/she depends on the Counsellor. b) As in many cases, counselee is not able to find out the way to solve his/her own problem, he/she fails to adjust or cope up with the same situation in future. c) In some cases, counselee becomes hopeless when he/she would not able to reach to the Counsellor and get instant advice. d) The counselee cannot take his/her own decision. e) This process is not suitable for emotional problems. B. Non-Directive Counselling: This is a client centered counselling. Carl Roger is the chief exponent of this approach where client is the centre of the process where the main role of the counsellor is to create an atmosphere for the client to work out on the problem. This is also known as permissive counselling. Characteristics- There are some charectiristics of non-directive counseling process which are as follows– a) The non-directive counseling process is a counselee centered process. b) The counselee plays an important and active role throughout the process. c) This technique integrates the counselee with the problem. It focuses on person rather than problem. d) The counselee is free to express his/her thoughts and statements. e) The counselee is capable to solve his/her problem. Steps of Non-Directive Counselling – 1. Defining the Problematic situation – Counsellor establishes rapport with the counselee. He/she defines and create the situation or environment in a way that the counselee can think about the probable solutions of his/her problems.

NSOU ? CC-ED-10 71 2. Free Expression of Feelings – The Counsellor create a reliable, acceptable and friendly environment where the counselee can express his/her thoughts or feelings freely. 3. Development of Insight – Insights are developed in the mind of counselee gradually and he/she become able to choose the right solution of the problem. 4. Classification of Positive and Negative Feelings – The Counsellor accept, recognize and helps to classify the positive and negative feelings of the counselee. 5. Session Termination – When the counselee initiate his/her positive steps towards the solution of his/her problem gradually and start to feel a decreasing need of help of the counsellor, counsellor can terminate the session. Figure: Steps of Non-directive counselling Merits – a) This technique helps to the counselee to be capable to solve the problem. b) No such test or tools are required in this process. c) This process provides more independence to the counselee. d) This process helps a counselee to remove emotional and mental blocks. e) It reduces client's tension and stress.

72 NSOU ? CC-ED-10 Demerits – a) It is a slow and time consuming process. b) It depends on the ability and initiatives of the counselee. c) The Counsellor require vast psychological knowledge. d) As steps taken by the counselee is not fully reliable, sometime solution of the problem may be inaccurate. e) It is not suitable for those who are not mature. C. Eclectic Counselling: Thorne is the chief advocate of the eclectic counselling technique. As the word eclectic suggests this is neither directive nor non-directive approach. This counselling type tries to find a middle path two between the two to use best of both world. Counsellor and client both have to perform their roles, as per the need of the situation. Therefore it is highly flexible in its approach.

100%

MATCHING BLOCK 58/64

SA

II B.Ed. Guidance and Counselling (Eng).pdf (D125473247)

Experience of mutual confidence and faith in the relationship are basic

of this type of counselling. This approach is consistent with modern ways of life where one single value or truth doesn't hold permanency but it tries to harmonies with the things as they approach and work accordingly. Eclectic approach gives importance to non-directive counselling where individual is motivated to take control of counselling by influencing as much possible but also it pays attention to directive approach where she/he sees it necessary to take control and recognizes that student is not ready to assume responsibility. Characteristics – a) Eclectic counselling is the combination of directive and non-directive counselling. b) This technique is very flexible. Directive and non-directive processes can be switch over any time as per the demand of the situation. c) The professional efficiency and skill of the Counsellor is very important for this process. d) In this process objective and coordinating methods are used. e) In this counselling process the principle of low expenditure is focused. f) Counsellor is neither too active nor too passive as in directive and no-directive counselling respectively. Steps – 1. Diagnosis of the problem – In the first stage Counsellor tries to diagnose the main problem in a trustful friendly environment or helps the counselee to identify the problem.

NSOU ? CC-ED-10 73 2. Analysis of the problem – After identification, the Counsellor analyses the problem and tries to find out the root causes of the problem or helps to the counselee to find out. 3. Preparation of plan – In this step, a tentative plan for modifying the factors which are responsible behind the problem is being prepared. 4. Securing effective conditions – The Counsellor create an effective atmosphere for counseling. 5. Interview and stimulation – The Counsellor interview the counselee and stimulate him/her to develop his/her own resources to be capable to try new modes of adjustment. 6. Decision making – In this step proper technique to handle the situation or problem is being select which may contribute to adjust with the situation or cope-up with the problem. Figure: Steps of eclectic counselling

74 NSOU ? CC-ED-10 Merits – a) Flexibility in selecting method from directive and non-directive provide several options to solve the problem. b) There is no hard and fast rule. It removes the rigidity. c) It is economical and effective. d) Demerits – a) Execution of eclectic process is very difficult and complex. b) Both directive and non-directive counseling cannot be mixed together. c) It may be harmful if the Counsellor has little or no understanding about what is helping the counselee. d) Some people are of the view that eclectic counseling is vague, opportunistic and superficial. 5.4 Organizing Guidance and Counselling Programmes Guidance Programme: As psychologist Jones (1951) said "

93%

MATCHING BLOCK 57/64

W

the focus of guidance is the individual and not the problem, its purpose is to provide the growth of the individual in self- direction

providing opportunity for self-realization and self – direction is the key-note of guidance.” Therefore organizing guidance programme must always keep its focus on the student in educational process. Mere solving the specific problem is not the purpose of guidance. According to Lefever, Tussel and Weitzil, “

94%

MATCHING BLOCK 59/64

SA

411-Guidance & Counsellingl.docx (D130737966)

Guidance is an educational service designed to help students make more effective use of the school training programme.”

Guidance, hence, is an integral part of pupil activity. A broader opinion about guidance as a set of services is expressed by G. E. Smith who described Guidance as a process consisting of “a group of services to individuals to assist them in securing the knowledge and skills needed in making adequate choices, plans and interpretations essential to satisfactory adjustment in a variety of area.” These areas may be enumerated as educational, vocational, personal of some other ones which produce problems before the individual. Hence, Guidance is a service that is universal and continuous. In modern education mentoring services has gained a lot of importance which is a scaled down process of guidance. Mentoring throughout the academic life helps student realize her/his own worth in long run and helps in personal and professional growth.

NSOU ? CC-ED-10 75 Guidance programme can be of various types. Some of those are explained below – In School following principles should be followed for guidance ? Defining the Objectives Clearly ? Defining the Tasks ? Allocation of Duties ? Defining the Powers ? Defining the Relations ? Nature of Guidance Organization ? Simplicity Here the main responsibility of organizing lies with the head of the institution. She/He has to address the problems and make the process continuous and smooth running. It is important to to share the workload under her/his guidance. Capacity building is another important part of organizing guidance programme as these are skill based processes. School assigned psychologist plays an equally important part in guidance programme in school. In college level guidance programme is as important as regular classes. The new system of education has increased the importance of guidance services at various levels. At higher level technical and vocational education have been encouraged which requires vocational guidance services at college and university level. The placement services are urgently needed at higher level of education. Guidance programme in colleges should include ? Collection of data such as home and family background etc. ? Orientation programme for students on institutional orientation, course orientation, facility orientation, educational talk, film shows etc. ? Orientation programme for the parents / guardians of the students ? Maintaining cumulative record card ? Identifying low and high achievers ? Personality counselling etc. ? Supplementary orientation programme for higher level students ? Remedial programme for the already identified low achievers and enrichment for higher achievers ? Outdoor activity for final year students experiencing and preparing for future life

76 NSOU ? CC-ED-10 ? Getting help from experts if needed ? Arranging career conferences for final year students ? Helping students in learning the skills which will help them in effective study, use of library resources, etc. 5.5 Difference Between Guidance and Counselling As is discussed above by now you have a clear idea that guidance and counselling are two different processes with a clear division of applicability. Let us make it clear by setting out the boundaries where these two differs from each other in the below mentioned qualities – Sl. No. Criteria Guidance Counselling 1 Meaning Advice or information Professional advice given provided by superior to by counselling expert to an overcome a challenge or individual for personal difficulty psychological problem 2 Nature Preventive / advisory Remedial/ative 3 Approach Comprehensive and extrovert In-depth and introvert 4 Use Helps to choose the best Helps in self-actualisation/ alternative change in perspective 5 Area Education and vocation Personal and socio- psychological 6 Done by Superior/ subject expert/ Skilled person or professional trained in guidance in counselling 7 Mode of Individual or group Individual execution 8 Decision Guide Client making authority 9 Privacy Not- confidential Confidential 10 Relationship Authoritative Rapport based/ personal

100%	MATCHING BLOCK 61/64	SA 470E2310-MSW-Counselling and Guidance - Final ... (D165249716)
The counselling process is a planned, structured dialogue between a counsellor and a client.		

There are several steps of a counselling process i.e. relationship building, problem assessment, goal setting, counselling intervention, evaluation and termination. Three types counselling processes are there – directive, non-directive and eclectic. Directive Counseling was a concept founded by E.G. Williamson. It is a counsellor- centered process where counsellor directs the steps to be taken by the counselee. The steps of directive counselling are analysis, synthesis, diagnosis, prognosis, counselling and follow-up. The concept non-directive counselling was introduced by Carl Rogers. It is client centered approach where the counsellor creates an atmosphere for the client to work out on the problem and become capable to solve his/her own problem. The steps of non-directive counselling are - defining the problematic situation, free expression of feelings, development of insight, classification of positive and negative feelings, session termination. Thorne is the chief advocate of the eclectic counselling technique. Eclectic counselling is the combination of directive and non-directive counselling. This technique is very flexible. Directive and non-directive processes can be switch over any time as per the demand of the situation. Guidance programme can be organised in schools and colleges. In School following principles should be followed for guidance – Defining the Objectives Clearly – Defining the Tasks – Allocation of Duties – Defining the Powers – Defining the Relations – Nature of Guidance Organization – Simplicity There is a clear division between guidance and counselling. Guidance is preventive in nature, where counselling is remedial and curative. Guidance helps to choose best decision, where counselling helps to get solution by him/her. Guidance is less confidential than counselling. Guidance can be provided in group or individual, but counselling can be done one to one generally.

78 NSOU ? CC-ED-10 5.7 Self-Assessment Questions 1. What are the various approaches of counselling process? 2. What is the main goal of directive approach? 3. How non-directive approach is different from directive approach as a process? 4. What do you mean by eclectic process of counselling? 5. How guidance and counselling is different in their approaches? 6. How guidance is different from counselling for teacher's role in them ? 7. How guidance is different from counselling in the matter of time of application ? 8. How educational guidance is different from educational counselling? 9. Is there any similarity between guidance and counselling? 10. Plan a counselling session in your institute and submit the design for approval. 5.8 References 1. Binet, A., Simon, T., & Town, C. H. Unit 6 ? Mental Health & Education Structure 6.1 Objective 6.2 Introduction 6.3 Teacher as a Counsellor 6.4 Steps of Counselling Process 6.5 Professionalism in Guidance and Counselling 6.6 Summary 6.7 Self-Assessment Question 6.8 Reference 6.1 Objectives After completion of the unit students will be able to ? Understand teacher's role as an counsellor ? Select the steps to be followed in counselling ? State how to develop professionally in guidance and counselling 6.2 Intorduction How a teacher function as a counsellor? Having qualities alone is not sufficient to become a professional counsellor. One must undergo special training to acquire the necessary skills. Professional counsellors usually hold a masters' degree in Human Development or Child Development/ Psychology of Education, along with at least a post graduate diploma/degree in Counselling. During the course, the trainees receive supervised practical training under trained Psychologists or Counsellors as practical training is essential for developing the skills of a counsellor. Details of professional aspects of counselling is discussed below. 6.3 Teacher as a Counsellor Counselling is a process where individual learn out themselves their interpersonal relationship and overall behaviour which helps their allover personal development. That is why counselling 80 NSOU ? CC-ED-10 is a trained job which requires specific skills and competencies to help students relate effectively. Then why teachers? Is it wise to consider teacher as counsellor? One person who constantly observe students behaviour is their teacher. Therefore it is expected that a teacher would identify any behaviour change which requires attention. Also student and teacher are in a rapport based relationship. By counsellor we mean someone who guides on personal and psychological problems. But it also says counsellors are trained practitioner who work with people

(D165249716)

to help them bring about effective change or enhance their wellbeing.

Therefore, to be a counsellor a teacher needs to play the following roles – i. Helping the students in adjusting in their surroundings ii. Helping students in their studies iii. Giving awareness of the importance of education iv. Helping students in making rational decision v. Helping students with their learning problem vi. Refereeing the students to the counsellor vii. Cooperating with the counsellor viii. Cooperating with the parents Teacher may or may not have formal training in counselling as that is not a mandatory criteria of teaching job but counselling is a mandatory part of teaching. Therefore, as shown in the above list, teachers' role is to initiate the process of wellbeing of a student and refer as and when it feels necessary to address the related problem. In this connection it must be added that there are few symptoms which makes a teacher aware that a trained counsellor must be consulted for the student. Some of those symptoms are – – Suicidal thoughts and hopelessness – Homicidal thoughts – Extreme mood shifts, irrational behavior or lack of judgment – Self-harm – Cutting – Odd behavior and speech patterns – Poor personal hygiene – Extreme changes in sleeping, appetite and weight

NSOU ? CC-ED-10 81 – Decreased concentration, motivation and interest – Excessive substance use, internet use, or gambling – Family issues – Social isolation – Loss – Relationship issues – Consistent poor academic functioning The endeavour to facilitate the holistic growth of a child must enable the child to realize a mentally healthy personality. The basic foundation of one's personality takes shape during childhood years and the formative years are spent in the school by the school going population. Therefore it is imperative for the school to provide an environment conducive to the positive growth of a child's personality. An approach restricted to imparting reading, writing and recall is not wholesome and will invariably lead to failure in achieving the desired objective. More so, when in modern times the complexities of life are adding to information overload, plethora of choices, increasing competition in all spheres of life and the consequent stress and strain. In such an environment, it becomes necessary that every teacher be sufficiently equipped to take care of the psychological needs of children. 6.4 Steps of Counselling Process In any kind of approaches of counselling process the following steps are followed in general– 1. Rapport and relationship building between counsellor and counselee - a. Introducing self b. Listen with attention and identifying the client c. Ensure physical comfort d. Client should be able to speak without interruption and judgment e. Non-verbal communication is observed 2. Assessment / Defining the problem – techniques used for assessment a. Recording b. Intuitive guess with supporting circumstantial evidence c. Fact association for generalization

82 NSOU ? CC-ED-10 d. Observation e. Enquiry 3. Identify and Goal setting for counselee – a. Immediate goal b. Ultimate goal 4. Initial intervention – Process of adaptation to achieve immediate goals which might need re-planning and new intervention 5. Planning and introducing termination – Termination of counselling must be in phases with sensitivity and preplanned. 6. Follow up – a must for future wellbeing Process has the following characteristics – ? Various tools are used at different stages of the counselling process. It usually means tools can be employed as the counsellor understands the problem and process is unfold ? Counselling process has different models but tools remains same among these processes ? Administration of tools are different subject to subject ? It is a planned

II B.Ed. Guidance and Counselling (Eng).pdf (D125473247)

cooperative process in which a trained professional helps a person to identify sources of difficulties

and concern ? Acquiring new skill set to confront the difficulties is the ultimate goal of counselling 6.5 Professionalism in Guidance and Counselling Like any other profession guidance and counselling demands professionalism from the practitioners. There can be an argument that some may naturally possess many of the qualities required for the job, but that is not enough here as mental state of another person is shared with full confidentiality therefore clients are in extreme vulnerable situation than any other regular professional requirements. Some areas of professional behaviour includes- Confidentiality: Confidentiality is an important ethical principle in counseling: You can't help a client effectively unless she knows you won't betray her secrets. When you hear things you don't think you

NSOU ? CC-ED-10 83 should keep secret – your client intends to commit suicide, for instance – the ethical code guides you in how to respond. Relationships: Keeping your client-Counsellor relationship professional isn't always easy. You may find you both move in the same social circle, or you might discover a mutual attraction. Because your patient is in a vulnerable position, that raises the possibility of exploiting your power, for example, taking advantage of a patient.

Autonomy: Autonomy is a basic moral principle in counseling. People are entitled to make their own decisions and act on them, and Counsellors shouldn't try to take that away. In specific cases, you may have to balance respect for individual choice with other factors, as when your client isn't capable of rational decisions, or her decisions could cause serious problems for herself or others. Your professional code can help you decide when to stand back, when to intervene and when to explain the consequences of your client's actions but let her make the final decision.

Professionalism: Having an ethical code also guides you as a career professional interacting with clients. Before any individual agrees to become your client, she should be able to learn exactly what services, techniques and counseling procedures you employ and what sort of payment arrangements you expect. She should also understand the limits of your confidentiality policy. Following a code of ethics means acting honestly as a business person, as well as a Counsellor. The role of counsellor is very important in educational institutions, especially for the students of adolescent period. The consultation skills of the counsellor in which the success of the counselling process depend are as follows- a) Ability to build rapport – Rapport is an essential condition for a comfortable and unconditional relationship between the counsellor and the counselee in a friendly environment. b) Communication skill – It is the ability of exchanging ideas and opinions through speech, writing or signs. By this skill a bond of relationship can be establish between counsellor and the counselee to solve the problem. c) Observational power – Observing body language, realizing mental state of the counselee are one of the major skills of the counsellor. d) Empathy – Empathy means 'feeling into'. It is the ability to feel and describe the thoughts and feelings of others.

84 NSOU ? CC-ED-10 e) Probing skill through questioning – This skill helps the counselee for self-talk. Proper questioning helps to explore the personal and secrete information. f) Organizing facts – This is the ability to arrange all facts systematically. This is an important skill of a counsellor. g) Sensitivity – This is another important skill of a counsellor which help to realize the pain of the counselee. h) Ethical sense – Reliability and maintaining secrecy of personal information is the main quality of a counselor. i) Listening skill –

During listening it is important that the counselor is listening through the minimal prompts such as head nods, saying 'yes' etc.

Sitting squarely, openness, leaning, eye contact, relax etc. are important aspects of listening. Effective listening consists of hearing, attending, understanding, responding and remembering. j) Honesty and confidentiality – Personal honesty and professional confidentiality are two very essential skills. k) Crisis management – a counsellor of educational institution should have the ability of crisis management and the knowledge of shock absorbing power, optimal stress level etc. l) Monitoring and closure – This is the ability to monitor whole process and deliver appropriate closing questions and comments are very important skills. In India the guidance, counseling, psychotherapy, psychological treatments, social work interventions, rehabilitation counseling etc. are all monitored by Rehabilitation Council of India. They monitor all the training institutions and ensure that the Counsellors get the proper training. They also make sure that the Counsellors are updated by organising refresher courses for the practicing Counsellors so that all can use latest techniques at any given time. 6.6 Summary ? To be a counsellor a teacher needs to play the following roles – i. Helping the students in adjusting in their surroundings ii. Helping students in their studies iii. Giving awareness of the importance of education iv. Helping students in making rational decision v. Helping students with their learning problem vi. Refereeing the students to the counsellor

NSOU ? CC-ED-10 85 vii. Cooperating with the counsellor viii. Cooperating with the parents ? Counselling has salient steps for its proper implication ? Guidance and counselling demands professionalism from the practitioners. There can be an argument that some may naturally possess many of the qualities required for the job, but that is not enough here as mental state of another person is shared with full confidentiality therefore clients are in extreme vulnerable situation than any other regular professional requirements. 6.7 Self-Assessment Questions 1. What is intervention? 2. Why counselling process needs to start with rapport building? 3. What is client – counsellor secrecy? 4. What are the tools of counselling process? 5. How to terminate a counselling process? 6. What is the role of teacher as a counsellor? 7. What is the process of defining the problem in counselling? 8. What is autonomy in counselling? 9. Why goal setting is very important for counselee? 10. What do you think is the main challenge for a teacher to implement f students' wellbeing through counselling? 6.8 Reference 1. https://archive.mu.ac.in/myweb_test/ma%20edu/M.A.%20Edu.%20Guid.%20&%20Coun..pdf 2. <p>Individual or Group Tests: An individual intelligence test is one which can be applied to one person at a time. A group intelligence test can be administered to several persons simultaneously. Individual tests require the test administrator to establish a rapport with the subject and be sensitive to her/his feelings, moods and expressions during the testing session. Group tests, however, do not allow an opportunity to be familiar with the subjects' feelings. Individual tests allow people to answer orally or in a written form or manipulate objects as per the tester's instructions. Group tests generally seek written answers usually in a multiple-choice format. Verbal, Non-Verbal, or Performance Tests An intelligence test may be fully verbal, fully non-verbal or fully performance based, or it may consist of a mixture of items from each category. Verbal tests require subjects to give verbal responses either orally or in a written form. Therefore, verbal tests can be administered only to literate people. PREFACE In a bid to standardise higher education in the country, the University Grants Commission (UGC) has introduced Choice Based Credit System (CBCS) based on five types of courses: Core, Generic, Discipline specific elective, and Ability/Skill enhancement for graduate students of all programmes at Elective/Honours level. This brings in the semester pattern, which finds efficacy in tandem with credit system, credit transfer, comprehensive and continuous assessments and a graded pattern of evaluation. The objective is to offer learners ample flexibility to choose from a wide gamut of courses, as also to provide them lateral mobility between various educational institutions in the country where they can carry the acquired credits. I am happy to note that the University has been recently accredited by National Assessment and Accreditation Council of India (NAAC) with grade "A". UGC Open and Distance Learning (ODL) Regulations, 2017 have mandated compliance with CBCS for U.G. programmes for all the HEIs in this mode. Welcoming this paradigm shift in higher education, Netaji Subhas Open University (NSOU) has resolved to adopt CBCS from the academic session 2021-22 at the Under Graduate Degree Programme level. The present syllabus, framed in the spirit of syllabi recommended by UGC, lays due stress on all aspects envisaged in the curricular framework of the apex body on higher education. It will be imparted to learners over the six semesters of the Programme. Self-Learning Materials (SLMs) are the mainstay of Student Support Services (SSS) of an Open University. From a logistic point of view, NSOU has embarked upon CBCS presently with SLMs in English. Eventually, these will be translated into Bengali too, for the benefit of learners. As always,

we have requisitioned the services of the best academics in each domain for the preparation of new SLMs, and I am sure they will be of commendable academic support. We look forward to proactive feedback from all stake-holders who will participate in the teaching-learning of these study materials. It has been a very challenging task well executed, and I congratulate all concerned in the preparation of these SLMs. I wish the venture a grand success.

Unit-1 The Child Structure 1.1 Objectives 1.2 Introduction 1.3 Child Development: Concept, Nature and Significance 1.3.1 Concept of Child Development 1.3.2 Nature of Child Development 1.3.3 Significance of Child Development 1.4 Principles of Child Development 1.5 Socialization Process: Child and Social World 1.5.1 Concept of Socialization 1.5.2 The Process of Socialization of a Child 1.5.3 Importance of Socialization for a Child 1.5.4 Principle of Social Development: Erickson's Theory of Psycho-social Development 1.6 Summary 1.7 Self-Assessment Questions 1.8 References 1.1

Objectives After completing this unit you will be able to— Understand the concept

of

child development; Explain the

nature of child development; Describe the significance of child development; Apply the principles of child development; 9

10 GE-ED-31 NSOU Explain the concept of socialization of the child; Understand the process of socialization of a child; Describe the importance of socialization for a child; Understand Erickson's theory of Psycho-social development. 1.2 Introduction All the living things of this dynamic planet are continuously changing their forms both quantitatively and qualitatively. Living organisms are different from non-living things as they pass through a specific complex cycle of life. All living organisms including humans too are dynamic and ever-changing. The changes in human being are mainly due to biological and psychological factors and partly due to the personal choices and incidents that may happen in one's life due to chance. Changes in human life start right from the birth. Changes that are visible and quantitative are generally referred to as growth like increase in height, weight, shape and expansion of vocabulary etc. In contrast, the comprehensive changes in a human that are both quantitative and qualitative are referred to as development. The development includes both biological, emotional, and psychological changes that occur in a human from birth to the end of life, so it is a lifelong process though its rate may vary at different stages of life depending on various elements. Development is controlled and supported by many factors like genetic, environment, social interaction, learning etc. In this unit, we are going to understand the concept of child development as it passes through different stages of life. Then we will explore the nature of child development and its significance. Since it has been found that development follows a systematic and sequential pattern so there are some guiding principles behind the development of child which are also discussed in this unit. It is important to understand that we the human are social beings and thus a human child develops more appropriately in a supportive social setting. The interaction of child and society during the process of development is discussed at the end of this unit under the concept and process of socialization of child. We will also learn the importance of socialization and the principle of social development. 1.3 Child Development: Concept, Nature and Significance 1.3.1 Concept of Child Development The life of a human starts from the womb of the mother, after birth a human passes through five different stages of development: infancy, childhood, adolescence, adulthood,

11 NSOU GE-ED-31 and old age. All these stages are marked by certain approximate years of age but one should be very clear here that these age demarcations are hypothetical as there is no very clear separation between the two consecutive stages. During all these developmental stages human beings acquire different physical, behavioural, emotional, and personality characteristic the qualitative sum of which is known as development. If we focus on the childhood stage of the human then it has two sub-stages: pre- childhood, which ranges from 3 years to 6 years of age and later-childhood that ranges from 7 years to 12 years. The next stage of human development is adolescence, which ranges from 13 years to 19 year. Before childhood comes infancy that ranges from birth to 2 years of age. Childhood development involves all the physiological, emotional, moral, social, and psychological changes that occur in a human child from birth till the conclusion of adolescence so it roughly covers the range of age from birth to 18 years. Studying child development seeks to explore, understand, and explain how and why human changes from birth to the end of adolescence. A study of a child's development examines how the motor skills of child changes and how the child's other physiological changes are related to the social environment, emotional expressions, cognitive abilities, personality traits etc. Development in human is a lifelong process but not uniformly continuous, it is somewhat non-uniform that means at some stage of life the development may get accelerated and at some point, it may slow down then again may raise at later stages of life. Child development is characterized by a very high degree of changes in life as compared to any other stages which may be attributed to the rapid physical, cognitive, and affective changes associated with childhood and adolescence. 1.3.2 Nature of Child Development The nature of child development presupposes that development is a continuous process. This continuity is governed by principles and laws that are valid for all the stages of the ongoing growth process. All the developmental changes that happen in one stage of human development is related to the other prior stages as two consecutive stages are being overlapped with no strictly distinct boundaries. Child development is progressive that never goes in a backward direction but the developmental progress path is not linear, it is rather spiral in nature. At any particular stage of child development, there is likely to be a period where instead of new development the already acquired developmental traits get consolidated for some time then the process again get progressed upward in a spiral manner to facilitate new developments based on previously achieved ones. Child development comes under human psychology and thus is a part of developing

12 GE-ED-31 NSOU positive science. It is called 'developing positive science' because unlike developed positive science like mathematics, physics, biology, chemistry etc. here the observations, findings and interpretations are not objective or absolute. The development in a child to some extent varies from children to children, the observations and characteristics of development are subjective in nature. For example, the way a child socializes with the family and then with the peers cannot be measured and studied experimentally, it can only be observed in a naturalistic way. The way a child develop values, ethics, assimilates cultural values, develop emotions are very subjective and depends on the environment that occur naturally in uncontrolled conditions. It is undesirable to develop emotions in children forcefully, instead we must provide the proper environment to help them to inculcate positive emotions. Only in case of the development of negative emotions among children, we must intervene ethically to cease it. Children should never be subjected to any form of unethical practices to study or modify their developmental processes. The imprints of genetics and environmental factors contribute to the process of developmental changes. There is a reciprocal relationship between the child and its development, appropriate description of observations, facts, and quantification of changes could help to understand this reciprocal relationship better. 1.3.3 Significance of Child Development The growth and development of the child start inside the mother's womb and after birth to three years of age, the growth and development are unprecedented. During this time the child uses all the senses and take control over its organs through motor skills, such activities become possible due to the formation of millions of new neural links in the brain. From three to six years of age, the brain of the child develops to 90% of the size of an adult, during this period, the child collects an enormous amount of information from their experience and through contacts with physical as well as social environments. These childhood experiences are both positive and negative and that affect their future by deciding their mental wellbeing, physical health, moral values, social bonding, and ability to adapt in any adverse environment. Various literature on child psychology, growth and development suggested that early childhood development plays an important role in deciding the future role of the child in the society as it has a direct positive impact on a child's long-term health outcomes and will improve future opportunities, school attainment, and even their occupational potential. For parents and guardians, the period of child development is an opportunity where with a proper investment with love, care, protection, nutrition, education, and positive

13 NSOU GE-ED-31 social support the child is more likely to become mentally and physically a healthy person. Such a child can support positively to the society, trust others, be helpful to everyone, understand the responsibility as a citizen, and participate in the process of growing the economy. In contrast to it, the developmental period of a child is a period of great vulnerability and risk too. Many children who do not get the supportive and protective social environment like those who are neglected, abused, homeless, orphan, war displaced or malnourished cannot realize their true potentials. Studies revealed that children who are socially neglected, living in extreme poverty, surrounded by a toxic environment, and those who do not get adequate positive parenting failed to develop proper psycho-motor skills. Such children often suffer anxiety, stress, disparity, and get psychologically disturbed. These ill effects and negative experiences of childhood development continues incrementally to adulthood. Adverse effect to early child development negatively impacts the children's readiness to school and learning abilities. Such children perform poorly not only in academics but also in life skills, they often remain left-alone among their peers which may lead to suicidal tendency. However, recovery is possible with appropriate interventions and supports. Investment in child development policies and programs will result in long-term returns, as children with adequate support in their early years healthier and better educated are more likely to contribute to society and the global economy. A very significant part of childhood development is that it allows children to express their emotions, not only to their family members but also to outsiders. In pre and late childhood, children interact with other children of the same age where they learn some important emotional lessons like sharing toys or food that give them the joy of companionship. This emotional experience is extremely educational also that remain throughout their lives. Social and communication skills are another significant part of early childhood development, it help them to overcome the shyness and develop empathy for peers. Children learn to deal with an entirely new situation when they are exposed to a new environment with close family support. Fighting and conflict are normal behavioural expressions among children during the developmental process but should be dealt with patiently and constructively. Children in preschool develop a feeling for interacting with others and learn some social behaviours. This experience complements the child's home life and promotes their emotional and intellectual development. Proper childhood development lays the foundation for children to take up new hobbies. Hobbies and novel interest among the children give them confidence, better start at school, and place them ahead of those children who lack proper environment during the development

14 GE-ED-31 NSOU process. Such development of hobbies make them free thinkers, problem solvers, explorers, and prepare them to grow as a creative individual. Cognitive development is an important part of the child development process. Cognitive development includes skills associated with thinking, reading, learning, remembering, reasoning, and paying attention. In early childhood development, children develop the ability to distinguish between various objects based on their shape, size, colour, and texture. They also learn how to arrange materials and categorize them. Cognitive development in children increases their attention span and ability to count numbers, identify colours, increases vocabulary, and reading simple words. Childhood development builds the future pathway for children and plays a crucial role in preparing the children to adapt to the environment, both social and physical. Schools also play an important role in supporting childhood development, early years of schooling help them to understand the importance of socialization and lifelong learning, these in turn, support their lifelong development. 1.4 Principles of Child Development Already it is stated that to some extent child development is unique to every single child but chronological studies on child development around the world suggested that there exists a logical and sequential pattern from the conception of the child to adulthood. Based on such logic and sequences of pattern certain principles of child development was formed. We will now discuss all those principles of child development in detail : a. Principle of continuity: The development of the child is a continuous process that means it is a non-stop process that starts from conception and ends with death. The rate of development may not be the same at all stages. Generally, the development in a child is much prominent and higher than the other stages of life. Changes may be small but continuously occur throughout life and affect all the dimensions of one's life. b. Principle of individual difference: Even within the same species every organism is distinct and this distinction known as the individual difference is more contrasting among humans. Due to impacts demography, social environment, race, culture, economy, personal choice, and heredity human beings are very different from each other and for the same, the child development is also found different between any two children as no two children get a similar environment and supports. Thus, individual differences play an important role in deciding the developmental process among the children. c. Principle of non-uniform development rate: We already know that child development is a continuous process but its nature is non-uniform. The developmental rate

15 NSOU GE-ED-31 always follows a non-uniform pattern where it does not exhibit steadiness and streamline increase in different dimensions of personality or the developmental periods and stages of life. On passing from one stage of development to another the signs of development sometimes become very hard to notice and at some stage, they become very prominent. For example, infants, spend learning crawling is not the same as the time they take to develop the ability to walk alone. d. Principle of sequential pattern: Although development depends largely on the individual difference which makes the development process unique for each child, still there is a unique trend or pattern in the child development. Among all human beings, it is found that the continuous process of development follows a definite universal pattern in one or other dimension like the development of language among the kids occurs more or less at the same time band. This is true for all other cognitive, emotional, motor, social, and psychological developments with some individualistic rare exceptions. So, over the different developmental stages and periods of the human child, the existence of a universal sequence is predominant. e. Principle of proceeding from general to specific: It is a common observation that a child first learns general abilities then gradually moves to the specific abilities. In infants we can see that during the early stage of developments they used to cry for all their needs then with gradual development they learn to use vocal or sign language to express their needs. Similarly, we see that for babies all kinds of plants are just simply 'plants' they cannot distinguish between trees, shrubs, herbs etc. Slowly with growing age and developing cognitive skills they learn to distinguish between them. This gradual change of exhibition of responses and skills from general to specific is governed by the principle of proceeding from general to specific which states that development always occurs from general to specific or from whole to part. f. Principle of integration: From the previous principle we understood that children first learn the general responses then move to the specific, now the developmental process also let them combine the specific responses and form the general one which is governed by the principle of integration.

It is the integration of the whole and its parts as well as of the specific and general responses that make a child develop satisfactorily in various dimensions of his/

her growth and development. g. Principle of interrelation: Many dimensions of child development are interrelated, the development that has been achieved in one dimension may be related to other dimensions also and may play an important role in maintaining the continuous but non-uniform nature of the child's overall development. A healthy baby is very essential to have healthy mental

16 GE-ED-31 NSOU health, for example children who are physically challenged (or specially challenged) often may suffer from depression, inferiority complex, and low self-confidence resulting in poor mental and social development. This is why the goal of education is directed towards achieving homogenous and all-round development in children as a deficit in one part may affect the whole personality of the children. h. Principle of interaction: As soon as a child is conceived in the mother's womb a continuous interaction of the baby with the environmental forces begins. This interaction is in between the genetic inheritance of the child and the environment that may be physical, social, emotional or economic, such interactions influence the development and each child develops their own unique personality traits. This interaction during the development is never-ending just like the process of development itself. i. Principle of predictability: The continuous, and sequential pattern of child development has one great advantage which is that development is predictable in nature. In most cases, we can predict the changes in a child in one or more dimensions at any particular stage of its growth and development. For example, when a child starts crawling we can predict that is going to come next and approximately the age when the child is stand up and walk soon. Not just such simple general predictions we can also possibly predict the range within which the future development of an individual child is going to be. For example, with the mental and cognitive development of the child during early childhood, we can predict about his/her future performance at school and in the later future also, though such prediction may not turn out to be completely true always, as development depends on individual differences and environment. j. Principle of spiral advancement: Child development does not follow a straight path instead it is spiral in nature. Once a child starts developing, the rate keeps on changing, sometimes it becomes very slow and looks negligible then it may move backwards which is known as the period of consolidation. At this period the child reinforces on the past and previous developments then again start moving forward in a very characteristic of spiral nature of the developmental process. k. Principle of cephalocaudal and proximodistal tendencies: Growth and development in a child have their own orderly, definite sequence, and direction. This direction and sequence of development are defined by the principle of cephalocaudal and proximodistal tendencies. According to cephalocaudal tendency, the development of a child occurs from head to foot that is longitudinally from top to bottom. It can be seen that a child first learn, to control the head, hand, and upper part of the body so then at later stages take control of legs and feet. Proximodistal tendency suggests that development in a child

17 NSOU GE-ED-31 occur radially from the centre to extremities, development is first seen in the central portions of the body like the chest then toward the hand and finally the fingers. l. Principle of cumulation and recapitulation: The development in a child is not based on any single experience but is due to the sum total of all the experience with the environment. All the new experiences are compiled based on old experiences which consolidates the present experience and support the development. m. Principle of interaction of maturation and learning: Another important principle of development is that it occurs as a result of both maturation and learning. Maturation refers to changes in a developed organism due to the emergence of abilities, characteristics, traits, and potentialities present at birth. Learning denotes the changes in behaviour due to training and or experiences. Maturation is the inner growth process unaffected by training. Another factor that causes growth is 'learning'. Learning is the process of conducting the repeated exercise and building experiences. Learning may result from practice, which in due course of time may bring about a change in the individual's behaviour. Maturation and learning are closely related and one influences the other. This means that traits potentially present in a child will not develop to their maximum without an effort or learning. Thus, learning has a great influence on growth and development, maturation provides the raw material for learning and determines to a large extent the more general patterns of the individual's behaviour. 1.5 Socialization Process: Child and Social World 1.5.1 Concept of Socialization Human is a social being and society plays the most crucial role in the all-round development of the individual. Society acts as the umbrella for the human that provides security, shelter, food, and emotional supports. Societies are the shared community with complex codes, norms, and organizational structures, it is the pool of cultural and moral values that shapes the children to become responsible contributor to their society in future. Now we can define socialization as the process of acceptance of a set of norms and values by the individual through transparency from the society. This makes the process of socialization of a child a foremost requirement during the process of development. In fact, socialization is an inseparable part of child development. Socialization is the process through which social and cultural continuity is achieved. Generally, people use the word 'socializing' very often in place of 'socialization' but one should understand that socializing is the process of interacting with others like family, peers, friends, colleague etc. and thus it's the sociological process by which an individual gets socialized.

18 GE-ED-31 NSOU 1.5.2 The Process of Socialization of a Child Just like development, socialization in human is also a lifelong process and both are complement to each other. Social-psychologists suggest that socialization represents the lifelong learning process of human and for a human child, socialization is the key factor that influences the kid's behaviour, thinking, believes, and all actions in future as an adult. Charles Cooley (1864-1929) a renowned sociologist asserted that people's 'self' understanding is constructed, in part, by their perception of how others view them, a process termed the 'looking glass self'. George Herbert Mead (1863-1931) for explaining the process of socialization propagated the concept of 'self' as a distinct identity of an individual developed through social interaction. An individual right from childhood always tries to see 'self' as what others want to see in him or her from their eyes. Through the process of socialization, children simply learn to put themselves in someone else's shoes and look at the world through their perspectives. This assists the children in becoming self-aware, as they look at themselves from the perspective of the "other." In absence of the socialization, a child will lose the 'self' as there will be no mirror of 'others' from the society to show who he or she is and what he or she should be? In this way, children gradually learn to take the roles of others in society and at the final stage generalized all experiences to use the socio-cultural norms and values as a reference for evaluating others. If we want to simplify the process of socialization then it can be said that socialization occurs at two stages—primary socialization and secondary socialization. Primary socialization occurs when a child learns the attitudes, values and actions appropriate to individuals as members of a particular culture. Primary socialization is due to interaction with the immediate family and close friends. The secondary socialization process is the result of interaction with the smaller community or group of people within a larger society. Such socialization is done by school or workplace or religious group or by any other larger agencies of society. For example, when children get admitted to school, they learn new behaviours, values, and conducts other than what they have already acquired from their families. 1.5.3

Importance of Socialization for a Child The social environment is deeply related to many dimensions of a child's all-round development this is the reason that makes socialization of child from early stages of life an undeniable necessity. Socialization among the family and in the school helps the child to understand the 'self', they develop the sense to understand the things from others point of view and they want to see them as what others expect in them. For children, thus school plays an important role in socialization and social development as it gives them the chance

19 NSOU GE-ED-31 to interact with peers and teachers which helps them to understand the social and moral codes of society. Playing with other children helps to overcome shyness and egocentric nature, they learn to care for others, set their goals, overcome the obstacles, solves the problem, and get emotionally connected all these are the distinct features of childhood socialization. The absence of social interaction gives unrepairable damage to a child's overall development. A remarkable example of the consequences of such absence of social interaction in the child was the "Victor of Aveyron", he was found in the wild areas of France, wandering like animals at the age of 12. He was brought to the city and people tried to socialize him but it didn't work. For the rest of his life, he was speechless, emotionless and socially inert with a limited cognitive capacity just like that of a toddler's. He failed to live the full life and died at the age of 40. Socialization is not only important for the children but it is also important for society. Socialization helps the child to see in it what society want to see in him or her. This leads to the development of future members of the society with all the desired values and morals of that society, who can be able to respect their culture, helps in its assimilation and transmission. 1.5.4 Principle of Social Development: Erickson's Theory of Psycho- Social Development A developmental process that includes cognitive and affective behaviour is strongly related to socialization. In fact, social behaviour is the reflection of an individual's cognitive, emotional, and moral development. Famous psychoanalyst Erik Erickson being inspired by the works of Sigmund Freud studied the dependence of human development on its social surrounding and postulated the famous principle of 'Psycho-social development theory'.

67%

MATCHING BLOCK 1/32

W

Unlike Freud's theory of psychosexual development, Erikson's theory described the impact of social experience across the whole lifespan. Erikson was interested in knowing how social interaction and relationships play a role in the development and growth of human beings. '

Conflicts or crisis' of life: According to Erickson from birth to the death of an individual the social development present him with what he called as the 'conflict' or situation of 'crisis', each of this crisis makes some specific demands at different ages or stages of growth and development. It is the individual who tries to resolve this crisis and his success or failure determines his advancement to the next stage of development. Success in resolving the crisis makes a positive impact on personality development whereas failure often harms social development and personality. So, stages of growth and development are

20 GE-ED-31 NSOU like steps of a ladder where each previous step is essential for the upcoming step and failure in any one stage of it get propagated to all the other forthcoming stages of development. Stages of Psycho-social development: Erickson discovered eight such crisis of life arising at different ages of any individual's development and linked them with the eight stages of psychosocial development by dividing the entire life span. In table 1.1 all the stages of development are given with a summary of the characteristic of all the stages. Table 1.1 Psycho-social developmental stages The above table 1.1 outline the developmental ages,

76% MATCHING BLOCK 2/32

W

the type of crisis that needs to be resolved at a particular stage

or age of any individual, important life events respective to that age or period and expected outcome or personality that is likely to develop. Upon resolving all the crisis of different periods of life a person may acquire positive traits like trust, autonomy, initiative, industry, identity, intimacy, generativity, and ego integrity. On other hand, falling at a developmental period may develop a negative personality like mistrust, shame, doubt, guilt, inferiority, role confusion, isolation, stagnation, and despair. All these stages do not start all of a sudden or end up abruptly but they are overlapped. One stage of psycho-social development lays the foundation for the next stage, failure or success of the previous stage to some extent decides the process and outcome of the next successive stage. Let's see each of the stages of psychosocial development in details. Stage 1: Trust vs. Mistrust (0 to 18 months). This stage of development occurs between birth to 18 months of age. At this period the infant is completely dependent on his/her mother and family for care, food, protection, and love. If a caregiver fails to provide Infancy (birth to 18 months) Trust vs. Mistrust Feeding Hope Early Childhood (2 to 3 years) Autonomy vs. Shame & Doubt Toilet Training Will Pre-school (3 to 5 years) Initiative vs. Guilt Exploration Purpose School Age (6 to 11 years) Industry vs. Inferiority School Confidence Adolescence (12 to 18 years) Identity vs. Role Confusion Social Relationships Fidelity Young Adulthood (19 to 40 years) Intimacy vs. Isolation Relationships Love Middle Adulthood (40 to 65 years) Generativity vs. Stagnation Work and Parenthood Care Maturity (65 to death) Ego Integrity vs. Despair Reflection on Life Wisdom

21 NSOU GE-ED-31

W

adequate care and love, the child will come to feel that they cannot trust or depend upon the adults in

their life whereas fulfilment of all the requirements they develop trust. Thus, it is called the period of trust vs. mistrust in psycho-social stages of development. It is truly an infant that cannot develop 100% trust or mistrust but it's the perfect balance between the two extremes that Erickson considers necessary for a child to have better hope of success for the next stages. Stage 2: Autonomy vs. Shame and Doubt (18 months to 3 years). This stage starts at eighteen months of age and continues to three years of age. After developing the sense of trust and security from his/her environment the child from the age of eighteen months starts gaining more control over the motor and linguistic skills this allows exploring the environment and testing its limits. This develops the sense of autonomy in the child so at this stage, the parents must give them support, freedom, and safety. If at this stage the children are restricted or given too much protection then they don't develop the sense of confidence in themselves and lose the autonomy to develop the negative senses like shame and doubt over their abilities. Erickson suggested maintaining a balance between the two that means complete freedom should not be given to the child, a reasonable amount of doubts help the child to set his limits and the development of shame helps the child to develop a sense of right and wrong. Stage 3: Initiative vs. Guilt (3 years to 5 years). This stage of psycho-social development happens between the ages of three to five years. This stage is characterised by the crisis of initiative vs. guilt. Gaining trust and autonomy from the earlier stages of development the child now starts actively interacting with the environment. They become curious and starts asking questions about everything, do plan and take new initiatives for various exciting new things. Like the previous two stages, parents play a crucial role in this stage also, parental support and encouragement in taking new initiative helps the child to decide the course of actions. Whereas any discouragement and failure may result in guilt. So parents should not humiliate and scold the child on their failures they must be taught how to overcome them and correct them through the process of self-evaluation. So supervision and guidance from parents or guardians play an important role at this stage. Stage 4: Industry vs. Inferiority (6 years to 11 years). From the age of six, the children generally start going to school and the school environment plays an important role at this stage of psycho-social development which is characterized by the crisis of industry vs. inferiority. At this stage, the child who is full of trust, autonomy and initiative abilities start participating at various works not only at home but also at school with their peers under the watchful eyes of their teachers. The well-developed motor and cognitive skills also 22 GE-ED-31 NSOU encourage them to take new projects which develop the sense of industry and success in it gives them a sense of achievement. Such a child will constantly work harder

and achieve more in terms of competence and productivity. On the other hand,

if their performance is not better than their peers they may lose confidence in themselves and feel inferior. The parents, teachers and school environment play a vital role at this stage of development in resolving the crisis. Therefore, it's the responsibility of the school and teachers to make the environment supportive and encouraging for the children so that they don't develop inferiority complex and consider themselves as a valuable asset to society. Stage 5: Identity vs. Role confusion (12 years to 18 years). The fifth psycho- social

During adolescence, children explore their independence and develop a sense of self. Those who receive proper encouragement and reinforcement through personal exploration will emerge from this stage with a strong sense of self and feelings of independence and control. Those who remain unsure of their beliefs and desires will feel insecure and confused about themselves and the future.

Teacher, parents and friends can play a very constructive and supportive role at this stage of the crisis. Adolescents looking for identity must be recognized by their parents, peers and teachers. They should not be treated as a child anymore and must be assigned various responsibilities independently. Stage 6: Intimacy vs. Isolation (19 years to 40 years). This stage of psycho-social development starts from late adulthood. At this stage, they are confronted with the crisis of intimacy vs. isolation. So at this stage, they look for people with whom they can form personal and intimate relation by merging their identity with another. The relationship grows so intimate at this stage that the individual even risks the loss of ego and self-image for maintaining a harmonious relationship. Such relationship can be seen between lovers, intimate friends and teacher-pupil. When an adult fails to get an intimate partner or friend it leads to a sense of isolation, it is when a person breaks off all ties from friends, partner, and even society. Such an isolated person becomes introvert, self-absorbed, and often mentally ill. Though a certain level of isolation is crucial to maintain one's individuality and the development of one's personality in the desired direction.

23 NSOU GE-ED-31 Stage 7: Generativity vs. Stagnation (40 years to 65 years). This stage of psycho-social development starts at middle adulthood near about at the age of 40 and continues till 65 years of age. Remember as mentioned at the beginning, these age slabs are just indicative, it depends from person to person and environmental factors. As an individual successfully meets all the crisis of previous stages and develops all the positive behaviours he/she establishes himself/herself well in society. Now at this stage, the individual tries to be an example for the upcoming generations, act as a mentor for the young's. This is often realized by raising their own kids as parents, guiding the juniors, helping the young people, and involving in charity or other social works. This helps in developing the sense of generativity and productivity, whereas failure to do so leads to the development of a sense of stagnation and personal destitution. Here also like other stages, there is a need to have a balance between the two crisis as somewhat stagnation is needed in the form of pause in the flow of life which helps to re-evaluate, re-plan, and re-energizes oneself. Stage 8: Ego integrity vs. Despair (65 years to death). This stage of psychosocial development is associated with later adulthood or old age, again it is hard to determine when exactly old age starts as every person is different psychologically and physiologically but more or less it starts around the age of 65 in the modern age. At this stage, a person is confronted with the last crisis of the life 'ego integrity vs. despair'. Ego integrity refers to the integration or sum total of all the positive senses of all previous stages of development which gives the person a sense of fulfilment, accomplishment, and completeness. Such a person with a sense of ego integrity remains at peace during the last days of life and often die happily without any regret. Whereas a person who doesn't resolve all the previous crisis of the life remains despair and feel unsatisfied with the life. Erikson's theory differed from many others because it addresses development throughout the entire lifespan, including the old age.

90%

MATCHING BLOCK 12/32

W

Older adults need to look back on life and feel a sense of fulfilment. Success at this stage leads to feelings of wisdom, while failure results in regret, bitterness, and despair. 1.6 Summary The

growth and development of a child begin from the womb of the mother and ends with the death. Growth refers to quantitative changes only whereas development includes all the quantitative as well as the qualitative changes of the child. Studying the development of a child helps us to understand the connection between the physiological, psychological, and social changes in the child. The early stages of development of the child that ranges from birth to early adulthood are very important as the proper nurturing and support during this period help them to develop into a complete personality with perfect physical, emotional,

24 GE-ED-31 NSOU and mental health. The developmental process always follows certain principles. Development is a continuous process that occurs in a sequential pattern. A child first learns general abilities then moves to specific one, also their development occurs from head to toe and spine to fingers. Due to the sequential nature, one can predict the developmental stages, though it has been found that sometimes the development occurs such slowly that it appears to be ceased but this is the period where the child consolidates by reinforcing on previous stages to move forward. The process of development of the child is strongly associated with society. Erickson's theory of psycho-social development explains the influence of society on the various developmental stages of a child. Erickson described how the crisis or conflicts confronting the child due to the social environment either support or obstruct him from successfully moving to the next stage of development. During each stage of development, the child acquires the norms and values of the society he belongs to and this process is termed as 'socialization'. Socialization helps the child to become what society expects him to be. Schools play an important role in the socialization of the child by helping them to interact with peers and teachers which give them the opportunity to better understand the norms, morals, values, and culture specific to their society. 1.7 Self-Assessment Questions 1. What do you mean by the 'development of the child'? 2. What is the nature of child development? 3. What are the adverse effects of improper child development? 4. 'Child development is a continuous but non-uniform process'—Explain this statement. 5. How the various dimensions of child development are related? 6. What is the principle of predictability in child development? 7. What is the principle of cephalocaudal and proximodistal tendencies? 8. Briefly explain the relationship between maturation and learning in a child's development. 9. Explain the socialization process of the child. 10. Why socialization of the child is important?

25 NSOU GE-ED-31 11. What do you mean by 'Conflicts or crisis of life' in Erickson's theory of psycho-social development? 12. Describe the various stages of psycho-social development as proposed by Erickson. 1.8 References Carmichael, L., & Mussen, P. (1970). Carmichael's manual of child psychology. Wiley. Erikson, E. To understand human development, different theories of child development have been developed arisen to explain various aspects of human growth. Many psychologists, educationists and philosophers suggested various theories of development, they are classified in different categories based on their domain of influence on development like psycho- social theory, socio-cultural theory, cognitive theory, attachment theory, behavioural theory, and psycho-sexual theory of development. This unit introduces the various constructs and critical perspectives of human development through the three most important theories

76%

MATCHING BLOCK 11/32

W

of development: (i) Piaget's theory of cognitive development, (ii) Kohlberg's theory of moral development,

and (iii) Vygotsky's socio- cultural developmental theory. Development theories proposed by Kohlberg and Vygotsky 28 GE-ED-31 NSOU belong to the category of social theory of development. Theories of child development helps in understanding how and why children grow, learn, and behave. Based on these theories educationists design the effective child pedagogy. Education for children is aimed to prepare the children to adapt to the environment. No two children are same, they differ in their individual needs and personality traits which is known as individual difference in totality. A traditional classroom is rigid in nature which is controlled by teacher and the pedagogy is not designed keeping the individual differences of learners in notice. So in the late 19th century many philosophers and educationists like Rabindranath Tagore, John Dewey, Jean Jacques Rousseau, Froebel, and Johann Pestalozzi started an unorganized movement against the narrowness, rigidity, and formalism of traditional teacher-centred education. Their focus was on making the education for the 'whole child' that is to facilitate the child's cognitive, emotional, moral, and physical development. This movement laid the foundation of progressive education, as this movement was directed toward equipping the child with the ability to think and experiment rather than rote memorization, like in traditional education hence the name 'progressive' was given to such education. One of the key-characteristics of such education is its 'child-centred' nature. Child-centred education places the child first, and an approach with the message that all children have the right to an education that helps them grow to their fullest potential. Child centred learning is focused on the child's needs, abilities, interests, and learning styles with the teacher as a facilitator of learning. 2.3 Constructs and Critical Perspective of Development: Piaget, Kohlberg, and Vygotsky 2.3.1 Piaget's Theory of Cognitive Development Piaget was a Swiss biologist and psychologist, who initially worked on developing intelligence test at Binet Testing Laboratory in Paris. Later his interest grew towards studying the development of a child and he along with his wife spent a long period of life studying the cognitive development of children. Piaget's theory of cognitive development explains how the human baby collects and organizes information and how this process changes with development. He proposed children are born with few basic abilities like sucking, looking, reaching, and grasping. These basic cognitive abilities are the 'schemas' as he called them. The cognitive structure of an individual contains many such schemas. All the subsequent learning and knowledge development are based on schemas. He explained how cognitive structures and cognitive functioning evolves to help an individual in making

29 NSOU GE-ED-31 meaning out of their past and present experiences. These experiences ultimately result in successful adaptation to the environment. Piaget explains this developmental process through constructs of schemas, the process of assimilation, accommodation, and equilibrium. So in Piaget's theory of cognitive development, there are two important aspects of human cognition: (i) cognitive structure and (ii) cognitive functioning. The cognitive structures of any individual have many schemas each specific to a certain cognitive ability. For example, in the case of an infant 'sucking' is one such schema, it refers to one general ability to suck an object. Interaction with the environment taking place using this schema result in learning particular behaviour. Apart from inherited schemas like sucking, gasping, looking, and reaching when children grow, with the interaction of physical and social environment they can form different schemas, resulting in changes and modification in their cognitive structure. The interaction with the physical and social environment through schema allows the individual to adapt to it for survival as well as growth and development. Schemas forming the cognitive structure plays a very vital role in one's cognitive functioning. The adaptation by an individual is carried out through the cognitive functioning or process of assimilation, accommodation, and equilibrium. Assimilation involves the incorporation of new events into pre-existing cognitive structures. Accommodation means existing structures change to accommodate the new information. This dual process, assimilation-accommodation enables the child to form schema. Equilibration involves the person striking a balance between himself and the environment, between assimilation and accommodation. When a person experiences a new event, disequilibrium sets in until he can assimilate and accommodate the new information and thus attain equilibrium. This is how an individual develops by continuously assimilating information and replacing them with new information through accommodation to bring necessary changes for adapting to the environment as per the demand and finally attaining the state of equilibrium between assimilation and accommodation.

2.3.2 Piaget's Stages of Cognitive Development

Piaget's theory emphasized the role of interaction of inherited abilities with the physical and social environment in the cognitive development of an individual. He defined schemas and how schemas form the cognitive structures which help the cognitive functioning to adapt to the environment. However, he concluded that the organization of cognitive structures in every individual

95%

MATCHING BLOCK 15/32

SA

Draft Full Book.pdf (D159412383)

always takes place in particular order involving definite stages of cognitive

or intellectual developments, thus he suggested four stages of cognitive development. Let's understand all the four stages of development one by one, a summary of the four stages is also given in table 1.2.

30 GE-ED-31 NSOU Table 1.2. A summary of Piaget's stages of cognitive development

Stage	Age	Goals
(i) Sensori-motor	Birth to 2 years	Object permanence
(ii) Pre-operational	2 to 7 years	Transductive reasoning, symbolic thought
(iii) Concrete operational	7 to 11 years	Logical thought
(iv) Formal operational	11 to 15 years	Hypothetical reasoning, Scientific reasoning

Sensori-motor stage (birth to 2 years of age). Sensori-motor stage of development is characterized by the absence of language and interactions with the environment through sensory and motor abilities. The child is born with a very limited number of reflexes initially like sucking, looking, grasping and reaching. These are uncoordinated but after few months from birth, they develop coordination. Now they can grasp things with their reach, they can look at things they wish and can suck the things they put in their mouth. Till now the infant cannot understand the permanence of thing that means the object which is out of sight does not exist at all for them. Around 8 months onward they realize that objects around them have independent and permanent existence. For example, at this age when an object like a toy is taken away from the child or kept hidden, he realized that the toy still exists even it is not within sight. The main schema that develops at this stage is the ability to form a mental image of things with this the child move to the next stage of cognitive development involving the symbolic world of language.

Pre-operational stage (2 to 7 years of age). At this stage of development, the child leaves behind the direct use of sensory-motor abilities and starts using the newly acquired symbolic abilities like sounds and language. The child now can ask for things using words or sign language instead of using hands to reach them. This stage again has two sub-stages: Pre-conceptual Stage (2 to 4 years of age) and Intuitive Stage (4 to 7 years of age). During pre-conceptual stage, the child develops a sense of very basic concepts. They often generalize things, for example, all green leafy plants for this age group of children are tree, and they cannot classify them into tree, shrubs or herbs. Their sense of logic is at an initial stage, they think transductive rather than inductive or deductive. At this stage, children are egocentric they see everything from their own point of view only. At an Intuitive Stage, the concept formation begins, now the child can generalize as well as specify the objects like a child can now tell that vegetables, herbs, trees, and shrubs all are the forms of plants. Though the child is still not much logical about his/her course of action or thinking. Piaget concludes that at this stage, child misses two important cognitive ability — the concept of reversibility and conservation. Let's try to understand it in this way, a child at intuitive phase 31 NSOU GE-ED-31 does not understand that course of action or thought can be reserved like his dog is a Labrador and it's a pet animal so he may not be able to conclude that any pet can have a name or breed and can stay with him. Similarly, a child also doesn't understand that a definite quantity of water in a glass, when poured in a bowl, remains the same, this is the concept of (conservation) that remains absent at this stage of cognitive development. So to conclude, at this stage the child interacts with the environment through symbols and mostly remain illogical about the thoughts with full of contradictions.

Concrete operational stage (7 to 11 years of age). The stage is called concrete because children can think logically much more successfully as they can manipulate real (concrete) materials or pictures of them. Piaget considered the concrete stage a major turning point in the child's cognitive development because it marks the beginning of logical or operational thought. This means the child can work things out internally in their head, rather than physically try things out in the real world. Now they develop both the concept of reversibility and conservation of material. The child can now make the relationship among the things he sees, can make logical thinking and find out any irregularities or discrepancies. The child does not remain egocentric as he/she can understand others thought or view and appreciate them. However, his thought process and actions are limited to real world objects or concrete items operated by him, he remains incapable of thinking abstract items and solve hypothetical problems.

Formal operational stage (12 to 15 years of age). The cognitive structures of the child are now very well formed and the cognitive functioning takes place at a very sophisticated level. Children can follow the form of a logical argument without reference to its content. They don't need any real object or problem to think about it, they can consider a hypothetical scenario and think over it. During this time, people develop the ability to think about abstract concepts, and logically test hypotheses. This stage represents the emergence of scientific thinking, formulating abstract theories and hypotheses when faced with a problem. Concrete operations are carried out on objects whereas formal operations are carried out on ideas. Formal operational thought is entirely free from physical and perceptual constraints. During this stage, adolescents can deal with abstract ideas like they no longer need to think about slicing up a pizza to understand the idea of division and fractions. Piaget concluded that the thought process and the intellectual functioning of the child at this stage form the base of the individual's future intellectual development and actualize the potential to the maximum at all available circumstances.

32 GE-ED-31 NSOU 2.3.3 Kohlberg's Theory of Moral Development Morality is the ability of an individual to distinguish between wrong and right within a specific social structure. It enables the individual to treat everyone fairly with the concern of their welfare. Moral development involves the acquisition of the attitudes, dispositions, sentiments, and cognitive competencies involved in the process of moral judgment and action. The concept of moral development is similar to that of developmental psychology as both originated from the same old philosophical thought of human development. Just like cognitive development which can be assessed as there is a definite way in which a child's cognition develops, moral development can also be assessed. Though there is one striking difference between the two, cognitive development is 'value neutral' that means there is no desired way of development it will follow the natural course but for moral development, there is a defined desired way acceptable to the society. For example, it is perfectly acceptable for one child to be confident and impulsive and another to be quieter and more patient. However, it is not considered an acceptable state of affairs if the first of these children is dishonest and the second is violent toward others. These features make moral development a part of social developmental theory. Lawrence Kohlberg, a psychologist at the University of Harvard put the most remarkable theory of moral development. His theory rejected the popular belief that a child acquires the morality from their parents, teachers, and peers only. According to him, moral development is dependent on the cognitive development of an individual, a child for instance uses his thinking and reasoning to make judgments they do not just internalize it from outside or from any direct sources like parents or peers. For studying the process of moral development in human, Kohlberg first defined moral development as the development of an individual's sense of justice. He then identified three levels of moral development, each containing two stages as represented in table 1.3. Table 1.3 Kohlberg's stages of moral development.

Level	Stage	Name	Age (in years)	Characteristic
I Pre-moral level	1	Obedience for avoiding punishment	4 to 10	Obedience to obtain rewards and favours.
	2	Obedience to obtain rewards and favours.	4 to 10	Obedience to avoid criticism of society.
II 3 Conventional	3	Maintaining mutual relations and moral level approval of others.	10 to 13	
	4	Obedience to avoid criticism of society.	10 to 13	

33 NSOU GE-ED-31 III 5 Post-conven- 13 to late Obedience to the democratically tional moral level adulthood accepted law and mores of community welfare. 6 ,, Conforming to the universal ethical principles and own conscience. Pre-moral level (4 to 10 years). From four years onwards the child develops a sense of morality. The child makes the judgment about what is wrong and what is right based on the morality of others especially the near relatives. At the initial stage (Stage 1) of the pre-moral level, the child's morality is controlled by the fear of punishment from the parents so they obey them. At the second stage (Stage 2), the child's morality is based on his interest and consideration. He/She follows the others for rewards or favours in return for their judgment. So, the child's morality at this level of development is manipulative. Conventional moral level (10 to 13 years). The next level of moral development is marked by the acceptance of social rules regarding what is good and morally correct. During this time, adolescents and adults internalize the moral standards they have learned from their role models and society. This period also focuses on the acceptance of authority and conforming to the norms of the group. There are two stages at this level of morality- in the early years (Stage 3) of this level the child focuses on living up to the social expectation and roles. The moral judgment at this stage is based on the desire to obtain the approval of others, they often try to be accepted as 'good boy' or 'good girl'. At the later years (Stage 4) of the conventional moral level, the judgment of the child is governed by the conventions, laws, and norms of the society. At this stage of moral development, people begin to consider society as a whole when making judgments. The focus is on maintaining law and order by following the rules, doing one's duty, and respecting authority. Post-conventional moral level (13 years onward). This is the ultimate level of moral development where the individual now does not depend on the parents, peers, or any other individual to decide about the wrongs and rights. He/She no longer considers the social norms or laws as the criteria for making judgments, his moral judgment now depends on his own consciences and experiences. This development again occurs in two stages - at the initial stage (Stage 5) of this level, the individual's morality is internalized to such an extent that his/her moral judgment does not contradict the authority or society only if it agrees with the principles upon which the demands of authority are based on. His/Her morality is now rational, based on the welfare of mankind and its rights. In the last stage (Stage 6) of moral development, the individual's all morality is controlled only by his/her conscience and the universal principles of respect, justice, equality, rights, and welfare. At

34 GE-ED-31 NSOU this stage people go above the legal system to decide about right and wrong, they listen to their inner voice first and lead a life that they can live without any shame and guilt. 2.3.4 Vygotsky's Socio-Cultural Development Theory Lev Vygotsky was a Soviet psychologist, in his short life of 38 years he worked in the very diverse field like law, language, literature, and psychology. He worked contemporary to Jean Piaget and gained popularity for his contribution in the field of child's developmental psychology. He believed children learn about their world through physical interaction. Vygotsky's socio-cultural theory asserts that learning is an essentially social process in which the support of parents, caregivers, peers, and the wider society, as well as culture, plays a crucial role in the development of higher psychological functions. Vygotsky's socio- cultural

94%

MATCHING BLOCK 13/32

W

theory of human learning describes learning as a social process and the origination of human intelligence in society or culture. The major themes of Vygotsky's theoretical framework

are the socio-cultural orientation of learning, mediators of development and zone of proximal development (ZPD). Socio-cultural orientation of learning : Vygotsky emphasized that human cognitive development is heavily influenced by culture. He suggested that though some higher animals like apes possess some basic cognitive skills just like humans but they are never equivalent to that of humans. The cognitive skills possessed by human beings are very unique, he called them 'higher mental process' and focuses his theory on such cognitive abilities only. He asserted that human culture is not just an ethnographic identity but is associated with the development of these higher mental process and thus shapes human cognition. Culture shapes, modifies, and evolves one's higher cognitive process like perception, attention, memory, and problem-solving. His proposal of socio-cultural dependence of cognitive ability was based on three things: i. understanding how the transition of behaviour occurs from animals to human, ii. studying the historical change of cognitive abilities with cultural change from a different era, and iii. investigation of developmental construction of child psychology in society. Due to his short-lived life, he didn't get the opportunity to establish all his hypothesis at that time but he gave some valid arguments based on other works with higher animals (Kohler's study with apes). He argued that though some animal possesses both basic cognitive ability of problem solving and communicative skills but these two aspects remain disassociated in them. In human, due to constant association between the problem solving skill and speech, the speech becomes intellectual and problem solving become verbal

35 NSOU GE-ED-31 intelligence. Studies by the team of Vygotsky found that people of the same culture develop a different level of intellect when they are generation apart. Similarly, in some studies, people of the same culture when migrated to distant land and society also in course of time showed a different level of cognitive evolution. These arguments and findings form the basis of Vygotsky's theory. Mediators of development : A very important aspect of Vygotsky's theory is the role of mediators, Vygotsky proposed three mediators relevant to the higher cognitive function in humans: i. physical tools, ii. symbolic tools, and iii. human mediation. Physical tools refer to all those physical machines that can shape the environment, human needs physical and mental capabilities to 'handle' such tool. The presence of such new tools encourages the human to acquire new physical and cognitive skills to operate them properly. The most important among the three mediators is the symbolic tool, like oral speech, reading and writing systems, mathematical symbols, graphic organizers, and pictorial representations. Human first experience these symbolic skills from interaction with people then acquire them and internalize these skills to shape their cognitive structure and functions. These symbolic tools are highly culture specific, thus cultural dependence of development is well justified. Finally, coming to the last tool 'the humans', regarding human mediation Vygotsky mentioned two aspects. On the one hand, he suggested that every higher mental function in the child's development first appears in the interaction between people (inter-psychologically), and then, when internalized, it appears as an inner mental function (intra-psychologically). Vygotsky emphasized the role of caregivers, parents, and mentors as a human mediator, he explained the working mechanism by giving an example of an infant asking for an object through gesture. In this scenario, the adult helps the child to get that object, this mediation helps to develop the higher cognitive processes in infant and instead of gesturing toward the object the infant makes a gesture to the adult for the object. In course of the development of higher abilities, the child learns to replace the gesture with verbal command, thus explaining how interaction resulted in internalization which leads to the development of higher cognitive skills. Zone of proximal development (ZPD) : ZPD is the most important part of Vygotsky's theory of socio-cultural development and it has gained such popularity that people often falsely consider it the whole theory of Vygotsky. A diagrammatic representation of ZPD is given in figure 1.1. Vygotsky criticized that other theories of development mainly focused

36 GE-ED-31 NSOU on that psychological functioning of the children which are already fully matured and displayed by the children by their independent activity. Fig 1.1 Diagrammatic representation of ZPD ZPD explained about those cognitive abilities also which the children cannot demonstrate on their own. Vygotsky proposed that every child has some cognitive functions by which they can perform functions on their own without some external help. Similarly, there are tasks which a child cannot perform or learn on his/her own but when an adult or mentor guides the child learns to perform some of the activities outside the zone of what he/she can do by himself/herself. This mentoring is done by giving 'scaffolding' and the zone of development under it, is called the 'zone of proximal development'. In the educational context, ZPD

76%

MATCHING BLOCK 16/32

SA

PAL Essay.docx (D46668960)

helps to explain the relationships between education and child development. Vygotsky asserted that

the educational process should include the development of children's cognitive functions as one of its main objectives. Contrary to a popular view that instruction should be based on already fully formed cognitive functions, Vygotsky proposed that it should target those emergent functions that can be shaped by education. In this way, students will not only acquire information and specific skills but will also form higher mental functions. 2.3.5 Vygotsky's Periods of Child Development Vygotsky along with his young team proposed a model of periods of child's development, this model was based on the concept of 'Leading activity'. According to this concept, a child may be involved in various activities at any particular period of his development but there will be only one activity called the 'leading activity' that will contribute the most in the cognitive and emotional development of the child in that period. Vygotsky proposed this model based on his socio-cultural theory of development, thus the period of child's development is culture specific, so a model prepared for industrial society with a formal educational system will not be the same for the illiterate society with a poor socio-economic Can't do it even if guided. ZPD: Can do if guided Can do independently

37 NSOU GE-ED-31 group. It is the main reason for which this model is not widely popular among academics. The model of development, we are going to discuss is suitable for industrial society with formal education. The periods of child development alternate between those where leading activity has an emotional-interpersonal focus and the periods with cognitive focus. It is important to remember that some children may stay longer in some of the periods or make a quicker transition to the next period depending on their social situation of development so there is no clear distinct separating age between the periods, the age is just indicative gives in table 1.4.

Period	Age in years	Emotional-interpersonal focus	Cognitive focus
1	0 to 1	Emotional interaction with caregivers or parents	
2	2 to 3	Object centred joint activity	
3	3 to 6	Socio-dramatic play	
4	6 - 12	Formal learning	
5	12 - 18	Interaction with peers	
6	18 above	Vocational activity	

In the developmental period, the child has three alternate emotional-interpersonal aspects and three cognitive aspects. At each period the child's interpersonal, emotional, and cognitive skills lead to the formation of new motive that helps in the formation of new leading activity in the next stage and this activity influences the development of higher cognitive and emotional skills that propagate to the next stage. Let's try to understand it with an example. During the first period of development the child focuses on the emotional connection with parents this gives motive to the child to play with them and in the second period of development, the key focus is the joint activity or object (like toys, colours etc.) centred play. In the second period, joint activity develops the motive for the third period focused on socio-dramatic play where the leading activity is the development of the ability to flexibly switch roles, enhanced self-regulation, and the development of symbolic thought. Now the child not only just play with the toys but can imagine it as his real life friends, switch roles with the playmates etc. Equipped with the skill of emotion, joint activity, and socio-dramatic play child proceed to the fourth period of formal learning, which is the period of getting ready for formal schooling. This period is considered very important because whatever higher skills the child

38 GE-ED-31 NSOU learned in the past is required here, the child should be able to assume a new role of the student which is different from those of son, daughter, sibling, or playmate. Likewise period of formal learning forms a new motive that develops a leading activity of interaction with peers and friends, this is the fifth period of development where the child is completely under the influence of social forces. Interaction with peers then motivates him/her to initiate vocational activities of his/her life. In this entire developmental process through different periods, the interaction with people like parents, mentors, and peers are very crucial as they help the child to acquire cognitive skills beyond the limits of the self-acquired skills. Thus, the social and cultural interactions help the child to reach the zone of proximal development.

2.4 Child-Centred and Progressive Education

2.4.1 Concept of Child-Centred Education

The basic theme behind the child-centred education is the fact that all children have the right to education which will help them to grow and develop completely. Thus, the education and pedagogy within it should be such that the child's right to education is always protected and every child gets an equal opportunity of social, emotional, physical, linguistic, and intellectual development. Every child is a unique and special individual. Consequently, the education and its curriculum must be suitable for every individual child. It must be respectful and account for their individual uniqueness of age, gender, culture, temperament, and learning style. So, it is very essential that in a child-centred education children participate in their own education and development, they should be mentally involved and physically active in learning what they need to know and do. This makes it very essential that children's ideas, preferences, learning styles, and interests are considered in the planning for and implementation of teaching-learning practices under child-centred education. One thing that should be remembered that child-centered education is the part of progressive education because it is aimed to support the child in its progress towards overall development.

2.4.2 Characteristic of Child-Centred Education

In child-centred education the development of the body, mind, and soul of the child must be reflected in the curriculum and teaching-learning practices. Naturalist educationists like Tagore and Rousseau advocated that child should be educated close to nature in the most natural way possible. His/Her needs and desires should be given the utmost priority, education should not be forced upon the child. The child must learn at his/her own pace and as per his/her own curiosity to know such that curiosity forms the basis of the education, this is at the heart of child-centred education. At the early stages of child-centred education

39 NSOU GE-ED-31 emphasis is given on sensory and motor development instead of reading books. So, as we are now very clear about the child-centred education let's now see some of the important characteristics of it : a. Democracy: The most important characteristic of child centred education is its democratic nature which is aimed to develop democratic values with democratic methods of implementation. Education is considered to bring equality, justice, trust, and respect among children. Child-centred education grants freedom to every child to grow and develop through free-thinking, discovery, exploration, and experimentation. Such education looks beyond the limited scope of books and makes education available from nature for nature. b. Self-activities: Self-activities are the inseparable element of child-centred education. Activities like plays, games, songs, role-play, expedition, and experimentation are encouraged in child-centred education. It allows the child to explore deep down the area of their interest. All children have natural tendency to explore and know, this curious nature of the children are motivated and nurtured in child-centred education. Self-activities make the children self-reliant, expressive, and perseverance to their respective goals. c. Spontaneous development: In traditional education, the development of the child is restricted by the very stringent and narrow curriculum, often the child feels himself/herself as alienated to such systems. They don't get the opportunity to synchronize with the educational process and thus lag behind the natural flow of his development, especially in emotional and social domains. Child centred education keeps the child at the centre of all pedagogy designed to the child's own comfort level so it helps the child to progress at his own pace spontaneously as per his/her own interest. The teacher's role here is just to facilitate the process of development by guiding the child and providing a supportive environment. d. Education-based on experience: An important characteristic of child centred education is to prepare the child to learn from their own experience and the resulting development in the child is permanent. The course and subjects in child-centred education are designed to facilitate experience-based knowledge assimilation to meet the need of the child. The child is the centre of the whole education process. The role of the teacher is like a guide and mentor to provide complete freedom to the child to grow naturally based on permanent experiences. Child-centred Education is the ideal system to manifest the latent talent of the child. e. All round development: Child-centred education is an outcome of the movement of progressive education which was a revolt against considering education a tool of changing

40 GE-ED-31 NSOU human behaviour as per the need of the society. As a result of it, child-centred education is practiced not as a tool but as a need for the overall development of the child. When a child gets the freedom to explore and experimentation he/she learns through his/her own interest and develop the insight to understand himself, this helps to overcome the faults, limitations, and reluctance. The child through practical experiences and inner knowledge able to proceed towards achieving emotional, intellectual, moral, social, and spiritual development to move to the state of completeness f. Choice and Consequences: In child-centred education, children are empowered as they take responsibility for themselves as learners and community members. With such responsibility brings the freedom of mind and trust in themselves and society. Child centred education act as a garden where children can explore joyfully by their own to learn and teachers are the gardener with a responsibility of creating an environment where children can experience their own choices and consequences. This is how learning takes place in a child-centred educational setup. g. Empathy, caring and mutual trust: Children learn better and develop to their highest potential when child and teacher both respect each other and there is empathy between them. Child-centred education has these characteristics, it gives the teacher a scope to understand the need of children and to act as a caregiver not just their instructor. The learning groups are generally small, thus teacher can give individual focus on every children's need, and student develops lifelong interpersonal relationships with their teachers. Teacher and students with such a level of bondage, empathy, care, and trust creates an emotionally and physically safe environment of learning that helps them to develop as a 'whole'. h. Taking reasonable risk: When the education is child-centric where children grow and develop in such an educational functioning where they are the centre of focus and learning is on their own interest and effort, there is always a chance of failures or setbacks. In order to succeed the children should experience failure and obstacles so that they can know how to overcome it by proper solution. Child-centred education advocates about taking a reasonable risk by the children so that they can know how to overcome it or how to look for solutions but such risk should not threaten the children's overall development and health. The teacher, here plays the role of control to keep the level of any such possible risk under check. i. Collaborative learning: As caring, sharing, and learning is the key to child-centred education so it makes collaborative learning an important characteristic of child-centred education. Collaborative learning occurs when children with similar interest and curiosity come together to explore, experiment, and learn together. Collaborative learning can also take place

41 NSOU GE-ED-31 in presence of a teacher where the teacher instead of acting as an expert simply act as a co- learner. Collaborative learning makes students with different backgrounds, race, or upbringing, to work together. They come together in a setting that may not be possible if it were not for collaborative learning. In order to solve a given problem, children need to communicate. They can hear different opinions and learn more about different cultures. The collaborative learning methodology is ideal for children that have difficulties in a social setting. 2.4.3 Issues related with Child-Centred Education We have already learn, that child-centred education is a result of the movement for progressive education, but even after so many decades the educational system around the world are not completely shifted to it. Most of the countries are still following the traditional teacher- centred and rigid curriculum based education. This issue is multifaceted in nature, one of the main reason behind the non-acceptance of child centred education is its high cost. The progressive education aimed to meet the right to education of every child but child-centred education demands individual commitment to every child for that large number of educators are required that is not economically sustainable for the majority of educational organization. Especially for poor nations and nations with high population density, such individualized education through child-centred education is impossible to achieve. Even in most countries where such education exists, it has become a luxury for the elites. Though in a blended form where child-centred education is incorporated in the traditional methods it has gained popularity in recent days. Educationists often criticize that child centred-educations are based on the social and cultural philosophy of west without taking any cross-cultural validation in the account. So an approach that may be valid in the city of London may not be applicable at the rural and tribal belt of Indian villages. So non-existence of a uniform code of functioning and operational design is an important issue faced by the child centred education. The teachers are the important pillar of any pedagogical model, the same is true for child-centred education also where the child is the focus of all activities. For such educational practices, it is very essential to have teachers or mentors who can understand the need of every child. They must also have the highest level of communicative skills and psychologically competent to understand the state of emotions of the children and their state of preparedness. It is very difficult to train such professionally competent teachers on a mass scale as it needs years of experience for the teachers to reach that level. Thus, making child-centred education accessible to every child is a challenging task, so its large scale operational feasibility is constrained by intellectual resources also and this is a big challenge standing in the way of universalizing it.

42 GE-ED-31 NSOU 2.4.4 Progressive Education: Origin and Philosophy In this section, we will discuss the origin of the movement of progressive education more elaborately and will try to understand the philosophy behind it, as most of the popular educational methods find their roots deep down in this movement only. Near the end of the 19th century, a series of reform movements known collectively as "Progressivism" gained momentum and soon made an impact on politics, culture, journalism, social services, and education in the United States. It resulted as a reaction to the problems created by the dramatic increase in urbanization and industrialization that characterized the second half of the 1800s which made a severe stratification of the society into different classes both economically and socially. Although progressivism was never an organized and unified movement, it found expression through many separate societies and many individual reformers such as Jacob Riis, Sinclair Lewis, and Jane Addams. One of the major concerns of progressivism was the quality life of the child. Its supporters made efforts to improve health care and nutrition, build children parks and amusement centres, protest against child labour and raise voice for securing human rights, make education freely available to every child, and altering fundamentally the nature of schools and schooling. One of the strong voices in that element of progressivism was that of John Dewey (1859-1952), who played a key role in changing the focus of education from the school to the student. He believed that a dictatorial, formal, and suppressing school environment was inadequate preparation for life in a vibrant democracy. He understood that children were naturally playful and curious, and held that it was through these qualities that the most meaningful learning could take place. At the famous University of Chicago Laboratory School, he and others developed curricula and methodologies that focused on activities and projects, discovery, investigation, and real-world experiences. Dewey declared that education was not a preparation for life, but a part of life itself. He believed that teacher's or mentor's supervision and guidance was essential for a good classroom but did not need to become oppressive and inflexible. Dewey also had a mammoth influence on teacher training, primarily by establishing teaching methodology as a science and ensuring that it was as important as mastery of any subject area on the path to teacher certification. All the forms of education that exist today against the rigidity of traditional education is originated as a consequence of the movement of progressive education. This pedagogical movement values experience over learning facts at the expense of understanding what is being taught. He argued that education should not just present the facts in front of the students to be learned mindlessly without understanding its relevance

43 NSOU GE-ED-31 that will be forgotten by the learners very quickly. He considered education as a journey of experiences and hence progressive in nature, learners must build upon experience over the previous ones to find and learn new things. Traditional schools always try to create a world separate from the students' life that means the contextual nature of learning is completely missing. Dewey always supported that school activities of the students must always be connected to their real life experiences or learning will never occur in a true sense. Progressive education emphasized over connecting the psychological aspects of the students with the society, family, and physical environment, thereby making the journey of learning joyful and memorable for the complete development of the student. The philosophy behind progressive education says that teacher is not the centre of education any more they are basically the facilitator. Teachers should teach the children how to think, explore, and experiment rather than relying on the rote memorization of unverified facts. Learning by doing is at the heart of progressive education. This form of teaching-learning process is called 'experiential learning', where students participate in hands-on projects and group works that allow the students to use their cognitive abilities to find out the solution and learn from mistakes to propagate the process of knowledge generation as well as assimilation. Progressive education is the best way of educating students through real life experience rather than the experiences of others. It advocates making school a place of creativity, critical thinking, and interaction with peers, it prepares the students to be a better member of the society through utilizing its skills and also by preserving their own individuality. 2.4.5 Principles of Progressive Education Progressive education was a drive that started to bring equilibrium between the individualism and community of the 19th century. Community refers to the socio-cultural structure comprised of people of different caste, religion, language, race, and sex. In the 19th century, countries like the USA had a much divided community of affluent and poor people, also it was cursed with racial discrimination. Education was also affected by such discrimination so some of the leading visionary educationists like Dewey wanted to give individualism of the people preferences over the communal separation. He tried to bring individualism and community together with the movement of progressive education. The progressive education aimed to bring individual and community together was initiated based on some fundamental principles. Some of the most important principles are described below : (1) Progressive education is based on the principle of harmonious relation between the learner, teacher, and the environment. It assumes that each child is unique and their

44 GE-ED-31 NSOU educational needs are also unique, so it is essential for the teachers to understand their special needs. Progressive education is best accomplished where relationships are personal and teachers design programs which honour the personal trait, linguistic, and cultural diversity of the local community. (2) Curriculum balance is maintained by a commitment to children's individual interests and developmental needs, as well as a commitment to the community within and beyond the school's walls. Progressive education demands the active participation of the community in the process of pedagogy as general education cannot meet the individual needs if not prepared in the context of the need of the community. (3) Schools following progressive education cuddle the home cultures of children and their families. Classroom activities are the mirror of these values and aimed to bring the various cultural perspective together. This helps in overcoming the barrier of any dominant culture and bring respect to multicultural societal structure. (4) Progressive education considers that students are active constructors of knowledge and learn through direct experience and primary sources. The teacher should only act as the facilitator with the primary aim of providing socially, emotionally, and physically a supportive environment conducive to the overall growth and development of the students. (5) The school is a model of democracy and human relationships. It is the tool for confronting issues of racism, classism, and sexism. Education should impart a sense of justice and equality among the learners so that every society can overcome the long running discriminations among the different sections of the society. (6) Schools actively support critical inquiry into the complexities of global issues. It empowers the learners to understand the problems at the global level, prepare them to take the responsibilities for the entire human race irrespective of their own social status and political considerations. Children or learners can thus assume the powerful responsibilities of world citizenship. 2.5 Individual Difference Among the Learners: Diversity of Language, Caste, Gender, Community and Religion 2.5.1 Concept of Individual Difference The study of individual differences helps to understand not only what makes humans similar to one another, but also what makes them different. By considering the variations 45 NSOU GE-ED-31 that can occur from one person to another, one can best be understood with the full range of human behaviour. According to the 'dictionary of education' by Carter B. Good (1959) : "Individual differences stand for the variation or deviations among individuals in regard to a single characteristic or number of characteristics." Also "It stands for

100% MATCHING BLOCK 14/32

W

those differences which in their totality distinguish one individual from another.

So, we can say that individual differences are the differences among humans that distinguish or separate them from one another and makes one as a single unique individual." In psychology, especially in educational psychology, the individual difference is the basis upon which the children are compared with each other. Studying and understanding individual difference make the educators capable of recognizing the small variations as well as the extreme differences among the children. In this way, it becomes easier for the educators to identify the children those having special needs. Individual difference enhances the understanding of the developmental process of children at its various stages. We know that

each learner is a unique individual, with different shades of cognitive and affective development, social maturity, linguistic ability, motivation, aspiration, learning styles, needs, interests, and potential. Apart from this, there are other factors

underlying student differences like differences in intelligence,

75% MATCHING BLOCK 18/32

SA

Hemlata M.Ed 19-21.docx (D140533047)

differences in social and economic background, variations in past learning experiences, and perhaps variations in the level of harmony between the learner and the curriculum. Given these factors, catering for individual differences is intended neither to minimize the gap between individuals nor to even out their

performances and skills. In fact, understanding individual differences

61%

MATCHING BLOCK 19/32

SA

Hemlata M.Ed 19-21.docx (D140533047)

should aim for understanding why learners are able or unable to learn well and finding appropriate ways to help them learn better.

Education aims to enable every learner to attain all-round development according to their own attributes. The goal of this universal education is to provide support and guidance in accordance with the abilities and learning needs of the learner so that they can develop as a complete individual. 2.5.2 Types of Individual Difference So we have read that differences and vibrations exist among human beings, making every individual a unique creation. All the differences can be considered to belong to three major categories - physiological differences, psychological differences and environmental

46 GE-ED-31 NSOU differences. Physiological differences are that variations amongst us which are associated with our physical structure and composition. Psychological differences are associated with the differences in our mental state, emotional consideration, cognitive aspects whereas all other external factors like economy, religion, caste, community etc. that creates variations in humans are referred to as environmental differences. Let's see in detail some of the sub-factors of these three categories of individual difference that are present amongst us: a. Physical difference: It includes all those differences that are associated with the physical attributes of a human being. The differences in our skin colour, eye colour, hair colour, texture, length and structure of our hand, leg, neck, and ear belongs to this category. Also, our way of walking style, speech, and other body language belongs to it. b. Intellectual difference: No two human have the same level of intellectual or cognitive abilities. Every individual has a different level of thinking, reasoning ability, creative potential, and problem-solving capabilities. Even if we take general intelligence we see people differ in their levels of intelligence, some people are genius, some are bright, some are normal whereas some are below normal and also a few may be idiot. c. Motor difference: Though it is somewhat similar to physical difference but unlike physical difference motor differences are mainly associated with all the various motor abilities that we human can possess. It includes differences like muscular movement, reflexes, steadiness, resistance to fatigue, ability to run, jump, and flex etc. d. Emotional difference: Individual differences also exists between the human in the form of emotional state. Some people are emotionally very stable and expressive whereas some are unstable, immature, and unable to express it. This is the reason why we see some people who are very caring and loving whereas others are introvert and rarely express their feelings. e. The difference in achievement: It has been found through achievement tests that individuals differ in their achievement abilities. These differences are very much visible in reading, writing and in learning mathematics. These differences in achievement are even visible among the learners who are at the same level of intelligence. Such differences are the consequences of the differences in the various factors of intelligence and the differences in the various experiences, interests, and educational backgrounds. f. The difference in interest and aptitudes: Variation also exists amongst us based on our field of interest, that's why some of us love to meet people, go to picnic, travel to different places, and attend social functions like parties very often. Whereas we also see people who are less interested in such social activities, they like to stay in isolation, do

47 NSOU GE-ED-31 work solo rather than in partnership etc. Similarly, people also have a difference in their aptitudes, like some people have mechanical or engineering aptitude whereas some have aptitude in art and music. g. Racial differences: There are different kinds of racial differences. Differences in the environment is a normal factor in causing these differences. This difference generally makes some people of a particular race taller, darker, and physically fit than others. h. Difference in beliefs and opinion: People are found to have a difference in their beliefs like some people may believe in ghost some may not, some believe that we are the creation of all-mighty where others may consider it just the process of evolution only. Opinion of the people also differ from person to person, a person's opinion about homosexuality may be positive and supportive where others may have a negative opinion about it. i. Difference in social and moral development: Human beings are social animal but not every person has the same level of social attachment and commitment. Some people are found to have adjustment well in their social life and living happily whereas some are socially isolated, unsocial, and some even maybe antisocial. Similarly, variation is also seen in the morality of people. All people don't have the same criteria for deciding what is right and what is wrong. All the above discussed variations made us conclude that in all the dimensions and aspects of human behaviour and personality traits the individuals differ from each other and thus no one can be exactly similar to another.

2.5.3 Causes of Individual Difference So, now we have the concept of individual difference and the different types of individual differences that exist amongst us. There is a big question that needs to be answered - why the individual differences exist amongst us? Or in another way, what is the cause of individual differences among us? Two main reasons are responsible for catering to individual differences in human being and they are our heredity and the environment. Let's discuss them a little extensively.

a. Heredity: One of the most significant and fundamental causes of individual differences is heredity. It is a very common observation that in a family the resemblance between the siblings is much more than that with any other people who don't belong to that family. The individual inherits many common features from his/her parents and ancestors. When human reproduce they give birth a baby who inherits many features of both the parents, this occurs

48 GE-ED-31 NSOU due to the mixing of genes. Genetic factor plays an important role in deciding many of the physical as well as psychological features of

82% MATCHING BLOCK 20/32

W

an individual. Individuals inherit various physical traits like face with its features, colour of eyes and hair, type of skin,

the shape of skull and size of hands, colour blindness, baldness, stub-finger and tendency to certain diseases like cancer, hypertension, diabetics etc.

80% MATCHING BLOCK 23/32

W

mental traits like intelligence, abstract thinking, aptitudes and prejudices. Now it is an admitted fact that heredity differences result in the quantity and rate of physical as well as mental development

being different among different individuals. b. Environment:

73% MATCHING BLOCK 22/32

W

Environment significantly influences individual difference. Changes in a child's environment are reflected in the changes in

the personality. Psychologically speaking, a person's environment consists of the sum total of stimulation that he/she receives from conception until death. Right from the conception of the child in the mother's womb the external forces start playing their role, after the birth the child tries to adjust to the physical environment. Thereafter, slowly with development, social environment starts interacting with the child and results in the development of unique features and traits causing the variation with other individuals. So the

100%

MATCHING BLOCK 21/32

W

environment consists of physical, intellectual, social, moral, political, economic, and cultural forces. All these forces cause individual differences.

Modern psychologists believe that individual differences are caused by both heredity and the environment. Personality is also the outcome of mutual interaction between heredity and the environment. 2.5.4 Education and Individual Difference The understanding of individual difference has a huge significance in education. Extensive research work that has been carried on the individual differences of the learners have added a great part of knowledge which in return helped in improving the pedagogy. It is very important to know these differences, their correlations, origin, and causes because it helps in planning the education of a particular child as per his/her unique need. Education is deeply concerned with individual difference resulting from the variation in the level of maturity and growth of the learners also it helps to understand the differences in development as a result of education and training of the past. Education can be made more accessible, efficient, and less expensive if it can be known which differences among the people are due to training and which are due to the difference in the degree of maturity. Individual differences must be kept in mind by the teacher if the needs of the individual pupil are to be met. It should be remembered that physical and emotional differences must be met, as well as intellectual differences. The teacher must be familiar with the approaches of teaching-learning to modify the learning situation according to the need of the individual

49 NSOU GE-ED-31 learner. Any program of instruction must take into consideration the important facts about differences in individuals and traits. One thing that should be kept in consideration by the teacher while selecting his approach that there is a wide range of differences but they do not vary distinctly. Some of the differences are overlapped and correlated to each other, thus approaches must follow a common pattern so that most of the differences could be taken care of. Teacher's approach of instruction can never become effective and systematic unless the differences among the learners are not recognized, it's the irony of modern educational practices that here every learner is considered alike and so a common curriculum is imposed upon them. The traditional method of teaching intended to emphasize more the similarities of the learners than the variations. To ignore the fact that people differ in the diversity of language, caste, gender, community, and religion could be a dangerous mistake. There is an urgent need to keep the functioning of the schools flexible and adaptable along with the proper training of the teacher so that it can have the capability of supporting the proper development of all the learners with a difference. Let's see some of the common individual differences among the learners in a classroom apart from those that we have already discussed in the above sections. We will limit the context of our discussion to Indian classrooms and learners only. a. Language differences: India is a country with multiple languages, no other country in this world has such diversity concerning language and culture. Each state has its own official language and within the state, hundreds of different languages exist. So each school have a large diverse population of students belonging to different language groups. Instructions in a single language are thus not recommended as many students will not be able to follow it, thus multi-linguistic approach of teaching-learning should be followed with the emphasis on a mother tongue or native language. Language is the basis of all education, so if the language differences are not considered and taken care of then it will going to hurt all other learning and developmental areas of the learner. b. Caste differences: There are mainly four different traditional castes in India. This classification was made in ancient time based on the nature of work the person used to do. Unfortunately, in our society social classification of an individual is often made based on his work and this continued for a very long time as a result people from certain castes are considered inferior in all aspects from others. Long running caste-based discrimination has resulted in educationally backward learners. The learners from different castes thus have cognitive and affective differences as a result of discriminatory feed from their social environment. In school, such variation should be taken seriously and learners must be given special support to meet their needs.

50 GE-ED-31 NSOU c. Gender differences: Gender differences have three dimensions- physical, social and cognitive. Physically boys are stronger, more active, and restless whereas comparatively girls are gentle and patient in nature. The physical growth of the boys and girls are also not the same through all the stages of growth and development. Socially, boys tend to have large groups of friends, often outspoken whereas girls like to have few friends in schools. On average, girls are more motivated than boys to perform well in school, at least during elementary school. By the time girls reach high school, however, some may try to downplay their own academic ability in order to make themselves more likeable by both genders. Even if this occurs, though, it does not affect their grades from kindergarten through twelfth grade, girls earn slightly higher average grades than boys. Teachers must understand these gender differences should not treat everyone equally when it comes to the process of learning. It can be done by making teaching efficient and curriculum flexible only then the challenges of gender difference could be resolved. d. Community and religion differences: Religious faith and beliefs of the learners are different. Their religion and its teaching are the important social factor that affects the various dimensions of a child's development. Some religion gives more freedom towards self-expression whereas some are comparatively conservative, such things make the traits of learners different from each other. Education should allow the learners to develop under their own religious faith and in a classroom where pupil belonging to different community and religion are learning together, it becomes essential to guide them towards understanding and respecting all the different religions. Religion not only represents one faith but is also the basis of their culture and social conducts. Therefore, special attention must be given to develop the knowledge of the teachers about the religious differences and act accordingly to make the learning process suitable for all learners with differences. 2.6 Summary We discussed about the three different theories of development. Piaget's theory of cognitive development tells us about the four distinct stages of a child's cognitive development- sensori-motor, pre-operational, concrete operational, and formal operational stages. These four stages cover birth to fifteen years of a child's development. It describes how each stage is characterized by a definite cognitive goal to be achieved by the child. By the completion of sensori-motor stage the child develops the sense of permanence of the object, at the pre-operational stage, symbolic thought process starts, at the concrete operational stage he begins to think logically but it's the formal operational stage where he can also think abstractly.

51 NSOU GE-ED-31 Kohlberg's theory of moral development belongs to the group of social theory of child development. Kohlberg considers moral development as a result of one's cognitive and social development. He describes three distinct levels of moral development - pre-moral, conventional-moral, and post-conventional moral levels. Each level is further divided into two stages. At the first level of development, the morality of the child is influenced by the punishment and rewards from parents, at the second level, the moral judgments of the child are according to social norms and rules, he/she decides the wrong and right for pleasing the others and to get their social affiliation. At the final level of moral development, the child's judgment becomes democratic and he uses his conscience. Vygotsky's socio-cultural development theory emphasised over the role of culture and society in determining the development of a child. He suggested that humans are different from other mammals as human possess what he called the 'higher mental process', it is the ability to learn and evolve in close association to one's social and cultural groups. He further concluded that there are three mediators: physical tools, symbolic tools, and human mediation which are responsible for the development of a child. In the educational field he suggested that for every child there exists a zone of proximal development where the child can learn more than his/her capacity if assisted by some adult or guide. In this unit, we have discussed that child-centred education is the need of society where the child will be at the centre of pedagogy. The education will be more democratic, choice-based, collaborative, self-activity based, and self-experience centred. Despite many advantages, it also has some issues like it needs huge resources to function, specialized teachers, and lack of validation in multi-cultural classrooms. We discussed the origin, philosophy, and principles of progressive education. Progressive education was started as a movement against the rigidity of traditional education it is an effort to bring individualism and community in education together. It advocates making learning more joyful, culture- based, and child-centric. Progressive education aims to construct the knowledge among the learners directly through experiences and protect the child's right to education for all. In the end, we learned about the variations that exist among the learners in terms of their physical, mental, emotional, and social state known as the individual differences. Both the heredity and environmental forces are the determinants of the wide individual differences found in human beings. The knowledge of the individual differences among the learners has a significant implication in education. It helps the teachers and parents to understand the individualities of their children and design their teaching and nurturing methods accordingly. It also helps the learners to know themselves in terms of their own potentialities.

52 GE-ED-31 NSOU 2.7 Self-Assessment Questions 1. Explain the process of 'assimilation and accommodation' in connection to cognitive development. 2. What are the main features of pre-operational stage of cognitive development? 3. Describe Kohlberg's theory of moral development. 4. Explain Vygotsky's periods of child development. 5. What do you mean by Zone of Proximal Development? 6. Write a short note on Vygotsky's socio-cultural developmental theory. 7. What are the main characteristics of child centred education? 8. Describe some of the important issues with child centred education. 9. What do you mean by progressive education and what are its main principles? 10. Highlight the important principles of progressive education. 11. What do mean by 'individual differences' of children? 12. Explain the causes of individual differences and describe the different types of individual differences. 13. How language, community, and religion are related to individual differences among children? 2.8 References Good, C. (1974). Dictionary of education. McGraw-Hill. Hayes, W. (2007). Objectives After completing this unit you will be able to—

Explain the meaning of

intelligence; Describe the multidimensional nature of intelligence; Differentiate among different theories of intelligence;

Emphasise on the importance of intelligence in education; Describe the needs of talented and creative learners;

Understand the educational needs of talented and creative learners; Explain the concept of marginalization; Describe the

socio-culturally marginalized learners in the classroom; Explain the strategies for the education of marginalized learners;

Explain the meaning of specially challenged children; Understand the need for the education of specially challenged

learners; Explain the concepts of gender and sex; Explain the concept of gender role and factors determining gender

role; Explain the gender bias or discrimination;

56 GE-ED-31 NSOU Describe the major areas of gender bias; Explain the causes of gender bias; Describe the connection between gender and educational practices. 3.2 Introduction In a group of children (or among the individuals) we see they all behave differently, some are a very good speakers, some are good in sports, some can convince others very easily, some are very good in mathematics, some are good in science, some can solve the problems very quickly, whereas some are good in dance, arts or music. Such incidents display exceptionally good behaviour can be attributed to different traits and skills of the children like their level of interest, motivation, knowledge, passion, emotions etc. There is another very important factor which also plays a very important role in deciding the behaviour of human which is known as 'intelligence'. Intelligence has been a very interesting topic of psychology, especially in educational psychology for a very long period. Despite having such a long history of understanding there is no standard definition of what exactly constitutes intelligence. Some researchers have suggested that intelligence is a single general ability. Others believe that intelligence encompasses a range of aptitudes, skills, and talents. The same goes with its definition, this unit will first explore the concept of intelligence, various constructs or factors of intelligence, and its relation to learners. In most societies we have seen that some people are considered least important, they are not the part of mainstream of society, and such people are culturally different and neglected. They are termed as the socio-culturally marginalized people. Children from such groups of people are subjected to discrimination at schools and they often find education unsuitable to meet their needs. This unit will thus explore why such children are not the centre of society and what can be done for their education. Another important group of children in our schools are those who are suffering from some kind of disability which may be physical or mental. Such children also find education inaccessible, but it is the disability of the society to provide them the appropriate opportunity of learning. In such case it becomes essential to learn how education should be structured to include them also in the present process of teaching-learning by not considering them as disabled but believing in them as a 'specially abled' or 'specially challenged' learners. Most of the schools and educational institutes in India are co-educational in nature, where both boys and girls enjoy the learning experience together under the same roof. Boys and girls are the two genders that may behave differently in the classroom and their individual

57 NSOU GE-ED-31 need may also be different. The educators need to understand the psychological and social aspects of gender so that they can be better equipped themselves to understand the student's gender based differences and needs. Both the gender of students come from many different, culture, families, region, and religion, thus forming the base to have a wide variety of experiences which shapes their gender outlook. The biological factor also plays an important role in determining the student's gender perception. The last section of this unit will explore the meaning of gender, issues of gender bias and its effects on educational practices. 3.3 Intelligence: Multi-dimensional Constructs of Intelligence and Addressing the Talented and Creative Learners in Schools 3.3.1 Defining Intelligence Throughout the psychological history of intelligence, it has been a controversial field of study as despite being a topic of interest of many psychologist and educationist there is a considerable amount of disagreement about the nature of intelligence and about what component make up intelligence. Throughout the timeline of the development of theories of intelligence, researchers have proposed various definitions. Some of the most popular definitions of intelligence are given below: Stern (1914) : "Intelligence is

100%

MATCHING BLOCK 27/32

W

a general capacity of an individual consciously to adjust his thinking to new requirements.

It is the general mental adaptability to new problems and conditions of life." Wagnon (1937): "Intelligence is the capacity to learn and adjust to relatively new and changing conditions." Jean Piaget (1952): "Intelligence is the ability to adapt to one's surroundings." Apart from these three, there are numerous definition of intelligence but all of them if taken separately gives the incomplete picture of the intelligence. The first attempt to give a comprehensive picture of intelligence was done by David Wechsler (1944), according to him "

Intelligence is the aggregate or global capacity of an individual to act purposefully, to think rationally, and to deal effectively with his environment."

The current development in the field of intelligence suggested that intelligence is the (a) ability to learn from the experience by acquisition, retention, and use of knowledge as per the situation, (b) ability to identify the problems posed by the environment (c) finally,

58 GE-ED-31 NSOU to have the skill and knowledge for finding out the useful solution of the problem and learn from the experience to use it in future. On a conclusive note, it can be said that intelligence is a kind of mental energy, in the form of cognitive abilities, available with an individual which enables him or her to handle the environment in terms of adaptation to face novel situations as effectively as possible so that the individual can lead a successful and happy life.

3.3.2 Theories and Multi-dimensional Construct of Intelligence Just like the definition of intelligence, there are numerous theories of intelligence, none of them is absolute and there does not exist any unified theory of intelligence. Various eminent psychologists proposed many theories to explain how intelligence operates and what kind of behaviour is to be expected from an intelligent individual, these theories are an attempt to reveal the dimensions or factors of intelligence. All the theories of intelligence are basically representing two different paradigms of intelligence, one of them considers that the intelligence of an individual is a single factor structure or one-dimensional. That means a person who is intelligent in one field or area of life he has the ability to excel himself in all other fields of life. Conversely, a person who fails in one area of life is also unable to perform well in other fields. This theory belongs to the old school of thought, longitudinal studies showed that people who failed in some particular field later did exceptionally well in some other fields of life. So, this paradigm of intelligence theory lost its popularity with time. Later, with more progress in the field of intelligence research, a new paradigm emerged that supports the multifactor or multidimensional nature of intelligence. E.L. Thorndike was the propagator of this theory, it considered intelligence to be a combination of numerous separate elements or factors, each one being a minute element of one ability. There is, then, no such things as general ability or single factor and there are only many highly independent specific abilities which go into the accomplishment of different tasks. One-factor theory and multi-factor theory represent two extreme views or paradigm of understanding and functioning of intelligence. Thus, being an intelligent person in mathematics does not guarantee the success in science and arts as per one-factor theory but if we believe in multi-factor theory, an individual has the potential to be creative in many different fields at the same time. This indicates that there is maybe some correlation between the successes of a person in two or more fields of life. This concept is not new, it was Spearman (1923) who first tried to explain this multiple intelligence through his two-factor theory.

59 NSOU GE-ED-31 3.3.2.1 Spearman's two-factor theory : Spearman proposed this theory in 1923 as he advocated that intelligence consisted of a general factor (g) and several specific factors (s). All the intellectual activities involve common mental energy which has some upper threshold and runs through all the different tasks this is known as the 'general factor.' For example, consider a child excellent in languages - English and Hindi, it is partly due to his general intelligence for languages and partly due to the specific skills, abilities, and interest in English and Bengali separately which he might possess. So, intelligence in multiple areas is seen among the individual when a general intellectual ability 'g' combines with the specific intellectual abilities in other fields say s_1 , s_2 , s_3 etc. forming the total intelligence of 'I' of the individual. Mathematically, Thus, it may be represented as, $I = g + s_1 + s_2 + s_3$ One important aspect is that the specific factor does not act independently it is influenced by the state of readiness of the individual, social, and physical environment also. Spearman's theory could explain multiple intelligence well but still, there are some serious drawbacks to it. Two-factor theory does not mean that there are just two factors in fact there may be more than two factors g, s_1, s_2, s_3, s_4 ...and these specific factors are not mutually exclusive. These factors may overlap and the result of overlapping was not explained by Spearman's theory. This explanation was later made by Thurston, when he proposed his 'Group Factor' Theory which emphasises that various factors come together to give rise to a group factor essential for some particular task. Thus, there may exist many such group factors responsible for various intellectual abilities in an individual.

3.3.2.2 Guilford's Model of Intellect : J.P. Guilford and

his associates proposed a model of intelligence. It was based on the factor analytical research studies conducted by them

that involved series

of intelligence test. They concluded that all intellectual activities can be described in terms of three basic dimensions or parameters—

operations, contents, and products. Operations are what the respondent does. These include cognition, memory recording, memory retention, divergent production, convergent production, and evaluation. Contents refer to the nature of materials or information on which intellectual operations are performed. These include visual, auditory, symbolic (e.g., letters, numbers), semantic (e.g., words) and behavioural (e.g., information about people's behaviour, attitudes, needs, etc.). Products refer to the form in which information is processed by the respondent. Products are classified into units, classes, relations, systems, transformations, and implications. Since this classification (Guilford, 1967) includes $5 \times 5 \times 6$ categories, therefore, the model has 150 cells represented in fig 1.2. Each cell is expected to have at least one factor probability;

60 GE-ED-31 NSOU some cells may have more than one factor. Each factor is described in terms of all three dimensions.

The above mentioned theories are representations of the psychometric approach to understand the intelligent behaviour. Fig 1.2 Guilford model of the structure of intellect 3.3.2.3 Gardner's Theory of Multiple Intelligence The theories of intelligence that we discussed so far are based on the notion of factors, but Howard Gardner opposed this concept of the general factor of intelligence and proposed the theory of multiple intelligences based on the consideration that intelligence can be best described in terms of some fundamental cognitive functioning in human. According to him, intelligence is not a single entity; rather distinct types of intelligence exist. These intelligence are independent of each other. It means that, if a person exhibits one type of intelligence, it does not necessarily indicate being high or low on other types

of intelligence. He asserted that human intelligence or cognitive competence can be better described as a set of individual's multiple abilities, talent, and mental skills related to multiple numbers of domains of knowledge in a particular cultural setting.

Gardner also put forth that different types of intelligence interact and work together to find a solution to the problem. Gardner studied extremely talented persons, who had shown exceptional abilities in their respective areas, and described eight types of intelligence. These are as follows: (i) Linguistic intelligence: It is the capacity to use the language fluently and flexibly to express one's thinking and understanding others. Persons high on this intelligence are wonderful speakers, i.e. they are sensitive to different words can create mental pictures of

61 NSOU GE-ED-31 the context in the listener's mind through their speeches. Poets, lawyers, teachers, lyricists, and writers are very strong in this component of intelligence. (ii) Logical-Mathematical intelligence: This intelligence reflects skills in scientific thinking and problem solving. Persons high on this type of intelligence can think logically and critically. They can do deductive reasoning very easily, can solve puzzles and encryptions quickly. They are mathematical genius, problem solver, and super quick with numbers. Scientists, Philosophers, and Nobel Prize winners are likely to be strong in this component. (iii) Spatial intelligence: Such people have exceptional skills in forming visual images and patterns. It refers to the abilities involved in forming, using, and transforming mental images. The person high on this intelligence can easily represent the spatial world in the mind. Pilots, sailors, sculptors, painters, architects, interior decorators, and surgeons are likely to have highly developed spatial intelligence. (iv) Musical intelligence: This intelligence is reflected through sensitivity to musical rhythms and patterns. It is well demonstrated through one's ability to compose music, to hear themes in music, and to understand the minute change in pitch and rhythms of sounds. Musician, singer, musical instrument players, and composers are likely to have such kind of intelligence. (v) Bodily-Kinesthetic intelligence: People with such intelligence can flex their body usefully and creatively which not only looks aesthetically wonderful but they can use it for solving a problem and constructing new things. Athletes, dancers, actors, sportspersons, gymnasts, and surgeons are likely to have such kind of intelligence. (vi) Interpersonal Intelligence: This intelligence consists of cognitive abilities to be sensitive to subtle aspects of others' behaviours. This is the skill of understanding the motives, feelings, and behaviours of other people so as to bond into a comfortable relationship with others. Psychologists, counsellors, politicians, social workers, and religious leaders are likely to possess high interpersonal intelligence. (vii) Intrapersonal intelligence: Just opposite to interpersonal intelligence, intrapersonal intelligence is the awareness of one's own feelings, motives, and desires. This refers to the knowledge of one's internal strengths and limitations and using that knowledge to effectively relate to others. Persons high on this ability have finer sensibilities regarding their identity, human existence, and meaning of life. Philosophers and spiritual leaders are the examples of this type of intelligence. People with such ability have the sensitivity to all the elements of our natural world.

62 GE-ED-31 NSOU It is reflected in one's ability to relate with the natural world, to be sensitive to the degradation of nature and life. Ability to find sustainable solutions to natural problems. It is useful in recognizing the beauty of different species of flora and fauna and making subtle discriminations in the natural world. Hunters, farmers, tourists, botanists are likely to have such intelligence.

3.3.3 Importance of Intelligence in Education Intelligence is not just a cognitive function but also depends on emotional state, social, and physical environment. The majority of the students in a classroom have some kind of intelligence like linguistic, logical-mathematical, musical, body-kinesthetic intelligence etc. They may have this intelligence from moderate to high values and theories of intelligence emphasize that such intelligence is very essential for learners to gain knowledge and fulfil their need to develop completely. The teaching-learning process does not completely depend on the technique of the teacher only, the part that intelligence plays in the education of the learner must be considered strongly. In the teaching-learning process, the learner must have the general ability to learn as the learning process is conditioned by the intelligence of the learner. Both activities must meet certain conditions if they have to take place successfully. Learning is impossible without intelligence. In other words, intelligence is the basis of learning. The effectiveness of learning is conditioned by the degree of intelligence. It is a well verified and accepted fact that learners who have moderate to high intelligence are very easy to motivate, guide, and teach than the students with low intelligence as such students then need special care and resources to teach. For intelligent learners teacher can experiment with various innovative ways of teaching which will only be going to help the children as they will get the scope to use their skills and test their limits, such learners will be able to excel very high in life. They also need minimal practice in their work. It is, therefore, possible that a student with high intelligence can perform excellent in school, college or university with moderate energy and normal time. The effectiveness of teaching-learning is conditioned by intelligence. Quality education can easily be achieved if we are able to identify intelligent learners, understand the type of intelligence, and able to foster intelligence in them.

3.3.4 Talented and Creative Learners in the Classroom We already know that in a classroom no two children are the same they differ cognitively, emotionally, socially, and physically this variation which is popularly known as individual differences creates a special group of children called 'exceptional children'. According to Telford and Sawery (1981) "the term exceptional children refers to those children who deviate from the normal in physical, mental, emotional, or social characteristics to such a degree that they require special social and educational services to develop their maximum potential." Among the various kind of exceptional children, talented and creative learners are one of them. Generally, talented or gifted learners are the pupils with unusually high verbal skills, they score very high on achievement tests. However, the most current definition of "gifted students includes unusual talents in a range of activities, such as music, creative writing, art, and sports (Davis & Rimm, 2004)". This definition of gifted students is a result of the idea of multiple intelligence. Gifted children are often creative in their behaviour, creativity refers to the ability of the students to generate novel ideas and products which are useful as well as appreciable by society. In a classroom, the teacher needs to identify such learners who are talented and creative in behaviour. Since they are very distinct from others they are not very hard to identify, some of the very prominent traits found in talented and creative learners are given below:

- a) They learn very rapidly and easily.
- b) Uses a great deal of common sense and practical knowledge.
- c) They think clearly and divergently.
- d) They can recognize the relationship and comprehends meanings.
- e) Such learner don't practice rote learning but learn with interest and joyfully.
- f) Perform difficult logical problem solving task.
- g) Ask many questions and have a wide range of interest.
- h) They are very original in thinking, uses good but unusual methods to accomplish the task.

It is not always necessary that to identify such learner one need to conduct special intelligence and creativity test, it can be done very easily by the teacher through observation of above mentioned behaviour of the learners.

3.3.5 Needs of Talented and Creative Learners Contrary to a common impression, students who are gifted or talented are not necessarily hard to deal with socially, less healthy, or narrow in their interests, in fact, quite the contrary

64 GE-ED-31 NSOU (Steiner & Carr, 2003). They also come from all different economic and socio-cultural groups. Unfortunately, despite their obvious strengths as a learner, such students often feel boring in school curriculum unless teachers can provide them with more than the challenges of the usual curriculum. Such children have some special needs apart from the general needs of care, protection, and love like the need for extra knowledge, creativity, ingenuity, support for the development of special abilities and the need for self-expression. A school child at the junior level of schooling may have a very high level of skill with reading but if the teacher doesn't recognize it and support his/her talent then soon the child may lose this talent and his/her peers may quickly catch up with his/her initial level of ability. Without accommodation to their unusual level of skill or knowledge, students who are gifted or talented can become bored by school, and eventually, the boredom can even turn into behaviour problems. Generally, talented and creative children are very curious in nature so they keep asking unusual questions or explanations from their teachers and parents. If the teachers or parents don't understand their nature and instead of meeting their curiosity scold them or insult them then they may feel rejected and become a nuisance. Talented and gifted children look for appreciation of their ingenuity and creativity in their field of interest if they don't get it and teacher, as well as peers, give them undue attention and less appreciation, they may become too conscious of his/her superiority and develops a boastful attitude. They may start considering their peer as fools and inferior, the peers in turn consider such children undesirable and due to jealousy reject them socially. As a result, talented children become withdrawn or aggressive towards others and themselves. By definition, students with gifts or talents are capable to be creative, committed to work at levels that often approach talented adults. Other students including students with disabilities may reach these levels, but not as soon and not as frequently. Therefore, such children face difficulties in a normal school set-up where every activity are designed similar for all students with the average level of abilities. For talented children these activities do not possess any challenge either, they do it very quickly or quit it due to lack of interest and motivation. As a result, they spend the rest of the time carelessly, inattentively, and idle. Thus, lack of proper understanding of the need of such gifted, talented, and creative children resulted due to the failure of arranging proper supportive environment for them and it ultimately leads to wastage of human potentials and development of behavioural problems among the young generation of learners.

65 NSOU GE-ED-31 3.3.6 Education of Talented and Creative Children It is very common to have few exceptional children in a classroom who are talented in various dimensions and have high creative potentials but the rest of the children are average or below average. It is thus difficult to adapt a common curriculum for everyone as it will not meet their individual needs. Many educationists and philosophers advocated for well thought out special educational program for such children. Some of the plans forwarded by them are—(a) separate schools for exceptional children, (b) ability grouping or separate classes, (c) Acceleration or double promotion for talented children, and (d) enrichment program. Establishing a special school is one of the many suggestions given by the thinkers, where children with exceptional talents and creative abilities will be admitted and an entirely separate curriculum will be implemented. The environment for them will be supportive and special teachers will supervise them through their entire development. Though critics refer to such school as undemocratic and too selective in nature because education should be inclusive in nature not for some elite and special classes only. A much feasible idea is to create a separate classrooms with the same school, such grouping of students with gifted abilities will help to nurture their abilities within the normal school setup. It will require extra time and specially trained teachers to conduct such class, for nations with huge learning population this idea may not be very practical to adapt. Another concept in the education of gifted children is acceleration or double promotion. According to this scheme, the gifted and creative children are allowed to promote to the next higher class in mid-terms or promote to two classes higher after completing the session as it will give them the chance to fulfil their extra need of knowledge. The plan, though quite feasible, suffers from a serious defect in it as it creates a gap between educational ability and experience. The children who get early promotion to the advanced grade usually find it hard to adjust among children who are senior to them in age. Though intellectually at par with them, they lag behind in emotional, social, and physical spheres and thus become victim to adjustment problems. Another proposal for the education of gifted children is what is technically known as 'enrichment'. Enrichment is the process of selecting and organizing different learning experiences and activities appropriate to the children's adequate development. Such enrichment is the need of every child but in the case of talented and creative children, it will give them a greater variety of experience or tasks at a more advanced level. In

66 GE-ED-31 NSOU comparison to other schemes, the enrichment method is the best way of educating the talented and creative learner as it will not require a special school or class and will not be a burden on limited resources. This method does not segregate other pupils from the quality educational system so is ethically most democratic to be accepted by every social system. 3.4 Addressing Socio-culturally Marginalized and Specially Challenged Learners in the Classroom 3.4.1 Concept of Marginalization The concept of 'marginalization' first explained by Park (1928) in his seminal essay, "Human migration and the marginal man" where he suggested that migration of people from one land to another distant land finds it very difficult to live in some very different social environment, lack of proper adjustment resulted into abnormal personality among such people. He termed them as 'marginal man'. Later, Billson (1996) explained the concept more elaborately and explained its significance in the social realm. He distinguished three different forms of marginalization, cultural marginalization, social marginalization, and structural marginalization. Cultural marginalization refers to the situation when an individual due to some reasons choose or forced to live in two different cultures but failed to connect himself or herself with any of the two cultures. The culturally marginalized person often feel inferior in such non-connecting cultures, it results into non-transmission of marginalized culture and many cultures has been lost in history due to acculturation.

100% MATCHING BLOCK 25/32

W

People who are socially marginalized are largely deprived of social opportunities.

This marginalization is either inborn or acquired. People born with physical disabilities or in socially rejected communities are socially marginalized by birth. Whereas some are marginalized later due to various events that occur in like accidents, criminal causes, illness, mental state etc.

100% MATCHING BLOCK 26/32

W

They may become stigmatized and are often at the receiving end of negative public attitudes. Their opportunities to make social contributions may be limited, and they may develop low self- confidence and self-esteem.

Social policies and practices may mean that they have relatively limited access to valued social resources such as education, health services, housing, income, leisure activities, and work. The unified definitions of marginalization can be stated as the condition where an individual or community stays separated from the rest of the society, forced to occupy the fringes and edges and they are never at the centre of any social, cultural, economic, and political things. Marginalized people are not considered to be a part of society. Deprivation of resources essential for the prosperous and satisfactory living of a human is the most

67 NSOU GE-ED-31 common result of marginalization. Along with such deprivation of resources, marginalized individuals are also excluded from services, programs, and policies. Marginalization needs to be understood in terms of exclusion, both individual and group. Exclusion is sometimes implicit and those that commit it are often unaware that they are doing so.

3.4.2 Socio-culturally Marginalized Learners in a Classroom

For a marginalized child means he/she has been forced to be at the edge or corner of the system such that he/she is not at the centre of anything. Such things can be observed and even experienced by many of us in any school, playground, or any classroom. The children who are not like others in a classroom means those who don't talk like everyone else, those who don't have a similar taste for art or music, those who don't belong to the same culture, those who speak a different language, those who look differently, and those who dress differently are not considered to be a part of the peer group. Such children are often seen to be left alone in a school environment, sometimes even neglected by the teachers, they are the victims of socio-cultural marginalization. Children belonging to the group of people or communities who are subjected to exclusion face the same treatment in school also. They may also feel marginalized because they are poor, considered to be of 'low' social status and viewed as being less human than others. Sometimes, marginalized children are viewed with hostility and fear by their peers. This sense of difference and exclusion among the marginalized child leads to the condition of deprivation where they are not having access to resources and opportunities, lose their ability to assert their rights. They experience a sense of disadvantage and powerlessness against the more powerful and dominant sections of society who own land, are wealthy, better educated and politically powerful. Thus, marginalization is seldom experienced in one sphere. Economic, social, cultural and political factors work together to make certain groups in a society feel marginalized including the children belonging to that group.

3.4.3 Strategies for the Education of Marginalized Learners

Changes are necessary from the elementary level of education, the steps taken for universalization of elementary education in a country like India is the right step towards it. As a result, there is an increase in enrollment suggesting an increased willingness of the parents to support their children's education that can help them to come out of poverty, social isolation, and exploitative situation. The massive increase in the demand for elementary education resulted in the restructuring of the educational policies that advocates for the development of the creation of institutional mechanisms for providing education that can meet the diverse needs and expectations of all children and their parents. Though some 68 GE-ED-31 NSOU major steps have been taken which is visible in the form of improvements in a school environment the process of discrimination against the deprived, disadvantaged, and marginalized children are still continuing. It is mainly because, education in India is historically governed by the interests of elites and the upper class resulting in the exclusion of a large section of children out of its purview and making universalization of education an elusive goal. This process of exclusion can be considered as a denial of distributive justice that reinforces relational injustice, which is characteristic of India's hierarchic society. Most of the people of marginalized group or community are poor and less educated so they fail to negotiate and put forward their demands to the elite class of educators and policymakers. Any progressive society needs to put the poor and marginalized at the centre of the educational process and policymaking units so that such people can be aware of their rights to education. According to Subrahmaian (2003), "Strengthening the voice of the poor and marginalized in education is crucial, not just for effective policy formulation, but is essential to close the gap between intention and practice". So one of the best strategies to secure the education of marginalized learners is to avoid any such educational policies that result in inequalities in educational attainment and outcome. Policymakers must realize the fact that quality related problems in teaching-learning arise more frequently when the equality related issues are not taken care of effectively. Most of the backward areas don't have an adequate number of elementary school, even if they have some it is run by a single teacher and such schools are ill-equipped to address the learning needs of marginalized learners. Under various initiatives like 'Sarva Siksha Mission' large number of schools are being made in remote corners of the country, non-formal schools are upgraded to formal schools for mainstreaming the deprived children. Because of resource constraints, it is essential to correct the policy of inadequate investment and low expenditure to facilitate the holistic development of elementary education. It is also possible to decentralize the educational management, making schools and local authority together responsible for the education of deprived marginalized groups.

3.4.4 Specially Challenged Learners in the Classroom

3.4.4.1 Meaning of specially challenged children:

Not every child is born with similar abilities. In our society, many children are physically disabled like missing limbs, eyesight, hearing, speech, improper mental functioning, and may be other deformations. Over time the stigma and social narrowness associated with such children has reduced and due to social as well as educational reforms, such children are now considered as born with special abilities which are not found in others. Such children face challenges that are very

69 NSOU GE-ED-31 special in a sense as it makes them capable of overcoming situations that a general child cannot even think of. The criticism behind the use of the word 'disable' lies in the notion that it is not the child who is disabled in doing something but the disability lies in the society or environment to support the special need child. Let's take an example, a child using a wheelchair is disabled by the steps or stairs present in the school campus not because the child cannot walk. Here it's the disability of the society to fail to understand the need of the child and act accordingly to give the child a similar experience like all the other children. So, it can be said specially challenged children in a school are those children who have some special needs and requirements to behave and live like any other children, to fulfil these needs and requirements come under the responsibility of the school and society. Some of the major categories of conditions which comes under the terminology of 'specially challenged' children or learner are: Children with locomotor disability. Mildly and moderately hearing impaired. Partially sighted children. Blind. Mentally retarded educable group. Children with multiple handicaps (blind and orthopaedic, hearing impaired and orthopaedic, educable mentally retarded and orthopaedic, visual impaired and mild hearing impaired) 3.4.4.2 Education of specially challenged learners: In the year 1974, the Ministry of Welfare, Government of India under the mission of 'education for all' launched a special educational drive for the specially challenged learners called Integrated Education for Disabled Children (IEDC). The prime aim of the program is to enable such children to face life and society courageously and develop a level of self-confidence so that they can be brought to the mainstream of society with all dignity and equality. This scheme aimed to provide proper educational opportunities and environment to the specially challenged learners in the regular school along with all the other children, it also ensures their achievement and retention throughout the schooling period. Under this scheme, many special schools were made to function in close connection with normal schools. The IEDC scheme provides for a wide range of incentives and interventions for the education of specially challenged children. These include preschool training, counselling for parents, allowances for books and stationery, uniforms, transportation, readers and escorts, hostel facilities, and other assistive tools.

70 GE-ED-31 NSOU The scheme provides one special teacher for every eight children with special abilities, community involvement, and a resource room in a cluster of eight to ten schools. Several voluntary organizations are implementing the scheme in various states. As a result of these, there has been a sharp decline in the dropout rate of such children, the average achievement has improved, the enrollment ratio increased, and participation of specially challenged people in jobs has increased. Though many special schools are also present for such children their enrollment in such schools is not significantly higher than in regular schools. In fact, special schools create some sort of social segregation of specially challenged people so the emphasis is on 'inclusive education'. Inclusive education has the potential to lay the foundation of a more inclusive society where being 'different or special' is accepted, respected and valued. The best way is thus to increase the access of education to specially challenged learners and then bringing the society to get connected with them through inclusive education. As inclusive education brings education to a wide variety of students from all different background to grow side by side under the same classroom. The most essential feature of such inclusive schooling required for the specially challenged learners are given below: Inclusive curriculum: A curriculum common for all, which meets the need of all different kind of learners are called an inclusive curriculum. Such curriculum is based on the principles of equality, equity and social justice, and thus does not involve any element of discrimination based on gender, ethnicity, indigenous group, socio-economic status, and ability or disability. Such a curriculum ensures that every specially challenged learner will have an organized school where there will be enough flexibility and scope to grow and develop. For such a curriculum, it is essential to have a clear and forceful policy on inclusion together with adequate financial assistance, an effective public information effort to combat prejudice and create informed and positive attitudes, an extensive program of orientation and staff training, and the provision of necessary support services. Teaching practices: Inclusive education does not demand any new teaching methods for the specially challenged learners but it expects some modification in the existing practices by the teachers so that learning can take place conveniently among such learners. Some of the popular techniques that are used in inclusive education are group learning, peer mentoring, speaking slowly and clearly so that hearing-impaired children can do lip-reading, using models and charts, and using audio stories. Many suggest cultural contextual learning strategies like folk songs, dance, craft etc. are also very effective in teaching-learning. Language acquisition: The goals of education are the same for all children provided

71 NSOU GE-ED-31 that these goals are balanced and brought in harmony with the individual needs of each child. There are some issues associated with the current curricula like the repetition of topics, excessive exercise, less emphasis on co-curricular activities etc. such areas of content need improvements. In Inclusive curriculum subjects like language is given the highest priority as it is the basis of rest on the pedagogy. It has been seen that children with hearing problem generally need more time to comprehend, for this reason computer-aided learning and visual aided learning are important for language acquisition as an important element of inclusive education. Some curriculum also includes braille as the third language where there is a three language learning policy. Contextual mathematics and science: Subjects like mathematics are more contextual than simple the bookish or textual forms. Problems are more related to the life and society of the children so that especially challenged children with learning difficulties can learn with ease by connecting with the subject. Here also use of information and communication technology is promoted to connect the children with all other children so that they can learn in groups and share experiences. Learning is done in these subjects mostly through activity- based learning. Art, craft, and music: Art, craft, and music are very effective medium of self- expression and communication, so they are given an important place in the curriculum for specially challenged learners. It also includes many other forms like dance, drama, sculpture, carving, puppetry, etc. for self-expression and communication with the world. It also helps in developing self-confidence and self-worth in learners. Art classes use collaborative methods to encourage many students to take up this creative mode of self-expression as their profession in future life. For specially challenged students, art education also acts as a healthy leisure activity. Physical education: This component of the curriculum is essential for those children who have problems with their physical growth, movement, motor skills, mental health, social adjustment. It is well known that most children with physical challenges can play different games or perform physical activities (Dash, 1997) with little to no assistance at all. Such inclusion of physical activities like yoga, sports, swimming, health and hygiene classes help the learners to develop properly with improved attention and concentration. It also has many therapeutic effects on specially challenged learners. Specially challenged children are not different from other children they are an integral part of our society with similar needs and the same potential, it is therefore important to develop a 'school for all' having an inclusive curriculum. The curriculum needs to be balanced in such a way that it is common for all, and yet takes account of the individual

72 GE-ED-31 NSOU needs of all learners. It is also important to take into consideration pedagogical issues. The curriculum should be accessible to all and care should be taken to ensure that specially challenged learners are not segregated from the mainstream by providing them with the equal right and opportunity of an education process. 3.5 Gender as a Social Construct: Gender Roles, Gender Bias, and Educational Practice 3.5.1 Understanding the Concept of Sex and Gender Genetic characteristic and social environment are the two most powerful factors that decide the behaviour of an individual, the same is true for the perception of sex of a person. Though the word 'sex' and 'gender' are often used interchangeably but there is a conceptual difference between the two. Sex is related to one's born characteristic, it is a biological term used for male or female depending upon their sex organs like their genital and hormones. The physiological characteristics which are recommended by medical science like chromosomes, external genitalia, internal genitalia, gonads, hormonal states, and secondary sex characteristics are the criteria based on which we refer someone to be of male or female sex. It cannot be changed completely, male and female are the two extreme ends of sexes but there are some deviants where people may have features of both the sexes and they are referred to as 'transgender'. Human is a social being, sometimes social forces are dominant over the genetic traits and they play an important role to determine one's socio-cultural role. 'Gender' refers to the socially constructed roles, behaviours, attributes, and activities that a given society considers appropriate for men and women. The word 'Gender' originated from the Latin word 'genus', which means 'kind or race'. Gender is a psychological and cultural term referring to one's subjective feelings of maleness and femaleness, it is the reflection of society's evaluation of behaviour as masculine or feminine. For example, it is the society that defines boys are stronger so must get involve in education and occupation to support the family whereas girls are soft and polite so must look after the family at home. Thus to conclude, sex refers to all those aspects, which are biological and is inherent in a person whereas gender is made up by society and culture, and hence, is left to human perception. 3.5.2 Gender Role In a classroom most of the learners, both boys and girls have different beliefs, practices, and behaviour. On exploring closely we will see that they actually represent the beliefs and

73 NSOU GE-ED-31 practices of their family, community, society, and religion. This effect of society is so deep that even their perception about the various roles of both genders are influenced by social beliefs. This process of acquiring gender related behaviours and attitudes through the intervention of society is called gender socialization. It is the gender socialization which decides or in other word imposes the role to be played by the boys and girls in a society. For example, we see that in our society most of the activities are gender-specific like nursing is considered to be a female-only profession, though anyone can do it still hearing of word 'nurse' just create the perception of a female in our mind. It is the perception of the society and people around us that certain activities should be completed only by a particular gender for the reasons that they consider are best. These behaviours and attitudes that are generally considered acceptable, suitable, or desirable for people by society based on their actual or perceived sex are called gender roles. According to Block (1973) "Gender role is a constellation of qualities an individual understands to characterize males and females in his or her culture. These qualities include activities, role relations, social position, personality characteristics and a host of abilities and behaviours". Society expects us to behave according to our assigned sex, like it wants the girls to be polite, caring, nurturing and homely whereas wanting the boys to be strong, risk-taking, hardworking, and vocational in nature. When a person takes or shows any such behaviour and attitude accepted by society it represents the gender role perceived by the person. Generally, most popular cultures and societies accept two basic gender roles - Masculine that means to have the qualities attributed to males and feminine which mean to have qualities attributed to females. There are many different characteristics of gender role which distinguish it from sex: (a) gender roles are not inherited they are learned and perceived behaviour. (b) Gender roles are culture specific it varies from country to country, state to state or society to society. (c) Gender roles are affected by several factors such as age, class, race, ethnicity, religion and ideologies, in addition to the geographical, economic, and political environment. (d) Roles may be complementary or conflicting in nature. 3.5.3 Factors Determining Gender Roles We have already read that heredity does not influence the gender role but other factors like society, culture, and personal choice do affect the gender roles. Now we will discuss some of the major factors that determine one's gender roles. Personal choices: The most important factor that determines one's gender role is

74 GE-ED-31 NSOU their personal choice. Most of the time these personal choices are recognized by society but there are some contradictions too. Sometimes the personal choices are so strong that it supersedes the inherited sex and a person has the masculine attributes despite of being female and a male may prefer to have feminine attributes. Personality traits: Every person has their own distinct personality. Personality traits are multi-dimensional which are developed as a result of the interaction of the person with the social and physical environment. Personality traits determine one's behaviour in the social world and it can decide the person's gender role. Due to their distinct personality, women are often expected to be accommodating and emotional, while men are expected to be self-confident and aggressive. Domestic Behaviours: The family we live in and the community we are connected with gives us some distinct but specific behaviour as they expect it from us such as some people expect that a girl or women in a family will take care of the children, cook, and clean the home, while boys or men take care of finances, work on the car, and do the home repairs. Such family and domestic expectation of behaviours also determine the person's gender role in that particular society. Occupations: Sadly even in most modern societies and cultures still many of the occupations are gender specific. We often assume that teachers and nurses are women and that pilots, police, and firefighters are men. It is due to the social perception of occupation as the determining factor of gender role. Physical Appearance: Gender roles are also determined by one's appearance. Social contact develops the human child with a mental visualization of the appearance of typical men and women. Women are expected to be fair, slim, and graceful with long hair, while men are expected to be dark, tall, and muscular. Men and women are also expected to dress and groom in ways that are stereotypical to their gender like men should wear pants, shirt, and having short hairstyles whereas women should wear sari, salwar, and skirts with make-up. 3.5.4 Gender Bias or Discrimination We learnt that cultures and societies determine the role of various genders but not every gender in their role are treated equally by the society and the people. In a family, we have seen that sons are given priority in everything over the daughters as they are considered to be the future earning member of the family. Such discrimination or bias is seen in education also where boys are sent to the schools and girls are forced to work at

75 NSOU GE-ED-31 home and look after the others. It is not only seen in developing nations only but throughout the world, even in developed nations. Women are considered weak and inferior to men in their education, career, economic advancement, and political influence. So gender bias or discrimination can be defined as an act or action that specifically denies opportunities, job, education, health, security, financial benefits, privileges, and rewards to an individual because of gender.

3.5.5 Major Areas of Gender Bias

Birth preferences: In countries like India, bias against gender starts from the womb itself. Societies over-favouring the masculine gender are causing illegal abortions of female babies. Even in modern days when such practice is considered criminal offence people are still doing such discrimination against girl children.

Fundamental rights: The right to grow, develop, speak, freedom of expression, to live, are considered to be the fundamental rights of anyone but many societies and nation don't consider both genders equally eligible for these rights. Girls often face bias when they claim their fundamental rights, such denials of rights are seen in the form of practices as a preference for sons, early marriage, female genital mutilation, domestic abuse, sexual exploitation, discrimination of skin colour, less food, and less access to education.

Education: Education is one such area where gender bias is much greater than other fields. Girls are often denied an education by their family as they are considered to be the temporary members of the family. Boys are preferred over girls for education as such society consider men as the suitable gender for vocations and capable of earning for the family. So investing in a girl child's education is considered to be a wastage of money.

Employment: Gender inequality can also be seen in the case of employment. Women in India are primarily responsible for childcare and household. A majority of women are found in the vast rural and urban unorganized sector. According to an estimate by the National Commission on Self-Employed women, 94% of the total female workforce operates within this highly exploited sector. Employment in this sector is characterized by low pay and long hours of work. Due to various prevailing social conditions, women lack the opportunity to acquire skills and training, which could facilitate occupational shifts. Since women have to bear the major burden of domestic chores, which is a poor household is time-consuming and labour-intensive, they do not have the time and opportunity to acquire skills and training for better jobs. The organized sector accounts for approximately 10% of the female labour force.

76 GE-ED-31 NSOU Wage: Wage disparity is seen not only in poor nations but also in developed nations. Women are underpaid in most of the professions in comparison to men. From daily workers, construction workers, skilled technician etc. men are always preferred and thus paid significantly higher than women with similar competency. It can be seen in art and talent industries also where men actors are earning much more for the same project in comparison to actresses.

3.5.6 Causes of Gender Bias

Gender bias is not new it has been in our culture from the beginning of the human race but the question is what are the factors responsible for this discrimination? In India, women are treated unequally to their men counterpart in every field whether it is religious, economic, or social affairs. Now we will discuss some of the major causes of gender bias or discrimination in our society and culture.

Poverty: Poverty is the prime cause of gender disparity, it is much visible in poor nations around the world. In a developing nation like India, more than 30% of the population lives below the poverty line and among them, 70% are women. The greater number of women living below the poverty line is due to the absence of freedom, independence, and economic opportunity for women. Women in some groups or societies don't even have the rights of ownership of land, ancestral properties, and credits. They are discriminated in society as they don't have the financial strength to put their demands and rights.

Illiteracy: Literacy is the backbone of any society, it strengthens the values, culture, economy and equality of the society. People who are educationally backwards are exploited everywhere and not given equal status. Thus, illiteracy is also another reason for gender bias because in most nations it has been found that girls' literacy is far behind that of the boys and so the women are not aware of their rights and are subjected to discrimination and injustice.

Lack of job opportunities: On an average still women are less educated than men in most of the region as a result of it their job opportunities are very narrow. Apart from it women have the added responsibilities of taking care of family and children so they don't have the full freedom, abundant time and mobility like the men do so they are less preferred for any kind of jobs. Some jobs still consider women totally unsuitable for it and thus don't even allow women to apply for it, in such way jobs too are the sources of gender bias.

Customs and traditions: In India women are the centres of many social beliefs, customs, and traditions but unfortunately, the majority of them just discriminate against them as a gender. Traditional families give women lower importance and status in their all

77 NSOU GE-ED-31 customs and practices. Women have to stay inside the home, should do all domestic works, have no financial power and are not involved in any decision making process of the family these are some of the oldest traditions in families which are the origin of gender discrimination. Social attitudes: Many social activists and reformers attempted to restore honour and dignity to women, but stereotypical social attitudes still persist in our population. Despite substantial social development and technological advancement, women in our society still continue to be the victims of exploitation, superstition, illiteracy, and social atrocities. The social attitudes that women are housekeepers and should be confined to the four walls of the house is perhaps an important cause of gender disparity. They are not allowed to raise their voice regarding their own rights for the honour of the family. Lack of awareness: People become a victim and subjected to inequality when they are not aware of their capacities, powers, laws, and rights. Especially girls and women are not aware of the social and economic laws protecting them for empowerment. So they accept all form of discrimination that persist in society and families simply due to their ignorance. 3.5.7 Gender and Educational Practices School is a part of society and bear all its characteristics so the unfortunate reality of gender discrimination is also present in the school. Such bias is not going to help in achieving the educational goals. Educational practices and managements like teaching-learning activities, student's interaction, co-curricular activities, school management, and planning are the areas where such gender bias is present. Teaching-learning materials like textbooks sometimes present our societies stereotypes of presenting girls doing homely working and helping mother whereas boys are helping father in occupational works. Similarly, activities like promoting girls in dance and music and involving boys in sports also reflect the gender bias in educational institutes. The teachers need to understand that boys and girls have different needs and gender-specific requirements, teacher must work to fulfil these needs without discriminating between them. Issues do exist with school management system especially which are in remote areas and socio-economically backward regions, they also fail to provide proper separate toilets for different genders and not properly equipped to address the problems of sexual harassments. Most of the schools do not provide a gender responsive environment for effective teaching and learning to take place. In order to have a gender sensitive and neutral school, a holistic approach involving various interventions is required. Some of the intervention packages can include the following elements :

78 GE-ED-31 NSOU (a) Undertaking gender sensitization of parents, community leaders and members, teachers, girls and boys in order to raise their awareness and understanding of the need to support girls' education. A society where women are not literate and empowered will never become progressive and harmonious. (b) Teachers are the important pillar of educational structure and it is essential to give them proper professional training to understand the complexities of dealing with human behaviour and individual differences which includes gender differences also. (c) Since in most society and culture, women are the prime victim of gender inequality so empowering girls with skills for self-confidence, assertiveness, speaking out, decision-making and negotiation will help them to overcome gender-based constraints to their education. (d) Empowering boys with skills to detach from gender oppressive attitudes and practices such as aggression, bullying, and sexual oppression, and to develop the self-confidence needed to accept gender equality positively. (e) Training the school community to manage sexual maturation issues of both girls and boys with particular emphasis on menstruation management, sex education, and birth control. (f) Training teachers in guidance and counselling skills related to gender and social issues. Such guidance will help the students to understand their gender and its role in the society, it will also help the students to overcome any prevailing gender conflicts. (g) Establishing a counselling centre in school with a psychologist in order to provide services for the social and psychological development of girls and boys. Schooling age is the age of maximum social, emotional, and physical development, at this period children develop the perception about their role and identity so it is necessary to help them to develop the proper personality and gender identity. 3.6 Summary Intelligence is the mental energy available to the individual that helps the individual to cope with the environment. Spearman's two-factor theory suggested that there are two factors, one general intelligence 'g' and another special intelligence 's'. He postulated that each particular intellectual ability is a result of one common or general intellectual ability and one or more specific intelligence. Which was later explained in the group factor theory by Thurston. In

79 NSOU GE-ED-31 another theory by Guilford, he lays down a model of structure of intellect involving three interrelated and interacted basic parameters - operations, contents and products for explaining the structure of human intelligence. Later, Gardner rejected the idea of 'factors' and he defines intelligence as a set of multiple abilities, talent, and mental skills. These sets of different skills help the individual to solve problems or create things that are acclaimed by society. He defined seven such sets of intellectual abilities. Intelligence is needed in every aspect of our life, in education, it has special significance as it forms the basis for learning any new skills or behaviour. Intelligent learners are found easy to teach, guide, and motivate. Among the different kinds of children, there are may also be some exceptional children in a classroom who are physically, mentally, and emotionally much ahead of others. Some of such kinds are known as creative and talented learners who are divergent thinkers and always shows novelty in their works. Such children always need extra efforts in their regular curriculum to meet their urge for extra knowledge and challenges. Another kind of learner we have learned about in this unit is the socio-culturally marginalized learners. Children from such groups who are for some reason living in a society that does not affiliate them as a mainstream of their culture belongs to the socio-culturally marginalized learners. They need robust policies and their implementation to overcome the hurdles and discrimination in education. Another type of learners we come across are the specially challenged learners, they are the children with some form of disability. They are not obstructed from education because of their disability but by the disability of the society in failing to bring education to them. Inclusive education with a special focus on contextual curriculum, arts, music, crafts, and physical education can help to make education more meaningful and accessible to them. Lastly, we learned about gender and related issues in connection to education in this unit. Unlike sex which is determined by birth, gender is perceived by the individual from society. Discrimination between the genders is an unfortunate but common practice in everyday life, same is seen in education also where boys are always preferred for education over the girls by their families and societies. For a progressive and harmonious society it is very essential to remove any form of such gender bias or discrimination which has already been started.

3.7 Self-Assessment Questions

1. Define intelligence. Explain Spearman's two-factor theory of intelligence.
2. How Guilford's Model of Intellect is different from Spearman's two-factor theory of intelligence?

80 GE-ED-31 NSOU

3. What is the importance of intelligence in education? What are the different types of intelligence according to Gardner's theory of multiple intelligence?
4. Who are the exceptional children? What are the important characteristics of talented and creative learners?
5. What are the problems associated with talented and creative learners?
6. What are the educational practices that can be adapted to meet the needs of talented and creative learners?
7. What is marginalization and explain its various forms?
8. How the classrooms can be made suitable for marginalized learners?
9. Who are 'specially challenged' learners? What can be done for the education of specially challenged learners?
10. What is inclusive education and how is it beneficial for specially challenged learners?
11. Differentiate between sex and gender.
12. What are the factors that determine the gender role?
13. What is gender bias and what are its main causes?
14. How gender bias can be overcome through education?

Objectives After completing this unit you will be able to—

Explain the concept and nature of language; Describe the thought process of learners and critical thinking; Explain the children's strategies of learning in social context and activities; Explain the concept of a child's learning through problem-solving; 85

86 GE-ED-31 NSOU Explain the concept of a child's learning through scientific investigation. 4.2 Introduction The growth and development of children is a continuous process and during this journey, they keep gaining experiences through continuous interaction with their environment. We call this process of acquiring knowledge and experience as the process of learning. In this unit, we shall try to understand the role of language in the learning process of children and how children develop the skills of cognition and thinking. The ability to think is the basis of learning and it is not a single-layered step, it happens at different levels. Thinking has many different styles or kinds. In this unit, we shall especially focus on the critical thinking ability of the children. Critical thinking gives the ability to see the problem or obstacle from multiple directions and helps in logically solving it with the most efficiency. The complete learning process of the children is very much contextual, it depends on their culture and society to a great extent. This unit will help us to understand how the nature and social environment help in fostering the problem-solving nature of the children. Teachers, parents, peers, and friends also play an important role in the learning process of children. So learning is a complex process that is multi-dimensional but could be transferred from one person to another, if the physical, emotional, and social environment is conducive for it. 4.3 Language, Thought Process, Learning and Critical thinking 4.3.1 Language Language and its nature: All living organisms can develop a mechanism to communicate with each other, it may be in the form of sound, sign, color, light, and gesture. The most structured form of such communication is seen among humans and it is known as 'language'. Human languages are unique among the other animals as it is not dependent on a single mode of transmission like sound or sight. Most of the human languages have a written script and these languages are highly subjected to culture, locality, and era. Human languages are learned right from the birth of the child, which may be as simple as the cry and movements of hand by the child that becomes way more sophisticated in the form of complex verbal and non-verbal modes with the growth and development of the child. The nature and importance of learning a language is a complex process of investigation, collaboration, sharing, and discovery facilitated by language. Languages are composed of interrelated and rule-governed symbol systems making them a unique but social means of representation, exploration, and communication. Language is also an identity of an individual

87 NSOU GE-ED-31 and gives a distinguishing feature to their culture. It is important for forming interpersonal relationships, understanding social situations, transmitting knowledge and experience. Language forms the base of a formidable democratic society by directing the thought and action of its participants towards harmonious living. Language acquisition and development: Children initially learn the language at their home and later other social agents play an important role in it. Language learning is a continuous process and it goes in conjunction with the overall development of a child. Children come to school with many different languages as their mother tongue. It is important to respect their languages. Educational institutes must reinforce upon their first language as the skills learned during it will help them to acquire the second language very easily. In their early years, children develop language informally. Long before they understand explicit language rules and conventions, they reproduce and use language to construct and convey new meaning in unique ways. Later, language learning occurs in specific contexts for specific purposes, such as learning about a particular topic, participating in the community, and pursuing works and leisure activities. Language learning is a shared responsibility: Learning of language never happens in isolation, it is multi-dimensional in nature which needs the participation of many people and social institutions. Every child and student can learn languages but the responsibility must be shared among the family, teachers, peers, and even community. It is a common observation that children face difficulty in learning a second language more than their first language (mother tongue), the reason is the lack of sharing of the responsibility. The less participation of family and community sometimes makes it difficult for the learners to acquire the second language easily. Though there may be an exception in some cases where the family of the learner is well versed in the second language and participates in the process of learning through communicating with the learner. Students require ongoing opportunities to use language in its many forms. Opportunities to learn a language occur first at home and are extended as children move into the larger community. Schools provide environments where students continue to develop language knowledge, skills, and strategies to achieve personal, social, and academic goals. Teachers are the most crucial link in this chain of shared responsibility where they help in polishing their language skills through providing the proper grammatical base of the language and by making them known to its proper form and function. They help students develop and apply strategies for comprehending, composing, and responding in a variety of situations. Important parts of language learning: Language learning not only helps the learners to communicate correctly and effectively but also helps in improving the arts of language.

88 GE-ED-31 NSOU The art of all languages has five different parts: (i) listening and speaking, (ii) reading and writing, and (iii) representating. Development of the art of language helps the learners to participate most effectively in social responsibilities, communication, and personal satisfaction. (a) Listening & Speaking : An oral form of language is the fundamental form of language of the human being. It is the easiest way of sharing thoughts, feelings, opinions, support, protest, information, etc. Listening and speaking enable the learners to share concepts, ideas, and understanding about the other topics too. The knowledge domain gets enriched due to the contribution of the learners through the oral form of language as it carries the community's values, traditions, beliefs, and culture. Listening helps the learners to compile all the information from different resources and speaking helps them to solve problems and achieve the goals. To become discerning, lifelong learners, students at all grades need to develop fluency and confidence in their oral language abilities. They are benefited from many opportunities to listen and speak both informally and formally for a variety of purposes. (b) Reading and writing : Reading and writing are the more formal and permanent parts of the language. It not only helps in communicating and learning but also helps in preserving the learning. Reading and writing help learners to extend their knowledge, improve their understanding, and personal satisfaction. Reading is one of the essential steps of learning, it is a habit that needs proper support and should sustain lifelong only then the real goal of learning and development can be achieved. By developing proper reading skills and strategies learners can construct a meaningful interpretation of the written text and understand the problems so that they can direct the action toward its solution. Writing enables students to explore, shape, and clarify their thoughts, and to communicate with others. By using effective writing strategies, students construct and refine ideas, compose and revise with increasing confidence and skill. (c) Viewing and representing : This part of the language learning helps the learners to understand how the information, ideas, values, or experiences are being conveyed in visual forms. Visual media like television, computer, mobile, e-tablets, films, diagrams, maps, symbols, photographs, videos, paintings, etc. are the source of presenting and viewing the language. It is the approach that helps the learner to widen their knowledge and skills to the masses. Many of the comprehension processes involved in reading are viewing, which may not be just from the books or prints but also from all other resources too.

89 NSOU GE-ED-31 4.3.2 Thought process of the learners Thinking is a higher cognitive ability generally seen in higher level vertebrates, especially in humans thinking is mostly covert. All the daydreams, imagination, creative thoughts, problem understanding, problem-solving, wishes, reading, writing, and decision-making involve the process of thinking. Learning and developing thinking skills help an individual to comprehend the information and organize it, to connect the links and lots of ideas, make plans, investigate, and ask questions. Thinking makes us very unique beings who have morality and values. Ross defined thinking as, "Thinking is a cognitive aspect of mental activity with regard to psychological aspects". Thinking is of different forms - creative thinking, reflective thinking, critical thinking, concrete thinking, abstract thinking, or divergent thinking. Creative thinking is the ability to generate novel ideas and thoughts by breaking through the old theories, principles, and ideas. Reflective thinking is the ability to solve complex problems, thus it requires reorganization of all the relevant experiences to a situation or removing obstacles instead of relating with those experiences or ideas.

Critical thinking refers to the ability of careful evaluation of the situation to determine the authenticity, value, accuracy, and validity. It helps in careful observation of the situation to conclude without strictly breaking down the information but rather taking them as a whole. Concrete thinking is the ability to consider concepts, make generalizations, and think philosophically. Concrete thinking is a necessary first step in understanding abstract ideas. First, we observe and consider what our experiences are telling us, and then we can generalize. Abstract thinking is opposite of concrete thinking; it is the ability to think in a generalized manner then relate it to other items, ideas, events, and experiences. Divergent thinking is the ability to generate multiple solutions for a given situation or problem then use logic, facts, and knowledge to find the most appropriate solution for it. It is very essential in pedagogy to teach the learners about the process of thinking and to develop the appropriate thinking style. Teaching thinking means teaching creative thinking, reflective thinking, critical thinking, concrete thinking, abstract thinking, or divergent thinking skills to enhance teaching and learning activities. Waters (2006) explained that for language learning, the thinking process is very important. Learning occurs when an individual builds new knowledge and experiences on the older one by connecting them in their mind using the process of thinking. The thinking process of learners could be explained using the Bloom's taxonomy. It explains the learning objectives of the learners in three domains - cognitive, affective, and sensory. Thinking is the cognitive process, therefore the cognitive domain of Bloom's taxonomy explains the learning of the learners at different levels. Let us 90 GE-ED-31 NSOU now see the level at which the thinking process of the learner happens. Knowledge: Knowledge involves recognizing or remembering facts, terms, basic concepts, or answers without necessarily understanding what they mean. This step provides the resources for the learner to start thinking, they get the direction to think and goals to achieve. Comprehension: Comprehension is the step where the learner understands the facts and ideas by organizing, summarizing, translating, generalizing, giving descriptions, and stating the main ideas, these processes are the result of thinking. Application: Utilization of the acquired knowledge and understanding results in proper application of it. It happens through solving problems in new situations by applying acquired knowledge, facts, techniques, and rules. For that, the learner should be able to think about how to use prior knowledge to solve problems, identify connections, and relate them through the mental process. Analysis: At this level, the learner through the cognitive skill of thinking examines and breaks down the information into small chunks, investigates the parts separately then relates them to others, makes inferences, and tries to generalize through evidences. Synthesis: This step includes the use of thought processes for the skillful organization of discrete information into a single piece of meaningful result. Evaluation: At the last step of the thought process the learners make a judgment about the right and wrong, bad and good. It helps them to set criteria for their work based on its quality.

4.3.3 Learning and Critical thinking The nature of learning is as extensive as the entire life of a human. Learning depends on the inborn responses of an individual and it is a lifelong process that starts from the cradle and ends in the grave. Often people associate learning with all those activities which an individual learns in professional institutions like school, graduate college, medical college, technical institution, or vocational centers. It is a very wrong conception of learning that, learning is merely the process of acquiring skills by the learner which is needed to cope with one's environment. Psychologists consider learning as a cognitive process thus it has a close association with cognition and its element like thinking. Some of the popular definitions of learning process are given below:

Woodbirth - "the process of acquiring new knowledge and new responses is the process of learning."

91 NSOU GE-ED-31 Skinner - "Learning is the process of progressive behavior adaption." Crown bank - "Learning is shown by a change in the behavior as a result of experience."

95%

MATCHING BLOCK 29/32

SA

Draft Full Book.pdf (D159412383)

Crow & Crow - "Learning is the acquisition of habits, knowledge, and attitudes."

The process of adapting to the environment by a learner helps in gaining experiences, such experiences bring modification in the behavior. Learning is based on the collective interaction of all such experiences of the learner. Two factors are included in the process of learning - maturity, and the ability to take advantage of earlier experiences. For example, if a child is playing on the floor and sees an ant then out of curiosity the baby will try to touch it. If the child gets bitten by the ant then from next time due to the experience gained the child will learn to avoid coming in contact with such an ant or insect of a similar kind. Thus, Learning is the progressive change in behavior by the earlier experiences. Based on this, we can say that learning is education. Learning and Education, both indicate the same process. Both activities go on forever and everywhere in life. The child grows toward maturity, taking the advantage of his experiences. In this entire process of learning 'thinking' or thought process goes side by side. Both thinking and learning being the cognitive process complement to each other in the growth and development of a child. Critical thinking is arguably the most essential part or kind of thinking which is always desired among the learners for truly achieving the goals of pedagogy. Critical thinking is the ability to think rationally using all cognitive skills or strategies which may increase the chances for a desirable outcome. Though in pieces of literature there is no single definition of critical thinking, it is often considered as the mystified concept in educational psychology. Some psychologists consider critical thinking uses a metacognitive ability of the learner where they use the self-awareness and understanding of their own thought process to solve problems, make inferences, taking decisions, and sharpen the skills to connect the dots of information. Development of the thinking skills in the learners usually occurs at two levels - a higher level of critical thinking skills and a lower level of thinking skills. A higher level of thinking skills involve meaningful learning which require judgment, analysis, and synthesis. Moreover, higher-order thinking skills are reflective, sensitive to the context, and self-monitored. The thinking at the higher level is judgmental in nature and thus it becomes more complex but equally credible and multifaceted. It occurs in steps by combining many small pieces of information a big picture is created which means problems are solved by carefully observing and understanding each of its constituents. Lower level thinking skill is memorizing, rote

92 GE-ED-31 NSOU learning, and casual learning, which is unreflective and inapplicable. It does not help the learners to develop creative thinking skills. On the contrary, meaningful learning helps the learners to develop critical and creative thinking skills to solve any problems in their practical life. As critical thinking is multi-dimensional in nature one cannot ignore the social and democratic aspects of creative thinking. How a person will think and learn depends largely on their cultural and social context. A learner living in rural areas may not have the level of thinking to understand and comprehend the knowledge related to modern urban architecture. Similarly, learners from rich and urban societies will lack the ability to realize the sophistication of rural art and craft as they are not linked to that grass-root level of cultural participation. This contextual linkage and cultural background define the type of problem faced by the learners, resource availability to find its solution and cognition skills. Pedagogy aims to teach learners how to think critically and teachers should encourage it. The teaching of critical thinking can be of two types: (1) the teaching of critical thinking refers to teaching students trainable and assessable reasoning skills and processes, and (2) the teaching of critical thinking means teaching students those trainable and assessable reasoning skills as well as cultivating in them the dispositions and awareness associated with critical thinking. Engaging students actively in critical thinking processes through the effective use of teacher questions, discussion, and reflection in a context that supports critical thinking and values inquiry, and teachers' practicing of critical thinking skills, attitudes, and explicit explanations of the significance of critical thinking could help students to develop both the critical thinking skills and associated critical attitudes. Such skills could be developed in the learners through various activities and tasks like: (a) Debate and group discussions: Debate and discussions within a group are the healthy way of exploring the solution of any problem. It helps in targeting a problem from multiple angles and finding the most effective as well as an efficient solution. Practicing discussion sessions among the learners in a classroom helps in sharing thoughts and ideas which leads to a collective thought process. In such a process, the gaps in the thinking of an individual are filled by the ideas of others and this improves the thinking skills of the entire group. (b) Project-based tasks: Cognition should not be limited to individuals but should be shared among them so that learners can define the problem and find the solution with the cooperation of others. Project-based teaching-learning provides such an opportunity in the

93 NSOU GE-ED-31 classroom for every learner, especially it is beneficial for those who are at the lower level of critical thinking. It helps in the transition of those learners who have never gone above the memorization of the information to the level where they can learn the skill of analysis and synthesis in collaboration with those who are well skilled in a higher level of critical thinking. (c) Activity-based learning: This is a method of teaching-learning that is quickly gaining popularity among the educational administrators, institutes, planners, teachers, and learners. The main reason behind it is the ability to indulge all the participants involved actively in the process of learning through discovery and self-guidance. A teacher just acts as the facilitator of the learning where the main part of the teacher is to provide the problem then allow the learners to get actively involved with it by exploring the problem, trying different possible solutions, using metacognition to assess the progress and drawbacks. All such activities develop the skill of reasoning, judgment, analysis, and synthesis.

4.4 Learning Process through Children's Strategies, Social Context and Social Activities

4.4.1 Steps in child's learning process

The process of learning is a life-long process as we have already discussed but at certain stages of life, it has greater importance than the other stages. During childhood and adolescence when the individual goes through a drastic cognitive and affective development the formal system of learning is needed. Such a formal system to guide the learning process is known as education. According to Peel, "Learning is a change in a person which, happens according to the changes in his environment." Based on different literature one can enlist the following characteristics of the learning process - (a) By learning, permanent and temporary, both types of changes come in a person. (b) Learning is universal in nature, every individual wherever they keep on learning in every moment. Though the amount of learning and what they are learning may be different. (c) Learning is possible by social and biological adjustments or conscious purposes. (d) Learning can produce both types of behaviors - socially desirable or undesirable in a person. (e) Learning may be faulty and undesirable sometimes. What a person is learning may not be considered suitable for individual or society. (f) The development of the child occurs during the process of learning. The contribution of learning in the total development of the child is so important, hence, learning becomes the synonym of development. (g) Adjustment with the surroundings is another important characteristic of the learning

94 GE-ED-31 NSOU process. It helps us to survive, thus survival of human depends on their learning abilities. (h) Learning is purposive in nature. The goal of learning could be attained by purpose only. Purpose decides the aim of learning and provides the direction to the responses. (i) Learning leads to developing new skills, abilities, motivation, and ideas. This sometimes helps learners to use the resources for creating new products which makes the learning process a creative behavior in nature. (j) A person can use the same skills and solutions of the problem from other similar problems, which is learned in some other situations. Thus, learning is transferable in nature. These entire characteristics make learning a process that was implemented in all educational institutes. The process of learning always happens in steps, not in any abrupt fashion. Learning needs proper strategic steps to make the process more efficient and effective otherwise it will never meet the goals of learning and complete development of the children. These steps are dependent on children and the environment of the learning. Some of the important steps are discussed here. The first step is the motivation of the child. Motivation is the urge of the learner to achieve the goal for self-satisfaction. Motivation is originated in a person to fulfill his/her need, which has its purpose, being inspired with the purpose, he/she becomes active. Every action and behavior of a person has its own purpose, that means the action is purposeful, this makes purpose the second step of the learning process. The next strategic step is the complication that arises during the process of learning. On confronting the complication, the learner modifies the behavior and the process of modification comes with experience. Such experience leads to the development of new skills under the process of learning. The next step is the generation of multiple responses for the achievement of the purpose and goal. Learner repeats the successful response in the process of learning which brings the reinforcement. Reinforcement is an important step of learning which helps in the unification of all earlier knowledge of new successful responses connected to different activities. Such experiences built on older ones become part of the learner's knowledge. These are the strategic steps upon which the entire process of learning happens. 4.4.2 Strategies of child's learning process Strategies of learning are suitable for facilitating effective and comprehensive learning. Let us know how to study and achieve the learning objectives. Some of the most effective and popular learning strategies are discussed here : (a) Whole vs. part learning: Two most popular strategies used for the child's learning are learning the entire content as a whole or learning it in parts. Though it depends

95 NSOU GE-ED-31 largely upon the mental age, growth, development of the child, and complexities of the content. Learning the content as a whole is effective when the content is short and not very difficult to comprehend, also the learner is motivated enough to learn it. In the case of complex and less organized content, the best strategy is to learn the content in part then generalize the findings by connecting them to draw the complete picture of it. Such a strategy is suitable for young learners and those who are slow in progress. (b) Mediating learning strategy: This is a modified strategy over learning the 'whole' content. 'Whole learning' is good to follow when the learning content is easy and short. In case the content has some complex parts or difficult words then for children it will be very difficult to learn the entire content as a 'whole'. In such a scenario mediating strategy comes as a savior where the learner learns the difficult words or parts first then reads the entire content as a whole. It makes learning much more effective and fruitful. Learners neither lose interest nor the meaning of learning the content, it makes learning much more intensive and inclusive than the whole learning strategy. (c) Spaced learning vs. unspaced learning strategy: Spaced learning strategy refers to the method where the entire learning task is divided into several parts each separated by a certain period of time. Whereas in unspaced learning the entire learning content or task is completed in a specified period of time. A shorter and spaced learning strategy is good for younger children as it keeps their attention and motivation level high which makes them understand the content well. For highly organized and involving content one can use the unspaced learning but it always needs children who are bright with a high level of motivation. (d) Recitation strategy: It is a very popular strategy but very primitive and often criticized for lacking novelty. In this method, the same behavior of learning content is repeated over and over till the child retains it permanently in memory. This is very basic in nature of learning; it does not develop a deep understanding of the content. Such methods are often used for very small kids to learn language content and basic day-to-day tasks. (e) Memory system: Memory is often considered as a method of storing information or knowledge and then recalling it at the time of need. It also involves the processing of the stored information or knowledge to use it according to the new situation. It involves three basic steps - recall, recognition, and re-learning. This process is very similar to computers but human memory systems are not very fast as computers and can do limited processing of information through human memory systems are

96 GE-ED-31 NSOU much more fascinating than the computers which lack affective aspects of the human system. The memory system can be trained to make the learning process very fast and resource saving. For example, while learning the colors by a child instead of just reciting the different colors it is much easier to train the child's memory by connecting the color of familiar fruits with the colors he is learning. This training of memory buys association, recalling, recognition and re-learning makes the entire learning process easy and efficient.

4.4.3 Influence of social and contextual factors on the learning process

In a broader sense, learning is also a part of child's growth and development, this process starts right from the womb of the mother. Environmental factors like the mother's mental state, emotional state, physical health, care of family and society greatly influence the growth, development, and process of learning of the child. Environmental factors like culture, society, religion, family, friends, teachers, etc. remain the major influencing element of the learning process of a child. These contextual factors may affect the child's behavior and learning process in a supportive way as well as adversely, it all depends on how favorable the factors are for the child. The interaction time and conditions with the environmental factors decide the degree of support to the child's learning process and at this point, it also allows the educators and parents to develop a favorable learning environment for the child. It is the environmental factors that bring maturity in the child with age through the process of learning, so learning and maturity go side by side. Maturity has a great effect on the process of learning. Maturity means physical development. Mental ability also develops along with physical development. There are changes in the behavior of humans as a result of this development. The behavioral change happens due to maturity and learning. The process of learning goes throughout the life. In this way the development of the human being takes place. Maturity is also a continuous process of development. Maturity means that children become capable of doing something at a certain age which they were not able to do earlier. Maturity and the process of learning are closely related. As the body of the child grows towards maturity, he/she begins to use the powers within, and his/her behavior keeps on changing. For this change, physical, motor, and mental maturity are needed but it happens under the influence of various environmental factors. Maturity is needed for learning but the contextual factors of the individual always accompany it from womb to death. In order to learn the skill which requires physical and mental maturity, forcing someone to learn it early and out of context is not beneficial. Hence, it is harmful to force the child to learn, read, and get knowledge

97 NSOU GE-ED-31 of any subject. Learning under immaturity harms the child. It affects the physical health of the child as well. Coming back to the social factors, surrounding of the child - home, school, locality, family conditions like the number of members, available space at home, lighting conditions, cleanliness, noise level, availability of resources and comforts all are very crucial in affecting the learning process. At home, the family members, especially the parents, must support the learning. Parents care, freedom, support in academics, rewards always promote the learning process as it gives the learner the motivation in learning. In contrast, punishments and isolations in the home by the parents may make the learning process of the child very slow. Sometimes the adverse home environment may lead to the learning of socially undesirable behavior. Consider a society where the majority of the people live in poverty. In such an environment expecting a child to get a chance to learn or complete his learning is nothing less than a dream. In such a society, children are forced by the circumstances to start working from a very tender age to earn for their family. They hardly get time or opportunity to enroll in any formal educational institution. In a family, there is no one to support the extra expenses of their learning, nor do they get guidance from illiterate parents. Conservative societies also don't allow the girls to go to schools so they never get a chance to learn through the modern formal learning process, though very few of them at least learn some of the vocational works at home as a traditional occupation. Cultural background and social expectations also regulate the learning process. The spirit of the culture is reflected in the various social and educational institutions. The culture of the child has some demands and it determines the learning process. A society that has industry in its culture always motivates the children to learn the various tool making, technical aspects, industrial skills, and management at every early stage of the learning process. Similarly, agricultural societies focus on developing those skills in the children which will be beneficial for promoting agricultural practices. The philosophical elements of culture also influence the process of child learning. A child in a democratic culture tends to acquire democratic values and attitudes. An aristocratic or dictatorial culture promotes learning of autocratic modes of thought and behavior. Peers, friends, and teachers are other important elements of the environment that directs the flow of the learning process. The teacher is an important constituent of the teaching-learning process; Learning is facilitated and guided under the skillful methods of the teacher. The way the teacher teaches and manages the students affects their learning. An authoritarian teacher will create aggression and hostility among students while a democratic teacher will create a participatory climate for learning. The democratic environment

98 GE-ED-31 NSOU leads students to be constructive, thoughtful, and cooperative in behavior. Generally, students learn better in a democratic setup because they like democratic procedures. In such methods teachers are not the masters or instructors, they simply make the learning process of the learner easier and joyful. The teacher does not dominate the process; they can get better results by decentralizing authority, increasing the independence of students. Such methods involve encouraging students to participate in learning activities in and outside the classroom. Teachers must promote active learning in such cases where active interaction with peers and friends in and outside the classroom is also required. The relationship of the learners with peers and friends in the classroom, school, society, etc., creates a particular type of emotional climate conducive to proper learning. Such climate solely depends upon their cooperative and friendly relationship. A sound relationship provides a tension-free environment for the student to learn and to compete in the class. Peer learning should be included in the learning process as it is much more interesting for the learner. Free discussion and group tasks with friends encourage the learners to analyze the problem from a different angle and find out the solution. Free interaction of learners, peers, and teachers should also be practiced regularly. If any misunderstanding is created or arises it should be immediately clarified to maintain the healthy climate and cordial relationship among the peers and productive nature of the classroom.

4.5 Alternative Conception of Learning: Child as a Problem Investigator Children are natural problem solvers, eager to make sense of their world. Supportive adults and stimulating environments can help them develop this important skill.

4.5.1 Problem-solving and scientific investigation Problem-solving is the fundamental way of a child's learning. It is a part of everyday life and used to get the answer to everyday issues. It must be valued, promoted, and involved in everyday classroom practices. The child gets the opportunity to solve the problem in his or her daily life on different contextual grounds. Some problems are easy and take little time whereas some take much more time to solve as they are complex. Children look for alternative solutions if they do not get the right kind of resources to solve the problem at hand. In the case of solving any type of problem, the child's thinking becomes directed and focused. They try to use all their sources, both internal (like self-efficacy, grit, intrinsic motivation) and external like support and help of others to arrive at the right and appropriate decision. By observing the child closely, teachers can use the

99 NSOU GE-ED-31 child's social, cognitive, and emotional experiences to facilitate problem-solving and promote strategies useful in the life-long process of learning. Problem-solving is the thinking that is goal-directed. Our everyday activity is goal-directed. Problem-solving does not always mean solving some complex numerical or some very difficult hurdle or some obstacle that a person faces but it could be any simple activity that children do to reach their goals. Thus, there are two ends between which the learning happens in case of problem-solving, one is the problem itself another end is the goal and there are several steps and mental operations with which these two are connected or reached. The learning actually happens through the experience gained in connecting these two ends. Let's now see the steps (mental operation) through which the connection of these two ends happens. The first step is the (a) Identification of the problem: In this step, the learner confronts the problem and develops an initial understanding of the problem. It is essential to estimate the gravity of the problem at this stage. Then it is the (b) Representation of the problem: Where the learner should break the problem into parts to understand different approaches required to find the possible solution of it. Next comes the (c) Planning: Here the learner looks for all the resources necessary to attack the problem from a different angle. (d) Evaluation of solutions: At this stage, the learner takes suggestions and views from others, uses his or her past experiences, and looks for similar situations to decide about the most efficient method for solving the problem. Then follows the (e) Execution of the most suitable and effective solution: Which will meet all the criteria of achieving the goal. The learner then (g) Evaluates the outcome: Where the learner analyzes the goal achieved. If there still remain many untouched areas or the goal is only partially reached then at the final stage of problem-solving the learner (h) Rethink and redefine the problem: As well as the entire steps which have been followed. This helps them to find out the loopholes and corrections needed so that in the subsequent attempts the problem could be solved completely to achieve the goal hundred percent. The steps followed in problem-solving are scientific in nature. These steps are very similar to steps followed during a scientific investigation. Scientific investigation is a part of problem solving and children learn by investigating the world around them. Children learn by using their senses to investigate the world around them. Through investigation, children learn how things work, what things do, and why things happen. Children also learn how to keep themselves safe through investigation. For example, a child burning a piece of paper through observation may draw the inference that fire could burn them too and will cause a painful blister if they stand too close to a fire. Through investigation, children learn about living things, such as how fish swim in water, how a frog jumps, or how plants and

100 GE-ED-31 NSOU flowers grow. The natural curiosity of the children, problem-solving tendency, and investigating nature should be used by the teacher to improve their learning process. 4.5.2 Teacher's role in problem-solving and scientific investigation The range of teaching-learning activities in the classroom runs from memorization and repetition all the way to solving problems and thinking creatively. The role of the teacher in a classroom is to look for all such possible methods to model the problem and facilitate the classroom environment conducive to problem-solving. When teachers articulate the problem or situations they (the learners) have faced and discuss the different steps to solve it the children become more aware of the process and significance of problem-solving. The teacher can use blocks, models, and other objects to teach different subjects, which taps into children's fine motor skills and their visual understanding. The teacher should invite children to talk about (or write about) ideas and processes in the concerned subjects, which links their verbal thinking to an understanding of the different concepts. The teacher's role is two-fold in nature. The teacher should value the process of problem-solving and must encourage the students with trust. Secondly, the teacher must promote an environment in the classroom that is conducive to the problem-solving practices by the children. The teacher must include the development of communicative skills, cooperative learning, and ideational behavior in the problem-solving learning process. Such a curriculum of teaching-learning must have clearly defined goals and deeply rooted values in it. For the classroom to be fully inclusive, the teacher needs to make sure that the curriculum is accessible to and relevant for all children in terms of what is being taught (content), how it is taught, how the children learn best (process), and how it relates to the environment in which the children are living and learning. Children need lots of opportunities to learn through investigation. They often rely on the adults around them to provide these opportunities. The teacher plays the most important role to provide all such opportunities which not only motivate the children but also protect them from any possible danger or adversaries. There are many learning opportunities for children when investigating and exploring the natural world. There are many places which a teacher can take children to learn about the natural environment and to develop the children's curiosity. Children are naturally curious, so it is very important to think about keeping them safe and out of danger when teachers take them out on visits. Thus, the teacher is not just their guide but also their guardian. Some children have lots of opportunities to explore the local environment, but children who live in crowded cities may not have open space near to where they live. In such a case, the teacher should take them on an excursion where every child can get the opportunity to learn from nature through investigation. This

101 NSOU GE-ED-31 role in the process of learning is not only applicable for learning nature and natural science but also in learning literature, history, art, and music. Investigating and handling objects is a very good way to learn about different subjects. This can be a great opportunity for children to examine objects using all of their senses. Problem-solving and the use of scientific investigation methods let the children choose the pace and design their own learning process where they can explore all possibilities and get the most appropriate solution. Such an approach of learning among the children is effective and makes the learning as well as teaching a very satisfying and interesting activity in a classroom. 4.6 Summary Language is essential not only for communication but also required for the proper development of a child. Language acquisition is a very important step of learning and it helps in the process of learning all other behaviors. Learning of language happens due to the active participation of different agencies of societies. Teachers, parents, family members, school, culture, and religion facilitate the learning process of the children. Language helps in developing cognition and 'thinking' is one of the primes of these. Development of thinking skills and abilities occurs in many different steps and children must be properly guided through all these steps to achieve the goals of learning. Children may have different thinking styles like creative thinking, reflective thinking, critical thinking, concrete thinking, abstract thinking, and divergent thinking. Critical thinking is very crucial among the others, it has two levels - higher level and lower level of critical thinking. Both the levels have different requirements in the process of learning of the child. Society and culture are two important environmental factors that affect the critical thinking and thus the learning process of the children. Children use the thinking skill in close association to the environment for solving the problems with which they are confronted in daily life. Children are natural investigators, they observe nature, identify the problem, plan the solution, execute the plans, find the solution, re-analyze it, and modify the process. Thus, the learning process is complex with multiple dimensions and it is essential to understand each of the dimensions carefully to utilize the available resources for efficiently meeting the goals of pedagogy. 4.7 Self-Assessment Questions 1. What is the nature of language? Why is learning a language important? 2. Describe the different important parts of language? 3. What is thinking? What are the different forms of thinking?

102 GE-ED-31 NSOU 4. What are the steps involved in the thought process of the learners? 5. Why is critical thinking important in learning? 6. How critical thinking could be fostered among the learners? 7. What is the nature of learning? What are its characteristics? 8. Describe the steps of the learning process. Explain some of the important strategies of learning. 9. How context and society could influence the learning process of a child? 10. What is the importance of family in the learning process of a child? 11. How can a teacher help in promoting a problem-solving environment in the classroom? 4.8 References Atkinson, D. (1997). Objectives After completing this unit you will be able to— Explain the concept of

teaching; Describe the nature of teaching; Describe the function of teaching; Explain the types and significance of teaching; Describe the factors contributing to teaching and learning; Describe the concept of teaching-learning materials; Describe concepts and different types of teaching-learning materials. 5.2 Introduction Teaching-learning is the interlinked or mutually connected event and considered as the heart of all educational events. Through teaching knowledge, skills, experiences, and culture are being transferred from one generation to the another. This unit will explore all the aspects of teaching including its concept, dual nature as 'arts' and 'science', three-factor functioning, its types, and significance. Teaching-learning is aimed at the development of the learners into a complete personality. For the complete development of the individual, the role of personal factors and environment are vital as they affect the teaching and learning process. We will explore a few of such factors like intelligence, motivation, emotions, and environment (social environment) in this unit. It is very essential for the teacher to meet the objectives of the teaching-learning at the end of the present session, it is very difficult for them to achieve it even if they know the entire curriculum and have a long experience unless their practice in the classroom is supported by the aiding materials called the teaching- learning materials (TLM). TLM is discussed in detail in this unit to explain how various different types of TLM help in making the process of learning interesting, joyful, effective, meaningful, and satisfactory for the learners as well as for the teachers. 5.3 Teaching 5.3.1 Concept of Teaching Learning is the ability that makes humans distinct from all other living beings. Learning

105 NSOU GE-ED-31 exists in other living beings too but in the humans, learning process and the abilities to acquire knowledge are extreme. The main reason behind it is our highly developed intellect and well-structured society. People from society impart or transmit the skills, knowledge, understanding, information, tradition, history, and culture to the other younger people, this act of transmission is popularly known as teaching. Teaching may also mean sharing present and ancestral experiences or communicating information for example lectures. According to educational psychologists, teaching is the process of modification of behaviour of individuals. In education, teaching is tandem to learning, teaching generates experiences that result in learning, and learning in return opens up new opportunities to explore the unknown that teaches more new experiences. Dewey (1934) once described education comparatively as "education is learning just as selling is buying". Different educationists have different ideas about teaching, some of them are mentioned below:

Morrison (1934): "Teaching is intimate contact between a more mature personality and a less mature one which is designed to further the education of the latter". John Brubacher (1969): "Teaching is arrangement and manipulation of a situation in which there are gaps or obstructions which an individual will seek to overcome and from which he will learn in the course of doing so". Gage (1963): "Teaching is a form of interpersonal influence aimed at changing the behaviour potential of another person". Edmund Amidon (1967): "An interactive process, primarily involving classroom talk which takes place between teacher and pupil and occurs during certain definable activities". From all the above ideas it can be asserted that teaching is sophisticated, goal-oriented, and multi-dimensional in nature. Educationists and psychologists found mainly two different concepts in the process of teaching. Some view teaching as simply the process of conditioning of behaviour and thus consider it as what a teacher does in the form of stimuli to bring the environment conducive to proper conditioning. Whereas those who view teaching as an individual effort of 'knowing' consider it as a process of following a set of steps designed for learners to define their own purpose and problems and preparing the plans to solve those problems to achieve the purpose of 'knowing'. Teaching and learning are the two sides of the same coin, they represent a well-designed continuous set of events that are aimed to bring desired changes in behaviour. Teaching is an intentional activity that means that teaching may not logically imply learning,

106 GE-ED-31 NSOU but it can be anticipated that teaching will result in learning. Teaching supports the internal processes of learning of an individual that result the change of behaviour. Thus teaching is the outer side of the internal process of learning. In its most common form, the process of teaching takes place in a classroom situation where through the formal process of interaction with the learners the teacher fulfills the learning needs of the learners. Teaching is goal-oriented and systematic, teaching helps to motivate the learners by providing them the facts, knowledge and skills to solve problems. Teaching helps the learners to develop life skills necessary to adapt to the environment or bring changes in the environment according to their needs, it imparts understanding about the world around us.

5.3.2 Nature of Teaching

Teaching is the process of initiating learning, it is the teacher who acts as the facilitator of learning by satisfying the educational needs of the learners and playing an important role in bringing prosperity to the society and uplifting it. The role of the teacher in a classroom is very diverse, they are the learner's ideal, mentor, supervisor, role model, and many more. In a classroom, not every teacher teaches in an identical way, some teachers are more interesting to listen to and their classes are much more interactive and joyful to participate. Teaching has an aesthetic value as it can be different for different learners, not everyone learns or understands in the same way so teaching should be flexible and must have different forms. This shows the nature of 'art' in teaching but at the same time teaching is systematic, its effects can be seen and assessed, it has objectives that are planned before the practice initiates, this makes teaching 'science' too. The teacher continuously studies the situation in a classroom chooses a path in between incorporating both the natures of teaching to make it most effective for the learners. Let us now explore this dual nature of the teaching elaborately.

Teaching as Arts:

Art is the expression of human creativity and imagination in the form of appreciable products that have both emotional and aesthetic values. This concept of arts helps us to understand the artistic nature of teaching. A teacher with his/her skill and grace tries to present the learning experience in the most beautiful and meaningful way possible. The kinesthetics of teachers can be effective in teaching too. The voice, gestures, facial expression, body language, and appealing personality of the teacher adds beauty to the teaching process. The activities of the teacher are dynamic that are influenced by many qualities and contingencies. Teaching as art is flexible and not bound by any strict time and rules. The aesthetic qualities and sense of teachers are reflected in their way of teaching irrespective of the subjects and levels they are teaching. Teaching does not stop abruptly;

107 NSOU GE-ED-31 it often gets generated during the course of learning. Artists who excel in their art, similarly, a teacher always projects the strength within him in his/her teaching instead of simply following the stringent traditional ways. The teacher uses the skills, emotions, positivity, and affection to teach and motivates the learners successfully. Teaching as an art is a more humanistic approach of learning. Teaching as Science: In the late second half of the 20th century, the influence of the writings of Johann Friedrich Herbart contributed to the origin of the thought of teaching as a science. Many educationists then practiced teaching following the framework and mechanism of science (Lutzker, 2007). Based on scientific considerations, teaching is given a scientific approach and teacher training and classroom are designed accordingly. Science seeks truth and is based on experimentation and verification, so as a science, teaching is based on scientific inquiry, rational organization of content, and systematic presentation of it to the learners. Learning has a pre-defined objective to be achieved, and the teacher prepares a systematic lesson or teaching plan to achieve the pre-set goals. Traditional methods of teaching are more toward the scientific nature of teaching where teaching activities are logically arranged and taught in rigidly structured ways. Teaching depends on the teacher and they control the classroom and also the output of the process, teachers are fully accountable for the end product so they never deviate from the pre-defined paths. As per this thought of practice, the teacher never gives an excessive personal touch to the teaching, he does what he has been trained for by the teacher education institutions. We can say that teaching is science as it is systematic, logically planned, executed in the class, and before teaching begins, the objectives are fixed to bring about desired behavioural changes in the learner.

5.3.3 Functions of Teaching

The process of teaching-learning involves three variables - teacher, learner, and mediating variables that influence or facilitate the learning. The learner is the dependent variable that undergoes the process of teaching to develop the desired changes by the teacher who acts as the independent variable. The achievement of the goals of teaching depends on the proper interaction of the dependent and independent variables and the success of this interaction is mediated by all essential mediating variables. These three variables of teaching perform the functional or active part in the process of teaching. The three major functions of teaching performed by them are: (a) Diagnostic function: The teacher performs the function of a doctor in education. As the doctor first looks for the symptoms of illness in the patient through proper diagnosis

108 GE-ED-31 NSOU then only prescribes the treatment. Similarly, a teacher does the following diagnostic functions to meet the objectives of teaching-learning and overcome the learning problems: i) With the help of various diagnostic tests, the teacher finds out the initial behaviour of the learner and the initial cognitive and affective potentials of the learners. ii) Teachers diagnose and then determine the objectives of the teaching based on the desired behavioural changes that they wished to bring in the learners taking into consideration the initial behaviour and environmental conditions. iii) His diagnosis also involves the analysis of teaching content, teaching aids, tools, and environment essential for carrying out the job. iv) Finally, the teacher needs to diagnose his/her own potentials, limitations, and preparedness to teach so that he/she can achieve the objectives of bringing behavioural changes in the learner. (b) Prescriptive function: After the proper initial diagnosis of the learner, self, and environment, the teacher makes the necessary prescription for achieving the pre-decided objectives and goals. Achievement of the goals of teaching needs proper interaction between the teacher and the learner which needs proper controlling and management of mediating variables. The teacher performs this function of prescription in the following ways : i) Selection of teaching-learning content and systematic sequencing of all the contents. ii) Designing and planning all the teaching plans, arranging all the teaching aids, teaching tools, and strategies as per the learning needs of the learners. iii) Arranging a proper environment of learning conducive to effective teacher-student interactions. The teacher remains very active in prescriptive functioning in comparison to the dependent variable, the learners. The prescriptions are made to bring the change in initial behaviour of the learner, arrangement of content, tools, strategies are made to achieve the goals of teaching. (c) Evaluative function: Evaluative function is concerned with the evaluation of all the tasks or steps and their progress performed during the prescriptive functions. The evaluative function is associated with the realization of the achievement of the teaching objectives. The failure in the realization of the objectives during evaluation is either due to the improper diagnosis of the initial behaviour and situation or may

109 NSOU GE-ED-31 be due to some serious mistakes in providing the prescription for the proper behavioural change and lack of correct interactions of the three variables of teaching. 5.3.4 Types of Teaching Methods Teaching has different types based on the approaches adopted by the teachers and the methods used. Methods of teaching play an important role in the delivery of learning content to the learners in the classroom. The approach adopted by the teachers in a classroom is the comprehensive way of dealing with a particular learning and classroom problem, it includes the plan of actions on the basis of which the various methods or combinations of methods of teaching are developed. However, a method is an orderly and logical arrangement of ideas based on a particular approach. Which method a teacher is going to use in the classroom depends on the grade of the students, their learning needs, interests, level of motivation, and availability of resources. Some of the most popular methods of teaching used in the classroom by the teachers are discussed below. i) Lecture method: The lecture method is the teacher-centric approach of teaching where the major role is played by the teacher in a classroom whereas the learners have a very small role. It is the most common method of teaching under the traditional way of teaching, where the teacher tries to present the learning content to the students through verbal communication with the use of few teaching aids to make teaching more meaningful and interesting. It is popularly known as the 'chalk and talk' method of teaching. ii) Demonstrative method: This method of teaching is very popular among the science, mathematics, and computer teachers to present the teaching-learning content in the form of a live demonstration to the learners. This method uses the sense of hearing and seeing of the learners to accomplish the goals of teaching-learning. This method is more effective than the lecture method because visualising the subject matter live is much more effective and easy to retain as well as comprehend than just hearing the content through the teacher's lecture. This method suffers the drawback of not allowing the learners to take part in the demonstration actively; that means it restricts the learner from in-hand experiences. iii) Lecture-cum-demonstration method: This method combines the strengths and features of both the above-mentioned methods of teaching. The teacher uses the combination of lecture method and demonstration to present the content in the most interesting and effective way to the learners so that the objectives of teaching

110 GE-ED-31 NSOU can be met easily. The teacher here can first present the content in the form of demonstration and then explain the process and inferences through a class lecture or he/she can give the lecture to explain the demonstration simultaneously. iv) Heuristic method: This method also known as the 'learning through discovery', is a very popular method of learning in sciences where the learners explore the facts and principles themselves, to discover the phenomenon and then understand it. To get experience one has to strive for exploration. By this method, the learner reaches the solution and learns from it. This method helps the learners to think abstractly and rationally too, learning becomes explorative in this method and they become confident about their learning behaviour. This method alone cannot be very beneficial. Generally, it has to be combined with some other suitable ones, and then teaching should proceed so that learners get the proper supervision and guidance. v) Problem-solving method: In this method, the content of teaching-learning is presented in front of the learner in the form of a problem and the teacher acts as the guide who helps the learners with the tools and guidance necessary to solve the problem by themselves. The learner first tries to understand the nature of the problem, once it's known he/she gets motivated intrinsically to solve the problem. The steps to be followed in this problem-solving learning method must be outlined by the teacher. The main steps are— (i) Identifying the problem: Why it is taken up; (ii) Hypothesis framing; (iii) Data collection; (iv) Analysis of data; (v) Interpretation; and (vi) Conclusion. The drawback of this method includes the slowing down of the teaching process as each of the steps are time-consuming. vi) Project method: This method is also called as experimental method, in this methods sometimes a working model is made by the learner to represent the phenomenon, and sometimes research is done as a project to investigate a phenomenon to draw out the causes and inferences. This method is helpful in bringing out the creative and investigating aspect of the child. It requires a lot of logical thinking and the co-operation of peers and teachers too. vii) Analytic and synthetic method: Analysis means to break the whole into components and then study it. In an analytical method of teaching the big content or a complex problem is first broken down into small units then it becomes easier for the learner to comprehend and find out the solution. Here, the teacher makes the learner to move from unknown to known and he/she encourages sequential

111 NSOU GE-ED-31 learning and logical thinking among them. Whereas, synthetic method is simply the opposite of analytic method here one moves from known to unknown. The small units from the content are explained and combined to give the complete picture of the content. This method focuses on memory training. viii) Inductive and deductive method of teaching: Inductive method is moving from specific to general and the deductive method is from general to specific. Specific facts or examples are given and the learner reaches generalization. It is mostly focused on the students and their capacities and abilities, rather than on the teacher. There are many advantages of inductive teaching and learning; knowledge is acquired naturally by exposure, and students are encouraged to utilize their reasoning skills, prior knowledge, intelligence, and mental focus. In deductive reasoning, the role of the teacher is bigger than the learners. The teacher is one who gives and disseminates all information. The flow of the information here is from general to specific. The usual flow of information begins with the concept's introduction and presentation followed by activities. Information is based on facts, statements, and predetermined logic. The method is easy to apply, leaves little room for mistakes, and the information being taught is valid. There is also a clear and defined scope; the method requires little preparation on the part of the teacher.

5.3.5 Significance of Teaching We live in a society where we are connected through our culture, language, religion, knowledge, science, and technology. For a culture to survive and thrive it is very essential that all the skills, language, culture, tradition, knowledge, understanding, and experiences should be transmitted to the new generation. It is also essential that every society must work for the enrichment and upliftment of the existing skill, knowledge, and understanding of its members so that this society may prosper. One of the ways of achieving all this is by the method of preparing the future members of the society who will have all the behavioural abilities to carry on the essential knowledge and experiences. This is done by the means of teaching, which is important to bring desired changes in the behaviour of the individuals so that they can become worthy responsible members of society. This helps every society in its preservation and transmission. The behavioural change in an individual through teaching also helps them to develop into a complete personality. In a society not everyone is equal, some of the families are poor, both economically and academically. It is not possible for them to provide a proper learning environment to

112 GE-ED-31 NSOU their children, so teaching provided through an institution or organization gives them a chance to get their future generation educated just like the other advantageous groups of the society. Thus, teaching also plays a significant role in removing disparity from society. Through teaching, we are improving the health and living standard of mankind by making achievements in the field of medicine, science, and technology. Teaching is an inseparable part of learning so if there is learning one cannot avoid the contribution of teaching in it and in the true sense, teaching is self-generated during the process of learning.

5.4 Factors Contributing to Teaching-Learning: Personal (Intelligence, Emotion, and Motivation) and Environmental We discussed that teaching and learning both are connected, one causes the other. Teaching-learning depends on various factors which basically belongs to two major categories, personal and environmental. Let us consider a case where Sudip, a class 10 student is very good at cricket, he enjoys the game more than academics and he is supported by his school coach who considers him a good learner. Sadly, he belongs to a very poor family unable to help him financially. Also, they want him to take academics more seriously than cricket. We could clearly see that here learning depends on many factors like intelligence, motivation, likes and dislikes, family support, peer support, financial support, and many more. So depending on the nature of the factors they are classified as personal and environmental. These factors mediate the learning behaviour of the learners. Personal factors are also known as psychological factors, factors like intelligence (cognition), motivation, emotions, interest, aptitude, etc. belong to this category. These are present within the individual and interact with the environmental factors (which are external to the individual) like socio-emotional, societal, cultural, and other school-related factors. The environmental factors are the external factors that highlight the role of surroundings and environment in learning. We can understand the learning completely only in the light of this complex interaction of both personal and environmental factors. In this section, we will discuss the role of three very important personal factors: (i) cognition or intelligence, (ii) emotion, and (iii) motivation.

5.4.1 Intelligence Intelligence in humans has been studied over the last many decades and still going on. It is an interesting field of study among psychologists and educationists. Many studies suggested that learning is strongly correlated to learning. It is a common observation by the teachers that in a class students with high intelligence learn the content much more easily

113 NSOU GE-ED-31 than the others. The understanding and definition of intelligence is the subject of debate as there is no single definition of it, intelligence is subjective and depends on culture and environmental condition. It can become clear with one example, say in a class there are four students, one is a skilled football player, another one is very good in story writing, the third one is great with mathematics and the fourth one is an amazing painter. Now it is difficult for us to decide who is the best intelligent, possibly everyone, or no one? This is indicative of the fact that we cannot define 'intelligence' with a single context. Many people define it in different ways but broadly we can define intelligence as the ability to learn about, learn from, understand, and interact with one's environment. This general ability consists of a number of specific abilities, which include: Ability to adapt to the environment or change the environment accordingly. The ability to acquire knowledge. The ability of rational thinking, critical reasoning, and comprehending relationships. Ability to evaluate and judge. Ability to generate original and divergent thinking. Reuven Feuerstein (1990), defines intelligence as the "unique propensity of human beings to change or modify the structure of their cognitive functioning to adapt to the changing demands of a life situation." Intelligence is studied in close connection to the scholastic performance of the children and for that various intelligence tests have been developed and used. Such tests to measure intelligence are widely used and popular in educational institutions, jobs, and the military recruitment also. High scores on such tests are often found to be associated with high scores in academics, individuals involved in high profile jobs, and well established in life. Sternberg proposed triarchic theory of intelligence to give the most comprehensive picture of intelligence that doesn't reject the previously popular factor theory but includes it within his theory. The triarchic theory describes three fundamental aspects of intelligence: (i) Analytic intelligence, (ii) Creative Intelligence, and (iii) Practical intelligence. Analytic intelligence comprises the mental processes through which intelligence is expressed. Creative intelligence consists of abilities to overcome a situation or problem which is completely new or nearly novel. Practical intelligence is needed by an individual in the socio-cultural setting for adapting to the environment or changing the environment according to his/her requirement. Triarchic theory suggested that general ability is a part of analytic intelligence and to understand the intellectual behaviour of an individual like learning skills, it is important that 114 GE-ED-31 NSOU all the three aspects of intelligence work in confluence. The three aspects of intelligence help the individual to understand the problem or the confronting situation by analyzing it through different dimensions then try to look for any possible unique solution of it, during the course of learning this he/she also takes into consideration the context of the situation. It is very well understood now that intelligence forms a strong background for learning new experiences and utilization of the learned knowledge. Gardener's theory of multiple intelligence found special importance in pedagogy. Gardener proposed that there are different kinds of intelligence, each has different functioning but they may work together to produce a new intellectual behaviour. Based on this theory, educationists asserted that the intelligence which is high on manifestation in fact determines the factors that affect what one learns and how well he learns. Intelligence also influences how well a learner will be engaged in the learning process. Gardener's theory operationally defines intelligence as the potential of an individual to solve problems, do reasoning, dealing emotions, developing interests, moral sense, and living successfully with the environment. To conclude, it is certain that intelligence is significantly and positively correlated to the learning ability of the learners, and those who are having high intelligence are supposed to learn better, quicker, and more as compared to others with average or low intelligence.

5.4.2 Emotion It is a common observation that when we are happy we do all our work including academic tasks very attentively, efficiently, and with joy. Whereas when we are sad or angry, we frequently make mistakes and feel demotivated towards doing any work. It is, therefore, well established that emotions play a significant role in building and directing our behaviour. Sometimes emotions are so strong that we feel completely under their control. Emotions make us humane, they color our lives and guide our behaviour in a particular direction to shape our personality.

100%

MATCHING BLOCK 30/32

SA

Draft Full Book.pdf (D159412383)

According to Crow and Crow (1973), "Emotion is an affective experience that accompanies generalized linear adjustment to mental and physiological stirred-up states in the individual that shows itself in his/her overt behaviour."

Emotions are feelings or affective experiences that are responsible for bringing such psychological changes in humans influence to alter the behaviour of the individual. Emotional changes and development are influenced largely by the process of maturation and learning. Primarily, it has been shown that emotions originate in the brain, specifically in the limbic system. The limbic system is a small structure located in the middle of the brain between the lower center or brainstem and the higher center or cortex. The brainstem controls alertness and arousal and sends sensory messages to the cortex via the limbic system.

115 NSOU GE-ED-31 Much of our thinking and learning takes place in the cortex and our limbic system interprets and directs emotions and behaviour. Thus, it can be said that both emotions and learning occur in the brain. Learning helps us to acquire new knowledge and also makes us think. Thinking affects the emotions of the human and emotion makes us think so to conclude, we can say that there is a complex connection between emotion and our learning. Happy incidences improve our positive mood whereas bad incidences make us angry and sad, now being happy makes us think of happy thoughts that automatically help us to learn and acquire knowledge in a psychologically supportive state of emotion and mind. To conclude, it can be said that when a learner experiences positive emotions, the learning process can be enhanced, and oppositely, when a learner experiences negative emotions, the learning process can be disabled.

5.4.3 Motivation Mangal (2008) defined motivation as something that prompts, compels, and energizes an individual to act or behave in a particular manner at a particular time for attaining some specific goal or purpose. It is the biological, emotional, and psycho-social needs that generate drives and generate an activating force known as motivation that moves an individual to act or behave in a particular way at a particular time. Motivation is an important factor in many contexts - home, school, work, and society at large. Pieces of literature support a strong interrelation of motivation with the achievement of the learners and performance in all curricular activities. Learners who are motivated in school tend to achieve higher, they spend more time in school, get involved in all the classroom activities, participate in group and co-curricular activities, learn more, and in general perform better in examinations. No one can deny the prime role of motivation in learning and all academic practices of the learners. Motivation is the inner urge of the learners to know and understand, it activates, guides, and controls the whole learning. In a classroom, it is a common observation by the teacher that the same task is done differently by the learners. Among the various other factors, motivation is one of the factors which basically energizes the learner to complete the learning task more efficiently and quickly as they find it more interesting and rewarding to do. Interestingly, there may be a variation in 'what motivates', 'how much it motivates' and 'what impact it has on the learner'. This variation in motivation is due to the difference in the level and the drives behind the motivation. For some people it may be the need and drive, for some, it may be the rewards, and for some others, it may be just the inner satisfaction and self-reward or intrinsic motivation that determines the type and level of motivation. Motivation must be understood as a construct that encompasses the concepts of needs,

116 GE-ED-31 NSOU drives, and incentives. It seems to be a synthesis of all of them. Motivation is something that energizes, directs, and sustains behaviour; it gets students moving, leads them in a particular direction, and keeps them going. Practically, some level or form of motivation is present in every learner in a classroom. Some learners in a classroom are motivated by the classroom teaching and interested in more challenging learning content, seek interesting projects and earn high grades in all exams. Whereas some students are more inclined toward classroom peer bonding and interactions, they are motivated towards extracurricular activities and student council or club. We also find poor-performing students in academics very high on athletics and other sports, the only reason behind it is their very high motivation and self-satisfaction in learning sports over academic practices. Sometimes the external rewards like recognition, prizes, respect etc. are the drives that generate the motivation in the learners to perform the learning such motivation is known as extrinsic motivation whereas motivation is the result of inner urge, joy, and satisfaction of doing the task and gaining knowledge is called intrinsic motivation. It is found that learners are very creative with their behaviour during learning when they are intrinsically motivated, though extrinsic motivation too is essential in making learning as well as teaching effective for the learners.

5.4.4 Environment

The environment is our surroundings, it consists of all the animate and inanimate things that may affect us directly or indirectly. Our society and community also represent the social environment in which we are living. Both the physical, psychological, and social environment plays an important role in the process of learning as well as teaching. A teacher needs physical resources to carry out the job of teaching and creating the content. He also needs enough mental support, peace of mind, job satisfaction, and interest to effectively get involved in the teaching-learning process. The social environment shapes the classroom environment as we know, school is simply a miniature society. The physical and socio-cultural environment in which a child grows significantly influences his/her learning. If we observe carefully we will know that learning is in fact the interaction with the environment and gaining experience through it for the acquisition of knowledge which helps the individual to adapt to its environment or modify it. The social constructivist's view of psychology holds that all learning is culturally oriented and guided. The socio-cultural environment can be sub-divided into factors like - family, community, and diversities in a society like caste, race, class, religion, languages etc. Family is the first school of the child, he/she learns all the fundamental motor skills and cognitive abilities in the

117 NSOU GE-ED-31 family. The family has a major impact on the social skill, attitudes, morality, and development of values. The family plays a continuous role in the journey of the entire socialization process of the child. Family is the cradle of all learning, a healthy relationship between the child and the parents provides an environment conducive to overall personality development and learning all good. A distorted and unhealthy environment, on the other hand, adversely affects the learning of the student. The upward mobility brings resistance on the part of the student to learn. Students in such families find themselves unable to cope up. The community in which a child lives also guides learning and behaviour, many attitudes, habits, beliefs, perceptions, stereotypes, and social roles, as well as responsibilities, are formed by the direct experience or interaction of the child with the community and people living in it. For example, we have seen that many of the habits and classroom behaviour of the child is learned by them from their peers and friends. Students' interpersonal relationships form a particular type of emotional climate in the classroom that acts as the foundational support for collaborative learning. A child who doesn't have a supportive peer environment does not learn as desired by society and family. The school thus must support the free and constructive interaction among the learners and peers to make the learning process effective and meaningful. Caste, race, social class, language, and religion too are the significant factors affecting learning in our country. Such factors shape the attitudes, values, achievement goals, and morals of the child. Often the children from the socially disadvantaged group and those from deprived caste and religion do not get proper social as well as economic supports to continue their education. So it is found that social class and status are directly linked to the level of education obtained. Learning is also found to vary across religious and ethnic groups, owing to the distinction in their beliefs, values, attitudes, and practices. It has been seen that an adequately enriching and stimulating environment provides the learner with more learning opportunities and greater control over the environment than an impoverished or needy environment.

5.5 Teaching-Learning Materials: Textbooks, Multimedia, Multilingual Resources for Classroom use, and Remedial Teaching

5.5.1 Concept of Teaching-Learning Materials (TLM)

Suppose you as a teacher, on your first day of the job for the first class you went empty-handed in the classroom and for the next class, you went with a textbook, chalk, and a duster. Now if I ask you which class was more convenient for you and the response

118 GE-ED-31 NSOU of the learners were good? Obviously, your answer will be the latter class. The reason is that in the latter class you were equipped with a textbook for referring in class, also you used chalk and blackboard to write the content and draw any necessary figure or diagram. Such practices will naturally make the learners more interested in the studies and make the teaching-learning process more efficient as well as effective. Here, the textbook, chalk, board, duster are the tools or materials that are used by the teacher to help the learner to develop the concept with ease and efficiency, such materials are known as teaching- learning materials (TLM). TLM is not something new; it has been in practice since ancient times (Lal, 2011). The function of TLM in the pedagogy is to make learning more attractive, practical, meaningful, and joyful for the students. The use of TLM in the classroom by the teachers helps to reinforce the content to be delivered, develop skill, and concrete understanding of the content. It makes the class lecture or demonstration novel and refreshing every time as it makes the learner anxiety-free and removes them from boredom. The most effective TLM are those that are based on direct experiences of the learners like field experiences and dramatic participation, whereas the poor TLM is based on indirect experiences like text or verbal speech. The use of TLM in a classroom is purposeful, it makes the learners motivated to learn new things and they become curious to gain knowledge. As per the Edgar Dale's (1969) cone of experience, the more the TLM is based on giving direct experiences to the learner the more it helps in retaining the learning content by them for a longer time. The learning objectives from the domain of cognitive, affective, and psychomotor could easily be achieved through the use of TLM. The teacher could easily organize the teaching content and present them in a very attractive and meaningful way through the use of TLMs. It helps in the formation of concepts among the learners. Also, they develop the proper learning attitude which remains in them for a very long time. There are various types of TLM, that can be broadly classified into three main categories - (i) Audio TLM, (ii) Video TLM, and (iii) Audio-video TLM. Audio TLM targets the auditory senses of the learner it includes - speech, audio tapes, recordings, telephonic conversations, etc. Video TLM involves the visual sense, it includes materials like - videotapes, charts, graphs, cartoons, models, mock-ups, pictures, textbooks, magazines, newspapers, encyclopedias, programmed learning materials or SLM, video CDs/DVDs etc. Audio-video TLM includes the projected aids, which use both auditory and visual senses to enhance learning. The greatest advantage of these is that they are the closest representation of reality. These include - Motion Picture Film, Television, Video CDs/DVDs/cassettes, Slide-tape presentations, Multimedia computer etc. We will now discuss some of the popular and common TLM materials.

119 NSOU GE-ED-31 5.5.2 Textbook Textbooks are the most popular and omnipresent TLM, it is equally popular among both the teachers and the learners. Textbooks are so essential that a teacher, despite knowing the complete curriculum, can not proceed with the teaching-learning if he/she is not provided with a textbook. Students also use it as the main source of learning the content in a class, it also acts as the reference book for them to understand the contents being explained by the teacher. A textbook is developed by subject experts and experienced teachers strictly based on the prescribed syllabus of the subject for a particular class. The topics in a textbook and the concepts within a topic are arranged in a specific order as per the syllabus and decided by the expert group who developed the textbook. Therefore, the textbook is considered as the sum total experience of the school curriculum in respective subject areas by the students, teachers, parents, and all other stake-holders. The textbook is multifaceted, which aids both learning and teaching so using it is not as simple as we think about it. Some teachers without understanding the objectives of the content in the textbook and without going through the introduction, directly jump to the exercise and summary they often miss the sequences and learning organization. Such improper practice definitely decreases the potentiality of the TLM like textbooks. Textbooks are the most influential TLM and the only one based on which the entire examination and the evaluation systems are functioning. The exam papers are prepared based on the contents in the textbook and the evaluation is also based on it. It will not be wrong to say that all the curricular activities in the school are completely based on the topics of the prescribed textbooks. Textbooks are recognized as the basic material for teaching and learning which require some very important characteristics to be present in it like - Textbooks must possess all the authentic information and verified contents. Content must be organized according to the learning sequence and should be connected to the previously acquired knowledge of the learner. The textbooks must be written in simple language that is easy to understand and memorise. The printing should be clear and fonts should be easy to read. The presentation of contents needs to be conversational and must be based on educational-psychological theories and established principles of pedagogy. Wherever necessary the textbook must have pictures, diagrams, and examples to explain the concept clearly to the learner.

120 GE-ED-31 NSOU The presence of the various activity tasks and self-assessment questions is always an essential feature of a good textbook. Presentation of contents needs to motivate the learners throughout the process of learning. Even in today's digital world the importance and requirement of the textbook will never decrease. A good textbook will always remain the best friend of both teachers and the students. 5.5.3 Multimedia Multimedia TLM in education consists of a combination of five basic items as an aid in teaching-learning: Text, Video, Audio, Graphics, and Animation. Here text does not just indicate printed items in the textbooks but all the printed or written items used for the purpose of teaching-learning. Contents written on the video clip or graphic picture are also considered as text but as a part of multimedia materials required for teaching-learning. Let's try to understand these media one at a time. Audio materials may be as simple as the voice or speech of a teacher. Voice or sound can be a means of teaching in the classroom by conveying messages to the learners. The teachers used to give explanations about the learning content verbally. For that teachers have to modulate his/her voice, express the feeling; put emphasis and pause at the appropriate places, it is known as the lecture method of teaching, which is considered as one of the oldest methods. In the modern classroom along with the lecture teacher also uses other audio TLM like tape-record players, audio CDs/DVDs, radio, podcasts, etc. Tape-records and audio CDs/DVDs are used as TLM in lower classes to present stories, rhymes, dramas etc. in the most interesting ways which make learning very effective. Similarly, such TLM is also used in distance education and adult education to provide teaching-learning experiences right at their finger-tips. Radio once was the most popular media for providing mass education, now FM is very popular among young people and it is slowly growing as the platform to broadcast educational content. In India, the first radio broadcast of educational content was made in 1937, and to date channels like 'Gyan Vani' are following its path. Radio is one of the reasons for the success of the distance education program in India. Unlike radio which is a mass broadcasting media podcast is a personalized broadcasting media. Teachers can make audio content and upload it to the cloud storage from where students can download it and listen to it at their time and place of convenience. It is used to teach specific and

121 NSOU GE-ED-31 target groups of learners. Next, media are the video equipment like projectors, monitors, video CDs/DVDs, TV, etc. The projector is used in the classroom to project the content of learning directly in front of the class. The content may be the lessons from a textbook or some animation or video or diagrams and pictures prepared by the teacher. Video CDs/ DVDs along with the computer monitors are also popular media in a smart classroom to present the learning content to the children in the most interesting possible. TV is audio- visual media that uses both the senses of vision and hearing of the learners as a result it comes out to be a very effective TLM. Multimedia TLM refers to the combination of two or more of the above-mentioned materials. For example, in a classroom, the teacher is teaching about 'effects of global warming', for that teacher is using the textbook as the reference and using the overhead projector along with PC and audio speaker in the classroom to show a small documentary about the melting of polar ice. He/She is also explaining the documentary in between the pauses. This is the scenario where a teacher is using multimedia materials as a TLM to meet the needs of teaching-learning and achieve the objectives of learning. New age classrooms are using many other all-in-one compact multimedia devices like K-YAN which is a combination computer, smartboard, projector, speaker, and ICT devices (Barai, 2018). The use of such all-in-one devices has revolutionized the concept of multimedia TLM and our classroom learning experiences. It can make learning interactive between the learners and the technology. Multimedia will gain more importance in our classroom with time. 5.5.4 Multilingual Resources of the Classroom Multilingualism is the characteristic feature of our India, we have 22 major languages and more than 19500 narrative languages or mother tongues. A Typical Indian classroom has students with many different mother tongues, whereas schools are mostly bilingual, having such linguistically diverse students in the classroom is challenging for the teachers and educationists. It becomes difficult for the teachers to communicate with the students, especially at the elementary levels. Kids at home first learn their mother tongue or native language and when they come to the school for the first time it becomes very difficult for kids to communicate and understand the learning contents or instructional process. In this situation, it becomes essential for the classroom to have the facility of multilingual resources in the form of teachers with the ability to read, write, and speak in multiple languages. Secondly, the teaching and learning content should be in multiple languages which includes multilingual textbooks, charts, maps, and audio-video aids. The new education policy,

122 GE-ED-31 NSOU NEP-2020 has also advocated for the implementation of a multilingual approach to teaching and learning at all levels of education. The justification behind this recommendation is the ease of comprehension by the learners in their mother tongue but at the same time, one cannot neglect the importance of regional or national language. Languages are representative of one's culture, wisdom, knowledge, skill, and expertise. Therefore, multilingualism is a big resource of our society. When one knows the national or regional language and perfectly speaks the native language then the person will be able to synthesize knowledge and express it accordingly. Thus, it is very essential to include indigenous languages, mother tongues, or native languages in education to realize the benefits of synthesizing and clearly expressing knowledge. Multilingualism practices and resources in a classroom enhance the intellectual flexibility and creativity of the learners. Studies have revealed that children who grow up in a supportive environment speaking more than one language from an early age are more perceptive and intellectually flexible than those who speak single language. Multilingual resources like teachers are the human capital so are the learners as they are produced or created at the cost of time, efforts of the experts, purchasing of study and training materials. Language skills are productive especially in the individual's role as a consumer and in the role as a producer. Those deficient in language skills find it very costly. It is therefore beneficial to have many languages entrenched in an education system in order to get a solid and all-around human capital. Multilingual resources not only preserve linguistic diversity through education but also help in national unity through making people know their mother tongue along with the regional or national language, in this process, the people naturally embrace the value of unity, harmony, and togetherness.

5.5.5 Remedial Teaching In any classroom, not every learner is the same, depending upon their cognitive, emotional, interest, motivation, and learning curiosity their learning ability, performance, and achievement varies a lot. Some learners often perform poorly in evaluation or classroom interaction; there may be one or more reasons behind it. Such learners sometimes need to start from the point where they are facing problems and guidance requires to progress toward the success. This need of the learners may be fulfilled through remedial classes or teaching. The word remedial here conveys the meaning of teaching which is developmental in scope. The aim of remedial teaching is not to make any correction in their learning problems but to develop those first-time basic skills that are essential to learn or do any particular task most efficiently.

123 NSOU GE-ED-31 Remedial teaching is just effective teaching in which the learners and their needs are at the center of the teaching process. Remedial teaching is not something different from normal classroom teaching; it includes all the features of good classroom teaching with an emphasis on learning and understanding the difficulties of the learner. In remedial teaching, the teacher takes the learning to the level of the learners and through intrinsic motivation uplifts their standard of competence. It is developed on the basis of proper diagnosis of the problems of the learners to meet their needs and minimize the difficulties of the learners. It must also be noted that most of the learning problems or difficulties of the learners diagnosed in the remedial class are not essentially present within the learners themselves, some of the problems may be relative to the context where the learning is taking place, such as the family background of the child, the physical and learning environment of the school, and also the friends group of the learners. Understanding such factors of learning issues with the students makes the remedial teacher competent to be flexible and try to accept their learning difficulties as a transient and soluble problem. Teachers engaged in remedial class must view the learners as children who can be taught and helped to overcome their learning difficulties. It is essential for a remedial teacher to understand thoroughly the strengths and weaknesses of his/her students so that appropriate teaching approaches can be adapted to meet their individual needs. It is important for the teacher to understand that though learners who need remedial classes are low on academic achievement, it does not signify that they are limited in their potential and their limitations are temporary. With proper remedial help, other TLM, the use of stimulating teaching strategies, closer guidance, and more individual attention, these student's interest in learning can be improved and they would make better progress. The ultimate aim of remedial teaching is to help learners who have fallen behind to learn to the best of their ability and to bring them back into the mainstream class as soon as possible.

5.6 Summary In this unit, we have developed the concept of teaching as the practice of changing behaviour of the learners through proper stimuli or if teaching is the process of 'to know' then it is the set of steps that guide the individual to know from the experiences. Teaching is a tandem to learning or vice-versa. The aesthetic nature of teaching makes it an 'art' but the systematic and sequential nature of it gives it a 'scientific' nature too. There are three variables in teaching - independent variable (teacher), dependent variable (learners), and mediating variables classroom environment. These variables perform many functions like the diagnosis of the learners' needs, prescribing the solutions, and doing an evaluation of

124 GE-ED-31 NSOU the outcomes. Teaching-learning has many different methods and approaches, here we discussed some of the most popular methods like, lecture method, demonstrative method, heuristic method, a problem-solving method, project method, deductive-inductive method, and analytic-synthetic method. We have also explored the various personal factors like intelligence, motivation, and emotion that affect teaching-learning. High intelligence, positive emotions, and intrinsic motivation along with rewards and appreciation are positively related to learning. Environmental factors, especially socio-cultural factors too affect significantly the process of teaching-learning. Lastly, we have studied about the TLM. TLMs are the supportive tool for the teachers which make learning effective and a pleasurable experience for the learners as they find learning interesting, motivating, and able to retain the knowledge for a longer period.

5.7 Self-Assessment Questions

1. Describe the concept of teaching. Why is teaching both Arts and Science?
2. What are the different functions of teaching?
3. What are the different methods of teaching?
4. Write a short note on the significance of teaching.
5. How does the intelligence level of children affect their respective learning?
6. What is the role of motivation in the teaching-learning process?
7. How is the family environment interrelated to the learning of the children?
8. What do you mean by teaching-learning materials and what are their different types?
9. What is the importance of textbooks as TLM?
10. How Audio-visual and interactive TLMs can improve the classroom experiences of the learners?
11. Why is remedial class important for learners with difficulties?

Objectives After completing this unit you will be able to— Explain the concept of measurement; Describe the importance of

measurement in education; Describe the types of measurement; Explain the features of a good measurement tool; Explain the concept of assessment; Describe the importance and types of assessment; Describe the concept of evaluation; Describe the characteristics of the evaluation in education; Explain the concept of the continuous and comprehensive evaluation; Describe the reporting the learner's achievement. 6.2 Introduction Progressive society demands quality in the educational system. One of the ways of improving and maintaining the quality of education is through continuously monitoring the pedagogy and the outcome. Evaluation of the feedback loop in pedagogy gives the ability to understand the areas of improvement and adapt to the changes for improvement. Evaluation of the learners helps in understanding their progress and areas that need improvement. Evaluations are done by various methods of assessment and measurement. Educational measurement is nothing new in pedagogy. Educators have been testing students from the beginning of the educational system, it is widely used to assess what behavioral changes have taken place. A teacher wants to know the shortcomings of the method of teaching he/she uses, for which these tests are very important. The introduction of some of the modern ways of evaluation in the educational world is comparatively new. Such new tools were introduced in this field in order to get rid of the serious shortcomings of measurement. From the beginning of the twentieth century, three types of important progress were noted down in the field of educational measurement: testing, measurement, and evaluation. Nowadays, evaluation is considered to be an important contribution of psychology and education. In this chapter, we will explore the evaluation methods, process and discuss its type, need, importance, and requirements.

128 GE-ED-31 NSOU 6.3 Assessment, Measurement, and Evaluation in Education 6.3.1 Concept of Measurement Measurement is the process by which the attributes or dimensions of some physical objects are estimated or determined like measuring the weight, height, length etc. In education, measurement refers to the application of a standard scale or measuring tool by which the quantitative aspect of progress in the teaching-learning process is determined. Some of the popular definitions of measurement in education given by famous educationists are given below J P Guilford: "measurement means the description of data in terms of numbers and this, in turn, means taking advantage of many benefits that operate with numbers and mathematical thinking". E L Thorndike: "Anything that exists at all, exists in some quantity; and anything that exists in some quantity is capable of being measured." J. M. Bradfield: "Measurement is the process of assigning symbols to the dimension of phenomenon in order to characterize the status of phenomenon as precisely as possible." Encyclopedia of educational research defines measurement in more precise terms as a means to observe or determine the magnitude of a variant. Measurement gives the teacher a quantitative estimate of how much the learner has acquired during the process of learning. In our daily life, we measure various items and objects in units like length, height, weight, etc. using a scale, tapes, and balance; but there is a wrong notion about measurement. The scoring and ranking of the participants in any drawing competition or musical performance is also a kind of measurement so whenever a teacher arranges the achievement of the students in a quantitative fashion then it represents the measurement in education. It is essential in measurement that the assignment of scoring or any other quantitative value must be given to the learners according to certain established rules that means measurement is always based on certain criteria. 6.3.2 Importance of Measurement Measurement involves the process of quantification of behavior in a learner. This quantification indicates to what extent a particular set of skills or knowledge or understanding is present in a learner. It has been found that the measurement in any field involves three characteristics: (a) identification and definition of quantity, attribute, or variable that is to be

129 NSOU GE-ED-31 measured. (b) finding out the set of activities by which the attributes of a variable may be made perceivable. (c) establishing a set of methods or techniques for converting observation about the learner and teaching-learning process into a quantitative statement of degree, extent, or amount. Measurement is important for identifying the individuals who are more capable in terms of their skill, knowledge, and understanding than the others in a class so that the individual need of the high performer as well as the low performer learners could be addressed. This makes measurement an important means through which the grading and promotion system in an educational setting could be operationalized. In education, measurement is largely required for the analysis of data from educational assessment of tests; this makes measurement an important element in all types of research work related to education, educational psychology, and pedagogy. 6.3.3 Types of Measurement Based on the object or the subject which one is intended to measure, we can categorize the measurement into two different types - physical measurement and psychological measurement. (i) Physical measurement: Physical measurement is the measurement of the object which has its absolute existence. The tools which are used to measure the object which has its physical presence are universal and always start with zero of the scales. All such tools are highly standardized and hence used over the world with the common system of measuring units. For example, we measure the length of an object which will remain to some extent fixed all over the world. Similarly, the measurement of the weight of an object is also constant around the world. Physical measurement is always accurate and quantitative. (ii) Psychological measurement: Psychological measurement is also known as mental measurement or educational measurement. There is no absolute zero in the case of psychological measurement and also it is not universal around the world. Such measurements are context-centric and hence the result may vary depending upon the environment in which it is carried out. For example, measuring the creative potential of a person or testing the intelligence level through certain tools are subjective in nature; the result obtained from one socio-cultural group of a sample will not be similar to some other socio-cultural group of the sample. In the educational system, the measurement of performance of the learner is done through various quantitative measuring tests for which the principles of measurement are utilized and such measurement is known as educational measurement. Educational measurement provides a clear picture about the level of acquired skills and knowledge of

130 GE-ED-31 NSOU different groups of learners; it also helps in identifying the strengths and weaknesses of each individual learner. Educational measurement helps the teacher to design the proper instructional process which will guide the learner to achieve the goals of teaching and learning. Educational psychologists take the help of different valid and reliable psychological tests to know the level of different traits within an individual. It helps them to modify human behavior according to academic and social purposes. The different kinds of such educational measurements are - intelligence tests, achievement tests, attitude tests, aptitude tests, inventories, personality tests, creativity tests, emotional intelligence tests, etc. The methods used for these tests are discussion, interaction, interview, observation, rating scale, cumulative scores, etc. 6.3.4 Features of Good Measurement Tool There is a difference between measuring an absolute object and the traits/behavior of an individual. It is very essential in the case of educational measuring tools to be very precise and accurate in measuring the behavior and personality of the individual. Such tools must be free from any kind of personal error, variable errors, interpretative errors, and environmental interference. Some of the important features of good measuring tools are given below: (i) Validity: It is said to be valid if it successfully measures what is it actually intended to measure. Validity is one of the most important criteria for a tool to be good for measurement. For example, if someone wants to measure the divergent thinking ability of an individual then the tool used should measure only the divergent thinking ability not the other dimension of thinking styles. (ii) Reliability: Reliability is the consistency of a measuring tool that means how accurately it measures the dimension which it is designed to measure. For example, if an intelligence test is administered on some individual and the individual has scored 65 in that test then when the test is re-administered on the same individual after some period the score obtained by the individual still remains 65, then one can say that the intelligence test is highly reliable as it has produced a consistent result. (iii) Objectivity: Objectivity of a test refers to two aspects - first, item objectivity, and second, scoring objectivity. Item objectivity means the question of the test will have only one response so that different independent scorers should give a score for only one definite response of a particular question. Score objectivity refers to the condition when all the different examiners will score in a similar manner for a particular question that means their score will not vary significantly. To have high objectivity in a test requires that it should not have any kind of ambiguous questions, double-ended questions, with double negatives,

131 NSOU GE-ED-31 and long and essay-type open questions. Such questions should be avoided to have a clear objectivity in the test. (g) Practicability: A good measurement test needs to be highly practical in nature. The test should be easy for the teacher to use for the purpose for which it is made. (h) Comprehensive and precise: The direction of the test must be easy and clear so that both the administrator and the respondent can make a precise understanding about it and should be able to make responses without any ambiguity. The direction for administration and for scoring must be clearly stated so that in a classroom both the teacher and the learners can easily understand and follow it. (i) Ease of administration: The test must be easy to administer by the teacher in a classroom. The test should not involve too much time and labor to administer. For example, if there is a test that requires more than two or three teachers for a single classroom then it is a resource-hungry test and does not have ease of use. (j) Economical: A good measurement test should be inexpensive in its application and usage so that the educational institute and the teacher can afford it for the benefit of the masses. The test of measurement should not be developed using lots of financial resources only then it will be inexpensive for the users. (k) Readily available: A good test of measurement must be available in an open domain so that it can be used by everyone for the benefit of the learners. Though there are many reliable and standardized tests of measurement available in the market, they are subject to copyright and hence cannot be used without the consent of the author. (l) Ease of scoring: It is very essential for a good measurement test to have clear direction about the scoring system and procedure. The scoring-key must be provided with every good measurement tool.

6.3.5 Concept of Assessment

In its narrowest sense, the meaning of assessment is to give students some tests and then score the responses to provide them marks or grades. This concept of assessment is very limited in its scope and purpose. Assessment is one of the most important ways of understanding the strength and weaknesses of the teaching-learning process. In the most general sense assessment is the process of making a judgment of the worth of a person or learner in an educational context. In education, assessment is widely recognized as an ongoing process that is aimed at understanding and improving the students' learning. Assessment is concerned with converting the goals and aims of the learning into results. It

132 GE-ED-31 NSOU is a process by which various information is collected about the learner through different tools like the test, interview, oral examination, questionnaire, practical problem-solving tasks, etc. After which the data is carefully analyzed to know about the learner's state of preparedness and future prospects in pedagogy. Assessment is a process by which information is obtained relative to some known objective or goal. In an educational context, assessment is often considered synonyms to a test but a test is a form of assessment, so all tests are considered as assessment tools but not vice versa. Test in the form of assessment is used to check how far the goals and objectives of pedagogy are achieved, it helps us to identify individual learners' weaknesses and strengths so that the teacher can provide specialized academic resources and support for the improvement of the learner. The tools of assessment are developed by many groups of people involved in academics like teachers, institutional administrators, district administrators, education officers, cooperative bodies, private companies, the government department of education, etc.

6.3.6 Importance of Assessment

Assessment is important because it affects our decision about the grade achievement, instructional need, curriculum, and overall development of the learner in academics as well as in co-curricular areas. Assessment helps us to know how reliable the teaching-learning process is through which the learners and the educator are going through. A teacher can explore alternatives of the regular teaching-learning modes through the proper assessment of their methods of teaching so that the most efficient method of pedagogy can be identified that fits the context of the classroom of any particular society. Basically, assessment is important because it drives students' learning and predicts their future performance. Assessment is important because it makes the learner aware of their drawbacks so that they can seek the way to reinforce their learning strategies to overcome them. The performance of the learners assessed through different tools also motivates them and directs their learning towards a more meaningful direction. Well, designed assessment strategies and tools play a crucial role in educational decision-making and curriculum design. Assessment in education is a vital component of quality management and improvement so that courses and curriculum at different levels of education could be made more learner- centric, goal-oriented, and efficient. The assessment provides diagnostic feedback and tells us about the student's knowledge, performance, needs, and what are the things that need to be taught better. It helps the teacher to set the standards of the teaching-learning process like what are the things that

133 NSOU GE-ED-31 need more emphasis in the classroom. Assessment tells about the efficiency of the teacher in the classroom also helps in doing self-evaluation of the teacher. Based on the learner's assessment the teacher decides what else is needed in his/her teaching technique so that the learner could be guided towards the objectives and goals of learning.

6.3.7 Types of Assessment in Education Assessment is an important part of the teaching-learning process and it is used at the various stages of teaching and learning. Some assessment is done at the beginning of the process of teaching and learning whereas some are carried out during the process of teaching-learning and some are done at the end of a particular teaching-learning session. Different assessments have different scopes and purposes based on which they can be classified into four major types. Let us discuss each of the four different types of assessment used in education.

(i) Placement assessment: Placement assessment is the most basic type of assessment that is generally conducted at the beginning of the teaching-learning process. It attempts to understand the entry-level behavior or the knowledge of the learners. The purpose of placement assessment is to make the teacher aware of the learner's existing level of knowledge, skill and understanding so that the new learning experience which the learner is going to explore could be related to the previous one. This assessment helps in developing and practicing the most suitable type of teaching-learning activities needed for any particular type of learner.

(ii) Formative Assessment: Formative assessment is a kind of assessment that is used during the ongoing process of teaching-learning. It is often administered more than once by the teacher or the school academic administrator to understand the effectiveness of the ongoing teaching-learning process. The general goal of formative assessment is to collect detailed information that can be used to improve the functioning of the teaching-learning process while it is happening. What makes an assessment formative is not the design of a test, but the technique of self-evaluation, but the way it is used to inform about the effectiveness of the teaching-learning process. Formative assessment helps teachers to identify the concept that the learners are facing difficulty to understand and the skills which they are having difficulty to develop or the learning standards which they have not achieved yet so that the adjustment can be made in the learning process and learning resources to meet the desired objectives. Examples of formative assessment are class tests, monthly examinations, quarterly examinations, and half-yearly examination. Apart

134 GE-ED-31 NSOU from these the questions given at the end of the units are also a form of formative assessment.

(iii) Diagnostic Assessment: Just like the formative assessment, diagnostic assessment is also conducted during the teaching-learning process. As the name suggests, diagnostic assessment is done to diagnose the learning difficulties faced by the learner during the process of teaching and learning. Diagnostic assessment is carried out based on the data obtained from the formative assessment. It uses multiple measures and reports to identify students' strengths and needs in specific areas of skill so that the teacher can provide remedies to address their learning needs. Diagnostic assessment directly guides academic curricular and instructional decisions because there is a better understanding of what a student does or does not know in relation to a specific learning goal. The types of assessment used for diagnostic purposes include universal screening, classroom observation, monitoring, and various other qualitative techniques like teacher-student interaction, group discussion, etc. that are helpful in knowing the learning gaps.

(iv) Summative Assessment: Summative assessment is used to evaluate the students' learning, understanding, skill acquisition, knowledge level, and academic achievement at the end of the defined period of teaching and learning. Such assessments are typically done at the end of a course, semester, program, or school year. Summative assessment is a kind of certification that is given to the learner after achieving a minimum level of accomplishment. Feedback provided in summative assessment is terminal in nature and cannot be used for modification of learner's behavior because it is conducted at the end of a term. There are different techniques and tools which are used in summative assessment; they may be verbal or nonverbal in nature, for example, teacher-made standardized tests, annual examinations, and semester and examinations.

6.3.8 Concept of Evaluation Evaluation is a broader concept of understanding the progress in the process of teaching and learning. Evaluation includes both measurement and assessment procedures to draw a comprehensive picture of the attainment of the goals of pedagogy. Evaluation is done by assigning values to the measured score through its proper assessment and we add judgment to the final result. When we are evaluating we are making a judgment as to the suitability, desirability, or value of a thing. In pedagogy, evaluation is a continuous process and is concerned with more than just the formal academic achievement of students. Evaluation

135 NSOU GE-ED-31 of a learner cannot be done just by their performance in a classroom or through the year- end examination; evaluation needs careful understanding and exploration of the learner's cognitive, affective, and social domains. This exercise of the test depends upon the strategies and resources used by the teacher as well as the learners. The goal of teaching-learning can only be met if the entire dimensions of learners' needs could be understood and satisfied; which is possible only if the evaluation of the entire teaching-learning process is done with most accuracy. Evaluation is the crucial step in improving the quality of education. J.M Brafield defined evaluation as, "the assignment of symbols to phenomena in order to characterize the worth or value of phenomena usually with reference to some social, cultural, and scientific standards." In the classroom, a teacher does the evaluation by considering the sum total of all the measurements done through various tests which are carried out on the learners and by considering all the non-measurement methods used during the process of teaching-learning like observation, interaction, discussion, interviews, etc. Finally, the teacher adds their own value judgment to the entire process to conclude the outcome of the teaching-learning process. Therefore, we can say that evaluation is equal to all quantitative measurements plus the qualitative assessment and the value judgments added by the teacher. It can be said that measurements and assessments are the means and evaluation is the end. In any evaluation process first comes the measurement which provides data for assessment and finally comes the evaluation. In the process of evaluation, assessment is done by comparing two or more sets of data collected through various tests on the learners reflecting the progress of the teaching-learning process and then the judgment about the attainment level is made, the learning outcomes then help in making the decisions. Such decisions help in the improvement of all the different dimensions of pedagogy. Diagrammatic representation of the relationship between evaluation, assessment, and measurement is presented in a figure given below: Fig: 6.1 Relationship between evaluation, assessment, and measurement

136 GE-ED-31 NSOU 6.3.9 Characteristics of Evaluation Evaluation is a continuous process that starts with the entry of a learner into the formal educational system and continues till the completion of the course. Evaluation is not confined to a particular stage of the teaching-learning process, as the child moves from one stage of education to another stage of education the process of evaluation continues. The progress of the child depends upon the process of evaluation. Evaluation requires careful interpretation of the data sets; it requires comparison of various data to arrive at a conclusion based upon which the decision for the improvement in the process of teaching-learning depends. Evaluation is comprehensive in nature. It does not depend only upon the academic status of the learner but includes the overall growth and development of the learner. It includes cognitive, affective, and psycho-motor domains of the learner also. It involves adding values and making judgments about the child's progress to make decisions about improvement and corrective measures in the learner's learning process. Evaluation is not objective in nature. It is subjective judgment depending upon the various dimensions involved in pedagogy. Evaluation is highly systematic in nature, it follows a definite pattern and steps to attend the goals of pedagogy. Evaluation is philosophical in nature. Evaluation involves both quantitative measurement and qualitative assessment alongwith value judgment. 6.4 Evaluating Learner Achievement: Entry Level, Continuous and Comprehensive, and Outcome-Based Evaluation 6.4.1 Understanding Continuous and Comprehensive Evaluation Education aims at making children capable of becoming responsible, productive, creative, knowledgeable, and useful members of a society. All the educational system measures and assesses the achievement level of the learners from time to time. Continuous and comprehensive evaluation refers to one such method of assessing the achievement of the

137 NSOU GE-ED-31 learner which is based on the systems evaluation technique and it covers all the aspects of student's growth and development. It is a developmental process of assessment that emphasizes two major objectives - first, making the evaluation a continuous process, and second, assessing the comprehensive learning and behavior outcomes of the learners. The term continuous is used as a notion that the development of a child through the process of learning is continuous in nature and hence the evaluation should be continuous too, whereas comprehensive means that the evaluation scheme tries to cover both the curricular and the co-curricular aspects of students' growth and development. School education is the necessary foundation for strengthening human resources which is the core element for the development of a nation. From the time of our independence, many educational commissions and policies emphasized upon free and compulsory education in our country. From the Universalization of Elementary Education to the Sarva Siksha Mission, the main goal was to provide quality education for everyone. The various national policy of education recommended improving the quality of education in schools and colleges. The major recommendations include the child-centered approach of teaching-learning through reforms in the context and the process of education, school facilities, professionally trained teachers, laying down the minimum level of learning, and emphasise upon continuous and comprehensive evaluation. The concept of a continuous and comprehensive evaluation is a process of determining the extent to which the objectives of quality education and the overall development of the children are achieved. It is not only aimed towards assessing the achievement level of the learners but also to improve it continuously throughout the learning process. A continuous and comprehensive evaluation is also concerned with the identification of the best learning experience conducive to the overall personality and cognitive development of the learner so that desirable behavioral changes can be fostered in them. In connection to this, the national policy of education (1986) recommended that a minimum level of learning should be ensured at each stage of primary education. For it certain competencies are identified for each subject at every grade of schooling. Each competence constitutes and expects a performance standard that lends itself to criterion testing which is continuous and competency- based. It is very essential for the teachers especially at the school level to adapt a robust scheme of a continuous and comprehensive evaluation that may help in establishing the learner's attainment of a minimum level of competencies. A competency also becomes a criterion to organize the teaching-learning process, and at the same time to access the student. It is a very well-known fact that evaluation is usually done to measure the knowledge and understanding outcomes. The evaluation of skill and higher mental abilities are neglected to a great extent. A good continuous and comprehensive evaluation ensures that the evaluation of non-cognitive aspects like attitude, appreciation, interest, motivation, personal and social

138 GE-ED-31 NSOU qualities of the student are also done properly. At this point, it is necessary to stress upon the fact that evaluation should be comprehensive in nature where all the learning experiences including scholastic, co-scholastic, and personal as well as the social qualities are assessed thoroughly. 6.4.2 Objectives of Continuous and Comprehensive Evaluation A continuous and comprehensive evaluation is required because different specific areas of learners' growth need different types of evaluation through certain techniques. Continuous and comprehensive evaluation helps in decision-making regarding various aspects of the teaching-learning process promoting the students increasing equity, efficiency, and accountability. For the same the teacher has to select the most appropriate technique for the situation and develop the necessary tool for the same and decide upon the time and place of evaluation. Some of the important objectives behind the use of continuous and comprehensive evaluation are: A continuous and comprehensive evaluation is needed to develop the cognitive, emotional, and social skills of the learners. It focuses on shifting the learners from the rote learning practice toward learning based on experience and thought process. One of the important objectives of continuous and comprehensive evaluation is to integrate evaluation with each and every step of the teaching-learning process. Another important objective is to control and improve the quality of education and uplift the performance level and quality of achievement of the learners. To determine the social utility, desirability, or effectiveness of an educational program and to take necessary decisions about the learner, the process and context of learning. In modern pedagogy, a continuous and comprehensive evaluation is aimed to make the learning process a child-centered activity, where the children will learn to evolve into a complete person under the guidance of their teacher. Its objective is to make the teacher as facilitator of learning, not the controller of the process of teaching and learning. 6.4.3 Implementation of Continuous and Comprehensive Evaluation As already discussed, a continuous and comprehensive evaluation is very important for improving learners' overall quality across all the domains of teaching-learning. In the context of school, implementing the continuous and comprehensive evaluation demands the

139 NSOU GE-ED-31 continuous updating of the teacher's judgment about the learners and their performance in academics as well as co-scholastic areas. Some important points to be considered for implementing the continuous and comprehensive evaluation are: Careful examination of the course and specification of competencies to be attended by the learners in terms of knowledge, understanding, application, and skill performance. Knowledge and ability to construct assessment tools that are criterion-based appropriate for assessing the competencies. It is essential to carefully plan the competency-based teaching procedures. There should be complete harmony between the teaching and assessment process without which assessment will be ineffective and distorted. Proper maintenance of record regarding the improvements and drawbacks of the learner should be kept, so that suitable modification pedagogy and evaluation can be done. Proper implementation of continuous and comprehensive evaluation requires knowledge and skill of evaluation, commitment, and assistance to provide remedial teaching on the part of the teacher.

6.4.4 Concept of Outcome-Based Evaluation

Outcome-based education is a learner-centric teaching-learning model that focuses on evaluating students' performance through outcomes. These outcomes include learners' knowledge, skill, understanding, attitude, metacognition, creativity, etc. Its focus remains on the evaluation of outcomes of the program by stating the change in the behavior. Outcome evaluation is the assessment done to measure the final results of a learning program. It is done by educational institutes for calculating the behavioral change and its impact as the product of the teaching-learning process. The outcome-based evaluation focuses on input from the participants and how the activity affected them or brought any change in them. It is concerned with what kind of difference the activity of learning made for them. The importance of outcome-based evaluation lies in the fact that it helps us to know how well the objectives of a learning program were met. The analysis of this short can be useful for educational institutes with learners' learning at different levels. Such evaluation is effective in depicting the picture about the current program of learning and in predicting the direction in which it is heading. Some of the other advantages of outcome-based evaluation are: It helps in estimating the cost of the program and the result helps in designing the

140 GE-ED-31 NSOU other course of future educational programs of action. It helps in understanding the impact of the educational program and how fruitful will be the prospect of such a program of learning to replicate in other scenarios. It helps in gaining the confidence of society over the present quality of education. Keeping outcome-based evaluation an integral part of pedagogy ensures the reliability of educational programs in the future.

6.5 Preparing Results: Scoring, Grading, and other Components

The assessment and evaluation of various dimensions of the learner during and after the completion of the teaching-learning process come in the form of their performance or achievement results. Preparation of the result is an important task carried out by the teacher and the educational institute to reflect the level of accomplishment by the learner at the end of the academic session. In this regard, the national curriculum framework (2005) reported that "a good evaluation and examination system can become an integral part of the learning process and benefit both the learners themselves and the educational system by giving credible feedback. The purpose of assessment is necessary to improve the teaching-learning process and materials, and to be able to review the objectives that have been identified for different stages by gauging the extent to which the capabilities of the learners have been developed." This recommendation makes it mandatory for the educational institutes to record and report the results of the learner for communicating to the parents in a format (having both quantitative and qualitative information) which includes both their scholastic and non-scholastic abilities and performance. We have already discussed that the purpose of assessment and evaluation is to help the teacher to understand the drawbacks and the strength in the process of teaching and learning, as well as it helps the student to enhance and construct their learning. For the same, the teacher must understand the level of performance of each student and the student must also get the necessary feedback on various aspects of their skills, knowledge, understanding, and other non-cognitive aspects. It is possible when the teacher will provide them feedback at the time of performing the activities and also mention in their report both the quantitative and the qualitative accomplishment. Therefore, preparing a result and reporting the performance of the learner is a challenging task performed by the teachers and the academic board of the educational institute. We will discuss here some of the important aspects of preparation for the result of the learners.

141 NSOU GE-ED-31 Use of indicators: While measuring the performance of the learner it can be recorded in terms of two indicators - quantitative and qualitative. The complete picture of the students' development and achievement can be viewed only when both the scholastic and the co-scholastic areas are taken into consideration. The descriptive indicators are qualitative in nature. Such indicators depict the efficiency and the skill of the students that they reflect in their behavior. In junior classes like the primary level of education, descriptive indicators are communicated to the parents and included in their annual and cumulative reports. This report includes the learner's ability to acquire first language and second language skills, ability to be involved in the conversation, and abilities to solve basic mathematical problems. It also includes their ability to cope up with social and environmental phenomena and participation in different co-curricular activities. It is impossible to involve all the qualitative indicators in a report card therefore only certain relevant indicators are generally presented in the learner's report card. The performance and achievement of the learners in academics are generally represented in terms of quantitative indicators like the marks and grade obtained in a class test, periodic test, half-yearly test, annual examination, oral test, and teacher-made test. They are presented in a report card to communicate the performance of the learners to their parents. It is also helpful in deciding a minimum level of achievement necessary to promote the learners to the next stage of education. Scoring and recording: The scores from quantitative data obtained from the different examinations and qualitative data obtained from co-scholastic activities are recorded in the Report Card. It is very vital to follow certain procedures if the scoring is to be done with maximum accuracy and reliability. The necessity for extreme caution and care in scoring has been indicated by many pieces of literature. It has been found that errors can occur due to the failure to understand the proper scoring direction which can be heppened due to carelessness in marking, adding, subtracting, computing, and transcribing the scores. The best way to overcome such errors is by professional training to handle the scorers and by arranging a procedure to re-score the report cards, randomly few of them if not all. A sample report card of the secondary section is given below : Student's Name: Roll No. Class and Section. Mother's/ Father's/Guardian's Name: Date of Birth: Academic session:

142 GE-ED-31 NSOU Co-curricular subjects: Subjects Grade Work education Arts Music Physical education Result of the student: Remarks of the class teacher: Signature of the class teacher: Signature of the principal: Subject Academic Year (Full marks 100) Periodic test (10) Half- yearly examinatio n (10) Noteb ook (5) Project (5) Annua l exami nation (70) Marks obtain ed (in 100) Grade First language Second language Subject 1 Subject 2 Subject 3 Additional subject

143 NSOU GE-ED-31 Grading scale for academic/ curricular areas: Grades are awarded on an 8 point grading scale as presented in the table given below Marks range Grade 91-100 A1 81-90 A2 71-80 B1 61-70 B2 51-60 C1 41-50 C2 33-40 D 32 & below F (Failed) Note for the scorer: Reporting in the academic area is to be done both in the marking and grading systems. The assessment of the co-curricular area is to be done only in grading. In the remarks section for the class teacher, the qualitative description of the individual students can be made. The systematic and proper preparation of the report card helps in preparing a profile of the student, this profile will help the student in excelling his career towards new highs and bigger achievements. Developing a student profile helps to provide a deeper understanding of students' unique interests, traits, and abilities. Thus, it is essential for the educational institutes and the teachers working in those institutes to maintain a scientific and systematic report of each learner so that it could improve the overall quality of the learner and education. 6.6 Summary Education is not simply the acquiring of knowledge but it is the overall personality development of a child so that the child can adapt to the surroundings and thrive in the society by contributing meaningfully to its society and nation. In scholastic areas education includes the development of the mind and the ability to acquire knowledge, develop understanding, analyze and synthesize it, apply the knowledge in practical situations and also critically reflect on various issues. But for the complete development of body, mind,

144 GE-ED-31 NSOU and spirit it is essential to help the learner in co-scholastic (or co-curricular) areas by the development of sense, morality, work experience, art and culture, life skill, and value education. A quality education includes both scholastic and co-scholastic learning in its teaching-learning process. One of the important parts of education to ensure its quality is by making measurement, assessment, and evaluation an integral part of teaching-learning. Measurement, assessment, and evaluation are the elements of the same process where a learner is judged with the value about his/her achievements based on certain quantitative and qualitative indicators. Learning is a continuous process and so is the evaluation. Such evaluation is termed as continuous and comprehensive evaluation which is now an integral part of our modern education system which confirms the quality output from the process of teaching-learning. Based on the output of the process of teaching-learning, evaluations are modified and so are the strategies of instruction thus evaluation based on output is gaining popularity among the teacher and educational administration. Proper evaluation is possible only when proper documentation of the student's achievement is done. Teachers prepare the Report Card of the learner as a mirror to show their achievements, strengths, and weaknesses. The report card should be based on both quantitative and qualitative indicators of the learner so that the parents can get the complete picture of their children.

6.7 Self-Assessment Questions

1. What do you mean by measurement? What is its importance in pedagogy?
2. What do you mean by assessment? Describe the different types of assessment?
3. What are the features of good measuring tools?
4. How evaluation, assessment, and measurement are related in education?
5. What are the characteristics of evaluation in education? Write about the importance of assessment in education.
6. Why is continuous and comprehensive evaluation important in education?
7. What are the objectives of continuous and comprehensive evaluation and how can it be implemented effectively?
8. What is outcome based evaluation?
9. What are the types of indicators based on which the results are prepared?
10. How are the achievements of the learners presented in the report card?
